Meanwhile, Higashifuchie Elementary School has suspended all physical education classes and has instructed students to stay away from the school's yard during class breaks.

"They say that there is no health threat, but it's not easy to trust what they say right away. I want authorities to appropriately explain the measures they have taken," said a mother whose son is in the first grade at the school.

According to officials, the school had received approximately 10 inquiries from parents in relation to the radiation.

Japan asks Turkey to proceed with talks on nuclear plant deal

TOKYO (Kyodo) -- Japan asked Turkey on Tuesday to continue with talks on a nuclear power plant deal in the latter country, while confirming with the United States plans to strengthen technical cooperation on nuclear power between the two countries.

The move came during talks between Japan's industry and trade minister, Yukio Edano, and his counterparts from Turkey and the United States in Paris on the sidelines of a ministerial meeting of the International Energy Agency.

The latest overtures signal Tokyo's willingness to pursue the export of nuclear power technology, as a way to shore up Japan's fragile economy, while seeking to reduce its nuclear dependence domestically in the aftermath of its worst nuclear disaster in March.

Since last December, Ankara has given two Japanese companies -- Toshiba Corp. and Tokyo Electric Power Co. -- priority rights to negotiate a deal to build a nuclear power plant in Turkey.

But following the devastating accident at its Fukushima Daiichi nuclear plant, Tokyo Electric Power signaled in July its intention to withdraw from the talks. The focus is thus on whether Turkey would continue with the talks.

At the meeting on Tuesday, Edano asked Turkey's energy minister, Taner Yildiz, to move the talks forward. "I would like you to continue (to positively) evaluate Japan's technology, according to Japanese officials," he said.

Yildiz indicated that he would consider the matter in a forward-looking manner, the officials said.

During another meeting, U.S. Energy Secretary Steven Chu pressed Edano to explain Tokyo's stance on its atomic energy policy in the wake of the nuclear disaster.

Edano told his U.S. counterpart that Japan intends to make use of its technology and knowledge of nuclear power in the international arena, while reducing its dependence on nuclear power plants for electricity generation at home.

To do so, the government will further promote Japan-U.S. cooperation, the economy, trade and industry minister was quoted by officials as saying at the meeting.

At a separate meeting, Edano reached a basic agreement with Guenther Oettinger, the European Union's energy commissioner, to hold a ministerial dialogue on energy between the two sides next spring.

Fukushima city begins full-scale decontamination efforts

The Yomiuri Shimbun

FUKUSHIMA--The Fukushima municipal government on Tuesday began the first phase of decontamination for the entire city, beginning with the Onami district, where high radiation has been detected.

Prime Minister Yoshihiko Noda visited the district to witness the start of decontamination work, which is expected to be completed by the end of the year.

Located about 60 kilometers away from the Fukushima No. 1 nuclear power plant, it is calculated that a person in Onami would receive a cumulative radiation dose of more than 5 millisieverts a year.

The decontamination work is being conducted in line with basic central government guidelines and is regarded as a test case to study the effects of intensive cleaning in an entire district for a limited period of time.

The municipal government will soon expand areas subject to decontamination, and will eventually clean 110,000 households throughout the city. It faces several challenges, such as how many volunteers will be willing to help the cleanup in addition to companies, as well as securing temporary storage facilities for radiation-contaminated topsoil and other matter removed from the houses.

Sending kids to school becomes heartwrenching decision

Naoki Taruta / Yomiuri Shimbun Staff Writer

MINAMI-SOMA, Fukushima--It was back to school Monday for five primary and middle schools for the first time since emergency evacuation preparation zones were opened for parts of Minami-Soma, Fukushima Prefecture, and Hisae Suzuki had a special request. "Could you drive the kids to school?" she asked her 65-year-old mother.

A nurse at a hospital in Minami-Soma, Suzuki, 36, worked the night shift the previous day. She plans to drive her three sons to and from Haramachi Daiichi Primary School except for six or seven times a month when she has to work night shifts.

Although emergency evacuation preparation zones created in the wake of the crisis at the Fukushima No. 1 nuclear power plant have been opened, parents like Suzuki remain worried about their children's exposure to excessive radiation.

All five schools are located in Minami-Soma's Haramachi district, which was inside the emergency evacuation preparation zone that covered all or part of five municipalities in the prefecture.

The Suzukis, however, still live at emergency rental housing in Soma available to evacuees after the March 11 disaster, even though the emergency evacuation preparation zone in Minami-Soma was dissolved on Sept. 30.

"Due to concerns over radiation exposure, we won't return to our house unless we can confirm it's safe," Suzuki said.

She is considering sending her eldest son, sixth-grader Shigeyuki, 12, to a middle school in Soma--instead of a school near their original house--in April next year after he graduates from primary school.

Whether or not her children can play their favorite sport, baseball, in Haramachi, will factor into the decision.

However, her two younger sons--fourth-grader Yusuke, 9, and second-grader Kiyonori, 8--have been urging Suzuki to return to Haramachi, saying, "All our friends are there."

"I'd like my sons to have more freedom to do the things they like," Suzuki said. "I know we shouldn't stay at the [Soma] shelter for too long."

Meanwhile, Reiko Sato, 41, whose family evacuated from Minami-Soma to Yonezawa, Yamagata Prefecture, decided not to allow two of her children to return to Haramachi Daiichi Primary School when it reopened.

She said she would decide on the timing "after taking [the district's] decontamination efforts into account." Her youngest child, Hiromu, is only 4 years old, and Sato's main priority is to avoid any future health risks to her children posed by excessive radiation.

Her husband, Hidemasa, 41, spends five days a week in Minami-Soma working at his used car sales and real-estate rental businesses.

The couple's children--eldest son Taiko, 12, and daughter Haru, 9--are adjusting to primary school in Yonezawa, but sometimes become homesick.

Sato therefore takes the children to play baseball in the Soma district on weekends when other children from Haramachi are there.

"Of course I'm worried about radiation exposure," Taiko said, "but I want to attend middle school in Haramachi."

Yet the sixth-grader's mother had a more immediate concern: "I'm wondering where his primary school graduation ceremony [in March] will take place--Minami-Soma or Yonezawa."

Japan still considering total nuclear power pullout

By Marie Maitre - http://www.washingtonpost.com/business/economy/update-1-japan-still-considering-total-nuclear-power-pullout/2011/10/18/gIQAwqHhuL_story.html

PARIS, Oct 18 (Reuters) - Japan has not ruled out the possibility of complete closure of its nuclear power stations as one option for the country's future energy policy after the world's worst nuclear accident in 25 years, economy minister Yukio Edano said.

"I am certain that we are going to reduce nuclear power generation but whether we are going to reduce it to zero is a separate issue," Edano, the economy, trade and industry minister told Reuters on the sidelines of a ministerial meeting hosted by the International Energy Agency in Paris.

Asked whether pulling out of nuclear was being considered, Edano said: "Yes, it is still under consideration."

Earlier Edano told a press briefing that Japan was working on improving its energy efficiency and would promote the development of renewable energy sources and of gas powered generation plants to make up for lost nuclear output.

Japan's former prime minister Naoto Kan concluded in March that nuclear power was no longer worth the risk after an earthquake and tsunami crippled the Fukushima power plant.

But his successor Yoshihiko Noda has signalled that nuclear power could play a role for decades and pro-nuclear interests are quietly campaigning for their sector.

The government has let a panel of experts begin a debate on Japan's energy policy.

Public concern about safety leapt after the Fukushima accident, which forced 80,000 people from their homes and sparked fears about food and water supply. Some 70 percent of voters polled in July backed Kan's call to phase out nuclear plants.

A series of scandals in which regulators and power companies tried to sway hearings on reactors has also dented public trust.

Noda has acknowledged that public safety concerns will make it tough to build new reactors, but has stopped short of saying atomic power would play no role at all by 2050.

He said decisions on reactors already under construction would have to be made "case-by-case".

Discovery of radiation 'hot spots' in Tokyo sparks calls for decontamination standards

Officials have called for government standards on radiation decontamination measures following a spate of discoveries of radiation "hot spots" in the Tokyo metropolitan area.

On Oct. 2, a high radiation level of 3 microsieverts per hour was detected on a road in Tokyo's Setagaya Ward by a member of the "Setagaya Kodomo Mamoru Kai" (Setagaya Children's Protection Association), which was founded in June in the wake of the ongoing crisis at the Fukushima No. 1 Nuclear Power Plant. The member took measurements based on information on social media site Twitter. As it turned out, the radiation was coming from radium stored underneath the floor of a home in the ward.

At the time, Setagaya Mayor Nobuto Hosaka spoke of the difficulty in pinpointing hotspots, saying, "It's impossible for administrative officials to search everywhere. We want people to actively provide information to us in the future."

Tokyo's Adachi Ward detected a level of radiation of 3.99 microsieverts per hour next to the machinery room of an elementary school pool on Oct. 17, following measurements taken independently by a resident. However, the government has not yet provided any clear guidelines relating to decontamination work.

Based on the International Commission on Radiological Protection's limit of one millisievert of artificial radiation per year under normal circumstances, some local bodies have used a level of 0.25 microsieverts per hour as a guideline to determine whether or not to decontaminate areas, but the response varies between local bodies.

Tokyo's Arakawa Ward is the only one of Tokyo's 23 wards that has not taken its own radiation measurements. It has received reports from residents that there are hotspots with radiation measurements of up to 1 microsievert per hour, but ward officials have merely commented, "Safety was confirmed in measurements taken by the Tokyo Metropolitan Government in June."

Noriko Chikumoto, representative of "Arakawa-ku no Kodomo no Mirai o Kangaeru Kai" (Association to Protect the Future of Children of Arakawa Ward), said, "We're worried, and we want the government and local bodies to set clear decontamination guidelines."

Eiichi Yamamoto, head of the Arakawa Ward Government's environment section, said "(Radiation) measurements are a sensitive issue, possibly affecting the lives of residents and their properties. We want the government to establish unified standards."

The Ministry of Education, Culture, Sports, Science and Technology is currently working on guidelines for radiation measurement and decontamination.

Environmental associations detect high radiation in Tokyo's Katsushika Ward

Two environmental associations in Tokyo's Katsushika Ward met the ward's mayor, Katsunori Aoki, on Oct. 18, seeking radiation tests and decontamination measures after they detected radiation of up to 5.47 microsieverts per hour in the ward.

The Katsushika Aozora no Kai, an association that has tackled the issue of atmospheric pollution in Katsushika Ward, and the Katsushika branch of the Tokyo Kogai Kanja to Kazoku no Kai, which represents victims of pollution and their families, made the request after conducting their own radiation tests at 314 locations starting in July.

The association representing victims of pollution also detected radiation measuring up to 6.7 microsieverts per hour in Edogawa Ward and 3.62 microsieverts per hour in Adachi Ward. It plans to make similar requests for testing and decontamination efforts in those wards.

Both associations took their measurements below gutters, where it is easy for radioactive materials to collect, using simple radiation measurement devices. At 65 locations, they found the radiation level one to two centimeters above the ground was 1 microsievert per hour or greater, and at least 5 microsieverts per hour in two of those locations.

Officials in Katsushika Ward have been taking weekly measurements at 7 parks in the ward since the end of May, and in August, they conducted radiation tests at all 436 sandpits at kindergartens, schools and other educational facilities. The highest level that had been detected during those tests was 0.57 microsieverts per hour, recorded on Aug. 12 at an elementary school sandpit.

The Katsushika Ward Government has decided to take measurements on roads and other areas near where the two associations detected high levels of radiation, and decide whether or not to go ahead with decontamination measures based on those results.

"This is a level that has not been detected before so we're surprised," a ward official commented. "We can't enter private land, but we want to conduct measurements on public land in the vicinity."

Katsushika Aozora no Kai head Noriaki Yoshikawa commented, "The situation surrounding Katsushika is extremely serious. The ward should proceed to ascertain the state of contamination and proactively decontaminate these areas."

Radiation monitoring by drone begins in Fukushima

A city near the troubled Fukushima Daiichi nuclear power plant has begun monitoring radiation levels of farmlands and forests with a small unmanned helicopter.

The move comes after the central government lifted an evacuation advisory for parts of Tamura City and 4 other municipalities outside the 20-kilometer no-entry zone around the Fukushima Daiichi nuclear plant at the end of last month.

On Wednesday, the Japan Atomic Energy Agency began monitoring radiation using the drone at the request of the city. The agency tested a 300-meter-long, 150-meter-wide area of a rice field from a helicopter equipped with a measuring instrument about 20 meters above the ground. It also carried out tests on forests.

Data transmitted by the helicopter is reportedly translated into radiation levels 1 meter above the ground and indicated by instruments at ground level.

Aircraft are suitable for measuring radiation levels of large areas and other locations that are difficult for people to access.

In the areas of Fukushima Prefecture where the evacuation advisory has been lifted, residents had previously been advised to stay indoors and prepare for emergency evacuation. But many residents decided to evacuate their homes.

The tasks facing Tamura and the 4 other municipalities are decontamination and radiation monitoring for both residents and evacuees.

Radioactive cesium detected in Tokyo tea leaves

Radioactive cesium in levels above the government standard has been detected in tea leaves produced in Tokyo and Saitama, north of the capital. The contamination is believed to have been caused by the Fukushima Daiichi nuclear plant accident.

The Tokyo Metropolitan Government says 3 brands of tea leaves grown in northwestern Tokyo have been found to contain 550 to 690 becquerels of radioactive cesium per kilogram. The government limit is 500 becquerels.

The Saitama prefectural government says it found 504 to 2,063 becquerels per kilogram in locally-grown leaves of 97 brands.

The samples tested by the prefecture were not early-picked leaves, which are said to be more likely to contain radioactive material. The prefecture had already found that such leaves of 14 brands contained radioactive cesium above the limit.

The authorities have asked the producers to dispose of their tea leaf stocks.

Municipalities decline nuclear power subsidies

Four Japanese municipalities have demonstrated their opposition to nuclear power by declining government subsidies for hosting nuclear plants.

The government this week began receiving yearly applications for subsidies from municipalities where nuclear-related facilities are located.

About 12 billion dollars have been allocated since the program started in 1974.

NHK has learnt that, in a rare move of opposition, 4 out of the 44 municipalities that host nuclear facilities around the country plan to skip the application this year.

One of them, **Minamisoma City** in Fukushima Prefecture, has demonstrated its anti-nuclear stance by refusing to accept subsidies for the planned Namie-Odaka power plant to be operated by the Tohoku Electric Power Company. In addition, Minamisoma City has decided to decline subsidies allocated for cities surrounding the Fukushima Daiichi plant.

City Mayor Katsunobu Sakurai said the city has made clear its rejection of nuclear power as part of its recovery plan.

Sakurai added the city will demand that the central government subsidize renewable energies.

Neighboring **Namie Town** has also declined subsidies related to the Namie-Odaka plant. The town said

building new nuclear power facilities is not reasonable when Fukushima Prefecture and others are working to remove existing plants.

Wednesday, October 19, 2011 19:43 +0900 (JST)

Journalists' responsibilities heavy in face of unprecedented crisis (Part 1)

The front page of the March 13 morning issue of the Mainichi, reporting on an explosion at the Fukushima No. 1 Nuclear Power Plant. (Mainichi)

The unprecedented disaster at the Fukushima No. 1 Nuclear Power Plant, in which fuel meltdowns were found to have taken place simultaneously at three reactors, poses a massive challenge to the media. Looking back, did we promptly deliver accurate information that could save the lives of the public? Reflecting upon our experiences gathering information from the disaster areas, as well as from the Prime Minister's Office, plant operator Tokyo Electric Power Co. (TEPCO), the Ministry of Economy, Trade and Industry's Nuclear and Industrial Safety Agency (NISA), and other groups and individuals, what can we say about our coverage of the ongoing crisis?

Press conferences were held intermittently by TEPCO and NISA beginning March 11, when the nuclear disaster was triggered by the Great East Japan Earthquake and tsunami. As the safeguards meant to guarantee the safety of the nuclear power plant failed one after another, it was our task as reporters to discern the state of the plant with the limited information we had, motivated by a sense of impending danger to residents living in close proximity to the power plant. At the mercy of backtracking government and TEPCO officials, however, we were often at a loss as to how to confirm

the legitimacy of the information we were given and how the information should be relayed to the public.

A little after 3:30 p.m. on March 12, images of the Fukushima No. 1 Nuclear Power Plant appeared on the screen of a television at TEPCO's head office in Tokyo's Uchisaiwaicho district. It appeared as though just the steel frame of the upper part of the No. 1 reactor building remained. The reporters grew alarmed. "Something's not right," one said.

However, even after seeing the footage, TEPCO's public relations officer stubbornly insisted: "We don't know what's going on. We're trying to confirm with those on the scene." Finally, at a press conference held four hours later, TEPCO admitted that there had been a hydrogen explosion at the plant's No. 1 reactor.

By that afternoon, radioactive cesium and iodine were detected in the power plant's surrounding areas. Koichiro Nakamura, then deputy director-general of NISA and the press officer for the agency, explained that it was possible that a reactor meltdown had taken place. Soon thereafter, Nakamura stopped appearing in press conferences. The new press officer refused to offer any further information, sticking to the line: "We can't discuss anything until the Prime Minister's Office has made an announcement." Subsequently, NISA avoided using the phrase "core meltdown," replacing it with either "fuel damage" or "core damage."

However, several months later, it emerged that NISA had previously asked power companies to fake support for nuclear power at a symposium, and on Aug. 10, approximately five months after the onset of the nuclear crisis, then NISA director Nobuaki Terasaka announced: "We recognized the possibility of a core meltdown soon after the incident began."

On March 12, NISA designated the Fukushima disaster a level 4 on the International Nuclear and Radiological Event Scale (INES), but a month later upgraded it to level 7, the worst level on the scale, which had until then been given only to Chernobyl. An understated announcement would be made, followed later by a revision. Statements concerning the nuclear disaster simply repeated this pattern.

So did TEPCO and the government respond appropriately to the crisis? I cannot shake the feeling that the damage could have been reined in far more than it has been. And slowly, through the efforts of the "Investigation Committee on the Accidents at the Fukushima Nuclear Power Station of Tokyo Electric Power Company" set up by the government, it's become clear what prevented officials from being more effective.

In preparation for a midterm report to be submitted by the end of the year, the committee has been conducting interviews with TEPCO and government officials. These interviews have revealed that it occurred to neither NISA nor to the Ministry of Education, Culture, Sports, Science and Technology (MEXT) to use a computer system called the System for Prediction of Environmental Emergency Dose Information (SPEEDI), in coming up with an evacuation plan. Furthermore, no one in NISA had even recognized the necessity of contacting neighboring countries, let alone raising the issue, before low-level radioactive water was dumped into the Pacific Ocean on April 4.

What I've gathered from my experiences trying to understand the disaster is that both TEPCO and the government have failed to look at the crisis from the point of view of the victims.

Norio Kanno, the mayor of the Fukushima Prefecture village of Iitate, lamented that he did not receive any information from the central government for a month or two after the nuclear disaster began, and suggested that it was because "hearts (of government officials) lacked concern for the disaster areas." There is anger directed toward media, too, which we as journalists must accept and learn from.

The basic mission of newspapers is to collect information in the field and deliver it accurately to the public. At the beginning of the nuclear crisis, however, we had no idea whether the information we had to work off of was accurate. In addition, many experts were divided on what they believed. Requests for permission to go on-site to the power plant to report were denied by TEPCO. When reporters haven't looked at the scene themselves, how are they to communicate the very limited information that they do have?

Settling of the ongoing crisis, including decontamination beyond the plant's borders, is expected to take many years. The investigation into the disaster's cause has just begun. The responsibility to stand on the side of those who receive the news, and write articles that will contribute to reconstruction and to shed light on the cause of the disaster weighs squarely on our shoulders. (By Junko Adachi, Science and Environment News Department)

(This is part one of a six-part series on coverage of the Fukushima nuclear crisis.)

(Mainichi Japan) October 20, 2011

Panel proposes widening nuclear disaster planning zone to 30 km

Residents dressed in clothing to protect them from radiation prepare to board a bus on Aug. 26 ahead of temporary visits to their homes within three kilometers of the crisis-hit Fukushima No. 1 Nuclear Power Plant. (Mainichi)

TOKYO (Kyodo) -- The secretariat of the Nuclear Safety Commission of Japan proposed on Thursday expanding the zone where intensive disaster countermeasures are to be taken to a 30-kilometer radius of a nuclear power plant from the current 8-10 km in the event of a future nuclear accident.

The secretariat also proposed newly designating a 5-km radius around a nuclear plant in its guidelines as a zone from which people should immediately be evacuated following a plant accident.

It sought the establishment of a 50 km-perimeter around a disaster-struck plant within which preparations would be made for distributing potassium iodide tablets to mitigate the impact of exposure to radiation.

The proposal was presented to the commission's working group reexamining evacuation rules for nuclear accidents in the wake of the disaster at the Fukushima Daiichi nuclear power plant in Fukushima Prefecture.

A government map displaying radiation levels in the area around the Fukushima No. 1 Nuclear Power Plant.

In the accident, which was triggered by the massive earthquake and tsunami in March, the government set a no-go zone in areas within 20 km of the crippled power plant, far wider than the maximum 10-km radius under the existing guidelines.

The government also designated some vicinities of the no-go zone as so-called emergency evacuation preparation zones, prompting many of those residing in such areas to evacuate.

The commission has been reviewing the existing guidelines after the disaster revealed their insufficiencies.

(Mainichi Japan) October 20, 2011

Nuke committee drafts disaster-response revisions

Japan's Nuclear Safety Commission has drafted a plan for expanding areas that should be fully prepared against nuclear accidents to within 30 kilometers of nuclear power plants, from the current 10 kilometers.

A working group at the commission drew up the draft plan, following the March accident at the Fukushima Daiichi nuclear power plant when the government had ordered residents living within 30 kilometers of the plant to evacuate or to stay indoors.

The plan calls for designating areas within a radius of about 30 kilometers of nuclear plants as Urgent Protective Action Planning Zones, or UPZ. The definition of the UPZ is in line with the emergency-response requirements proposed by the International Atomic Energy Agency.

The working group calls for designating areas within 5 kilometers of plants as precautionary action zones, where residents need to immediately evacuate in the event of an accident.

The group also wants residents within a radius of about 50 kilometers to be prepared to take action to prevent internal exposure to the thyroids, for example by taking iodine tablets.

The committee plans to further study the revision plan, together with experts and municipalities.

If implemented, major reviews of anti-nuclear disaster programs by local governments will be required, as the number of municipalities involved will be around 130, about 3 times more than the current figure.

Thursday, October 20, 2011 16:14 +0900 (JST)

Fukushima crisis could have been avoided: French nuclear commission

In this March 15, 2011 photo released by Tokyo Electric Power Co., smoke rises from the badly damaged Unit 3 reactor, left, next to the Unit 4 reactor covered by an outer wall at the Fukushima No. 1 nuclear complex in Okuma, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- The chief of the French atomic energy commission said Wednesday that Japan may have been able to avoid a nuclear disaster at the Fukushima Daiichi power plant if it acted more quickly to pour seawater to cool the reactors after they lost their cooling functions in the wake of the March 11 earthquake and tsunami.

"There was a need to inject seawater from outside within six to 12 hours...and I think it was physically possible to avoid (the accident), although I can say this only now," Bernard Bigot said during a question and answer session after delivering a speech in Tokyo.

The chairman of the French Alternative Energies and Atomic Energy Commission also emphasized the need to make preparations on the assumption that an extreme situation may happen, and vowed his country would never allow an accident involving the release of radiation outside its nuclear power plants.

Hit by a magnitude 9.0 earthquake and tsunami on March 11, the Fukushima nuclear plant in northeastern Japan lost nearly all its power sources and consequently the ability to cool the reactors and spent fuel pools. The government acknowledged that the Nos. 1 to 3 reactors suffered meltdowns.

Seawater injection to cool the reactor cores as an emergency step started with one of the reactors on March 12.

(Mainichi Japan) October 20, 2011

Hot spot decontaminated at Tokyo primary school

The Yomiuri Shimbun

Workers remove soil during decontamination work at Higashi-Fuchie Primary School in Adachi Ward, Tokyo, on Tuesday.

Soil around a small "hot spot" detected at a primary school in Tokyo was removed Tuesday, as the local ward office started measuring radiation levels at hundreds of other facilities it operates.

A radiation level of 3.99 microsieverts per hour was detected under a drainpipe at Higashi-Fuchie Primary School in Adachi Ward on Monday, but this figure dropped to 0.15 microsieverts per hour after the soil was removed, according to ward officials.

Soil to a depth of 10 centimeters in a one-square-meter area around the drainpipe was removed, put in a bag and buried in a hole 1.2 meters deep at a different location at the school.

Tests conducted under the drainpipe after the soil was removed detected 0.15 microsieverts per hour at a depth of five centimeters, and 0.13 microsieverts per hour at depths of 50 centimeters and one meter.

Ward officials said these radiation levels do not pose any health risks to humans. The area, which was next to the school's swimming pool, is no longer off-limits.

Meanwhile, the Adachi Ward Office on Tuesday began measuring radiation at about 800 facilities it operates, including nurseries as well as primary and middle schools. These tests will focus on gutters and areas under drainpipes where contaminated rainwater could accumulate and cause high radiation levels.

If a radiation level of 0.25 microsieverts per hour is detected at a height of 50 centimeters, the ward will remove soil around the spot or wash it with high-pressure water, ward officials said.

They are scared !

From: The Hindu (<http://tinyurl.com/3q92qtg>)

PARIS/NEW DELHI, October 20, 2011

Alliance Francaise cancels lectures on nuclear energy by French journalist

by Vaiju Naravane, Priscilla Jebaraj

In the wake of India's postponement of French reactor purchase decision

French journalist Naïke Desquesnes was preparing for a month-long trip to India to present a lecture series on “Covering Nuclear Energy Post-Fukushima” at six Alliance Française centres when she received a surprise phone call on September 23.

Philippe Gasparini, Director of Alliance Française Bangalore, where her first lecture was scheduled to be delivered on October 10, was calling to say that the subject of her talk had been turned down.

“He said he had perhaps not ‘been diplomatic enough’, but the **French embassy and Areva did not want such a ‘delicate subject’ to be discussed,**” Ms. Desquesnes told The Hindu. He seemed to have been hauled up by the French embassy in Delhi, she felt.

Mr. Gasparini asked her if she had seen The Hindu's September 20 report that India would postpone its final decision on the purchase of the EPR type of nuclear reactors from France until post-Fukushima nuclear safety tests were completed satisfactorily. In the wake of recent uncertainty over nuclear energy and the possible impact on the French reactor manufacturer Areva, **Ms. Desquesnes felt that French authorities were afraid of a debate on the subject.**

Areva has an agreement to build the first of six EPR reactors at Jaitapur in Maharashtra with an option of four more reactors to follow, but nuclear deals around the world have been hit by the March 2011 Fukushima nuclear disaster.

Mr. Gasparini confirms that he and his fellow Alliance Française directors decided to reject the topic of Ms. Desquesnes' lecture at short notice, but refused to discuss why her subject matter was not acceptable.

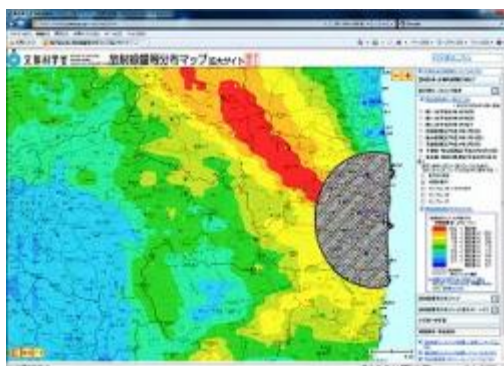

“It was her proposal, it was not really approved by us anyway,” he claimed. “We gave her other topic options, but she was not willing to be prepared for anything else.” He listed India-China relations as a possible alternative, but Ms. Desquesnes, who had spent a month gathering news clippings to present a detailed analysis of the press in France, Japan and India in the wake of Fukushima, declined to research a new subject.

“There was a logistics problem and a misunderstanding with the journalist, so we had to cancel,” said Mr. Gasparini. Asked about his statement to French news outlet Mediapart that it was not a good time to discuss this “very sensitive” subject, Mr. Gasparini told The Hindu: “All subjects are sensitive... Sometimes, if we cannot do it, we simply cannot do it. We need to be flexible.”

The Alliance Francaise is a non-governmental institution promoting French language and culture, which nonetheless works closely with the Cultural Action Office of the French Embassy in New Delhi, and also receives some support from the French Foreign Ministry in Paris.

Ms. Desquesnes' employer, the Courrier Internationale is a monitor of the world press, and has a partnership with the Alliance Francaise around the world to organise talks and seminars on the role of the press and the media.

Most detailed radioactive contamination maps yet published online

The government's new radiation contamination map site is seen in this screen capture taken on Oct. 18. (Mainichi)

The most detailed government maps yet of cesium concentrations and radiation levels stemming from the crisis-stricken Fukushima No. 1 nuclear plant are now available online.

The Ministry of Education, Culture, Sports, Science and Technology site (link below) went live on Oct. 18 with both web-based and PDF versions of the maps, providing not only information by municipality as had been the case previously, but measurements by district.

The maps, intended to help residents who had called for better information on contamination levels between areas of the same municipalities, use soil and air sample data already released. Users are presented with a grid laid over a map of most of eastern Japan. Selecting a square in the grid zooms in on that area, at which point users can choose more detailed maps displaying airborne contamination levels, cesium 134 or 137 levels, or total cesium levels.

Only 3 companies to make quick return to industrial area near nuclear plant

A police checkpoint is seen near a highway in Naraha, Fukushima Prefecture, on Sept. 30. An industrial area of Naraha is seen in the background. (Photo courtesy of the Naraha Municipal Government)

Only three of 19 companies surveyed by the town of Naraha, near the disaster-stricken Fukushima No. 1 nuclear complex, have said they will quickly return to the town's industrial zone -- despite the lifting of an evacuation preparation advisory over part of the town.

Even adding in those companies that would like to return "in the near future," the number only climbs to seven, the town says.

"Lifting the advisory before radioactive decontamination has been done is an example of doing things in the wrong order. Temporary storage places for waste haven't even been decided," said a town official.

Most of the town, including the northern part of the industrial area, is within a 20-kilometers radius of the plant and is still under an evacuation order. However, a government advisory for several other areas including the southern part of the town's industrial area was lifted on Sept. 30.

A town government request to permit operations within the 20-km radius zone was granted, but workers will still have to pass through a police check when entering the zone. Before the disasters, the industrial area employed 600 to 700 people.

A food package maker that is headquartered elsewhere but has a facility in the industrial area continued production after the March 11 disasters using a factory in Niigata Prefecture. To reassure clients about

its inventory of products that had already been produced in Naraha, it had screening tests for radioactive material done, but at least one client still refused to buy those products. Although damage at the company's factory in Naraha was relatively light, the company does not yet have a plan for when it might resume operations there.

"The radiation levels there are low, but we still don't know when or where during the manufacturing process radioactive materials might attach themselves to products. Even if we restarted production, without an announcement of safety by authorities we would have to conduct screening tests for radioactive material, and costs would outstrip our income."

Another problem is securing the necessary employees. Of the six employees of a bolt and screw processing company in Naraha, two with elementary-school age children have fled elsewhere. Schools around the industrial area have not resumed operations, so even if the company restarted operations, it isn't clear that its evacuated employees would soon return.

"We plan to go back to the industrial area, but without enough people, our production ability will be lowered. We also need to secure homes for our employees. I want authorities to quickly get the area decontaminated so that our employees can work without worry," says company president Osamu Fukao.

Meanwhile, a Fukushima city-based dry-cleaning company, Dojinsha, says it cannot resume business in the area because its regular customers who lived nearby have evacuated, and a local electronics manufacturer says it cannot return to the industrial area because it has not yet been paid compensation by the Tokyo Electric Power Co. for equipment moving costs.

Fukushima assembly OKs reactor decommission

The assembly of Fukushima prefecture has adopted a petition calling for the scrapping of all 10 nuclear reactors in the prefecture. The prefecture hosts two Tokyo Electric Power Company-run nuclear stations, one of them severely damaged by the March disaster.

The petition adopted by a majority vote on Thursday was submitted by a civic group in June, following the nuclear accident at the Fukushima Daiichi power plant.

The petition urges the decommissioning of all reactors run by Tokyo Electric Power in the prefecture -- six at the Daiichi plant and four at the Daini plant.

This is the first time in Japan that a prefecture hosting nuclear plants has voted to adopt such a petition.

Tokyo Electric has concluded it will decommission four reactors at the Fukushima Daiichi plant that suffered severe damage in the March disaster. But the utility has yet to come up with detailed plans for the remaining six reactors.

Journalists strived to get truth about nuclear fallout to public (Part 2)

The question of how much and where radioactive materials were dispersed by the hydrogen explosions at the Fukushima No. 1 nuclear plant have been of the utmost importance to residents of both Fukushima Prefecture and beyond, and one we began to pursue soon after the nuclear disaster started to unfold.

The government initially designated the area within a 20-kilometer radius of the power plant an evacuation zone, while those living between 20 kilometers and 30 kilometers from the plant were instructed to remain indoors. However, high levels of radiation were being detected even beyond those areas. A long-term advisory to stay indoors had not been a part of the government's disaster preparedness guidelines, and would pose too great a burden on residents. It seemed to us that a designation of evacuation zones based on actual radiation measurements was necessary.

That was when we came up with the idea of calculating cumulative radiation levels at various locations. At the time, radiation monitoring results released by the Ministry of Education, Culture, Sports, Science and Technology (MEXT) and municipal governments were limited to the amount of radiation detected in the atmosphere per hour (dosage rate). But since local residents would continue to be exposed to radiation, we felt it far more important to provide information on cumulative radiation levels.

When we appealed to MEXT to provide this information, we were told it was not something they could do right away. It was decided then that the Mainichi would crunch the cumulative radiation level numbers by adding together dosage rates released by public sources.

Between March 14 and March 21, the cumulative radiation level in the city of Fukushima reached 1770.7 microsieverts. The figure was 299.7 microsieverts for the Fukushima prefectural city of Iwaki and 34.1 microsieverts for the Tochigi Prefecture capital of Utsunomiya for the same period, and 33.2 microsieverts in the Ibaraki Prefecture capital city of Mito between March 15 and March 21. Having found the cumulative radiation in the city of Fukushima to exceed the average 1500 microsieverts of natural background radiation that we are normally exposed to annually, the Mainichi's Science and Environment News Department debated what to do with the information, concerned about the public response the information could spark.

Ultimately, we decided to release the information along with the explanation that cumulative radiation levels indicate how much radiation one would be exposed to if they stayed outdoors all day, and that radiation levels in general were trending downwards. We also added commentary from multiple experts that the radiation levels posed no health risks for people "stepping out to shop" for groceries, and published the information in the March 23 morning issue of the Mainichi's Japanese edition.

Following publication, we received inquiries from various municipal governments in Fukushima Prefecture, and were criticized by some readers for "causing panic among Fukushima city residents." We maintain, however, that by contributing information on cumulative radiation levels -- which until then had been largely ignored -- we helped residents come to their own conclusions on what to do next.

On March 25, MEXT began releasing cumulative radiation figures. Since then, it has gone on to conduct detailed monitoring of radiation levels, and has posted predicted cumulative radiation levels through March 2012.

We still regret not having been able to predict that radioactive contamination would spread to the extent that it has. We keep asking ourselves if there was any way we could've sounded a more precise alarm when large volumes of radioactive materials were released on March 14 and March 15, as we continue working toward protecting the public from unnecessary exposure. (By Taku Nishikawa, Science and Environment News Department)

Fukushima salmon fishermen look ahead to uncertain future

Tomiaki Nihei, a salmon fisherman for over 43 years, catches salmon in Fukushima's Abukuma River. (Mainichi)

FUKUSHIMA -- If this was a regular year, the nets of salmon fishermen in this prefecture would be heavy with thrashing fish caught on their way up-stream to spawn. A great many of the fish would also be set aside to let nature take its course under the fishermen's supervision, millions of their progeny released into the local rivers in the spring with hopes of their return as adults in four years.

With two of the prefecture's main rivers winding through the 20-kilometer no-go zone around the crippled Fukushima No. 1 nuclear plant, however, this year is anything but regular.

"What will happen four years from now?" is the question many fishermen are asking as the annual salmon season, which flourishes in the towns of Namie and Naraha along the prefecture's Ukedo and Kido rivers between the end of September and mid-November, began.

Fishermen from the Izumitagawa and Kidogawa fisheries cooperatives in the towns each normally release some 15 million young salmon into the rivers every spring, part of their efforts to boost fishing stocks.

The salmon business near the prefecture's Pacific coast was not only profitable, with annual revenues reaching as high as 200 million yen, but it also attracted hundreds of tourists to see the fish return to the rivers fully-grown.

This year, however, as a consequence of the nuclear disaster at the Fukushima plant, both Namie and Naraha were designated no-go or emergency evacuation preparation zones. Moreover, much of the towns' salmon hatchery was destroyed by the March 11 quake and tsunami.

Unable to open the fishing season, fishermen from these towns are now looking at hatching and releasing only about one-fifth the numbers they would in a normal year. Their anxieties, however, also reach four years into the future, when they will welcome an autumn with very little to catch.

Fishermen from the Abukuma Fisheries Cooperatives on the Abukuma River -- in the west of the prefecture and relatively far from the damaged nuclear plant -- discussed suspending fishing this season due to radiation fears. Considering the consequences four years from now, however, they decided to open fishing on Oct. 14, though only until the end of the month. They have estimated they will release no more than 100,000 young salmon next spring -- half that of a regular season.

"If we are afraid all the time we can't do anything. This is part of my life -- this is where I've lived all my life," says 60-year-old salmon fisherman Tomiaki Nihei, adding that he cannot welcome the winter unless he catches salmon. As of Oct. 20 he had caught only about 100.

According to Fukushima Prefecture-led monitoring, while radiation has been found in some kinds of fish -- including sweetfish, char and landlocked masu salmon -- at present salmon is not among them. It is believed that they have not become contaminated because they eat almost nothing from just before they return to the river all the way to their spawning grounds.

As the percentage of salmon to return to Fukushima Prefecture is not high in general, fishermen are worried that the fishing season four years from now will be an especially lean one.

Local gov'ts facing widened evacuation perimeter against nuclear reactor restarts

As the government moves to expand emergency evacuation zones around the nation's nuclear plants to 30 kilometers, all the municipalities affected are now against unconditional reactor restarts at their local plants, a Mainichi survey released Oct. 20 has found.

The Mainichi polled 84 cities, towns and villages in 20 prefectures in response to a Nuclear Safety Commission of Japan proposal to expand the maximum evacuation perimeter around the plants from a 10- to a 30-kilometer radius in the event of a nuclear accident. Seventy-nine of the 84 local governments around 15 nuclear plants responded. Fukushima Prefecture, which has declared it will give up nuclear energy due to the ongoing crisis at the Fukushima No. 1 nuclear plant, was not surveyed.

Asked about approving the restart of idled reactors, 51 local governments replied they couldn't say one way or the other, 17 said they would give approval with safety preconditions attached, two were against any restarts, and nine did not respond. None of the 79 municipalities supported unconditional restarts.

Furthermore, less than half of the municipalities expressed intentions to sign a nuclear power safety agreement with utilities concerned. Such a pact requires approval by a mayor or local assembly if an electric power firm tries to build a new nuclear power plant or expand an existing one. The poll found that 36 local governments signaled readiness to conclude such an accord, 41 were undecided and two had no such plans.

City assembly members find radiation hotspot in Chiba, call for better monitoring

MATSUDO, Chiba -- City assembly members checking local radiation levels have revealed they discovered a hotspot emitting 7.0 microsieverts per hour near a greenhouse here.

The assembly members from the Japanese Communist Party (JCP) added, however, that they will not reveal the exact location of the 7.0 microsievert hotspot or how the city has dealt with it for fear of harmful rumors.

The group furthermore said on Oct. 20 that they recorded hourly radiation levels of more than 1 microsievert at 37 out of 144 locations they checked, including parks, private houses and day-care centers. The group said it monitored radiation levels at a maximum of 25 points per location from Sept. 7 through Oct. 17. About 1,830 people joined the JCP group in monitoring radiation levels 5 centimeters above ground.

"We were surprised to find extremely high radiation levels at places which were considered relatively safe. More detailed radiation checks are necessary," the JCP group stated.

Among parks checked by the group, a sandbox in the city's Nishinoshita Park registered a radiation level of about 3.42 microsieverts per hour, prompting city officials to conduct decontamination work to reduce the level to 0.3 microsieverts. The city has double-checked locations which were initially monitored only by residents, and carried out emergency decontamination measures at about 10 locations.

Perspectives

Journalists keep close eye on Fukushima nuclear worker radiation exposure (Part 3)

The wide perception gap that has surfaced between Tokyo Electric Power Co., the operator of the tsunami-hit Fukushima No. 1 nuclear plant, the government and other parties has raised serious questions about the management of plant workers' radiation exposure.

Shortly after the plant was stricken with meltdowns and hydrogen explosions in March, Mainichi reporters, mainly those with the Tokyo City News Department, began interviewing workers struggling to bring the crippled facility under control.

Most of the workers are from Fukushima Prefecture, and many of them commute to the plant from shelters or dorms where they were taking refuge after their homes were badly damaged in March 11's natural disasters.

A 30-year-old worker for a sub-subcontractor said he had been told by an employee of the subcontractor, "We won't write down the amount of radiation you were exposed to during the latest work on your radiation management record. You don't have to worry about it."

Radiation exposure amounts and the results of regular medical exams are supposed to be stated clearly on each worker's radiation management record. If workers suffer from cancer in the future, there will be no proof of the causal relationship between their radiation exposure and the disease unless such data is included in their radiation management records, making them ineligible for workers' accident compensation benefits.

Further interviews with the utility, the government organizations concerned including the Health, Labor and Welfare Ministry, and other parties have revealed there was a wide perception gap among them over maximum exposure limits for workers.

Health ministry regulations stipulate that nuclear power station workers can be exposed to a maximum of 100 millisieverts over five years, and 50 millisieverts in a single year. However, in the case of an emergency such as a nuclear accident, they can be exposed to up to 100 millisieverts during work to bring the plant under control. In the Fukushima nuclear crisis, the ministry raised the upper limit to 250 millisieverts.

The ministry concluded that workers who are exposed to 100 to 250 millisieverts during efforts to tame the Fukushima nuclear crisis must be withdrawn from further work for five years on the grounds that the conventional regulations apply to the Fukushima crisis.

However, TEPCO was of the view that the conventional regulations do not apply to the work at the Fukushima plant, arguing that workers should not be deprived of employment for long periods. Because of this, the subcontractor omitted the levels of radiation workers were exposed to from their radiation management records.

"In the end, we are the ones who are going to be left holding the bag," a 28-year-old worker lamented in an interview with the Mainichi.

The Mainichi published an article about the omission of exposure data from the 30-year-old worker's radiation management record on the front page of its April 21 morning edition.

It was subsequently learned that at least one TEPCO employee had been exposed to more than 250 millisieverts, prompting the ministry to step up its radiation management instructions to the utility.

There have been some cases of plant workers being exposed to excessive levels of radiation during their work because of sloppy management. We are determined to continue to shed light on how workers' radiation exposure is being handled in an effort to improve their working environment. (By Satoshi Kusakabe, Takayuki Hakamada and Akiyo Ichikawa, Mainichi Shimbun)

2 boys in Fukushima Pref. internally exposed to radiation

TOKYO (Kyodo) -- Two boys in Fukushima Prefecture were found to have been internally exposed to the highest levels of radiation detected during checks conducted on nearly 4,500 local residents in the wake of the nuclear crisis at the Fukushima Daiichi power plant in the northeastern prefecture, the prefectural government said Thursday.

The level of exposure is estimated to be equivalent to 3 millisieverts during their lifetime, which would not have harmful effects on their health, according to government officials. The local government has not disclosed the boys' exact ages, saying only that they are between 4 and 7 years old.

The boys, who are from the town of Futaba, which partly hosts the plant that was severely damaged by explosions after the March 11 earthquake and tsunami, showed the highest levels of internal exposure among 4,463 residents of 13 high-risk municipalities tested between June 27 and Sept. 30, the officials said.

Among others tested, eight people measured 2 millisieverts, six 1 millisievert and the remaining 4,447 below 1 millisievert, they said.

They were tested using whole body counters either at the National Institute of Radiological Sciences in Chiba city or the Japan Atomic Energy Agency in Tokaimura, Ibaraki Prefecture. Estimates for adults were calculated to measure accumulated radiation exposure in the coming 50 years, and for children until they reach the age of 70.

In a related development, Japan Atomic Power Co. said Thursday that a 21-year-old male worker was internally exposed to radiation at the Tsuruga nuclear plant's No. 2 unit after possibly wiping his face with a cloth contaminated with radioactive substances.

The level of exposure was estimated at 1.7 millisieverts for the next 50 years, far below the government-set maximum allowable radiation exposure limit of 50 millisieverts per year for workers at

nuclear-related facilities, and is not expected to have harmful effects on the man's health, company officials said.

The worker, who was in charge of checking the valves of the unit's primary coolant system, threw an uncontaminated cloth into a garbage bag in his work area inside the reactor building, but later stuck his hand into another garbage bag that contained low-level radioactive waste, including a contaminated cloth which he is believed to have used to wipe his face, the officials said.

As radioactive substances were detected on his face and chest area as he was leaving the facility, radioactive substances were found inside his abdomen in a test conducted after he was decontaminated on the surface, they said.

The garbage bag with the contaminated cloth was from another building, and workers are supposed to seal such bags when transporting them outside each work area. Japan Atomic Power plans to make sure workers manage waste properly, the officials said.

Chiba Pref. city finds major radioactive hot spot on public land

Kashiwa Municipal Government workers take radiation measurements at a site on city land where emissions of 57.5 microsieverts per hour have been detected. (Mainichi)

KASHIWA, Chiba -- Officials here announced Oct. 21 the city government has discovered a hot spot emitting extremely high radiation of 57.5 microsieverts per hour on a plot of public land in a residential district.

The new hot spot was found within a radius of just one meter. Radiation levels in Kashiwa and its vicinity are relatively high because of the effects of the ongoing Fukushima nuclear crisis, but the latest discovery of such an intense hot spot in the city's Nedokoyadai district came as a surprise. City radiation task force chief Seiichi Someya speculates, "It's hard to imagine that it is due to effects" of the Fukushima crisis.

The city purchased land in the district from the Finance Ministry in around 1957 and built 30 houses, before gradually demolishing them and clearing the land. At one time, the local community borrowed it and used it as a public square.

A resident strolling in the area carrying a dosimeter found the hot spot and notified the city on Oct. 18. City officials checked it with a Geiger counter capable of measuring up to only 10 microsieverts. Chiba Prefecture's environment foundation took its own measurements and recorded the startling 57.5 microsieverts per hour.

On Oct. 21, the city sealed off roads around the hot spot, banned entry within 3 meters and covered the hot spot with sandbags and blue tarps. The city will work with the Education, Culture, Sports, Science and Technology Ministry to conduct a full-scale check on Oct. 24.

A 44-year-old male, who was born and grew up the area, says he has never heard of anything pertaining to nuclear power in Kashiwa. He says he is worried about his mother, who frequents the area.

Radiation of 3.35 microsieverts per hour was recorded recently in an area of Tokyo's Setagaya Ward, but the culprit turned out to be radium kept in several dozen bottles under the floor of a local house.

(Mainichi Japan) October 22, 2011

New algae a better radioactive absorber than currently used mineral, researchers say

CHUO, Yamanashi -- A new type of algae is better at absorbing radioactive strontium and iodine than a mineral currently being used to treat radioactively contaminated water, say scientists.

According to a research group, the new algae, called "Parachlorella sp. binos" or "binos" for short, is better at absorbing some radioactive materials than is zeolite, which is being used at the Fukushima No. 1 Nuclear Power Plant to treat radioactively contaminated water.

Binos has already been commercialized by Japan Biomass Corp., a University of Tsukuba-affiliated startup, for the cleaning of sewage, and the corporation conducted joint research with the Kitasato Institute and other groups to explore applying binos to cleaning radioactively-contaminated water as well.

Researcher Hiroki Shimura of the University of Yamanashi's medical department agreed to help with the research and conducted tests with the algae on radioactively contaminated water collected from ditches in Namie, Fukushima Prefecture, from April through July.

He put 100 grams of binos each into one-liter samples of contaminated water, one with two megabecquerels of radioactive cesium-137, one with two megabecquerels of radioactive strontium, and one with three megabecquerels of radioactive iodine. After 10 minutes, the strontium was around 80

percent removed and the cesium-137 was around 40 percent removed. After 24 hours, the iodine was about 40 percent removed.

Binos that has been processed into jelly-like spheres is seen at left, and binsos spheres that have been dried are seen at right at the University of Yamanashi, Chuo, Yamanashi Prefecture. (Mainichi)

By contrast, zeolite did not absorb iodine at all. After about one hour, zeolite absorbed only around 60 percent of the strontium in its mixture, compared with 95 percent absorbed by the binsos algae.

Because binsos is an alga, it can be easily grown where there is light and carbon dioxide. Researchers say that if dried, the weight of binsos shrinks to 1/20, which could help simplify dealing with it after it has been used to absorb radioactive materials.

The researchers are talking with power plant equipment makers over introducing the algae to work at the Fukushima plant, and a demonstration of using the algae to treat radioactively contaminated soil and then storing the algae is planned in the city of Date, Fukushima Prefecture, at the end of October. The demonstration will be conducted by multiple corporations including Japan Biomass Corp.

Japan, France agree to boost cooperation on nuclear safety

TOKYO (Kyodo) -- Japanese Prime Minister Yoshihiko Noda and his French counterpart Francois Fillon agreed Sunday that the two countries will bolster cooperation on nuclear safety, following the nuclear crisis at the Fukushima Daiichi power plant crippled by the March 11 earthquake and tsunami.

The leaders also agreed to work together in dealing with the eurozone sovereign debt crisis, which is posing a threat to global economic growth and financial market stability, ahead of the Group of 20 meeting in Cannes, France, early next month.

Noda and Fillon said at a joint press conference after their talks in Tokyo that Japan and France have compiled a statement on nuclear safety, pledging that they will act together to promote the strengthening of international nuclear safety standards.

During their meeting, the two leaders also agreed to cooperate toward the start of free trade negotiations between Japan and the European Union, and signed a treaty aimed at protecting bilaterally exchanged classified diplomatic information, they said.

Noda will meet German President Christian Wulff on Monday and British Prime Minister David Cameron on Tuesday, government officials said.

(Mainichi Japan) October 23, 2011

Japan, France to cooperate on nuclear safety

The prime ministers of Japan and France have agreed to cooperate in improving the safety of nuclear power plants.

Japanese Prime Minister Yoshihiko Noda met French Prime Minister Francois Fillon in Tokyo on Sunday.

They agreed on the importance of strengthening the safety of nuclear power plants to the highest level, and confirmed that the 2 countries will cooperate in cleaning up radioactive substances.

In a joint statement, the 2 countries agreed to study the possibility of setting up an international emergency response team that would be swiftly dispatched to deal with nuclear accidents.

The statement also calls for the creation of a committee to strengthen bilateral cooperation in the nuclear energy field.

Referring to credit worries in Europe triggered by the financial crisis in Greece, Noda said the sovereign debt problem is a pressing issue, and Japan will help to resolve it.

Fillon responded that decisive measures are being prepared to support Greece.

They agreed to cooperate on this issue ahead of the G20 meeting that will be held in France next month.

The 2 leaders also agreed to work together for the signing of an Economic Partnership Agreement between Japan and the European Union.

Sunday, October 23, 2011 16:34 +0900 (JST)

Japan, France to propose nuclear efforts

Japan and France plan to announce a joint communique on nuclear safety, which will include the creation of an international response team for nuclear emergencies.

Visiting French Prime Minister Francois Fillon will meet Japanese Prime Minister Yoshihiko Noda on Sunday.

Government sources say the communique will confirm the 2 countries' resolve to work together in making their nuclear power plants among the safest in the world.

The communique will also refer to plans to create an international response team, which will be dispatched to countries hit by nuclear accidents to provide assistance.

Japan and France are also studying **ways to establish an institution to nurture personnel with expertise in the area of nuclear power risk management.**

The 2 sides are also expected to announce joint efforts in the area of decontamination, and the establishment of a committee aimed at strengthening nuclear cooperation.

Noda expressed his hope that release of such a communique will deepen Japan's ties with France, which has an edge in nuclear power technology.

The French Prime Minister arrived in Japan on Saturday, and first visited the disaster-hit city of Ishinomaki in Miyagi Prefecture. He said France is ready to help with recovery efforts in both emotional and economic ways.

Sunday, October 23, 2011 09:01 +0900 (JST)

High-level radioactive cesium detected in soil in Kashiwa

CHIBA (Kyodo) -- The municipal government of Kashiwa in Chiba Prefecture said Saturday it found a high level of radioactive cesium in soil of city-owned land.

Up to 276,000 becquerels of cesium per kilogram of soil was detected 30 centimeters below the surface on Friday after an abnormal level of airborne radiation was found earlier in the week, the municipality said.

It said it will seek to identify the cause of the contamination jointly with the science ministry.

When the municipal government first received a report of airborne radiation of 57.7 microsieverts per hour at the site, it said the radiation was unlikely to be related to the nuclear accident at the Fukushima Daiichi power plant since the high radiation level was detected in a small area.

Science ministry officials said they cannot deny the possibility that the wrecked nuclear power plant is the source of the radiation.

(Mainichi Japan) October 23, 2011

Forests to be used to store radioactive soil / Agency to let local govts open temporary sites

The Yomiuri Shimbun

The Forestry Agency has decided to allow local governments to use plots of land in state-owned forests to temporarily store soil and rice straw contaminated with radioactive substances from the crippled Fukushima No. 1 nuclear power plant.

Local governments will be responsible for preparing the land for the temporary storage sites, while the central government will shoulder the cost using its reserve fund for reconstruction.

Many local governments affected by the March 11 disaster are having difficulty securing storage sites for contaminated soil and other matter.

Providing land in the state-owned forests may help resolve this problem.

The sites will store soil removed in the process of decontamination and rice straw contaminated with radioactive materials.

Local governments may ask to be allowed to store sludge from the water supply and sewage systems, as well as ash produced by incinerating it.

In principle, the temporary storage sites will be built in forests within the jurisdictions of local governments that have collected contaminated soil.

If there are no state-owned forests with the jurisdiction of a local government, it will decide what to do in consultation with other local governments.

The sites will be located tens or even hundreds of meters from residential areas.

If a forest is near a water source, local governments will be required to consult with governments downstream before building temporary storage sites.

Contaminated soil and other matter will be encased in waterproof materials. If the quantity to be stored is large, the contaminated material will be placed inside concrete containers or surrounded by concrete walls.

As the sites are defined as temporary storage facilities, contaminated matter will not be buried.

According to an Environment Ministry estimate, up to 28 million cubic meters of contaminated soil in Fukushima Prefecture should be removed as it is assumed to have a radiation dosage of 5 millisieverts or higher per year.

If the soil is evenly piled up one meter high, the total area would be about 65 square kilometers, equivalent to half the area inside Tokyo's Yamanote loop railway line.

The central government has asked municipal governments to secure temporary storage sites until proper storage facilities have been completed.

After local residents strongly opposed plans to store contaminated soil in school yards or playgrounds, Iitatemura and Nihonmatsu, both in Fukushima Prefecture, asked the Forestry Agency to come up with other methods.

The Agriculture, Forestry and Fisheries Ministry has found that about 7,200 tons of rice straw have been stored in farmers' warehouses and other places in eight prefectures, including Hokkaido, Miyagi and Fukushima, as it could not be disposed of.

The sludge from the water supply and sewage systems and the ash, which cannot be disposed of due to radiation contamination, totaled about 130,000 tons as of September in Tokyo and 14 other prefectures.

It has yet to be decided how to secure sites to store the sludge.

(Oct. 24, 2011)

Govt to check Fukushima pollen / Cedar pollen may carry cesium on the wind, but at 'harmless' levels

The Yomiuri Shimbun

The Forestry Agency will start checking for radioactive substances in cedar pollen in Fukushima Prefecture as early as next month in response to the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, the agency said.

There is very little data in Japan or elsewhere in the world about pollen from plants grown in areas with high levels of radiation. If high levels of pollen-borne radiation are found, the Environment Ministry plans to release the data at the end of this year together with its forecast of the expected amount of cedar pollen to be dispersed in the air next spring.

The agency plans to pick male cedar flowers in the no-entry zone and check them for radioactive cesium, it said.

"As it will be the first such survey, we honestly don't know how much we will find. We'd like to obtain objective figures by making an accurate survey," an official of the agency said.

According to the agency and the Fukushima prefectural government, the prefecture has about 184,500 hectares of national and private cedar forests, accounting for about 20 percent of the total forests in the prefecture.

The agency has yet to decide the size of the areas to be surveyed, it said.

According to the Social Welfare and Public Health Bureau of the Tokyo metropolitan government, the wind sometimes carries cedar pollen more than 200 kilometers.

"It depends on the velocity and direction of the wind. Pollen is said to fly from dozens to hundreds of kilometers. When a survey was conducted by helicopter, pollen was found as high as 5,000 meters in the air. It is highly likely that pollen from Fukushima Prefecture reaches the Tokyo metropolitan area," said Norio Sahashi, a visiting science professor at Toho University and an authority on pollen.

But specialists say people do not have to worry too much about the effect of the pollen on human bodies.

"Even if pollen from radiation-contaminated areas does contain radioactive cesium, the amount people will take in is expected to be very limited. From the standpoint of radiation exposure, the amount is at a level that can be ignored," said Satoshi Yoshida, an expert on radiation ecology and a senior researcher at the Research Center for Radiation Protection of the National Institute of Radiological Sciences.

Yoichiro Omomo, special advisor at the Institute for Environmental Sciences, said, "Those who are allergic to cedar pollen do not need to worry too much as long as they take ordinary measures."

In late March, many inquiries were received by the Meteorological Agency and local governments about a yellowish residue found in gardens and elsewhere in the Kanto region.

Many residents apparently feared the residue was a radioactive substance from the crippled nuclear power plant, but it turned out to be pollen from the Kanto region.

The Environment Ministry began receiving inquiries from some local governments about whether radioactive substances will be contained in next spring's pollen, prompted by local residents' concerns on the subject.

(Oct. 24, 2011)

New levee prevents total power loss at nuclear plant in Ibaraki

TOKYO (Kyodo) -- A nuclear power plant in Ibaraki Prefecture run by Japan Atomic Power Co. managed to avoid a total power loss during the March 11 earthquake and tsunami thanks to a levee the company was reconstructing voluntarily, sources familiar with the matter said Sunday.

A government panel investigating the nuclear crisis at the Fukushima Daiichi power plant is analyzing measures taken by the company at the Tokai Daini atomic power plant on the assumption that the absence of such steps would have led to a similar serious accident, a source close to the panel said.

Japan Atomic Power concluded in 2002 that in preparing measures to deal with tsunami at the Tokai plant in Tokai, Ibaraki Prefecture, waves as high as 4.86 meters should be anticipated, based on an evaluation technology adopted by the Japan Society of Civil Engineers, the company said.

But the Ibaraki prefectural government requested that the company reevaluate the estimate after its own projection of flooding from tsunami, made public in October 2007, showed that tsunami waves in nearby areas could be as high as 6 to 7 meters, the company said.

Japan Atomic Power then changed its wave level assumption to 5.7 meters and started the reconstruction work in July 2009 to raise the height of the 4.9-meter levee at the plant to 6.1 meters to protect seawater pumps designed to cool an emergency diesel generator.

The reconstruction work was almost completed by September last year, but the remaining work to fully cover cable holes on the levee was scheduled to take place before around May this year, the company said.

The tsunami that hit the Tokai plant in March was 5.3 to 5.4 meters in height, exceeding the company's earlier estimate but around 30 to 40 centimeters lower than the later assumption.

Hit by the tsunami, the Tokai plant suffered a loss of external power as experienced by the Fukushima Daiichi complex.

The levee was overrun, causing one of three seawater pumps to fail, but the power plant succeeded in achieving a stable reactor condition known as cold shutdown with an emergency diesel generator cooled by the two remaining seawater pumps.

Meanwhile, Tokyo Electric Power Co., which projected in 2002 a maximum tsunami height of 5.7 meters for the Fukushima Daiichi plant, failed to take measures despite further in-house research in 2006 and later.

Though the utility calculated in 2008 that a tsunami higher than 10 meters could hit the nuclear power plant, which was close to the actual level seen in the March disaster, it reported the calculation to the Nuclear Industrial Safety Agency on March 7 this year, just days before the massive quake hit northeastern Japan on March 11.

The government panel investigating the Fukushima Daiichi crisis is also probing measures implemented at the Fukushima Daini plant, both operated by Tokyo Electric, and the Onagawa nuclear power plant in Miyagi Prefecture run by Tohoku Electric Power Co., the source close to the panel said. The panel is scheduled to compile an interim report on its findings in December.

Hotspot hotline

Japan's science ministry has launched a telephone hotline to deal with public concerns about radiation exposure in areas outside Fukushima Prefecture. The prefecture hosts the damaged nuclear complex.

The ministry set up the hotline after radiation monitoring by local governments and citizens' groups found a number of locations within the Tokyo Metropolitan Area with levels exceeding government limits.

The ministry is asking local governments and citizens' groups to tell it if they find sites where the hourly radiation dose at one meter above the ground is more than one microsievert higher than nearby areas.

One microsievert per hour is the government-set limit for determining whether topsoil at school playgrounds should be removed, using state subsidies.

The ministry is also asking the local governments to carry out simple decontamination work, such as clearing mud from ditches if necessary.

The ministry says the central government will support decontamination efforts if radiation levels remain more than one microsievert higher than nearby areas even after the cleaning.

The ministry has posted a guideline on its website on how to properly measure radiation levels, such as the right way to hold the dosimeter and the time needed for a reading.

An other NPP in a high seismicity area...

Energy ministry: fate of Armenian nuclear power plant workers unhappy about their wages unclear so far

<http://www.arka.am/eng/energy/2011/10/24/28624.html>

YEREVAN, October 24. /ARKA/. Negotiations between Armenian Nuclear Power Plant workers unhappy about their wages and Energy Minister Armen Movsisyan are under way now, and results will be reported later, Lusine Harutyunyan, press secretary of the ministry, said on Monday.

“The matter was discussed today morning,” she said. “Certain proposals were put forward, but no final decision was made.”

Some 158 workers and engineers unhappy about their salaries submitted their resignations to the plant’s administration on September 20.

Reports in Armenian media in late September said the re-launch of the plant was under threat after 158 workers submitted resignation applications demanding an increase in their wages. The plant is scheduled to resume operating on October 27 upon completion of a regular repair.

The Armenian Nuclear Power Plant, the only nuclear power plant in the South Caucasus, which accounts for about 40 percent of Armenia's electricity, is located in Metsamor, some 30 kilometers west of Yerevan.

The plant was launched in 1997. Now only the second, 107.5-megawatt unit of the plant operates. It generates about 50% of the country’s electricity.

The plant’s financial flows have been managed since 2003 by Russian Inter RAO UES, owned by Russian Rosatom. -0—

Nuclear plant accidents threaten relations between food producers and consumers

A cow is fed straw at a cattle farm on July 15 in Asakawa, Fukushima Prefecture, which was found to have fed cows radioactive cesium-contaminated straw. (Mainichi)

Nuclear accidents could threaten not only the livelihoods and health of people living nearby but also relations between food producers and consumers.

Victims of the ongoing Fukushima nuclear crisis are not only residents near the crippled nuclear plant who have been forced to evacuate from their affected neighborhoods. My news coverage of the contamination of foods with radioactive substances leaking from the tsunami-hit Fukushima No. 1 Nuclear Power Plant has uncovered that the crisis has fundamentally damaged mutual trust between local food producers including farmers and consumers.

It came to light on July 8 that some beef was contaminated with radioactive cesium. The Tokyo Metropolitan Government examined beef from cows shipped from Minamisoma, Fukushima Prefecture, and detected cesium in excess of the permissible level.

The number of beef cows confirmed to have been tainted with the radioactive material sharply increased. Furthermore, it was learned that some meat from these cows had already been shipped to various areas across the country and even consumed.

The source of the cesium has turned out to be rice straw that had been given to the animals as feed. A notice that the national government had sent to livestock farmers following the nuclear accident made no mention to the possibility that rice straw could be contaminated with radioactive materials from the plant.

In late September, I visited a farmer that had shipped the rice straw, only to be turned back just as I expected. A neighbor said the farmer used an in-house power generator to maintain his barn and constantly look after the cattle, while most local residents had fled the neighborhood and the delivery of daily necessities and supplies necessary for farming had been suspended. Nonetheless, he was criticized by some news organizations for being primarily responsible for the contamination of beef.

While banners and stickers saying, "Hang in there, Fukushima!" are spotted across the country, numerous harmful rumors on Fukushima products can be found online. There are many rumors that are discriminatory to Fukushima and other messages slandering Fukushima people on the Internet. However, Minamisoma farmers should definitely not be blamed for the contamination. Rather, they are victims of the nuclear crisis, just like consumers who are sensitive about invisible radiation.

I have still been unable to find the right answer on what and how I should report to help restore the mutual trust between producers and consumers. (By Eisuke Inoue, Tokyo City News Department)

(Mainichi Japan) October 25, 2011

Radiation research suggested as way to keep released livestock near nuclear plant alive

Masami Yoshizawa looks after one of his cows at his farm in Fukushima Prefecture. (Photo courtesy of the Kibo-no-Bokujo -- Fukushima Project)

KORIYAMA, Fukushima -- Pursuing research on radiation's effects on animals has been suggested as a way to keep livestock animals roaming the no-entry zone near the disaster-hit Fukushima No. 1 Nuclear Power Plant from being killed or starving in the harsh winter.

Nearly 2,000 cows and other livestock are estimated to still be in the 20-kilometer radius no-entry zone around the crippled power plant.

The plan is being pushed by members of the citizens' group "Kibo-no-Bokujo -- Fukushima Project" (ranch of hope -- Fukushima project). On Oct. 21, around 30 people including local livestock farmers, government legislators and veterinarians met in Koriyama, Fukushima Prefecture, to discuss the issue.

Masami Yoshizawa, 57, who has about 330 high-quality beef cow at his livestock farm situated in the no-entry zone, said he cannot bear to abandon the animals.

"I know the cows have lost their economic value since they've been exposed to radiation. But I think there must be a way to allow them to live. As a cattle breeder, I cannot leave them to die," he said. "We have to catch them by winter."

Yoshizawa has gotten permission from the government to regularly return to his livestock farm to feed his animals. He says that every time, livestock other than his own also come seeking food.

Meanwhile, a 54-year-old woman who had beef cattle in the no-entry zone said tearfully, "I freed 30 of my cows before evacuating. I believe they're still alive."

There have also, however, been reports of cows and pigs that are now living wild making their way into residents' left-behind homes.

To keep the animals alive while preventing damage to resident's property, the Kibo-no-Bokujo -- Fukushima Project is working on a **plan to enclose the animals on Yoshizawa's farm, where researchers will use them to observe the effects of radiation on large mammals**. They are planning to get help from universities and other research institutes.

Earlier, in May of this year, university researchers asked the central government to let livestock exposed to radiation in Fukushima Prefecture live for use in research. Senior Vice Minister of Agriculture, Forestry and Fisheries Nobutaka Tsutsui expressed support for the idea, but almost no concrete measures have been mapped out.

According to the Kibo-no-Bokujo -- Fukushima Project, there were approximately 3,500 cows, 30,000 pigs and 680,000 chickens remaining in the 20-kilometer radius no-entry zone, which got that designation on April 22. On May 12, the government decided to slaughter all livestock in the zone, and it has so far killed about 300 cows. Most of the pigs and chickens are believed to have died from lack of water and food without people to look after them. Not counting any remaining chicken, there are estimated to be somewhat less than 2,000 animals left, mostly cows.

Unedited Fukushima accident manual released, loss of power sources not envisioned

The government's Nuclear and Industrial Safety Agency (NISA) released part of an unedited severe accident manual for the Fukushima No. 1 Nuclear Power Plant on Oct. 24, revealing that Tokyo Electric Power Co. (TEPCO) had not envisioned the possibility of all power sources at the nuclear complex being lost.

TEPCO, the operator of the crippled nuclear power plant, had earlier submitted to a special House of Representatives committee largely blacked-out emergency operation manuals for the Fukushima nuclear facility. The manuals were in fact used when the Great East Japan Earthquake and ensuing tsunami struck the nuclear complex. On Oct. 24, NISA released part of an unedited manual after submitting it to the same lower house panel. The manual revealed the fact that there was no operational manual that envisioned a loss of all power sources needed to activate emergency condensers and back-

up water injection devices to cool down nuclear reactors. The revelation highlights flaws in TEPCO's contingency plan in the event of a loss of power sources.

What was released on Oct. 24 is part of an emergency operation manual for the No. 1 reactor at the Fukushima nuclear power plant. It shows methods of cooling down nuclear fuels as well as ways of "venting" in order to hold down pressure in the containment vessel. NISA also released documents prepared by TEPCO that compare the operation manual and what was actually done when the crisis broke out.

According to the documents, all power sources were lost due to the effects of tsunami at 3:37 p.m. on March 11. As a result, whether valves for emergency condensers were operating properly could not be confirmed. Because the manual did not envision possibilities of all power sources, including batteries, being lost in the event that emergency generators and external power sources were lost, the manual itself was in fact useless when all power sources were actually lost on that day.

In September, TEPCO submitted to the lower house committee largely blacked-out manuals on the pretext of the need to protect nuclear security as part of anti-terrorism measures and intellectual property rights. NISA then ordered TEPCO to resubmit the manuals.

On Oct. 22, TEPCO said at a news conference, "After comparing the manuals, there was no problem with actual operations."

Kim urges simultaneous action on nuclear standoff

North Korean leader Kim Jong Il has reportedly insisted that the six parties involved in the talks on his country's nuclear program should implement their 2005 agreement based on the principle of simultaneous action.

State-run China Central Television reported on Tuesday that Kim met Vice Premier Li Keqiang in Pyongyang on Monday.

According to the report, Kim said the six-party talks should be restarted as soon as possible. He is said to have referred to the September 19, 2005 joint statement of the six-party talks, and added that all the parties should implement the agreement on the principle of simultaneous action.

The agreement says North Korea is committed to abandoning all nuclear weapons and existing nuclear programs and that the other countries stated their willingness to provide energy assistance to the country.

The talks have been suspended since December 2008. The United States, South Korea and Japan say North Korea should first act toward denuclearization before the six-party talks can be resumed.

In US-North Korea direct talks in Geneva, the United States demanded that North Korea immediately halt its uranium enrichment activity.

Vice Premier Li told Kim that China will continue to play a constructive role in improving inter-Korean relations and maintaining peace and stability on the Korean Peninsula. His remarks are seen as indicating that China will step up efforts to restart the talks.

Kim's son and designated heir Kim Jong Un was seen greeting the Chinese vice premier in a move apparently aimed at showing closeness between the 2 countries.

Tuesday, October 25, 2011 18:04 +0900 (JST)

US, N.Korea end 1st day of nuclear talks

The US special envoy to North Korea says the 2 countries still need to overcome differences concerning the North's nuclear program.

Stephen Bosworth made the remarks after the first of 2 days of direct talks between the countries at the United States' UN mission in Geneva on Monday.

It was their first direct talks since July. The 2 sides presented their positions on a resumption of the six-party nuclear talks that have been stalled for nearly 3 years.

The details of Monday's discussions, which lasted about 3-and-a-half hours, were not disclosed. But the US delegation is believed to have urged North Korea to immediately end its uranium enrichment program and accept inspectors from the International Atomic Energy Agency.

North Korea reportedly reiterated its demand that the six-party talks should be resumed without conditions.

Speaking to reporters, Bosworth said that the 2 sides have narrowed some differences, but they still have issues to resolve.

North Korea's First Vice Foreign Minister, Kim Kye Gwan, did not take questions from reporters.

The US and North Korean officials will meet again at the North's UN mission on Tuesday.

Vietnam to stick with plan to introduce Japanese nuclear technology: deputy PM

Vietnamese Deputy Prime Minister Nguyen Xuan Phuc told the Mainichi on Oct. 25 that Vietnam is set to form an agreement with the Japanese government over the construction of nuclear power facilities in Vietnam's Ninh Thuan province using Japanese technology -- effectively giving the project the go-ahead.

The deputy prime minister revealed the plans during an interview in Hanoi with Atsushi Narita, general managing editor of The Mainichi Newspapers' Editorial Division. However, the unpredictable situation

amid the ongoing nuclear crisis at the Fukushima No. 1 Nuclear Power Plant, which has resulted in widespread radiation contamination, has created resistance in Japan to resuming exports of nuclear power.

Vietnamese Prime Minister Nguyen Tan Dung is set to visit Japan on Oct. 30, and conclude an agreement with Japan at that time. When former Japanese Prime Minister Naoto Kan visited Vietnam in October last year, he confirmed that Vietnam would partner with Japan in the construction of two reactors. After the outbreak of the nuclear crisis at the Fukushima plant, Vietnam maintained that it would apply Japanese technology in the project, but there had been no formal agreement between the governments of the two countries.

During negotiations, Vietnam presented six conditions to the Japanese government, including the introduction of safety-verified, cutting-edge technology, and provisions pertaining to the disposal of nuclear waste. Japan has consecutively met these conditions.

The final outstanding issue was low-interest loans to the Vietnamese government that would provide capital for construction. Both countries are believed to have reached an agreement on this, meaning that all of the hurdles for construction have been cleared.

In his interview with the Mainichi, Phuc said that Japan and Vietnam had formed a "strategic partnership." He said that Fukushima was an unexpected accident, but stressed that there had been no change in the relationship between the two countries in terms of nuclear-power cooperation.

Phuc was appointed deputy prime minister in August this year after having served as minister and chairman of the Government Office of Vietnam, and is in the head position among Vietnam's four deputy prime ministers. He responded to the interview at the request of a Mainichi group visiting Vietnam, headed by Mainichi Newspapers President Yutaka Asahina.

High levels of radiation detected at 2 schools in Chiba Prefecture

ABIKO, Chiba -- High levels of radiation have been detected on the premises of two elementary schools here, local education authorities have revealed.

According to the Abiko Municipal Board of Education, 11.3 microsieverts of radiation per hour was detected just above the surface of the ground near a ditch in the compounds of the Abiko Municipal Daiichi Elementary School on Sept. 15. The amount was 1.7 microsieverts in the air 50 centimeters above the ground.

Soil had piled up in the ditch, which had been damaged by growing tree roots, a situation similar to a residential area of the Chiba Prefecture city of Kashiwa where 57.5 microsieverts per hour was detected.

Radioactive cesium amounting to 60,768 becquerels per 1 kilogram of soil was found in the ditch.

The amount of radiation 50 centimeters above the ground had declined to 0.6 microsieverts per hour by Oct. 7 after the soil was removed.

The Education, Culture, Sports, Science and Technology Ministry pointed to the possibility that rain water contaminated with radioactive cesium overflowed from the ditch, soaked the nearby soil and accumulated in it.

At the Abiko Municipal Namiki Elementary School, 10.1 microsieverts per hour of radiation was detected near the surface of the ground where sludge removed from its swimming pool had been buried.

The school covered the area with a waterproof tarp and piled up dirt on the tarp to decrease the radiation emissions, after which 0.6 microsieverts per hour was detected 50 centimeters above the ground.

The two schools have sealed off the areas where high levels of radiation were detected.

Journalist determined to get story of nuke disaster victims to the world (Part 6)

At just past 3:30 p.m. on March 12, I was interviewing people in Minamisoma, Fukushima Prefecture, who had lost their homes in the previous day's disasters when a sudden "boom" echoed across the landscape. It was the sound of a hydrogen explosion ripping apart the No. 1 reactor building at the Fukushima No. 1 nuclear plant, some 20 kilometers to the south.

In the six months between that massive explosion and my transfer to the Tokyo Science and Environment News Department in October, I reported constantly from the exclusion zones in Minamisoma, the village of Iitate and surrounding areas, speaking to many victims of the March disasters.

Right after the meltdowns at the Fukushima No. 1 plant, trucks carrying supplies refused to come near the coast of the prefecture over fears of radioactive contamination, and a serious fuel shortage set in. With no gas for my car, I borrowed a motorcycle from a local Mainichi newsagent to go out and get my stories. In coastal Minamisoma, where the tsunami had claimed many lives, crematoriums ran low on the heavy oil needed for their furnaces. The dead were forced to wait their turns, though there was not even a sufficient supply of dry ice to keep the bodies cold.

"I can't leave their bodies here like this," said one man who had lost his family to the waves. "Please, write an article that will bring people here to help us," he added with tears welling in his eyes.

The nuclear disaster, meanwhile, took its own share of victims, such as the 93-year-old Minamisoma woman who wrote "I'm evacuating to the grave" before taking her own life.

Afterwards, her family asked me to "truly convey the meaning of her death." They told me that right after the beginning of the nuclear crisis, the woman had come with them when they evacuated to a relative's house. After a while, however, most of the family moved on to a refugee shelter outside the prefecture, leaving only the woman and her grandchild behind. She and the child returned home, but the woman ended up spending most of the day alone. Her family still regrets leaving her so isolated.

I must admit that I couldn't truly understand the emotional scars left by the disasters on their victims, and I often felt impatient.

Once, when I was with residents of Namie during visits to their homes in the exclusion zone, I saw one woman standing in front of the ruins of her tsunami-wrecked house. She was statue-still, her mouth open in a silent wail, tears rolling down her cheeks. The woman's eldest son had gone missing in the disaster. His body had been found amongst tsunami debris nearby.

"I'm sorry I couldn't come and search for you. I'm so sorry," she murmured as she faced the debris pile, her hands pressed together.

Later she said to me, "I want to rebuild my house here, but I can't. As a reporter, do you understand how that feels?" I had no answer for her. All I could do was stare at her as she walked away. It had taken all the strength I had just to take in her sadness, her loss.

There were about 78,000 people living in what is now the exclusion zone around the Fukushima No. 1 plant, and so there are 78,000 different kinds of fear of radiation, 78,000 different shades of frustration at being unable to return to their home, their birthplace. Even so, listening to the victims of the March 11 disasters, eating the same food and harboring the same anxieties, I feel strongly that I want to share the full range of human emotion with them.

There is no sign yet of when the crisis at the Fukushima plant will be resolved or when the evacuees will be able to return home, if ever. As long as the people of the nuclear disaster zone continue their struggle with radiation, I hope to stick close to them, and keep getting their stories to the world. (By Keisaku Jinbo, Science and Environment News Department)

(This is the final installment of a six-part series on coverage of the Fukushima nuclear crisis.)

(Mainichi Japan) October 27, 2011

Nuclear plant suspension may lift CO2 output by 170 mil. tons: gov't

TOKYO (Kyodo) -- Emissions of carbon dioxide are estimated to rise by 150 million to 170 million tons a year if suspended nuclear power plants remain offline, Environment Minister Goshi Hosono said Thursday.

At the House of Councillors Environment Committee, Hosono said the estimate is based on the assumption that thermal plants will make up the entire power shortfall from all 44 suspended nuclear reactors, out of a total 54 in Japan.

The estimate also assumes that the 44 reactors, if operational, would be running at 66 to 75 percent capacity.

Hosono indicated that **as nuclear plants will be suspended gradually, the annual estimations do not necessarily represent the actual and future conditions.**

(Mainichi Japan) October 27, 2011

Tokyo to accept rubble from quake-hit Iwate Pref. from Nov. 2

Rubble piles up at a temporary disposal site in Iwaki, Fukushima Prefecture. (Mainichi)

TOKYO (Kyodo) -- The Tokyo Metropolitan Government said Wednesday it will accept from Nov. 2 rubble resulting from the March 11 earthquake and tsunami in Miyako, Iwate Prefecture, one of the hardest-hit prefectures.

The rubble will be **transported by Japan Freight Railway Co.** to Tokyo's Koto and Ota wards where it will be crushed. **It will then be incinerated in Koto and the remnants used as landfill in Tokyo Bay,** the metropolitan government said.

The rubble will be checked for possible radioactive contamination from the Fukushima Daiichi nuclear power plant when it is loaded onto freight trains and another radiation check will be performed before it gets crushed.

Tokyo plans to dispose of some 500,000 tons of debris from Iwate and Miyagi, another prefecture seriously affected by the disaster, by March 2014 although many residents in the capital area are opposed to the idea because of radiation fears.

(Mainichi Japan) October 27, 2011

Gov't expects more than 30 years to decommission Fukushima nuclear reactors

Japan is expected to take more than 30 years to fully decommission crippled nuclear reactors at the Fukushima No. 1 nuclear plant, according to a draft report compiled by the Nuclear Safety Commission of Japan obtained by the Mainichi on Oct. 26.

It is the first time for the government's body to officially state that it is expected to take "more than 30 years" to decommission the troubled No. 1 to 4 nuclear reactors. According to the draft report, the work to remove spent nuclear fuel from nuclear fuel pools would begin sometime after 2015, while the work to remove melted nuclear fuel from the reactors would start sometime after 2022. The draft report is expected to be endorsed at a study meeting on Oct. 28 of experts on medium- and long-term measures.

At the Fukushima No. 1 Nuclear Power Plant, there are a total of 1,496 spent nuclear fuel rods in the No. 1 to 3 reactors, while there are 3,108 fuel rods in the spent nuclear fuel pools of the No. 1 to 4 reactors. In order to actually decommission the reactors, those fuel rods must be recovered, cooled down and stored under stable conditions for a long time.

According to the draft report, the work to decommission the reactors is expected to start as early as next year after a "cold shutdown" is achieved by the end of this year. In order to recover melted nuclear fuel from the reactors, robots and other means would be used to decontaminate the interior of the reactor buildings before repairing damaged parts of the containment vessels. Furthermore, in order to block radiation, the entire containment vessels would be filled with water so that the work to recover melted nuclear fuel could be started sometime after 2022.

Meanwhile, damage to the fuel in the spent nuclear fuel pools is relatively minor, but the existing cranes cannot be used because the reactor buildings, except for the one for the No. 2 reactor, were badly destroyed by hydrogen explosions. Therefore, new cranes have to be brought in to start to recover the fuels sometime after 2015 after fitting out the temporary storage facility installed near the No. 4 reactor.

In light of the fact that it took about 20 years to recover all fuels at the Three Mile Island nuclear complex, the draft report said it was estimated to take "at least more than 30 years to complete the measures to decommission" the reactors at the Fukushima No. 1 Nuclear Power Plant. In order to decommission the reactors as early as possible, it is necessary to 1) positively accept opinions from experts abroad, 2) respond flexibly if the plans do not work properly, 3) put priority on research and development essential for the actual work to be done on the spot, and 4) cultivate engineers at home, the draft report says.

At the Fukushima plant, the decommissioning work has to be carried out on the four reactors simultaneously, and therefore it is likely to be an extremely difficult mission. For this reason, the draft report says, "it is necessary for both public and private sectors to join forces as 'all Japan' to proceed" with the project. Along with the "Nuclear Safety Agency" to be set up next spring, the draft report for the first time stressed the need to form a third-party organization tasked with checking the progress in the decommissioning work.

(Mainichi Japan) October 27, 2011

Kashiwa city warns citizens of radioactive decontamination fraud

KASHIWA, Chiba -- Local authorities here are warning residents not to be deceived by anyone passing his or herself off as a local government official and offering to measure and remove radioactive substances for money.

According to the Kashiwa Municipal Government, in and around Kashiwa's Nedo district, where an abnormally high radiation level of 57.5 microsieverts has been detected, a man has been putting flyers into mailboxes and telling residents he is from the municipal government. He reportedly offered to measure radiation for 5,000 yen and remove radioactive substances for 10,000 yen.

A city government official said, "The city has not designated or recommended any specific contractors." There have been no reports of people paying for such services, but the city authorities do not rule out that they could appear in the future. The municipal government has tried to alert local citizens through e-mail and Twitter.

A 57-year-old business manager of an Iwaki, Fukushima Prefecture radiation measuring company that is now operating in Kashiwa said, "You can't do decontamination work for that kind of (cheap) price." He added, "We don't want to be lumped in with the fraudsters."

Many residents in Kashiwa are worried about high levels of radiation in the city. "Bekumiru", a privately-owned self-service radiation measuring facility which started business in Kashiwa this October, kept its facility open on the night of Oct. 26 for those residents who wanted to check well water for radiation. Because customers do the measuring themselves, the facility is far cheaper than the services of other radiation screening companies. Four citizens brought well water this night, but none of them found radiation in the water. A 32-year-old housewife said, "I feel relieved after hearing the result."

(Mainichi Japan) October 27, 2011

TEPCO won't build retaining wall to stop radioactive water seeping into ground water

Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 nuclear power plant, has given up a plan to install a land-side retaining wall aimed at preventing radioactive water from permeating into the ground water, the utility has announced.

The utility, however, will **construct an ocean-side retaining wall to prevent contaminated water from leaking into the sea, starting on Oct. 28.**

TEPCO had initially planned to build a land-side retaining wall (an underground dam) as well, thereby surrounding all four sides of the reactor buildings and turbine buildings of the No. 1 through No. 4 reactors at the plant, in order to prevent highly radioactive water from coming into contact with the ground water.

However, the utility concluded that such a plan would be "ineffective" on the grounds that the ground water in the area flows only downward into the ocean as the area's terrain is seaward-dipping and building a U-shaped retaining wall on the land side would make no point in preventing contaminated water from leaking into the ocean. The utility also said a land-side retaining wall would lower the ground water level around the reactor and turbine buildings, raising the risk of contaminated water leaking from those buildings. In addition, the utility said, the construction of such a wall would require the removal or relocation of existing facilities surrounding the buildings.

TEPCO will start a drilling survey to assess the depths of the ground water ahead of the construction of the ocean-side retaining wall, which will take two years to complete. Some 700 piles of sheets, each measuring 22 to 24 meters long, will be driven in over an approximately 800-meter-long stretch, the utility said.

"I can't leave their bodies here like this," said one man who had lost his family to the waves. "Please, write an article that will bring people here to help us," he added with tears welling in his eyes.

The nuclear disaster, meanwhile, took its own share of victims, such as the 93-year-old Minamisoma woman who wrote "I'm evacuating to the grave" before taking her own life.

Afterwards, her family asked me to "truly convey the meaning of her death." They told me that right after the beginning of the nuclear crisis, the woman had come with them when they evacuated to a relative's house. After a while, however, most of the family moved on to a refugee shelter outside the prefecture, leaving only the woman and her grandchild behind. She and the child returned home, but the woman ended up spending most of the day alone. Her family still regrets leaving her so isolated.

I must admit that I couldn't truly understand the emotional scars left by the disasters on their victims, and I often felt impatient.

Once, when I was with residents of Namie during visits to their homes in the exclusion zone, I saw one woman standing in front of the ruins of her tsunami-wrecked house. She was statue-still, her mouth open in a silent wail, tears rolling down her cheeks. The woman's eldest son had gone missing in the disaster. His body had been found amongst tsunami debris nearby.

"I'm sorry I couldn't come and search for you. I'm so sorry," she murmured as she faced the debris pile, her hands pressed together.

Later she said to me, "I want to rebuild my house here, but I can't. As a reporter, do you understand how that feels?" I had no answer for her. All I could do was stare at her as she walked away. It had taken all the strength I had just to take in her sadness, her loss.

There were about 78,000 people living in what is now the exclusion zone around the Fukushima No. 1 plant, and so there are 78,000 different kinds of fear of radiation, 78,000 different shades of frustration at being unable to return to their home, their birthplace. Even so, listening to the victims of the March 11 disasters, eating the same food and harboring the same anxieties, I feel strongly that I want to share the full range of human emotion with them.

There is no sign yet of when the crisis at the Fukushima plant will be resolved or when the evacuees will be able to return home, if ever. As long as the people of the nuclear disaster zone continue their struggle with radiation, I hope to stick close to them, and keep getting their stories to the world. (By Keisaku Jinbo, Science and Environment News Department)

(This is the final installment of a six-part series on coverage of the Fukushima nuclear crisis.)

Nuclear plant suspension may lift CO2 output by 170 mil. tons: gov't

TOKYO (Kyodo) -- Emissions of carbon dioxide are estimated to rise by 150 million to 170 million tons a year if suspended nuclear power plants remain offline, Environment Minister Goshi Hosono said Thursday.

At the House of Councillors Environment Committee, Hosono said the estimate is based on the assumption that thermal plants will make up the entire power shortfall from all 44 suspended nuclear reactors, out of a total 54 in Japan.

The estimate also assumes that the 44 reactors, if operational, would be running at 66 to 75 percent capacity.

Hosono indicated that **as nuclear plants will be suspended gradually, the annual estimations do not necessarily represent the actual and future conditions.**

Tokyo to accept rubble from quake-hit Iwate Pref. from Nov. 2

Rubble piles up at a temporary disposal site in Iwaki, Fukushima Prefecture. (Mainichi)

TOKYO (Kyodo) -- The Tokyo Metropolitan Government said Wednesday it will accept from Nov. 2 rubble resulting from the March 11 earthquake and tsunami in Miyako, Iwate Prefecture, one of the hardest-hit prefectures.

The rubble will be **transported by Japan Freight Railway Co.** to Tokyo's Koto and Ota wards where it will be crushed. **It will then be incinerated in Koto and the remnants used as landfill in Tokyo Bay,** the metropolitan government said.

The rubble will be checked for possible radioactive contamination from the Fukushima Daiichi nuclear power plant when it is loaded onto freight trains and another radiation check will be performed before it gets crushed.

Tokyo plans to dispose of some 500,000 tons of debris from Iwate and Miyagi, another prefecture seriously affected by the disaster, by March 2014 although many residents in the capital area are opposed to the idea because of radiation fears.

Gov't expects more than 30 years to decommission Fukushima nuclear reactors

Japan is expected to take more than 30 years to fully decommission crippled nuclear reactors at the Fukushima No. 1 nuclear plant, according to a draft report compiled by the Nuclear Safety Commission of Japan obtained by the Mainichi on Oct. 26.

It is the first time for the government's body to officially state that it is expected to take "more than 30 years" to decommission the troubled No. 1 to 4 nuclear reactors. According to the draft report, the work to remove spent nuclear fuel from nuclear fuel pools would begin sometime after 2015, while the work to remove melted nuclear fuel from the reactors would start sometime after 2022. The draft report is expected to be endorsed at a study meeting on Oct. 28 of experts on medium- and long-term measures.

At the Fukushima No. 1 Nuclear Power Plant, there are a total of 1,496 spent nuclear fuel rods in the No. 1 to 3 reactors, while there are 3,108 fuel rods in the spent nuclear fuel pools of the No. 1 to 4 reactors. In order to actually decommission the reactors, those fuel rods must be recovered, cooled down and stored under stable conditions for a long time.

According to the draft report, the work to decommission the reactors is expected to start as early as next year after a "cold shutdown" is achieved by the end of this year. In order to recover melted nuclear fuel from the reactors, robots and other means would be used to decontaminate the interior of the reactor buildings before repairing damaged parts of the containment vessels. Furthermore, in order to block radiation, the entire containment vessels would be filled with water so that the work to recover melted nuclear fuel could be started sometime after 2022.

Meanwhile, damage to the fuel in the spent nuclear fuel pools is relatively minor, but the existing cranes cannot be used because the reactor buildings, except for the one for the No. 2 reactor, were badly destroyed by hydrogen explosions. Therefore, new cranes have to be brought in to start to recover the fuels sometime after 2015 after fitting out the temporary storage facility installed near the No. 4 reactor.

In light of the fact that it took about 20 years to recover all fuels at the Three Mile Island nuclear complex, the draft report said it was estimated to take "at least more than 30 years to complete the measures to decommission" the reactors at the Fukushima No. 1 Nuclear Power Plant. In order to decommission the reactors as early as possible, it is necessary to 1) positively accept opinions from experts abroad, 2) respond flexibly if the plans do not work properly, 3) put priority on research and development essential for the actual work to be done on the spot, and 4) cultivate engineers at home, the draft report says.

At the Fukushima plant, **the decommissioning work has to be carried out on the four reactors simultaneously**, and therefore it is likely to be an extremely difficult mission. For this reason, the draft report says, "it is necessary for both public and private sectors to join forces as 'all Japan' to proceed" with the project. Along with the "Nuclear Safety Agency" to be set up next spring, the draft report for the first time stressed the need to form a third-party organization tasked with checking the progress in the decommissioning work.

Kashiwa city warns citizens of radioactive decontamination fraud

KASHIWA, Chiba -- Local authorities here are warning residents not to be deceived by anyone passing his or herself off as a local government official and offering to measure and remove radioactive substances for money.

According to the Kashiwa Municipal Government, in and around Kashiwa's Nedo district, where an abnormally high radiation level of 57.5 microsieverts has been detected, a man has been putting flyers into mailboxes and telling residents he is from the municipal government. He reportedly offered to measure radiation for 5,000 yen and remove radioactive substances for 10,000 yen.

A city government official said, "The city has not designated or recommended any specific contractors." There have been no reports of people paying for such services, but the city authorities do not rule out that they could appear in the future. The municipal government has tried to alert local citizens through e-mail and Twitter.

A 57-year-old business manager of an Iwaki, Fukushima Prefecture radiation measuring company that is now operating in Kashiwa said, "You can't do decontamination work for that kind of (cheap) price." He added, "We don't want to be lumped in with the fraudsters."

Many residents in Kashiwa are worried about high levels of radiation in the city. "Bekumiru", a privately-owned self-service radiation measuring facility which started business in Kashiwa this October, kept its facility open on the night of Oct. 26 for those residents who wanted to check well water for radiation. Because customers do the measuring themselves, the facility is far cheaper than the services of other radiation screening companies. Four citizens brought well water this night, but none of them found radiation in the water. A 32-year-old housewife said, "I feel relieved after hearing the result."

TEPCO won't build retaining wall to stop radioactive water seeping into ground water

Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 nuclear power plant, has given up a plan to install a land-side retaining wall aimed at preventing radioactive water from permeating into the ground water, the utility has announced.

The utility, however, will **construct an ocean-side retaining wall to prevent contaminated water from leaking into the sea, starting on Oct. 28.**

TEPCO had initially planned to build a land-side retaining wall (an underground dam) as well, thereby surrounding all four sides of the reactor buildings and turbine buildings of the No. 1 through No. 4 reactors at the plant, in order to prevent highly radioactive water from coming into contact with the ground water.

However, the utility concluded that such a plan would be "ineffective" on the grounds that the ground water in the area flows only downward into the ocean as the area's terrain is seaward-dipping and building a U-shaped retaining wall on the land side would make no point in preventing contaminated water from leaking into the ocean. The utility also said a land-side retaining wall would lower the ground water level around the reactor and turbine buildings, raising the risk of contaminated water leaking from those buildings. In addition, the utility said, the construction of such a wall would require the removal or relocation of existing facilities surrounding the buildings.

TEPCO will start a drilling survey to assess the depths of the ground water ahead of the construction of the ocean-side retaining wall, which will take two years to complete. Some 700 piles of sheets, each measuring 22 to 24 meters long, will be driven in over an approximately 800-meter-long stretch, the utility said.

(Mainichi Japan) October 27, 2011

Kashiwa govt wants help with hotspot

Tadao Baba and Eiji Noyori / Yomiuri Shimbun Staff Writers

KASHIWA, Chiba--A radiation hotspot in Kashiwa has still not been decontaminated a week after radiation of 57.5 microsieverts per hour was recorded on a city-owned plot of land.

The city insists such a high level of radiation is beyond the level a local government can handle on its own, though it decided to conduct surveys to find other hotspots after many residents expressed anxiety over the issue.

The Kashiwa municipal government said last Friday that radiation of 57.5 microsieverts per hour had been detected about 30 centimeters below the surface of the plot of land. Its subsequent examination of soil at the location detected radioactive cesium of up to 276,000 becquerels per kilogram.

Airborne radiation of 2 microsieverts per hour was recorded one meter above the ground--the same level detected in Iitatemura, Fukushima Prefecture, which was designated part of the expanded evacuation zone after the beginning of the crisis at the Fukushima No. 1 nuclear power plant.

On Sunday, the Education, Culture, Sports, Science and Technology Ministry said Kashiwa's hotspot was likely caused by the Fukushima crisis.

Since Monday, the municipal government has been receiving more than 200 calls every day, mainly from local residents asking officials to measure radiation at their houses or conduct decontamination as soon as possible.

The plot of land in question used to be the site of a city-run housing complex. Recently residents had used it for recreational activities. The plot was flattened by leveling a slope in a hilly area. It comprises a field, a paved pedestrian walkway and a street gutter that is 30 centimeters wide and 30 centimeters deep.

The high level of radiation was detected in the soil near an L-shaped corner in the gutter, of which a nearby 50-centimeter-long section was found to be damaged.

Takao Nakaya, head of the ministry's Office of Radiation Regulations, said it was highly possible the high level of radiation was caused by water containing radioactive cesium seeping into the soil over a long period.

After the outbreak of the nuclear crisis, clouds containing cesium spread over a widespread area, causing relatively high levels of radiation at many locations in the Tokyo metropolitan area. Kashiwa is just north of Tokyo.

"If the damage to the gutter caused [the hotspot in Kashiwa], it won't be surprising if similar levels of radiation are detected in other places," said Tsutomu Tohei, professor emeritus at Tohoku University.

If radioactive cesium adheres to the surface of soil or a leaf, it tends to remain there, Tohei said. However, rainwater may bring cesium that was previously scattered over various places to a particular spot, such as a gutter. If such cesium accumulates for a long time, the radiation level would become higher than in surrounding areas.

The Kashiwa municipal government has decided to examine all other plots of land owned by the city. In addition, the city will implement similar measures for private properties beginning next month, examining the premises of residents who make such requests or lending residents measuring devices.

However, the municipal government has yet to establish a framework to systematically find other hotspots. It has only covered the recently discovered spot with uncontaminated soil and blue tarpaulin sheets.

"It's difficult to find a company to decontaminate [the site] given the extremely high level of radiation," a city government official said. "The situation is more than we can handle as a local government."

The municipality has started discussions with the Environmental Ministry and Cabinet Office, asking the central government to take responsibility for determining the cause of the hotspot and the exact amount of contaminated soil, as well as decontaminating the location.

The hotspot was first discovered by a man living in the neighborhood who always carries a dosimeter.

Frustrated by the slow response of local governments to the radiation problem, many citizens and organizations are checking radiation levels in their neighborhoods on their own. These efforts will likely lead to the discovery of many more hotspots.

However, people may get different figures at the same spot depending on their examination methods or specific dosimeters.

Kiyoshi Nomura, associate professor at the University of Tokyo, said people do not have to worry too much about localized radiation.

(Oct. 28, 2011)

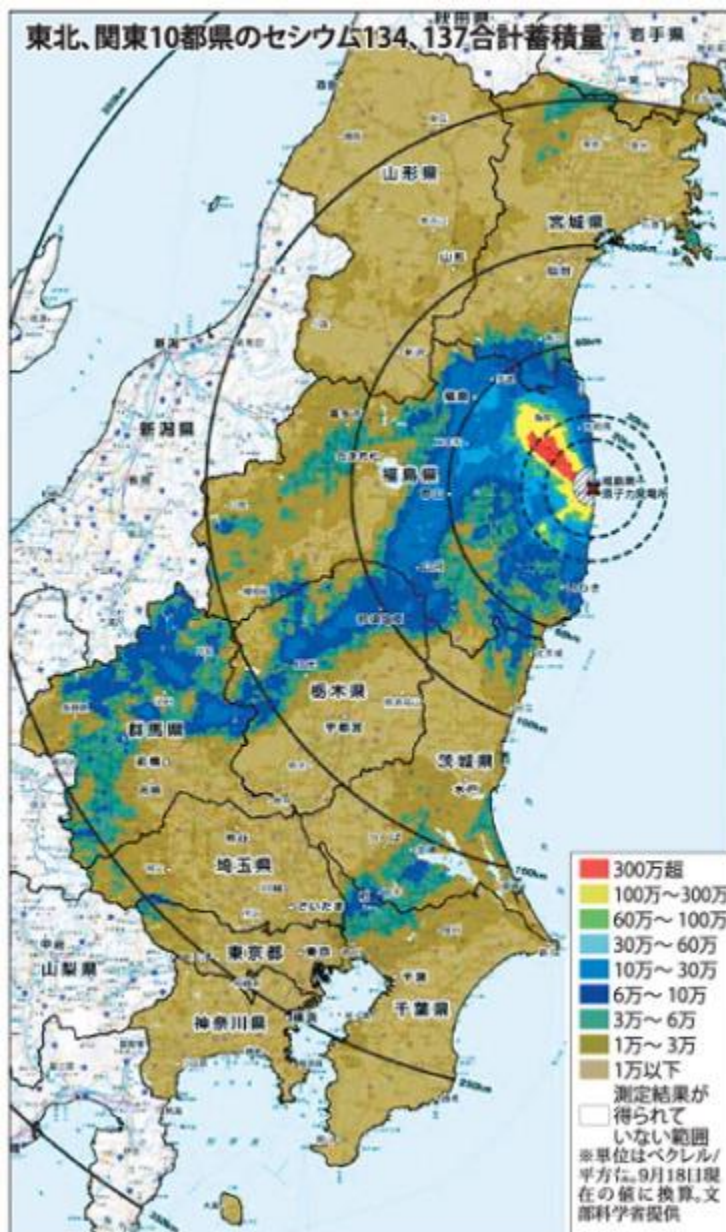

Gov't to slash upper limit on internal radiation exposure from food

The government will tighten the provisional safety limit for annual internal radioactive cesium exposure through food intake from the current 5 millisieverts to 1 millisievert by around April 2012.

"The current provisional safety limit, which was set in response to emergencies, is safe enough, but it will be tightened in order to ensure increased food safety and security," Health, Welfare and Labor Minister Yoko Komiyama said during a press conference following a Cabinet meeting on Oct. 28.

The ministry's move comes after the Food Safety Commission of the Cabinet Office reported on Oct. 27 that over 100 millisieverts of lifetime internal exposure to radiation would affect human health. The ministry is further set to review food classification, which is currently divided into five groups, and consider introducing safety standards for baby food at its council meeting convening on Oct. 31.

In elaborating on the reasons for the tighter cesium limit, Komiyama cited a **guideline set by the Codex Alimentarius Commission that limits cesium intake to no more than 1 millisievert a year**, as well as the fact that cesium concentrations in most food items have dropped substantially in recent tests. The minister said the opinions of many experts were also taken into account.

A government map displaying radiation levels in 10 prefectures relatively close to the Fukushima No. 1 Nuclear Power Plant. Areas in red show over 3 million becquerels of cesium per square meter, whereas those in light brown show less than 10,000. (Data as of Sept. 18. Image courtesy of the Ministry of Education, Culture, Sports, Science and Technology)

The new food safety regulations for cesium will be applied to agricultural products to be shipped sometime after April next year. The ministry will take transitional measures for newly cropped rice and other products that have already been distributed after clearing the current provisional safety limit, until next season's new rice is shipped. The ministry council will also review the types of radioactive materials subject to safety regulations, as no radioactive iodine has been detected in recent testing.

The Food Safety Commission's report on the 100-millisievert lifetime internal exposure limit -- filed with the health minister on Oct. 27 -- translates into 1.25 millisieverts of cesium per year if a person is

presumed to live for 80 years. A senior Health Ministry official said, "We have decided on the new (1 millisievert) standard in greater consideration of the safety, in light of the latest monitoring test results."

The current provisional safety limit was drawn up by the Health Ministry with advice from the Nuclear Safety Commission immediately after the nuclear crisis at the Fukushima No. 1 nuclear plant broke out in March.

A Health Ministry report released in July has revealed that each person in the country was estimated to have been internally exposed to an average of about 0.1 millisievert per year of radiation through food intake since the onset of the nuclear crisis.

"Under the current provisional safety limit, consumers are experiencing increased anxiety as they watch radiation measurements. Tightening the safety limit will reassure many people," said Hisa Anan, secretary-general of the National Liaison Committee of Consumers' Organizations.

(Mainichi Japan) October 28, 2011

Govt to lower radioactive intake limits

Japan's health ministry is set to lower its radiation limits for food to one millisievert per year as early as April. The figure is one-fifth the current level.

The ministry set provisional radioactivity safety limits on foodstuffs at 5 millisieverts per year after the nuclear accident at the Fukushima Daiichi plant in March.

This would translate into 500 becquerels of radioactive cesium per kilogram in meat, fish, vegetables and cereals such as rice.

The tentative limits were based on the levels which are said to have no health effects even when a person consumes foods with radioactive materials for one year.

The ministry decided to lower the limits to match international standards as radioactive substances detected in foodstuffs have been falling since the accident.

On Thursday, Japan's Food Safety Commission recommended that cumulative internal radioactive exposure from food during a person's lifetime be limited to no more than 100 millisieverts.

The new safety limits would result in stricter standards for each food item, and are likely to fall within the levels recommended by the commission.

The ministry's panel is to start deliberating the issue next week to set standards for each food item.

Study: Japan nuke radiation higher than estimated

NEW YORK (AP) -- **The Fukushima nuclear disaster released twice as much of a radioactive substance into the atmosphere as Japanese authorities estimated, reaching 40 percent of the total from Chernobyl, a preliminary report says.**

The estimate of much higher levels of radioactive cesium-137 comes from a worldwide network of sensors. Study author Andreas Stohl of the Norwegian Institute for Air Research says the Japanese government estimate came only from data in Japan, and that would have **missed emissions blown out to sea.**

The study did not consider health implications of the radiation. Cesium-137 is dangerous because it can last for decades in the environment, releasing cancer-causing radiation.

The long-term effects of the nuclear accident are unclear because of the difficulty of measuring radiation amounts people received.

In a telephone interview, Stohl said emission estimates are **so imprecise** that finding twice the amount of cesium isn't considered a major difference. He said some previous estimates had been higher than his.

The journal Atmospheric Chemistry and Physics posted the report online for comment, but the study has not yet completed a formal review by experts in the field or been accepted for publication.

Last summer, the Japanese government estimated that the March 11 Fukushima accident released 15,000 terabecquerels of cesium. Terabecquerels are a radiation measurement. The new report from Stohl and co-authors estimates about 36,000 terabecquerels through April 20. That's about 42 percent of the estimated release from Chernobyl, the report says.

An official at the Nuclear and Industrial Safety Agency, the Japanese government branch overseeing such findings, said the agency could not offer any comment on the study because it had not reviewed its contents.

It also says **about a fifth of the cesium fell on land in Japan, while most of the rest fell into the Pacific Ocean.** Only about 2 percent of the fallout came down on land outside Japan, the report concluded.

Experts have no firm projections about how many cancers could result because they're still trying to find out what doses people received. Some radiation from the accident has also been detected in Tokyo and in the United States, but experts say they expect no significant health consequences there.

Still, concern about radiation is strong in Japan. Many parents of small children in Tokyo worry about the discovery of radiation hotspots even though government officials say they don't pose a health risk. And former prime minister Naoto Kan has said the most contaminated areas inside the evacuation zone could be uninhabitable for decades.

Stohl also noted that his study found cesium-137 emissions dropped suddenly at the time workers started spraying water on the spent fuel pool from one of the reactors. That challenges previous thinking that the pool wasn't emitting cesium, he said.

(Mainichi Japan) October 28, 2011

Fuel retrieval at Fukushima to start in 10 years

Japan's Atomic Energy Commission says it aims to start retrieving melted nuclear fuel rods from the Fukushima Daiichi power plant within 10 years.

The Commission's expert panel on Friday presented a draft report on the timetable for scrapping the plant.

The report says decommissioning will start with repairing the containment vessels of the No.1 to No.3 reactors, where meltdowns occurred.

The vessels will then be filled with water to block radiation released from the melted fuel.

The commission also plans to start moving spent fuel rods from pools at the No.1 to No.4 reactors to another pool in the plant within 3 years. This will take place after the reactors achieve a state of cold shutdown.

The report projects that the decommissioning will take more than 30 years to complete.

The timetable is longer than that for the Three Mile Island nuclear plant in the United States, because the containment vessels were damaged at Fukushima along with the pressure vessels that house fuel rods.

In the 1979 Three Mile Island accident, about 70 percent of the reactor's fuel rods melted. Fuel retrieval began 6 years after the accident and lasted for 5 years.

The work at Fukushima is expected to be longer and more difficult, because the extent of the damage is more severe and workers will have to repair 4 reactors simultaneously.

Friday, October 28, 2011 18:39 +0900 (JST)

Over 80% of Japan's reactors offline

Forty-four of Japan's 55 nuclear reactors are currently idle, mainly for safety inspections.

Eighteen of them are undergoing stress tests mandated by the government. But none are expected to resume operations soon because the nuclear plant accident in Fukushima has raised safety concerns among local authorities hosting nuclear plants.

Of the 10 reactors still running, 4 will be shut down for routine inspections by year-end. The rest are scheduled to go offline by early next year.

If none of the reactors restart, Japan will have no active nuclear power plants within several months.

Friday, October 28, 2011 16:39 +0900 (JST)

Japanese group develops handheld decontaminator

A group of Japanese researchers says it has developed a handheld device capable of removing radioactive substances using laser beams.

The machine was created by researchers from the Wakasa Wan Energy Research Center in Fukui Prefecture, central Japan.

The device uses laser beams moving at a high speed to scrape off radioactive substances attached to the surface of pipes and other objects at nuclear power plants. The dust is then collected inside the machine.

The researchers say that, since only the surface is scraped off, the machine generates one thousand times less radioactive waste than conventional methods.

The device is about 30 centimeters high and wide, and 40 centimeters long. The team says it is the world's first portable radiation decontaminator.

When the researchers began developing the machine 7 years ago, they meant it to be used to reduce radioactive waste from nuclear plants, and also in the decommissioning of a prototype test reactor in Fukui Prefecture, known as Fugen.

The device is expected to be used in the operations to remove radioactive substances from the Fukushima Daiichi nuclear plant, which was badly damaged in the March 11th tsunami.

EDF Delays Construction Of 4 Nuclear Reactors In UK

By Inti Landauro

Published October 28, 2011

| Dow Jones Newswires

PARIS -([Dow Jones](#))- French power company Electricite de France SA, or EDF, (EDF.FR), Friday decided to delay the construction of four planned nuclear reactors in the U.K., a company spokeswoman said, confirming a report from Les Echos newspaper.

EDF is taking time to evaluate the consequences of delays at a reactor under construction in Flamanville, northern France and the Fukushima Daiichi nuclear disaster in Japan, the spokeswoman said.

EDF will release a new calendar for the project during the fall, she said.

Les Echos said the company is evaluating whether conditions for the EUR20 billion investment are met in the U.K.

EDF was planning to start building the first of the planned nuclear reactors in 2013, the newspaper said.

Read more: <http://www.foxbusiness.com/industries/2011/10/28/edf-delays-construction-4-nuclear-reactors-in-uk/#ixzz1c4Fc1qA6>

Japan's leaders must face country's 'latent' possession of nuclear weapons

I've made four visits to the Rokkasho Nuclear Reprocessing Plant in Aomori Prefecture which, since 1993, has cost the government over 2 trillion yen to build and run on a trial basis.

The reason for the multiple visits was the plant's significance in the country's energy security scheme. It was important that we probe and monitor not just the safety of the plant, but the trends in local residents' attitudes and their tactics in dealing with politicians, the speed of construction, and any "interference" by other countries.

The cold and wet northeasterly "yamase" winds -- also known as "gashifu," literally "starvation winds" -- were blowing every time I visited the village of Rokkasho, enveloping everything in a thick fog. The conditions in region were not conducive to growing crops; it was not a "rich" area.

So perhaps these winds had something to do with why the village gave up the land that had belonged to it for generations to nuclear power.

But it was the presentation of the plant as a national project that would fulfill government policy and goals that ultimately won the villagers' "cooperation." "Of a nuclear power plant's spent nuclear fuel, only 5 percent or less should be disposed of," the government had explained. "Uranium and plutonium can be recycled. We want to reprocess the fuel and pave the way to energy self-sufficiency."

In the 27 years since the application for the construction of a reprocessing plant was lodged with Rokkasho, the village has undergone tremendous change. Massive cranes have been brought in, and hefty structures have gone up one after another. Nuclear money has brought wealth to the village, making its per capita income the highest of any municipality in Aomori Prefecture. Despite some twists and turns, the national project was getting closer to becoming a reality.

There's a little "secret" to the reprocessing plant, however.

On July 17, 1988, Japan implemented revisions to the Japan-U.S. Nuclear Agreement that would allow Japan to construct nuclear fuel reprocessing plants, despite strong opposition from the U.S. Congress. Using its own enrichment technology, it was now possible for Japan, in theory, to produce the raw materials necessary to build nuclear bombs.

By 2005, the year I last visited Rokkasho, the facility had been subject to 11 routine inspections and 14 unannounced inspections from the International Atomic Energy Agency (IAEA), whose aim was to ensure that the plant was not producing any such materials. Despite being a nonnuclear weapons state, Japan was now a "latent" nuclear weapons state. Japan claims it is protected against threats from other countries by the U.S. nuclear umbrella, but the rest of the world sees Japan as a state that would not hesitate to possess nuclear arms, if the circumstances called for it.

The call to eliminate our dependence on nuclear power has become widespread since the crisis at the Fukushima No. 1 nuclear plant began. And yet, our leaders have failed to make any mention of the country's latent nuclear weapons capacity.

The true elimination of our dependence on nuclear power, however, must include our abandonment of nuclear weapons possession. The decisions we face now hold the key to the security of our country.

Kashiwa govt wants help with hotspot

Tadao Baba and Eiji Noyori / Yomiuri Shimbun Staff Writers

KASHIWA, Chiba--A radiation hotspot in Kashiwa has still not been decontaminated a week after radiation of 57.5 microsieverts per hour was recorded on a city-owned plot of land.

The city insists such a high level of radiation is beyond the level a local government can handle on its own, though it decided to conduct surveys to find other hotspots after many residents expressed anxiety over the issue.

The Kashiwa municipal government said last Friday that radiation of 57.5 microsieverts per hour had been detected about 30 centimeters below the surface of the plot of land. Its subsequent examination of soil at the location detected radioactive cesium of up to 276,000 becquerels per kilogram.

Airborne radiation of 2 microsieverts per hour was recorded one meter above the ground--the same level detected in Iitatemura, Fukushima Prefecture, which was designated part of the expanded evacuation zone after the beginning of the crisis at the Fukushima No. 1 nuclear power plant.

On Sunday, the Education, Culture, Sports, Science and Technology Ministry said Kashiwa's hotspot was likely caused by the Fukushima crisis.

Since Monday, the municipal government has been receiving more than 200 calls every day, mainly from local residents asking officials to measure radiation at their houses or conduct decontamination as soon as possible.

The plot of land in question used to be the site of a city-run housing complex. Recently residents had used it for recreational activities. The plot was flattened by leveling a slope in a hilly area. It comprises a field, a paved pedestrian walkway and a street gutter that is 30 centimeters wide and 30 centimeters deep.

The high level of radiation was detected in the soil near an L-shaped corner in the gutter, of which a nearby 50-centimeter-long section was found to be damaged.

Takao Nakaya, head of the ministry's Office of Radiation Regulations, said it was highly possible the high level of radiation was caused by water containing radioactive cesium seeping into the soil over a long period.

After the outbreak of the nuclear crisis, clouds containing cesium spread over a widespread area, causing relatively high levels of radiation at many locations in the Tokyo metropolitan area. Kashiwa is just north of Tokyo.

"If the damage to the gutter caused [the hotspot in Kashiwa], it won't be surprising if similar levels of radiation are detected in other places," said Tsutomu Tohei, professor emeritus at Tohoku University.

If radioactive cesium adheres to the surface of soil or a leaf, it tends to remain there, Tohei said. However, rainwater may bring cesium that was previously scattered over various places to a particular spot, such as a gutter. If such cesium accumulates for a long time, the radiation level would become higher than in surrounding areas.

The Kashiwa municipal government has decided to examine all other plots of land owned by the city. In addition, the city will implement similar measures for private properties beginning next month, examining the premises of residents who make such requests or lending residents measuring devices.

However, the municipal government has yet to establish a framework to systematically find other hotspots. It has only covered the recently discovered spot with uncontaminated soil and blue tarpaulin sheets.

"It's difficult to find a company to decontaminate [the site] given the extremely high level of radiation," a city government official said. "The situation is more than we can handle as a local government."

The municipality has started discussions with the Environmental Ministry and Cabinet Office, asking the central government to take responsibility for determining the cause of the hotspot and the exact amount of contaminated soil, as well as decontaminating the location.

The hotspot was first discovered by a man living in the neighborhood who always carries a dosimeter.

Frustrated by the slow response of local governments to the radiation problem, many citizens and organizations are checking radiation levels in their neighborhoods on their own. These efforts will likely lead to the discovery of many more hotspots.

However, people may get different figures at the same spot depending on their examination methods or specific dosimeters.

Kiyoshi Nomura, associate professor at the University of Tokyo, said people do not have to worry too much about localized radiation.

Gov't to slash upper limit on internal radiation exposure from food

The government will tighten the provisional safety limit for annual internal radioactive cesium exposure through food intake from the current 5 millisieverts to 1 millisievert by around April 2012.

"The current provisional safety limit, which was set in response to emergencies, is safe enough, but it will be tightened in order to ensure increased food safety and security," Health, Welfare and Labor Minister Yoko Komiyama said during a press conference following a Cabinet meeting on Oct. 28.

The ministry's move comes after the Food Safety Commission of the Cabinet Office reported on Oct. 27 that over 100 millisieverts of lifetime internal exposure to radiation would affect human health. The ministry is further set to review food classification, which is currently divided into five groups, and consider introducing safety standards for baby food at its council meeting convening on Oct. 31.

In elaborating on the reasons for the tighter cesium limit, Komiyama cited a **guideline set by the Codex Alimentarius Commission that limits cesium intake to no more than 1 millisievert a year**, as well as the fact that cesium concentrations in most food items have dropped substantially in recent tests. The minister said the opinions of many experts were also taken into account.

A government map displaying radiation levels in 10 prefectures relatively close to the Fukushima No. 1 Nuclear Power Plant. Areas in red show over 3 million becquerels of cesium per square meter, whereas those in light brown show less than 10,000. (Data as of Sept. 18. Image courtesy of the Ministry of Education, Culture, Sports, Science and Technology)

The new food safety regulations for cesium will be applied to agricultural products to be shipped sometime after April next year. The ministry will take transitional measures for newly cropped rice and other products that have already been distributed after clearing the current provisional safety limit, until next season's new rice is shipped. The ministry council will also review the types of radioactive materials subject to safety regulations, as no radioactive iodine has been detected in recent testing.

The Food Safety Commission's report on the 100-millisievert lifetime internal exposure limit -- filed with the health minister on Oct. 27 -- translates into 1.25 millisieverts of cesium per year if a person is

presumed to live for 80 years. A senior Health Ministry official said, "We have decided on the new (1 millisievert) standard in greater consideration of the safety, in light of the latest monitoring test results."

The current provisional safety limit was drawn up by the Health Ministry with advice from the Nuclear Safety Commission immediately after the nuclear crisis at the Fukushima No. 1 nuclear plant broke out in March.

A Health Ministry report released in July has revealed that each person in the country was estimated to have been internally exposed to an average of about 0.1 millisievert per year of radiation through food intake since the onset of the nuclear crisis.

"Under the current provisional safety limit, consumers are experiencing increased anxiety as they watch radiation measurements. Tightening the safety limit will reassure many people," said Hisa Anan, secretary-general of the National Liaison Committee of Consumers' Organizations.

(Mainichi Japan) October 28, 2011

Govt to lower radioactive intake limits

Japan's health ministry is set to lower its radiation limits for food to one millisievert per year as early as April. The figure is one-fifth the current level.

The ministry set provisional radioactivity safety limits on foodstuffs at 5 millisieverts per year after the nuclear accident at the Fukushima Daiichi plant in March.

This would translate into 500 becquerels of radioactive cesium per kilogram in meat, fish, vegetables and cereals such as rice.

The tentative limits were based on the levels which are said to have no health effects even when a person consumes foods with radioactive materials for one year.

The ministry decided to lower the limits to match international standards as radioactive substances detected in foodstuffs have been falling since the accident.

On Thursday, Japan's Food Safety Commission recommended that cumulative internal radioactive exposure from food during a person's lifetime be limited to no more than 100 millisieverts.

The new safety limits would result in stricter standards for each food item, and are likely to fall within the levels recommended by the commission.

The ministry's panel is to start deliberating the issue next week to set standards for each food item.

Study: Japan nuke radiation higher than estimated

NEW YORK (AP) -- **The Fukushima nuclear disaster released twice as much of a radioactive substance into the atmosphere as Japanese authorities estimated, reaching 40 percent of the total from Chernobyl, a preliminary report says.**

The estimate of much higher levels of radioactive cesium-137 comes from a worldwide network of sensors. Study author Andreas Stohl of the Norwegian Institute for Air Research says the Japanese government estimate came only from data in Japan, and that would have **missed emissions blown out to sea.**

The study did not consider health implications of the radiation. Cesium-137 is dangerous because it can last for decades in the environment, releasing cancer-causing radiation.

The long-term effects of the nuclear accident are unclear because of the difficulty of measuring radiation amounts people received.

In a telephone interview, Stohl said emission estimates are **so imprecise** that finding twice the amount of cesium isn't considered a major difference. He said some previous estimates had been higher than his.

The journal Atmospheric Chemistry and Physics posted the report online for comment, but the study has not yet completed a formal review by experts in the field or been accepted for publication.

Last summer, the Japanese government estimated that the March 11 Fukushima accident released 15,000 terabecquerels of cesium. Terabecquerels are a radiation measurement. The new report from Stohl and co-authors estimates about 36,000 terabecquerels through April 20. That's about 42 percent of the estimated release from Chernobyl, the report says.

An official at the Nuclear and Industrial Safety Agency, the Japanese government branch overseeing such findings, said the agency could not offer any comment on the study because it had not reviewed its contents.

It also says **about a fifth of the cesium fell on land in Japan, while most of the rest fell into the Pacific Ocean.** Only about 2 percent of the fallout came down on land outside Japan, the report concluded.

Experts have no firm projections about how many cancers could result because they're still trying to find out what doses people received. Some radiation from the accident has also been detected in Tokyo and in the United States, but experts say they expect no significant health consequences there.

Still, concern about radiation is strong in Japan. Many parents of small children in Tokyo worry about the discovery of radiation hotspots even though government officials say they don't pose a health risk. And former prime minister Naoto Kan has said the most contaminated areas inside the evacuation zone could be uninhabitable for decades.

Stohl also noted that his study found cesium-137 emissions dropped suddenly at the time workers started spraying water on the spent fuel pool from one of the reactors. That challenges previous thinking that the pool wasn't emitting cesium, he said.

Fuel retrieval at Fukushima to start in 10 years

Japan's Atomic Energy Commission says it aims to start retrieving melted nuclear fuel rods from the Fukushima Daiichi power plant within 10 years.

The Commission's expert panel on Friday presented a draft report on the timetable for scrapping the plant.

The report says decommissioning will start with repairing the containment vessels of the No.1 to No.3 reactors, where meltdowns occurred.

The vessels will then be filled with water to block radiation released from the melted fuel.

The commission also plans to start moving spent fuel rods from pools at the No.1 to No.4 reactors to another pool in the plant within 3 years. This will take place after the reactors achieve a state of cold shutdown.

The report projects that the decommissioning will take more than 30 years to complete.

The timetable is longer than that for the Three Mile Island nuclear plant in the United States, because the containment vessels were damaged at Fukushima along with the pressure vessels that house fuel rods.

In the 1979 Three Mile Island accident, about 70 percent of the reactor's fuel rods melted. Fuel retrieval began 6 years after the accident and lasted for 5 years.

The work at Fukushima is expected to be longer and more difficult, because the extent of the damage is more severe and workers will have to repair 4 reactors simultaneously.

Friday, October 28, 2011 18:39 +0900 (JST)

Over 80% of Japan's reactors offline

Forty-four of Japan's 55 nuclear reactors are currently idle, mainly for safety inspections.

Eighteen of them are undergoing stress tests mandated by the government. But none are expected to resume operations soon because the nuclear plant accident in Fukushima has raised safety concerns among local authorities hosting nuclear plants.

Of the 10 reactors still running, 4 will be shut down for routine inspections by year-end. The rest are scheduled to go offline by early next year.

If none of the reactors restart, Japan will have no active nuclear power plants within several months.

Friday, October 28, 2011 16:39 +0900 (JST)

Japanese group develops handheld decontaminator

A group of Japanese researchers says it has developed a handheld device capable of removing radioactive substances using laser beams.

The machine was created by researchers from the Wakasa Wan Energy Research Center in Fukui Prefecture, central Japan.

The device uses laser beams moving at a high speed to scrape off radioactive substances attached to the surface of pipes and other objects at nuclear power plants. The dust is then collected inside the machine.

The researchers say that, since only the surface is scraped off, the machine generates one thousand times less radioactive waste than conventional methods.

The device is about 30 centimeters high and wide, and 40 centimeters long. The team says it is the world's first portable radiation decontaminator.

When the researchers began developing the machine 7 years ago, they meant it to be used to reduce radioactive waste from nuclear plants, and also in the decommissioning of a prototype test reactor in Fukui Prefecture, known as Fugen.

The device is expected to be used in the operations to remove radioactive substances from the Fukushima Daiichi nuclear plant, which was badly damaged in the March 11th tsunami.

EDF Delays Construction Of 4 Nuclear Reactors In UK

By Inti Landauro

Published October 28, 2011

| Dow Jones Newswires

PARIS -([Dow Jones](#))- French power company Electricite de France SA, or EDF, (EDF.FR), Friday decided to delay the construction of four planned nuclear reactors in the U.K., a company spokeswoman said, confirming a report from Les Echos newspaper.

EDF is taking time to evaluate the consequences of delays at a reactor under construction in Flamanville, northern France and the Fukushima Daiichi nuclear disaster in Japan, the spokeswoman said.

EDF will release a new calendar for the project during the fall, she said.

Les Echos said the company is evaluating whether conditions for the EUR20 billion investment are met in the U.K.

EDF was planning to start building the first of the planned nuclear reactors in 2013, the newspaper said.

Japan's leaders must face country's 'latent' possession of nuclear weapons

I've made four visits to the Rokkasho Nuclear Reprocessing Plant in Aomori Prefecture which, since 1993, has cost the government over 2 trillion yen to build and run on a trial basis.

The reason for the multiple visits was the plant's significance in the country's energy security scheme. It was important that we probe and monitor not just the safety of the plant, but the trends in local residents' attitudes and their tactics in dealing with politicians, the speed of construction, and any "interference" by other countries.

The cold and wet northeasterly "yamase" winds -- also known as "gashifu," literally "starvation winds" -- were blowing every time I visited the village of Rokkasho, enveloping everything in a thick fog. The conditions in region were not conducive to growing crops; it was not a "rich" area.

So perhaps these winds had something to do with why the village gave up the land that had belonged to it for generations to nuclear power.

But it was the presentation of the plant as a national project that would fulfill government policy and goals that ultimately won the villagers' "cooperation." "Of a nuclear power plant's spent nuclear fuel, only 5 percent or less should be disposed of," the government had explained. "Uranium and plutonium can be recycled. We want to reprocess the fuel and pave the way to energy self-sufficiency."

In the 27 years since the application for the construction of a reprocessing plant was lodged with Rokkasho, the village has undergone tremendous change. Massive cranes have been brought in, and hefty structures have gone up one after another. Nuclear money has brought wealth to the village, making its per capita income the highest of any municipality in Aomori Prefecture. Despite some twists and turns, the national project was getting closer to becoming a reality.

There's a little "secret" to the reprocessing plant, however.

On July 17, 1988, Japan implemented revisions to the Japan-U.S. Nuclear Agreement that would allow Japan to construct nuclear fuel reprocessing plants, despite strong opposition from the U.S. Congress. Using its own enrichment technology, it was now possible for Japan, in theory, to produce the raw materials necessary to build nuclear bombs.

By 2005, the year I last visited Rokkasho, the facility had been subject to 11 routine inspections and 14 unannounced inspections from the International Atomic Energy Agency (IAEA), whose aim was to ensure that the plant was not producing any such materials. Despite being a nonnuclear weapons state, Japan was now a "latent" nuclear weapons state. Japan claims it is protected against threats from other countries by the U.S. nuclear umbrella, but the rest of the world sees Japan as a state that would not hesitate to possess nuclear arms, if the circumstances called for it.

The call to eliminate our dependence on nuclear power has become widespread since the crisis at the Fukushima No. 1 nuclear plant began. And yet, our leaders have failed to make any mention of the country's latent nuclear weapons capacity.

The true elimination of our dependence on nuclear power, however, must include our abandonment of nuclear weapons possession. The decisions we face now hold the key to the security of our country.

NOVEMBRE 2011

A pro nuclear point of view, but interesting insights on nuclear diplomacy.

Challenges ahead for India's nuclear diplomacy

Siddharth Varadarajan

<http://www.thehindu.com/opinion/op-ed/article2586304.ece>

Nullifying the effect of the Nuclear Suppliers Group's ban on enrichment and reprocessing exports will require diplomatic finesse and commercial hardball.

After the diplomatic successes of 2008, when the Nuclear Suppliers Group (NSG) exempted India from the cartel's ban on atomic sales to countries that have not signed the Non-Proliferation Treaty (NPT) or placed all their nuclear facilities under international safeguards, 2011 has not been a very good year at all.

Negotiations with the Japanese on a nuclear agreement have run aground, **India's liability law is being unfairly attacked by its potential partners** and, of course, the 46-nation **NSG adopted new guidelines for the export of sensitive nuclear technology this June** — Including enrichment and reprocessing (ENR) equipment and technology — that made the sale of these items conditional on the recipient state fulfilling a number of “objective” and “subjective” conditions. The first of these conditions, namely NPT membership and full-scope safeguards, were specifically designed to dilute the 2008 waiver India received and were not needed to ban ENR sales to any of the other three countries outside the NPT (Pakistan, Israel and North Korea) since the NSG's original guidelines — with their catch-all NPT conditionality for the export of any kind of nuclear equipment — continue to apply to them.

Though Washington denies targeting New Delhi and says it has been working to restrict the sale of ENR equipment and technology for many years now, the new guidelines' redundant reference to the NPT was introduced in order to fulfil an assurance that Condoleezza Rice, who was U.S. Secretary of State at the time, gave Capitol Hill in 2008. Some Congressmen feared other nuclear suppliers would steal a march on the United States by offering India technologies the U.S. wouldn't. To allay their concerns, the U.S. administration said it would ensure an NSG-level ban on sensitive nuclear technology exports to India. A draft was circulated in November that year and finally approved in June 2011.

The Hindu's report

The fact that India failed to prevent the adoption of the new guidelines despite knowing they were in the pipeline for more than two years suggests a certain complacency on the Manmohan Singh government's part. We know from WikiLeaks cables that the issue was dutifully raised by Indian diplomats in many of their meetings with U.S. officials. But never was the proposed ENR ban projected by the government as an attempt by Washington to unilaterally rewrite the terms of the nuclear bargain it had struck with India.

When *The Hindu* broke the story about the G-8 deciding to implement such a ban in 2009 pending its adoption by the full NSG, senior Indian ministers took the view that this did not matter. It was only

when the Nuclear Suppliers Group finally adopted the new guidelines this June that South Block decided to put on its punching gloves.

The fact is that the **NSG's 2008 decision to lift its embargo on India was not some kind of unilateral concession**. It was part of a complex bargain involving reciprocal commitments by both sides. If the supplier nations agreed to drop their insistence on the NPT and full-scope safeguards and open the door to full civil nuclear cooperation with India, India committed itself to fulfilling several onerous steps, including the difficult and costly separation of its civilian and military nuclear programmes, the placing of its civilian facilities under International Atomic Energy Agency (IAEA) safeguards, the signing of an Additional Protocol, as well as extending support to a number of nonproliferation and disarmament-related initiatives at the global level. At a fundamental level, the logic of this bargain hinged on two components. First, the NSG was making a judgment about India's status as a responsible country with advanced nuclear capabilities. Second, the NSG and India were acting on the basis of reciprocity.

India's expectations

Though Indian officials made their anger known almost immediately in off the record briefings, External Affairs Minister S.M. Krishna finally provided the government's formal response to the new NSG guidelines in a *suo moto* statement to Parliament in August. Noting the concerns that had been raised by MPs, he made the following “clarifications”: (1) The basis of India's international civil nuclear cooperation remains the special exemption from the NSG guidelines given on September 6, 2008 “which contain reciprocal commitments and actions by both sides.” (2) That exemption accorded “a special status to India” and “was granted knowing full well that India is not a signatory to the Nuclear Non-Proliferation Treaty.” Pursuant to the “clean” exemption, “NSG members had agreed to transfer all technologies which are consistent with their national law” including technologies connected with the nuclear fuel cycle.

Mr. Krishna said the only outstanding issue is the “full implementation” of the September 2008 understanding. “This is what we expect and our major partners are committed to.” This understanding contained commitments on both sides. “We expect all NSG members to honour their commitments as reflected in the 2008 NSG Statement and our bilateral cooperation agreements.”

The Minister then noted the statements made by the U.S., France and Russia following the NSG's June 2011 meeting in which each country tried to assure India that the new guidelines would not “detract” from or “affect” the original waiver granted in September 2008. Stating that not every NSG member has the ability to transfer ENR items to other countries, Mr. Krishna added: “We expect that those that do and have committed to do so in bilateral agreements with India, will live up to their legal commitments.” He also held out a carrot — the huge expansion planned for India's civil nuclear industry — and repeated once again in that context that “we expect that our international partners will fully honour their commitments in this regard.”

French example

While the three big nuclear suppliers have all said the new guidelines do not “detract” from the grand bargain of 2008, South Block should not set much store by these assurances. The fact is that there has been a setback and a diplomatic effort is needed to recover lost ground and ensure that India is excluded from the purview of the new ENR restrictions imposed by the NSG.

The one supplier that has been the most forthcoming so far is France. Indian officials will have taken heart from French Foreign Minister Alain Juppe's public articulation in an interview in Delhi last month that France did not consider itself bound by the new guidelines when it came to nuclear commerce with India. The Minister confirmed that notwithstanding the NSG rules, Paris remained free to sell ENR items and technology in a manner consistent with its national law and its bilateral agreement. French diplomatic sources also told this writer that the French delegation at the NSG meeting in June had entered a verbal reservation to the new ENR guidelines questioning their applicability to India. The French intervention was not challenged and was duly recorded in the minutes, the sources said.

Of course, the challenge for India will be to hold the French to their word, as and when the requirement for cooperation in the ENR field is required. Though India has its own capabilities in these fields, there is no reason why it should not seek access to the best international components and equipment for the new reprocessing plant it has committed to build. With both France and Russia, India must make it clear that the multibillion dollar contracts which are on the anvil for the purchase of new reactors will also depend on Paris and Moscow's willingness to follow through on their promises and commitments on full civil nuclear cooperation. The U.S. has not so far committed itself to sell ENR equipment to India. New Delhi can live with that. But not with American efforts to block others from cooperating with it.

(Mainichi Japan) November 1, 2011

PM Noda looks set to back down from pursuit of less reliance of nuclear power

Speculation is growing that Prime Minister Yoshihiko Noda has backed down from his position for Japan to seek to rely less on nuclear power.

In their summit talks on Oct. 31, Noda told Vietnamese Prime Minister Nguyen Tan Dung that Japan will continue to export nuclear reactors. In an earlier interview with The Financial Times, Noda expressed hope that a certain number of nuclear reactors, which have been stopped for regular maintenance work, can be reactivated.

Following the accident at the tsunami-hit Fukushima No. 1 Nuclear Power Plant, the government suspended its talks with other countries over exports of nuclear power complexes.

However, the Cabinet decided in August to resume talks with Vietnam **for fear that confidence will be lost in Japan in the international market** unless it allows a contract for a project that a Japanese

company has already won from the country to go ahead. The final round of talks with Vietnam was actually resumed in September.

Still, Prime Minister Noda remains prudent in giving the green light to future exports of nuclear reactors and technology. "The exports to Vietnam will not lead to fresh talks with other countries on nuclear power accords or exports of nuclear reactors," he said.

Economy, Trade and Industry Minister Yukio Edano also said the government will "take some more time" before deciding whether to permit fresh exports of nuclear power complexes and technology.

However, Foreign Minister Koichiro Genba and his Indian counterpart Shri S. M. Krishna agreed on Oct. 29 that the two governments will press forward with talks on a bilateral nuclear power agreement, which is indispensable for Japan's exports of nuclear reactors and technology to India. The move could be interpreted as an indication that Tokyo is considering fresh exports of nuclear power despite the prime minister's cautious approach.

The Democratic Party of Japan (DPJ)-led government had initially promoted exports of nuclear power complexes. In its new growth strategy released in June 2010, the administration called for exports of various forms of infrastructure including nuclear reactors in packages. It then signed a nuclear power accord with Jordan in September last year, with South Korea in December and with Vietnam in January. Four such agreements, including one that the Liberal Democratic Party-led previous administration had signed with Russia, have been submitted to the Diet for approval.

Editorial: Safety must be guaranteed as precondition for nuke reactor export to Vietnam

Safety must be guaranteed as a precondition for the government giving the green light to the export of nuclear reactors to Vietnam.

Prime Minister Yoshihiko Noda and his Vietnamese counterpart Nguyen Tan Dung have reached an agreement under which Japan will be granted a contract to build two nuclear reactors, each with an output of 1 million kilowatts, as part of the second phase of the construction of a nuclear power station in Ninh Thuan, southern Vietnam. Operations at these reactors are scheduled to begin in 2021 and 2022.

The government will go ahead with Japan's exports of reactors to Vietnam after the Diet approves the bilateral nuclear power agreement.

In a speech to the U.N. in September, Prime Minister Noda said he would ensure the world's top level of safety as a precondition for exporting nuclear power complexes. Japan must not export danger and concern by placing priority on profit over safety. Maximum caution should be exercised in ensuring safety before giving the green light to exports.

At a bilateral summit in October 2010, Japan agreed to be a partner in the development of nuclear power plants in Vietnam. Vietnam had asked Japan to extend low-interest loans for the project, provide

the most advanced technology, help develop a skilled nuclear power workforce, process radioactive waste and extend other forms of cooperation as a condition for granting Japan the contract.

One cannot help but wonder why the government, which is pursuing reduced reliance on nuclear power, has chosen to give the green light to exports of nuclear reactors. As the reasons for exporting nuclear technology, the government has explained that it will help stabilize the global energy supply, reduce greenhouse gas emissions, maintain and improve technology and skills in Japan, and contribute to Japan's economic growth.

True, the construction of a single nuclear reactor is reportedly a 500-billion-yen project. The government, which has been worried that domestic demand is shrinking, declared in its new growth strategy in June that it will promote the sale of infrastructure packages including nuclear power plants abroad.

Still, the government has failed to bring the crisis at the Fukushima No. 1 nuclear plant under control and is still trying to get to the bottom of the disaster's cause. The crisis has uncovered various problems with the management of nuclear power plants, including plant operator Tokyo Electric Power Co.'s failure to assume that all external power sources could be lost for such a long period in case of a disaster. If Japan chooses to unconditionally export nuclear reactors in pursuit of profits at this stage, it will never win international confidence.

Vietnam, for its part, is aiming to secure stable power sources to help attract foreign investment and sustain its economic growth. The country has already placed an order with Russia for the construction of two nuclear reactors, but reportedly intends to avoid excessive reliance on a single major provider. In that sense, it places high expectations on Japan's nuclear power technology. It is only natural that Japan, which has been in negotiation with Vietnam over nuclear reactor exports, feels obliged to respond to the country's request.

Still, if Japan -- which has witnessed a stunning collapse of the myth of nuclear power's safety -- moves to export nuclear reactors, it needs to keep in mind that it must ensure their safety.

It is a matter of course that Tokyo must upgrade the safety of nuclear power plants while paying close attention to the results of investigations by the government's accident investigative panel and a similar panel to be set up in the Diet.

Japan may enter negotiations with other countries on exports of nuclear reactors and technology. The executive and legislative branches of the government should hold substantive discussions on the issue to prevent the government from permitting exports to numerous countries without restraint.

(Mainichi Japan) November 1, 2011

Xenon suggests possible nuclear fission

A nuclear energy expert says the presence of xenon in the No.2 reactor leaves open the possibility that localized and temporary fission could still occur.

Professor Koji Okamoto of the University of Tokyo Graduate School says substances from melted fuel

that could undergo fission are probably scattered around, but are unlikely to react.

He says, however, that neutrons from radioactive materials could react with the uranium fuel and other substances.

Okamoto says a self-sustaining chain reaction that creates criticality is unlikely to happen because huge amounts of boric acid have been poured into the reactor.

He adds that these neutrons must be closely monitored to make sure fission does not take place.

The professor also referred to a plan by the government and TEPCO to achieve a state of cold shutdown by the end of the year. He says that if fission reactions are not under control, it would not be a cold shutdown.

Okamoto says TEPCO must locate the melted fuel inside and outside the reactor in order to prevent further reactions.

Wednesday, November 02, 2011 10:24 +0900 (JST)

Nuke watchdog says fresh meltdown unlikely

Japan's nuclear watchdog says it believes another meltdown at the Fukushima Daiichi nuclear power plant is unlikely, but will continue to monitor the situation closely.

The Nuclear and Industrial Safety Agency held a news conference on Wednesday, after radioactive xenon was detected in the containment vessel of the No.2 reactor. The presence of the substance indicates that nuclear fission may have briefly resumed.

The safety agency says it is unlikely that nuclear fuel has begun melting again, as the density of xenon is low and there has been no change in the reactor's temperatures.

The agency also says it will closely monitor if xenon continues to be detected after Tokyo Electric Power Company poured boric acid solution into the reactor to suppress nuclear fission.

It added that it cannot yet say how the latest development will affect the government's plan to achieve a cold shutdown of the disabled reactors by the end of the year.

Senior official Yoshinori Moriyama said it is difficult to determine the amount of nuclear fuel remaining in the containment vessel of the No.2 reactor. He said his agency will assess the situation and judge if it is still possible to stably lower temperatures in the reactor and containment vessel.

Wednesday, November 02, 2011 15:10 +0900 (JST)

TEPCO finds sign of fresh nuclear fission at Fukushima reactor

In this April 10 2011 file photo taken by T-Hawk drone aircraft and released by Tokyo Electric Power Co. (TEPCO), the reactor building of Unit 2, center, of the Fukushima Dai-ichi nuclear power plant is seen in Okuma town, Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that it has detected signs of a recent nuclear fission in the No. 2 reactor at the crippled Fukushima Daiichi power plant, but ruled out the possibility that a major criticality accident had occurred.

The plant operator injected early Wednesday water containing boric acid to control a possible nuclear reaction at the reactor, where nuclear fuel is believed to have melted when the cooling system failed following the devastating March 11 earthquake and tsunami. The company said the reactor's temperature and pressure were stable.

As for the possibility of criticality, in which nuclear fuel sustains a fission chain reaction, the utility's spokesman said such a phenomenon may have happened "temporarily or partially," but he does not think enough energy has been generated to raise the reactor's temperature and pressure.

The latest incident suggests that the plant's seemingly stable situation could be fragile, even almost eight months after the crisis erupted. The world's worst nuclear crisis in 25 years resulted in the meltdown of nuclear fuel in the Nos. 1 to 3 reactors at the Fukushima complex.

It may also affect the government and TEPCO's plans to achieve a state of cold shutdown by the end of the year, although TEPCO spokesman Junichi Matsumoto said his company does not expect a major impact on the progress so far.

Possible evidence of a recent nuclear fission was found when gas was extracted from the No. 2 reactor's primary containment vessel to check the radiation level on Tuesday.

TEPCO said it has found two types of radioactive xenon that are typically generated by nuclear fission and have relatively short so-called half-lives.

The two are xenon-133 and xenon-135, and as their radioactivity is reduced to about half in about five days and nine hours, respectively, their existence suggests that a nuclear fission took place recently, according to Matsumoto.

But TEPCO added that it needs confirmation and has asked the Japan Atomic Energy Agency for further analysis.

Even if the substances are confirmed, TEPCO believes that their density levels are quite low.

Water injection to keep the No. 2 reactor cool is continuing, and the government's Nuclear and Industrial Safety Agency said the overall situation is "stable."

(Mainichi n) November 2, 2011

TEPCO: Reactor may have gone critical

The operator of the crippled Fukushima Daiichi nuclear power plant says it found in the facility's No.2 reactor radioactive substances that could have resulted from continuous nuclear fission.

The Tokyo Electric Power Company, or TEPCO, said on Wednesday that it detected xenon-133 and xenon-135 in gas taken from the reactor's containment vessel on the previous day. The substances were reportedly in concentrations of 6 to more than 10 parts per million becquerels per cubic centimeter.

Xenon-135 was also detected in gas samples collected on Wednesday.

Radioactive xenon is produced during nuclear fission.

The half-life of xenon-133 is 5 days, and that of xenon-135 is 9 hours.

TEPCO says the findings suggest that nuclear fission may have occurred recently, not just after the March 11th accident, and that a state of criticality could have occurred temporarily in some areas.

TEPCO workers poured a boric acid solution into the reactor on Wednesday to suppress nuclear fission.

The utility says it has not found any significant change in temperature and pressure of the reactor, and that large-scale criticality did not occur.

TEPCO says the reactor's cooling process is continuing and that the firm expects to achieve cold shutdown at the plant this year as planned. But the utility also says it wants to take a close look at the situation of the plant's No.1 and 3 reactors.

Wednesday, November 02, 2011 20:37 +0900 (JST)

Nuke watchdog says fresh meltdown unlikely

Japan's nuclear watchdog says it believes another meltdown at the Fukushima Daiichi nuclear power plant is unlikely, but will continue to monitor the situation closely.

The Nuclear and Industrial Safety Agency held a news conference on Wednesday, after radioactive xenon was detected in the containment vessel of the No.2 reactor. The presence of the substance indicates that nuclear fission may have briefly resumed.

The safety agency says it is unlikely that nuclear fuel has begun melting again, as the density of xenon is low and there has been no change in the reactor's temperatures.

The agency also says it will closely monitor if xenon continues to be detected after Tokyo Electric Power Company poured boric acid solution into the reactor to suppress nuclear fission.

It added that it cannot yet say how the latest development will affect the government's plan to achieve a cold shutdown of the disabled reactors by the end of the year.

Senior official Yoshinori Moriyama said it is difficult to determine the amount of nuclear fuel remaining in the containment vessel of the No.2 reactor. He said his agency will assess the situation and judge if it is still possible to stably lower temperatures in the reactor and containment vessel.

Genkai nuclear reactor restarts after 1 month hiatus

SAGA (Kyodo) -- Kyushu Electric Power Co. resumed operation of a nuclear reactor at its Genkai power plant late Tuesday that came to a halt as a result of human error nearly a month ago, after securing approval from local municipal leaders, company officials said.

The Fukuoka-based utility reactivated the No. 4 reactor at the plant in the town of Genkai, Saga Prefecture, at around 11 p.m. Tuesday, despite opposition among some local residents, with an eye to resuming power generation Wednesday afternoon.

It is the first time since the start of the nuclear crisis at the Fukushima Daiichi power plant in March that a utility has reactivated a nuclear reactor that went offline due to a technical problem.

While public concern over nuclear safety remains heightened following the Fukushima crisis, Saga Gov. Yasushi Furukawa and Genkai Mayor Hideo Kishimoto approved the utility's plan to restart the reactor.

"If the state made the judgment after a full examination, we'll accept it," Furukawa told reporters.

Kishimoto also suggested he approved the restart after hearing an explanation from Kyushu Electric Executive Vice President Haruyoshi Yamamoto. Kishimoto said the nuclear safety agency's positive assessment had encouraged him to approve the move.

Kyushu Electric said Monday it would resume operation of the reactor within a few days as the Nuclear and Industrial Safety Agency rated the utility's report on the cause of the error and error-prevention measures as "basically appropriate."

But some local residents remain opposed to the utility restarting the reactor. Kyushu Electric had received around 200 phone calls expressing opposition by late afternoon Tuesday, with one person saying he has lost trust in the utility following its attempt to manipulate public opinion regarding nuclear power.

The No. 4 reactor automatically shut down on Oct. 4 as an abnormality in its steam condenser emerged after repairs had been carried out based on a faulty manual.

Industry minister Yukio Edano, who oversees the nuclear safety agency, said in Tokyo on Tuesday that the government would leave Kyushu Electric to decide whether to restart the reactor, while encouraging the utility to fully consult with local residents before making a final decision.

The government requires nuclear reactors halted for regular checks to pass so-called stress tests before they are allowed to resume operation. But Edano said the No. 4 reactor at the Genkai plant was halted due to human error and was not subject to the stress tests.

Kyushu Electric said Monday it planned to reactivate the No. 4 reactor once preparations were completed and that the reactor will be halted for regular checks in December as previously planned.

The utility's chairman Shingo Matsuo was eager to restart the reactor as soon as possible, saying in Miyazaki Prefecture, "We believe that we have obtained local understanding."

Areas to be well-prepared for nuclear accidents to be expanded

TOKYO (Kyodo) -- A working group under the government's nuclear safety panel decided Tuesday to expand priority areas that should be prepared for possible nuclear accidents to a 30-kilometer radius of a nuclear power plant from the current 8 to 10 km.

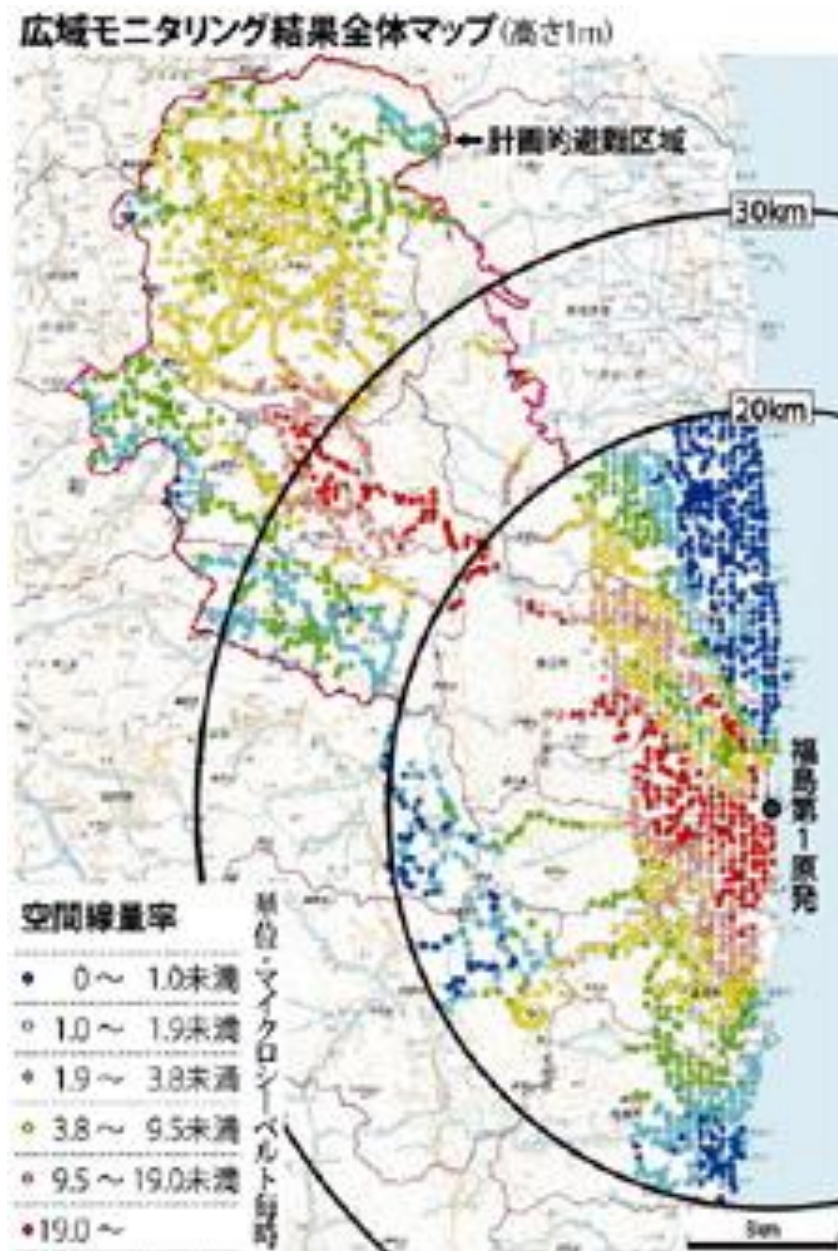

The group is reviewing areas where enhanced disaster-prevention measures should be taken, after the nuclear crisis at the Fukushima Daiichi nuclear power plant led the government to set a 20-km radius of the plant as a no-entry zone and advised people living in areas outside the zone where high radiation dose had been detected to evacuate.

But the move is expected to increase expenses to implement disaster-prevention measures nationwide, suggesting the heavy burden required to operate nuclear power plants in the country.

Under the plan, the government would replace the current Emergency Planning Zone with two types of zones, including one called a Precautionary Action Zone which would cover a 5-km radius of a nuclear power plant and would require residents to immediately evacuate in the event of a rapidly developing nuclear accident.

The other one is called an Urgent Protective Action Planning Zone, which would cover a 30-km radius and would be asked to be prepared for evacuation depending on the situation. The areas should also be prepared to check the radiation level swiftly by setting up monitoring posts.

As the Fukushima crisis resulted in the release of radioactive substances beyond the 30-km radius, the plan also cited the need to designate another area where people may be asked to stay indoors or ingest stable iodine to prevent radioactive iodine from accumulating in the thyroid and increasing the risk of thyroid cancer.

A government map displaying radiation levels in the area around the Fukushima No. 1 Nuclear Power Plant.

The zone is called a Plume Protection Planning Area and should cover a 50-km radius from the plant, the plan said.

The proposed expansion to a 30-km range means that heavily populated prefectural capitals such as Mito, Kyoto and Kagoshima would be included, while the total population of cities, towns and villages involved under the new guideline, including the plume protection area, would stand at nearly 20 million.

The nuclear crisis at the plant operated by Tokyo Electric Power Co. was triggered by the devastating March 11 earthquake and ensuing tsunami, and resulted in the nuclear fuel meltdown at the Nos. 1 to 3 reactors.

(Mainichi Japan) November 2, 2011

Nuclear safety body used inspection criteria drafted by nuclear fuel firm

The only legally mandated, independent nuclear industry inspection body in Japan copied nuclear fuel inspection criteria directly from documents provided by the company making the fuel, the Mainichi has discovered.

The documents, obtained by the Mainichi through repeated official information requests, show that the Japan Nuclear Energy Safety Organization (JNES) copied an inspection manual verbatim from materials it ordered Global Nuclear Fuel Japan Co. to create. Global Nuclear Fuel is one of the firms subject to JNES checks.

The legally mandated JNES inspections are based on official manuals which include a list of inspection procedures and pass criteria. The Mainichi obtained the manual for a check of nuclear fuel scheduled for delivery to Higashidori nuclear plant in Aomori Prefecture. The Mainichi also obtained a draft inspection procedure document -- listing inspection goals, items, methods for sampling fuel lots, and fuel rod measurements -- created by the fuel shipment's maker, Global Nuclear Fuel.

Except for the cover and first page, the JNES manual and the Global Nuclear Fuel document were identical, even down to the page format and font.

JNES deputy head of inspections Masaharu Kudo had previously told the Mainichi that "we do receive data (from Global Nuclear Fuel), but of course we don't use it as-is. The JNES checks the data and produces its own manual as well."

After the Mainichi compared the JNES manual and the Global Nuclear Fuel document -- finally obtained after two official information requests -- Kudo admitted the documents were the same, but denied there was any problem with the practice, saying the JNES and the nuclear fuel firm "consult with each other in drawing up the inspection procedures, so of course the draft and the manual will be identical.

"The JNES would have no access to the necessary data without the nuclear fuel maker, so we ask them to cooperate," Kudo continued. "It wouldn't be impossible for the JNES to draw up the manuals independently, but if we tried we'd be at it all day."

According to the safety organization, it received the Global Nuclear Fuel draft inspection procedures in electronic form in September 2008, and on Dec. 18 the same year JNES staff inspected fuel that was to be shipped to the Higashidori nuclear plant using a manual copied directly from the Global Nuclear Fuel document.

Furthermore, JNES staff noticed later that the minimum fuel rod length already reported to the government was 3 to 5 centimeters longer than the value listed in both the inspection manual and the Global Nuclear Fuel draft procedures. JNES staff had not in fact looked at the manual, but compared the rods to another Global Nuclear Fuel document to confirm the rods were the proper length before issuing a passing grade for the shipment.

The error in the manual was found in February 2009, just before the JNES reported to the government that the fuel had passed inspection. After an internal investigation, the JNES discovered it had made the same mistake three times when checking Global Nuclear Fuel products. The organization had already certified all three shipments.

"The nuclear fuel firm also carries out internal checks, so there's no problem with asking them to draw up draft inspection procedures for their own products," Kudo said. "If we found any mistakes in the drafts, we corrected them."

Shortcomings in nuclear safety assessment found

The organization in charge of assessing the safety of Japan's nuclear plants has **admitted it allowed nuclear fuel rods to pass quality checks using a faulty manual.** [\[read above!!\]](#)

The manual was borrowed from the Japanese manufacturer of the rods.

The Japan Nuclear Energy Safety Organization conducted the checks in 2008 on 4 sets of fuel rods for reactors.

The government-backed organization says it approved 3 of the 4 sets even though the manual said the rods were 3 to 5 centimeters shorter than the actual length of 4 meters.

It says the examiners failed to notice the mistakes as they did not closely check the manual beforehand.

Industry watchdog, the Nuclear and Industrial Safety Agency, says it will order the organization to correct these shortcomings and improve its screening procedures.

Sloppy inspection procedures threaten Japan's nuclear safety regulations

The stunning revelations that the Japan Nuclear Energy Safety Organization (JNES) under the jurisdiction of the government's Nuclear and Industrial Safety Agency (NISA) prepared inspection procedures for nuclear facilities after copying everything off draft inspection procedures worked out by a nuclear fuel company have called into question the country's atomic safety regulations.

Sloppy inspection procedures worked out by the government-affiliated body were revealed at a time when Japan is struggling to ensure nuclear safety in the wake of the outbreak of a crisis at the Fukushima No. 1 Nuclear Power Plant and is trying to step up measures to check the safety of nuclear power plants. In line with strict inspections carried out in the United States, Japan needs to vastly improve its procedures to inspect nuclear power plants.

Yoshihiro Nishiwaki, a visiting professor at the graduate school of the University of Tokyo, was stunned by the revelations and said, "Inspections are carried out by the government itself, and therefore they should make painstaking efforts to determine the content of inspections on their own." While working for the then-Ministry of International Trade and Industry (MITI), he was assigned to the U.S. Nuclear Regulatory Commission (NRC) from September 1991 to June 1993. He spent about six months inspecting nuclear reactors in Atlanta, Georgia. There he realized differences between the two countries in terms of methods and ideas of inspecting nuclear reactors.

NRC inspectors decide on when and what they plan to inspect on their own and conduct inspections without advance notice in principle. Connecting their own computers with the local area network (LAN) at a nuclear facility, they even check e-mails exchanged between facility workers and subcontractors. If necessary, they bring in inspection equipment to check to see if devices at the facility have deteriorated. That's because nuclear plant operators could present only self-serving documents. "I was impressed with the attitudes taken by inspectors to check master inspection procedures on their own and try to uncover problems and illegal practices at nuclear facilities," Nishiwaki said.

Before compiling inspection reports, inspectors hold heated debate with plant operators on key points. In most cases, arguments presented by inspectors are accepted, but the details of such debate are released to the public and inspection reports are written in plain words.

In Japan, on the other hand, plant operators carry out inspections first and then inspectors check to see if the examinations are sound by using almost the same techniques as those used by the plant operators. Therefore, JNES says, "there is no problem even if we prepare inspection procedures in accordance with the draft steps prepared by the plant operator." The timing of inspections is notified to plant operators in advance, and on the first day of inspections, hordes of workers from power companies and plant makers come out and greet the inspectors.

Since 2003, Japanese inspectors have been conducting "snap" inspections. But they only inspect areas they had not notified of in advance during the inspection period.

In the United States, there are strict rules governing inspectors' dealings with plant operators. Inspectors are not allowed to eat with plant operators even if they pay for their own bill. In Japan,

however, it is not rare for inspectors to eat together with operators at the facility prior to inspections even though they pay for their own meals.

While working for MITI, Nishiwaki observed trouble in which some devices were not operating properly during inspections of a nuclear power plant. "When we asked them to show us maintenance records, a worker said to us, 'We will have them operational for sure. Please have sushi or something with our executives until then.' But I turned that down." Nishiwaki added, "The idea that inspectors simply check what operators have inspected leads to the creation of an atmosphere that 'it is sufficient just to have documents sorted out and ready and maintain equipment properly just during their visit.'"

Schoolgirl in Fukushima exposed to high level of radiation in September

FUKUSHIMA -- A young girl was found to have been exposed to 1.7 millisieverts of radiation in September due to the ongoing nuclear crisis at the Fukushima No. 1 nuclear power plant, city authorities have revealed.

The Fukushima Municipal Government announced on Nov. 1 that a third-year elementary school girl in the city was exposed to the high level of radiation in September alone, with her three brothers also having been exposed to 1.4 to 1.6 millisieverts of radiation in the same month. Their residence was located close to a highly-radioactive spot, and the family has since moved outside Fukushima Prefecture.

"The radiation level would not affect their health," a city official said.

The result came after the city distributed personal dosimeters, called "glass badges," to 36,989 residents, including pregnant women and children.

The city has collected the individual dosimeters from 36,478 residents for analysis and found that 99 percent of them had been exposed to no more than 0.3 millisieverts of radiation in September. Apart from the four children, no other residents in the area were found to have been exposed to over 1 millisievert of radiation.

Editorial: Closer monitoring and more explanation of Fukushima reactors needed

This Sept. 29, 2011 photo released by Tokyo Electric Power Co. shows the No. 2 reactor building of the crippled Fukushima Dai-ichi nuclear power plant in Okuma town, Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

The government and Tokyo Electric Power Co., the operator of the tsunami-hit Fukushima No. 1 Nuclear Power Plant, should step up their monitoring of the plant's reactors to check whether nuclear fission is occurring and provide good explanations of the situation in the reactors to the public.

Xenon was detected in the containment vessel of the plant's No. 2 reactor, and the finding was confirmed by the semi-governmental Japan Atomic Energy Agency.

Xenon is a radioactive substance with a short half-life generated in the process of nuclear fission of uranium, a nuclear plant fuel. The finding suggests that nuclear fission is occurring in the reactor, and it was initially feared that the reactor temporarily reached criticality -- a chain of nuclear fission reactions.

Small-scale criticality temporarily occurring in a reactor would not mean that the reactor is in a dangerous situation. Criticality can be sustained only if certain conditions, such as the right ratio of water and fuel inside the reactor, are met.

Still, we mustn't let down our guard. The government and TEPCO need to find out why the fission has occurred and take appropriate responses. TEPCO has injected boric acid into the No. 2 reactor to prevent it from reaching criticality, but more may need to be done.

Even if the reactor is not in a dangerous condition, the possibility that it might reach criticality has surely caused anxiety to the public. It is important for TEPCO and the government's Nuclear and Industrial Safety Agency (NISA) to clearly explain the condition of the reactors and the implications of the discovery of xenon.

The xenon was detected from gas inside the reactor's containment vessel using a containment vessel gas management system that began operations in late October. It was the first time that such a measurement was conducted, and at least one expert says it would be no surprise if nuclear fission has been occurring since well before these latest findings.

The gas inside the containment vessels of the Fukushima plant's No. 1 and 3 reactors has not yet been analyzed. The government and TEPCO should carry out similar examinations of the inside of their containment vessels as soon as possible to check for nuclear fission occurring in them.

More than these individual measurements, however, what is needed is a system that constantly monitors the conditions of all the nuclear reactors at the plant. Officials should consider equipment that can detect neutrons, as they can be used as a direct indicator of whether criticality has occurred.

The government and TEPCO have announced their intention to bring forward the timing of achieving a so-called "cold shutdown" of the crippled reactors in their roadmap to bringing the nuclear plant under control. They define a cold shutdown as a situation in which the temperature inside the pressure vessels of the reactors are kept sufficiently low and the emissions of radioactive substances are under control.

However, the discovery of xenon in the No. 2 reactor's containment vessel suggests nuclear fission is occurring even though the temperature at the bottom of the pressure vessel is thought to be below 100 degrees Celsius. It raises questions as to whether such a reactor can be considered stable, even if it is under that temperature threshold.

The conditions and locations of melted fuel in the plant's No. 1 to 3 reactors as well as the details of the damage to the reactors remain unclear, and after this most recent finding, the government and TEPCO must step up their monitoring.

Xenon at Fukushima not result of 'critical' nuclear reactions: TEPCO

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Thursday the detection of radioactive xenon at its stricken Fukushima Daiichi power plant, indicating recent nuclear fission, was not the result of a sustained nuclear chain reaction known as a criticality, as feared, but a case of "spontaneous" fission.

"It is not leading to instability of the reactor or a rise of the radiation level outside," the utility known as TEPCO said, adding that it does not expect the incident to impact its goal of attaining a stable condition of the plant's troubled reactors called cold shutdown.

The plant operator said it has judged that spontaneous fission, which it says occurs at a constant rate, has generated xenon-133 and xenon-135 at its crisis-hit No. 2 reactor, as a criticality would have resulted in the recording of concentration levels 10,000 times higher.

The data at hand match estimated levels of xenon produced by sporadic fission of curium-242 and curium-244 inside melted fuel, it said.

It also cited as evidence supporting its view the detection of xenon even after it poured boric-acid solution to absorb neutrons necessary for a fission reaction, and a lack of abnormal rises in the reactor's temperature or pressure.

Xenon, which was found Tuesday from gas collected from the No. 2 reactor's primary containment vessel, is believed to have leaked out of the fuel's cladding tubes due to their meltdown, it said, adding that it plans to continuously monitor gas inside the furnace.

The nuclear crisis at the plant, the world's worst in 25 years, erupted in the wake of the March 11 earthquake and tsunami, and resulted in the meltdown of nuclear fuel in the six-reactor power complex's Nos. 1 to 3 reactors.

When it revealed Wednesday that it had detected xenon at the No. 2 reactor, it touched on the possibility that melted fuel inside the reactor may have temporarily gone critical.

Forgotten radioactive materials cropping up in wake of Fukushima nuclear crisis

Workers examine soil near a supermarket in Setagaya, Tokyo, where a high level of radiation was detected, in this picture taken in on Nov. 1. (Mainichi)

Residents wary about radiation in the wake of the ongoing the crisis at the Fukushima No. 1 Nuclear Power Plant have been **uncovering abandoned radioactive substances, with repeated discoveries of radium-266 in Tokyo's Setagaya Ward.**

Radioactive materials were used widely in the past, including in medical products and luminous paints. After World War II, a law requiring people to obtain the government's permission when using such materials was put into effect, but the law was not always strictly abided by. Now, with many residents armed with dosimeters in the wake of the Fukushima crisis, it is possible that more radioactive materials may be uncovered.

On Oct. 3, a resident with a dosimeter in Tokyo's Setagaya Ward reported a high level of radiation in an area of the ward to ward officials. When the Ministry of Education, Culture, Sports, Science and Technology and other parties investigated, dozens of glass bottles containing radium-266 were found

under the floor of a home in the ward. In Tokyo's Shinjuku Ward, meanwhile, a former junior high school teacher told school officials that radioactive substances had probably been left at the school, and a small amount of uranyl sulfate was found.

Radium, which is found in nature, was the most widely used radioactive substance in Japan. From before the war, it was **used in luminous paint to make watches and measuring equipment glow, and it was also used in radium needles which were inserted into the body on the grounds that they could treat cancer.**

However, in 1958, after the harmful effects of radium were uncovered, regulations including the law on prevention of radiation hazards from radioisotopes required people to report the use of such substances to the government, or get permission to use them, depending on the condition of the radioactive material. However, there were repeated cases in which people continued to possess radioactive substances without getting permission, with the materials being left untouched when their owners died.

"In some cases people stored them away carefully, saying they were family treasures. It remained a fact that the law hadn't seeped in," said Yoshihide Nakamura, an official from the Japan Radioisotope Association.

Nakamura said the association launched a campaign around the period from 1965 to 1974 -- conducted at the request of the former Science and Technology Agency -- to have people report unused radioactive substances. This led to many discoveries of radium.

In spite of the campaign, however, not all radium could be collected. In 2000, illegally dumped radium needles were uncovered at a scrap-processing factory in Kobe.

Other radioactive substances have been used at universities and other research organizations without the government's permission. In 2004, more than 1,000 bottles of waste fluid containing tritium and other substances that were used in previous experiments at Tokushima University were uncovered. Several similar findings have been made over the past few years. In 2005 and between 2009 and 2010, the Ministry of Education, Culture, Sports, Science and Technology asked about 3,000 universities and organizations that handled radioactive substances to conduct inspections. In the second investigation, 60 institutions reported 201 discoveries of such substances.

"There are a lot of old substances, such as those that university professors purchased overseas and left behind when they retired without others realizing," said Takao Nakaya, head of the Radiation Regulation Office of the Ministry of Education, Culture, Sports, Science and Technology. The government now requires reports to be filed every year to prevent other cases of materials being left undetected.

Since gamma rays are easily released from radium, residents with dosimeters could find more abandoned radium. But Nakamura says people shouldn't overreact.

"If such substances are found, people shouldn't overreact. That could lead to the people who discover radioactive substances finding it more difficult to speak out about their discoveries," he said.

Broken bottle of radium caused Tokyo supermarket hot spot: science ministry

A broken glass bottle containing a lump of radium found buried near a supermarket in Tokyo's Setagaya Ward on Nov. 1. (Photo courtesy of the Ministry of Education, Culture, Sports, Science and Technology)

The mystery of where the radioactive material discovered by a supermarket in Tokyo's Setagaya Ward came from may have been cracked with the Nov. 2 discovery of a buried chemical reagent bottle.

Abnormally high levels of radiation were detected Oct. 28 on the property of a Power Larks supermarket during radiation checks spurred by a local resident's warning. It was determined that the hot spot was not connected to the Fukushima nuclear plant, as radium was not one of the elements released in the disaster.

Work by the Ministry of Education, Culture, Sports, Science and Technology and other authorities to clear the hot spot and determine its cause has been ongoing for several days, resulting in the Nov. 2 find of the broken 500-milliliter bottle containing a mass of dark red-brown material believed to be radium-226.

After digging out the soil around where the bottle had been, radiation at the site dropped from 40 millisieverts per hour to 25 microsieverts per hour, leading the science ministry to conclude that radium in the bottle was indeed behind the hot spot.

Even after the bottle and surrounding soil were removed, however, a sweep of the supermarket property found 12 places both in- and outside the building emitting relatively high radiation of between 0.2 and 12 microsieverts per hour. Furthermore, there were three spots on the roads bordering the property which registered radiation doses of 0.3 to 2 microsieverts per hour. Airborne radiation around the supermarket hovered around 0.1 microsieverts per hour.

The science ministry and other authorities have said they will continue their examination of the area.

Chiba gov't: Cement company discharged water far over radiation limit into Tokyo Bay

CHIBA -- Radioactive cesium far in excess of a provisional legal limit was found in drainage water that a cement company discharged into Tokyo Bay, the Chiba Prefectural Government has announced.

According to the prefectural government, water that Ichihara Eco Cement discharged into the bay contained 1,054 to 1,103 becquerels of cesium per kilogram of the water, 14 to 15 times the provisional upper limit that the central government has set.

The company discharged an average of 300 tons of water per day, making an estimated total of around 13,200 metric tons for September to October alone. It continued the discharging until stopping on Nov. 2.

The prefectural government has begun investigating the seawater to check contamination levels.

Businesses are not legally required to measure or report the amount of radioactive substances they discharge, but on Oct. 28, the cement company reported to the prefectural government that it had found 1,103 becquerels of radioactive cesium per kilogram of its waste water on Sept. 15 and 1,054 becquerels on Oct. 11, prefectural government officials said.

Ichihara Eco Cement accepts more than 30,000 tons of refuse incineration ash generated in Chiba Prefecture a year and processes it into cement. With operations offline for the foreseeable future, it is feared that the incident could adversely affect local bodies' garbage incineration work.

The prefectural government asked the company to stop discharging water into the bay on two occasions because the levels far exceeded the provisional upper limit.

As to why it continued to discharge the water into the bay even after finding high radiation levels, an Ichihara Eco Cement official said, "We could not judge whether to stop because there are no clear legal standards, and we could not refuse incinerated ash coming from local bodies because it had nowhere else to go. We will follow instructions from the authorities and do our best to respond to the situation."

Minor criticality suspected at Fukushima plant's No. 2 reactor

The Yomiuri Shimbun

A small-scale criticality incident--in which nuclear fuel achieves a fission chain reaction--may have taken place at the No. 2 reactor of the crippled Fukushima No. 1 nuclear power plant, as small amounts of radioactive xenon were detected, the plant operator, Tokyo Electric Power Co., said Wednesday.

TEPCO injected boric acid into the reactor, as boric acid is effective in suspending nuclear fission reactions by absorbing neutrons.

There have been no significant temperature fluctuations in the reactor and radiation levels in and around the unit have not shown major changes, according to TEPCO.

Xenon 133 and xenon 135 are radioactive substances generated when nuclear fission reactions take place.

The substances were found Tuesday in gas from the reactor containment vessel, Junichi Matsumoto, acting director of TEPCO's Nuclear Power and Plant Siting Division, said at a press conference.

Xenon 133 has a half-life of about five days, while xenon 135's is about nine hours. Because the two substances have very short half-lives, a small-scale fission reaction is likely to have taken place within the reactor, he said.

"As the reactor's cooling is progressing, this finding will not have a major impact on the situation," Matsumoto said.

However, TEPCO and the government are likely to be forced to make careful decisions as they try to bring the reactors to a stable state of cold shutdown within the year, observers said.

"We don't believe criticality has been maintained," Matsumoto said.

TEPCO suspects a nuclear fission chain reaction took place caused by existing neutrons within the reactor or that very local criticality took place as the water temperature in the reactor decreased and water density increased, due to the recent increase of water injection.

At the No. 2 reactor, TEPCO activated in late October a gas management system to remove radioactive substances contained in the gas within the containment vessel with filters. The two types of xenon were detected in the gas.

The amounts detected were about one-100,000th becquerel per cubic centimeter for both types.

Since the amounts of the two substances are extremely small, TEPCO plans to ask the Japan Atomic Energy Agency for another round of checks.

Cooling of the No. 2 reactor had been delayed among the Nos. 1-3 reactors at the Fukushima No. 1 plant. The amount of water injected was increased on Sept. 14.

(Nov. 3, 2011)

TEPCO retracts criticality call

The operator of the Fukushima nuclear power plant has retracted an earlier assessment that a continuous nuclear reaction, or a criticality, could have taken place in the damaged Number 2 reactor.

The Tokyo Electric Power Company, or TEPCO, said on Thursday that the small amount of xenon-135 it detected in gas taken from the reactor's containment vessel was the result of the spontaneous nuclear fission of radioactive curium-242 and -244. The two substances are contained in nuclear fuel.

The amount of xenon-135 detected almost matched the amount that would have been produced if the radioactive curium in the fuel had undergone spontaneous fission.

TEPCO says a criticality event would have resulted in higher levels of xenon concentration.

Spontaneous fission refers to the nuclear fission of radioactive materials other than uranium, and it does not lead to criticality. Such fission is said to occur constantly.

The earlier detection of small amounts of Xenon-135 had suggested the possibility of a criticality occurrence in the melted fuel in the damaged reactor.

TEPCO says it will send the assessment to the Nuclear and Industrial Safety Agency for reevaluation.

Thursday, November 03, 2011 15:20 +0900 (JST)

Emergency zones planned for future N-crises / Drawing on lessons of Fukushima Pref. disaster, preparations to be made up to 50 km from plants

The Yomiuri Shimbun

New disaster management zones

A panel of the Cabinet Office's Nuclear Safety Commission has agreed to set up new nuclear disaster management zones by tripling the radius of the present standard emergency zone to 30 kilometers around the nation's nuclear power plants.

In a draft of its report, which the panel basically agreed upon, a key disaster management zone with a current radius of eight to 10 kilometers will be expanded to a zone with a 30-kilometer radius to be called the urgent protective action planning zone (UPZ).

In the UPZ, evacuation plans and other measures will be implemented if an accident occurs at a nuclear power plant.

Within the UPZ, a five-kilometer radius will be designated as the precautionary action zone (PAZ), from which residents should immediately evacuate in the event of a nuclear accident.

Outside the UPZ, a zone called the plume protection planning area (PPA) will be set up. In this zone, with a radius of about 50 kilometers, people will be instructed to stay indoors or will be provided with iodine pills in such an emergency.

Around the nation, the number of municipalities located partially or fully within the emergency zones will increase from the current 45 to 135 if the UPZs are established. Among prefectural capitals, the whole of Mito and part of Kyoto will be included.

The review is part of the commission's revisions of disaster management guidelines. The commission will compile an interim report about the guideline revisions by the end of this fiscal year.

A nuclear safety agency, which will take over the commission's duties next fiscal year, will implement the guideline revision. The municipal governments to be affected will include the new zoning in their respective disaster management plans under a basic law on disaster management.

Lessons from the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in Fukushima Prefecture are behind the expansion of the disaster management zone.

In a previous version of the draft of the report, the area within a 50-kilometer radius was regarded as a single zone in which preparation for such an emergency would be necessary.

But the latest draft designates the area within a 30-kilometer radius as such a zone and considers areas beyond 30 kilometers as a separate zone, to indicate a difference in the seriousness of measures to be taken.

The new zone system will cover three times as many municipal governments and four times as large a population as the current system.

The local governments will also begin reviewing their respective disaster response plans for such purposes as securing evacuation places.

Drafting evacuation plans and other measures requires close collaboration with nearby local governments. Thus there will be many hurdles to clear.

Haruki Madarame, chairman of the Nuclear Safety Commission, said, "Though it isn't perfect, [the draft of the report] was compiled in a proper form," after he approved the the panel's decision to expand the emergency planning zone (EPZ) on Tuesday.

The planned expansion is based on developments of the Fukushima No. 1 plant crisis, in which the radius of the evacuation zone was expanded repeatedly--from three kilometers to 10 kilometers to 20 kilometers.

As a result, residents in the expanded zone were thrown into confusion.

The changes also include new guidelines over whether evacuation will be necessary.

Until the Fukushima crisis, the government designated evacuation areas with data from sources such as the System for Prediction of Environmental Emergency Dose Information (SPEEDI).

After the revision, the government will be able to order an evacuation if monitored radiation levels inside the UPZ reach a predesignated limit.

The zoning is in line with a 2002 proposal by the International Atomic Energy Agency. Though the commission once discussed a review of the nation's zoning in 2006, the revision was not made.

The current review plan took into account the fact that an airborne plume of radioactive substances reached points 50 kilometers from the Fukushima No. 1 nuclear plant.

Thus the panel initially planned to designate areas between 30 and 50 kilometers from nuclear power plants as a third category of disaster management zone in which local governments will distribute iodine pills to deal with internal exposure to radiation and compile plans to have people stay indoors.

But many members of the panel criticized the measure, saying that the difference between the third-category zones and the UPZ is unclear. Thus the commission decided to designate the places as "areas" instead of "zones" to help clarify the drawing of borders.

The commission will begin discussing radiation levels at which the guidelines will call for people to be evacuated or instructed to stay indoors.

The IAEA has presented standards calling for residents to evacuate within a week if the radiation level reaches 100 microsieverts per hour and within a few hours if the level reaches 1 millisievert per hour. The commission plans to use the figures as references.

The work to revise the guidelines, including the expansion of the EPZ to a 30-kilometer radius, will be finished in or after next fiscal year.

After that, the municipal governments will revise their respective disaster prevention plans.

The local governments will need to upgrade or acquire radiation monitoring devices, but it is uncertain how they will secure funds for this purpose.

(Nov. 3, 2011)

No room for administrative 'sectionalism' in dealing with nuclear disaster

Internal exposure and external exposure to radiation are technically two different things, but to those who are under threat of radiation exposure, there's no significant difference; they're on the receiving end of both. There's no distinction between "internal" or "external" when it comes to fears for one's well-being.

Last week, the Food Safety Commission (FSC) submitted a recommendation to Health, Labor and Welfare Minister Yoko Komiyama suggesting a maximum 100-millisievert cumulative lifetime internal exposure to radiation through food.

Though the commission had initially incorporated both internal and external exposure in its calculations, it ultimately did an about-turn, merely addressing the risks from food -- its stated field of expertise -- in its final report. As for external exposure, the commission stated that "the issue should be dealt with by the appropriate agency."

The public, however, is urgently seeking a yardstick by which to measure the overall risks that we face.

I fully understand that it's a huge challenge to offer such information. But by now, no one believes that food issues should be tackled by the Ministry of Health, Labor and Welfare (MHLW) while the Ministry of Education, Culture, Sports, Science and Technology (MEXT) takes up the problem of external exposure.

Since the crisis at the Fukushima No. 1 Nuclear Power Plant began, the "vertical sectionalism" that has prevented collaboration among various agencies and ministries has been highly criticized. Needless to say, to bring together those various organizations and respond organically to the unfolding disaster takes political strength and fortitude.

When I think about this sort of sectionalism, I'm reminded of the Kanemi oil poisoning incident that wreaked havoc in western Japan. The death of a massive number of fowl in the spring of 1968 had prompted an official from the Ministry of Agriculture and Forestry -- which oversaw poultry farming -- to investigate the factory where the deaths originated. The official, however, failed to look into the cooking oil that the same factory produced, and made no attempts to advise the Ministry of Health and Welfare -- which oversaw food products -- to pursue the matter. That fall, countless people fell ill through dioxin-contaminated cooking oil that had been produced at the very factory.

Had the agriculture ministry official stuck their nose into the health ministry's "business" and worked together, it's likely that many of the deaths and negative health effects could have been prevented.

There's another case in Japan's past that makes the calls for swift measures in response to the current nuclear crisis all the more compelling.

Minamata disease, considered one of Japan's first pollution-related epidemics, was "officially" discovered in 1956. Three and a half years later, the Ministry of Health and Welfare's Food Poisoning Subcommittee released a report pointing to "some kind of organic mercurial compound" as the culprit. The Ministry of International Trade and Industry (MITI), however, argued that it was "too soon to conclude that the chemicals came from the factory."

In 1968, when environmental and health problems across Japan were making headlines, Minamata disease was finally recognized as a pollution-caused illness. It was not until 1971 that it was determined that vertical sectionalism rampant at the time would not lead to a resolution and the Environment Agency was established, comprising officials from various government agencies and ministries. By then, over 15 years had passed since the disease was first identified.

In the film "Ikiru" (To Live), directed by Akira Kurosawa, residents petitioning the city to build a park for their children are bounced around by various public agencies that all claim to lack the authority to handle the matter. It's a portrayal of Japanese bureaucracy in the 1950s, and I want to believe that our country will not take the same tack today. (By Kenji Tamaki, Expert Senior Writer)

Halt of crop farming in Fukushima forces manure to accumulate on cattle farms

At his cattle farm, Kazunori Mizunoya looks at a cow knee deep in its own excrement in the Fukushima Prefecture village of Nakajima on Oct. 20. (Mainichi)

FUKUSHIMA -- Two months after a government ban on beef was lifted, cattle farmers here are growing increasingly desperate as nearby vegetable farmers have halted production due to the ongoing nuclear disaster, **leaving nowhere to take the accumulating manure that was previously used as fertilizer.**

"When vegetable farmers are pushed into a dead end, there's a domino effect that puts us into dire straits, too," says 51-year-old Kazunori Mizunoya, a cattle farmer raising some 600 cows in Nakajima, a village located 70 kilometers from the troubled nuclear power station.

Not only is the fertilizer shed overflowing with manure, the cows in the barn stand in their own excrement nearly 70 centimeters deep. They sometimes shake their massive bodies as if they're trying to wiggle free.

Cows like to be clean, and suffer high stress levels and illness when kept in unhygienic conditions. Indeed, almost half the cows in Mizunoya's barn are experiencing deteriorating health.

The area where Mizunoya raises his cattle is home to farms that raised broccoli, tomato and cucumber. Cattle farmers provided vegetable farmers with manure to be used as fertilizer, and in return, vegetable farmers provided cattle farmers with rice straw to be used as cow feed. Mizunoya had built such reciprocal relationships with 10 vegetable farms nearby, supplying them with 1,500 tons of fertilizer every year, which was used on a total of 30 hectares of farmland every year in March and July.

The nuclear disaster triggered by the March 11 earthquake and tsunami interrupted that cycle, however. **Many vegetable farms were forced to forgo planting in the spring, and continued radiation fears prevented many of the farmers from planting summer vegetables as well.** This year, none of the farms used fertilizer from Mizunoya's farm in the spring, and only two of the 10 farms did so in the summer.

The Ministry of Agriculture, Forestry and Fisheries (MAFF) has set the maximum allowable radiation levels for fertilizer at 400 becquerels per kilogram. Since September, the Fukushima Prefecture Government has been running tests at the approximately 3,400 farms in the prefecture raising beef cattle and dairy cows, and advising them to supply fertilizer to crop farmers if radiation levels are below the limit. Mizunoya has not fed any radiation-tainted rice straw to his cattle, and tests show that there are no problems with the fertilizer produced at his farm. He says, however, that there's been an **emerging trend of crop farmers avoiding local fertilizer.**

The prefectural government has advised that cattle farmers remove excrement from the cow barns and store it in a separate location. Mizunoya however, has not done so because of the **many residences in the vicinity and a fear of causing environmental pollution.** According to prefectural officials, many cattle farmers are facing similar conundrums.

The ban that was placed on Fukushima cattle after the discovery of radiation-tainted meat was lifted on Aug. 25. Mizunoya began shipping his cows after they were tested in early September and found to be safe. **Fukushima beef cattle attract few customers, however, and prices are half of what they were prior to the nuclear crisis.** As a result, Mizunoya ran out of operating funds, and has taken out a loan of over 100 million yen.

"When the mad-cow epidemic took place, I had to borrow money but was able to survive," Mizunoya says. "This time, though, radiation fears just keep on escalating, and there's no telling when and how much (the operator of the troubled nuclear power plant) Tokyo Electric Power Co. will compensate us."

Gov to study ways to confirm lack of criticality

Japan's government plans to study ways to confirm that sustained nuclear fission has not resumed at the Fukushima Daiichi power plant.

The minister in charge of the nuclear crisis, Goshi Hosono, told this to reporters on Friday after radioactive xenon was found at the plant's No. 2 reactor this week.

The presence of xenon indicates that nuclear fission occurred recently.

Hosono said xenon was detected not because of new developments, but due to detailed radiation monitoring by the Tokyo Electric Power Company.

He also said he supports the utility's view that xenon was produced through spontaneous fission, not sustained fission, or criticality.

Hosono said a precondition for putting the plant's reactors into a cold shutdown is ensuring that the accident will no longer escalate. He added that an absence of criticality is one way to achieve such a state.

He suggested that the government hopes to present related measures this month to coincide with a monthly review of the timetable for bringing the plant under control.

Friday, November 04, 2011 16:48 +0900 (JST)

70 percent in Japan want end to nuclear power

An NHK poll shows that nearly 70 percent of Japanese people want to reduce or abolish nuclear power in the future.

NHK polled about 2,600 randomly selected adults nationwide over 3 days through October 30th. 1,775 people responded.

24 percent of respondents said all nuclear power plants should be shut down and 42 percent said the number should be reduced.

23 percent said the existing facilities should be maintained and 2 percent said they want more nuclear plants.

49 percent of respondents said they are very afraid of another nuclear accident and 37 percent are worried to a certain extent.

When asked if nuclear power generation will become safe in the future, 46 percent said yes and 48 percent said no.

Friday, November 04, 2011 06:53 +0900 (JST)

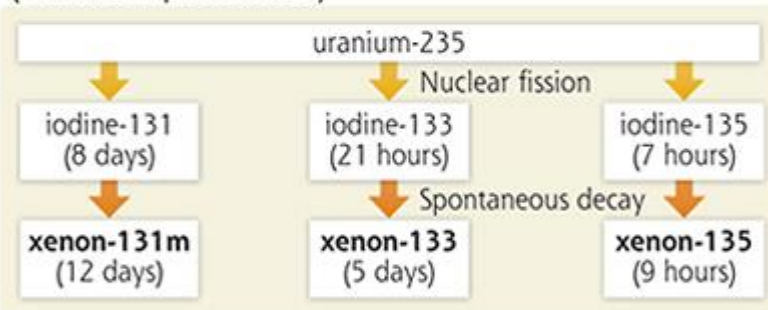

TEPCO: N-plant xenon not result of criticality

The Yomiuri Shimbun

Situation at No. 2 reactor at Fukushima No. 1 nuclear power plant

How radioactive xenon is created (half-life in parentheses)

Difference between criticality and spontaneous fission

Tokyo Electric Power Co. said Thursday radioactive xenon detected in the No. 2 reactor at its crippled Fukushima No. 1 nuclear power plant was the result of spontaneous fission, not a nuclear chain reaction known as criticality as had been feared.

TEPCO said **spontaneous fission, in which radioactive curium produced during the operation of a reactor splits on its own, is occurring sporadically inside the reactor.**

The recent detection of minute amounts of xenon can be explained by the splitting of curium, it said.

Xenon was detected Tuesday in gas from the No. 2 reactor's containment vessel.

Although the amounts were minute--about one-100,000th becquerel per cubic centimeter--TEPCO said a small-scale criticality incident could have taken place temporarily, given the short half-lives of the two types of xenon detected--five days for xenon-133 and nine hours for xenon-135.

However, after analyzing the data, TEPCO concluded criticality did not occur, explaining that **even a small-scale criticality incident should produce 10,000 times more xenon than the amount detected.**

TEPCO said the spontaneous fission of curium is a normal phenomenon in idled reactors and it would not hamper ongoing efforts to stabilize the reactor.

"There will be no impact on the stabilization of the nuclear reactor and the surrounding environment," the utility said.

Radiation fears behind debris refusals / Remaining refuse may cause secondary damage, hinder reconstruction efforts

The Yomiuri Shimbun

The start Wednesday of shipments of debris from the Great East Japan Earthquake to Tokyo, the first destination for such refuse outside the Tohoku region, was a long-awaited first step toward wider disposal of the wreckage.

However, an Environment Ministry survey released Wednesday showed that only 54 local governments and garbage-disposal unions, less than 10 percent the figure in a previous survey, were considering accepting debris from disaster-hit areas.

A huge quantity of debris remains in the devastated areas almost eight months after the March 11 disaster, and secondary damage such as fires in piles of debris has occurred. People also have voiced concern that the slow pace of disposal may adversely affect reconstruction efforts.

In Miyako, Iwate Prefecture, on Wednesday, wood, plastic and other debris were thrown by heavy machinery into containers on trucks, which then headed to a JR cargo terminal in Morioka.

Miyako Mayor Masanori Yamamoto observed the work and said: "Today's achievement represents great progress for reconstruction. I'm grateful."

The Iwate prefectural government and the Tokyo metropolitan government signed an agreement that Tokyo will accept 11,000 tons of debris by the end of fiscal 2011 to dispose of it. Including this figure, the metropolitan government plans to accept about 500,000 tons of debris from Iwate and Miyagi prefectures by the end of fiscal 2013.

So far, however, Tokyo is the only prefecture outside the Tohoku region that has accepted debris from the disaster-hit areas. An official involved with the issue at the Kyoto city government said, "The Environment Ministry says the debris is safe, but we can't convince our residents."

The Kyoto city government once abandoned a plan to burn firewood made from pine trees in Rikuzen-Takata, Iwate Prefecture, during the Kyoto Gozan Okuribi fire festival.

The ministry conducted a similar survey in April, at which time the Kyoto city government said it could accept about 50,000 tons of debris annually.

In the latest survey, however, it said it could take none. The decision was made in light of Kyoto residents' concern about radioactive contamination from debris, according to officials.

The municipal governments of Akita and Tsu also said they could accept debris in the April survey but backed out in the latest survey.

Local governments that expressed their intention to consider accepting debris are also in a difficult position. The city government of Hachinohe, Aomori Prefecture, has decided to accept debris only from Iwate Prefecture because the city and Iwate Prefecture both belonged to the Nambu-han feudal clan during the Edo period (1603-1867).

However, the city said its acceptance would be conditional. "We know we have to cooperate with reconstruction, but we'll only accept debris from which there will be no effect from radiation," an official said.

An environmental affairs union in charge of garbage disposal in central and southern parts of Nagasaki Prefecture also said it would accept 6,500 tons a year on the condition that debris contaminated with radioactive substances would be excluded.

Nagasaki Prefecture received aid from across the nation when Fugendake peak in the Unzen mountain area erupted in 1991 and related volcanic disasters damaged the area. As a result, many people in the prefecture have expressed their willingness to help the disaster-hit areas.

At the same time, however, the prefecture is in a difficult position. "Nagasaki suffered an atomic bombing, so some people have strong fears about radiation pollution. It's difficult to explain this," a union official said.

The ministry plans to compile documents to explain how filters in garbage incinerators can remove more than 99.99 percent of radioactive cesium, among other information to relieve public concerns.

The ministry also aims to encourage local governments to accept debris from the disaster-hit areas through such efforts.

===

Debris hinders recovery

Debris has hampered reconstruction efforts in areas affected by the March 11 disaster. In Rikuzen-Takata, which was devastated by the quake and tsunami, a city government official said: "We're securing sites to temporarily store debris, even borrowing land owned by private individuals. Our reconstruction work won't make progress if the debris remains. It will hinder urban planning."

In Ofunato, Iwate Prefecture, three temporary debris storage sites are in school yards. "If the debris can be removed quickly, the yards can be used for students," a city official said.

In Yamadamachi, Iwate Prefecture, a fire started in a 15-meter-high pile of debris on Oct. 12 and has still not been extinguished.

An official at a municipal fire station said, "In winter, when the air tends to be dry, the fire may grow bigger and spread to surrounding areas."

The fire station was carefully breaking the pile of debris apart with heavy machinery and spraying water on it.

According to Shinichi Sakai, a researcher of environmental engineering who heads Kyoto University's Environment Preservation Research Center: "The Tokyo metropolitan and Iwate prefectural governments made their decisions after carefully checking for radiation pollution through such means as analyzing the kinds of radioactive particles inside the waste and radiation emissions on the surface.

"Pollution levels differ from place to place. Radiation levels of incinerated ash on the northern part of the Sanriku coast are lower than those in Tokyo. I hope local governments will cooperate to dispose of debris over wider areas based on rational numerical data," he said.

Nuclear safety body to form third-party committee to investigate inspection methods

The Japan Nuclear Energy Safety Organization (JNES) said on Nov. 4 that it will form a third-party committee to investigate whether there are any problems with its nuclear facility inspection methods following revelations that the body copied its procedures directly from drafts provided by a nuclear fuel firm.

The nuclear inspection body, under the jurisdiction of the government's Nuclear and Industrial Safety Agency (NISA), made the decision in line with instructions from Economy, Trade and Industry Minister Yukio Edano. The third-party committee will consist of more than five members selected

from legal experts and those known for taking a cautious approach to nuclear policies. The committee is expected to compile and submit a report by the end of this year.

The Mainichi broke the news this week on the JNES's 2008 inspection of nuclear fuel rods using procedures copied verbatim from documents the body ordered the fuel maker itself to provide. Apart from that incident, the JNES has systematically carried out similar inspections on nuclear facilities before they went into operation.

The JNES had previously told the Mainichi, "The inspection methods are appropriate, and therefore we have no intention of changing them." However, Yasukazu Mochimaru, a senior JNES official, said at a news conference, "We cannot deny the possibility that we have relied excessively on (nuclear) firms, adding, "The general public has doubts about whether the JNES has the qualifications to inspect nuclear facilities. We want to listen to opinions from the committee and clear the problems."

The committee will also look into findings that the JNES failed to uncover the fact that Hitachi Zosen Corp. did not conduct necessary tests on a uranium enrichment facility run by Japan Nuclear Fuel Ltd. in Rokkasho, Aomori Prefecture, in 2009, and that the nuclear safety body failed to notice flaws in inspection documents on the Oi Nuclear Power Plant prepared by Kansai Electric Power Co., and therefore failed to conduct inspections on the plant properly in 2009 and 2010. The committee will examine the process for creating inspection procedures, relationships between the JNES and nuclear firms, the JNES' human resources development and training programs, and other areas.

Areva, Kazatomprom Sign Deal To Produce Nuclear Fuel For Asia

By Christopher Pala & contributing to Dow Jones Newswires; +7 701 707 9013; chrispala@gmail.com

Published November 04, 2011 - <http://www.foxbusiness.com/industries/2011/11/04/areva-kazatomprom-sign-deal-to-produce-nuclear-fuel-for-asia/>

| Dow Jones Newswires

ALMATY, Kazakhstan -([Dow Jones](#))- France's Areva SA (AREVA.FR, ARVCY) and Kazakhstan's Kazatomprom signed deals Friday in Kazakh capital Astana during a visit by the French industry minister to mine uranium and produce nuclear fuel for the Asian market, a statement issued by his press office said.

The agreement provided for the creation of a plant to produce nuclear fuel for the Asian market. Construction could start immediately after the conclusion of a feasibility study at the end of the first quarter of 2012, the statement said.

The deals were part of a strategic partnership the two companies signed in 2009 to operate a joint venture named KATKO to operate mines that will extract 4,000 tons of uranium a year between 2012 and 2039 and broaden their cooperation in the upstream-nuclear cycle, the statement said.

They included a contract committing Kazakhstan to buy French solar panels to power the KATKO mines, according to the French statement.

They were signed in the presence of Eric Besson, the French minister of industry, energy and the digital economy, who was on a two-day official visit, and Asset Issikeshev, vice prime minister and industry minister of Kazakhstan.

After more than tripling its output in four years to become the world's largest producer of uranium, Kazakhstan stabilized its production this year to around 19,800 tons in order to avoid depressing prices. Kazatomprom, the state nuclear concern, is expected to produce about 11,000 tons, more than Canada or Australia.

TEPCO to review criteria for determining 'criticality'

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Sunday it will review its criteria for determining a self-sustaining nuclear chain reaction, known as criticality, in the wake of recent confusion over a case of "spontaneous" fission, which occurs at a constant rate.

The operator of the crisis-hit Fukushima Daiichi nuclear power plant only reported the criteria last month to the government's Nuclear and Industrial Safety Agency but did not include cases of spontaneous fission, when a rare gas like xenon is detected at a reactor, as in the incident on Tuesday.

When it revealed Wednesday that it had detected radioactive xenon at the crippled plant's No. 2 reactor, the firm known as TEPCO said that melted fuel inside the reactor may have temporarily gone critical, but denied the possibility the next day, saying it was the result of spontaneous fission.

The criteria were included in TEPCO's medium-term safety measures for the Fukushima Daiichi plant reported to the government on Oct. 17, amid the ongoing nuclear crisis at the plant triggered by the March 11 earthquake and tsunami.

(Mainichi Japan) November 7, 2011

TEPCO begins removing cesium from spent fuel pool

The operator of the Fukushima Daiichi nuclear power plant has begun removing radioactive cesium from water in the spent fuel pool of one of the damaged reactors.

Tokyo Electric Power Company installed a device to remove cesium inside the cooling water of the spent fuel pool at the No.2 reactor. The device became operational on Sunday.

The concentration of radioactive cesium remains high in the cooling water of the spent fuel pools following meltdowns at the No. 1, 2, and 3 reactors.

TEPCO has been removing radioactive material from the reactors' cooling water since July, but the No.2 reactor became the first where the procedure took place **in the spent fuel pool**. TEPCO aims to reduce the concentration of radioactive material in the water from one-hundredth to one- thousandth within about a month.

There are fears that the metal pipes and walls of the spent fuel pools will erode, as seawater was used after the accident to cool down the spent fuel pools of the No. 2, 3 and 4 reactors. TEPCO has already begun removing salt from the water in the pool at the No.4 reactor, and plans to do the same at the pool of the No.2 reactor.

The company said removal of radioactive material from the pool water is necessary as a step toward removing salt. The salt concentration of the pools is not particularly high -- about one-tenth of the seawater -- but erosion caused by salt may cause holes to form.

Monday, November 07, 2011 05:44 +0900 (JST)

Robot suits tested for Fukushima nuclear plant

A high-tech body-brace machine called a "robot suit" may be used to help workers at the Fukushima Daiichi nuclear plant move around more easily while wearing heavy protective gear.

A venture in Ibaraki Prefecture, eastern Japan, originally developed the assistive device with University of Tsukuba researchers for people with disabilities and the elderly.

The device has sensors that move the brace based on nerve signals from the human brain.

The venture has now reinforced the robot suit's materials to strengthen its lifting power so that it can be used at the Fukushima nuclear plant.

Those entering the plant have to wear protective gear against radiation that weighs some 15 kilograms.

The venture says the device can help to assist the movement of up to 60 kilograms.

Last Tuesday, the venture team conducted tests to see how well the device can assist workers who are

removing rubble and conducting repairs.

University of Tsukuba Professor Yoshiyuki Sankai says **the robot suits will enable workers to do many more types of work and stay longer inside the reactor buildings.** He says it may be possible to put the nuclear plant under control earlier if the device is used.

Monday, November 07, 2011 10:24 +0900 (JST)

Fukushima-produced low-cost Geiger counters hit the market

Sanwa Corporation's President Yuichiro Saito shows the newly developed Geiger counter models, "Geiger Fukushima," left, the iPhone-specific device, middle, and the still-under development Geiger-Muller tube. (Mainichi)

FUKUSHIMA -- A local manufacturer here has developed a new low-cost and high-performance Geiger counter to meet residents' increasing concerns over radiation leaking from the crippled Fukushima No.1 nuclear power plant.

"Geiger Fukushima," manufactured by Sanwa Corporation in Otama, Fukushima, will cost 18,800 yen -- a bargain price for the usually very expensive, and recently not easily available, radiation measuring instruments.

The new device will run on two AAA batteries and will be able to measure radiation over a range between 0.04 to approximately 440 microsieverts per hour. Based on the measured data, it will also be able to estimate the approximate amount of radiation a person will be exposed to in one year.

In addition to "Geiger Fukushima," the company has also manufactured an additional model that is to be specifically used on iPhones in combination with the radiation-measuring application "Geiger Bot." That model will cost 9,800 yen.

"I want 'Geiger Fukushima' to help residents protect themselves from hot-spot areas," says Yuichiro Saito, president of Sanwa Corp. The concerned father of two has been a direct witness to residents' growing anxieties since the beginning of the nuclear disaster in March.

Sanwa Corp. has already been receiving a number of inquiries, including such from the Fukushima Prefecture village of Kawauchi, which is expecting some 1,000 households to return to their homes as the emergency evacuation preparation zone -- within which the village fell into -- was lifted at the end of September.

Meanwhile, Sanwa Corp. is also developing a self-manufactured Geiger-Muller tube (GM tube) -- the instruments' central radiation-detecting element -- which up to now had not been manufactured in Japan. If fully successful, Sanwa's future Geiger counters will be sold at even cheaper prices, in smaller sizes and with higher performance, company officials say.

The two new Geiger counter models will be sold online by the authorized non-profit organization "Eigyoshientai," which is currently accepting advanced orders. For more information see <http://eigyoshientai.shop-pro.jp/> (Japanese language only).

Low radiation areas should be used as bases for restoration work for Fukushima: expert

Areas that are contaminated with relatively low radiation from the Fukushima No. 1 Nuclear Power Plant should be used as bases for prolonged work to restore the disaster-hit prefecture, a leading radiation expert says.

"Work to decontaminate and improve infrastructure (in Fukushima) should be carried out first in low radiation areas as bases," said Tatsuhiko Kodama, head of the Radioisotope Center at the University of Tokyo. After obtaining permission from local municipalities in the evacuation zone within 20 kilometers from the crippled Fukushima nuclear power station, Kodama, accompanied by journalists, measured radiation levels of areas in the region on Nov. 5. There were areas that measured less than 1 millisievert per year (0.23 microsieverts per hour) -- the lowest level of radiation which requires the central government to conduct decontamination work.

Kodama, wearing protective gear, a mask and plastic gloves, traveled north on National Route 6 from Hirono, Fukushima Prefecture, in a passenger car equipped with radiation measuring devices, and entered the 20-kilometer no-go zone.

Roads in many areas in the no-go zone remained caved in or cracked. In residential areas, many houses or walls remained collapsed or damaged. Very few people were seen in the areas and only a few

passenger cars, used apparently by nuclear plant workers or local residents who were making brief visits to their homes, were seen passing by.

When Kodama entered the zone, the level of radiation in the atmosphere near the border was 0.45 microsieverts per hour, but when he moved closer to the Fukushima nuclear plant that straddles the towns of Okuma and Futaba, the level of radiation was over 10 microsieverts per hour. The radiation level rose further to 22 microsieverts per hour in an area about two kilometers from the nuclear power plant.

Kodama moved further north into Minamisoma where the level of radiation was 0.36 microsieverts per hour. An area near the border within the no-go zone dropped to 0.1 microsieverts per hour. Kodama then moved away from National Route 6 to visit a fishing port in Namie, about six kilometers from the nuclear plant, where the level of radiation in the atmosphere above about one meter from the ground was about 0.08 microsieverts per hour.

"Rather than drawing lines uniformly by distance, the central government should examine radiation levels in detail and decide to allow people to enter the evacuation zone to do decontamination or construction work," Kodama said.

(Mainichi Japan) November 7, 2011

Nuclear safety agency denies criticality at Fukushima reactor

TOKYO (Kyodo) -- The government's nuclear safety agency said Monday that it supports Tokyo Electric Power Co.'s view that the recent detection of radioactive xenon at one of its crippled reactors at the Fukushima Daiichi nuclear power plant was not a result of a sustained nuclear chain reaction known as criticality, as earlier feared.

The Nuclear and Industrial Safety Agency said what is known as "spontaneous" fission created xenon-135 because it found that the density of the substance had not changed even after Tokyo Electric injected water containing boric acid, which should have lowered the density of xenon-135 if criticality had taken place.

"We judge Tokyo Electric's report (on the detection of xenon) to be basically appropriate," the agency said in a statement.

The plant operator known as TEPCO initially touched on the possibility that the melted fuel inside the stricken No. 2 reactor may have gone critical temporarily, but it concluded in a report submitted to the agency Friday that spontaneous fission had generated xenon-135.

The agency has been studying the content of the report.

With the Nos. 1 to 3 reactors suffering core meltdown and releasing massive radioactive substances in the wake of the devastating March 11 earthquake and tsunami, a criticality event could cause further damage to the fuel and worsen the situation at the plant.

Cabinet Office Parliamentary Secretary Yasuhiro Sonoda stressed Monday that the latest development is not expected to affect the target to achieve the stable state, known as cold shutdown, of the reactors at the plant by the end of the year.

(Mainichi Japan) November 8, 2011

No criticality in Fukushima

Japan's nuclear agency has confirmed that sustained nuclear fission did not take place at the Fukushima nuclear power plant last week.

The Nuclear and Industrial Safety Agency disclosed the results of experts' studies on a report by Tokyo Electric Power Company, or TEPCO.

The utility detected a small amount of the radioactive material, xenon-135, in the reactor's containment vessel of the damaged No.2 reactor on Tuesday of last week.

TEPCO initially feared it may signal an ongoing nuclear reaction. But it determined that the substance was produced through spontaneous fission, a form of radioactive decay, and not from sustained fission or criticality.

The nuclear agency said the density of the xenon, which did not change when a boric acid solution was injected into the reactor, proved that criticality did not occur.

The agency ordered TEPCO to regularly check the density of nuclear substances inside the vessels and to report any changes.

Cabinet Office Parliamentary Secretary Yasuhiro Sonoda said on Monday that it is regrettable that TEPCO was slow to report the incident to local governments, calling on the utility to share information as quickly as possible.

Tuesday, November 08, 2011 02:48 +0900 (JST)

TEPCO to review CO2 emissions reduction target amid nuclear crisis

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Monday it will review its voluntary target to cut carbon dioxide emissions when generating electricity as the utility increases its reliance on thermal power generation amid the nuclear crisis at its Fukushima Daiichi power plant.

The company has sought to reduce its average annual CO2 emissions intensity over the five-year period through fiscal 2012 by 20 percent compared with fiscal 1990 through emissions trading, but it is now facing the difficulty of purchasing carbon credits through trading because its financial condition is deteriorating due to the crisis.

The move could affect other Japanese utilities as the industry as a whole has set the same target, while the situation may also weigh on Japan's efforts to tackle global warming.

Because the company, known as TEPCO, will review its CO2 emissions target, it has decided not to use carbon credits that were purchased in fiscal 2010 for about 5 billion yen.

TEPCO said its CO2 emissions in fiscal 2010 through March 2011 stood at 109.90 million tons, up 2 percent from fiscal 2009.

The fiscal 2010 figure increased because TEPCO boosted thermal power generation to meet rising electricity demand stemming from the heat wave in the summer.

Of the three nuclear power plants operated by TEPCO, the Fukushima Daiichi and Fukushima Daini complexes were hit by the devastating March 11 earthquake and tsunami. While the company is still struggling to fully stabilize the Fukushima Daiichi plant, the adjacent Fukushima Daini plant has already achieved a state of cold shutdown.

(Mainichi Japan) November 8, 2011

Gov't seeks to enhance transparency of nuclear stress tests

TOKYO (Kyodo) -- The government will seek to enhance the transparency of its nuclear safety checks introduced in the wake of the crisis at the Fukushima Daiichi power plant, such as by disclosing all exchanges between nuclear regulators and plant operators, industry minister Yukio Edano said Tuesday.

Edano also said that the agency will accept questions and requests from the public through e-mails about the so-called "stress test" process.

Under Japan's stress tests, modeled on the nuclear safety reviews conducted in the European Union, utilities basically will study the extent to which key installations would be able to withstand the impact of extreme natural disasters occurring on unexpected scales.

After the first phase of the assessment, the government will decide whether to allow the restart of reactors that are idled for checkups. The second-stage assessment will determine whether nuclear power plants should remain in operation.

The first phase has already begun, with Kansai Electric Power Co. becoming the first utility to report the results of its stress tests on a nuclear reactor to the Nuclear and Industrial Safety Agency on Oct. 28.

Edano told reporters that the agency has questioned Kansai Electric on several issues in written form in relation to the report, and those exchanges will be disclosed on the agency's website.

"In principle, exchanges between the agency and plant operators will be made public," said the head of the Economy, Trade and Industry Ministry, which has the nuclear safety agency under its wing.

Kansai Electric submitted its assessment on the No. 3 reactor at its Oi nuclear power plant in Fukui Prefecture, which is currently undergoing regular checkups.

(Mainichi Japan) November 8, 2011

Iwate debris depot fire extinguished after one-month operation

MORIOKA, Japan (Kyodo) -- A fire station in Yamada, Iwate Prefecture, said Monday it had completed extinguishing a fire after around a month that broke out at a depot for debris from the March 11 earthquake and tsunami.

The fire, which started Oct. 11, destroying a 2,871 square-meter area of the temporary debris depot, was confirmed to have been extinguished by the fire station.

Although flames could not be seen throughout the period, the 15-meter-high heaps of debris continued to smolder, giving off a stench.

Although local authorities reduced the size of the heaps using heavy machinery, firemen were unable to get water to reach the source of the fire, it said.

Even after the fire appeared to be almost extinguished on Oct. 22, the authorities continued to use heavy equipment to level the heaps until their height was lowered to around 5 meters, it said.

Since the heaps of debris nearly stopped emitting smoke after the start of this month, the station concluded Monday that there is no possibility that they will catch fire again, it added.

Survey to compile detailed radiation map in Fukushima begins

An unmanned helicopter dispatched by the Ministry of the Environment and other institutions to monitor radiation is seen in Iitate, Fukushima Prefecture, on Nov. 7, 2011. (Mainichi)

FUKUSHIMA Japan (Kyodo) -- A detailed survey to compile a map of airborne radiation levels began Monday in Iitate village in Fukushima Prefecture, with the aim of collecting data for use when drawing up decontamination measures in the prefecture affected by the ongoing nuclear crisis, Environment Ministry officials said.

The ministry is expected to conduct monitoring work at about 3,000 locations in the prefecture in November, including about 400 spots in Iitate, covering mainly residential areas within a 20-kilometer radius of the radiation-leaking Fukushima Daiichi nuclear power plant, it said.

Measurements will be taken by unmanned helicopters around woodland and rivers, while monitoring vehicles will travel along roads in residential areas, it said.

The ministry will compile the distribution map using an area of 100 square meters as a base unit in the survey through February, as well as data already collected by the Ministry of Education, Culture, Sports, Science and Technology.

The survey is "the first step of decontamination work by the government," said Soichiro Seki, a senior Environment Ministry official. "We will try hard to restore normal conditions in Fukushima, keeping in mind that Fukushima cannot be revitalized without decontamination."

The survey will be conducted as the government steps up efforts to reconstruct Fukushima, one of the three prefectures hardest hit in the March 11 earthquake and tsunami, including cleaning up contaminated residential areas.

(Mainichi Japan) November 8, 2011

Minute radiation monitoring begins in no-go zone

The environment ministry has launched a detailed survey of radiation levels in areas near the crippled Fukushima Daiichi nuclear power plant.

This information will enable the government to pinpoint which areas in the irradiated 20-kilometer zone of the plant need to be decontaminated first. Areas with radiation levels of about 20 millisieverts per year will also be included.

About 30 people, including ministry officials and Tokyo Electric Power Company staff gathered at a monitoring point in Iitate Village. The village is in a government-designated evacuation zone, from which all residents were ordered to leave.

Radiation levels for the survey will be measured at 100 meter intervals at an altitude of 50 meters, using unmanned helicopters and cars.

The ministry will provide an interim report on the results in December.

In the 12 designated municipalities, three corporations commissioned by the government have been selected to carry out the survey how to proceed the decontamination work effectively.

The ministry is set to begin full-scale cleanup efforts from next January according to the result of these surveys.

A ministry senior official said he hopes the survey and decontamination work will move forward quickly to allow some 100,000 evacuees to return to their homes.

Monday, November 07, 2011 19:42 +0900 (JST)

1/4 won't return to Fukushima restricted zone

A survey in Fukushima Prefecture has revealed that one in 4 evacuees has no intention of returning to the restricted areas around the disaster-stricken nuclear power plant.

A group from Fukushima University sent questionnaires to all households from 8 municipalities in the district of Futaba, where the Fukushima Daiichi nuclear plant is located. Roughly half, or 13,500, responded.

26.9 percent of evacuees said they wouldn't be returning to their hometowns. Among people in their early 30s or younger, the figure rose to 52.3 percent.

More than 30 percent of evacuees from 3 towns in the no-entry zone said they won't return. The 20-kilometer zone is where radiation levels are particularly high.

Asked what troubles them most, nearly 60 percent cited a lack of prospects for ending their time in evacuation.

In the comment section of the survey, some evacuees wrote that they loved their hometowns and the people they know there, and that they would want to return home soon if it was possible.

The survey's leader, Associate Professor Fuminori Tanba, says the comments indicate that the evacuees do want to return home, despite the high number of those saying they will not. He also says the central and local governments should come up with steps to satisfy the wishes of the residents.

Tuesday, November 08, 2011 13:05 +0900 (JST)

Smaller increase in children's weight in Fukushima

A survey shows that some children in Fukushima Prefecture have smaller average weight gains this year compared to the year before. A paediatrician says the results indicate the negative effects of the nuclear plant accident in March.

Doctor Shintaro Kikuchi tracked the weights of 245 children aged from 4 to 6 in 2 kindergartens in Koriyama City, Fukushima Prefecture. The results show an average weight increase of 0.81 kilograms over the past year through June. The increase for children in the same age group the previous year was 3.1 kilograms.

The average increase for children aged 5 to 6 in the survey was 0.84 kilograms. But a nationwide health ministry survey conducted last year for children of the same age group showed an average gain of 1.8 kilograms.

The Fukushima Daiichi nuclear accident has caused high levels of radioactivity in areas around the plant. Koriyama is located about 60 kilometers from the facility and many children in the city have been forced to play indoors to avoid contamination.

Kikuchi noted that the smaller weight increases could be related to reduced appetite resulting from less exercise as well as changes in the secretion of growth hormones due to stress. He said measures should be taken to restore normal hormone levels in the children.

Monday, November 07, 2011 20:09 +0900 (JST)

Nuclear power companies subject to cyber attacks

The operators of nuclear power plants in Japan have become the latest victims of cyber criminals.

NHK asked 10 electric power companies that manage nuclear power plants if they have experienced attacks on their computer networks in the past year.

Tokyo Electric Power Company, Hokkaido Electric Power Company and Tohoku Electric Power Company said they had received targeted cyber attacks through emails disguised as business communications from government offices.

TEPCO says, however, that it has no evidence of an information leak.

Five other utilities reported that their computers were hit by viruses delivered through email, but they also said they have had no data leakage.

Noting past cyber attacks on nuclear facilities abroad, Keio University Professor Keiji Takeda says hackers may have sent viruses to try and collect data from plants in Japan.

He says not only electric power companies, but also gas and water suppliers, railway operators and other infrastructure operators should share information on viruses and check again to see if their computers have been infected.

Earlier, Japanese government institutions and defense contractors came under cyber attacks.

Researchers remove 90 percent of radioactive cesium from sludge with bacteria

HIROSHIMA -- A research team here has succeeded in developing a method of removing radioactive cesium from sludge using bacteria.

Hiroshima International University professor Ken Sasaki, who studies the application of biotechnology in radiation decontamination, along with Ota Kohkan, a Hiroshima-based company selling waterworks-related materials and equipment, collected sludge from a swimming pool at a public school in the Fukushima Prefecture capital of Fukushima and ran experiments there in September.

The researchers mixed 90 grams of photosynthetic bacteria with alginic acid and other chemicals, forming the resulting granular material into marble-sized spheres. These were injected into 50 liters of concentrated sludge, whose radiation levels were monitored for three days.

Radiation levels ranging from 12.04 to 14.54 microsieverts per hour at the start of the experiment were found to have dropped to between 2.6 and 4.1 microsieverts per hour by the end of the third day. Subtracting the 1.2 microsieverts of radiation that was detected in the area around the pool during the experiment due to the Fukushima No. 1 Nuclear Power Plant disaster, the bacteria was found to have reduced radiation levels in the sludge by a maximum of 89.4 percent.

The negative charge of the surface of the bacteria used in the experiment has the property of attracting positively-charged materials, which it did with the positively-charged cesium. Moreover, the bacteria feed on potassium, and Sasaki says the bacteria likely absorbed the cesium because of its resemblance to potassium.

Through dehydration and incineration, the volume of the used bacteria mixture can be reduced to a seventy-fifth of its original volume, and weight to a hundredth. Cesium turns into gas and is dispersed at 640 degrees Celsius, which can be avoided if temperatures are kept at 500 degrees or lower.

Sasaki, who is planning to run demonstration experiments, is hopeful that the technology can be applied to the decontamination of radiation-tainted soil. "The strength of this technology is that it makes decontamination possible at regular temperatures and pressures," he said. "It is low cost as well, and we'd like to see it used in Fukushima's reconstruction efforts."

Cabinet endorses decontamination plan

The Japanese Cabinet has endorsed a basic plan on cleaning up radioactive fallout from the accident at the Fukushima Daiichi nuclear power plant.

Under the Environment Ministry's plan, decontamination work will be carried out in areas where the annual radiation exposure reaches one millisievert or more.

The central government will be responsible for decontaminating the no-entry and evacuation zones around the troubled plant. Radiation levels are especially high in these areas.

In other affected areas, the clean-ups will be planned and performed by local municipalities, with the central government bearing the cost.

The plan also calls for cutting radiation levels approximately in half within two years in areas where the annual radiation is below 20 millisieverts. In schools and parks where children spend a lot of time, the reduction rate is raised to around 60 percent.

Environment Minister Goshi Hosono told reporters that he wants to hold thorough discussions with the relevant municipalities before designating areas subject to decontamination work.

Des traces de radioactivité détectées en République tchèque

LEMONDE.FR avec AFP | 11.11.11 | 17h36 • Mis à jour le 11.11.11 | 19h36

L'Agence internationale de l'énergie atomique (AIEA) a fait état, vendredi 11 novembre, de [traces d'un élément radioactif](#) dans l'atmosphère en République tchèque et dans certains pays européens, sans préciser de quels autres Etats il s'agissait.

Cela dit, l'agence onusienne estime que les niveaux relevés *"ne présentent pas de risque pour la santé publique"*. L'iode 131 est un élément radioactif dont la demi-vie (période durant laquelle il a perdu la moitié de sa radioactivité) est très courte, environ huit jours. L'origine de la présence de ce produit dans l'atmosphère reste à définir, mais n'est pas liée, selon l'AIEA, à l'accident de la centrale nucléaire japonaise de Fukushima en mars dernier.

Selon l'autorité de sûreté nucléaire tchèque, de l'iode 131 à très faible dose a été détecté dans l'air au cours des deux dernières semaines. *"Nous surveillons les évolutions de la situation en détail afin de localiser et d'identifier la source qui est probablement située hors du territoire tchèque"*, a-t-elle précisé dans un communiqué.

"Nous n'avons détecté aucune augmentation dans la concentration d'autres radionucléides [éléments radioactifs], ce qui suggère que la cause ne serait pas liée à un accident dans une centrale nucléaire", selon l'autorité.

Low levels of radioactive particles in Europe: IAEA

By [Sylvia Westall](#) and Fredrik Dahl - <http://www.reuters.com/article/2011/11/11/us-nuclear-iodine-iaea-idUSTRE7AA4U020111111>

VIENNA | Fri Nov 11, 2011 12:26pm EST

(Reuters) - Very low levels of radioactive iodine-131 have been detected in Europe but the particles are not believed to pose a public health risk, the U.N. nuclear agency said Friday, saying it was seeking to find the source.

The International Atomic Energy Agency (IAEA), the Vienna-based U.N. watchdog, said it did not believe the radioactive particles were from Japan's stricken Fukushima nuclear power plant after its emergency in March.

Experts said the origin of the radiation -- which has been spreading for about two weeks -- remained a mystery but could come from many possible sources ranging from medical laboratories or hospitals to nuclear submarines.

The Czech Republic's nuclear security watchdog said it had tipped off the IAEA after detecting the radiation it thought was coming from abroad but not from a nuclear power plant. It suggested **it may come from production of radiopharmaceuticals**.

Germany's Environment Ministry said slightly higher levels of radioactive iodine had been measured in the north of the country, ruling out that it came from a nuclear power plant.

Hungary, Slovakia, Austria and Sweden also reported traces at very low levels that did not pose a health risk.

Iodine-131, linked to cancer if found in high doses, can contaminate products such as milk and vegetables.

Paddy Regan, a professor of nuclear physics at Britain's University of Surrey, said the suggestion that it may have leaked from a radiopharmaceuticals maker "sounds very sensible and totally reasonable."

He said since iodine was used in the treatment of thyroid conditions it was also likely that hospitals in many European countries would have it in their stores.

"It would be very unlikely for it to have come from Fukushima since the accident was so many months ago and iodine-131 has a brief half-life," he said.

Iodine-131 is a short-lived radioisotope that has a radioactive decay half-life of about eight days, the IAEA said.

Massimo Sepielli, head of the nuclear fission unit of Italy's national alternative energy body ENEA said any number of sources could be to blame for the readings.

"It could be coming from the transporting of (nuclear) material, it could come from a hospital ... it could even come from a nuclear submarine, even if it's a more complicated possibility ... but you can't rule that out."

CAREFULLY CONTROLLED

Professor Malcolm Sperrin, director of medical physics at Britain's Royal Berkshire Hospital, said any link with Fukushima was extremely unlikely.

"It is far more likely that the iodine may be as a result of excretion by patients undergoing medical treatment. Whilst such patients are carefully controlled, some release of iodine into the environment may be inevitable but would certainly be well below any limits where health detriment would even begin to be an issue for concern," he said.

The IAEA said the Czech Republic's nuclear safety body had informed it that "very low levels" of iodine-131 had been measured in the atmosphere over the country in recent days.

"The IAEA has learned about similar measurements in other locations across Europe," the brief statement said.

"The IAEA is working with its counterparts to determine the cause and origin of the iodine-131."

The Czech watchdog said it had detected iodine-131 at a number of monitoring stations **since late October**. It said there was no health risk from the iodine.

"It was detected by our radiation monitoring network, with probability bordering on certainty the source is abroad. It is iodine-131 and we have asked the IAEA if they know what the source could be," Czech State Office for Nuclear Safety chief Dana Drabova told Reuters.

Officials in Spain, Russia, Ukraine, Finland, [France](#), Britain, Switzerland, Poland and Norway said they had not detected any abnormal radiation levels. Romania's watchdog said there had been no incident at the country's sole nuclear plant.

Austria's Environment Ministry said small levels were measured in the east and north of the Alpine country, saying the estimated dose level for the population was one 40,000th of the dose of radiation received in a transatlantic flight.

In the world's worst nuclear accident since Chernobyl in 1986, an earthquake followed by a massive tsunami overwhelmed the Fukushima plant in [Japan](#), causing a reactor meltdown and leakage of radiation, including of iodine.

In the days and weeks after the accident, tiny amounts of iodine-131 believed to have come from Fukushima were detected as far away as Iceland and other parts of Europe, as well as in the United States.

Explosion at Fukushima plant's No. 4 reactor caused by hydrogen backflow: TEPCO

The fifth floor of the No. 4 reactor building at the Fukushima No. 1 nuclear plant is seen with its floor ballooned upward. (Photo courtesy of TEPCO)

The hydrogen explosion at the Fukushima No. 1 nuclear plant's No. 4 reactor building was caused by a backflow of the gas from the No. 3 reactor, according to a report released by plant operator Tokyo Electric Power Co. (TEPCO).

The TEPCO report states that the cause of the March 15 explosion was not hydrogen from the No. 4 reactor building's spent fuel pool, but rather a backflow of hydrogen from the No. 3 reactor. The No. 4 and 3 buildings share an exhaust pipe and their air conditioning ducts are connected.

When the March 11 earthquake hit, the No. 4 reactor was offline for regular maintenance and its fuel rods had been removed. The possibility that the explosion at the No. 4 reactor building was caused by a hydrogen backflow from the No. 3 reactor had already been raised after higher radiation levels were found in pipes connecting to the No. 3 reactor than other pipes in the No. 4 building.

Gov't updates radiation maps with data on six new prefectures

The government has released soil radiation maps covering a much broader swath of Japan than previous releases, covering six new prefectures.

The newly included prefectures are Iwate, Yamanashi, Nagano, Shizuoka, Gifu, and Toyama.

Areas contaminated with 30,000 to 100,000 becquerels of radioactive cesium per square meter were found in the municipalities of Ichinoseki and Oshu in Iwate Prefecture, Saku, Karuizawa, and Sakuho in Nagano Prefecture, Tabayama in Yamanashi Prefecture, and elsewhere.

The measurements were taken by helicopter and combine contamination with both cesium-134 and -137, which have half-lives of two and 30 years, respectively.

3,000 travel to Fukushima N-plant every day

Koichi Yasuda / Yomiuri Shimbun Staff Writer

Workers' identities are confirmed and they are given dosimeters before going to the Fukushima No. 1 nuclear power plant.

FUKUSHIMA--The base for workers at the crippled Fukushima No. 1 nuclear power plant in Fukushima Prefecture was opened to the press for the first time Friday, eight months after the March 11 disaster.

About 3,000 workers covered in head-to-toe protective gear travel to the nuclear power plant every day from J-Village, originally a sports training facility, in Hironomachi and Narahamachi, about 20 kilometers from the nuclear power plant.

Working day shifts at the plant, they change into protective clothes, medical masks and gloves at the center and receive a dosimeter from officials of companies related to plant operator Tokyo Electric Power Co. Getting on a bus to go to the plant, the workers do not talk much or smile at all.

Although eight months have passed since the crisis began and workers are close to achieving cold shutdown of the plant's reactors, the situation is still tense, as work must be done in some locations where radiation levels are still high at 100 millisieverts per hour or more.

Work at locations with high radiation levels is limited to about three to four hours a day. However, some workers return to the center covered in sweat.

The overall environment has improved remarkably in the past eight months. Just after the crisis began, workers had to sleep huddled together in hallways, but today two air-conditioned dormitory buildings that can accommodate about 1,600 people stand on what was a training ground for TEPCO's soccer team.

Initially, only simple emergency foods were available, but TEPCO has distributed boxed meals since May and a convenience store opened in August. In September, a restaurant in the center reopened.

A 37-year-old man from Aomori Prefecture said, "I'm grateful for the good working environment here."

Encouraging messages from children and others are displayed in the changing room and other places at the center, illustrating just how harsh and stressful the job is.

Problems remain. Waste including used protective gear and masks contaminated with low levels of radiation is being stored on a covered soccer practice ground. The pile has reached a volume of 4,000 cubic meters.

An official at the center said no measures for disposing of it have been decided.

TEPCO opened the center in 1997 with contributions of 13 billion yen. One of its practice grounds, one of the largest soccer facilities in the nation, has been converted from natural grass to gravel and is being used as a parking lot and heliport.

(Nov. 13, 2011)

Antinuclear-plant protesters rally in Fukuoka

FUKUOKA (Kyodo) -- A series of large antinuclear rallies took place in Fukuoka on Sunday with the organizer saying more than 15,000 people, including from South Korea, took part calling for dismantlement of all nuclear power plants in Japan.

Yukinobu Aoyagi, a leading member of the events, told a gathering in a park in the southwestern city, "We'll work together so as not to see our soil contaminated with radiation."

Lee Dae Su, an antinuclear activist from South Korea, said, "An accident could affect South Korea, so we can't tolerate nuclear plants anymore."

Saeko Uno, 40, who evacuated to Fukuoka Prefecture from Fukushima Prefecture, told the event she hopes to see "a world free of nuclear plants" following the nuclear crisis at the Fukushima Daiichi plant crippled by the March 11 earthquake and tsunami.

The participants then took to the streets marching through downtown Fukuoka, holding placards and signs including those that read "We don't want nuclear plants" and "No nuclear plants."

(Mainichi Japan) November 14, 2011

Gov't aims for 'cold shutdown' of Fukushima reactors, but bemoans lack of data

The wrecked reactor building at the No. 3 reactor at the Fukushima No. 1 Nuclear Power Plant is seen in this pool photo taken on Nov. 12. (Pool photo)

The government and Tokyo Electric Power Co. (TEPCO) are trying to achieve a stable condition called a "cold shutdown" of crippled reactors at the Fukushima No. 1 Nuclear Power Plant by the end of this year, but they have yet to come to grips with exactly what is happening inside the reactors crippled by the March 11 earthquake and ensuing tsunami.

In the latest roadmap to contain the Fukushima nuclear power plant, the government and TEPCO, the operator of the Fukushima nuclear power plant, aim for a "cold shutdown" of the reactors by the end of this year. Their definition of a cold shutdown of the Fukushima nuclear plant consists of 1) the temperatures of the bottoms of the reactor pressure vessels being held down below 100 degrees Celsius, 2) radioactive substances from the reactors being managed and controlled, and 3) stable maintenance of "circular cooling systems" designed to recycle radioactive water from the reactors as coolant.

On Oct. 14, TEPCO finished installing a covering over the No. 1 reactor in an effort to prevent radioactive substances from spreading. In addition, a ventilation system designed to remove radioactive substances from the reactor building through filters has been operating at the reactor, and the temperature of the bottom of the reactor pressure vessel has dropped below 40 degrees Celsius.

Crushed piping is observed from inside a bus at the crippled Fukushima Dai-ichi nuclear power station in Okuma, Fukushima Prefecture, Japan, Saturday, Nov. 12, 2011. (AP Photo/Ikuro Aiba, Pool)

At the No. 2 reactor, a "gas control system" designed to remove radioactive substances from the reactor building has begun to be operational. But an analysis of gas using the system suggested on Nov. 2 a possibility of a sustained nuclear chain reaction known as criticality following the detection of radioactive xenon. TEPCO and the government's Nuclear and Industrial Safety Agency (NISA) eventually concluded that it was not criticality but "spontaneous fission," revealing the very fact that they were not able to come to grips with the situation inside the reactor accurately. TEPCO plans to start operating gas control systems at the No. 1 and No. 3 reactors by the end of this year to step up its efforts to monitor radioactive substances at each nuclear reactor.

At the No. 3 reactor, which suffered a hydrogen explosion shortly after a similar blast at the No. 1 reactor, debris remains scattered in the reactor building. Furthermore, levels of radiation from the debris remain high, hampering efforts to contain the reactor. Therefore, TEPCO continues to use a crane to remove debris from the upper reactor building blown off by the hydrogen explosion.

The Unit 4 reactor building of the crippled Fukushima Dai-ichi nuclear power station is seen through a bus window in Okuma, Japan Saturday, Nov. 12, 2011. (AP Photo/David Guttenfelder, Pool)

At the No. 1, 2 and 3 reactors, melted nuclear fuel seems to be penetrating the pressure vessels and even leaking out from the reactor buildings. About 10 cubic meters per hour of water has been injected into the reactors to cool nuclear fuel. TEPCO unveiled an estimate that the probability of another reactor core being further damaged would be once in 5,000 years if the nuclear plant were to be hit by a major tsunami again and lose its entire functions to inject water. The utility submitted to NISA its plans to ensure safety at the plant over the next three years or so.

At the No. 4 reactor, which has no nuclear fuel in the reactor itself, about 1,535 fuel rods -- about three times the number of fuel rods at the No. 1, 2, and 3 reactors -- are kept in the spent nuclear fuel pool. For this reason, TEPCO completed the work to sustain the fuel pool with steel frames in late July.

Power plant chief details Fukushima nuclear disaster

OKUMA, Fukushima -- Masao Yoshida, head of the crippled Fukushima No. 1 Nuclear Power Plant, elaborated on the nuclear crisis triggered by the March 11 earthquake and tsunami, saying he and other plant workers thought at the outset of the disaster that they were going to die.

He also said in the first post-disaster interview with the media at the plant in Okuma, Fukushima Prefecture, on Nov. 12 that Tokyo Electric Power Co. plant staff did not know initially what was going on at the plant's reactors, including a hydrogen explosion at the No. 1 reactor on March 12.

The following was a summary of the question-and-answer session.

Question: This is the first time that you are speaking in front of the press corps. First of all, what do you want to say to the Japanese public?

Answer: I want to apologize from the bottom of my heart for the trouble and inconvenience that the power plant I am in charge of caused. We have received letters of support from all over Japan and around the world, and it's a great encouragement in particular to receive assuring words from the people of Fukushima Prefecture.

Q. What was the toughest situation you found yourself in throughout the crisis?

Naturally, it was the first week from March 11. I had no idea what was going to happen next, and we did everything imaginable. To put it in an extremely frank manner, we thought several times that we were going to die.

Q. Please tell us the circumstances surrounding the hydrogen explosion at the No. 1 reactor and how you felt?

A. First, we heard the sound of "boink" and wondered, what was that? We received information from people returning from the scene, "It looks like the No. 1 reactor has exploded." We heard (the explosion of) the No. 3 reactor and saw (TV) footage. We heard (the explosion of) No. 4 reactor at the plant's headquarters but we could not tell whether it was at the No. 2 reactor or the No. 4 reactor.

Q. When did you think you were going to die?

We at headquarters did not know details about the explosion at the No. 1 reactor. As injured workers were returning from the scene, we thought that if the containment vessel had exploded, massive amounts of radiation would spew out and the situation would be out of control. There was also an explosion at the No. 3 reactor and we could not pump water into the No. 2 reactor. A settlement (of the crisis) was nowhere in sight. In a worst case scenario, we thought the meltdowns would rapidly accelerate and become out of control, signaling the end of our world.

Q. When do you think you overcame the crisis?

A. After the explosions, a high concentration of contaminated water leaked in early April, and we worked hard to set up water-processing facilities. We really had a hard time through June. I think the overall system stabilized in July or August.

Q. How is the current status of the reactors?

A. As far as I can confirm from data, there is no doubt that the reactors have been stabilized. But it does not mean they are super stable. Radiation levels are still extremely high and still pose a danger to daily work. They have been stabilized to a degree that makes residents around the plant feel at ease, but work (to bring the crisis under control) is tough going.

Q. Fuel at the No. 1 and No. 3 reactors has melted. Can you stabilize it?

A. As far as we see from changes in temperatures in each section of the fuel reactors, the entire reactors including not only the pressure vessels but also containment vessels have been cooled even if the fuel has melted, and we think the reactors have stabilized.

In this image released Saturday, April 16, 2011, by Tokyo Electric Power Co., top of the container of the nuclear reactor, painted in yellow, of Unit 4 at the Fukushima Dai-ichi Nuclear Plant is observed from its side with a T-Hawk drone Friday, April 15, 2011 in Okuma, Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

Q. Are there any other major troubles right now?

A. It's not a problem for today or tomorrow, but in the short term, workers' radiation exposure and how to rotate people are thorny issues.

Q. How much is your own accumulative radiation exposure level?

A. I won't comment on that because it's personal information but it's reached a certain level.

Q. How are you going to deal with the crisis from now on?

A. One objective is a successful conclusion of Step 2 (to bring the reactors to a cold shutdown under the road map). With local conditions in mind, we will advance proposals for the next step (of mid- and long-term measures) and carry out the task to meet the needs of the people of Fukushima Prefecture.

Questions remain over tsunami safety measures at Hamaoka nuclear plant

The initial stages of construction of a coastal barrier are seen at the Hamaoka Nuclear Power Plant in Omaezaki, Shizuoka Prefecture, on Nov. 14. (Mainichi)

"I've never seen anything this solid," remarked Tomoya Shibayama, a specialist in coastal engineering at Waseda University as he surveyed a coastal barrier under construction at Chubu Electric Power Co.'s Hamaoka Nuclear Power Plant in Shizuoka Prefecture.

The barrier being built at the plant in the wake of the devastating March 11 earthquake and tsunami that crippled the Fukushima No. 1 nuclear complex has foundations reaching the bedrock as deep as 30 meters below ground. The design, based on steel frames filled with concrete, far surpasses the sturdiness of the barriers destroyed by the March 11 disaster.

Yet Shibayama has his reservations.

"I don't believe any coastal engineering specialists have been involved in the design. I can't see any sensible measures such as designing an offshore structure to reduce the force of a tsunami," he said.

Following the March 11 disaster that triggered the nuclear crisis at the Fukushima plant, it emerged the plant's operator, Tokyo Electric Power Co., had not listened to specialists who had warned about the possibility of a tsunami.

Is Chubu Electric Power Co. now heeding the advice of specialists to avoid a repeat of that disaster?

"We consulted the opinions of university researchers and other specialists, but we have not quoted any research papers," a company representative said. The company has been slow to release the names of the scholars it says it has consulted.

On July 22, Chubu Electric Power Co. announced that its new barrier would reach a height of 18 meters. A company official visited the Shizuoka Prefectural Government Headquarters and stated, "The biggest earthquake we can imagine at the Hamaoka Nuclear Power Plant is a magnitude-9 quake creating a tsunami 10 meters high. We've implement all possible measures."

Prefectural crisis management official Satoshi Kobayashi questioned the basis for the company's conclusions, but power company officials simply answered, "These are internal figures."

Kobayashi then said, "There is no clear basis for them. It would be better not to produce figures so hastily," sending the company a warning about the danger of acting on internal assumptions.

To independently check the reliability of Chubu Electric Power Co.'s tsunami countermeasures, the Shizuoka Prefectural Government formed a tsunami committee within its disaster prevention and nuclear power science council. Committee member Kenji Harada, an associate professor in coastal engineering at Shizuoka University, expressed concern that the wall to protect the water intake pump at the plant is just 1.5 meters high. Even if a tsunami was stopped by the barrier, a rise in the sea level would cause seawater to overflow from the intake chamber on the plant grounds, submerging the cooling water intake pump and possibly resulting in a malfunction.

Meanwhile, a more serious issue has emerged. At a meeting of the Seismological Society of Japan in Shizuoka in mid-October, Yoshinobu Tsuji, an associate professor in seismology at the University of Tokyo, spoke to the Mainichi about the possibility of a tsunami in the vicinity of the Hamaoka nuclear plant reaching an elevation of 15 to 20 meters -- far higher than the maximum level predicted by Chubu Electric.

Chubu Electric Power Co. appears to have adhered to "company decisions" so it can quickly move forward with its tsunami countermeasures. But to win the confidence of local residents and local

bodies, it must release information and carefully provide explanations that answer the safety issues raised by researchers.

IEA: Gas imports to jump with no new nuke plants

The International Energy Agency says Japan is likely to face a sharp increase in spending on natural gas imports in 2035 if it halts construction of new nuclear power plants following the Fukushima nuclear accident.

IEA Executive Director Maria van der Hoeven provided estimated calculations in a news conference in Tokyo on Wednesday.

She said Japan will pay 66 billion dollars for imported natural gas in 2035, as energy demand from emerging economies increases and gas prices rise. That figure is nearly double the current level.

She added that if Japan were to stop building new nuclear reactors, the cost of gas imports would increase by about an additional 13 billion dollars.

Van der Hoeven warned that in 2035, Japan will be spending about 40 billion dollars more on natural gas annually than it is now. She added that this could have a substantial impact on Japan's trade balance.

Van der Hoeven also said that higher energy costs would cause a sharp rise in electricity prices, affecting Japanese industries.

She added that the Japanese government should find a solution to these issues if it chooses to reduce its reliance on nuclear power, as alternative measures, such as the use of renewable energy sources, and energy-saving efforts will have limited impact.

<http://www.bloc.com/article/societe/sujets-d-actualite/iode-131-nuage-radioactif-europe-2011-11-16.html>

Iode 131 détecté partout en Europe

Des traces d'iode radioactif sont détectées depuis quelques semaines partout en Europe. Le premier pays à avoir signalé publiquement la présence d'iode 131 dans l'air ambiant fut la République Tchèque. Mais d'autres pays avaient déjà alerté l'Agence Internationale de l'Energie Atomique (AIEA), notamment l'Autriche et la [Hongrie](#). Très vite, la Pologne, la Slovaquie, l'Allemagne, la Norvège, le Danemark et la Russie confirmèrent la présence d'iode radioactif sur leur territoire. Enfin, on sait depuis hier que la France est aussi concernée par ce [nuage radioactif](#) d'iode 131.

Un nuage radioactif sans risque pour la santé

Si la présence d'iode 131 dans l'air ambiant amène de nombreuses questions, l'AIEA et l'IRSN (Institut de Radioprotection et de Sûreté Nucléaire) affirment qu'il n'y a pour l'instant aucun danger. En effet, les doses considérées sont tellement infimes qu'elles ne mettraient pas en danger la santé des personnes, même sur une longue période.

Iode 131, signe d'un événement nucléaire en cours

Là où la présence d'iode 131 inquiète vraiment, c'est qu'elle signale un événement nucléaire récent et peut être encore en cours. En effet, la durée de vie des particules d'iode 131 est particulièrement brève : demi-vie de 8 jours (perte de la moitié de l'activité radioactive en 8 jours). Si on en trouve aujourd'hui, c'est donc forcément qu'un incident ou un accident nucléaire en a relâché très récemment. Et en relâche peut-être encore... Sans compter que cet événement s'inscrit dans la durée puisque, rien qu'en France, les traces d'iode 131 sont détectables depuis le 19 octobre...

Origine du nuage radioactif inconnue

L'AIEA, pourtant chargée de contrôler l'utilisation des matières nucléaires, n'a toujours pas désigné le responsable de cette contamination. Elle déclare ne pas en connaître l'origine, ce qui est particulièrement inquiétant. Mais on peut légitimement douter de ce que dit l'AIEA et considérer que l'agence préfère se taire. Et ce silence inquiète aussi... De nombreuses pistes ont dès lors été évoquées. On parle d'un problème sur une usine de production de traitement médical (l'iode 131 est utilisé en médecine), sur un réacteur de recherche ou sur une centrale nucléaire. La mise en commun des données par les différents pays devrait permettre de reconstituer le mouvement du nuage d'iode 131 et de remonter à sa source.

La piste de Fukushima ne peut pas être écartée

Mais la piste la plus sérieuse reste évidemment l'accident en cours à la centrale nucléaire de Fukushima, au [Japon](#). En effet, après les explosions de mars dernier, des particules radioactives ont survolé la planète et de l'iode 131 a été détecté en France. Aujourd'hui, cet iode a probablement entièrement disparu. Cependant, de nombreux témoignages évoquent une reprise de criticité (réaction de fission nucléaire incontrôlée) à Fukushima. Dans un premier temps, le réacteur 2 fut surveillé de près, mais il existe aujourd'hui des doutes sur le 3. Des sources japonaises ont aussi évoqué de sérieux problèmes sur les réacteurs 5 et 6, que l'on croyait jusque-là épargnés. Or, si les combustibles fondus (corium) sont en fort épisode de criticité, ils rejettent forcément de l'iode 131 dans l'[atmosphère](#). La promptitude des autorités à discréditer la piste de Fukushima pose évidemment question

Source Bloc.com : <http://www.bloc.com/article/societe/sujets-d-actualite/iode-131-nuage-radioactif-europe-2011-11-16.html#ixzz1dsSKZ3D5>

<http://www.simplyinfo.org/>

...Et surprise à 11h55 – mais est-ce une surprise pour la France avec l'antécédent de 1986 ? – [le site du Monde](#) annonce que l'Hexagone est également touché par le nuage radioactif !

Il s'appuie pour cela sur la publication d'une [note de l'IRSN](#) toute fraîche sortie, qui fait le point sur des analyses faites la semaine dernière. Ce qui est très surprenant, c'est que cet organisme dit avoir été informé « de façon informelle à travers les réseaux scientifiques dont il est membre ». Ce qui signifie que l'AIEA, au courant de la pollution depuis plusieurs semaines, n'a pas estimé utile d'alerter les services nationaux compétents de tous les pays européens. Ce manque de réactivité est très grave, car il veut dire clairement que pour l'AIEA, un incident nucléaire, ce n'est pas si grave que cela, et que l'enquête qu'elle était censée faire de manière rapide dans un souci de protection des populations n'a pas été menée sérieusement. A vrai dire, ce n'est pas étonnant, car il faut bien savoir que cette structure internationale n'a pas vraiment pour objet le bien-être des populations mais principalement le développement de l'utilisation l'énergie nucléaire ([Article 3 de ses statuts](#)).

.....

Contaminated water still headache for Tepco

Tuesday, Nov. 15, 2011 - <http://www.japantimes.co.jp/text/nn20111115f2.html>

By [KAZUAKI NAGATA](#)

Staff writer

Tokyo Electric Power Co. has fought an eight-month battle to decontaminate the massive amounts of radioactive water in the reactor basements of the Fukushima No. 1 plant, and the struggle is far from over.

Though it continues to process contaminated water currently flooding the basements of the reactor and turbine buildings for recycling to cool the reactors, the utility has yet to come up with a way to drain all the water from the buildings. With the trouble unlikely to be resolved anytime soon, the threat of further soil, groundwater and sea contamination near the power plant continues.

Tepco originally planned to process 200,000 tons of contaminated water and remove it all by the end of this year, but some 200 to 500 tons of groundwater flows into the buildings every day, rendering this option impossible.

The massive inflow of groundwater indicates the basement walls may be cracked, and thus there is a risk that the contamination can spread to the outside environment. Tepco does not know exactly where the groundwater is coming in from.

The amount of groundwater changes depending on the weather, and increases when it rains, Tepco spokesman Junichi Matsumoto said Friday.

Groundwater around the Fukushima plant flows from mountains in the west toward the Pacific.

Tepco takes groundwater samples every day and has so far said the contamination has not spread below the water table or, during the current cleanup operations, to the sea, at least to any significant extent.

Matsumoto stressed the importance of keeping the current water levels both inside and outside the reactor and turbine buildings constant.

The water level inside the reactor and turbine buildings is about 3 meters above mean sea level, and lower than the groundwater, which is 5 to 6 meters above sea level.

As long as these water levels are kept in balance, the contaminated water will not leak into the ground, he said.

"We will maintain the current balance for a while," said Matsumoto, adding that the utility is not sure how long it will have to do so.

This means the water from inside the buildings will not leak out and contaminate the groundwater. But because groundwater continues to flow into the buildings, Tepco's water removal efforts are endless and until the problem is resolved, the plant won't be brought under control.

The reactor basements contained 77,000 tons of radioactive water as of Nov. 8. Until most is cleared out, it won't be possible to spot cracks or holes in the containment vessels.

In addition, the amount of radioactive waste, particularly sludge, created through processing tainted water keeps increasing. The amount of sludge was 581 cu. meters as of Nov. 8. Reactors 1, 2 and 3, which suffered meltdowns, are currently being cooled by circulating the contaminated water, which is being processed before it is pumped in.

To keep the radioactive water from draining into the sea, Tepco started constructing an underground wall between the shore and the reactor buildings late last month.

The wall, about 800 meters long and 22 to 23 meters deep, will take two years to complete.

Experts say, however, that building the containment wall just on the east side will not be effective.

"The groundwater keeps flowing in the direction of the sea. Even if the wall blocks a certain amount of it, the water will accumulate behind it, eventually build up and flow around the wall into the ocean," said Yoshikazu Suzuki, who heads Chiba-based Kimitsu System Co., which specializes in soil and water decontamination.

It would be more effective to build a wall around the west, north and south sides to keep the groundwater from reaching the reactor and turbine buildings rather than building a wall by the sea, said Suzuki, who surmises the contaminated water is already flowing into the groundwater and sea. He said Tepco should then dig wells at the plant complex to pump the contaminated water out of the ground.

Tepco considered the full enclosure option but decided against it for now because it entails further risk and would upset the current water level balance, posing the danger of the contaminated water inside the buildings escaping into the ground.

Excessive levels of radioactive cesium found in Fukushima rice

FUKUSHIMA (Kyodo) -- Excessive levels of radioactive cesium have been found in rice harvested in the city of Fukushima, the Fukushima prefectural government said Wednesday, marking the first time such levels of the isotope have been detected in the national staple since the nuclear crisis erupted in March.

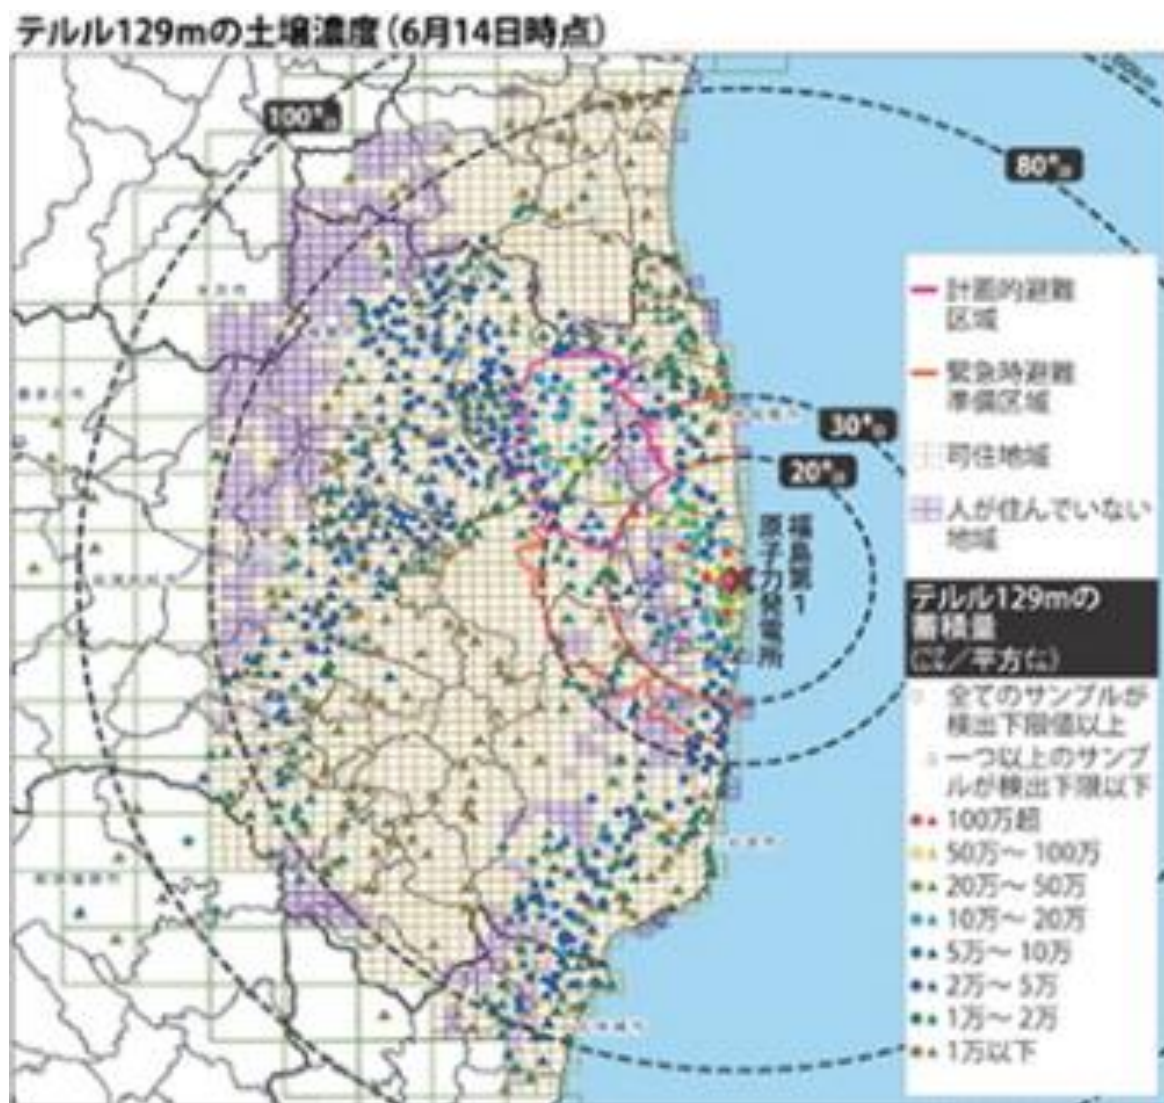

The cesium in the rice samples taken at a farm in the city measured 630 becquerels per kilogram, against the provisional 500-becquerel limit set by the government, according to the local government.

The central government has started considering banning rice shipments from the area, government sources said.

None of the 840 kg of rice produced at the farm this year has been shipped to markets, local officials said. The local government asked farms in the Onami area in the city where the rice was harvested to refrain from shipping their fresh produce, but one ton of rice has already been shipped to rice sellers, including at least one in the city.

The prefectural government said it will also inspect rice grown at the roughly 150 farms in the area for traces of radioactivity.

The prefectural government was testing rice samples from the farm in question after a farm cooperative found radioactive cesium exceeding the permitted level in the samples on Monday, according to the local government. The cooperative tested the samples at the farm's request.

A screen capture of a Ministry of Education, Culture, Sports, Science and Technology map displaying the diffusion of the radioactive element tellurium 129m around the Fukushima No. 1 nuclear plant. (Mainichi)

Alarming levels of cesium measuring 500 becquerels per kg were found in rice harvested in Nihonmatsu, Fukushima Prefecture, in a preliminary test in September, but those measured in the subsequent test were within the allowable limit.

After testing rice samples from all the 48 cities, towns and villages in the prefecture where rice has been grown this year, the Fukushima governor declared last month that the crop produced in the prefecture, which hosts the crippled Fukushima Daiichi power plant, was safe.

The Onami area is located in the mountains several kilometers to the east of the center of the prefectural capital.

Japan mulling banning cesium-tainted rice shipments from Fukushima

TOKYO (Kyodo) -- The Japanese government is considering banning shipments of cesium-contaminated rice from the Onami area in the city of Fukushima that was affected by the accident at the Fukushima Daiichi nuclear power plant, Chief Cabinet Secretary Osamu Fujimura said Thursday.

"We're considering restricting shipments of rice harvested in the Onami area in the city of Fukushima...and we'll draw a conclusion swiftly," Fujimura, the government's top spokesman, said at a press conference.

Excessive levels of radioactive cesium were found Wednesday in rice harvested in the area, the first time such levels of the isotope have been detected in the national staple since the crisis erupted at the Fukushima nuclear power station, crippled by the devastating March 11 earthquake and tsunami.

But Fujimura also said that rice containing excessive levels of cesium has not been put on the market so far as it was found in tests conducted before being shipped.

"I've heard the problem will not become serious," he said, adding the government will continue to make efforts to prevent the spread of unfounded rumors about Japanese products being contaminated by radioactive substances.

(Mainichi Japan) November 17, 2011

Half of radioactive materials from Fukushima fallen into sea: study

TOKYO (Kyodo) -- More than half of the radioactive materials that were emitted into the atmosphere in the days after the Fukushima nuclear disaster have since fallen into the ocean, according to a recent simulation by a team of researchers.

Between 70 and 80 percent of the radioactive cesium from the Fukushima Daiichi power plant in Fukushima Prefecture had fallen into the sea by April, with the rest having fallen on land, according to the simulation done by the Meteorological Research Institute in Tsukuba, Ibaraki Prefecture, and other researchers.

"The Fukushima nuclear power plant is located on the eastern edge of Japan, so only small amounts ended up falling on land because (such materials) get carried by the westerlies between March and April," said Yasumichi Tanaka, a senior researcher at the Japan Meteorological Agency institute and a member of the research team. However, it suggests **the fallout that did not make landfall polluted the ocean**, he added.

A simulation model applied in the study was developed by the institute and the agency, and was used to see how such radioactive isotopes as cesium-131, cesium-134 and cesium-137 got dispersed in the days after the disaster triggered by the March 11 earthquake and tsunami.

On the premise that the materials were dispersed with each particle being the size of less than 1 micrometer, the simulation showed they largely completed a trip around the globe in roughly 10 days after first crossing the Pacific.

Once released into the atmosphere, the materials were dispersed mostly northbound and reached the western coast of the mainland United States around March 17 after passing through eastern Russia and Alaska, according to the simulation. **They are likely to have largely completed a round-the Earth trip around March 24.**

Most of the radioactive materials fell with rain as they got carried through the atmosphere, the study showed, saying that about 65 percent of the cesium-131 released into the air in the disaster has since fallen into the sea.

The results of the study will be presented to an academic meeting in Nagoya that began Wednesday.

(Mainichi Japan) November 17, 2011

High radioactivity detected in some Fukushima rice

An inspection of recently-harvested rice in Fukushima Prefecture has found levels of radiation higher than the government-allowed limit.

The Fukushima Prefectural government says tests have detected 630 becquerels per kilogram of radioactive cesium in rice from a field in the Oonami district in Fukushima City. The government's maximum allowable level is 500 becquerels per kilogram.

Oonami is about 50 kilometers from the disabled Fukushima Daiichi nuclear power plant.

The prefectural assessment followed tests conducted by a local agricultural cooperative on Monday, which pointed to higher dosages than the interim tolerable limit.

The prefecture says the farm in question produced about 840 kilograms of rice this year. It says the harvested rice is being kept in a warehouse and has not gone into circulation.

The prefecture says it has asked all farmers in the district to suspend rice shipments.

The central government says it has begun to assess whether to ban rice shipments from the district altogether.

This is the first time that radiation levels higher than the government limit have been found in rice crops since the nuclear accident.

Last month, the prefecture allowed shipments from the district after tests at 2 locations largely confirmed radioactive levels lower than the legal limit.

The prefecture says it will reexamine the crops from all 154 farms in the district.

A prefectural agriculture department official says the prefectural government is appalled by the test results. He says the prefecture will try to obtain information on distribution of rice from surrounding areas, and will investigate why the rice contained such high levels of radiation.

The head of the local agricultural cooperative says his cooperative takes the fact that radioactive cesium has been detected in the district seriously despite the contradictory results of earlier tests. He says his cooperative plans to conduct more detailed tests.

Thursday, November 17, 2011 06:07 +0900 (JST)

Fukushima Prefecture probes cesium-tainted rice

Fukushima Prefecture is trying to track down all rice harvested in one district of Fukushima City after radioactive cesium higher than the government limit was found in some of the rice.

The prefectural government says 630 becquerels per kilogram of radioactive cesium has been detected in rice harvested in the Oonami district in Fukushima City. The maximum allowable level set by the central government is 500 becquerels per kilogram.

The prefecture says that rice harvested from the same rice paddies is stored at facilities including a local agricultural cooperative, and none of that rice has been released to the market. The prefecture has asked all 154 farmers in the district to suspend rice shipments.

Still, the prefectural government has asked all the farmers about their shipments. Based on the

interviews of 86 farmers, about one ton of rice was sold to local dealers from the district.

The government is trying to confirm whether any of the rice has reached consumers.

The Fukushima Prefectural government is investigating the cesium contamination while continuing the interviews. The prefecture will discuss its course of action with Fukushima City and local agricultural cooperatives on Thursday afternoon.

Thursday, November 17, 2011 13:44 +0900 (JST)

Accident manuals for No 2 & 3 reactors disclosed

Accident manuals for reactors Number 2 and 3 at the Fukushima Daiichi nuclear plant have again disclosed a lack of proper procedures to deal with a nuclear accident.

The Nuclear and Industrial Safety Agency released Tokyo Electric Power Company's procedural manuals for the two reactors on Thursday. The portion of the manual for the No 1 reactor was disclosed in October.

The newly disclosed portions, about 180 pages each for reactors 2 and 3, describe procedures on water injection into the reactors and procedures to vent steam to reduce pressure within the reactor containment vessel.

But, the manuals had not made sufficient and specific preparations for an extended all-station blackout such as the one that occurred at the No 1 reactor.

The utility staff members followed the procedures in the manuals immediately after the March earthquake hit the power plant, but very few steps were followed after the tsunami.

The latest disclosure of the manuals came after the utility earlier submitted them to a Lower House panel with most of the contents blacked out.

TEPCO had insisted the information had to be kept secret in order to protect its intellectual property rights and because disclosure could open its facilities to terrorist attack.

Thursday, November 17, 2011 15:29 +0900 (JST)

L'iode radioactif baladeur viendrait de Hongrie

LEMONDE.FR | 17.11.11 | 13h58 • Mis à jour le 17.11.11 | 16h24

Le mystère est sans doute résolu : une installation hongroise de production d'isotopes médicaux serait à l'origine des rejets atmosphériques d'iode radioactif détectés ces derniers jours, à l'état de traces, dans plusieurs pays d'Europe centrale ainsi qu'en Allemagne et en France.

L'Institut hongrois de recherche sur les isotopes a annoncé, jeudi 17 novembre, avoir enregistré, dans son laboratoire de Budapest, une augmentation de ses émissions d'iode 131. Selon le directeur de cet institut, ces rejets n'expliqueraient pas – ou du moins pas en totalité – la contamination observée jusqu'en France. Mais, d'après l'Agence internationale de l'énergie atomique (AIEA), qui n'a pas encore communiqué officiellement cette information, le laboratoire de Budapest serait bien l'origine principale de la **contamination, qui ne présenterait pas de danger sur le plan sanitaire.**

L'ACTIVITÉ DU LABORATOIRE A ÉTÉ INTERROMPUE

Ce laboratoire avait déjà constaté une hausse de ses émissions d'iode 131 au cours du premier semestre 2011. Bien que les niveaux soient restés inférieurs, selon les dirigeants, au seuil toléré par les autorités sanitaires, la production d'isotopes avait été suspendue de juin à août, pour permettre une amélioration du système de filtrage. La production a repris en septembre, mais les émissions d'iode radioactif ne sont pas redescendues à leur niveau antérieur. L'activité du laboratoire serait à nouveau interrompue.

Le 11 novembre, l'AIEA avait indiqué avoir été informée, par les autorités de contrôle de la République tchèque, de la présence dans l'air ambiant de *"très faibles niveaux d'iode 131"*. Des traces de particules radioactives, présentes dans l'atmosphère sous forme d'aérosols, ont également été décelées en Pologne, en Slovaquie, en Autriche et en Allemagne. En France, les niveaux mesurés par l'Institut de radioprotection et de sûreté nucléaire (IRSN) étaient de quelques microbecquerels par mètre cube d'air. Des concentrations beaucoup trop faibles pour présenter un risque sanitaire.

Différentes hypothèses avaient été émises pour expliquer cette faible pollution à l'iode 131, dont celle de rejets accidentels provenant d'un réacteur nucléaire, industriel ou de recherche. Si la source de l'iode radioactif semble désormais identifiée, **l'incapacité des autorités nationales et internationales à la localiser rapidement reste préoccupante.**

Pierre Le Hir

Environment Ministry official under fire for dumping radioactive soil near home

Environment Minister Goshi Hosono bows in apology over the dumping of radioactive soil by a ministry official, in this picture taken on Nov. 17. (Mainichi)

A Ministry of the Environment official has dumped radioactive soil on a vacant lot of land near his home in Saitama Prefecture after the soil was sent to the ministry by a Fukushima resident, it has been announced.

Environment Minister Goshi Hosono revealed during a press conference on Nov. 17 that an employee of his ministry had thrown away the soil containing radioactive materials near his home after the soil apparently collected in the city of Fukushima was sent to the ministry earlier this month. The ministry has so far received such soil twice, and the dumped soil was one of the two portions.

"It is something that should never have happened at the Environment Ministry, which is in charge of decontaminating radioactive materials. I deeply apologize to the general public," Hosono said.

According to the ministry, a cardboard box smaller than one containing A4 copy paper was sent to the ministry at around 9 a.m. on Nov. 8. Inside the box was a portion of soil wrapped in a plastic bag and a letter reading, "This soil was collected at my home in Fukushima city. I want the Environment Ministry to keep it and dispose of it," with the sender's name added. The letter also contained data on radiation dosages measured around the sender's home.

The levels of radiation emitted from the soil were 0.18 microsieverts per hour when measured 0.8 meters away and 0.6 microsieverts outside the plastic bag containing the soil. The radioactive concentration of the soil was estimated to be around 4,000 becquerels per kilogram.

When ministry officials were discussing how to dispose of the contaminated soil, the chief of the General Affairs Division of the Environment Minister's Secretariat reportedly said, "I understand the feeling of the resident who sent the soil. Since its radiation dosage is low, shall I throw it away in the garden of my house in Kashiwa, Chiba Prefecture?" Later, an employee of the same division took the soil to his home in Saitama Prefecture on Nov. 12 and dumped it on a nearby vacant land lot the following day.

After a smaller box with a content label reading "ash" was sent to the ministry apparently from the same sender on Nov. 16, the General Affairs Division reported the cases to Hosono and other high-ranking ministry officials, prompting the inappropriate soil disposal to surface. The ministry measured the radiation levels of the second box without opening it and found that the levels were about the same as those emitted from the soil in the first box.

Hosono said the ministry employee's action was extremely inappropriate and could violate a special measures law on the handling of radioactive contamination emanating from the disaster at the Fukushima No. 1 Nuclear Power Plant, which bans the dumping of contaminated soil without permission. The law will come into effect in January next year. The minister added that he is considering punishing the ministry employees concerned, including transferring the General Affairs Division chief to another section, as well as questioning his own supervisory responsibility.

(Mainichi Japan) November 17, 2011

Most radioactive cesium piled up within 2 centimeters of soil surface

Most of the radioactive cesium emitted by the crippled Fukushima No. 1 Nuclear Power Plant has piled up within two centimeters of the soil surface, the government has announced.

The Cabinet Office's Team in Charge of the Lives of Disaster Victims announced on Nov. 16 the detailed results of its survey on cesium dosage and accumulations in the soil, forests, buildings, rivers and other environments. Based on the results, the Cabinet Office has concluded that "most of the cesium can be removed if the top two centimeters of the soil is scraped away from its surface."

The survey, conducted between July and September, covered the Fukushima Prefecture town of Tomioka, which is designated as a no-go zone, and the town of Namie, which has both a no-go zone and an evacuation preparation zone. Officials said 80 to 97 percent of cesium detected in those areas' schools, parks, rice paddies and other locations was found within two centimeters of the soil surface.

In forests and orchards, cesium tended to penetrate deeper into the soil, but 68 to 88 percent of cesium still accumulated within two centimeters of the topsoil, according to the survey.

In the leaves of deciduous trees that have grown following the onset of the nuclear disaster in March, 60 to 26,000 becquerels of cesium per kilogram was detected, while the leaves of evergreen trees that have existed since before the March 11 disasters contained levels of cesium about 10 times higher than that, at 18,000 to 220,000 becquerels per kilogram. Meanwhile, fruits of trees that have grown in places with high cesium concentrations in the soil hardly bore cesium, the survey has found.

Gov't not to permit restart of 2 reactors at Genkai plant: Edano

TOKYO (Kyodo) -- Economy, Trade and Industry Minister Yukio Edano said Thursday the government will not allow Kyushu Electric Power Co. to restart two nuclear reactors at its Genkai power plant amid a scandal involving an attempt by the utility to misrepresent public opinion regarding the restart.

Kyushu Electric should not be allowed to resume operation of the No. 2 and 3 reactors, currently idled for regular checks, at its nuclear plant in the town of Genkai in Saga Prefecture "in view of its current governance," Edano told the Budget Committee of the House of Councillors.

Edano was referring to Kyushu Electric's campaign to mobilize employees to bombard a government-sponsored television program with e-mails in support of restarting the reactors.

A third-party panel set up by the utility to investigate the scandal concluded in late September that a remark by Saga Gov. Yasushi Furukawa prompted the utility to launch the e-mail campaign.

Kyushu Electric's Oct. 14 report to the industry ministry did not include the third-party panel's conclusion. With Edano angered by the report, the utility submitted a revised report on Wednesday that again omitted the panel's conclusion.

Kyushu Electric "has refused to accept a report it commissioned from the panel," Edano said.

(Mainichi Japan) November 18, 2011

Fukushima plant awaits gov't judgment over state of cold shutdown

TOKYO (Kyodo) -- The government will declare that the crisis-hit Fukushima Daiichi nuclear power plant has achieved a cold shutdown **once it confirms that the complex can maintain stability over the next several years even if it is hit by an earthquake or suffers malfunctions**, nuclear disaster minister Goshi Hosono said Thursday.

Hosono also said he believes the melted nuclear fuel of the Nos. 1 to 3 reactors, including the portion believed to have melted through the base of the reactor pressure vessels, is being stably cooled and reiterated he believes a cold shutdown will be achieved by the end of the year as planned.

In the road map for the resolution of the crisis, which is updated every month, the government and plant operator Tokyo Electric Power Co. said not only that the temperature at the bottom of the pressure vessels of all three reactors is below 100 C, but that the temperature inside the primary containment vessels of the reactors, where part of the melted fuel may be accumulating, was between 39 C and 70 C as of Wednesday.

"There have been various discussions on whether the fuel remains inside the pressure vessels, or has dropped to the (outer) primary container...and our explanation is that we think we are able to stably cool the fuel including that inside the primary containers and the pressure vessels," Hosono said at a press conference also attended by officials from the utility known as TEPCO.

Adding to signs of further progress in restoration efforts, **the amount of radioactive substances currently leaking from the crippled reactors has further declined to a maximum of 60 million becquerels per hour**, or around a 13-millionth of the level seen in the early days of the crisis, which was triggered by the devastating March 11 earthquake and tsunami.

The estimate means a person would be exposed to up to 0.1 millisievert when standing around the plant for one year, far below the government-set target limit of 1 millisievert per year.

Realizing a cold shutdown is the key goal of the "step 2" phase of the road map, with the government defining it as a situation in which the bottom part of a reactor pressure vessel at the plant is kept below around 100 C and radiation exposure from the release of radioactive substances is significantly held down.

Hosono said the government is "cautiously" checking whether the current situation can be maintained over the medium term even if the plant experiences another earthquake, accident or malfunction.

"As there are still various risks, we're currently confirming whether appropriate measures are taken...and if we confirm that, it will be the completion of step 2," he said.

Other tasks included in the step 2 phase have almost been completed, with workers starting to build a wall along the coast to prevent water containing radioactive substances from leaking into the Pacific Ocean.

They also finished installing a covering over the No. 1 reactor on Oct. 28 as the building housing the reactor was badly damaged by a hydrogen explosion.

After the step 2 phase, the government and TEPCO aim to start removing nuclear fuel stored in the spent fuel pools of the Nos. 1 to 4 units within 2 years and the melted fuel from the Nos. 1 to 3 reactors within 10 years.

GSDF to usher radiation cleanup work in Fukushima next month

TOKYO (Kyodo) -- Ground Self-Defense Force troops are set to be dispatched next month to clear up municipal buildings near the crisis-hit Fukushima Daiichi nuclear power plant, which will then serve as bases for a full-fledged decontamination operation from January, a government official said Friday.

Defense Minister Yasuo Ichikawa expressed his willingness for the dispatch during a morning ministerial meeting to discuss decontamination, Chief Cabinet Secretary Osamu Fujimura told a press conference, after hosting the first meeting of its kind.

The environment and defense ministries confirmed at the meeting that they will make a final arrangement on where the troops, envisioned to number about 300, will be engaged in the cleanup work after assessing data on radiation levels, he said.

The Environment Ministry has called on the GSDF to clean up the office buildings of the three towns of Namie, Tomioka and Naraha in Fukushima Prefecture, its officials said.

The decontaminated offices will serve as bases for private-sector workers who will engage from January in the removal of radioactive materials from areas affected by the country's worst nuclear disaster triggered by the March earthquake and tsunami.

The GSDF would aim to complete by the end of this year its decontamination work involving chemical corps with radiological capabilities, government officials said.

Anxieties grow about radiation costs / No clear criteria, answers from TEPCO have municipalities fearful for budgets

Tomoaki Tomita and Tatsuya Nozaki / Yomiuri Shimbun Staff Writers

A growing number of municipalities are demanding that Tokyo Electric Power Co. compensate them for costs related to the ongoing nuclear crisis at the Fukushima No. 1 nuclear power plant.

TEPCO has specified the terms under which it will compensate companies and other entities, based on guidelines set by the government, but it has revealed no such terms for municipal governments.

On Wednesday afternoon, Mayor Yoshio Kusama of Takahagi, Ibaraki Prefecture, visited TEPCO's headquarters in Tokyo. Takahagi is about 80 kilometers from the plant.

Kusama asked the utility to pay 9.84 million yen for decontamination work conducted from June to October and the purchase of radiation dosimeters. It was the city's second such demand to TEPCO--in June, it became one of the first municipalities to seek compensation from the utility, demanding 2.05 million yen.

"I'll keep making demands until work to deal with the nuclear crisis ends. I mean until there are no more costs [for the work]," Kusama told TEPCO Managing Director Naomi Hirose, who is deputy head of a task force to support people affected by the nuclear crisis.

"I'm telling you this while repressing [my anger] to one-tenth, one-hundredth of its true level," Kusama said.

Hirose responded, "We apologize for causing difficulty," and bowed. However, he did not say whether TEPCO would pay the money.

Municipal governments, particularly in the Tokyo metropolitan area, have increasingly requested compensation from TEPCO. As of Wednesday, at least 18 municipalities had demanded a total of 705.74 million yen.

Hitachi-Ota, Ibaraki Prefecture, is home to the 375-meter-long Ryujin Big Suspension Bridge, the longest bridge on Honshu. About 250,000 tourists usually visit the bridge annually.

However, as bridge toll revenues from April to August declined to less than 30 percent compared with the same period last year, the city has called on TEPCO to pay 26.72 million yen in compensation.

The city of Nagareyama, Chiba Prefecture, has demanded 287.1 million yen, including 9.6 million yen to pay its employees for special work related to temporarily storing incinerated ash and other contaminated waste.

====

Costs may hit local finances

Mayor Shingo Fujii of Toride, Ibaraki Prefecture, expressed concern that the cost of handling the nuclear crisis would weigh on municipal governments' finances.

"Municipalities are implementing numerous fiscal reforms to tackle their fiscal shortage. To secure funds for measures against radiation, we have to spend reserve funds for adjusting public finances [as stipulated in the Local Finance Law]," Fujii said Tuesday when claiming compensation with three other neighboring cities.

"Unless we make up the shortfall in the reserve fund, we'll have trouble with our fiscal management from next fiscal year," Fujii said.

Despite growing demand for compensation from municipalities, however, TEPCO has yet to provide clear responses. The government's Dispute Reconciliation Committee for Nuclear Damage Compensation has drawn up compensation guidelines for the private sector, but no such moves have been made for municipal governments. Due to the lack of specific criteria, more and more municipalities have called for compensation from TEPCO.

Meanwhile, the Shizuoka city government announced in April it would allow TEPCO to use its megafloat, a floating barge, to store radiation-contaminated water from the Fukushima plant. Shizuoka is still negotiating with the company on how much it should pay for use of the barge.

The city government spent about 500 million yen to build a fishing park off Shimizu Port, using the megafloat as its base. The park drew 20,000 visitors a year but is now closed. The city is reportedly asking TEPCO to pay **hundreds of millions of yen for providing the megafloat.**

On Monday, the government of Yashio, Saitama Prefecture, appropriated about 40.98 million yen in its supplementary budget to cover the cost of such work as decontaminating school grounds and parks. The city is unlikely to be designated a contaminated area entitled to government aid, but Yashio Mayor Shigemi Tada said, "I want TEPCO to pay for everything."

====

Unclear picture

The Fukushima prefectural government also reportedly intends to demand TEPCO pay costs related to dealing with the nuclear crisis. The crisis has led the prefecture to conduct a broad array of work, from decontamination over a wide area to health checks. But the prefectural government has yet to figure out the total amount needed to handle the crisis, as well as how much government aid it could receive.

"We don't know to what extent we can seek compensation, so we have no clear prospects," said an official of the prefectural government section handling nuclear damage.

In early September, Kawamatamachi in the prefecture demanded TEPCO pay some of costs for decontaminating soil in school grounds. Part of Kawamatamachi has been designated as an expanded evacuation area.

"We made the demand to **express the fact that municipalities are also victims** [of the nuclear crisis]," a town government official said.

News Navigator: How is the provisional radiation limit for food determined?

The government on Nov. 17 ordered the Fukushima Prefectural Government to suspend shipments of rice harvested in the prefecture's Onami district after levels of radioactive cesium exceeding the provisional limit were detected. Below are questions and answers relating to the provisional limit and the safety of contaminated products.

Question: What exactly is the provisional limit?

Answer: It is a limit established by the Ministry of Health, Labor and Welfare to regulate the sale of food products contaminated by radioactive materials. In the case of radioactive iodine, food is divided into four categories when determining the limit, while for radioactive cesium, there are five categories.

Q: How is the limit determined?

A: Radioactive materials have half-lives -- the time it takes for half of the atoms in a radioactive substance to undergo decay. Assuming that a product has been contaminated at one stage, the fact that the radioactivity in food decreases over time is taken into consideration to work out the yearly intake from eating this food, and this is set below a certain limit. If a person continued to eat food on the verge of the provisional limit day after day, they would go over the intake limit.

When considering the effects on the human body, the unit of becquerels, which indicates the strength of the radioactive material, is converted into millisieverts, which measures the radioactive dose equivalent. **The yearly intake level for radioactive iodine is 50 millisieverts, while the limit for cesium is 5 millisieverts per year.**

文部科学省がこれまでに測定してきた各地のセシウム134, 137の注着量の合計

A screen capture of a map released on Nov. 11 by the Ministry of Education, Culture, Sports, Science and Technology displaying accumulated radioactive cesium levels in eastern Japan. (Mainichi)

Q: Is it safe to eat the rice from Fukushima that was found to exceed the provisional limit?

A: This time cesium with radioactivity of 630 becquerels per kilogram was detected in unpolished rice. The half-life of cesium is about 30 years. By polishing the rice, about 60 percent of the radioactive materials could be removed, thereby bringing the level of radioactivity under the provisional limit. The Ministry of Health, Labor and Welfare says a person's health would not immediately be affected even if they ate the rice every day. Radioactive iodine, which has a half-life of about eight days, would hardly be detected at all. In estimating the concentration of radioactive materials in food, the concentration of radioactive materials in the ground and animal feed is first multiplied by the coefficient for the transition of radioactive materials into particular foods. This figure is then multiplied by a conversion coefficient, which is highest for infants. For children aged between 3 and 7, who have highly active metabolisms, the figure is smaller than that for adults.

The Ministry of Health, Labor and Welfare **plans to set a strict yearly intake level for cesium of 1 millisievert per year by around April next year, and establish new limits.**

Fukushima begins model decontamination project in no-entry zones

FUKUSHIMA -- A model decontamination project to work out specific methods for cleaning up areas tainted by radioactive materials from the Fukushima No. 1 nuclear power plant began here on Nov. 18.

Starting from Okuma, which is host to the damaged nuclear plant, the government began measuring the amount of radiation in one or two areas designated for the model project in a total of 12 municipalities near the plant.

The collected data will be used for decontamination operations in all affected areas in the prefecture, as well as to measure the decontamination effects after the clean-up operations are completed.

The first examined location for the project was a residential area near Okuma town hall. Approximately 30 workers measured radiation levels on the ground surface and at one centimeter and at one meter above the ground in each 10-meter-square section.

Radiation data was also gathered at approximately 100 other locations in the area considered as possible "hot spots," such as under trees and shrubs.

According to the Japan Atomic Energy Agency (JAEA), the highest radiation level measured within the area on that day was 43.4 microsieverts per hour.

The pre-decontamination monitoring will continue until around Nov. 20, followed by the first decontamination operations of the area planned to start within November, the JAEA said.

"We hope to begin using the data gathered from this project for decontamination operations as soon as possible so that people who lived within the no-entry zones can freely return to their homes," said Satoshi Takayama, Parliamentary Secretary of the Environment, who partially observed the project operations on Nov. 18.

Arabs push nuke energy despite Fukushima

Published: Nov. 18, 2011 at 1:29 PM - http://www.upi.com/Business_News/Energy-Resources/2011/11/18/Arabs-push-nuke-energy-despite-Fukushima/UPI-90311321640943/

DUBAI, United Arab Emirates, Nov. 18 (UPI) -- Most Arab states have shrugged off the political and environmental fallout from the March 11 Fukushima disaster in Japan and are pushing ahead with nuclear energy programs.

Kuwait, Bahrain and Egypt have stalled their plans because of heightened safety concerns triggered by the Fukushima meltdown caused by a 9-magnitude earthquake and a 49-foot tsunami.

But they have also been hit by the pro-democracy uprisings that have plunged the Arab world into political turmoil and an uncertain future.

It's not clear when, or even if, they might revive their nuclear plans.

But Arab countries that had already launched their nuclear energy programs, such as Saudi Arabia and the United Arab Emirates, are pressing ahead.

Eight months after the Fukushima meltdown, "the impact of the crisis on nuclear power plans in the Middle East and North Africa region is becoming clear," the Middle East Economic Digest reported this month.

"Countries that had already begun to develop nuclear power plants have largely stayed on track ...

"In contrast, countries that rushed to announce new plans in 2010 have been forced to reassess due to the Fukushima disaster," MEED reported.

Leading the way is Saudi Arabia, the world's leading oil producer which fears that by 2020 its oil output will be entirely consumed domestically to fuel power generation.

Right now, the kingdom is producing more than 8 million barrels per day, two-thirds of its total capacity.

Some economists say that if the current energy consumption growth rate of 7 percent continues, within 20 years the kingdom will burn the equivalent of almost all of its recent daily output.

Others have lower projections which the Saudis consider to be more accurate, although the forecasts remain dire.

In 2010, Khalid al-Falih, CEO of the state-owned Saudi Arabian Oil Co., known as Aramco, warned that if left unchecked domestic energy consumption would drain 3 million bpd from crude oil available for export by 2028, cutting of the country's economic lifeline.

At present Saudi Arabia's spare production capacity, which accounts for most of the spare capacity by 12-member Organization of Petroleum Exporting Countries, is vital for countering disruptions to oil supplies around the globe.

Without that capability to keep down oil prices when necessary, the world could be battered by serious oil crises initiated by radical states like Iran and Venezuela.

Prince Turki Al-Faisal, Saudi Arabia's former intelligence chief and later ambassador to Washington, said in September the kingdom plans to spend more than \$100 billion to build 16 nuclear reactors to meet its growing domestic energy needs driven by rapid population growth and economic development.

"After 10 years, we'll have the first two reactors," said Abdul Ghaini bin Melaibari, coordinator of scientific collaboration at King Abdallah City for Atomic and Renewable Energy, known as Ka-Care, set up in 2010 to formulate nuclear policy.

"After that, every year we'll establish two, until we have 16 of them by 2030."

On Tuesday, Riyadh signed an accord with South Korea to cooperate in developing nuclear power.

It signed similar pacts with France and Argentina earlier this year and is currently negotiating with the United States, Britain, China and Russia.

Korea Electric Power Corp. won a \$20 billion contract in December 2009 to build four nuclear plants with a combined capacity of 5,600 megawatts in the United Arab Emirates, another major oil producer facing swelling domestic energy demands, to be ready in 2017-20.

That would make the emirates the first Arab state, like Saudi Arabia an important U.S ally, with atomic power.

Emirates authorities forecast that national peak electricity demand will rise to more than 40,000MW by 2020. Only 20,000-25,000MW can be generated using domestic reserves of natural gas.

All told, 13 countries across the Middle East have announced plans for nuclear power stations, or revived old plans, since 2006.

Despite the vast hydrocarbon reserves held by Saudi Arabia and the other Persian Gulf producers, virtually every Middle Eastern state faces gas shortages as their populations grow, economies expand and energy consumption soars.

Jordan, a desert kingdom with few resources, is also sticking to its plans to establish a nuclear power project.

Its Atomic Energy Commission has taken bids from several companies, most notably Areva of France and Mitsubishi of Japan, to build a nuclear plant.

Fukushima radiation meters fail gov't accuracy requirements

A radiation meter made by Alpha Tsushin K.K. (Photo courtesy of the Ministry of Education, Culture, Sports, Science and Technology)

Radiation meters installed at parks and primary schools across Fukushima Prefecture do not meet the central government's minimum accuracy requirements, it was learned on Nov. 18.

The Ministry of Education, Culture, Sports, Science and Technology cancelled its contract with the meters' supplier the same day. The ministry will begin removing the 600 devices soon, **and reopen bidding on the radiation meter contract**. The meters were scheduled to start operating in October, but that has now been **pushed back to February next year at the earliest**.

According to the ministry, five firms bid on the meter supply contract in July, won by Tokyo-based telecommunications equipment firm **Alpha Tsushin K.K.** for some **370 million yen**. The contract requirements demanded that radiation measurements be accurate to within plus or minus 20 percent, but soon after they were installed in October the ministry discovered the meter readings were off by as much as 40 percent.

The science ministry intends to demand compensation from Alpha Tsushin for breach of contract.

A public relations official with the company told the Mainichi, "There are many points on which we cannot agree with the cancellation of the contract."

N-plant cold shutdown possible this year

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T111118006292.htm>

Step 2 tasks and achievements

Temperature changes in containment, pressure vessels (in Celsius)

Tasks		Goals	Current situation
Cooling fuel	Reactors	Cold shutdown	Not achieved
	Storage pools for spent fuel	More stable cooling	Achieved in Oct.
Containing discharge of radioactive substances	Polluted water	Reduction of quantity	Achieved in Oct.
	Groundwater	Preventing spread of seawater pollution	Achieved in Nov.
	Air, soil	Containing dispersal	Achieved in Nov.
Measurement, decontamination	Measuring, reducing and announcing radioactive emissions	Reducing emissions to sufficiently low levels	Achieved in Nov.
Protection against aftershocks	Anti-tsunami measures, reinforcement of buildings	Prevention of further damage	Achieved in Oct.
Improving workers' circumstances	Living, workplace conditions	Improvement	Not achieved
	Radiation control, medical care	Improvement of health care	Not achieved
	Training, deploying workers	Organized training and deploying of workers to measure radioactive emissions and perform other key tasks	Not achieved

The government and Tokyo Electric Power Co. have released a revised timetable for containing the crisis at the Fukushima No. 1 nuclear power plant, saying cold shutdown of the reactors can be achieved by the end of the year.

The government and TEPCO on Thursday also made their first announcement of a confirmed annual radiation level at the perimeter of the plant grounds. The most recent data shows the radiation level at 0.1 millisievert per year.

Step 2 of the timetable set a target of 1 millisievert per year as a condition of cold shutdown, and this important figure has now been confirmed.

Though continual monitoring will be necessary to determine if cold reactor stability can be maintained, Goshi Hosono, state minister in charge of the nuclear crisis, said, "Achieving cold shutdown within the year is possible."

To achieve cold shutdown, two conditions need to be fulfilled: reduction of the quantity of radioactive material discharged by the reactors, and keeping the temperature at the bottom of the pressure vessels at 100 C or lower.

The quantity of discharged radioactive materials has fallen about 40 percent from last month to 60 million becquerels per hour.

This represents one-thirteen millionth of the about 800 trillion becquerels immediately following the accident.

Because measurement accuracy has improved, the most recent figures released are confirmed rather than interim.

The temperature target has also been reached, with Thursday's temperatures reading 37 C in the No. 1 reactor and 68 C in the Nos. 2 and 3 reactors.

Regarding the containment vessels containing melted fuel, TEPCO said the temperature of the vessels had steadily dropped. The temperatures of the Nos. 1, 2 and 3 containment vessels were 38 C, 70 C and 58 C, respectively.

TEPCO stressed the entire reactor system, including the containment vessels, has been cooled.

However the condition of the melted nuclear fuel in the pressure and containment vessels is still unknown. Checking the condition remains a key task.

As work progressed on Step 2, three task categories--groundwater radiation measurement, containing the dispersal of radioactive material into the air and soil, and measurement and reduction of radiation levels--were achieved. Of the 10 task categories, six have now been completed.

The remaining categories are achieving cold shutdown, improving health care for plant workers and other ongoing tasks.

TEPCO aims to begin full-scale work to decommission the reactors after Step 2 is completed. TEPCO plans to formulate a technical timetable in cooperation with the government by the end of this year.

(Nov. 19, 2011)

N-fuel conditions unclear

Tatsuo Nakajima / Yomiuri Shimbun Staff Writer

The latest timetable for bringing a nuclear fuel meltdown at the Fukushima No. 1 nuclear power plant under control shows the situation is no longer in the critical condition it was immediately following the accident, but many issues remain unsolved.

The government and Tokyo Electric Power Co. have revised the timetable for the seventh time in the eight months since the crisis began. Data suggests the reactors and radioactive material are under control, and the power plant will achieve a cold shutdown once required conditions are confirmed.

However, the status of the molten nuclear fuel is unclear. It is not known how the fuel, believed to have partially melted through pressure vessels of the reactors and into containment vessels, has dispersed and how much lies in water.

It is questionable to assess the situation as nearly a cold shutdown. **Usually, to achieve a cold shutdown, all fuel rods should be cooled under water, and nuclear fuel, pressure and containment vessels should be intact and in good condition.**

The situation at the nuclear plant does not meet this definition. Is it appropriate for the government and TEPCO to call the current status nearly a cold shutdown?

On Nov. 2, TEPCO said a small-scale recriticality incident--in which nuclear fuel achieves a fission chain reaction--may have taken place at the No. 2 reactor of the power plant, creating a small panic. The company later said xenon discovered at the plant was the result of spontaneous fission, not a nuclear chain reaction known as recriticality as had been feared.

TEPCO should have been able to coolly handle the detection of xenon, but it failed to do so as it had not properly prepared necessary data. **These matters should not be dealt with in a hurried and sloppy manner as the end of the year, the target for achieving cold shutdown, approaches.**

There are many other unsolved issues, including **how to cope with contaminated water said to be accumulating at a rate of 200 to 500 tons a day in underground areas of the reactor buildings.** The government and TEPCO must thoroughly solve these issues without being bound by their timetable.

(Nov. 19, 2011)

Nuclear disaster drills held near Genkai plant

Two prefectures have held major preparedness drills that assume an accident at the Genkai nuclear power plant in western Japan.

Sunday's exercises were the first comprehensive nuclear disaster drills held by prefectural governments since the accident at the Fukushima Daiichi plant in March.

In Saga Prefecture, the drill was based on the scenario that an earthquake caused an automatic shutdown of 2 reactors, triggering a total loss of power at the plant and possible leakage of radioactive substances.

Workers at the nuclear plant practiced restoring the supply of electricity using generator vehicles acquired after the Fukushima accident. A record-high number of people -- about 25,000 -- took part in the drill.

The other drill in the adjacent prefecture of Nagasaki simulated a scenario in which a quake caused a leakage of nuclear materials.

The prefecture expanded the evacuation zone to areas within 30 kilometers of the plant from 10 kilometers in previous drills.

On the small island of Takashima, which lies entirely within 30 kilometers of the plant, all of the more than 2,300 residents evacuated by bus, going over a bridge to the mainland, or by ship.

But the bridge could be blocked if evacuation orders are issued to areas within 10 kilometers of the plant. In such an event, the authorities would have to prepare many ships for the evacuation effort.

Sunday, November 20, 2011 14:49 +0900 (JST)

No-entry zone cleanup begins / Many challenges loom in 1st decontamination efforts in area

The Yomiuri Shimbun

Workers in protective gear measure radiation levels in Okumamachi, Fukushima Prefecture, on Friday.

FUKUSHIMA--The government has begun a model decontamination project in Okumamachi, Fukushima Prefecture, located within the no-entry zone surrounding the crippled Fukushima No. 1 nuclear power plant.

Launched Friday, the project aims to establish effective decontamination and safety measures for workers. The operation is scheduled to be carried out in turn at 12 municipalities in the government-designated no-entry and expanded evacuation zones.

This is the first time that decontamination work has been carried out in the no-entry zone. **Based on the results of the model project, the government plans to start full-scale decontamination work in January.**

The model project is the first step toward realizing the return of residents of the no-entry zone to their homes. However, numerous tasks lie ahead in **decontaminating vast areas with unprecedentedly high levels of radiation.**

The operation began with measuring radiation levels in the area to be decontaminated. Workers in protective clothing, masks and goggles measured radiation levels in groups of four.

"It's 22.04 microsieverts at one centimeter above the ground," said a worker at the plaza in front of the town office of Okumamachi, about five kilometers southwest of the nuclear power plant. "It's 15.29 microsieverts at one meter above the ground," another said.

The radiation level in the area was about 20 microsieverts per hour. An official of the Japan Atomic Energy Agency, which was commissioned to do the work by the government, said, "[Radiation levels here] are one digit higher than in Fukushima and Date, where decontamination work has already started."

However, **the official believes the decontamination measures taken in Fukushima and Date will not be enough to lower radiation levels in these areas.**

Various methods are expected to be tried in the model project. One is using a circulation system: Areas are first cleaned by spraying warm water at high pressure, and the water is then collected, decontaminated and reused for a second round of high-pressure cleaning.

Another key problem is **how to keep down workers' radiation exposure**. The atomic energy agency is considering using gloves and aprons made with radiation-resistant lead.

Securing temporary storage sites for the contaminated soil and chunks of asphalt that will be produced during decontamination is also a difficult problem.

Atsuyuki Suzuki, the agency's head director, told reporters Friday: "If we use a lot of time and manpower, radiation levels will fall, but this will delay residents' return to their homes. As for temporary storage sites, all we can do is persistently seek people's cooperation."

(Nov. 20, 2011)

Future cancers from Fukushima plant may be hidden

In this Nov. 12, 2011 file photo, workers in protective suits and masks wait to enter the emergency operation center at the crippled Fukushima No. 1 nuclear power station in Okuma, Japan. (AP Photo/David Guttenfelder)

FUKUSHIMA, Japan (AP) -- Even if the worst nuclear accident in 25 years leads to many people developing cancer, we may never find out.

Looking back on those early days of radiation horror, that may sound implausible.

But the ordinary rate of cancer is so high, and our understanding of the effects of radiation exposure so limited, that any increase in cases from the Fukushima nuclear plant disaster may be undetectable.

Several experts inside and outside Japan told The Associated Press that cancers caused by the radiation may be too few to show up in large population studies, like the long-term survey just getting under way in Fukushima.

That could mean thousands of cancers under the radar in a study of millions of people, or it could be virtually none. Some of the dozen experts the AP interviewed said they believe radiation doses most Japanese people have gotten fall in a "low-dose" range, where the effect on cancer remains unclear.

The cancer risk may be absent, or just too small to detect, said Dr. Fred Mettler, a radiologist who led an international study of health effects from the 1986 Chernobyl disaster.

That's partly because cancer is one of the top killers of people in industrialized nations. Odds are high that if you live long enough, you will die of cancer. The average lifetime cancer risk is about 40 percent.

In any case, the 2 million residents of Fukushima Prefecture, targeted in the new, 30-year survey, probably got too little radiation to have a noticeable effect on cancer rates, said Seiji Yasumura of the state-run Fukushima Medical University. Yasumura is helping run the project.

"I think he's right," as long as authorities limit children's future exposure to the radiation, said Richard Wakeford, a visiting epidemiology professor at the Dalton Nuclear Institute at the University of Manchester in England. Wakeford, who's also editor of the Journal of Radiological Protection, said he's assuming that the encouraging data he's seen on the risk for thyroid cancer is correct.

The idea that Fukushima-related cancers may go undetected gives no comfort to Edwin Lyman, a physicist and senior scientist with the Union of Concerned Scientists, a group that advocates for nuclear safety. He said that even if cancers don't turn up in population studies, that "doesn't mean the cancers aren't there, and it doesn't mean it doesn't matter."

"I think that a prediction of thousands of cancer deaths as a result of the radiation from Fukushima is not out of line," Lyman said. But he stressed that authorities can do a lot to limit the toll by reducing future exposure to the radiation. That could mean expensive decontamination projects, large areas of condemned land and people never returning home, he said. "There's some difficult choices ahead."

Japan's Cabinet this month endorsed a plan to cut contamination levels in half within the next two years. The government recently announced it plans to study the risk from long-term exposure to the low-dose radiation level used as a trigger for evacuations.

The plant was damaged March 11 by a tsunami triggered by a magnitude-9 earthquake. Japanese authorities estimate it leaked about one-sixth as much radiation as the Chernobyl accident. It spewed radioactive materials like iodine-131, cesium-137 and 29 others contaminating the water, soil, forests and crops for miles around. A recent study suggested that emissions of cesium-137, were in fact twice what the government has estimated.

So far, no radiation-linked death or sickness has been reported in either citizens or workers who are shutting down the plant.

And a preliminary survey of 3,373 evacuees from the 10 towns closest to the plant this summer showed their estimated internal exposure doses over the next several decades would be far below levels officials deem harmful.

But while the Fukushima disaster has faded from world headlines, many Japanese remain concerned about their long-term health. And many don't trust reassurances from government scientists like Yasumura, of the Fukushima survey.

Many consumers worry about the safety of food from Fukushima and surrounding prefectures, although produce and fish found to be above government-set limits for contamination have been barred from the market. For example, mushrooms harvested in and around Fukushima are frequently found to be contaminated and barred from market. Controversy has also erupted around the government's choice of a maximum allowed level for internal radiation exposure from food.

Fukushima has distributed radiation monitors to 280,000 children at its elementary and junior high schools. Many children are allowed to play outside only two or three hours a day. Schools have removed topsoil on the playgrounds to reduce the dose, and the Education Ministry provided radiation handbooks for teachers. Thousands of children have been moved out of Fukushima since the March disasters, mainly due to radiation fears.

Many parents and concerned citizens in and around Fukushima, some even as far as Tokyo, carry Geiger counters for daily measurement of radiation levels in their neighborhoods, especially near schools and kindergartens. The devices are probably one of the most popular electronics gadgets across Japan these days. People can rent them at DVD shops or drug stores in Fukushima, while many Internet rental businesses specializing in Geiger counters also have emerged.

Citizens groups are also setting up radiation measuring centers where people can submit vegetables, milk or other foods for tests. Some people are turning to traditional Japanese diet -- pickled plum, miso soup and brown rice -- based on a belief that it boosts the immune system.

"I try what I believe is the best, because I don't trust the government any more," says Chieko Shiina, who has turned to that diet. The 65-year-old Fukushima farmer had to close a small Japanese-style inn due to the nuclear crisis.

She thinks leaving Fukushima would be safer but says there is nowhere else to go.

"I know we continue to be irradiated, even right at this moment. I know it would be best just to leave Fukushima," she said.

Yuka Saito, a mother of four who lives in a Fukushima neighborhood where the evacuation order was recently lifted, said she and her three youngest children spent the summer in Hokkaido to get away from the radiation. She tells her children, ages 6 to 15, to wear medical masks, long-sleeved shirts and a hat whenever they go out, and not to play outside.

She still avoids drinking tap water and keeps a daily log of her own radiation monitoring around the house, kindergarten and schools her children attend.

"We Fukushima people are exposed to radiation more than anyone else outside the prefecture, but we just have to do our best to cope," she said. "We cannot stay inside the house forever."

Japanese officials say mental health problems caused by excessive fear of radiation are prevalent and posing a bigger problem than actual risk of cancer caused by radiation.

But what kind of cancer risks do the Japanese really face?

Information on actual radiation exposures for individuals is scarce, and some experts say they can't draw any conclusions yet about risk to the population.

But Michiaki Kai, professor of environmental health at Oita University of Nursing and Health Sciences, said that based on tests he's seen on people and their exposure levels, nobody in Fukushima except for some plant workers has been exposed to harmful levels of radiation.

Radiation generally raises cancer risk in proportion to its amount. At low-dose exposures, many experts and regulators embrace the idea that this still holds true. But other experts say direct evidence for that is lacking, and that it's not clear whether such small doses raise cancer risk at all.

"Nobody knows the answer to that question," says Mettler, an emeritus professor of radiology at the University of New Mexico and the U.S. representative to the United Nations Scientific Committee on the Effects of Atomic Radiation, or UNSCEAR. If such low doses do produce cancers, they'd be too few to be detected against the backdrop of normal cancer rates, he said.

To an individual the question may have little meaning, since it deals with the difference between no risk and small risk. For example, the general population was told to evacuate areas that would expose them to more than 20 millisieverts a year. A millisievert measures radiation dose and 20 mSv is about seven times the average dose of background radiation Americans get in a year. A child exposed to 20 mSv for a year would face a calculated risk of about 1 in 400 of getting cancer someday as a result, says David Brenner of Columbia University. So that would add 0.25 percent onto the typical lifetime cancer risk of about 40 percent, he said.

And the average dose among the 14,385 workers who worked on the plant through July was 8 mSv, according to the Japanese government. The average lifetime risk of cancer to an individual from that dose alone would be calculated at about 0.05 percent, or 1 in 2,000, Brenner said.

Brenner stresses that such calculations are uncertain because scientists know so little about the effects of such small doses of radiation.

But in assessing the Fukushima disaster's effect on populations, the low-dose question leads to another: If a lot of people are each exposed to a low dose, can you basically multiply their individual calculated risks to forecast a number of cancers in the population?

Brenner thinks so, which is why he believes some cancers might even appear in Tokyo although each resident's risk is "pretty minuscule."

But Wolfgang Weiss, who chairs the UNSCEAR radiation committee, said the committee considers it inappropriate to predict a certain number of cancer cases from a low-dose exposure, **because low-dose risk isn't proven.**[isn't it ?]

Nuclear accidents can cause cancer of the thyroid gland, which can absorb radioactive iodine and become cancerous. That disease is highly treatable and rarely fatal.

After the Chernobyl disaster, some 6,000 children exposed to radioactive fallout later developed thyroid cancer. Experts blame contaminated milk. But the thyroid threat was apparently reduced in Japan, where authorities closely monitored dairy radiation levels, and children are not big milk drinkers anyway.

Still, the new Fukushima survey will check the thyroids of some 360,000 young people under age 18, with follow-ups planned every five years throughout their lifetimes. It will also track women who were pregnant early in the crisis, do checkups focused on mental health and lifestyle-related illnesses for evacuees and others from around the evacuation zone, and ask residents to fill out a 12-page questionnaire to assess their radiation exposure during the first weeks of the crisis.

But the survey organizers are having trouble getting responses, partly because of address changes. As of mid-October, less than half the residents had responded to the health questionnaire.

Some residents are skeptical about the survey's objectivity because of **mistrust toward the government, which repeatedly delayed disclosing key data and which revised evacuation zones and safety standards after the accident. Also, the government's nuclear safety commission recommended use of iodine tablets but none of the residents received them just before or during evacuation, when the preventive medicine would have been most effective.**

Some wonder if the study is using them as human guinea pigs to examine the impact of radiation on humans.

Eisuke Matsui, a lung cancer specialist and a former associate professor at Gifu University School of Medicine, criticized the project. He said it appears to largely ignore potential radiation-induced health risks like diabetes, cataracts and heart problems that have been hinted at by some studies of Chernobyl.

"If thyroid cancer is virtually the only abnormality on which they are focusing, I must say there is a big question mark over the reliability of this survey," he said.

He also suggested sampling hair, clipped nails and fallen baby teeth to test for radioactive isotopes such as strontium that are undetectable by the survey's current approach.

"We should check as many potential problems as possible," Matsui said.

Yasumura acknowledges the main purpose of his study is "to relieve radiation fears." But Matsui says he has a problem with that.

"A health survey should be a start," Matsui says, "not a goal."

Tatsuhiko Kodama, head of the Radioisotope Center at the University of Tokyo, urged quick action to determine the cancer risks.

He said big population surveys and analysis will take so long that it would make more sense to run a careful simulation of radiation exposures and do anything possible to reduce the risks.

"Our responsibility is to tell the people now what possible risks may be to their health," he said.

Les Japonaises unies contre les mensonges d'Etat

Le Monde | 22.11.11 | 13h30 • Mis à jour le 22.11.11 | 20h43

Elles sont en première ligne. Actives au sein d'associations et d'ONG oeuvrant pour la prise en charge des personnes âgées, pour l'éducation, pour la défense de l'environnement ou pour la sécurité alimentaire, les Japonaises animent une solidarité locale exprimée lors de la plus grande manifestation antinucléaire, le 19 septembre à Tokyo.

La majorité des participants était des femmes. Un millier d'entre elles, venues de Fukushima, manifestaient à nouveau le 29 octobre dans les rues de Tokyo pour demander des mesures de protection de leurs enfants, protester contre la collusion de l'administration et des intérêts privés pour minimiser un danger mal évalué, et rappeler les valeurs que l'Etat est censé défendre, à commencer par la protection de la population.

La diffusion de cartes des dépôts de matières radioactives, d'inquiétantes mesures de radiation réalisées plus ou moins officiellement, des informations comme la leucémie aiguë contractée par Norikazu Otsuka, présentateur de la télé qui consommait en direct des produits de la préfecture de Fukushima, alimentent la méfiance des mères japonaises qui n'ont souvent qu'un seul désir : déménager.

"Je n'ai aucune confiance dans ce que dit le gouvernement, confie Kozue Nogami, dont la petite fille est à l'école primaire à Tokyo. Ni dans les médias qui ne font que reprendre le discours officiel." Ce qui les retient : l'emploi du mari, le prêt pour la maison familiale.

Contraintes de se débrouiller, ces mères créent des blogs pour échanger les informations ou font leurs courses sur Internet, où elles trouvent des produits venant de l'ouest du Japon, présumés plus sûrs. M^{me} Nogami, dont le budget alimentaire a augmenté de 15 000 yens (145 euros) par mois, oblige sa fille à apporter une gourde d'eau à l'école. Elle aimerait que cette dernière puisse aussi apporter son bento (plateau-repas) pour ne pas avoir à manger à la cantine, mais le proviseur n'y est pas favorable.

Ces gestes simples se heurtent souvent au mur des conventions sociales japonaises, très normatives. Le ministère de l'éducation véhicule l'idée que rien ne prouve l'impact direct des radiations sur la santé. *"Tout va bien, ne vous inquiétez pas"* est le discours martelé par les autorités et les médias, que les mères ne veulent pas entendre.

Leur mobilisation leur a permis d'obtenir des concessions, comme l'indication de l'origine des aliments - dont la plupart viennent de l'Est et du Nord - et des mesures de radiation dans les écoles.

Chez celles, majoritaires, qui suivent le discours officiel, il suffit de peu pour faire surgir la crainte. *"Nous n'avons aucune info, dit une résidente de l'arrondissement de Nakano, proche de celui de Setagaya où de hauts niveaux de radiation ont été relevés. Mes fils mangent à l'école mais je suis inquiète."*

Les initiatives des mères tokyoïtes prennent une autre dimension chez celles de la préfecture de Fukushima. Là, plusieurs font état de symptômes inquiétants chez les enfants : saignements de nez, diarrhées, inflammation de la thyroïde. Ecologiste pratiquant l'agriculture biologique à Kawamata, à 35 km de la centrale accidentée, Sachiko Sato, mère de quatre enfants et activiste du Réseau pour sauver les enfants des radiations, souligne le *"fossé entre ceux qui ont quitté la région et ceux qui sont restés"*. Ce qui est son cas : elle a envoyé ses enfants dans une autre ville, mais n'a pas quitté sa maison. *"La région de Fukushima est un champ de bataille entre ceux qui ont la folie de penser qu'ils peuvent dominer la nature et ceux qui la chérissent"*, dit-elle.

M^{me} Sato juge insuffisantes les mesures de surveillance périodique des enfants par une échographie de la thyroïde. Comme beaucoup de Japonais, elle accuse l'Etat d'utiliser les 2 millions d'habitants du département de Fukushima comme cobayes pour collecter des données, tout en affirmant qu'il n'y a pas de danger. **Les dosimètres donnés aux enfants ne sont pas nominatifs. Les données rassemblées servent à établir des taux moyens pour la région.**

Les victimes de la catastrophe nucléaire se sentent dans la position de celles des victimes des bombardements d'Hiroshima et de Nagasaki en 1945, avance M^{me} Mari Takenouchi, membre de l'Association des atomisés, qui rassemble des victimes du nucléaire depuis Hiroshima jusqu'à Fukushima.

Jusqu'au traité de San Francisco de 1952 qui rendit sa souveraineté au Japon et *"conformément aux ordres du général MacArthur, commandant des forces d'occupation"*, le sort des atomisés *"est resté un secret militaire"* et *"il était interdit aux médecins japonais de les examiner"*, rappelle le docteur Shuntaro Hida, 94 ans, qui était médecin à l'hôpital militaire d'Hiroshima et a miraculeusement survécu. *"A la suite de l'accident de Fukushima, ajoute-t-il, des centaines de parents sont venus me consulter, alarmés par les saignements de nez ou les gonflements de la thyroïde de leurs enfants. Je ne savais quoi leur dire."*

Au-delà du politique, les demandes des Japonaises portent le débat sur le terrain émotionnel plus fondamental du droit à la vie, analyse l'anthropologue David Slater de l'université Sophia à Tokyo. C'est sur ce terrain que se plaçait déjà Michiko Ishimure, institutrice à Minamata, victime dans les années 1950-1960 d'une intoxication au mercure déversé dans la mer, qui fit des milliers de morts et d'enfants handicapés. Par ses livres mêlant romanesque, poésie et journal intime, elle contribua à une lente prise de conscience de cette dramatique pollution industrielle. *"A Minamata se sont heurtés deux mondes : celui de pêcheurs qui vivaient en symbiose avec la nature et un autre pour lequel la nature n'était qu'un objet à asservir"*, disait-elle.

Un demi-siècle plus tard, avec l'image du *"champ de bataille"* qu'est devenue la belle région de Fukushima (probablement rayée de la carte pour des décennies), Sachiko Sato fait le même triste

constat. Aucune leçon n'a été tirée d'un drame révélateur des risques que la course à la rentabilité faisait courir à une population.

Emergency condenser at Fukushima plant may not have fully run after tsunami

An emergency cooling condenser at the Fukushima No. 1 Nuclear Power Plant appears to have only partially run after the loss of all external power sources caused by the March 11 tsunami, the plant's operator said.

There are two systems comprising the "isolation condenser (IC)," which is meant to cool down steam in a nuclear reactor in time of emergency, according to plant operator Tokyo Electric Power Co. (TEPCO).

When employees examined the plant on Oct. 18, the levels of coolant in the two systems in the plant's No. 1 reactor were at 65 percent and 85 percent. The coolant evaporates in the process of heat exchange.

Noting that water has not been supplied to either of the systems since the disasters on March 11, TEPCO officials said they suspect that the IC in the No. 1 reactor functioned only at a limited level or over a short period.

As to the cause of the suspected malfunctioning, TEPCO suggested that hydrogen generated by damaged nuclear fuel may have gathered in the piping, causing the IC's heat removal efficiency to decline. During the inspection on Oct. 18, the workers found no damage to the IC in the No. 1 reactor.

A high-ranking official of TEPCO said the IC would not have prevented the damage in the reactor even if it had functioned properly.

"Even if the IC had been working, it could have only delayed the damage to the reactor core a little bit. It wouldn't have been a fundamental solution," said Junichi Matsumoto, head of TEPCO's nuclear power division.

It is believed that after the IC was automatically activated in response to the earthquake, a worker manually stopped it and then restarted it.

The government's accident investigation panel is investigating to see if the IC was properly operated and if it functioned properly.

TEPCO gets 120 bil. yen as government insurance over nuclear crisis

TOKYO (Kyodo) -- Tokyo Electric Power Co., operator of the crisis-stricken Fukushima Daiichi power plant, said Tuesday **it has received 120 billion yen from the government under an existing insurance program for nuclear accidents.**

The funds will be used by the company to pay massive compensation to people and companies affected by the world's worst nuclear accident in 25 years. The utility, known as **TEPCO, has separately received 558.7 billion yen from a state-backed funding entity.**

TEPCO submitted a request on Oct. 24 for the payment of 120 billion yen, the maximum compensation amount set by a contract between the government and TEPCO for an accident at one nuclear power plant.

"We will continue to do our best to ensure that the indemnification payment process is as convenient as possible for all applicants," the company said in a statement.

As for compensation to make up for the victims' emotional distress, sources familiar with the matter said the company plans to review the current guideline so that each of the residents around the plant who evacuated because of the crisis will be paid 100,000 yen per month beyond Sept. 1.

Under the guideline, the amount of compensation was expected to be halved to 50,000 yen per month from Sept. 1, based on the assumption that the living environment of many of the evacuees was to have improved six months after the nuclear crisis began in March.

But criticism has been growing from Fukushima Prefecture that mental distress will "rather increase if life as evacuees prolongs."

TEPCO is expected to announce the revision on Thursday, according to the sources.

New third-party council should check nuclear regulation: panel draft

TOKYO (Kyodo) -- A government panel discussing ways to enhance Japan's nuclear safety regulation system said in a draft proposal unveiled Tuesday that **the overall handling of nuclear affairs should be checked constantly by a new third-party council consisting of people with the latest scientific knowledge.**

Membership of the council should require parliamentary approval, and, to ensure its independence, the council should not be involved in everyday matters dealt with by the new nuclear safety agency to be set up in the wake of the nuclear crisis at the Fukushima Daiichi power plant, the draft said.

"Instead...the council should stay a step away from the daily activities of the nuclear safety agency and have a function to oversee the agency's operation," it said.

During discussions held on the draft proposal, however, some members pointed out that the role, or character of the council appears to be unclear.

The proposal will be worked on in December and reflected in the country's ongoing process to launch the new nuclear safety agency under the Environment Ministry in April.

The decision to overhaul the country's nuclear regulatory system came as the government faced criticism over the Nuclear and Industrial Safety Agency, the primary nuclear regulatory body under the Economy, Trade and Industry Ministry, which promotes nuclear power.

The launch of the new agency is also aimed at rectifying the current situation in which various government organizations are involved in nuclear safety.

The new third-party council would replace the existing independent panel supervising nuclear safety regulation called the Nuclear Safety Commission.

(Mainichi Japan) November 23, 2011

Symposium on radiation exposure held in Hiroshima

International nuclear experts are discussing ways to promote medical research and treatment for radiation exposure.

They opened a two-day symposium on Wednesday in Hiroshima. It is the first meeting of its kind jointly sponsored by Hiroshima Prefecture, medical organizations, and the International Atomic Energy Agency.

One of the speakers was Fukushima Medical University Professor Seiji Yasumura. He is in charge of conducting a survey on the health of residents in Fukushima Prefecture following the nuclear disaster there.

Professor Yasumura said the current budget for his study is not sufficient because of the time needed to do the work and the fact that few people fill out the surveys that help him estimate levels of radiation exposure.

IAEA Deputy Director General Daud Mohamad said the agency will provide all possible support to Fukushima Prefecture if requested.

Radioactive cesium blankets 8% of Japan's land area

November 21, 2011 - <http://ajw.asahi.com/article/0311disaster/fukushima/AJ201111210014>

By HIROSHI ISHIZUKA / Staff Writer

Some 8 percent of Japan's land area, or **more than 30,000 square kilometers**, has been contaminated with radioactive cesium from the crippled Fukushima No. 1 nuclear power plant.

Spanning 13 prefectures, the affected area has accumulated **more than 10,000 becquerels of cesium 134 and 137 per square meter**, according to the science ministry.

The ministry has released the latest version of its cesium contamination map, covering 18 prefectures.

Radioactive plumes from the Fukushima No. 1 plant reached no farther than the border between Gunma and Nagano prefectures in the west and southern Iwate Prefecture in the north.

Ministry officials said the plumes flowed mainly via four routes between March 14 and 22 after the plant was damaged by the Great East Japan Earthquake and tsunami on March 11.

The first plume headed westward from late March 14 to early March 15, when huge amounts of radioactive materials were released following a meltdown at the No. 2 reactor.

It moved clockwise over a wide area in the Kanto region. Radioactive materials fell with rain and snow, particularly in the northern parts of Tochigi and Gunma prefectures.

A branch of the plume moved southward from Gunma Prefecture, passing through western Saitama Prefecture, eastern Nagano Prefecture and western Tokyo.

It stopped in western Kanagawa Prefecture, where the Tanzawa mountain range rises up.

The second plume headed northwest in the afternoon of March 15, heavily contaminating parts of Namie and other municipalities in Fukushima Prefecture.

The third plume headed northward, apparently in the afternoon of March 20.

Areas in northern Miyagi Prefecture and southern Iwate Prefecture were probably contaminated when it rained between the late afternoon of March 20 and early March 21.

The fourth plume headed southward from the night of March 21 and early March 22.

It passed through northern Chiba Prefecture but largely skirted central Tokyo due to a pressure pattern, limiting contamination in Tokyo and Kanagawa Prefecture.

It is believed that the amount of radioactive materials released from the Fukushima No. 1 plant increased between March 20 and 23, but the reasons are not yet known.

In Fukushima and seven other prefectures, **11,600 square kilometers, or 3 percent of Japan's land area, have annual additional radiation levels of at least 1 millisievert**, according to Environment Ministry estimates.

The government has said it will remove radioactive materials if annual additional radiation levels reach 1 millisievert or more.

The science ministry has been carrying out aerial monitoring of radioactive materials since April.

Helicopters fly at relatively low speeds, allowing monitoring of levels of radiation released from the ground at a height of 1 meter.

Cesium accumulations in soil and radiation levels are also measured separately at selected sites on the ground.

Officials estimate cesium accumulations at other locations using correlations between radiation levels 1 meter above the ground monitored from helicopters and the actual cesium accumulations at the selected sites.

Cesium 137 will have a long-term impact on the environment because it has a half-life of 30 years.

It was detected even before the Fukushima accident, apparently as a result of nuclear testing conducted by other nations.

Still, the maximum amount found in nationwide surveys since fiscal 1999 was 4,700 becquerels in Nagano Prefecture.

The science ministry's cesium contamination map excludes the effects of pre-disaster contamination.

The map will cover 22 prefectures when it is completed by the end of the year. Data for Aomori, Ishikawa, Fukui and Aichi prefectures will be added.

Editorial: Fundamental gov't review of Monju reactor and nuclear policy needed

The central pillar of the Japanese government's nuclear energy policy has heretofore been the nuclear fuel cycle, which entails the extraction of plutonium from reprocessed spent nuclear fuel, and using it to fuel fast-breeder reactors.

On Nov. 20, a Government Revitalization Unit panel responsible for screening wasteful government spending submitted a recommendation that the Monju prototype fast-breeder reactor undergo a fundamental review that includes the possibility of its abandonment.

An energy and environment committee within the government's National Policy Unit is tasked with deciding a comprehensive nuclear policy by the summer of 2012.

While **the waste-cutting panel's recommendation is not legally binding**, it is significant that all of the panel members spoke out against the continued operation of the Monju project in the same manner it has been carried out in the past. The National Policy Unit's committee on energy and the environment must fully consider the problems that have been pointed out by the administrative reform panel, and **carry out a major overhaul of Japan's energy policy**.

Soon after it began running, the Monju reactor was shut down in 1995, due to a fire caused by a sodium leak. **Last year, the reactor was started up again for the first time in over 14 1/2 years, but was shut down soon thereafter due to equipment being dropped into the reactor vessel. It is still not running.**

Thus far, more than one trillion yen have been spent on Monju, whose maintenance costs around 20 billion yen annually even when it is not running. A demonstration reactor must be built before the fast-breeder reactor reaches commercial viability, but it is still unclear when that will happen.

It should be clear even without the recommendation of the government panel that mindlessly continuing to pump taxpayers' money into the research and development of a project without any clear prospects is questionable.

There's also the **issue of safety**. The sodium used as a coolant in fast-breeder reactors reacts strongly with water, causing powerful fires. This makes Monju more difficult to control than light-water reactors under normal conditions as well as when something goes awry.

Additional postponements have been seen in the construction of fuel reprocessing plants -- which comprise another cornerstone of the nuclear fuel cycle vision -- due to multiple problems. As a result, costs have continued to balloon.

Such problems had already been identified even before the disaster at the Fukushima No. 1 Nuclear Power Plant operated by Tokyo Electric Power Co. In light of the ongoing crisis, however, these are issues that need to be considered even more seriously than ever before.

And yet, the fiscal 2012 budget request for Monju-related expenses is the same amount as the budget for the current fiscal year. There is no way the public will accept such a prospect. The government waste-cutting panel has suggested that 2.2 billion yen of the budget requested for output testing be shelved, but there needs to be further investigation of the budget request for other possible wasteful expenses.

At the recent waste-cutting deliberations, panel members voiced **grave concerns over the opaque spending of public funds by the Japan Atomic Energy Agency (JAEA)**, an independent administrative agency that operates Monju. A fundamental review must be conducted.

Given that the Japanese government announced its intention to move toward reducing its dependence on nuclear power after the crisis in Fukushima emerged, it's time we consider bringing an end to the nuclear fuel cycle policy.

The government must promptly establish a path toward redirecting what we have heretofore invested into nuclear power into the revival of Fukushima and into the development of renewable energy and energy conservation.

(Mainichi Japan) November 22, 2011

Radioactive strontium in Yokohama apparently unrelated to Fukushima

TOKYO (Kyodo) -- The science ministry said Thursday that radioactive strontium detected in sediment in Yokohama appears to be unconnected to the nuclear crisis at the Fukushima Daiichi power plant triggered by the March 11 earthquake and tsunami.

The ministry tested sediment collected at two locations in Yokohama's Kohoku Ward by the city office and soil in the neighborhood but did not detect strontium 89 with a half-life period of around 50 days, which would have been detected if the incident was related to the Fukushima nuclear crisis.

The test detected 0.82 to 1.1 becquerels per kilogram of strontium 90 with a half-life of around 29 years, within levels observed prior to the nuclear crisis.

The Ministry of Education, Culture, Sports, Science and Technology suspects the presence of the substance is attributable to past nuclear experiments conducted in the atmosphere.

In a test conducted by the Isotope Research Institute in Yokohama at the request of the city office, the private institute measured both strontium 89 and strontium 90, and detected 59 to 129 becquerels per kg of strontium.

Regarding the significant difference in figures detected by the ministry and the institute, the ministry said the institute's test may have also detected radium and other radioactive substances not related to a nuclear plant accident.

Meanwhile, radioactive strontium has been detected in soil samples taken from three locations in downtown Tokyo, a citizens' group said Thursday.

Soil collected from outside the Ministry of Economy, Trade and Industry, and the Tokyo International Forum, both in Chiyoda Ward, and the Kiyosumi-Shirakawa subway station in Koto Ward measured 48, 51 and 44 becquerels per kg, respectively, the group said, against 10 to 20 becquerels per kg seen prior to the Fukushima nuclear crisis at various places in Japan.

The same group discovered in October up to 195 becquerels of radioactive strontium in sediment from the top of an apartment building in Yokohama, south of Tokyo.

If inhaled or ingested, strontium tends to accumulate in bones just like calcium. It is believed to cause bone cancer and leukemia.

(Mainichi Japan) November 25, 2011

Japan plans to set special radiation limit for infant food

TOKYO (Kyodo) -- Japan's health ministry on Thursday proposed categorizing food and drink products in four groups, including one for infant foods, in setting tougher radiation standard levels.

While the Ministry of Health, Labor and Welfare has been working to lower the upper limit on radioactive cesium exposure to 1 millisievert per year from the current provisional level of 5 millisieverts, it has decided to give special consideration to infants who are more vulnerable to radiation than older people.

The other three categories are ordinary food, milk and drinking water. Most foods will be categorized as ordinary food and be put under unified supervision, while milk, drinking water and infant foods, including powdered milk and baby foods, will be examined separately.

The ministry submitted the proposal to a subcommittee of the Pharmaceutical Affairs and Food Sanitation Council and obtained its approval.

It will present a new standard level proposal to the subcommittee by the end of the year.

(Mainichi Japan) November 25, 2011

abinet Office, Foreign Ministry led suppression of Russian proposal to store nuke fuel

The Cabinet Office and the Foreign Ministry played a leading role in suppressing a Russian proposal to store and reprocess spent nuclear fuel from nuclear power plants in Japan even within the government, sources close to the case have told the Mainichi.

In diplomatic papers in 2002, Moscow proposed that spent nuclear fuel from Japan's nuclear plants be brought into Russian territory for temporary storage and reprocessing. The administration at the time, however, left the proposal unattended -- highly likely on purpose -- for fear that such a move could adversely affect Japan's nuclear energy policy.

Officials of the Cabinet Office, which serves as the secretariat for the Japan Atomic Energy Commission (JAEC), and the Ministry of Foreign Affairs, secretly met in September 2003 to discuss their response to the Russian proposal, according to the sources. The Agency for Natural Resources and Energy (ANRE), which is in charge of implementing the nation's nuclear power policy, had not received the Russian papers at that time.

The diplomatic papers, dated Oct. 25, 2002, were produced following a meeting between Koji Omi, then minister of state for science and technology policy, and then Russian Atomic Energy Minister Alexander Yurievich Rumyantsev in September 2002. In the meeting both parties were positive about establishing bilateral ties in the nuclear power sector.

According to the sources, officials of the Cabinet Office and the Foreign Ministry held talks over their response to Moscow's proposal after Russia became ready to accept spent nuclear fuel from overseas in

July 2003. The ANRE, which did not take part in the talks, only later received the diplomatic papers via fax from the Japanese Embassy in Russia sometime around February 2004.

At that time, ANRE officials were reportedly notified that talks involving the Cabinet Office over the diplomatic documents were already over and that Tokyo had not yet replied to Moscow's proposal even though it was "a formal offer made as a result of the meeting between incumbent ministers."

Concerned sources further told the Mainichi: "If we had intended to positively consider (the Russian proposal), we would have called on the ANRE to join our discussions. However, since we hadn't meant to address the issue head-on, we didn't invite the ANRE into our talks."

N-watchdog gets health role / New agency to handle residents' well-being, not just reactors

The Yomiuri Shimbun

A new nuclear safety agency to be established in April will deal with health problems caused by radioactive materials released from the Fukushima No. 1 nuclear power plant, it has been learned.

The new watchdog was expected to focus on regulating nuclear reactors and responding to nuclear emergencies. However, the government apparently plans to strengthen the agency's responsibilities by expanding its portfolio.

The new agency--which will be an extraministrial bureau of the Environment Ministry--plans to tap the ministry's expertise in handling the Minamata mercury poisoning disease and other environmental disputes, government sources said.

The agency will collect data and conduct long-term research because it remains unknown what health risks radioactive materials leaked by the nuclear plant have caused or will cause to local residents. The entity also will handle any lawsuits filed against the government, the sources said.

The agency will take over functions of existing nuclear regulatory organizations, including the Nuclear and Industrial Safety Agency, which is under the Economy, Trade and Industry Ministry. Since the March 11 earthquake and tsunami triggered meltdowns at the Fukushima plant that required thousands of residents to be evacuated, many observers have criticized the fact that the industry ministry is in charge of both promoting and regulating nuclear power.

The Cabinet Office's Nuclear Safety Commission will be consolidated into the new agency, and the Education, Culture, Sports, Science and Technology Ministry will transfer the role of monitoring radioactive materials to the new body.

The new agency, which will have about 500 employees, is expected to be responsible for:

- Monitoring residents' radiation exposure levels over an extended period.
- Epidemiological studies that will be used to create a database.
- Research on the effect of radiation on humans.
- Establishing environmental standards for radiation protection.

The Fukushima prefectural government has started lifetime thyroid examinations on about 360,000 prefectural residents who were 18 or younger at the time of the accident at the nuclear plant. The new entity will advise and assist such programs, the sources said.

Officials who hold doctor's licenses will be placed in the agency's departments in charge of health damage issues. The government also has begun setting up an advisory research panel, the sources said.

A special government task force has been dealing with issues related to residents' health problems stemming from the nuclear disaster. However, the task force, which arranged for internal radiation exposure checkups, will be dissolved when the nuclear crisis is brought under control. The panel is chaired by Prime Minister Yoshihiko Noda.

The Environment Ministry has jurisdiction over government compensation for Minamata patients. Last year it compiled relief measures to help unrecognized patients with the disease, which helped the government reach out-of-court settlements with major groups of plaintiffs this year.

The envisaged nuclear safety agency is expected to use the ministry's expertise in handling the Minamata case, according to the sources.

No specific health damage arising from radiation leaks at the Fukushima nuclear plant has been confirmed. It remains unknown whether there will be such cases and, if there are, how serious they will be. Concrete steps will be taken only after actual health problems have come to light, and if such damage could be recognized as a pollution-caused disease like Minamata disease, the sources said.

Chance for big tsunami in eastern Japan within 30 yrs revised up to 30%

A fire is seen in an area overcome by the tsunami in this photo taken from a Mainichi helicopter in Natori, Miyagi Prefecture, on March 11, 2011. (Mainichi)

TOKYO (Kyodo) -- The probability of a major earthquake occurring and triggering a massive tsunami in the Pacific Ocean off eastern and northeastern Japan within the next 30 years has been revised up to 30 percent from 20 percent, a government panel said Friday.

The Earthquake Research Committee has reexamined its long-term estimate of killer temblors after the March 11 quake and tsunami and found that a quake that triggers a tsunami as powerful as the one caused by the 1896 Meiji-Sanriku Earthquake, which killed more than 20,000 people, is more likely to happen in the sea zone stretching 800 kilometers north-south.

The panel stopped short of predicting the magnitude of the possible quake but said past records suggest it would be magnitude 8 or stronger.

A huge tsunami tears through a protective screen of trees and swallows homes in this photo taken from a Mainichi helicopter in Natori, Miyagi Prefecture, on March 11, 2011. (Mainichi)

The tsunami triggered by the 1896 quake reached as high as 38.2 meters, according to the records. The quake's estimated magnitude ranges from 6.8 to 8.5 among experts.

Meanwhile, the committee said the likelihood a quake with a magnitude of up to 9 occurs within the next 50 years in a sea area off Miyagi and Fukushima prefectures, which is closer to the shore than the 800-km zone, is almost zero percent.

Fukushima dairy farmer loses hope of returning as vegetation overruns farm

Once every 10 days, Namio Kanno, 64, checks on his home and dairy farm in the Yamakiya district in Kawamata, Fukushima Prefecture. Eight months since the Great East Japan Earthquake, tsunami and nuclear disaster, there is nothing he can do as the farm he spent 38 years on becomes overrun with vegetation.

"The maximum limit is three years," Kanno said about his evacuation from Yamakiya, which has been designated as a "planned evacuation zone" by the national government. "Any longer than that, and I won't be able to return the pasture to the way it was."

Weeds have grown hip high in what was previously cow pasture, and the cattle shed is entangled in vines. The farmer quietly turned the pages of an album in his living room. One picture showed a youthful Kanno with his pregnant wife, standing alongside a dairy cow. "That was our first cow," he said.

Kanno was born as the third son of a farming family in Kawamata. After leaving for Tokyo to attend college, he decided that he wanted to lead an autonomous life surrounded by nature. He decided on dairy farming, left school without graduating and began training to become a farmer. When he married his wife in 1973, he started a dairy farm named Ayuri, meaning "life" in Sanskrit.

The couple's first home was the cattle shed. To turn the steep and depleted land into pasture, Kanno slashed and burned the weeds, and hauled fertilizer from a pig farm 30 kilometers away. Within several years, the farmer was raising nearly 30 cows, and had become financially secure; he was able to send all four of his daughters to college. Before the nuclear disaster, Kanno had whittled down the number of cattle he owned to just enough for self sufficiency. He derived the most joy from his grandchildren's visits, and had even built a tree house for them by the pasture.

There are no cows left at the farm now, because Kanno gave them up before he evacuated. "How much time and money is it going to take to decontaminate the area, including the forests?" Kanno asked. "Is it even possible to scrape away the surface of the ground when the ground surface consists mostly of rock?"

The air radiation level at the farm is approximately six microsieverts per hour. The Cabinet approved a basic policy on radiation decontamination on Nov. 11, but it is still uncertain when the actual decontamination will begin. All the work that Kanno put into making the land fertile means that if left to its own devices, it will probably take just three years for the land to turn completely into forest. Kanno no longer has the physical endurance or emotional drive to turn a forest back into pasture.

"The government is planning to return the residents once they finish decontamination, but there are people like me who can't come back," Kanno said. "Are they going to give people like me the alternative of relocating to a new place?"

(Mainichi Japan) November 27, 2011

New system to dispose radioactive debris developed

A municipality in Fukushima Prefecture plans to use on a trial basis new disposal equipment for debris contaminated with radioactive substances.

The environmental equipment company based in Tokyo that developed the new system says it will reduce the volume of rubble from the earthquake and tsunami in March to about one-300th of the current size on average.

The company says the wreckage will be heat-treated in an oxygen-free environment and be broken down into gas, oil, and ceramic powder.

As the ceramic powder absorbs the radioactive material, the firm says the process is expected to create no contaminated ash.

Tests carried out in Hirono Town, Fukushima Prefecture, show that debris was reduced to one-268th of the current volume, and that almost all radioactive substances were absorbed by the ceramic powder.

The town plans to begin test-use of the equipment in December and consider full-scale introduction if it proves effective.

Other disaster-hit municipalities around the crippled Fukushima Daiichi nuclear plant are also interested in the new equipment.

U.S. to restart construction of N-reactors / Toshiba arm to deliver new model

The Yomiuri Shimbun

Nuclear power plant projects being screened by U.S. NRC

(Figures denote number of reactors; there are 26 in total)

After 34 years, the United States is expected to resume construction of nuclear reactors by the end of the year, and Toshiba Corp. will export turbine equipment for the reactors to that country early next month, it was learned Saturday.

According to sources, **construction will begin by the year-end on the Nos. 3 and 4 reactors of the Alvin W. Vogtle Electric Generating Plant in Georgia and the Nos. 2 and 3 reactors of the Virgil C. Summer Nuclear Generating Station in South Carolina.**

The U.S. Nuclear Regulatory Commission is expected to shortly approve the construction and operation of the reactors, which have been designed by Westinghouse Electric Co., a subsidiary of Toshiba.

The U.S. decision to resume construction of reactors is expected to pave the way for Japan to export related equipment to the United States, observers said.

The reactors to be constructed are of the AP1000 type, an advanced 1,100-megawatt pressurized water reactor, and are targeted to **go into operation in 2016 at the earliest.**

The AP1000 can better withstand disasters--the outer structure is so strong it can withstand the impact of a large airplane crashing into it[????]--and is designed to automatically cool down over a 72-hour period even after external power is lost. Four AP1000 reactors are currently being built in China.

Toshiba will export to the United States core equipment for the reactors that helps convert steam back to water, the sources said.

Before the construction of a reactor can begin, it needs to receive a final safety assessment report from the NRC as well as NRC approval for its construction and operation.

The NRC issued final safety assessment reports for the four reactors in summer after the onset of the crisis at the Fukushima No. 1 nuclear power plant.

U.S. electric power companies, which plan to construct the four reactors, have already started procuring equipment and have entered the final stage in preparation for the construction of the four reactors, as the utilities are likely to receive NRC approval soon.

The United States has 104 reactors in operation, making the country the world's largest nuclear energy producer. However, after the Three Mile Island nuclear power plant meltdown in 1979, construction of new nuclear power plants was suspended.

Former U.S. President George W. Bush, who called for less dependence on Middle East oil, shifted policy toward resumption of construction of nuclear power plants. Since 2007, many electric power companies have applied to build new nuclear power plants. The NRC is currently screening 26 new reactors.

Following the meltdowns at the Fukushima No. 1 nuclear power plant, the NRC placed priority on safety assessments for existing nuclear power plants, delaying the screening of new projects.

No construction on reactors has been carried out in the United States since January 1978.

Capitalizing on the planned construction of the four reactors, the Toshiba-Westinghouse alliance will try to secure more orders for advanced reactors from other countries.

(Nov. 27, 2011)

More cesium in Fukushima rice

The Yomiuri Shimbun

FUKUSHIMA--The Fukushima prefectural government has announced that radioactive cesium beyond the provisional regulatory limit was detected in unmilled rice harvested at five farms in the Onami district of Fukushima Prefecture.

Radioactive cesium exceeding the limit of 500 becquerels per kilogram was recently detected in harvested rice at another farm in the area, fueling concerns among consumers.

This time as much as 1,270 becquerels of radioactive cesium per kilogram was detected in unmilled rice, the prefecture said Friday. The rice has not been shipped to the market. Instead, it was stored in farmers' warehouses or a local agricultural cooperative, or was distributed to farmers' relatives.

The prefectural government is currently analyzing all the rice grown by the 154 rice farms in the district, or 4,752 bags containing 30 kilograms of rice each. It has finished inspecting 864 rice bags from 34 farms so far.

Apart from the first farm where rice was found to have been contaminated, excess radioactive cesium has been detected in 103 rice bags from five farms.

Excess cesium was detected in all 24 rice bags from the farm that produced rice in which radioactive cesium at 1,270 becquerels per kilogram was found. The minimum level of contamination at that farm was 970 becquerels per kilogram.

Radioactive cesium between 540 and 1,110 becquerels per kilogram was detected from unmilled rice from another farm, according to the prefectural government.

The five farms are located from one to 2.5 kilometers from the first farm in question. They have nothing in common with the first farm topographically, such as using the same freshwater from a mountain in their rice paddies.

In addition to the Onami district, the prefectural government is inspecting rice harvested in Date, which includes some hot spots recommended for evacuation, and in three other cities--Fukushima, Soma and Iwaki--which include areas with relatively high levels of radiation.

The local government plans to compile all results by mid-December.

(Nov. 27, 2011)

Nuclear insurance group won't renew Fukushima plant's liability insurance

The **Japan Atomic Energy Insurance Pool** has decided not to renew the Fukushima No. 1 Nuclear Power Plant's insurance contract when it expires in January next year, it has been learned.

The pool, a group formed by 23 nonlife insurance companies to provide nuclear power plant-related liability insurance, judged that the risks from the plant are still high, even though the nuclear disaster triggered by the March 11 earthquake and tsunami is gradually being brought under control.

If the nuclear plant, which is operated by Tokyo Electric Power Co. (TEPCO), is left uninsured, then work to bring the crisis under control and decommission the plant's crippled reactors could be adversely affected. TEPCO and the Ministry of Education, Culture, Sports, Science and Technology, which oversees compensation, are now considering alternative measures such as setting aside an amount of money to match the amount of insurance.

Under the Atomic Energy Damage Compensation Law, nuclear power plant operators are required to take out two types of insurance. One is the government's nuclear power damage compensation insurance, which covers damage caused by disasters such as earthquakes and tsunamis. Under this coverage, TEPCO has received 120 billion yen. The other is the Japan Atomic Energy Insurance Pool's liability insurance, under which private insurers cover general accidents and operating errors.

Liability insurance contracts last for one year, and the Fukushima No. 1 plant's contract expires on Jan. 15. **Since the risks associated with the plant are high, a pool from countries with nuclear power plants had been used to form reinsurance contracts, in which insurance is purchased by other insurance companies to disperse the risk.**

However, the risks involved in the handling of the nuclear disaster and the work to decommission reactors is on a different level from those at ordinary nuclear power plants. In July foreign reinsurance companies told the Japan Atomic Energy Insurance Pool that it would be difficult for them to take on a renewed contract, and the pool explained this situation to the Science Ministry.

The Atomic Energy Damage Compensation Law **forbids the operation of uninsured reactors** and other related activities. Since the ministry judged that removing fuel rods would fall under the classification of "operation and other related activities," thereby hindering its handling of the accident, it began discussing countermeasures with TEPCO.

TEPCO says that it is still in negotiations to renew its insurance contract, but there are no prospects of it being extended. The compensation law states that 120 billion yen can be set aside in the form of cash and marketable securities at the Legal Affairs Bureau in place of the insurance, and officials are considering using this method. However, due to compensation claims and increased use of fuel at thermal power plants, TEPCO is short of funds, and it remains uncertain whether the full amount could be secured.

Kyushu Electric to idle reactor at Genkai nuclear plant Thurs.

The Genkai Nuclear Power Plant in Genkai, Saga Prefecture, is pictured in this photo taken from a Mainichi helicopter on Aug. 31, 2011. (Mainichi)

SAGA, Japan (Kyodo) -- Kyushu Electric Power Co. said Monday it will idle the No. 1 reactor at its nuclear power plant in Genkai, Saga Prefecture, on Thursday for regular checks, leaving only one reactor in operation on the southwestern Japan island of Kyushu.

The only reactor to remain in operation -- the No. 4 unit at the Genkai plant -- is also scheduled to begin undergoing similar checks on Dec. 25. The utility will ask customers to reduce their maximum power usage by more than 5 percent between Dec. 26 and Feb. 3.

The four other reactors owned by the utility -- the Nos. 2 and 3 reactors at the Genkai plant and the Nos. 1 and 2 reactors at the Sendai nuclear power plant in Satsumasendai, Kagoshima Prefecture -- are already offline for regular checks.

On Monday, the utility also began first-stage work to assess the safety of the No. 1 reactor at the Genkai plant, a prerequisite for its restart after the checks are complete.

The safety of the reactor has been called into question because it began operation more than 35 years ago. But Kyushu Electric maintains that it knows of "no safety problems" related to the reactor.

During the upcoming checks, the operator will replace about a quarter of the 121 nuclear fuel assemblies inside the No. 1 reactor's core, hoping to resume power generation in early February and return to normal operation in early March.

It is not yet clear when the reactor will be restarted for power generation, however, because it remains uncertain when the safety assessment report for the reactor will be submitted to the government.

According to the Nuclear and Industrial Safety Agency, an arm of the industry ministry, 44 of the nation's 54 commercial reactors had stopped operating as of Monday. Once idled, the Genkai No. 1 reactor will leave just nine reactors in operation nationwide.

(Mainichi Japan) November 29, 2011

High cesium levels in Chiba likely related to Fukushima crisis

TOKYO (Kyodo) -- High levels of radioactive cesium found in Kashiwa, Chiba Prefecture, last month were likely related to the crisis at the crippled Fukushima Daiichi nuclear power plant in Fukushima Prefecture, the Environment Ministry said in an interim report Monday.

The cesium is highly likely to have been concentrated in the soil on city-owned land after rainwater seeped from a ditch nearby, the ministry said, discounting the possibility that the contaminated soil had been brought in from elsewhere.

During monitoring at around 30 spots within a 4 square-meter area, radiation measured up to 4.11 microsieverts per hour 1 meter above ground, and up to 450,000 becquerels of radioactive cesium per kilogram of soil was detected in the soil between 5 to 10 centimeters below the surface near the ditch.

There were other spots near the area where high levels of cesium were detected below the surface. The ministry will therefore expand the area monitored, planning to produce a final report, possibly by the end of the year, it said.

(Mainichi Japan) November 29, 2011

Excessive cesium levels found in more Fukushima rice, 9 kg sold

FUKUSHIMA, Japan (Kyodo) -- More rice harvested in Fukushima Prefecture has been found to contain excessive levels of radioactive cesium, and 9 kilograms of the rice was sold earlier this month, the prefectural government said Monday.

The cesium found in rice harvested at three farms in Date measured more than the provisional upper limit of 500 becquerels per kilogram set by the central government, with the maximum level detected standing at 1,050 becquerels, according to the local government.

The central government plans to ban shipments of rice from the area as early as Tuesday.

In mid-November, excessive levels of radioactive cesium were found in rice harvested at a farm in the city of Fukushima, marking the first detection of such high levels of the substance in rice since the nuclear crisis erupted in Fukushima Prefecture after the March 11 earthquake and tsunami, but none of the rice produced at the farm this year has been shipped to markets.

A total of 9 kilograms of rice from one of the farms in Date, however, was sold in six bags at farm stands in the city from early to mid-November, with prefectural government officials saying it was the

first time that rice contaminated with excessive levels of radioactive substances was confirmed to have been sold.

The prefectural government said it is checking who purchased the rice in question.

(Mainichi Japan) November 29, 2011

Farm households in 2 Fukushima cities to suspend rice shipments

FUKUSHIMA, Japan (Kyodo) -- The Fukushima prefectural government has decided to ask 2,381 farming households in Nihonmatsu and Motomiya to suspend part of their rice shipments, after excessive levels of radioactive cesium were found in rice harvested in the neighboring cities of Fukushima and Date, local government officials said Tuesday.

The prefectural government has already requested 1,941 farming households in four municipalities, including Date, to suspend shipments, and the latest move will raise the number to 4,322 in total.

Fukushima Prefecture is home to the Fukushima Daiichi nuclear power plant, crippled by the March 11 earthquake and tsunami.

The cesium found in rice harvested in the cities of Fukushima and Date exceeded the provisional upper limit of 500 becquerels per kilogram set by the central government.

(Mainichi Japan) November 29, 2011

TEPCO says no explosion occurred at No.2 reactor

The operator of the damaged Fukushima Daiichi nuclear power plant says there was no explosion at the No. 2 reactor, denying an earlier report that there was. But the company says it is still unable to determine how and why radioactive substances were released from the reactor.

NHK has obtained Tokyo Electric Power Company's interim report on the nuclear accident that was triggered by the earthquake and tsunami on March 11th.

The report includes findings from a study that the utility launched in June to analyze how the accident occurred and how workers responded to it.

The report says that almost all electricity sources for the reactors were lost at once following the tsunami.

As a result, multiple safety functions were also lost, causing meltdowns from the No. 1 to the No. 3 reactors.

TEPCO analyzed seismographic data recorded within the plant in the early morning of March 15th, 4 days after the disaster, when a large blast was reportedly heard near the containment vessel of the No. 2 reactor.

The company concluded in the report that there was no explosion at the No. 2 reactor, and that a blast at the No. 4 reactor was mistakenly believed to have occurred at the No. 2.

Later that day, pressure inside the No. 2 reactor vessel dropped sharply, and radiation levels near the plant's main gate rose above 10 millisieverts per hour, then the highest level so far.

The interim report fails to specify how the leakage occurred at the containment vessel, just saying that gas in the vessel was somehow released into the air.

Tuesday, November 29, 2011

Fukushima plant chief to go on sick leave

The head of the Fukushima Daiichi nuclear power plant is stepping down for health reasons.

Masao Yoshida of Tokyo Electric Power Company has been in charge of dealing with the situation at the plant since the March earthquake and tsunami damaged the reactors.

The utility says Yoshida, who will be replaced on Thursday, is **resigning in order to receive medical treatments at a hospital**. The company says it cannot disclose his illness and level of radiation exposure as that is personal information.

In a statement issued on Monday, Yoshida expressed his regret over leaving the plant at a crucial time and apologized to all the people involved. He said he has to undergo treatment for a disease that was discovered in a health check-up.

Yoshida spoke to reporters on November 12th when the damaged plant was opened to media for the first time since the accident. He said that he had expected to die several times during the first week of the crisis.

He added that when he saw the hydrogen explosions at the Number 1 and 3 reactors, and when his team was unable to pump water into the Number 2 reactor, he thought it was the end.

The utility says Takeshi Takahashi, who is a manager at TEPCO headquarters, will succeed Yoshida.

Monday, November 28, 2011

Japanese Nuclear Accident Simulations Severely Underestimate Radiation Risks

Press release - November 29, 2011 - <http://www.greenpeace.org/international/en/press/releases/Japanese-Nuclear-Accident-Simulations-Severely-Underestimate-Radiation-Risks/>

Tokyo, Japan, November 29, 2011 – Greenpeace today renewed its demand for the Japanese government to keep its nuclear reactors offline as simulation maps of potential accidents at Japan’s nuclear plants - used in the development of nuclear emergency response efforts - are completely inadequate, and have not been updated since the Fukushima disaster.

Following a Greenpeace freedom of information request on November 25, the Ministry of Education, Culture, Sports, Science and Technology (MEXT) released SPEEDI simulations of the radioactive contamination spread from all nuclear plants in Japan (1). These maps show only extremely low releases of radioactivity over a 10km area around the plants in the event of meltdown, making any emergency response plan based on them totally insufficient should another severe disaster like the Fukushima Daiichi crisis occur (2).

“The simulation of radioactive releases from the Ohi reactor for example, is scandalously inadequate. It foresees a radiation release in the order of 10,000 times less severe than what could happen during a major incident (3),” said Jan Vande Putte, Greenpeace International Nuclear Campaigner. “Similar over-optimistic scenarios have been used for reactors all over Japan. Hoping for the best is absolutely the wrong way to devise an emergency response plan.”

Greenpeace met with officials from MEXT and the SPEEDI programme today, and they confirmed that the current simulations are limited to low-level releases, and that the system needed upgrading to cover larger releases and wider areas beyond 10km from the plants.

“The Fukushima Daiichi emergency response effort was slow, chaotic and insufficient, and it appears the Government has learned nothing from it so far,” said Junichi Sato, Greenpeace Japan Executive Director. “These maps show that there is a strong risk of reactor restarts being pushed through without a proper, science-based assessment on the real risks being conducted, and without proper precautions being taken to protect the communities around the plants.”

Greenpeace is demanding that the Japanese government uses SPEEDI for what it was developed for, and run worst-case scenario simulations for all nuclear plants in Japan so there is a clear understand what effect a Fukushima Daiichi-type incident at other plants around Japan could have.

ENDS

Greenpeace is an independent global campaigning organisation that acts to change attitudes and behaviour, to protect and conserve the environment, and to promote peace.

Greenpeace International Press Desk Hotline, Amsterdam +31 20 7182470

Notes:

1) The simulations released under FOI to Greenpeace were made to support emergency preparedness drills of local and central government authorities. They calculate the concentration of radioactivity in the air, contamination on the ground and dose to the population within a range of 10km. Based on these maps, drills on evacuation or sheltering of the population, or distribution of iodine pills are organised.

Published maps (Japanese only): http://www.bousai.ne.jp/vis/speedi_z/

2) Greenpeace has measured contamination levels high enough to require evacuation under international standards at 60km distance from Fukushima Daiichi www.greenpeace.org/fukushima-data

3) A major incident in this case is based on a 15% release of iodine from the core of the reactor, which is still not a worst-case scenario. Nuclear safety authorities from the United States (NRC, Nureg-1150, 1990) and Germany (SSK, Heft 37, 2003) have calculated that under the worst-case conditions, even a release between 50% and 90% of all iodine is possible, though with a lower probability.

Fundamental questions being avoided about Monju must be asked

The following interaction took place Nov. 26 between reporters and Goshi Hosono, the state minister in charge of the nuclear crisis, after his visit to the Monju prototype fast-breeder reactor in Fukui Prefecture.

"What are your thoughts upon visiting Monju?" a reporter asked.

"I feel that we're coming to a turning point ..." Hosono responded.

"Do you think that decommissioning the plant should be among the options that are considered?" asked another reporter.

"I think there's a need for deliberation that includes that sort of option," Hosono answered.

This led to headlines regarding Hosono "contemplating the decommissioning of Monju." But did Hosono really say anything groundbreaking? I don't think he did.

On a superficial level, one gets the impression from media reports that those for decommissioning Monju are winning the fight against those for the reactor's survival. Decision-making at the political level is in the hands of pro-Monju advocates, however, and they haven't made much of a fuss about it. Their silence betrays a certain smugness that allowing the anti-Monju bloc to complain won't make a difference. It was under such nuanced circumstances that Hosono avoided making any clear-cut statements.

The Noda-sponsored non-legally-binding waste-cutting deliberations have failed to accomplish as much as it looks like. Government Revitalization Unit members gave up on Sunday to engage in fierce discussion, ultimately recommending that the Monju project undergo a "fundamental review."

The panel members recommended a cancellation of 2.2 billion yen of the 21.5 billion yen requested for the fiscal 2012 budget in Monju-related government spending. However, because the committee has avoided a basic discussion about whether it is necessary to continue with the Monju project at all, they haven't been able to address the remaining 19.3 billion yen. Its recommendation for a "fundamental review" is essentially the panel members unloading the problem on someone else who will hopefully take care of the rest.

Why, then, did the waste-cutting panel fail to engage in a fundamental debate on Monju's necessity? Most likely, the panel was holding back out of consideration for the Japan Atomic Energy Commission (JAEC), the organization responsible for deliberating the country's basic nuclear policy.

The Energy and Environment Commission -- the JAEC's umbrella organization -- probably warned the Government Revitalization Unit panel against venturing into the realm of nuclear controversy, and to refrain from causing any waves until next summer, when the government's new nuclear policy outline will be drafted.

Though media reports make it seem as though we are moving toward the direction of decommissioning Monju, unfortunately, that is not the case. After 44 years and a total 1 trillion yen in public funds, Monju is still not up and running. It doesn't even look like it will run, which is why immediately after the Great East Japan Earthquake, there were increased calls for the abandonment of Monju research and development. But now, a comeback is being staged by advocates for development that is "less wasteful."

Fast-breeder reactors like Monju run on plutonium extracted from spent nuclear fuel that's been produced by other reactors and reprocessed. Unless this nuclear fuel cycle is established, spent fuel will only continue to accumulate. Indeed, as of September 2010, the fuel storage pools in all of Japan, with a combined capacity of 20,420 tons, were filled with 13,530 tons of spent fuel, taking up 66 percent of storage capacity.

This data came to light in May when Liberal Democratic Party (LDP) lawmaker Taro Kono, who is staunchly against nuclear power and the nuclear fuel cycle, requested the information from the Ministry of Economy, Trade and Industry (METI). Kono has pointed out that even if we assume that the Fukushima No. 1 and No. 2 nuclear power plants and the Hamaoka Nuclear Power Plant in Shizuoka Prefecture remain shut down, calculations show that in less than six years, fuel storage pools will all be filled to the brim.

What are we going to do with the massive volume of nuclear trash that is about to overflow from our nuclear power plants? Avoiding reality is not an option available to us. We must wake up and pick up after the mess that economic prosperity has left behind. I can only hope that the prime minister and the nuclear crisis minister make the right turn at this turning point. (By Takao Yamada, Expert Senior Writer)

(Mainichi Japan) November 29, 2011

Only specialist firms should clean up areas with high radiation, say health experts

Only businesses specializing in radiation should be allowed to be engaged in the decontamination of areas where annual external exposure to radiation is over 1 millisievert, experts recommend.

Moreover, such businesses should be required to strictly control workers' exposure to radiation, according to recommendations made by experts commissioned by the Health, Labor and Welfare Ministry in the wake of the accident at the tsunami-hit Fukushima No. 1 Nuclear Power Plant.

Based on the suggestions, the ministry is set to work out regulations and guidelines on decontamination as early as Jan. 1 under the Industrial Safety and Health Act.

The new regulations and guidelines will apply to decontamination work at facilities where the hourly air dose of radiation is 0.23 microsieverts, or 1 millisievert a year.

If workers perform decontamination work on dozens of occasions a year in areas where radiation levels are 0.23 to 2.5 microsieverts, the ministry estimates that their annual external exposure will be well below 1 millisievert and believes that they do not have to undergo radiation exposure screening by their employers. Based on this estimate, the regulations and guidelines will allow local residents and volunteers to participate in decontamination in such areas.

However, the proposal adds that businesses specializing in radiation must be commissioned to decontaminate areas if workers are required to be engaged in decontamination work for long periods and their external exposure to radiation exceeds 1 millisievert a year. Businesses engaged in such work will be obligated to strictly control workers' exposure to radiation.

In areas where the air dosage of radiation is not more than 2.5 microsieverts per hour, regulations and guidelines will allow their employers to conduct simple checkups on them, such as sample testing.

In areas where the air dosage of radiation is higher than that level and in areas designated as evacuation zones near the crippled Fukushima nuclear plant, however, businesses must ensure each worker carries a dosimeter during their work and strictly check each individual's exposure to radiation.

Workers must wear protective masks and suits and undergo checks on their internal exposure to radiation every three months if they work in areas where soil and waste are highly contaminated with radioactive substances and where workers are exposed to huge amounts of dust.

However, questions have been raised over whether businesses will strictly abide by the regulations and guidelines as many small- and medium-sized companies without expertise are expected to engage in decontamination work.

The ministry's Policy Planning Division said it will instruct companies concerned to strictly abide by the rules.

"We'll invoke punitive clauses in the Industrial Safety and Health Act if we confirm any company deviates from the rules. We'll step up our instructions to businesses through local labor standards' inspection offices," a division official said.

(Mainichi Japan) November 29, 2011

Fukushima Pref. to decommission all 10 local nuke reactors

The Fukushima Prefectural Government has decided to decommission all 10 reactors in its jurisdiction, including those at the Fukushima No. 2 nuclear plant, in conjunction with its disaster recovery project, it has been learned.

A vision for restoration created by the prefectural government in August promoted the formation of a "society not relying on nuclear power," but made no actual reference to decommissioning reactors. Fukushima Gov. Yuhei Sato was expected to formally announce the measure in a news conference on Nov. 30.

Earlier, Sato stated that the No. 1 to 4 reactors at the damaged Fukushima No. 1 nuclear complex would be decommissioned, but when it came to the plant's No. 5 and No. 6 reactors and those at the Fukushima No. 2 plant, he had simply stated, "It is inconceivable to restart them."

In October the Fukushima Prefectural Assembly adopted a petition seeking decommissioning of all reactors in the prefecture.

In a meeting on the morning of Nov. 30, prefectural officials discussed how the decommissioning of reactors would affect employment and the finances of local bodies. Yoichi Nozaki, a prefectural official in charge of the restoration project, stressed that the prefecture's principles had not changed.

"The principle of moving away from nuclear power, which was put forward in our vision for restoration, has not changed," he said. "In the future we will have a Fukushima Prefecture without nuclear power."

Fukushima plant head told workers to disregard order on water injection

TOKYO (Kyodo) -- The head of the troubled Fukushima Daiichi nuclear power plant, who will be relieved of his post effective Thursday for medical treatment, told workers to disregard the plant operator's order to stop injecting seawater into a reactor soon after the nuclear crisis erupted in March, government and other sources said Tuesday.

Masao Yoshida, who has since drawn media attention over his decision to continue the seawater injection despite Tokyo Electric Power Co.'s decision to suspend the measure, told workers not to obey his ensuing instruction before going on to order them to stop injecting the water, according to government and TEPCO sources.

While some people have criticized Yoshida's unilateral action, others have said his decision prevented the situation at the plant from deteriorating as workers scrambled to try to bring the crisis, triggered by the March 11 earthquake and tsunami, under control.

The disaster caused the plant's No. 1 reactor to lose power and thus its cooling functions. As the supply of fresh water to cool the reactor was running out, workers began injecting seawater from shortly after 7 p.m. on March 12.

But the utility's head office instructed Yoshida to stop the seawater injection after a TEPCO official, who was dispatched to then Prime Minister Naoto Kan's office, reported to the head office that there was "a feeling that seawater injection could not be implemented without the prime minister's decision."

Yoshida then told the workers, "I will order you to stop the water injection..., but do not listen to it," before instructing them to stop the seawater injection, according to the sources.

The workers ignored the order and continued injecting seawater into the reactor, they said.

Based on a report from Yoshida, TEPCO initially announced that seawater injection had been suspended from 7:25 p.m. to 7:55 p.m. Two months later, he revealed that the injection had not actually been suspended and he was reprimanded by TEPCO.

On Monday, TEPCO said Yoshida had been hospitalized and will be relieved of his post, while declining to provide details of his illness and his accumulated radiation exposure, citing privacy, only saying that doctors have not indicated a link to radiation.

Yoshida, who became the plant's chief in June 2010, has directed onsite operations to bring the radiation-leaking plant under control since the March 11 disaster triggered Japan's worst nuclear crisis.

Japan's nuclear accords with 4 countries due to clear parliament

<http://mdn.mainichi.jp/mdnnews/news/20111130p2g00m0dm082000c.html>

TOKYO (Kyodo) -- Japan's bilateral civil nuclear cooperation accords with Jordan, Russia, South Korea and Vietnam could take effect in December, with Diet deliberations on them beginning Wednesday despite public concerns about exporting atomic technology in the wake of the Fukushima disaster.

The accords, which will lay the legal foundations for Japanese companies to supply nuclear equipment and technology to other countries, are expected to be approved by the House of Representatives on Dec. 2, lawmakers said.

If all goes smoothly, they will come into force next year after also being approved by the House of Councillors during the current parliament session, which ends Dec. 9 unless extended.

On Wednesday the Liberal Democratic Party, which controls the House of Councillors with smaller opposition parties, basically agreed to support enactment of the pacts.

Japan signed the pacts with the respective countries before the world's worst nuclear accident in 25 years occurred at the Fukushima Daiichi power plant, following the March 11 earthquake and tsunami.

Diet deliberations on the nuclear cooperation agreements had stalled after the accident. But the government and the LDP later decided to take the stance that such accords before the March disaster should become effective to prevent diplomatic relations from being damaged, and as long as other countries still wanted Japan's cooperation.

Necessary domestic procedures for the accords in the four countries have already been completed and they are only awaiting approval by the Japanese Diet, according to government officials.

Foreign Minister Koichiro Gemba told a House of Representatives committee that Japan will "do whatever is possible to ensure safety," when referring to the country's policy of not completely abandoning its nuclear exports.

Gemba told the lower house panel on foreign affairs he is also hoping to conclude a bilateral accord on cooperation in the peaceful use of nuclear energy with five countries -- Brazil, India, South Africa, Turkey and the United Arab Emirates -- on which Japan began negotiations prior to the Fukushima disaster.

In Jordan, a consortium of Mitsubishi Heavy Industries Ltd. and French nuclear power company Areva is competing with Russian and Canadian companies for nuclear power contracts.

Jordan has urged Japan to ratify a bilateral nuclear cooperation accord by the year-end, cautioning that without it, the Japan-French consortium will lose its chance of winning a bid to build a nuclear power plant there, according to diplomatic sources.

(Mainichi Japan) November 30, 2011

Fukui municipalities call on gov't to keep nuclear power plants

TOKYO (Kyodo) -- Fukui Prefecture municipalities that host nuclear power plants urged the central government on Tuesday to maintain the plants at a time when it is mulling the best combination of energy sources following the nuclear crisis at the Fukushima Daiichi power plant.

"The host communities hope the need for nuclear power generation will be shown and such power will be used in the search for a better mix of power sources," a group representing the municipalities said in a statement.

Jitaro Yamaguchi, chairman of the group and also mayor of Mihama town that hosts a Kansai Electric Power Co. nuclear power plant, handed the statement to Economy, Trade and Industry Minister Yukio Edano at the ministry.

Yamaguchi also said the request is premised on ensuring the safety of residents in areas with nuclear power stations.

Edano responded, "Even if the nation's (nuclear power) policy changes, we intend to thoroughly fulfill our responsibility (to the municipalities)."

On the same day, Mitsuharu Kanazawa, mayor of Oma town in Aomori Prefecture, asked Tadahiro Matsushita, senior vice industry minister, to realize the early resumption of construction of Electric Power Development Co.'s Oma nuclear power plant.

Farmer who unknowingly shipped radioactive rice says prefecture's testing not enough

DATE, Fukushima -- "I shipped my crops trusting Fukushima Prefecture's declaration about crop safety. It's really a shame that things turned out as they have," says farmer Ichiko Takahashi, whose rice was found to be over the government's radiation limit after part of it was sold to consumers.

"If the testing methods are not changed, the same problem (of crops over the government limit making it through) will happen again."

Even after the prefecture made its announcement that crops were safe in October, Takahashi had doubts that the radiation tests were sufficient and brought her crops in herself for testing. The results she

received on Nov. 18 were under the provisional government limit of 500, but not by much, at 476 becquerels of cesium.

She had already sent 18 kilograms of mochi rice for sale to customers. Afraid she would lose customers' confidence by selling the rice as it was, she asked for its sale to be halted and she took it to be tested at Fukushima University. A few days later she got news that it was over 700 becquerels. On Nov. 28, she also got news from the prefectural government that testing on her rice there had found it over the government limit.

Of the 18 kilograms of rice, 10.5 kilograms had already been sold. Nine of those kilograms were to unknown buyers, something that worries her.

Takahashi has a reputation in the area as a knowledgeable vegetable farmer and has taught elementary school students how to grow sweet potatoes and rice.

Says Takahashi: "I've farmed until now under the philosophy that you mustn't make anything dangerous. I tried to keep radiation out by not using water from the mountain rivers. What more could I have done?"

(Mainichi Japan) November 30, 2011

Gov't panel to discuss whether to decommission Genkai No. 1 nuclear reactor

The government's Nuclear and Industrial Safety Agency (NISA) decided on Nov. 29 to set up a subcommittee to discuss whether to review its safety assessments of the No. 1 reactor at the Genkai Nuclear Power Plant in Saga Prefecture in what could be a step toward decommissioning the aging reactor.

NISA, an arm of the Ministry of Economy, Trade and Industry, made the decision after some experts said at its hearing on measures against the aging of nuclear reactors on Nov. 29 that the pressure vessel of the Genkai No. 1 reactor was deteriorating faster than generally assumed and that the reactor should be decommissioned. The No. 1 reactor, the oldest reactor operated by Kyushu Electric Power Co., became operational in 1975.

It has been revealed that a process called "embrittlement" by which the pressure vessel becomes fragile after being exposed to neutrons emitted from the reactor core has progressed much faster than previously thought. Therefore, some experts have pointed out that the vessel, if cooled down quickly, could break down easily.

The No. 1 reactor will go through regular inspections from Dec. 1, but NISA's subcommittee plans to come up with final safety assessments of the reactor by the end of March 2012, and therefore there is a possibility of the reactor remaining shut down at least until then. Moreover, depending on the subcommittee's conclusions, Kyushu Electric's explanation that there is "no safety problem" could be undermined and calls for decommissioning of the reactor would likely emerge stronger.

At the hearing held on Nov. 29, Hiromitsu Ino, professor emeritus at the University of Tokyo, said, "I think the Genkai No. 1 nuclear reactor, which has been deteriorating much faster than predicted, should be decommissioned." On whether to resume operations of the reactor after regular inspections, he said, "Clearing the arguments presented at the hearing is a prerequisite." Another expert said, "There is a need to review the traditional methods of assessing the safety of pressure vessels."

(Mainichi Japan) November 30, 2011

TEPCO: Melted fuel ate into containment vessel

http://www3.nhk.or.jp/daily/english/20111130_39.html

The operator of the damaged Fukushima Daiichi nuclear power plant has announced the results of an analysis on the state of melted fuel in the plant's Number 1 unit.

The Tokyo Electric Power Company, or TEPCO, and several research institutes made public their analyses on the melting of fuel rods at 3 of the plant's units at a government-sponsored study meeting on Wednesday. The analyses were based on temperatures, amounts of cooling water and other data.

TEPCO said that in the worse case, all fuel rods in the plant's Number 1 reactor may have melted and dropped through its bottom into a containment vessel. The bottom of the vessel is concrete covered with a steel plate.

The utility said the fuel may have eroded the bottom to a depth of 65 centimeters. The thinnest part of the section is only 37 centimeters thick.

TEPCO also said as much as 57 percent of the fuel in the plant's Number 2 reactor and 63 percent in the Number 3 reactor may have melted, and that **some of the melted fuel may have fallen through reactor vessels.**

Wednesday, November 30, 2011

Melted nuclear fuel eroded reactor container by up to 65 cm: TEPCO

TOKYO (Kyodo) -- The operator of the crippled Fukushima Daiichi nuclear power plant said Wednesday that **the concrete base of the No. 1 reactor container had been eroded by up to 65 centimeters when the fuel inside melted,** although the steel container itself was left intact.

According to Tokyo Electric Power Co.'s analysis, all of the fuel inside the No. 1 reactor melted after cooling functions failed in the wake of the March 11 earthquake and tsunami, with a substantial amount of the fuel melting through the base of the reactor pressure vessel and dropping into the outer primary container.

If the erosion had expanded another 37 cm, the damage would have reached the steel wall, according to the utility known as TEPCO.

As for the Nos. 2 and 3 reactors, which also experienced meltdowns, the amount of fuel that dropped to the bottom of the pressure vessel is estimated to be around 60 percent.

The bottom of the two reactors' pressure vessels is unlikely to have been damaged on a large scale. But if the fuel had melted through the vessels, the primary container of the No. 2 reactor could have been eroded by 12 cm and that of the No. 3 reactor by 20 cm, TEPCO said.

Currently, the melted fuel inside the Nos. 1 to 3 reactors is believed to be cooled by water injection and no further erosion is occurring, it said.

Activists challenge government on nuclear waste management policy

http://www.taiwannews.com.tw/etn/news_content.php?id=1771961

Taipei, Nov. 28 (CNA) Environmental groups charged Monday that Taiwan's government has not resolved how to deal with nuclear waste and proposed suspending operations at the country's three nuclear power plants until the issue was dealt with. The environmentalists made the appeal at an environmental assessment meeting held by the Cabinet-level Environmental Protection Administration (EPA) on the government's radioactive waste management policy.

During the meeting, officials from the Atomic Energy Council (AEC), the country's top nuclear regulatory body, presented a report on its proposed approach to dealing with nuclear waste that will become official policy if approved by the EPA assessment committee. One of the plan's centerpieces was to have nuclear waste recycled overseas before shipping it back to Taiwan for permanent storage.

But environmental activists, including Green Citizens' Action Alliance Deputy Secretary-General Hung Shen-han, were not convinced the solution was viable and advocated shutting down Taiwan's three nuclear power plants until the issue was clearly addressed. Hung contended that one way or another, radioactive waste had to be stored either at home or abroad, and no foreign country has so far been willing to lease Taiwan land for storage of the waste. He acknowledged that radioactive waste could be recycled overseas but said the leftover material was still unstable and would still have to be stored in Taiwan, which he saw as a bad option. **Hung compared nuclear waste to a ticking time-bomb that threatened the life and property of Taiwan's people because of the unstable geographic nature of the island, which is prone to earthquakes.**

Wang Chung-ming of the Green Party Taiwan suggested that the government include the proposal to suspend nuclear power plant operations in the report the AEC was presenting to the EPA committee for approval. The report, which the activists said had many other loopholes and problems, also outlined four principles on which waste management should be based -- securing residents' approval, ensuring safety, reducing waste production, and developing efficient recycling and storage technologies. Taiwan's low-level radioactive waste is currently stored on the outlying Orchid Island and in the three nuclear power plants in which it is being produced. The government has selected Wuchiu in Kinmen and Daren in Taitung to serve as permanent storage sites for the waste, but it has encountered strong opposition from people in the two townships. (By Hsu Chih-wei and Elizabeth Hsu)

Japan's nuclear accords with 4 countries due to clear parliament

<http://mdn.mainichi.jp/mdnnews/news/20111130p2g00m0dm082000c.html>

TOKYO (Kyodo) -- Japan's bilateral civil nuclear cooperation accords with Jordan, Russia, South Korea and Vietnam could take effect in December, with Diet deliberations on them beginning Wednesday despite public concerns about exporting atomic technology in the wake of the Fukushima disaster.

The accords, which will lay the legal foundations for Japanese companies to supply nuclear equipment and technology to other countries, are expected to be approved by the House of Representatives on Dec. 2, lawmakers said.

If all goes smoothly, they will come into force next year after also being approved by the House of Councillors during the current parliament session, which ends Dec. 9 unless extended.

On Wednesday the Liberal Democratic Party, which controls the House of Councillors with smaller opposition parties, basically agreed to support enactment of the pacts.

Japan signed the pacts with the respective countries before the world's worst nuclear accident in 25 years occurred at the Fukushima Daiichi power plant, following the March 11 earthquake and tsunami.

Diet deliberations on the nuclear cooperation agreements had stalled after the accident. But the government and the LDP later decided to take the stance that such accords before the March disaster should become effective to prevent diplomatic relations from being damaged, and as long as other countries still wanted Japan's cooperation.

Necessary domestic procedures for the accords in the four countries have already been completed and they are only awaiting approval by the Japanese Diet, according to government officials.

Foreign Minister Koichiro Gamba told a House of Representatives committee that Japan will "do whatever is possible to ensure safety," when referring to the country's policy of not completely abandoning its nuclear exports.

Gemba told the lower house panel on foreign affairs he is also hoping to conclude a bilateral accord on cooperation in the peaceful use of nuclear energy with five countries -- Brazil, India, South Africa, Turkey and the United Arab Emirates -- on which Japan began negotiations prior to the Fukushima disaster.

In Jordan, a consortium of Mitsubishi Heavy Industries Ltd. and French nuclear power company Areva is competing with Russian and Canadian companies for nuclear power contracts.

Jordan has urged Japan to ratify a bilateral nuclear cooperation accord by the year-end, cautioning that without it, the Japan-French consortium will lose its chance of winning a bid to build a nuclear power plant there, according to diplomatic sources.

Gov't to aid infrastructure building in areas near Fukushima plant

A deserted field and buildings inside the contaminated exclusion zone around the crippled Fukushima Dai-ichi nuclear power station are seen through a bus window near Okuma, Japan, Saturday, Nov. 12, 2011. (AP Photo/David Guttenfelder, Pool)

TOKYO (Kyodo) -- The central government plans to carry out infrastructure projects, such as road and embankment improvement, on behalf of local governments in areas where voluntary evacuation advisories arising from the Fukushima nuclear crisis have been lifted, government sources said Wednesday.

According to an outline of planned legislation to facilitate reconstruction work after the nuclear accident, the national government would also provide the areas with reconstruction measures more favorable than those for other affected areas, such as free provision of land lots for industrial use and greater tax breaks.

The planned bill, which the government intends to present to the ordinary Diet session to be convened in January, is aimed at providing all-out government support for people gravely affected by radiation leaks from the Fukushima Daiichi nuclear plant crippled by the March 11 earthquake and tsunami.

Infrastructure improvements and other projects after the removal of evacuation directives would be carried out based on a rehabilitation plan to be worked out by the prime minister through consultations with Cabinet ministers and local government chiefs.

The Fukushima prefectural government would prepare a set of measures to promote local products, such as reduction or exemption of registration fees for products adopting Fukushima brand names.

The town of Minamisanriku is seen eight months after it was destroyed by the March 11 tsunami, in northeast Japan, Friday, Nov. 18, 2011. (AP Photo/Greg Baker)

To support the creation of environmental and other new businesses, the prefectural government would also prepare other programs, including simplified procedures for approving geothermal development projects.

Among other measures envisioned by the planned legislation, health surveys would be carried out throughout the prefecture, and the prefectural government would use basic resident registers, managed by municipal governments, to confirm information about residents.

Nobel winner, 9 others picked for nuclear crisis panel

TOKYO (Kyodo) -- Nobel chemistry laureate Koichi Tanaka and nine others were selected Wednesday as members of a special parliamentary committee to investigate the causes behind the ongoing nuclear crisis at the Fukushima Daiichi power plant, lawmakers said.

In a unanimous decision, Kiyoshi Kurokawa, 75, former president of the Science Council of Japan, was picked to head the 10-member panel by senior members of the rules and administration committees of both houses at a meeting of their joint consultative panel on the matter.

Formal appointments by the heads of the House of Representatives and the House of Councillors are likely to be made next week at the earliest, after expected approval at plenary sessions of each chamber on Friday, they said.

The special investigative committee is likely to start work in earnest in mid-December or later, with plans to produce a report around next June.

The parliamentary panel will function separately from a panel of third-party experts set up by the government to determine the causes of the nuclear crisis.

(Mainichi Japan) December 1, 2011

Nuclear cleanup volunteers' invisible enemy

Setsuko Kitaguchi / Yomiuri Shimbun Staff Writer

DATE, Fukushima--Some local governments in Fukushima Prefecture have started decontamination operations using volunteers to remove radioactive substances released after the accident at the Fukushima No. 1 nuclear power plant.

One work site in particular had a peculiar atmosphere, in which volunteers fought invisible, potentially hazardous radiation particles with simple equipment, **making them appear to be cleaning a garden.**

I participated in the decontamination volunteer work at a specific spot recommended for evacuation in Date, about 50 kilometers from the crippled nuclear plant.

At 9:30 a.m. Saturday, a bus carrying 33 participants arrived in the city's Tsukidate-Kitanosawayama district. Most of them were middle-aged or elderly men from other prefectures. There were six women including me.

In the basin in which rice paddies after the harvest could be seen in abundance, houses stood as if they were being supported by the mountain slopes.

We were provided with body warmers, dust masks and dosimeters. The radiation level I measured above the ground was about three microsieverts per hour.

Yearly exposure at this rate could exceed 20 millisieverts, which requires that the site be designated as a specific spot recommended for evacuation.

"We know there's radiation here," one participant said.

And yet the place was situated in such serene surroundings. We were surprised again.

We conducted the day's decontamination work at sites near two barns. We collected fallen leaves and put them into garbage bags, tying the top of the bags with adhesive tape.

We then scraped off topsoil with shovels and sickles. The bags were heavier than I expected as the contents contained a great deal of moisture. I carried the bags, shaky on my feet, to a temporary storage site on the premises.

When a city government official measured radiation levels below the eaves troughs of the barns and greenhouses, the meter read more than 10 microsieverts.

We were surprised again to see the wide range of radiation levels at different spots at the same location.

An hour after beginning the work, the mask made my face feel sweaty and itchy, but I could not remove it for fear of the radiation stirred up from the mud.

Just removing fallen leaves and scraping off the surface soil cut the radiation levels in half. Further digging up the soil to a depth of five centimeters brought the level down to less than two microsieverts.

In 2-1/2 hours we filled about 100 garbage bags.

A 45-year-old man from Ninohe, Iwate Prefecture, who also participated in the decontamination volunteer work in Fukushima, expressed his desire to help, despite the difficulties.

"Because there are people living here, I want to make the conditions better," he said.

Though it was not such hard physical labor, I felt mentally exhausted and my muscles ached, perhaps because I always kept an eye on my dosimeter as I worked.

On Monday, two days after the work, it was announced that radioactive cesium exceeding the government's interim limit had been detected in unpolished rice harvested in the Tsukidatemachi district of Date, where I had worked as a volunteer.

I cannot help but worry how much work will be required to make the town a place where residents can live with peace of mind.

In Fukushima Prefecture, only the city governments of Date and Fukushima are asking for volunteers to help with decontamination. Many other local governments have yet to compile decontamination plans.

But some of the other local governments are doubtful about whether decontamination operations by volunteers are effective.

"I'm not sure whether we are allowed to put volunteers in situations where they risk being exposed to radiation," one local government official said,

Next January, a law for special measures to decontaminate areas polluted with radiation, which will stipulate methods and the government's responsibility for the decontamination work, will be fully enacted.

Coinciding with the law coming into effect, the Environment Ministry and the Fukushima prefectural government will establish facilities staffed with decontamination experts.

The facilities will dispatch volunteers to local governments and instruct them on effective and safe decontamination methods.

(Dec. 1, 2011)

Wary of criticism, officials shelved withdrawal from nuclear reprocessing business

Top officials from Tokyo Electric Power Co. (TEPCO) and the Ministry of Economy, Trade and Industry (METI) secretly met in 2002 to discuss withdrawing from a project to reprocess nuclear fuel at the Rokkasho Reprocessing Plant in Aomori Prefecture, it has been learned.

The very fact that officials met to discuss this issue is a sign that Japan's bid to reprocess all of its nuclear waste domestically was saddled with problems from the outset. At the same time, the continued support that the project has received in spite of the doubts that government and industry officials held about its safety and economic feasibility shows a diseased side of Japan's nuclear power policy.

Sources familiar with the project said that TEPCO executives and other parties had made frequent visits to METI and the ministry's Agency for Natural Resources and Energy until around February 2004, seeking to withdraw from the nuclear fuel reprocessing project. In addition to ballooning construction costs and a series of problems, it was calculated in January 2004 that operation of the reprocessing plant could cost approximately 19 trillion yen.

Yet, while prospects for the plant were becoming bleaker, METI and TEPCO withheld from producing any guidelines for withdrawing as pulling out would lead to questions of responsibility for wasted money.

Another factor was the strong resistance from Japan's "Nuclear Power Village," the name given to supporters of nuclear power in Japan. Officials from the Agency for Natural Resources and Energy and the Cabinet Office's Japan Atomic Energy Commission, for example, concealed diplomatic documents that arrived from Russia in October in 2002, proposing to accept Japan's spent nuclear fuel, on the grounds that this could hinder domestic factory operations.

One former senior METI official learned about the existence of the Russian proposal for the first time in a Nov. 24 report in the Mainichi Shimbun newspaper.

"If we had been aware of the proposal, we could have suggested transporting nuclear fuel to Russia, and a path for pulling out of the project may have opened," the official lamented.

As a result, the reprocessing project has continued, and the 19 trillion yen has been tacked on to industrial and home power bills. When considering that the money businesses are spending on electricity ends up being added to the prices of the products they produce, the financial burden on each person in Japan works out at about 150,000 yen.

The reprocessing factory that members of the public are being made to fund is still not operating -- a fact that further highlights the failed nature of the project.

(Mainichi Japan) December 2, 2011

Japan to export nuclear technology if wanted, Noda says

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda said Friday that Japan will consider exporting its nuclear technology, in principle, as long as it is still wanted by other countries.

Noda said Japan will not provide its nuclear technology and expertise to any country without restriction, noting that peaceful use and other requirements must be ensured.

But Noda told a House of Representatives panel he believes it is "meaningful to provide things with high levels of safety" to other countries.

Noda's remarks came as Japan's bilateral civil nuclear cooperation accords with Jordan, Russia, South Korea and Vietnam are due to be approved by parliament this month, despite public concerns about the safety of atomic power in the wake of the Fukushima disaster.

The accords, which will lay the legal foundations for Japanese companies to supply nuclear equipment and technology to other countries, were approved by the committee on foreign affairs in the afternoon.

Japan signed the pacts with the four countries before the world's worst nuclear crisis since Chernobyl occurred at the Fukushima Daiichi power plant, following the March 11 earthquake and tsunami.

Before the crisis, the government led by the Democratic Party of Japan regarded exporting the country's nuclear technology, especially to fast-growing economies, as one of the most promising ways to generate economic growth.

Noda told the lower house panel that the government is seeking the parliamentary passage of the accords as necessary domestic procedures have already been completed in Jordan, Russia, South Korea and Vietnam. He said those countries are still hoping to have Japan's cooperation even after the nuclear crisis -- which has yet to be brought under control.

Noda said diplomatic relations must be taken into account with regard to the four accords as well as others Japan began negotiating prior to the crisis, including with Brazil, India and Turkey.

As for new agreements, Noda said the government must examine how Japan can cooperate for the peaceful use of nuclear energy taking into account the findings on the Fukushima accident.

To date, Japan has concluded bilateral nuclear accords with seven countries -- Australia, Britain, Canada, China, France, Kazakhstan and the United States -- and the European Atomic Energy Community.

A vote on the four nuclear accords in a lower house plenary session, which was initially due to take place on Friday, has been rescheduled for next week.

If all goes smoothly, they will come into force early next year after also being approved by the opposition-controlled House of Councillors during the current parliamentary session, which will end Dec. 9 unless extended.

In Jordan, a consortium of Mitsubishi Heavy Industries Ltd. and French nuclear power company Areva is competing with Russian and Canadian companies for contracts.

Jordan, which plans to conduct a bid to build a nuclear power plant by the end of this year, has urged Japan to approve their nuclear cooperation accord soon, according to diplomatic sources.

(Mainichi Japan) December 2, 2011

Diet panel approves civil nuclear pacts

A committee of Japan's Lower House has approved civil nuclear cooperation treaties with 4 countries. The house is to vote on the agreements next week.

The foreign affairs committee gave majority support on Friday for the treaties with Jordan, Russia, Vietnam and South Korea.

The main governing Democratic Party and the largest opposition Liberal Democratic Party voted for the pacts.

The treaties would allow Japan to export nuclear power generation facilities and transfer related technology to the nations.

Japan and the 4 countries signed the accords before the March 11th disaster and Fukushima nuclear accident. Diet approval had been pending ever since.

Japan's Prime Minister Yoshihiko Noda told the committee that Japan has a duty to share the lessons learned from the accident.

Noda said it would be meaningful for Japan to offer safe nuclear technologies to countries that request them, while ensuring the peaceful use of nuclear power and monitoring conditions in recipient nations.

But he expressed caution about signing similar pacts with more countries, citing the need to review the accident at the Fukushima Daiichi nuclear plant.

Friday, December 02, 2011 16:16 +0900 (JST)

TEPCO, industry ministry secretly agreed to abandon nuclear reprocessing plant in 2002

<http://mdn.mainichi.jp/mdnnews/news/20111202p2a00m0na015000c.html>

Senior officials at Tokyo Electric Power Co. (TEPCO) and the Ministry of Economy, Trade and Industry (METI) held a top secret discussion in 2002 about abandoning the Rokkasho Reprocessing Plant project, the Mainichi has learned.

The Mainichi obtained a memo written by a METI official with the names of the participants -- then TEPCO Chairman Hiroshi Araki, President Nobuya Minami, Vice President Tsunehisa Katsumata and METI

Administrative Vice Minister Katsusada Hirose -- the date, and the meeting's objective, as well as comments from those who were believed to have been involved. This marks the first time that such top-level deliberations between TEPCO and METI have come to light.

The pros and cons of the nuclear fuel cycle, including whether to continue with or abandon the Monju prototype fast-breeder reactor in Fukui Prefecture are set to undergo review, and **the revelation that TEPCO and METI officials were already suggesting abandonment of a nuclear reprocessing project -- a major pillar of the nuclear fuel cycle vision -- nine years ago is likely to affect the new national nuclear policy that the Japan Atomic Energy Commission of the Cabinet Office is slated to draw up by the summer of 2012.**

According to the memo and testimony from those involved, the meeting was held at the urging of METI, which cited "a lot of problems with the Rokkasho reprocessing plant" that could benefit from a discussion between leaders from the ministry and the utility. The meeting took place around May 2002 in a private room in a Tokyo hotel.

The participants agreed to "move in the direction of withdrawing" from the project in the Aomori Prefecture village of Rokkasho, and decided to meet again to discuss specifics of the withdrawal procedure. Later, the parties selected TEPCO board members who would explain the withdrawal to the Aomori Prefectural Government.

When the application for the Rokkasho project was filed in 1989, construction expenses were predicted to reach 760 billion yen. However, a series of problems including water leaks from a spent nuclear fuel storage pool assured that **the construction cost would end up being over 2 trillion yen.** If the plant reached full operation, **another 1 trillion yen would become necessary to cover future demolition costs.** TEPCO and other utilities began voicing concerns about the viability of the Rokkasho project, leading METI to set up the meeting in May 2002.

Three months later, however, when TEPCO's cover-up of cracked equipment and other damage was exposed, Araki and Minami resigned. As a result, a second meeting to negotiate the details of the Rokkasho withdrawal never took place.

Then TEPCO Chairman Araki, who is currently an advisor to the utility, refused to be interviewed about the case, saying that his "memories (about it) are vague." Former TEPCO President Minami said that he "has no recollection" of the 2002 meeting, but added, "We were talking with METI about whether to withdraw from the reprocessing project, and I discussed it with Araki and (then Vice President and current Chairman) Katsumata."

Katsumata also refrained from saying whether the meeting had taken place, but said, "We had about five management meetings within our company about whether or not to go forth with reprocessing." Meanwhile, former METI official Hirose said, "I absolutely have no recollection."

Xenon 400,000 times normal found in Chiba air immediately after Fukushima nuke accident

CHIBA -- Radioactive xenon-133 some 400,000 times normal levels was detected in the atmosphere here immediately after the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, a radiation survey organization said.

It took three months before the volume of radioactive substances returned to normal levels.

The Chiba-based Japan Chemical Analysis Center made the announcement during a radiation research session in Tokyo on Dec. 1, organized by the Education, Culture, Sports, Science and Technology Ministry.

Keisuke Isogai from the center denied that the high concentration of radioactive substance posed a health hazard.

"I think xenon-133 drifted from the Fukushima No. 1 nuclear plant to Chiba in the form of a plume. Since the detected amount translates into a cumulative external exposure to radiation of only 1.3 microsieverts over the three-month period, it won't cause a health hazard," he said.

The average amount of xenon-133 in the atmosphere was 1,300 becquerels per cubic meter of air in Chiba between March 14 and 22, as compared with zero to 3.4 millibecquerels before the crisis. The volume reached 400,000 times normal levels shortly after the nuclear crisis was triggered by the March 11 tsunami, according to the center.

Xenon-133 is generated in the process of nuclear fission of uranium and plutonium used as fuel at nuclear power stations. Since xenon-133 hardly reacts to any other substance, there is no fear of internal exposure to radiation even if inhaled, experts say.

(Mainichi Japan) December 2, 2011

TEPCO: Cooling stoppage info was not shared

A miscommunication between workers at the Fukushima Daiichi nuclear plant could have delayed a response to the accident on March 11th.

The operator says the plant's chief did not know for several hours that the only backup cooling system for the Number 1 reactor was manually shut down on the day of the earthquake and tsunami.

NHK has obtained Tokyo Electric Power Company's interim report on the accident to be released on Friday.

The report says workers in the reactor's control room stopped an emergency cooling system shortly after 6 PM. It says the plant chief, Masao Yoshida, and others in the facility's office building were unaware of the manual shut-down.

TEPCO says it was not until around midnight that the plant chief noticed the system was not working. A rise in the radiation levels at the reactor building alerted him to the possibility of damaged fuel rods.

The emergency system uses steam to cool down a reactor when there is no electricity supply. It was the only workable cooling system at the reactor after the plant lost its major power sources.

The report says the misunderstanding occurred because a malfunctioning gauge failed to show that the water level had dropped, exposing the fuel rods.

TEPCO estimates that damage to the exposed fuel rods occurred about 4 hours after the quake. It says this generated large amounts of hydrogen that caused the first explosion at the plant on the following day.

Fukushima Pref. to ask TEPCO to shut N-reactors

The Yomiuri Shimbun

FUKUSHIMA--The Fukushima prefectural government will ask Tokyo Electric Power Co. to **decommission all 10 reactors of its nuclear power plants in the prefecture**, prefectural officials have said.

The prefecture has borne the brunt of the nuclear crisis resulting from accidents at the utility's Fukushima No. 1 nuclear power plant on March 11.

Nuclear safety agreements between TEPCO and prefectural and municipal governments hosting nuclear plants require TEPCO to seek prior consent from local governments before operations are resumed.

TEPCO has already decided to decommission the Nos. 1-4 reactors at the Fukushima No. 1 nuclear power plant.

The prefecture's decision is likely to force the utility firm to consider decommissioning the Nos. 5-6 reactors at the plant and Nos. 1-4 reactors of the Fukushima No. 2 nuclear power plant, observers said.

Fukushima Gov. Yuhei Sato's decision to seek the shutdown of the reactors came after he studied the impact on the prefecture if they were decommissioned, such as the loss of nuclear-related local jobs and subsidies from the central government.

He expressed his intention at a meeting of heads of prefectural government departments concerning the nuclear crisis on Wednesday morning.

The prefectural government plans to include the policy in the prefecture's reconstruction plan, in which key points toward rebuilding and restoration of the prefecture are presented.

Asked by the media at a press conference Wednesday morning on how the firm would respond if Fukushima Prefecture asks TEPCO to decommission the reactors, Junichi Matsumoto, acting head of TEPCO's headquarters regarding nuclear plant locations, said the firm would hold consultations with local residents.

As of the end of September 2011, TEPCO had appropriated about 940 billion yen to control the nuclear crisis and decommission the Nos. 1-4 reactors of the No. 1 nuclear power plant.

If TEPCO decommissions all reactors of the No. 1 and No. 2 plants, the firm will incur additional costs, which will significantly aggravate the company's financial position, observers said.

(Dec. 2, 2011)

U.K. plutonium plan likely to influence Japanese nuclear policy

LONDON -- The United Kingdom came to have the world's largest plutonium stockpile because the development of fast-breeder reactors as well as facilities for reprocessing MOX fuel for use in light-water reactors hit a brick wall in both technological and economical developments, slowing down plutonium consumption to a much slower rate than had been planned.

Like the U.K., resource-poor Japan has viewed nuclear power, including fast-breeder reactors, as "quasi-domestic energy." It goes without saying that the U.K.'s anti-plutonium policy will influence how Japan -- which faces problems similar to the U.K. -- decides to deal with its nuclear fuel cycle.

The U.K. had always been at the forefront of nuclear energy development, building the West's first commercial reactor in 1956 and fast-breeder reactor in 1959. Concerns that the world would soon run out of oil and other fossil fuels emerged, and as development of nuclear weapons were stepped up from the early 1950s onwards, the country increasingly placed an emphasis on nuclear energy development.

However, with discoveries of an oil field in the North Sea and a massive uranium deposit in Canada in the 1970s, the relative economic appeal of plutonium began to wane. Like Japan's Monju fast-breeder project, the U.K. experienced sodium leaks and a host of other technical problems in its fast-breeder project, eventually withdrawing from it in 1994.

Fuel from Magnox, an old type of nuclear reactor that is still in use in the U.K., is extremely difficult to store long-term, and requires reprocessing. Because of this, the country's plutonium surplus continued to grow by 3 tons per year.

As a solution to this situation, the U.K. government decided on the use of MOX fuel in commercial thermal reactors. However, the Sellafield MOX fuel plant built in 2001 in northwestern England, which, while expected to produce 120 tons of fuel per year, produced only 15 tons in 10 years due to technical issues. It was forced to shut down this past August.

Asked about the current deliberations within the U.K. government regarding withdrawal from fuel reprocessing and the disposal of some of the country's surplus plutonium, Robert Pickard, the chair of the government's Committee on Radioactive Waste Management (CORWM) says: "Reprocessing has

heretofore taken the role of reducing nuclear waste, and promoting the reuse of nuclear materials. We have reached a crossroads, however, in that sort of thinking."

The U.K.'s journey through nuclear power overlaps with the history of Japan's nuclear development. Both countries pumped massive amounts of national funds into fast-breeder technology. In Japan, the construction of a nuclear fuel reprocessing plant was pushed forth in the Aomori Prefecture village of Rokkasho.

In a long-term nuclear energy strategy drawn up by the Japanese government in 1987, it was predicted that commercial viability of fast-breeder reactors would occur between the 2020s and 2030. The same report said that a reprocessing plant and a MOX fuel plant would be up and running by the mid 1990s.

Plans have subsequently been revised multiple times based on technical and other problems that emerged. Now, Japan is looking toward the commercial viability of its fast-breeder reactor by the year 2050, a reprocessing facility by 2012, and a MOX fuel plant by 2016.

Diet panel approves civil nuclear pacts

A committee of Japan's Lower House has approved civil nuclear cooperation treaties with 4 countries. The house is to vote on the agreements next week.

The foreign affairs committee gave majority support on Friday for the treaties with Jordan, Russia, Vietnam and South Korea.

The main governing Democratic Party and the largest opposition Liberal Democratic Party voted for the pacts.

The treaties would allow Japan to export nuclear power generation facilities and transfer related technology to the nations.

Japan and the 4 countries signed the accords before the March 11th disaster and Fukushima nuclear accident. Diet approval had been pending ever since.

Japan's Prime Minister Yoshihiko Noda told the committee that Japan has a duty to share the lessons learned from the accident.

Noda said it would be meaningful for Japan to offer safe nuclear technologies to countries that request them, while ensuring the peaceful use of nuclear power and monitoring conditions in recipient nations.

But he expressed caution about signing similar pacts with more countries, citing the need to review the accident at the Fukushima Daiichi nuclear plant.

Friday, December 02, 2011 16:16 +0900 (JST)

Japan to export nuclear technology if wanted, Noda says

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda said Friday that Japan will consider exporting its nuclear technology, in principle, as long as it is still wanted by other countries.

Noda said Japan will not provide its nuclear technology and expertise to any country without restriction, noting that peaceful use and other requirements must be ensured.

But Noda told a House of Representatives panel he believes it is "meaningful to provide things with high levels of safety" to other countries.

Noda's remarks came as Japan's bilateral civil nuclear cooperation accords with Jordan, Russia, South Korea and Vietnam are due to be approved by parliament this month, despite public concerns about the safety of atomic power in the wake of the Fukushima disaster.

The accords, which will lay the legal foundations for Japanese companies to supply nuclear equipment and technology to other countries, were approved by the committee on foreign affairs in the afternoon.

Japan signed the pacts with the four countries before the world's worst nuclear crisis since Chernobyl occurred at the Fukushima Daiichi power plant, following the March 11 earthquake and tsunami.

Before the crisis, the government led by the Democratic Party of Japan regarded exporting the country's nuclear technology, especially to fast-growing economies, as one of the most promising ways to generate economic growth.

Noda told the lower house panel that the government is seeking the parliamentary passage of the accords as necessary domestic procedures have already been completed in Jordan, Russia, South Korea and Vietnam. He said those countries are still hoping to have Japan's cooperation even after the nuclear crisis -- which has yet to be brought under control.

Noda said diplomatic relations must be taken into account with regard to the four accords as well as others Japan began negotiating prior to the crisis, including with Brazil, India and Turkey.

As for new agreements, Noda said the government must examine how Japan can cooperate for the peaceful use of nuclear energy taking into account the findings on the Fukushima accident.

To date, Japan has concluded bilateral nuclear accords with seven countries -- Australia, Britain, Canada, China, France, Kazakhstan and the United States -- and the European Atomic Energy Community.

A vote on the four nuclear accords in a lower house plenary session, which was initially due to take place on Friday, has been rescheduled for next week.

If all goes smoothly, they will come into force early next year after also being approved by the opposition-controlled House of Councillors during the current parliamentary session, which will end Dec. 9 unless extended.

In Jordan, a consortium of Mitsubishi Heavy Industries Ltd. and French nuclear power company Areva is competing with Russian and Canadian companies for contracts.

Jordan, which plans to conduct a bid to build a nuclear power plant by the end of this year, has urged Japan to approve their nuclear cooperation accord soon, according to diplomatic sources.

TEPCO injects nitrogen into pressure vessels

The operator of the Fukushima Daiichi nuclear power plant has started injecting nitrogen, an inert gas, into the pressure vessels of the crippled reactors to prevent another hydrogen explosion.

In late October, Tokyo Electric Power Company began extracting gases from the containment vessel of the No.2 reactor to remove radioactive substances. During the work, TEPCO found hydrogen

accumulating in parts of the reactor at a density of up to 2.9 percent.

TEPCO started pumping nitrogen into the pressure vessels of the No.1, 2, 3 reactors on Thursday to lessen the concentration of hydrogen.

The density of hydrogen accumulating in the containment and pressure vessels is thought to be below 4 percent, the level where an explosion could occur.

TEPCO says the nitrogen injection will push out hydrogen and reduce its concentration.

Keeping hydrogen density low is an indispensable condition in the second step of the process decided upon by the government and TEPCO to resolve the nuclear accident. They are aiming to achieve a state of cold shutdown for the reactors by the end of the year.

The Nuclear and Industrial Safety Agency plans to assess how well TEPCO can manage hydrogen levels.

Miyagi Pref. begins thyroid testing for kids near Fukushima border

SENDAI (Kyodo) -- The Miyagi prefectural government began testing the thyroids of 83 children of up to elementary school age Sunday in the town of Marumori, which borders Fukushima Prefecture, to examine the health impact of the Fukushima nuclear crisis.

The radiation level in the prefecture north of Fukushima is estimated to be below the annual limit of 1 millisievert in most areas but at 4.1 millisieverts and 2.8 millisieverts in two areas of the town, prompting concerns among residents, particularly those with children, it said.

It is considering testing also for internal exposure using a whole-body counter, it said.

"As it borders Fukushima Prefecture and the radiation level is high, I hope to get rid of my worries. I want test opportunities to be offered regularly," said Toru Sakuma, a 28-year-old self-employed resident who took his 1-year-old boy Haruki for the test.

(Mainichi Japan) December 4, 2011

Decontamination work opened to media near Fukushima plant

FUKUSHIMA (Kyodo) -- Work under a government model project to remove radioactive materials from areas around the crisis-hit Fukushima Daiichi nuclear power plant was opened to the media Sunday in Okuma, Fukushima Prefecture.

Using high-pressure water sprayers, a joint venture led by major construction contractor Obayashi Corp. has been engaged in the work for a week based on a detailed plan worked out by the government-commissioned Japan Atomic Energy Agency.

The project, aimed at confirming the decontamination method's effectiveness, safety and economic efficiency, is under way in areas within 20 kilometers from the Tokyo Electric Power Co. plant and other high concentration areas from where residents have been evacuated.

The administrative agency began monitoring radiation on Nov. 18 in Okuma, the town hosting those reactors at the plant that suffered core meltdowns in the wake of the March earthquake and tsunami. They have since released massive amounts of radioactive matter into the environment.

The day's work began at the Okuma town office building about 4 km southwest of the plant.

Confusion clouds Education Ministry notices on radiation levels in school lunches

A radiation contamination guideline of 40 becquerels per kilogram that the government introduced in connection with school lunches was actually meant for selecting radiation measuring equipment, the ministry has announced.

On Nov. 30, the Ministry of Education, Culture, Sports, Science and Technology sent 17 prefectures notices that could be interpreted as stating that the limit for radiation in ingredients for school-provided lunches was 40 becquerels per kilogram, and in a news conference on Dec. 1, Senior Vice Minister Yuko Mori confirmed this. On Dec. 2, however, Minister Masaharu Nakagawa explained that the figure was actually a guideline for selecting radiation meters.

The ministry did not consult the Ministry of Health, Labor and Welfare, which is formulating new radiation contamination guidelines under the Food Sanitation Law, before announcing the figure -- exposing the lack of communication between the two ministries.

In the wording of its notice, the ministry did not use any terms indicating a binding standard, but rather a guideline that was actually supposed to cover the selection of radiation meters. However, as the confusion sparked nationwide inquiries, the ministry sent another notice to prefectural education boards across Japan late on Dec. 1 stating, "This is a guideline for selecting measuring equipment to purchase, and is not setting a standard for school lunches."

In its original notice in November, the education ministry provided an example which said that if the radiation level in food exceeded a measuring limit of 40 becquerels per kilogram, then that particular food item could be removed from lunch menus -- giving the impression that 40 becquerels per kilogram was the limit.

On Dec. 1, the Ministry of Health, Labor and Welfare, upon media reports of a "school lunch limit," made an inquiry with the education ministry. The following morning, an education ministry official contacted the health ministry and apologized for insufficient coordination.

Commenting on the situation, a health ministry representative said, "If they had talked to us, we could have pointed out that it would cause confusion. We don't know why they didn't talk to us."

A high-ranking education ministry official, meanwhile, said that the notice lacked a detailed explanation.

Earlier the education ministry was hit with a barrage of criticism for setting the radiation dosage limit at which schoolchildren's outdoor activities would be restricted at 20 millisieverts per year.

(Mainichi Japan) December 3, 2011

Australia to export uranium to India NHK

Australia's ruling Labor Party has decided to lift the ban on uranium sales to India.

Australia has the largest known uranium reserves in the world, but the former Rudd administration did not allow exports to **India, which is not a member of the nuclear Non-Proliferation Treaty and possesses nuclear weapons.**

Prime Minister Julia Gillard told a conference of her ruling Labor Party on Sunday that exporting uranium to India, where energy demand is rising, is **in Australia's interest.**

Some cabinet members expressed concern that the uranium may be used to develop nuclear weapons.

Gillard said she will secure safety measures, indicating her intention to have India sign a bilateral agreement that would only allow it to use the uranium for peaceful purposes.

The plan to lift the export ban was approved with majority support from party members.

Australia apparently intends to strengthen its ties with India, which has a growing demand for nuclear power generation and is playing an increasingly important role in Asian security.

Sunday, December 04, 2011 23:11 +0900 (JST)

Plutonium brings no real chance of prosperity

In this April 28, 2011 image from video footage released Friday, April 29, 2011 by Tokyo Electric Power Co. (TEPCO), top parts of fuel rods are seen about 6 meters (20 feet) from the surface of water in the spent fuel storage pool at the damaged Unit 4 reactor building at the Fukushima Dai-ichi nuclear power plant in Okuma town, Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

Some readers appear to wonder why I recently write only about nuclear power generation in this column. I do so because I believe that it is a crucial issue that will determine the fate of Japan as well as the whole world.

There have recently been various news reports that offer valuable insight into the future of nuclear power generation. The Dec. 2 morning edition of the Mainichi Shimbun ran an article reporting that in 2002, the then administrative vice minister of economy, trade and industry and the chairman and president of Tokyo Electric Power Co. (TEPCO) were nearing an agreement to withdraw from a nuclear fuel recycling project.

Nuclear fuel recycling refers to a process of treating spent nuclear fuel from nuclear power stations with chemicals and extracting reusable uranium and plutonium from it. This project has so far been unsuccessful and there are no prospects that the project will work. It was only natural that the government regulator and the power supplier were negotiating a withdrawal from the project.

The negotiations came to nothing after top executives of TEPCO were forced to resign over the utility's cover-up of a series of technical problems. Nevertheless, the Mainichi report indicates that a change in Japan's nuclear power policy is not a pipe dream.

Furthermore, the Mainichi evening edition of the same day (the morning edition the following day in some areas) reported that the United Kingdom is planning to dispose of some of its surplus plutonium, which it had accumulated as a result of nuclear fuel reprocessing, in an underground repository. This news is of greater significance.

Plutonium is generated as a result of burning uranium in nuclear reactors. One gram of the substance has energy equal to that in 1 kiloliter of oil. It can be used as a material for both atomic bombs and fuel for nuclear reactors. The U.K. has steadily accumulated plutonium, but failed to develop fast-breeder nuclear reactors, which had been viewed as the core of the peaceful use of such a substance.

The U.K. then attempted to develop technology for the use of plutonium-uranium MOX fuel in thermal reactors at nuclear power stations, a project known in Japan as "pluthermal." However, the country has been unsuccessful in producing such fuel. The same is true with Japan. Areva SA, a nuclear technology

company in France, is now manufacturing plutonium-uranium MOX fuel, but questions remain as to its quality. The U.K. ended up being the world's largest holder of surplus plutonium.

The U.K. faced a major challenge in dealing with a massive amount of plutonium, which needs to be stored safely. The storage of plutonium costs a huge amount of money, but the U.K. can no longer afford to pay for this. The U.K. needs to prevent such a substance from falling into the hands of terrorists. The country has consequently decided to bury part of its plutonium in an underground repository that is scheduled to begin operations in 2040.

Even if the U.K. says it will bury only "part" of its surplus plutonium, its amount is enough to produce hundreds of atomic bombs. The amount of surplus plutonium that needs to be buried could increase as there is no prospect that the U.K. will be successful in developing technology to use plutonium-uranium MOX fuel in thermal reactors.

Moreover, the U.K. will abandon its project to reprocess spent nuclear fuel over the next decade. Behind the decision is the growing awareness that plutonium offers no positives, while also being a terrible nuisance. This is the essence of the story written by Haruyuki Aikawa, a Mainichi correspondent in London.

In this undated photo released Wednesday, April 13, 2011 by Tokyo Electric Power Co., a standing man is partially seen above an example of the truck used to move spent fuel rods in the pools. Nothing is decided yet but TEPCO told the press at its Tokyo headquarters Wednesday morning that this is one option TEPCO officials are considering to use at the tsunami-stricken Fukushima Dai-ichi nuclear power plant in Okuma town in Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

The U.K. has already abandoned developing fast-breeder nuclear reactors, and is set to give up nuclear fuel reprocessing as well. Moreover, its planned construction of a facility to dispose of radioactive waste including plutonium is likely to materialize even though it is still at a planning phase.

In contrast, there are no prospects that Japan can build a disposal facility. However, for Japan to call for operations at the Monju prototype fast-breeder nuclear reactor in Fukui Prefecture and the nuclear fuel reprocessing plant in the Aomori Prefecture village of Rokkasho to be carried out as planned, would be like putting the cart before the horse as it appears the country is incapable of building a disposal facility.

Plutonium is directly related to security issues. The U.K. possesses nuclear weapons but Japan does not. One may wonder whether Japan's independence will be threatened if it abandons nuclear fuel

recycling and loses its ability to produce plutonium. Even though it is an important point of contention the issue should not be used as a reason to underestimate the harm of plutonium.

Economy, Trade and Industry Minister Yukio Edano who is in charge of energy policy, Goshi Hosono, state minister for handling the nuclear crisis, and Yoshito Sengoku, second-in-command in the ruling Democratic Party of Japan's Policy Research Committee, have been hearing the views of experts on the issue.

It is not enough for the government to talk only about the dream of "prosperity" built on dependence on nuclear power. Japan's ability to overcome the mess that follows such prosperity is now being tested.
(By Takao Yamada, Expert Senior Writer)

New contaminated water leak at Fukushima nuke plant may have hit ocean

The wall of a leaky water purification unit is seen at the Fukushima No. 1 nuclear plant on Dec. 4. Dark patches where some of the contaminated water escaped the building can be seen along the bottom of the wall. (Photo courtesy of TEPCO)

Highly radioactive water may have escaped into the ocean from a water purification unit at the crippled Fukushima No. 1 nuclear station, plant operator Tokyo Electric Power Co. (TEPCO) announced on Dec. 4.

More than 45 cubic meters of water leaked from the unit with some of it escaping the machine's housing and flowing into a drainage ditch that leads to the Pacific Ocean 500-600 meters away, according to the utility, which added that the leak was discovered on Dec. 4 by a passing employee. TEPCO is now investigating the cause of the problem.

According to the power company, the leaked water contains radioactive substances such as strontium at between 100,000 and 1 million becquerels per cubic centimeter, emitting surface radiation of about 110 millisieverts per hour. The strontium content of the water is some 1 million times higher than the law allows for discharge into the ocean.

Some 45 cubic meters of contaminated water, about 5 centimeters deep, had collected in the purification unit housing, which covers 900 square meters. At the time of the leak's discovery, there were already signs that some of the water had escaped the housing and flowed into a drainage ditch about 10 meters away. TEPCO says it stopped the leak at just after 2 p.m. the same day.

"We currently believe the leak will have no effect on the water circulation system or our judgment on whether we've achieved a cold shutdown of the reactors," said TEPCO plant location headquarters representative Junichi Matsumoto.

(Mainichi Japan) December 5, 2011

Strontium-tainted water leak suspected

The operator of the Fukushima Daiichi nuclear power plant says about **45 tons of strontium-tainted water** may have leaked out of a water treatment device, with a portion of it spilling out of the facility.

Tokyo Electric Power Company says the water may contain high levels of radioactive strontium. Strontium causes internal radiation exposure.

The company is trying to determine whether the water reached the sea.

The utility said at about 11:30 am on Sunday a water leak was spotted in a device to remove salt from contaminated water from which radioactive material had already been removed.

It said the leak was stopped after the device was turned off, but at least 45 tons of water containing radioactive materials may have leaked out, with some portion possibly reaching a ditch outside the facility.

The level of radioactive cesium had been reduced to 45 becquerels per cubic centimeter after the treatment. But **the water is believed to have contained 130,000 becquerels per cubic centimeter of radioactive strontium.**

The ditch connects to the sea about 600 meters away. The power company is piling up sand bags in the ditch to prevent the water from flowing to the sea.

The water is used to cool down the reactors in the power plant and the utility says the leak does not pose any problems for the process.

Monday, December 05, 2011 06:09 +0900 (JST)

TEPCO: Radioactive water may have leaked into sea

The operator of the Fukushima Daiichi nuclear plant says radioactive water leaked from a water treatment facility may have reached the sea through a gutter.

Tokyo Electric Power Company says **slightly elevated levels of cesium were detected on Sunday in seawater around an outlet from the gutter.**

Earlier in the day, workers found that at least 45 tons of water had leaked from a desalinization device at the plant. The water then apparently seeped out of the building and flowed into the gutter.

The leaked water also contained radioactive strontium at levels that could pose health risks in case of internal exposure. **TEPCO says it will take about 2 weeks to complete its analysis of the situation.**

Before the leak was spotted, workers had last checked the water treatment device 21 hours ago and found no problems.

A TEPCO official says the company did not do enough to contain the leak because **it had assumed the water would stay within the building.** The official says it will take measures to ensure better detection of leaks.

Fukushima compiles radiation cleanup policy

Fukushima Prefecture has compiled a policy paper on how to clean radioactive materials farmland and forests, which occupy about 80 percent of the prefecture. Fukushima hosts the damaged nuclear power plant.

The prefectural government says the policy aims to ensure that eventually no radioactive cesium will be detected in any farm produce from the prefecture.

The policy says that to reach this goal, **radiation-absorbing agents will be sprayed onto farmland, and the topsoil scraped off.**

In orchards, tree bark will be removed and the trees then cleansed with water jet cleaners.

The policy aims to cap annual radiation doses in forests at one millisievert.

The policy also says the government will try to reduce radioactivity in forests near residential areas by about half in two years. **Fallen leaves will be removed on a regular basis from areas up to 20 meters inside the forests' perimeters.**

Based on the policy, Fukushima Prefecture plans to help individual communities draw up their own decontamination plans.

Monday, December 05, 2011 14:43 +0900 (JST)

Model decontamination starts / Project to test effectiveness of various methods before full-scale work

The Yomiuri Shimbun

FUKUSHIMA--An experimental decontamination project is now under way in parts of Fukushima Prefecture, including the town of Okumamachi, which is located within the 20-kilometer no-entry zone around the Fukushima No. 1 nuclear power plant.

The project went into full swing Sunday and will test various decontamination methods to see how effective they are at lowering the level of radiation in the air.

Official decontamination is scheduled to start in January around the nuclear power plant.

"We want to issue an interim report by the end of the year so full-scale decontamination can be conducted as soon as possible," said an official at the Japan Atomic Energy Agency, which has been entrusted with the project by the government.

The model project is scheduled to be carried out at 12 municipalities that include areas designated as no-entry or expanded evacuation zones, as the project aims to remove radioactive substances from wide areas.

On Sunday, decontamination operations were conducted at the Okumamachi town office, about four kilometers southwest of the nuclear power plant, and on a hill near a primary school in Katsuraomura, about 25 kilometers from the power plant.

About 45 workers clad in protective gear collected fallen leaves and cut grass.

High-pressure water jets were used to test the effectiveness of different methods on the rooftop of the Okumamachi town office--using cold water and hot water at a temperature of 50 to 60 C, and changing the duration of the spraying.

As a result, it was learned that spraying cold water for about 10 minutes lowered surface radiation by about 40 percent, to 9.87 microsieverts per hour from 16.45 microsieverts.

They also tried reusing the water after passing it through a filter.

"We want to test various techniques to establish an efficient method to lower air radiation levels," said Kazuo Todani, an executive director at the agency.

(Dec. 6, 2011)

Lower House approves civil nuclear agreements

The Lower House of Japan's Diet has approved civil nuclear cooperation agreements with Jordan, Russia, Vietnam and South Korea.

The accords won majority support from the ruling Democrats and main opposition Liberal Democrats at a plenary session on Tuesday, and were sent to the Upper House for final Diet endorsement. The

opposition New Komei, Communist and other parties opposed the deals.

Japan signed the agreements before the March 11th disaster and Fukushima nuclear plant accident.

The accords would allow Japan to export nuclear power generation facilities and transfer related technology to the countries.

Democrat Kimiko Kyono voted against the accords in defiance of her party, saying she cannot take responsibility for exporting such facilities with the plant still out of control and future safety not ensured.

About 10 members of the party abstained from voting.

The accords are expected to clear the Upper House on Friday.

Radioactive cesium found in Meiji baby formula

Containers of Meiji Step condensed milk are seen in Chiyoda Ward, Tokyo, on Dec. 6. (Mainichi)

TOKYO (Kyodo) -- Radioactive cesium of up to 30.8 becquerels per kilogram has been found in infant formula produced and sold by Meiji Co., the major food company said Tuesday, citing an internal examination.

The company suspects a link with the radioactive leaks from the Fukushima Daiichi nuclear power plant damaged by the 11 March earthquake and tsunami, saying ingredients for its Meiji Step milk powder may have come into contact with airborne radioactive cesium when they were being dried at a plant in Kasukabe, Saitama Prefecture, between March 14 and 20.

Radioactive cesium has been found in baby formula for the first time since the March disaster, prompting the Health, Labor and Welfare Ministry to begin looking into the matter.

The levels of cesium-134 and cesium-137 contained in the product remain below the government-set allowable limit of 200 becquerels per kilogram. A radiation expert said the reading was not at levels that would have an immediate impact on human health.

The company nonetheless plans to offer customers free replacements, affecting around 400,000 850-gram cans of the Meiji Step formula.

Amid concern that babies are more susceptible to the harmful effects of radioactive materials than adults, the ministry has planned to set a new limit for food products for babies.

The company will offer replacement products for batches with recommended consumption dates of Oct. 3, 4, 5, 6, 21, 22, 23 and 24 next year, according to the manufacturer. The dates are printed on the bottom of the cans.

Of the 23 samples with recommended consumption dates ranging from September to November 2012, four contained radioactive cesium of between 21.5 and 30.8 becquerels per kg.

The formula in question came from milk produced before the March disaster, according to the company.

"Because the cesium is diluted to 3 to 4 becquerels (per kg) when the powders are added to hot water, we don't think it will have an impact on health. But we still want to address the anxieties of those who bought the product by providing replacements," a public relations official of the company said.

The examination was conducted after a civic group in Nihonmatsu, Fukushima Prefecture, found radioactive cesium in the company's infant formula in a test late last month and asked Meiji to conduct a similar test.

When the health ministry examined 25 infant formula samples from multiple manufacturers, including Meiji, between July and August, the cesium level in each sample was below the minimum detectable limit of 5 becquerels per kg.

Meiji commands a leading share of roughly 40 percent in domestic baby formula sales. The same product has been exported to Vietnam under a different name.

Meanwhile, Meiji's Chinese unit said Tuesday infant formula sold in China does not pose a safety risk as it has been produced in Australia.

(Mainichi Japan) December 6, 2011

Meiji to step up radiation monitoring

Japanese food company Meiji says it will step up radiation monitoring of its products and release data online.

The company came up with new measures following the detection of radioactive cesium in its baby formula.

Meiji said on Tuesday that up to 30.8 becquerels of radioactive cesium per kilogram was found in powdered milk. The company produced the milk at a plant in Kasukabe, near Tokyo, immediately after

the March nuclear accident in Fukushima.

The level is below the government safety limit of 200 becquerels per kilogram, but Meiji decided to replace free of charge all 400,000 cans of powdered milk shipped in September.

Meiji says the contamination may have resulted from exposure to radioactive cesium from the Fukushima nuclear plant when the processing facility was ventilated to dry the product.

The food company says that from now on, it will check samples of its products daily instead of the current about once a month, and will upload the results to its website.

The company also plans to monitor aerial radiation levels in the plant's compound and stop production when readings are high.

Wednesday, December 07, 2011 10:58 +0900 (JST)

Water containing strontium leaked into sea from Fukushima plant

This Sunday, Dec. 4, 2011 photo released by Tokyo Electric Power Co. (TEPCO) shows radioactive water leaked from a building with a purification device placed inside at the tsunami-damaged Fukushima Dai-ichi nuclear power plant in Okuma, Fukushima Prefecture, north of Tokyo. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Tuesday that around 150 liters of water containing strontium and other radioactive substances has flowed into the Pacific Ocean from its crippled Fukushima Daiichi nuclear power plant.

The utility known as TEPCO said the amount of radioactive substances is estimated at around 26 billion becquerels, adding that the impact would be "negligible" even if people continue to eat marine products from the area.

The water leaked from a water processing facility after undergoing a process to remove radioactive cesium. But the facility is not capable of removing strontium, which tends to accumulate in bones and is feared to cause bone cancer and leukemia.

The wall of a leaky water purification unit is seen at the Fukushima No. 1 nuclear plant on Dec. 4. Dark patches where some of the contaminated water escaped the building can be seen along the bottom of the wall. (Photo courtesy of TEPCO)

The seawater near the plant has already been contaminated not only by massive radioactive fallout since the March 11 earthquake and tsunami triggered the nuclear crisis, but also by accidental releases of polluted water.

In the latest case, TEPCO found on Sunday that around 45 tons of water had accumulated inside a building housing part of the water processing facility and some of it was seeping through a concrete crack in the building to a nearby gutter, which leads to the sea about 500 meters away.

According to TEPCO's press release, the water contained radioactive materials including about 11 billion becquerels of strontium-89, 15 billion becquerels of strontium-90 and 4.4 million becquerels of cesium-137.

The water processing facility is essential to create water for injection into the crippled Nos. 1 to 3 reactors, as they have lost their key cooling functions since the March disaster.

This Sunday, Dec. 4, 2011 photo released by Tokyo Electric Power Co. (TEPCO) shows leakage from a purification device at the tsunami-damaged Fukushima Dai-ichi nuclear power plant in Okuma town, Fukushima Prefecture. (AP Photo/Tokyo Electric Power Co.)

The water used to cool the reactors contains massive amounts of radioactive substances and is channeled to the water treatment facility so it can be recycled as a coolant.

TEPCO said the latest incident has not affected the injection of water into the reactors.

(Mainichi Japan) December 7, 2011

TEPCO set to sell off some power plants

The Yomiuri Shimbun

Tokyo Electric Power Co. will consider canceling the construction of new thermal power plants and selling some existing ones to secure compensation funds for the crisis at the Fukushima No. 1 nuclear power plant, it has been learned.

Some of the money will also be used to decommission the nuclear plant, which was crippled by the March 11 disaster.

While reducing its own electricity generating capacity, TEPCO plans to buy power from factories with generating facilities through open bids, according to informed sources.

The new plan represents a major shift in TEPCO's corporate policy of generating and distributing power on its own, and could crack open the utility's regional monopoly and accelerate competition in the market.

TEPCO and the state-backed Nuclear Damage Liability Facilitation Fund will announce this week an action plan detailing the power company's corporate restructuring steps and future management policy.

The main pillar of the plan is a review of the electric power development program. Under this framework, TEPCO plans to cancel, in principle, the construction of new thermal power facilities, excluding those already under construction.

The Tokyo-based utility has been too financially strapped to build a new plant because it has been unable to issue corporate bonds since the accident at the Fukushima plant, the sources said.

TEPCO is moving ahead with a plan to build three or four thermal power-generating units, including one at its Hitachinaka thermal station in Ibaraki Prefecture, and have them fully operational by fiscal 2020.

A yet-to-be-built thermal power-generating unit that will be linked with the existing No. 1 unit at TEPCO's Goi thermal power station in Ichihara, Chiba Prefecture, and one planned at its Kawasaki plant, are likely to be reviewed, the sources said. The Goi plant will have an output of 2.13 million kilowatts.

TEPCO will decide by the end of March which of its 15 operating thermal stations will be sold. The plants, including facilities in Yokohama and Futtsu, Chiba Prefecture, will be judged on technical issues and economic efficiency, the sources said.

Following the sell-off, the utility will procure electricity from the so-called independent power producers (IPPs). Details of the bidding process will be decided by the end of January.

The sale of electricity by IPPs was liberalized in 1995. The revision allowed ordinary companies with power-generating facilities, such as gas and oil firms and steelmakers, to enter the market and wholesale power to utilities.

TEPCO bought electricity from IPPs from 1996 to 1999. From 2000 until recently, however, TEPCO did not buy electricity from IPPs, which discouraged new players from entering the power-generation business. But with its nuclear power plants shut down since the Great East Japan Earthquake, TEPCO has bought more power from IPPs.

Meanwhile, TEPCO said it will introduce smart meters on a wide scale in fiscal 2013. The meters will link power plants to electricity outlets.

With TEPCO set to drop its plans to build power plants, the utility plans to hold down power consumption during times of peak demand so it can avoid rolling blackouts and asking large-lot users to cut back on power, the sources said.

In addition to these cutbacks, TEPCO will trim a further 103.3 billion yen in expenses, on top of an earlier plan, raising the total cuts to 2.65 trillion yen over the next 10 years.

Under this restructuring plan, the company will not recruit new graduates and will solicit voluntary retirements from staff who have been at the utility for many years. TEPCO also plans to cut corporate pension benefits for retirees by up to 4.25 percent starting in October 2012. The company hopes to win approval for this plan from more than two-thirds of its retirees by the end of June.

===

Key points of action plan

- Make further cost reductions of 103.3 billion yen, in addition to those of the previous plan, bringing total cost reductions to 2.65 trillion yen over the next 10 years.
- Cancel, in principle, the construction of new thermal power plants. Procure electricity from newcomers to the power sector through bidding to make up for lost power.
- Study the possibility of selling off existing thermal plants and formulate a policy by March 2012.
- Reduce employee numbers through the end of fiscal 2013 by holding back on recruiting new staff and soliciting voluntary retirement, with the aim of cutting staff costs by 324.4 billion yen over the next 10 years.

-- Aim to reduce the benefits of corporate pensions for retirees by up to 4.25 percent, starting in October 2012.

(Dec. 8, 2011)

Gov't to decide Dec. 16 on 'cold shutdown' of Fukushima plant

In this April 28, 2011 image from video footage released Friday, April 29, 2011 by Tokyo Electric Power Co. (TEPCO), top parts of fuel rods are seen about 6 meters (20 feet) from the surface of water in the spent fuel storage pool at the damaged Unit 4 reactor building at the Fukushima Dai-ichi nuclear power plant in Okuma town, Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- Japan is set to decide Dec. 16 that the crippled Fukushima Daiichi nuclear plant has been brought under control by achieving a stable state called "cold shutdown," government sources said Wednesday.

The government has determined that it is possible to put the Nos. 1 to 3 reactors at the complex in the stable state by year-end, a timeline envisaged for the completion of step 2 in a road map drawn up to bring the crisis under control, according to the sources.

The government has for months been trying to keep temperatures in the cores of the damaged reactors below the boiling point for water in a stable manner and prevent a fresh release of radioactive materials into the surrounding environment.

The decision is expected to be made at a meeting of the nuclear disaster countermeasure headquarters headed by Prime Minister Yoshihiko Noda on Dec. 16, they said.

Given the imminent completion of step 2, the government plans to begin working in earnest to review evacuation restrictions imposed on areas around the Tokyo Electric Power Co. plant by using radiation levels as a guide, to enable a speedy return for displaced residents.

The government and the utility, known as TEPCO, will compile a medium- to long-term road map toward decommissioning the plant, while envisaging the removal of spent nuclear fuel rods left in the pools for the reactors, possibly within two years.

The Nuclear and Industrial Safety Agency has found "largely acceptable" a TEPCO plan to safely manage company facilities over the next three years, while instructing the utility to look into a recent leak of radioactive water from circulatory contaminated water desalination facilities, according to the sources.

The government has set as conditions for a cold shutdown in the road map achieving the state in which **temperatures at the bottom of the pressure vessel for each of the Nos. 1 to 3 reactors stay at 100 C or below and the yearly radiation dose at the plant's perimeter at 1 millisievert or lower.**

TEPCO says nuclear fuel inside the pressure vessel for each of the Nos. 1, 2 and 3 reactors leaked into the containment vessel encasing the inner vessel, but that the fuel remains cooled because of continued water injection.

In the aftermath of the March 11 earthquake and tsunami, cooling functions were completely lost for most of the reactors at the six-reactor complex on the Pacific coast, resulting in fuel meltdowns inside the crippled reactors and a massive release of radioactive materials into the air and sea.

Step 1 in the current road map to bringing the reactors under control was completed in mid-July after TEPCO succeeded in keeping reactor cores cooled in a stable manner.

(Mainichi Japan) December 8, 2011

Cesium-tainted rice found in another city in Fukushima Pref.

FUKUSHIMA (Kyodo) -- The Fukushima prefectural government said Wednesday it detected excessive levels of radioactive cesium in rice harvested in Nihonmatsu, following similar contamination of the crop produced in two other cities in the prefecture.

The cesium in the rice samples taken at a farm in Nihonmatsu measured 780 becquerels per kilogram, against the provisional 500-becquerel limit, local government officials said. None of the rice from the Nihonmatsu farm has been shipped to markets.

The number of rice farming households where cesium exceeding the limit has been detected in rice reached 22, the officials said. High levels of cesium exceeding the limit were found in rice samples collected in the cities of Date and Fukushima last month.

Fukushima Prefecture hosts the radiation-leaking Fukushima Daiichi nuclear power plant crippled by the March earthquake and tsunami.

(Mainichi Japan) December 8, 2011

Kansai Electric reactor shut down at Mihama

The operator of the Mihama nuclear power plant in western Japan says it has shut down one of 3 reactors because of an **ongoing leak of radioactive water within the reactor.**

Kansai Electric Power Company says work began on Wednesday night to manually shut down the

number-2 reactor at Mihama in Fukui Prefecture. It was completed as of 4 AM on Thursday.

The utility says radioactive water has been leaking from a valve in the pressure vessel into the collection tank since early November. It says **there is a risk that the water will exceed the processing capacity of the tank.**

The company says all the leaked water has been collected into the tank within the reactor, and that the leakage has caused no damage to the environment.

The reactor was scheduled to be shut down on December 18th for a regular checkup.

The suspension means that 46 of the country's 54 reactors, or 85 percent of them, are currently out of operation.

Thursday, December 08, 2011 05:02 +0900 (JST)

Radioactive ash returned from Akita

Akita Prefecture in northern Japan has begun to return radioactive ash from the incineration of garbage to the prefecture the ash was sent from. The ash had been brought to Akita from 10 municipalities in 6 prefectures located near Tokyo.

Because of the opposition of residents living near the garbage incineration plants, the prefecture has decided to return the radioactive ash to the municipalities of origin.

On Wednesday, about 18 tons of ash was sent from Akita to Saitama Prefecture.

In July, radioactive substances above the government's safety limit were detected in ash brought to Akita from two cities in Chiba Prefecture, raising concerns among residents near the incinerators.

There has been no place to store a total of 245 tons of ash with radiation levels below the government's safety limit. Akita Prefecture has begun to return the radioactive ash to the 10 municipalities of origin.

On Wednesday, about 18 tons of ash below the government's safety limit arrived in containers at a railway terminal in Saitama Prefecture, from Akita. The ash had been brought to 2 municipalities in

Akita from Kazo City in Saitama.

Kazo City says it is still without a site to dispose of the returned ash. It plans to keep it at its 2 garbage incineration facilities until it decides where to dispose of it.

News Navigator: How much time and money are needed to dispose of the Fukushima reactors?

In this photo released by Tokyo Electric Power Co. (TEPCO), a small fire breaks out from facilities sampling seawater located a few dozen meters from Unit 4 inside the tsunami-crippled Fukushima Dai-ichi nuclear power plant in Okumamachi, Fukushima Prefecture, northeastern Japan, Tuesday morning, April 12, 2011. The fire was put out soon and the ongoing cooling operations at the main units were not affected according to TEPCO. (AP Photo/Tokyo Electric Power Co.)

Heavy costs and decades of work are expected to be needed to dispose of the reactors at the devastated Fukushima No. 1 Nuclear Power Plant. The Mainichi answers common questions readers may have about the costs and time needed for the work.

Question: How much is the disposal of the Fukushima plant's No. 1 through 4 reactors expected to cost?

Answer: A government committee looking at Tokyo Electric Power Co.'s (TEPCO) finances estimated **at least 1.15 trillion yen, but this was in October, and the cost may grow larger.**

Q: Why is that?

A: Because work could drag on to remove radioactive material from the inside of the reactor buildings, repair the reactor containment vessels and fill them with water. Currently, no one can see inside the reactors to confirm how the nuclear fuel inside melted, and depending on the condition of the fuel, the time and costs of disposing of the reactors could increase. A top TEPCO official said, "We don't know how much it will cost in the end. It could end up costing trillions of yen."

Q: How are nuclear reactors normally disposed of?

A: First they are brought to under 100 degrees Celsius to a cold shutdown. They are then decontaminated of radiation, their radioactive materials are safely stored, and the reactors are disassembled. This generally takes about 15 years. However, in the case of the crippled Fukushima plant, the fuel is melted and additional work like filling the reactors with water is necessary, so 30 or more years are expected to be needed.

Q: Have cost estimations changed from before and after the Fukushima disaster?

A: Before the Fukushima disaster, the government's Agency for Natural Resources and Energy estimated that it would cost 65.9 billion yen to dispose of a single boiling water reactor with an output of 1.1 million kilowatts like those of the Fukushima No. 1 plant, and **3 trillion yen for all of the nation's 54 such reactors. However, after the disaster, a private think tank estimated that disposal of the Fukushima No. 1 plant reactors would cost up to 20 trillion yen over the course of 10 years.** The difference in these estimations shows just how huge the costs of this disaster are becoming. (Answers by Takuji Nakanishi, Science & Environment News Department)

(Mainichi Japan) December 8, 2011

Long and tough road ahead for work to decommission Fukushima nuclear reactors

It is expected to take more than 30 years to decommission crippled reactors at the Fukushima No. 1 Nuclear Power Plant, and workers tasked with the difficult mission would have to venture into "uncharted territory" filled with hundreds of metric tons of highly radioactive nuclear fuel, experts say.

After the expert committee of the Japan Atomic Energy Commission (JAEC) compiled a report on procedures to decommission the No. 1 to 4 reactors at the Fukushima No. 1 Nuclear Power Plant on Dec. 7, the actual work is expected to move into high gear after the turn of the year. As in the case of the 1979 Three Mile Island accident, the workers would try to remove melted nuclear fuel after shielding radiation with water, a technique called a "water tomb." But the work would have to be done in a "territory where humans have not stepped into before," said a senior official of Tokyo Electric Power Co. (TEPCO), the operator of the troubled Fukushima nuclear power station. The work is so difficult that it is expected to take more than 30 years to finish decommissioning the reactors.

The key part of the decommissioning work is to remove a total of 1,496 fuel rods from the No. 1 to 3 nuclear reactors and 3,108 fuel rods from nuclear fuel pools of the No. 1 to 4 reactors. The government and TEPCO are expected to start decommissioning the reactors early in the New Year after unveiling detailed plans around Dec. 16 that the nuclear plant has been brought under control by achieving a stable state called a "cold shutdown."

According to experts, filling the containment vessels with water completely to shield radiation is the "foremost and biggest hurdle." In order to carry out the task, it is necessary to spot and repair damaged parts in the containment vessels. But it is not an easy task. Up to about 5,000 millisieverts per hour of radiation -- lethal levels -- have been detected in the reactor building of the No. 1 reactor.

In the work schedule announced in April, TEPCO said it would bring the nuclear plant under control by filling the reactors with water. But subsequent analysis of the accident suggested that the No. 1 and 2

reactors had holes of up to 50 square meters caused by hydrogen explosions and the like. In the work schedule announced in May, TEPCO said it had scrapped its plan to repair the containment vessels and suspended the work to fill them with water.

Moreover, workers have been fighting an uphill battle to remove crumbled fuel. The reactors had been running without cooling water for a long time, and most of the fuel melted and apparently dropped into the containment vessel from the bottom of the pressure vessel at the No. 1 reactor.

A single fuel rod contains about 170 kilograms of uranium, and a simple calculation suggests that **about 254 tons of uranium in the reactors alone must be recovered**. The distance between the upper lid and the bottom of a containment vessel is up to 35 meters. From that far away, the work has to be done to chop off and recover melted and crumbled fuel by using remote controlled cranes. Furthermore, the melted fuel is mixed with metal from fuel pellets and reactor parts.

"The decommissioning work should be moved up and finished promptly," said Fukushima Gov. Yuhei Sato. He submitted a 6-item statement to the JAEC's expert committee. But at the meeting on Dec. 7, the expert committee did not give any in-depth response but simply added to its report that "We will urge people concerned to realize it as soon as possible." Kyoto University professor Hajimu Yamana, who heads the expert committee, said on Dec. 7, "Because no one has seen the inside of the nuclear reactors, the timing of starting the work to recover nuclear fuel mentioned in the report is only a nonbinding target."

(Mainichi Japan) December 8, 2011

Three Mile Island lessons could help resolve Fukushima nuke disaster

Lessons learned from the Three Mile Island nuclear disaster in the United States are playing a serious role in the handling of the meltdowns at the Fukushima No. 1 nuclear plant, according to a Japan Atomic Energy Agency (JAEA) scientist.

"We are putting the experience we gained from the Three Mile Island accident in 1979 to use," Fumihisa Nagase, who heads the agency's nuclear fuel safety research group, told the Mainichi. The JAEA is the only organization in Japan that has samples of melted fuel from the Three Mile Island nuclear station in Pennsylvania. Using the samples, Nagase and his team will increase research on how to dispose of the melted fuel at the Fukushima plant.

The fuel from Three Mile Island arrived in Japan in 1991 through an international research project run by the Organization for Economic Cooperation and Development. Roughly 60 small pieces of fuel, sealed in an aluminum container and weighing about 2.8 kilograms, now sit in a 15-meter-deep pool at the JAEA headquarters in Tokai, Ibaraki Prefecture.

The uranium fuel got mixed together with the zirconium oxide of its casing during the meltdown, and the pieces now look like chunks of hardened lava. Research on the pieces had been concentrated on gathering data on their exact composition and shape, and Nagase says the data will help develop tools to cut and collect the dangerous material in dealing with the Fukushima fuel.

In the Three Mile Island disaster, about 62 metric tons or 45 percent of the fuel in one reactor melted down. Of that, some 20 tons pooled at the bottom of the pressure vessel in a layer as thick as a meter. Workers didn't enter the pressure vessel until a year after the accident, and the fuel removal operation wasn't finished until 1990.

The Chernobyl disaster of 1986 was a different sort of accident altogether. There, most of the fuel was blown out of the reactor, so the entire reactor building was encased in a concrete "sarcophagus."

In the Fukushima No. 1 disaster, there was no core explosion. **However, the situation at the plant is far more serious than it was at Three Mile Island, as the pressure vessels of the Fukushima No. 1-3 reactors were destroyed. What's worse, the melted fuel in the No. 1 reactor began to eat into the concrete floor of the containment vessel.** Furthermore, the Three Mile Island meltdown was just one reactor. At Fukushima, three reactors melted down, while the No. 4 reactor -- in shutdown mode for regular maintenance at the time of the March 11 disaster -- was also severely damaged.

"I don't think all the reactors can be decommissioned simultaneously," says Yuichi Hayase, a member of an expert committee on the Fukushima disaster and an advisor to plant operator Tokyo Electric Power Co.

Meanwhile Roger Shaw, former director of radiation protection at the Three Mile Island plant, has warned those handling the Fukushima disaster to expect the unexpected. Shaw told the Mainichi that in 1979, when Three Mile Island workers got a camera into the pressure vessel, they couldn't see anything because so many microbes had bred inside. He furthermore said that resolving the Fukushima crisis will be many times more difficult than the disaster he dealt with, adding that an unbelievable amount of effort and the best knowledge in the world would be needed.

(Mainichi Japan) December 8, 2011

TEPCO mulling release of low-level radioactive water in sea

In this May 27, 2011 photo released on June 2, 2011 by Tokyo Electric Power Co. (TEPCO), temporary storage tanks for low-level radioactive polluted waters used for temporary cooling system in Fukushima Dai-ichi nuclear power plant in Okuma, Fukushima prefecture, northeastern Japan, are shown. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Thursday it is considering releasing into the Pacific Ocean low-level radioactive water now stored in tanks at the premises of its crippled Fukushima Daiichi nuclear power plant as storage capacity may run short by next March.

The plant operator known as TEPCO said the water would be released only after it clears the country's legal concentration limit of radioactive substances, including cesium and strontium, but a fisheries group immediately expressed strong concerns.

The National Federation of Fisheries Cooperative Associations filed a protest against the plan with TEPCO, saying it cannot accept such an action that could affect the fishing industry by lowering fish consumption.

Nobutaka Tsutsui, senior vice minister for agriculture, forestry and fisheries, said at a press conference he cannot approve of the plan.

He said he has already asked Tadahiro Matsushita, senior vice minister for economy, trade and industry which oversees the nuclear industry, to reconsider the TEPCO plan and will work on relevant parties to prevent TEPCO from implementing the plan.

The plant has been plagued with highly radioactive water accumulating inside reactor turbine buildings as a result of the continuing injection of water to cool the stricken Nos. 1 to 3 reactors.

The water is currently recycled as a coolant after reducing its radioactive level through a water processing facility, installed after the plant was hit by the March 11 earthquake and tsunami.

But as about 200 to 500 tons of groundwater a day flows into the reactor turbine buildings, the amount of water that is processed has exceeded that needed for injection into the reactors, according to TEPCO spokesman Junichi Matsumoto.

He said the capacity of tanks installed at the plant's premises is expected to total 15.5 tons but there is a possibility the capacity would fall short possibly by early March.

"We cannot keep on increasing the number of tanks in the next year or two. So we're considering the possibility of releasing water into the sea," Matsumoto told a press conference.

The water processing facility reduces the amount of radioactive cesium, but does not remove radioactive strontium, which tends to accumulate in bones and is feared to cause bone cancer and leukemia.

TEPCO has not only accidentally released highly radioactive water into the sea after the nuclear crisis, but also intentionally dumped low level radioactive water as an emergency measure in April, drawing concerns from neighboring countries.

In another accidental case, TEPCO said Tuesday that around 150 liters of processed water has flowed into the sea. The water is estimated to contain strontium, it said.

(Mainichi Japan) December 8, 2011

TEPCO boss part of utility group in shady deal on publication of radiation books

Photo shows supplementary books on radiation the Ministry of Education, Culture, Sports, Science and Technology commissioned the Japan Atomic Energy Relations Organization to produce. (Mainichi)

The education ministry commissioned a group managed by top executives of utility firms to produce supplementary books on radiation for elementary, junior and senior high school students even after the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, it has been learned.

The Japan Atomic Energy Relations Organization (JAERO) won a contract from the Ministry of Education, Culture, Sports, Science and Technology to produce supplementary books on radiation for school children before the outbreak of the crisis at the Fukushima nuclear complex on March 11. But the ministry did not change its decision to ask JAERO to produce the educational materials even after the nuclear disaster.

Toshio Nishizawa, president of Tokyo Electric Power Co. (TEPCO), and other top executives of utility firms are JAERO's board members. Critics say the selection of the group as a subcontractor for the contract is not appropriate in light of the situation gripped by the ongoing nuclear crisis in Fukushima.

JAERO won the contract at a competitive auction for about 21 million yen on March 9. Because previous supplementary books said in part that "Nuclear plants are designed to withstand major earthquakes and tsunami," the ministry suspended the use of the educational materials at schools in the wake of the nuclear accident. The ministry decided to then produce new supplementary books. But the ministry reviewed the details of the contract for the project without changing the subcontractor and increased the project cost to about 37 million yen due to rising expenses.

Setting an agenda of enlightening the public on the peaceful use of nuclear power, JAERO earned a total of about 1.2 billion yen in fiscal 2010, about 40 percent of the total revenue came in the form of funds in trust from government bodies such as the education ministry and the Ministry of Economy, Trade and Industry. The full-time executive director is a former employee of Kansai Electric Power Co., and three of the four part-time executive vice-presidents are former employees of utility firms, including a former chief of the Fukushima No. 1 Nuclear Power Plant. Part-time executive board members include TEPCO president Nishizawa and Kansai Electric President Makoto Yagi.

On the reason why the ministry did not change the subcontractor for the project after the outbreak of the nuclear crisis, an education ministry official in charge of the project said, "There is no change in their knowledge of radiation." On its relationship with utility firms, JAERO commented, "It does not affect the content of the supplementary books."

On behalf of the education ministry, JAERO had 13 radiation experts and teachers form a production committee to write and edit the supplementary materials. The books are focused on the basics and convenience of radiation, with only a brief mention of the nuclear accident in the preface. Hisashi Nakamura, the production committee chairman and professor emeritus at Tohoku University, said, "We produced them from the standpoint of knowing about radiation correctly. The committee checked the content independently from the executive office (JAERO)."

Hideyuki Ban, a co-director of the Citizens' Nuclear Information Center, a non-profit organization in Tokyo, lashed out at the content of the supplementary books. "They highlighted coexistence with radiation. They treated radiation risks lightly." On the subcontractor, he said, "I don't think it reasonable for an organization that promotes nuclear power generation to be entrusted with the project. Soul-searching on the nuclear accident is lacking."

(Mainichi Japan) December 8, 2011

Japan's parliament OKs nuclear accords with 4 countries

TOKYO (Kyodo) -- Japan's parliament approved on Friday bilateral civilian nuclear cooperation accords signed with Jordan, Russia, South Korea and Vietnam before the Fukushima disaster.

Approval by the opposition-controlled House of Councillors, with 183 votes in favor in the 242-seat chamber, paves the way for Japan to export its nuclear technology to the four countries.

The accords will take effect as early as next month because the necessary domestic procedures for them in the four countries have already been completed.

There have been persistent concerns about the safety of atomic energy in the wake of the nuclear accident at the Fukushima Daiichi power plant in the immediate aftermath of the March 11 earthquake and tsunami. Some ruling party lawmakers abstained from voting.

Lawmakers put parliamentary deliberations on the four nuclear accords on hold after the accident. But Prime Minister Yoshihiko Noda, who came to office in September, and other senior government officials said the accords should become effective as long as the four countries still want Japan's cooperation.

Noda also said Japan should avoid damaging diplomatic ties with the four countries as they have been waiting for the Diet to approve the agreements.

Japanese companies hope to export nuclear power plants to Jordan and Vietnam, and reactor parts to South Korea. Russia could give Japan access to a stable supply of nuclear reactor fuel.

Japan concluded bilateral nuclear accords with seven countries -- Australia, Britain, Canada, China, France, Kazakhstan and the United States -- and the European Atomic Energy Community.

Before the nuclear accident, the worst since Chernobyl, the government led by the Democratic Party of Japan regarded exporting the country's nuclear technology, especially to fast-growing economies, as one of the most promising ways to generate economic growth.

Foreign Minister Koichiro Gomba said Japan is still hoping to conclude a bilateral pact on peaceful nuclear energy cooperation with countries that the government began talks with before the Fukushima disaster, including Brazil, India and Turkey.

US official: Fukushima fuel worries were justified

ATLANTA (AP) -- The top U.S. nuclear official in Japan said Thursday that his team warned higher-ups that a spent fuel pool at a malfunctioning nuclear plant could be at risk of running dry, an issue that created a political controversy between U.S. officials and their Japanese counterparts. U.S. Nuclear Regulatory Commission official Charles Casto was assigned to direct site operations for the U.S. government's response to the nuclear disaster at the Fukushima Dai-ichi nuclear plant shortly after the accident last March. The plant was struck by a massive earthquake and a tsunami on March 11 that disabled its emergency cooling systems, leading to meltdowns, explosions and radioactive releases.

Less than a week later, NRC Chairman Gregory Jaczko told U.S. lawmakers that all the water from a spent fuel pool was gone -- a development that if true raised the risk that the used fuel could ignite and spread more radiation into the environment.

Japanese officials denied Jaczko's statement at the time. NRC officials have since acknowledged that recent evidence shows that the pool probably did not go dry.

Casto said his team was operating in what he likened to the fog of war. They had the greatest concerns about the spent fuel pool on the Unit 4 reactor, which had the hottest fuel. Without reliable information from plant sensors, his team believed a combination of circumstantial evidence showed that Unit 4 pool could be empty. That information included the massive damage observed at the plant, a spike in radiation readings near the building and water vapor plumes.

Casto said there were also concerns that one of the many aftershocks that followed the initial quake could trigger another tsunami, making conditions at the plant even worse.

"It was a possibility that they may be empty," Casto said, speaking about the pools during an interview in Atlanta with The Associated Press. "It wasn't unreasonable to think there was damage in that liner."

The condition of the plant's spent fuel pools was a concern throughout the crisis. Utility companies must remove nuclear fuel rods from a reactor when they can no longer sustain the nuclear reactions that produce heat and, ultimately, electricity. Those used fuel rods remain extremely hot and radioactive. They must be submerged in pools for a minimum of roughly five years.

While reactors are encased in protective steel and concrete, spent fuel pools are not. If the water drains from a pool, the exposed fuel rods can emit lethal doses of radiation to anyone nearby and even ignite, causing a fire that spreads radioactive toxins.

Working from the U.S. embassy in Tokyo, Casto said NRC officials had very limited information about plant conditions. Without electricity, many plant sensors no longer worked. Information from the remaining equipment was suspect since so much of it was badly damaged. Casto said his team focused instead on radiation readings collected by the U.S. military.

He said he worried that a pool liner could have been punctured by debris flung by the natural disasters or the explosions rattling the plant.

"You see all that damage on the top of that building and you're thinking, 'There's probably some damage on the spent fuel pools,'" Casto said.

U.S. officials were aware that no one had poured water onto the pool for three to four days after the tsunami, Casto said. Images from flying drones and even TV cameras showed white smoke -- likely water vapor -- coming from the area of the Unit 4 pool. Casto's team interpreted that as a sign water from the spent fuel pool was boiling.

"And then suddenly it stopped," he said.

Plant workers also reported high radiation levels from debris in-between the Unit 3 and Unit 4 reactor buildings. Casto said his team thought those radiation readings could indicate that damaged nuclear fuel had spread on the site.

"You put that together and you say, 'We're worried that there may not be water in that spent fuel pool,'" he said.

Some information was open to debate. Japanese officials once called Casto to an emergency center where he watched video taken from a helicopter that flew over the Unit 4 building. Japanese officials told Casto that they saw a reflection among the rubble, indicating there was water in its pool.

"I couldn't see it," he said.

(Mainichi Japan) December 9, 2011

Fukushima residents' radiation exposure revealed

Health checkups show that some Fukushima residents were exposed to 15 millisieverts of radiation in the first 4 months after the nuclear disaster.

The government has set a target of one millisievert per year as a safe exposure level.

Fukushima Prefecture has been testing all 2 million residents following the accident at the Fukushima Daiichi nuclear plant in March.

The authorities announced the estimated external exposure levels of about 1,700 people living in 3 municipalities, including Namie Town and Iitate Village.

These areas were designated as evacuation zones after the accident.

The results show residents, excluding those working at the Daiichi plant, were exposed to a maximum of 15 millisieverts of radiation during the first 4 months after the accident. About 10 people were exposed to more than 10 millisieverts.

This is the first time such figures have been made public.

Radiation levels of over 1,100 people, or two-thirds of the residents in the 3 municipalities, were less than the annual permissible limit of one millisievert.

98 percent of those tested are estimated to have been exposed to less than 5 millisieverts.

Some residents working at the nuclear plant have been exposed to more than 30 millisieverts.

Friday, December 09, 2011 10: Some Fukushima residents exposed to up to 37 millisieverts of radiation

FUKUSHIMA (Kyodo) -- Residents in three municipalities near the crisis-hit Fukushima Daiichi nuclear power plant have been exposed to up to some 37 millisieverts of radiation during the four months after the powerful earthquake and tsunami on March 11 crippled the plant, Fukushima prefectural government officials said Friday.

The local government worked out the estimated dose of exposure after conducting health checks on about 1,730 of the 29,000 residents in the towns of Namie and Kawamata and the village of Iitate in Fukushima Prefecture, who filed their behavioral records during the four months. The average dose is estimated at just above 1 millisievert.

It calculated the radiation dose for residents, based on levels in the air measured by the Ministry of Education, Culture, Sports, Science and Technology and by the ministry's radiation projection system, called the system for predicting environmental emergency dose information, or SPEEDI, which is operated by the Tokyo-based Nuclear Safety Technology Center.

The Fukushima Medical University said about half the 1,730 residents have been exposed to less than 1 millisievert, the maximum limit of radiation exposure per year in normal times, during the four months.

The remaining half has been exposed to more than 1 millisievert. Of those, some 40 people were exposed to 5 to 10 millisieverts. Nearly a dozen people were exposed to more than 10 millisieverts and the highest level was about 37 millisieverts.

The doses do not include natural radiation or from internal exposure.

Those who were exposed to high levels of radiation included people who worked at the Fukushima Daiichi power plant to contain the crisis.

None of the residents have been exposed to more than 100 millisieverts -- a level that poses high health risks, they said.

The Fukushima prefectural government conducted health checks on some 29,000 residents in the three municipalities, which are close to the nuclear power plant and are designated as evacuation zones.

The local government is continuing to conduct health checks on all the residents in Fukushima Prefecture, a population of some 2 million.

It is also using whole body counters and conducting urine tests to measure internal radiation exposure on people who spend long hours outdoor, such as farmers and construction workers, as well as on children and mothers who were evacuated from the no-entry zone in the 20-kilometer radius from the crippled power plant.

(Mainichi Japan) December 9, 2011

Editorial: Japan needs more discussion before exporting atomic energy technology

The Diet's approval of atomic energy agreements, which the government has signed with Jordan, Vietnam, Russia and South Korea, has opened the way for exports of nuclear power plants to these countries, but **the decision came too hasty and has not been thought through.**

The pacts are expected to come into force as early as January. However, the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant has not been brought under control and the cause of the accident needs to be clarified. The Diet has endorsed the accords without in-depth discussions on how to ensure safety of nuclear power stations.

Atomic energy agreements are aimed at preventing exported atomic-energy-related technology and materials from being diverted to military use, and are a prerequisite for exporting nuclear plants. Japan has already signed such accords with seven countries including the United States, France and China as well as the European Atomic Energy Community.

Under the agreements, Japan is expected to construct nuclear power plants in Jordan and Vietnam and commission Russia to enrich uranium while exporting parts for nuclear reactors to South Korea.

During Diet deliberation on the pacts, Prime Minister Yoshihiko Noda said, "If we receive requests for cooperation despite Japan's current situation based on lessons learned from the crisis, we should do whatever we can to contribute to international efforts to enhance the safety of atomic energy."

However, **one cannot help but wonder how Japan can prove its nuclear technology can contribute to global safety.** True, the Japanese nuclear power industry is quite advanced, but it alone cannot ensure the safety of operations at nuclear power stations.

Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 Nuclear Power Plant, is highly unlikely to participate in such an international deal even though it had been expected before the crisis to play a leading role in operations at these nuclear power stations abroad. Moreover, **even if Japan emphasizes that its nuclear technology is safe without clarifying the cause of the crisis, it cannot win confidence from the international community.**

At the same time, the prime minister also emphasized that it is Japan's responsibility to share its experiences learned from the nuclear crisis with the international community. While this is correct, Japan should put greater emphasis on sharing with the world its knowledge on how to prevent nuclear accidents based on its thorough investigation into the Fukushima nuclear crisis.

The Diet had only 10 days to deliberate on the atomic energy pacts. It failed to carry out thorough discussions on safety measures even though Jordan is an earthquake-prone country and it is reportedly difficult to secure the massive amount of water needed to cool down reactors that are expected to be built in inland areas of the country.

It has been pointed out by some critics that the government was desperate to ensure the pacts clear the Diet within this year so that Japanese companies will not be put in a disadvantageous position amid international competition for contracts on the construction of nuclear power stations. However, **some members of the ruling coalition voted against the pacts. Deliberations that fail to convince even some ruling coalition legislators can never win confidence from the Japanese public and the international community.**

The government is currently negotiating atomic energy agreements with India, South Africa and Turkey. In particular, Japan should exercise prudence in its negotiations with India, which is not a party to the Nuclear Non-Proliferation Treaty even though it possesses nuclear arms.

To prevent Japan from exporting danger and anxiety to the world while decreasing its reliance on nuclear energy, the executive and legislative branches of the government are urged to hold more in-depth discussions on nuclear energy safety based on its verification of the cause of the Fukushima nuclear crisis.

(Mainichi Japan) December 10, 2011

Residents exposed to high doses of radiation

The Yomiuri Shimbun

A Fukushima prefectural government survey on residents' external radiation exposure showed those in government-set evacuation zones were likely exposed to annualized radiation doses of up to 14 millisieverts, government sources said Friday.

This is the first statistical data indicating external radiation exposure among people living around the crippled Fukushima No. 1 nuclear power plant.

The prefectural government sent questionnaires to about 29,000 residents from Iitatemura, Namiemachi and the Yamakiya area in Kawamatomachi, which are designated as in either a no-entry zone or expanded evacuation zone, between late June and mid-July, ahead of those in other areas. The survey covered the four months after the crisis began.

The figure is based on analysis of questionnaires from 1,730 people who responded early. The prefectural Fukushima Medical University and the National Institute of Radiological Sciences analyzed the results of the survey.

About half of the surveyed residents from the three municipalities are believed to have been exposed to external radiation of at least the government-set annual limit of 1 millisievert, according to the sources.

While the prefecture projected the annualized external radiation exposure would be up to 5 millisieverts for most residents, the figure was 10 millisieverts or higher for about 10 residents.

Among those examined, a Fukushima plant worker was estimated to have been exposed to a maximum annualized dose of 37 millisieverts, while the highest dose among non-plant workers was 14 millisieverts. The resident is suspected to have gone through a highly contaminated area at the time of evacuation, according to the sources.

The prefectural government has been conducting health surveys on those who lived in the prefecture when the crisis broke out at the plant.

The prefectural government plans to release the survey results by the end of December.

Meanwhile, the city government of Koriyama, also in the prefecture, announced Thursday four primary and middle school students' cumulative radiation exposure exceeded 0.40 millisievert in the month from Oct. 5. The dose translates into an annualized dose of 4 millisieverts or more, city officials said.

The data was obtained from measurements by dosimeters that gauge cumulative radiation exposure. The city government distributed the dosimeters to 25,551 primary and middle school students. The cumulative radiation exposure levels among the students ranged between 0.01 millisieverts and 0.45 millisieverts, the city said.

"Experts told us the figures [for the four students] do not represent health problems, but we'd like to question the students to find out why their radiation exposure levels were high," a city official said.

The International Commission on Radiological Protection sets the annual limit for radiation exposure at 20 to 100 millisieverts at the time of an emergency and 1 to 20 millisieverts after the disaster has been contained.

At northern U.K. nuclear facility, decades of dismantling work remain

The former nuclear research site Dounreay as seen from a distance Dec. 6. The spherical structure is the western world's first experimental fast-breeder reactor. To its right is the prototype reactor. (Mainichi)

On Dec. 6, hail was falling on Dounreay, a nuclear research site in the United Kingdom's far north. The temperature was minus 2 degrees Celsius, and a bitter wind from the North Atlantic was blowing over a rough sea.

Clare Crawford, who handles community relations at Dounreay, where decommissioning work is underway, says that once the fast-breeder reactors and other nuclear facilities are dismantled, there will be no more work in this area. Pulling together her coat collar, she looked up at the sky. The conditions here, she says, are good for wind power generation. She hopes that the area can be transformed into a site providing renewable energy.

It was **in the 1950s** that the British government started constructing a fast-breeder reactor at Dounreay - becoming the first in the western world to do so. **Many people in the town, which had a population of about 10,000, were employed at the site** and it became a leading area in the nuclear fuel recycling business, which utilizes plutonium.

According to the British Department of Energy and Climate Change, officials at the time feared that petroleum and other fossil fuels would be exhausted before long. Following the advice of Nobel laureates and other scientists, the government invested a huge amount of national funds into the area as part of an energy-production dream. The complex that was built and put into operation contained 180 facilities, including fast reactors, nuclear fuel reprocessing facilities, and a nuclear fuel production factory.

The site's fast-breeder reactor program consisted of an experimental reactor built from 1954, a prototype reactor built from 1966, and a large demonstration reactor planned from 1985. However, in the late 1970s, large deposits of uranium ore were found in Canada and other areas, and the price of uranium plummeted to under 10 dollars per pound -- about one-tenth of the original price. Furthermore, an oil field was found off Britain, and the economic predominance of fast-breeder reactors grew thin. In addition, the reactors ran into problems including **repeated coolants leaks** -- similar to the accident that occurred at Japan's Monju fast reactor in 1995.

Workers in protective suits carry out the decommissioning process of the fast-breeder reactors at Dounreay. (Photo courtesy of the Nuclear Decommissioning Authority)

The British government subsequently gave up its fast-breeder reactor plan, and **in 1994, the prototype reactor was shut down. The British government is now spending a total of about 2.9 billion pounds (about 350 billion yen) and employing 2,000 technical workers to dismantle the site and construct a facility to dispose of radioactive waste.**

The goal for completing the dismantling of the facilities, which requires the removal of fuel rods, is **2039**. But Alex Anderson, who is in charge of this work, points out that **nearly 30 years have passed since the experimental reactor, which was shut down in 1977, started being dismantled in 1983, yet workers are still unable to remove the fuel rods from the reactor's core.** Even if the remaining work proceeds smoothly, it will take another 20 years, he predicts. That means the dismantling work will take **at least half a century in total.**

Low-level radioactive waste will be buried underground within the facility, but this won't be "safe" until about 2300.

Including spent nuclear fuel, **the Dounreay site still holds some 100 tons of uranium, and plutonium** -- which can be used in nuclear bombs -- and until officials decide what to do with it, the government needs nuclear nonproliferation and anti-terrorism measures. After I took photographs inside and outside the plant with the permission of a public relations officer, a security official told me, "You're too close. Delete them."

Britain's ending of the nuclear fuel recycling business that it pioneered is tinged with irony. It was not because of the cold that my hands shook as I deleted the photos on my camera. It was because I shuddered to think of the distant fate of this town and its shrinking population. (By Haruyuki Aikawa, Mainichi Shimbun)

TEPCO drops plan to release low-level radioactive water in sea

Tokyo Electric Power Co. (TEPCO) has dropped plans -- **at least for now** -- to release low-level radioactive water from the Fukushima No. 1 Nuclear Power Plant into the ocean after protests from fishermen.

TEPCO on Dec. 8 submitted a midterm analytical report on the status of the crippled nuclear power plant to the governmental Nuclear and Industrial Safety Agency (NISA). But the report did not include an initial plan to release the water into the sea after a national fisheries cooperative association and others protested the plan.

TEPCO considered the release because underground water is accumulating inside the power plant's reactor buildings at a rate of 200 to 500 cubic meters per day as TEPCO continues to apply water to cool the heavily damaged reactors, and this water has become contaminated.

The water is sent to storage tanks but those tanks will reach full capacity in the near future, so TEPCO considered treating the water to lower its radioactive levels below a legal limit and then release it into the ocean. After the protests from fishermen and others on Dec. 8, however, the utility reconsidered the plan.

The report from TEPCO deals with measures including removal of nuclear fuel from the containment vessels and spent nuclear fuel pool. NISA was to hold a hearing Dec. 9 to hear opinions of experts and evaluate the report.

(Mainichi Japan) December 9, 2011

Radiation levels in Koriyama children exceed annual limit: survey

KORIYAMA, Fukushima -- Radiation levels detected in children in this city near the crippled Fukushima No.1 nuclear plant exceed the government-set annual limit, a municipal government study has revealed.

The survey, the first of three to be conducted before March 2012, examined accumulated radiation levels in all 25,551 elementary and middle school children residing in the city, measured on a 24-hour basis daily, between the period of Oct. 5 and Nov. 6. Final survey data excludes the 0.06 millisieverts dosage presumed to be accumulated through natural exposure to radiation.

The average radiation level according to the survey data announced on Dec. 8 was 0.12 millisieverts, which calculated over a one-year period equals 1.33 millisieverts -- 0.33 millisieverts more than the annual limit set by the government for both children and adults.

The radiation exposure level was 0.10-0.19 millisieverts for 61.31 percent of the children, below 0.1 millisieverts for 32.73 percent, 0.20-0.29 millisieverts for 5.71 percent, 0.30-0.39 millisieverts for 0.23 percent, and 0.40-0.45 millisieverts for 0.02 percent.

Although the majority of the children -- 94 percent -- had radiation doses below 0.2 millisieverts, the highest dose found in four children equals 4.98 millisieverts when calculated over a one-year term. This is almost five times the annual limit.

According to officials at the Koriyama Municipal Government, the survey results were submitted to Toshiteru Okubo, the board chairman of the Radiation Effects Research Foundation, and other radiation experts serving as nuclear measures advisors to the city, for evaluation. All of them are said to have concluded that the results "pose no harm to the children's health."

Survey results were also reported to parents individually on Dec. 8.

"We hope this survey data will help people take action to decrease their radiation exposure levels by comparing it to their individual daily records," said an official at the Koriyama Municipal Board of Education.

The second phase of the survey was launched on Nov. 7 and will continue through Jan. 9, 2012, and the third will take place between Jan. 10 and March 1, 2012, the Koriyama Municipal Government has announced.

(Mainichi Japan) December 9, 2011

Japan PM: Crippled nuke plant stable by year's end

TOKYO (AP) -- Work to stabilize Japan's tsunami-hit nuclear power plant is on track and the government plans to declare it stable by the end of the year as planned, the prime minister said Friday.

Temperatures of the three melted reactor cores have fallen below the boiling point and radiation leaks have significantly subsided, Prime Minister Yoshihiko Noda said.

Those are the two key conditions to achieve what Japanese nuclear officials call "cold shutdown conditions," a milestone in the effort to stabilize and eventually close the Fukushima Dai-ichi plant altogether.

"We're about ready to draw a conclusion," Noda told a news conference Friday, marking the end of the current parliamentary session.

Some nuclear experts, however, question that claim because the nuclear fuel moved as it melted, so its condition and locations are little known.

The March 11 earthquake and tsunami that set off the radiation crisis at Fukushima Dai-ichi also heavily damaged the plant, and the damage and radiation concerns have limited how much information can be obtained about spent fuel rods and reactor cores.

The government and plant operator Tokyo Electric Power Co. are expected to make a monthly progress report around Dec. 16, and a formal announcement of cold shutdown is expected then.

Nuclear safety officials said the core temperatures and radiation leakage have met the requirements for some time now, and they are now making an overall safety evaluation to determine whether the plant can stably run the cooling system and properly launch crisis management steps in case of an unexpected development.

The crisis forced some 100,000 people to evacuate their homes, and part of the no-go zone near the plant may be uninhabitable for decades.

Noda said bringing the plant to the stable conditions is only a passing point on the path toward full closure of Fukushima Dai-ichi, which the government estimates will take 30 years.

Concerns about food safety stemming from radiation leaks in the area is also a pressing issue, Noda said, citing recent ban on rice grown in Fukushima and a trace of cesium detected in baby formula.

"We must address concerns about (food) safety and provide fuller explanations about it. We still need work in that area," he added.

Radioactive water leaks at Kyushu Electric's Genkai reactor

In this file photo, the Genkai nuclear power plant, owned by Kyushu Electric Power Co., is seen in Genkai, Saga Prefecture, on Dec. 7, 2009. (Mainichi)

SAGA (Kyodo) -- Kyushu Electric Power Co. said Saturday that 1.8 tons of coolant water containing radioactive materials had leaked within a purification system at an idled reactor at its Genkai nuclear power plant in Saga Prefecture.

But the utility failed to report the leak to the local governments when it detected it Friday morning, only notifying them of trouble with pumps in the system for the No. 3 reactor, which has been suspended for regular checkups, prompting the Genkai mayor to complain.

The water leaked from a joining area of the pumps, with no radioactive materials leaking outside the reactor building, and has been completely recovered, the utility said, adding that the intensity of radioactive matter contained is unknown.

On Friday, the company serving the Kyushu region in southwestern Japan said a rise in temperature over 80C at the base of one of the pumps triggered an alarm, but didn't reveal the water leak on the grounds that it did not go outside the purification system.

The government's Nuclear and Industrial Safety Agency said the leak within the purification system posed no immediate safety threat and urged the firm to investigate the cause.

But Genkai Mayor Hideo Kishimoto said, "It should have reported properly (to the Genkai town and Saga prefectural governments). I have been repeatedly telling it to change its corporate culture."

Meiji ignored info on cesium-tainted baby food for 2 weeks

TOKYO (Kyodo) -- Food maker Meiji Co. received information on three occasions in mid-November about radioactive cesium in its baby food but paid no heed to the leads for about two weeks until it finally looked into the matter when approached by Kyodo News and a citizens' group earlier this month, Kyodo learned Friday.

Meiji, which subsequently found up to 30.8 becquerels per kilogram in its Meiji Step milk powder, said it had initially concluded that "further investigation was unnecessary" because, of the three occasions, one was an anonymous call and the two others cited Internet information that the company was unable to confirm.

"We would like to respond with better sensitivity from now on," a Meiji spokesperson said.

An anonymous caller provided Meiji's customer service with information on Nov. 14 that a citizen's group in Fukushima Prefecture had detected cesium in the milk formula in late October, according to sources familiar with the matter.

On the same day, two consumers contacted Meiji saying they saw information about the suspected contamination on the Internet. They were told by the customer service that there was no problem with the product as the company conducts monthly checks, the sources said.

Meanwhile, in light of the cesium-tainted milk powder, Japanese health minister Yoko Komiyama said Friday her ministry will regularly test baby food products in connection with the Fukushima Daiichi nuclear plant crisis.

The tests will be conducted every three months or more frequently, she told a press conference.

The radioactive contamination of the Meiji product was the first found in baby food since the March 11 disaster and has attracted attention even though its level was far less than the government-set limit of 200 becquerels, amid concerns that babies are more susceptible to the harmful effects of radioactive materials than adults.

"As mothers and other consumers are very concerned (about radiation), we want to carry out regular tests," Komiyama said.

The ministry found no radioactive cesium when it tested 25 baby products in July and August after the earthquake and tsunami in northeastern Japan triggered the nuclear crisis.

(Mainichi Japan) December 10, 2011

TEPCO N-plant to get foreign insurer

The Yomiuri Shimbun

Tokyo Electric Power Co. will likely conclude a new contract with a foreign insurer for the crippled Fukushima No. 1 nuclear power plant, as Japanese firms have refused to renew the current arrangement, according to sources.

from the current amount of between 200 million yen and 300 million yen a year per plant. The premium for the new insurance policy is expected to jump more than 10-fold

Electric power companies are obligated to obtain damage insurance for each nuclear power plant in case of an accident and other irregularities.

The Japan Atomic Energy Insurance Pool, a group of Japanese insurance companies that provide coverage for nuclear power plants, refused to renew the existing policy contract with the Fukushima plant after it expires Jan. 15 next year.

The Law on Compensation for Nuclear Damage prohibits operating nuclear power plants and decommissioning reactors without insurance.

This means that without insurance TEPCO might have been forced to halt decommissioning the reactors, unless the company deposited 120 billion yen, equivalent to the amount of insurance benefits, with the Justice Ministry's Fukushima District Legal Affairs Bureau.

The law obliges all nuclear power plants to sign a compensation contract, which allows the government to pay for damage caused by a nuclear accident due to an earthquake or tsunami.

The law also obliges utilities to sign insurance contracts with private companies to cover ordinary accidents that might happen during normal operations or decommissioning. For the crisis at the Fukushima plant, TEPCO has already received 120 billion yen from the government.

(Dec. 10, 2011)

Massive signature campaign on nuclear power launched in Tokyo, Osaka

Advocacy group members ask people to sign a petition to express their opinions on the use of nuclear power in Tokyo's Shibuya Ward on Dec. 10. (Mainichi)

A residents' advocacy group seeking support for a local referendum on the use of nuclear power launched a pro-and-con nuclear power signature campaign in Tokyo and Osaka on Dec. 10.

Minna de kimeyo "Genpatsu" Kokumintohyo (Let everyone decide on nuclear power through local referendums) was formed in June 2011 amidst increased residents' concerns in the aftermath of the Fukushima nuclear disaster, triggered by the Great East Japan Earthquake and tsunami.

Celebrities such as actor Taro Yamamoto, "manga" (cartoon) artist Tetsuya Chiba, and movie director Shotaro Kobayashi are among the most vocal supporters and members of the group.

According to the law, campaign organizers are legally required to collect signatures from at least one-fiftieth of registered voters in Tokyo, or about 214,200 people, within a two-month period to demand that Gov. Shintaro Ishihara take action to revise a local ordinance to introduce a referendum.

If enough signatures are collected on time, Gov. Ishihara will have to officially submit the petition to an upcoming Tokyo Metropolitan Assembly session for deliberation.

"This is not an anti-nuclear power demonstration. We want to provide space for open debate where both anti and pro-nuclear power people can discuss the issue," said Kobayashi to residents in Tokyo's Shibuya Ward on Dec. 10.

During a press conference on Dec. 9, Gov. Ishihara said that he is not against people debating their personal opinions. "This is an open society," he said. "But I wish people would take radiation issues a bit more calmly."

(Mainichi Japan) December 10, 2011

Nobel laureate, citizens urge abolition of nuclear reactors

TOKYO (Kyodo) -- Nobel literature laureate Kenzaburo Oe and antinuclear activists held a rally in Tokyo on Saturday calling for the abolition of nuclear reactors in the aftermath of radiation leaks at the Fukushima Daiichi power plant.

Addressing the protesters in Hibiya Park, who numbered around 5,500, according to the organizers, Oe condemned the Diet's approval Friday of nuclear cooperation agreements with Jordan, Russia, South Korea and Vietnam to allow exports of Japanese-made reactors and technologies to the countries.

"The levels of politicians' caution regarding nuclear reactors have returned to those before March 11" when the massive earthquake and tsunami crippled the Fukushima plant, Oe said.

Only citizens' movements based on a resolve to eliminate nuclear reactors are dependable when seeking to achieve that goal, now that politicians are increasingly losing a sense of danger in relying on nuclear power, the novelist said.

Ayako Oga, the 38-year-old chief of the secretariat of a civic group formed by Fukushima residents, said, "Our state of emergency will not end as long as there is a fear that radioactive substances could fall from the sky again (as a result of a nuclear accident), necessitating evacuation."

After the rally, the protesters marched to the head office of Tokyo Electric Power Co., the operator of the Fukushima plant, chanting, "Farewell to nuclear reactors, we cherish our lives."

Mizuho Fukushima, the leader of the Social Democratic Party who took part in the demonstration, said, "I felt the feelings and enthusiasm of these people. We would like to make efforts to abolish nuclear reactors through our activities on the Diet floor."

Govt compiles decontamination guidelines

Japan's Environment Ministry has compiled guidelines for the removal of radioactive materials discharged from the Fukushima Daiichi nuclear plant.

The 164-page document with illustrations was disclosed at a meeting of experts on Sunday. It was compiled **for residents of cities and municipalities.**

The 4-part guidelines cover ways to measure radiation levels and remove radioactive substances. They also show how to collect, deliver and store radiation-tainted soil and other materials.

The decontamination process will be different for buildings, roads, soil and plants.

The guidelines recommend that water volume and pressure for decontaminating buildings should be adjusted as excessive amounts may cause the dispersion of radioactive materials.

It says moss and dead leaves should be manually removed before high-pressure sprays are used to save water.

It adds that **the used water should not be drained but collected in buckets.**

The guidelines propose the use of separate containers for different levels of radiation-contaminated soil. They also give the safe distances of storage spaces from residential areas.

Ministry officials say they hope the guidelines can facilitate the implementation of a plan to build temporary storage facilities as residents will have a clearer idea of the decontamination process.

The ministry is expected to release the document on Wednesday and explain the details to residents of the Tohoku and Kanto regions.

Sunday, December 11, 2011 23:28 +0900 (JST)

Vietnam PM: Growth centers on nuclear power

Vietnam's Prime Minister Nguyen Tan Dung has stressed that his country will aim for further economic growth with nuclear power as a major source of electricity.

The Vietnamese prime minister delivered a speech on Saturday in the southern province of Ninh Thuan, where nuclear power plants will be built by Japanese and Russian companies, with the aim of starting operations in 2020.

In the speech, Dung emphasized his confidence in nuclear power even after the accident at Tokyo Electric Power's Fukushima Daiichi nuclear plant.

He described the nuclear technologies in Japan and Russia as the most advanced and safest in the world.

He went on to say that building nuclear power plants will bring speedy and sustainable economic growth to the country.

Vietnam is now facing a serious power shortage due to rapid economic growth. The country is having to buy electricity from China.

Vietnam's plan to build nuclear plants is set to progress as Japan's Diet approved a civil nuclear cooperation agreement between the 2 countries on Friday.

The Vietnamese government will finalize the selection of Japanese companies and the type of reactors, based on the results of a geological survey of the planned site.

Sunday, December 11, 2011 10:33 +0900 (JST)

Radiation rose slightly after water leak at Genkai plant

SAGA, Japan (Kyodo) -- A radiation reading at Kyushu Electric Power Co.'s Genkai nuclear power plant in Saga Prefecture rose slightly above the usual range after coolant water leaked there Friday, the prefectural government said Sunday.

The reading at an outlet for seawater cooling the No. 3 reactor's secondary cooling system was 473 counts per minute at 3 p.m. Friday, against the usual range of 433 to 472 cpm, not high enough to immediately impact human health, it said.

On Friday morning, 1.8 tons of primary coolant water containing radioactive materials leaked within the reactor's purification system. The utility claimed the radiation reading is unrelated to that leak and said it will investigate the cause.

Water used in treating low-level radioactive waste is sometimes discharged from the outlet, but that was not the case Friday, the local government said, adding the reading sometimes rises under natural conditions such as rain.

(Mainichi Japan) December 12, 2011

Gov't nuclear cleanup work has to wait at least until late March

TOKYO (Kyodo) -- The Environment Ministry said Sunday that full-fledged efforts to decontaminate areas highly polluted by radioactive matter from the Fukushima Daiichi nuclear plant disaster cannot begin until late March or later.

The government **needs time to obtain the consent of individual landowners and to secure temporary storage sites for contaminated soil** removed from irradiated areas, ministry officials told a panel of experts commissioned to discuss the issue.

At the meeting, the ministry also presented the panel with its draft guidelines for how to go about the cleanup work in areas contaminated with radioactive material emitting one to 20 millisieverts of radiation per year, excluding naturally occurring radioactivity.

While the national government will directly take charge of decontamination in the no-go zone and areas with annual radiation of 20 millisieverts or more, municipalities are to undertake the work in other contaminated areas, using state funds and the guidelines under a special law to take full effect in January.

According to the guidelines, due to be made official later this week, the cleanup work for houses is to prioritize eliminating radioactive cesium accumulated on rooftops, among fallen leafs in gutters, and in moss and mud.

Radiation is to be reduced to less than 1 millisieverts per year and no more work is basically required once that goal is attained.

Contaminated soil, after being removed, is to be stored in locations a certain distance away from residential areas.

The ministry intends later this month to decide which areas to clean up.

(Mainichi Japan) December 12, 2011

Full decontamination to start in Fukushima in Mar.

Japan's Environment Ministry says it will delay the start of full decontamination work for no-entry zones and government-designated evacuation zones in Fukushima Prefecture until late March.

A law taking effect next month requires the state to decontaminate areas with high radiation levels. The restricted areas were designated after the March accident at the Fukushima Daiichi nuclear power plant. The government is now conducting a model project to seek effective ways to clean up the contaminated areas.

The Environment Ministry had said it would start decontamination work for these areas in January or later. However, it revealed on Sunday that full decontamination efforts for houses and farmland will begin in late March.

The ministry said it will start decontaminating infrastructure, including roads as well as water and electricity supply systems, in late January.

The ministry said it will take time to get permission from evacuees to decontaminate their homes and agricultural land. It also cited the difficulty of securing temporary storage sites for topsoil removed during decontamination work.

Regarding areas with annual radiation far above 20 millisieverts, the ministry said it will only start decontamination after launching a new model project to decide ways to do so and ensure the safety of workers.

The government is legally obliged to aim to end the transfer of contaminated soil to temporary storage spots by the end of March 2014, except for areas with particularly high radiation levels.

Nuclear power 'gets little public support worldwide'

By Richard Black Environment correspondent, BBC News

There is little public appetite across the world for building new nuclear reactors, a poll for the BBC indicates.

In countries with nuclear programmes, people are significantly more opposed than they were in 2005, with **only the UK and US bucking the trend**.

Most believe that boosting efficiency and renewables can meet their needs.

Just 22% agreed that "nuclear power is relatively safe and an important source of electricity, and we should build more nuclear power plants".

In contrast, 71% thought their country "could almost entirely replace coal and nuclear energy within 20 years by becoming highly energy-efficient and focusing on generating energy from the Sun and wind".

Globally, 39% want to continue using existing reactors without building new ones, while 30% would like to shut everything down now.

The global research agency GlobeScan, commissioned by BBC News, polled 23,231 people in 23 countries from July to September this year, several months after an earthquake and giant tsunami devastated Japan's Fukushima Daiichi power station.

Rising tide

GlobeScan had previously polled eight countries with nuclear programmes, in 2005.

In most of them, opposition to building new reactors has risen markedly since.

In Germany it is up from 73% in 2005 to 90% now - which is reflected in the government's recent decision to close its nuclear programme.

More intriguingly, it also rose in pro-nuclear France (66% to 83%) and Russia (61% to 83%).

Fukushima-stricken Japan, however, registered the much more modest rise of 76% to 84%.

In the UK, support for building new reactors has risen from 33% to 37%. It is unchanged in the US, and also high in China and Pakistan, which all poll around the 40% mark.

Support for continuing to use existing plants while not building new ones was strongest in France and Japan (58% and 57%), while Spaniards and Germans (55% and 52%) were the keenest to shut existing plants down immediately.

In countries without operating reactors, support for building them was strongest in Nigeria (41%), Ghana (33%) and Egypt (31%).

Atlantic oddity

Although the survey cannot determine definitively whether the Fukushima disaster was responsible for changes of opinion, it appears likely.

"The lack of impact the Fukushima nuclear disaster in Japan has had on public views towards nuclear power in the UK and US is noteworthy," said GlobeScan chairman Doug Miller.

"This contrasts with significantly increased opposition to nuclear new-build in most countries we've tracked since 2005."

Other pollsters have also found continuing support in the UK for nuclear energy.

The BBC/GlobeScan poll is broadly consistent with other global polls as well.

In June, both [Ipsos-Mori](#) and the Japanese [Asahi Shimbun newspaper](#) found drops in support for the technology in most countries, with support continuing in a number including the US.

The Ipsos-Mori poll found that nuclear enjoyed the lowest support of any established technology for generating electricity, with 38%.

Coal fared not much better, at 48%, while solar, wind and hydro all found favour with more than 90% of those surveyed.

"That renewable energy combined with efficiency can replace coal and nuclear is not only a majority popular belief, but a fact supported by a growing number of authoritative reports," commented Jan Beranek, who leads the energy team in Greenpeace International.

"Nuclear power is a relatively tiny industry with huge economic, technical, safety, environmental, and political problems.

"And the Fukushima accident reminded the world that all reactors have inherent risks."

But bodies such as the International Energy Agency see a continuing role for nuclear power, as the global demand for energy grows and governments struggle to control greenhouse gas emissions at a reasonable cost.

John Ritch, director-general of the World Nuclear Association, said that Fukushima was the first significant nuclear incident in 25 years, and has not caused a single fatality.

"Policymakers must respect public opinion, but they must also respect facts; and the facts still favour nuclear power," he told BBC News.

"Those facts warrant a better educational effort from industry, from governments and from journalists.

"Nuclear power will be even safer after Fukushima, and will continue to mature as the world's premier non-carbon technology."

At today's press conference of Tepco and Japanese government Sonoda ministerial aid of Cabinet Office announced a man (60) died at decontamination in Dateshi Fukushima.

The only sure thing is "It has nothing to do with radiation."

They are having an experiment of decontamination in Fukushima.

A man who joined it volunteer died suddenly.

1:00 PM: a team member noticed he didn't come back from work. They found him in his car. He did not have consciousness.

1:08 PM: ambulance arrived. Resuscitation was started.

1:20 PM: It was reported to Cabinet office.

1:26 PM: He was sent to the hospital.

2:00 PM: They confirmed he died.

No more details are announced.

Editorial: Decommissioning of Fukushima plant will need cooperation and vigilance

Experts of a Japan Atomic Energy Commission (JAEC) committee have drawn up a report on the procedures to decommission the stricken Fukushima No. 1 Nuclear Power Plant.

According to the schedule mapped out by the JAEC team, **workers will remove spent nuclear fuel from the plant within three years, and start the removal of melted fuel from the reactors within 10 years.** The entire decommissioning procedure is expected to take at least 30 years.

After all, we're talking about dealing with the damage caused by a disaster of unprecedented proportions, including nuclear meltdown in three reactors. In fact, the whereabouts and the state of the melted fuel are still unknown. Cleaning up after this disaster will undoubtedly be an extremely difficult task.

As varying levels of new technology will be necessary for the removal of nuclear fuel, it's hard to believe that the work will progress according to plan. We urge both plant operator Tokyo Electric Power Co. (TEPCO) and the government to make steady progress, only after adequately considering all possible stumbling blocks and ensuring both safety and efficiency.

It is important to consider the framework with which to carry out the decommissioning process. Since the crisis far surpasses a magnitude that Japan can deal with on its own, it will be beneficial to both Japan and the rest of the world to **carry out the work as an international project.**

There is bound to be technology and expertise abroad that we do not have in Japan. If we are able to take advantage of them, the work will proceed more efficiently. In return, Japan should be able to pass on the knowledge and lessons learned from the Fukushima crisis to the rest of the world.

Having caused a crisis of this magnitude, sharing knowledge internationally is Japan's responsibility. At the same time, increasing the transparency of the decommissioning process is likely to help Japan regain the world's confidence.

Cultivating a generation of Japanese and foreign workers with new expertise through the shutdown process is vital, as is the protection of intellectual property. If possible, we urge the exploration of possibilities not just in terms of technology, but also in the injection of funds toward such goals.

We stress the importance of ensuring that the decommissioning work does not advance the interests of certain groups. Considering the vast sums of money that the process will require, funds must not be funneled recklessly. We must rely on the wisdom we gain from a broad range of fields, and institute a system in which a neutral third-party organization inspects both the decommissioning plan and work. Fukushima Prefecture, which has suffered the greatest damage from the ongoing crisis, will be home to the decommissioning work for at least another 30 years. **Taking measures that tie the decommissioning process to the revival and development of local communities will be crucial.**

One way of supporting the recovery of local communities is to turn Fukushima into a research and development hub for the decommissioning of nuclear power plants. Of course, it is imperative that the voices of local residents be respected if such a path is to be taken.

It goes without saying that the decommissioning process must be carried out safely. We urge the government to proceed with vigilance, protecting workers from excessive radiation exposure and preventing any further radiation contamination outside the nuclear plant.

Fire breaks out at facility of Tsuruga nuke plant

A fire broke out at the site of the Tsuruga nuclear power plant in Fukui Prefecture on Monday evening. Workers at the plant have brought it under control.

The Plant operator, Japan Atomic Power Company, says the fire began at 7:50 PM in a makeshift electric device installed at a facility to process radioactive waste. No injuries have been reported.

It also says no radioactive materials have been leaked to surrounding areas.

The Nuclear and Industrial Safety Agency says the fire was ignited when workers turned a switch on a makeshift power board.

Monday, December 12, 2011 22:12 +0900 (JST)

Fire breaks out at waste facility of Tsuruga nuclear plant

TSURUGA, Japan (Kyodo) -- A fire broke out Monday evening at a waste disposal facility of a nuclear power plant in Tsuruga, Fukui Prefecture, but no one was injured and there was no environmental impact, the Nuclear and Industrial Safety Agency said.

The fire started at 7:50 p.m. on power-supply equipment of the waste disposal facility for the No. 1 reactor of Japan Atomic Power Co.'s plant, the agency said. The reactor is currently offline due to regular checkups.

The incident followed similar fire accidents that occurred at the plant on the Sea of Japan coast since May.

No Monju test runs in FY12, govt says

The Yomiuri Shimbun

The government has announced it will not resume test operations for a Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture, during fiscal 2012 in light of the current domestic situation following the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

Additionally, the government plans not to include 2.2 billion yen earmarked for test operation preparations in the fiscal 2012 budget.

Following recommendations from the Government Revitalization Unit, the government has reviewed the budgets for Monju and other nuclear energy-related projects, and will cut 4 billion yen from Monju's 21.5 billion yen budget request in the coming fiscal year.

On top of the 2.2 billion yen, the government is expected to slash about 10 percent of Monju's requested maintenance and operational costs. The project's research and development are run by the Japan Atomic Energy Agency.

The government is set to compile basic policies on energy strategy by next summer after a comprehensive review of its nuclear energy policies. Whether it will continue with the Monju project will depend on the government's new policies.

Test operations at the Monju reactor restarted last year for the first time in 15 years, but were once again suspended due to troubles during equipment inspection. The Education, Culture, Sports, Science and Technology Ministry made a budget request of 2.2 billion yen to prepare for restarting operations following the government's decision to do so.

The latest budget cuts, however, make it clear that the Monju prototype reactor will not be run during fiscal 2012, even if the program itself is kept intact. On Dec. 8, the House of Representatives Financial Administrative Oversight Committee passed a resolution to review budgets related to fast-breeder reactor development and the nuclear fuel cycle.

The 3.3 billion yen requested by the education ministry for research and development of practical applications for fast-breeder reactor technology also is the subject to budget cuts.

Edano spurns releasing radioactive water into sea

Industry Minister Yukio Edano has rejected an idea being considered by the operator of the crippled Fukushima nuclear plant to discharge low-level radioactive water into the sea.

Edano spoke to reporters on Tuesday, as Tokyo Electric Power Company considers the plan. TEPCO wants to reduce the level of radioactivity of the decontaminated water to below the level at which government standards allow it to be released into the sea.

The idea has drawn protests from fishing cooperatives across the nation.

Edano said that since March 11th, the fishing industry has been plagued by various issues, including falling sales due to unfounded rumors of radiation. He said going ahead with the discharge of tainted water without the understanding of the industry is unacceptable.

Edano added that TEPCO should properly think about how to win the industry's understanding and make proper efforts to this end.

Tuesday, December 13, 2011 15:34 +0900 (JST)

Fishermen's OK needed to dump nuclear plant water into sea: Edano

TOKYO (Kyodo) -- Japanese industry minister Yukio Edano on Tuesday called into question the Fukushima Daiichi nuclear power plant operator's plan to release low-level radioactive water into the Pacific Ocean, saying doing so without consent from fishermen should not be allowed.

"It should not be socially allowed that (the operator) goes ahead (with the plan) before gaining agreement from people involved in the fishery industry," Edano said at a press conference.

Tokyo Electric Power Co. said earlier this month it is considering releasing into the Pacific Ocean low-level radioactive water now stored in tanks at the premises of its crippled Fukushima Daiichi nuclear power plant, as storage capacity may run short by next March.

The utility known as TEPCO said the water would be released only after it clears the country's legal concentration limit for radioactive substances, including strontium, but domestic fisheries cooperatives fiercely oppose the plan.

Edano's remark effectively makes it necessary for TEPCO to gain consent from the fishery industry for its release of the power plant's treated water into the sea.

(Mainichi Japan) December 13, 2011

Remember past enthusiasm for nuclear science as we edge towards non-nuclear future

It's been pointed out in many quarters that the field of nuclear power in Japan has been failing to attract the interest of students. There was a time not so long ago, however, that nuclear energy was at the cutting edge -- the superstar of scientific disciplines.

One can catch a glimpse of this by looking at how nuclear researchers were depicted in the literature and films of the period -- although hints of misgivings are also easily found. Take, for example, Yasushi Inoue's novel "Hyoheki" (Ice wall), first serialized in the Asahi Shimbun newspaper in 1956 -- the same year the government formed the Japan Atomic Energy Commission and the industrial world entered the nuclear industry in a serious way.

"Hyoheki" is primarily the story of a man and a woman stranded in the mountains. However, the novel also depicts a senior researcher for a major company lab as a representation of the era's scientific rationalism. When someone tells him that nuclear science "carries all the hopes of humanity" and "contains within it every potentiality," the researcher replies, "I don't think only humanity's bright dreams and possibilities are wrapped up in nuclear science. It also carries the possibility of humanity's ruin."

When Inoue wrote these words, the United States and the Soviet Union were locked in a nuclear arms race and conducting above-ground nuclear tests, while at the same time the "peaceful use" of nuclear energy was being trumpeted as possessing "limitless possibility." In the cynicism expressed by the researcher Inoue depicted in the novel, one can see the author's own thoughts on nuclear technology seeping through.

In 1959, the Tokyo Shimbun newspaper ran a serialized novel by noted author Fumiko Enchi called "Watakushi mo moeteiru" (I, too, am burning). In the story, a young, dissolute nuclear physicist lost in his research absorbs a lethal dose of radiation when he makes a mistake during an experiment. Before dying, the man sums up the novel, saying, "I turned towards that thing all humanity hopes for: the peaceful application of nuclear technology. And I bet my life on opening that door just a crack."

Three years later, in 1962, film studio Toho Co. released a film titled "Gorath" in which nuclear power saves Earth from destruction by a mysterious object hurtling through space. The entire world's nuclear energy is combined to create a propulsion device at the South Pole and shift Earth out of the way of the object. The nuclear engine, however, alters Earth's orbit.

Regardless of the story's plainly ridiculous premise, what can be seen in the film is a spirit true to the era in which it was made, with the countries of the world transcending national interests to save the Earth through nuclear power.

In the period from the mid-1950s to the mid '60s, the image of nuclear power was forged by anxiety and fear of a nuclear holocaust mixed with sky-high hopes for nuclear technology's peaceful uses.

Things have changed a great deal since then. For today's youth, the Fukushima nuclear disaster has spurred the idea of leaving nuclear power behind. However, on this point there is one thing I'd like to say:

Look back on how nuclear science was portrayed in the 1950s and '60s. To resolve the great unknowns lurking in the undiscovered territories of a non-nuclear future, a fresh, vibrant intelligence and way of thinking -- a new superstar -- will be needed. Is it asking too much to bring all Japan's top minds together, just like in the movies, to tackle the challenge? (By Kenji Tamaki, Expert Senior Writer)

(Mainichi Japan) December 13, 2011

Fukushima gov't estimates radiation exposure of up to 19 millisieverts

FUKUSHIMA (Kyodo) -- Residents near the crisis-hit Fukushima Daiichi nuclear power plant may have been exposed to up to 19 millisieverts of radiation in the four months after the plant was crippled by the March 11 earthquake and tsunami, the Fukushima prefectural government said Tuesday.

The local government released its estimates of residents' radiation exposure in 12 municipalities near the power plant -- Namie, Kawamata, Iitate, Futaba, Okuma, Minamisoma, Tamura, Tomioka, Naraha, Hirono, Katsurao and Kawauchi. The plant is located in the towns of Futaba and Okuma.

Residents who evacuated from high-risk areas in the village of Iitate in late June may have been exposed to the highest amount of 19 millisieverts, it said.

Shunichi Yamashita, vice president of the prefectural government-run Fukushima Medical University, told a news conference that the level is low compared with the 1986 Chernobyl nuclear disaster in the then Soviet republic of Ukraine. "I think there is no problem," Yamashita said.

A screen capture of a map released on Nov. 11 by the Ministry of Education, Culture, Sports, Science and Technology displaying accumulated radioactive cesium levels in eastern Japan. (Mainichi)

The prefectural government, which has conducted health checks on all of its roughly 2 million residents, said it based its estimates of radiation exposure on the timing and place of evacuation.

It used a radiation calculation system, developed by the state-run National Institute of Radiological Sciences in the city of Chiba east of Tokyo, to estimate residents' radiation exposure.

The estimates show residents in a no-go zone covering areas within a 20-kilometer radius of the crippled plant who evacuated in the early stages of the crisis were exposed to 0.18-2.3 millisieverts of radiation during the period.

But exposure levels for residents outside the no-go zone, who were advised to evacuate later, were high at 0.84-19 millisieverts.

Delayed evacuation may have led to the high level of radiation exposure, experts said.

Separate from the estimate, the prefectural government released the results of priority checks on around 29,000 residents in the towns of Namie and Kawamata as well as the village of Iitate.

The local government analyzed radiation exposure for 1,727 of the residents who filed records of their movements during the four months. One resident, who worked at the Fukushima Daiichi plant in containing the crisis, was found to have been exposed to up to 37.4 millisieverts of radiation.

The dosages for other residents stood at between over 10 and less than 15 millisieverts for eight people, over 5 and less than 10 millisieverts for 43, over 1 and less than 5 millisieverts for 591, and less than 1 millisievert for 1,084.

(Mainichi Japan) December 13, 2011

Fukushima releases radiation checkup results

Japan's Fukushima Prefecture says a survey shows that radiation exposure levels among residents near the damaged nuclear plant are low, with little health impact.

The prefecture has been checking the health of its nearly 2-million residents, focusing on estimates of their external radiation exposure during the 4 months since the accident at the Fukushima Daiichi nuclear plant.

On Tuesday, the prefecture released the results for 1,727 people in Namie Town, Iitate Village and a district in Kawamata Town. The municipalities are 10 to 50 kilometers from the plant.

Fukushima says 1,675, or 97 percent, of the people are thought to have been exposed to less than 5 millisieverts of radiation. 1,084 people are thought to have been exposed to less than one millisievert -- the government's safety limit for one year.

Nine people are thought to have been exposed to 10 millisieverts or more. Five of them are nuclear plant workers, among whom the highest level was 37 millisieverts. Of other 4, one who repeatedly

visited an evacuation zone was exposed to 14 millisieverts.

Fukushima Medical University Vice President Shunichi Yamashita says the results show that exposure levels of most people were lower than a standard that would require evacuation, with extremely low health impact.

Tuesday, December 13, 2011 17:19 +0900 (JST)

Radioactive cesium detected in Tokyo grade school

An extremely high reading of radioactive cesium has been detected on a groundsheet at an elementary school in Tokyo.

Officials of Suginami Ward detected 90,600 becquerels per kilogram of radioactive cesium on the sheet. It was used to protect the school lawn against frost from March 18th to April 6th, soon after the Fukushima nuclear accident. The school is located about 230 kilometers from the nuclear plant.

The sheet's radioactivity level is over 11 times the government's 8,000 becquerels-per-kilogram limit for disposal by burying underground.

The city is considering incinerating the sheet with other garbage.

The school stored the sheet next to a gymnasium until early November. Ward officials who measured radioactivity near the area where the sheet was kept detected 3.95 microsieverts per hour at about one centimeter above the ground.

A mother whose son and daughter attend the school said she is worried that contamination from the nuclear plant is reaching Tokyo, despite the capital's distance from Fukushima. She says she wants a thorough inspection of the school building, including windows and gutters.

Tuesday, December 13, 2011 19:59 +0900 (JST)

Interim storage facilities planned for near N-plant

The Yomiuri Shimbun

The Environment Ministry plans to build interim facilities to store soil and ash contaminated with radiation from the Fukushima No. 1 nuclear power plant, in the prefecture's **Futaba county**, sources said Tuesday.

The ministry is expected to officially announce the plan by the end of the year. The ministry said it would select a location for the storage facilities by the end of fiscal 2012 at the latest. It now plans to choose municipalities to hold the material.

Futaba county has eight municipalities, including Futabamachi and Okumamachi, where the crippled nuclear power plant is located.

Toshitsuna Watanabe, mayor of Okumamachi, said Tuesday he was told by Environment Minister Goshi Hosono on Monday the ministry would hold a meeting with Futaba county municipalities soon to explain the interim storage facility plan.

According to sources familiar with the matter, ministry officials told the municipalities the government is considering purchasing or leasing land in areas with high levels of radiation expected to remain uninhabitable for an extended period.

The ministry believes limiting candidate sites for the interim storage facilities to within Futaba county, instead of elsewhere in Fukushima Prefecture, would boost facility construction and speed up decontamination work, the sources said. **The ministry plans to start building the facilities as early as the summer of 2014.**

But Watanabe told The Yomiuri Shimbun, "The government plans to construct interim storage facilities in Futaba county, but it should work on a model decontamination project first."

Meanwhile, Takashi Kusano, mayor of Narahamachi in the county, said, "As [the radiation] came from the Fukushima plant, we have no choice but to [build the facilities in the county]."

(Dec. 14, 2011)

9 months since 3-11 disaster

<http://www.simplyinfo.org/?p=4306>

While people were still in shock from the massive destruction caused by the earthquake and tsunami it was announced in the international media that there was a problem at a nuclear power plant. Little did anyone know what would transpire over the next few days.

TEPCO made brief announcements that there really wasn't a problem, they had everything under control at the Fukushima Daiichi nuclear plant. What was going on even before the tsunami hit was far worse than was being told. Workers saw critical cooling pipes rupture and heard explosions.

The plant director asked fearful workers to stay on, those that were not directly needed evacuated. The workers that stayed on struggled in darkness, scavenged car batteries and risked already rising radiation levels to try to bring the reactors under control. The back up generators were housed in the basements, the tsunami destroyed them. Offsite power was gone.

TEPCO executives decided they were going to abandon the plant. Had they actually done this and the reactors allowed to free fall, the scope of the disaster would have been considerably worse. As former Prime Minister Kan admitted in interviews after he stepped down, Tokyo would have been

abandoned, “nobody in Tokyo”. It would have not just left units 1-4 out of control but units 5 and 6 and also Daini where problems were also going on even though they were far less than at Daiichi.

TEPCO was still claiming to the public that everything was under control. The next day unit 1 exploded. The day after that (March 13th) unit 3 exploded in a massive blast that injured 11 people at the plant. On March 15th unit 2 exploded, though that is being disputed now by various parties as not being an explosion. There is speculation it was a massive water hammer into the torus that did significant damage to the lower portion of the building and containment. Also on March 15th unit 4 exploded in a blast that caused major structural damage and risked the failure of the spent fuel pool housing fresh fuel out of the reactor.

Billions of terabecquerels of radiation spewed into the air, even more leaked into the sea and continues to today. The radiation contamination dumped into the sea is now the largest radiation contamination of the seas in history. Radiation contamination was found by April in Russian seas and has been detected further west. Pacific tuna are being found in Japan with considerable contamination raising concerns about high on the food chain fish and those that migrate long distances across the Pacific like tuna.

Through all of this the residents of Fukushima were alerted and evacuated in an inconsistent pattern and all were told they could “go home very soon”. This was told to residents for months causing them to hold out hope and not begin the process of rebuilding their lives. It also caused residents to leave pets behind per government instructions leading to a massive problem of starving pets and farm animals in the evacuation zones. Many people today, 9 months later still remain un-evacuated in areas of high radiation. Students in Minamisoma can’t be outside for an extended period of time and wear dosimeters. Children all over the region are made to stay inside and otherwise try to avoid radiation rather than moving them somewhere safe. Initial testing showed many children in the region have significant internal radiation contamination.

Fukushima City showed shocking levels of radiation soon after the disaster started. The city still is not evacuated, Greenpeace recently did testing and found high levels in the city. Those with the means have left for somewhere safer. Those without the resources who did not get official evacuation assistance from the government are stuck. No new job, not enough resources to fund a move and no help from their government. Local officials have been far from compassionate. The mayor of Date City

accused people who didn't want to volunteer to clean up radioactive contamination as "acting like victims". The mayor of Fukushima City has been more worried about his tax base and economic implications than for the safety of the cities nearly 300,000 residents.

The elderly have been hit extremely hard by the disaster. Many died soon after the evacuations started as they were already weak and in hospitals or nursing homes. Some were abandoned and later rescued by others. The evacuations alone were too much for some to survive. Many elderly found the loss of homes that were in their families for generations and the loss of community too much and took their own lives. A number of farmers too found the loss of everything including their herds too painful and committed suicide after leaving heartbreaking notes.

The food problems have impacted people all over Japan. Initially the government downplayed the risk to the food supply and did nothing. Then slowly but surely cesium was found in beef in markets causing a major uproar all over Japan and huge concerns about the food supply. The government reluctantly added some testing programs while at the same time promoting food products from the impacted region. Citizens groups have stepped up and helped provide some food testing and confirmation of government testing to assure it is honest. Building a system from nothing has proven to be a monumental task. Meanwhile parents struggle daily about the normally simple task of what to feed their children. The government further failed the people by prematurely declaring all Fukushima rice "safe" after testing a few farms far from the areas known to be much more contaminated. As expected this backfired as rice from the region was found to indeed be contaminated. Parents have been fighting with school districts to assure students are fed safe foods for lunch. Bringing lunch from home is not permitted or is frowned upon in many schools making the safe lunch issue a major concern. Some districts have now adopted programs to test and prove lunch ingredients are safe.

Adding to the confusion and frustration around food is the government safety levels. The government declares anything under 500 bq/kg to be safe but few people see it that way and want to know the exact contamination level in their food. Citizen testing labs are helping as are programs such as Aeon foods testing of their products. The food retailer is doing their own testing, declaring exact contamination levels and not selling anything testing as contaminated even at low levels. These direct citizen and consumer actions are proving more effective than the government efforts that many times worry more about corporate profits and national image than the safety of the people.

All of this has caused anger, frustration and a growing dissatisfaction with both the government in Japan and the corrupt corporate structure of the power company monopolies. Decades of complacency, fraud, hiding accidents and ignoring safety has finally caught up with Japan's power companies. While the government has not done much to address the problems, the truth has been laid bare and the people are well aware. Huge protests have taken place in Japan in recent months. One large demonstration in Tokyo had over 60,000 people. Today marking the 9 month anniversary has demonstrations going on in cities all over Japan. Parents groups and anti-nuclear groups have steadily grown and are demanding change. Osaka recently bucked both main political parties and elected a mayor and governor who ran on a platform of public safety and ending nuclear power. Signatures are being collected in Tokyo and Osaka for two voter referendums that could end nuclear power in those prefectures.

The national government still has not quite realized what is going on. The focus has been on decontamination. A process that has been mostly using power sprayers to wash buildings, trees and roads with water in the hopes of removing radiation. This simply moves it into the soil, creeks, rivers and the sea. The decontamination process so far as been a failure, only lowering radiation levels by

about 10%. 70% of Fukushima is forest that will be impossible to effectively decontaminate without some significantly new technology. The forest contamination can then recontaminate other areas through run off, pollen and other methods. The government has pinned all their hopes on decontamination. Speculation about why frequently goes back to evacuee compensation and loss of tax payers in the impacted regions if people do not return. It boils down to money. If the government were to effectively address all the aspects of the disaster, from relocating all of the impacted to properly testing the food supply it could potentially bankrupt the entire country.

Evacuees worry about going home. Some worry they will be forced to return to somewhere unsafe, others worry they will never get to go home. Some worry that younger people will never return to the region leaving it to die as older populations dwindle. So many have had their lives torn apart and have lost everything. Many lost family members in the tsunami.

The workers have had their own struggles. Lack of proper safety gear, dishonest working conditions, lack of basic benefits and pay being skimmed by dishonest sub contractors have been just some of the problems at the plant. Many of the workers who were at the plant during the early days of the disaster received very high radiation doses. In the chaos of the early hours and days many on site didn't have proper safety gear including respirators. There have been a number of very suspicious worker deaths related to the plant that have all gone without investigation. One widow has received legal help from a lawyers association after her husband collapsed at the plant and didn't receive proper medical care for hours leading to his death. Workers have told stories of frightful events at the plant. One worker talked of going in to unit 3 to attempt to manually vent the unit. The torus unit was so hot it melted his rubber boots.

Fire department workers from all over Japan are being considered for ongoing medical care and screening. There was also talk of extending this to SDF soldiers. The ongoing health care, screening and potential disability coverage for the workers from both TEPCO and contractors is unknown. These brave men have been risking their lives and their health, a number of them have died or been injured. No program exists to assure they are paid back for their sacrifices.

For the last 9 months people from all over the world have been watching. They have been writing, researching, discussing and making sure this massive disaster that is still ongoing is not forgotten. Even just reading what is going on and being a person who possesses the knowledge of what is really going on in Japan plays a role in making sure this is all known. Sometimes just sharing the news is a powerful thing. Knowledge is power. Information wants to be free.

Gov't to designate 'difficult-to-return zones' near crippled Fukushima nuclear plant

The government is expected to consider designating areas that are exposed to more than 50 millisieverts per year of radiation from the crippled Fukushima No. 1 Nuclear Power Plant as zones that are difficult for local residents to return to possibly for the next several decades and buying out tracts of land there.

The government has started to consider dividing the region affected by the Fukushima nuclear crisis into three zones according to levels of radiation they are exposed to. Under the current scheme, the region is divided into "evacuation zones" which fall within a radius of 20 kilometers from the troubled nuclear power station and "planned evacuation zones" that are exposed to more than 20 millisieverts per year of radiation.

Under the new scheme, the government will divide the region into three zones; "preparatory zones" that are exposed to less than 20 millisieverts per year of radiation, "restricted residential zones" exposed to radiation of more than 20 millisieverts but less than 50 millisieverts per year, and "difficult-to-return zones" that are exposed to at least 50 millisieverts per year of radiation. In dividing the region into three different zones, the government will discuss details with local municipalities so that it could designate community-based zones in the region because levels of radiation differ from one place to the other in the same municipalities.

At the meeting on Dec. 16 of its task force dealing with the nuclear crisis, the government is expected to decide that it has completed "Step 2" of the roadmap to contain the nuclear crisis with the crippled Fukushima nuclear plant being brought under control by achieving a stable state called a "cold shutdown" and unveil plans to review the current scheme of evacuation zones by the end of the year.

A screen capture of a Ministry of Education, Culture, Sports, Science and Technology map displaying the diffusion of the radioactive element tellurium 129m around the Fukushima No. 1 nuclear plant. (Mainichi)

The "preparatory zones" with radiation exposure of less than 20 millisieverts per year are those areas to which local residents are supposed to make preparations to return to. There are still no residents living there, and therefore, the government will try to decontaminate living spaces and improve infrastructure such as water supply and sewerage systems, roads, schools, hospitals and so on in the zones. The government plans to lift the evacuation order for those areas where local residents can return to their homes in line with requests from local municipalities and progress in the work to improve infrastructure there. That could start sometime after spring of next year at the earliest.

"Restricted residential zones" that are apparently difficult for people to live in for the next several years are areas the government plans to try to curb the levels of radiation below 20 millisieverts per year. Areas with high levels of radiation, which could be designated as "difficult-to-return zones," spread northwest from the area near the Fukushima nuclear power plant. Among those areas, there are some places where it is apparently difficult for people to live for the next several decades.

Prime Minister Yoshihiko Noda told the plenary session of the House of Councilors on Nov. 25, "There could be areas that are difficult for local residents to return to for a considerable period of time. The government wants to consider medium- and long-term measures responsibly including buying up tracts of land." There is an idea of attaching the word "long-term" to "difficult-to-return zones", but some people within the government say it should not be used out of consideration for the feelings of the affected people. The government is thus still discussing what to do.

Nuclear disaster response recommendations shelved 10 days after explosion

TOKYO (Kyodo) -- The government shelved the Nuclear Safety Commission's proposal to evacuate residents around the damaged Fukushima Daiichi power plant and provide iodine to them after receiving a forecast on the spread of radioactive materials, government sources said Tuesday.

The government determined that it would be too late to take such measures as around 10 days had already passed since the first of a series of hydrogen explosions occurred at the Fukushima complex, the sources said.

The forecast was based on data from a government computer system known as the System for Prediction of Environmental Emergency Dose Information, or SPEEDI, designed to predict the spread of radioactive materials released in a nuclear plant accident. **The prime minister's office received the first SPEEDI-based report on March 23,** according to the sources.

The government has been criticized for not being able to put the SPEEDI data to faster use after the March 11 earthquake and tsunami triggered the nuclear crisis.

A government panel investigating the crisis is now examining the details of the delay in utilizing the data, according to the sources.

Man continues to live alone in Fukushima no-entry zone despite criticism

A man is continuing to live at his home inside the 20-kilometer no-entry zone set up around the Fukushima No. 1 Nuclear Power Plant, saying that while he understands the reasons behind the evacuation orders and why criticism could be leveled at him, he wants to stay as long as possible.

"I understand that the law is asking us to evacuate to protect our lives. But if that evacuation is to last for dozens of years, I want to stay as long as possible in the town of Tomioka, where I was born and raised," says 52-year-old Naoto Matsumura, who spoke to the Mainichi Shimbun outside of the no-entry zone.

Matsumura's home lies around 12 kilometers southwest of the Fukushima No. 1 Nuclear Power Plant. He says he is the only person left in the town of Tomioka. About one month after the March 11 disasters, Matsumura evacuated to the city of Koriyama, but seeing evacuees lying crowded on the floor of a shelter there, he felt he wouldn't be able to withstand it. He returned to Tomioka after around three days.

"I know people criticize me for being selfish. I'll pay any fines. But is it really a crime to return to your home? We're victims, after all," says Matsumura.

Water, electricity and other services are still cut to Matsumura's home. However, townspeople have allowed him to use any car gasoline he can find, fearing abandoned gasoline could cause fires. He eats stored rice and canned food. For a bath, he uses firewood to heat well water. At night he lights candles. "We made electricity for Tokyo, but now not even a single light works here," he says. At around 7 p.m. he climbs into his bedding and tunes in to the radio.

Every day, Matsumura spends several hours walking around the town, feeding wandering animals with food sent by humane societies. The animals include dozens of dogs and cats, around 400 cows, and even escaped ostriches. "It's what I can do, having returned to the town," says Matsumura.

Matsumura's parents lived with him before, but now they are evacuated to Shizuoka Prefecture. His mother, 80, has since developed dementia. His aunt, after evacuating from the area and being moved from hospital to hospital, saw her health deteriorate and passed away.

Wanting the world to know about what is really happening at Fukushima, Matsumura has actively responded to interview requests from western media like the BBC. He has passed the message that "no machine made by man is perfect" and "the 'energy of our dreams' (nuclear energy) was an illusion."

Matsumura has no dosimeter and does not know how much radiation he has been exposed to. He says that, for now, he is not experiencing health problems. However, even if problems appear, he says he does not want to leave.

"I want the area to be decontaminated as soon as possible, and to see the people return. I also think there are things that I can only do while I'm here. I want to do what I can so that residents can live here again."

Govt releases rules for nuclear fallout cleanup

Japan's Environment Ministry has issued specific rules and procedures for cleaning up fallout from the accident at the Fukushima Daiichi nuclear power plant.

The ordinance says the central government will shoulder the cost of decontaminating soil in areas with radiation levels of 0.23 microsieverts per hour or above.

The government is also responsible for disposing of sludge and debris contaminated with radioactive cesium of more than 8,000 becquerels per kilogram.

The ordinance is aimed at accelerating the clean-up work being done by the public sector. The Environment Ministry will next week announce the names of more than 100 municipalities in northern Japan and areas around Tokyo where clean-up efforts are necessary.

Cesium can be removed completely from dead leaves and weeds: research team

A Japanese researcher and a businessman have developed a technique to remove radioactive cesium from dead leaves and weeds completely and reduce the volume of such plants containing the radioactive substance by about 90 percent.

The finding could pave the way for local governments to dispose of such contaminated plants in smaller spaces.

Eisaku Katayama, a 62-year-old special researcher at Chiba University's engineering department, and Isamu Kawakami, a 63-year-old executive managing director of a building firm in Shibukawa, Gunma Prefecture, jointly developed the technique. They found out that **radioactive cesium binds to particles called "plant opals" contained in leaves or stalks**. Then they succeeded in removing cesium from the plants by separating "plant opals" from them. "The technique can be applied to various decontaminations," said Katayama.

They focused their attention on the fact that cesium has a tendency to firmly bind to minerals consisting mainly of silica acid compounds such as mica. Therefore, they formulated a hypothesis that the same thing would happen to "plant opals" and conducted experiments.

Katayama, former professor at Tokyo Medical and Dental University, and Kawakami sealed 570 grams of weeds so as not to allow water to evaporate in Soma, Fukushima Prefecture, in mid-November. On Dec. 10, they detected 28,924 becquerels of cesium per kilogram in the weeds that were reduced to a decaying pulpy liquid. They then added water to the liquid and filtered it with a coffee filter. In the end,

no cesium was detected in the liquid. When they observed the sediments left on the filter with a microscope, they confirmed there were numerous plant opals there. That's apparently because cesium chemically bound to plant opals and stuck to the filter.

The volume of the sediment was reduced to about one-tenth of the original volume of the weeds.

Cesium became concentrated in the sediment, but Katayama and Kawakami thought that the volume of dead leaves and weeds could be drastically reduced, and therefore, they want to develop equipment to handle large amounts of dead leaves and weeds that are contaminated with radioactive cesium.

Plant opals are particles of several micrometers to 100 micrometers. They come off from dead leaves and enter the air. Such being the case of the plant opals, Katayama and Kawakami suggest that fallen leaves and weeds must be kept in closed places, not outdoors, and people must take preventative measures such as wearing masks in contaminated areas strewn with many plants.

Katayama and Kawakami share the hobby of astronomical observation. Kawakami started to conduct research after he was asked about decontamination from his friend in Fukushima Prefecture. Katayama then decided to help him. "Under ordinary circumstances, we should prepare a research paper and announce the results. But we would like to place priority on putting our findings to practical use," Katayama said.

Gov't admits nuclear substances found in waste, unreported to IAEA

TOKYO (Kyodo) -- The Japanese government admitted Thursday that nuclear substances have been found in the waste of domestic facilities subject to International Atomic Energy Agency inspection, but left unreported to the U.N. nuclear watchdog.

Top government spokesman Osamu Fujimura said in a news conference that the matter will be reported to the IAEA soon, but did not say how much nuclear material was involved.

The chief Cabinet secretary said an investigation last year of records led to the discovery of nuclear substances that were unaccounted for in waste at the Japan Atomic Energy Agency's Oarai Research and Development Center in Ibaraki Prefecture.

The Ministry of Education, Culture, Sports, Science and Technology then conducted a probe in August of nuclear energy facilities subject to the IAEA's safeguard program and also found nuclear substances unaccounted for in facilities other than the agency's.

"Based on investigation so far, most nuclear substances have been properly managed as waste, and from that perspective, there is no problem in safety management," Fujimura said.

He added that the matter is still being investigated.

Senior government officials earlier said Japan has begun discussing with the IAEA about the discovery of unaccounted-for or unreported enriched uranium and plutonium in large quantities of nuclear waste disposed of by Japanese facilities.

Under its safeguards system, the IAEA promotes the peaceful use of nuclear energy and the prevention of nuclear material being used in weapons. It verifies declarations made by nations about their nuclear materials and activities.

Japan's safeguard agreement with the IAEA came into force in 1977.

40 years estimated to scrap Fukushima plant

Japan's government and the operator of the Fukushima Daiichi nuclear power plant say it will take up to 40 years to decommission the plant's damaged reactors.

NHK has learned about a timetable drawn up by the industry ministry and Tokyo Electric Power Company, based on a report released earlier by the state's Atomic Energy Commission.

The new timetable includes a plan to begin removing used fuel rods from spent fuel pools at 4 reactor buildings within 2 years, starting with reactor 4. That's one year ahead of what the Commission called for in its report.

The removed spent fuel will be temporarily stored within the compound.

The timetable also says that work to remove the melted fuel inside the No. 1 through No. 3 reactors should be completed in 25 years, when dismantling the reactors and buildings will begin. The ministry and TEPCO aim to completely scrap the entire compound within 40 years.

The schedule includes repair work to fill cracks in the reactors and containment vessels where contaminated water has leaked.

The unprecedented work involves very difficult working conditions, including high levels of radiation and the use of remote-controlled robots.

The government plans to declare on Friday that the second phase of its timetable to bring the Fukushima plant under control has been achieved, with all the reactors brought to a state of cold shutdown.

It also plans to release the new timetable to dismantle the reactors later this month.

Thursday, December 15, 2011 05:42 +0900 (JST)

Fukushima: No to nuclear power subsidies

Fukushima Prefecture will no longer apply for government subsidies for hosting nuclear power plants.

The Fukushima prefectural government concluded it will not apply for about three billion yen, or nearly 38-million dollars in subsidies starting in fiscal 2012, which begins in April.

The prefectural government says it made the decision, as its reconstruction plan asks for the central government to scrap all reactors in Fukushima Prefecture.

Prefectural officials began drawing up the plan after the March 11th disaster and the subsequent nuclear accident at the Fukushima Daiichi power plant.

Subsidies have already been declined for a planned nuclear power station in Minamisoma City and Namie Town near the plant.

In similar developments, Kagoshima Prefecture and Satsumasendai City in southwestern Japan, where the construction of another station is planned, say they will also skip applications.

Fukushima Prefecture hosts 10 reactors at two nuclear power stations. This year, the prefecture and its local municipalities requested almost 170-million dollars in subsidies.

Thursday, December 15, 2011 16:14 +0900 (JST)

Radiation doses vary with evacuation patterns

The Yomiuri Shimbun

FUKUSHIMA--Evacuation patterns affected the differing levels of external radiation to which residents of Fukushima Prefecture were exposed in the first four months of the crisis at the Fukushima No. 1 nuclear power plant, according to the prefectural government.

The difference was seen in interim results released Tuesday of health checks on all residents of the prefecture.

Just after the crisis began, the government initially failed to disclose data from the System for Prediction of Environmental Emergency Dose Information (SPEEDI), which was used to analyze how radioactive substances would spread from the nuclear plant.

The latest data renewed the anger of affected residents, who said they would have evacuated elsewhere had they been aware.

The interim health check results were shown in 18 model cases.

The model case with the highest estimated level of external exposure to radiation was that of residents who stayed in places with high levels of radiation in Iitatemura until evacuating the village in late June, when the village government relocated its functions to the outside of the village.

In this case, the estimated radiation level is 19 millisieverts.

The model case with the lowest level was that of Hironomachi residents who evacuated from the town the day after the crisis began.

In this case, the estimated radiation level is 0.18 millisievert.

Hiroe Yaguchi, 44, a resident of the Tatsuno district of Namiemachi, evacuated to the town's Tsushima district, outside the 20-kilometer radius no-entry zone around the nuclear plant, on March 12.

On March 15, she moved to an evacuees' shelter in Nihonmatsu.

Radiation levels in the town's Tsushima district have been high, and the district was later designated as part of a planned evacuation area.

Yaguchi said, "If I knew radiation levels in the Tsushima district were high, I would have evacuated to some other place. I wanted to be notified of the fact much earlier."

Yaguchi, her husband and their two children--who are middle and high school age--now live in a temporary housing unit in Nihonmatsu.

The interim results said the external radiation exposure of 97 percent of the residents was under 5 millisieverts and thus the expected negative health effects are extremely small.

But a 24-year-old woman in the Hiso district of Iitatemura, who evacuated with her three family members to Fukushima city, said, "I can't judge whether we should feel relieved even after seeing the numerical figures."

She, her husband, their 4-year-old daughter and 1-year-old son evacuated to Nihonmatsu on March 16, after which she learned she was pregnant.

"I fear the baby in my womb was affected [by radiation]. Because my children are small, I wish not only estimates but also checks on actual figures will continue to be done," she said.

(Dec. 15, 2011)

'Absolutely no progress being made' at Fukushima nuke plant, undercover reporter says

Tomohiko Suzuki, in full protective gear, near the Fukushima No. 1 nuclear plant on July 18. (Photo courtesy of Tomohiko Suzuki)

Conditions at the Fukushima No. 1 nuclear plant are far worse than its operator or the government has admitted, according to freelance journalist Tomohiko Suzuki, who spent **more than a month working undercover at the power station.**

"Absolutely no progress is being made" towards the final resolution of the crisis, Suzuki told reporters at a Foreign Correspondents' Club of Japan news conference on Dec. 15. Suzuki, 55, worked for a Toshiba Corp. subsidiary as a general laborer there from July 13 to Aug. 22, documenting sloppy repair work, companies including plant operator Tokyo Electric Power Co. (TEPCO) playing fast and loose with their workers' radiation doses, and a marked concern for appearances over the safety of employees or the public.

For example, the no-entry zones around the plant -- the 20-kilometer radius exclusion zone and the extension covering most of the village of Iitate and other municipalities -- have more to do with convenience than actual safety, Suzuki says.

Tomohiko Suzuki shows reporters a watch with a pinhole camera on Dec. 15 at the Foreign Correspondents' Club of Japan. He used the watch to photograph the inside of the Fukushima No. 1 nuclear plant while working undercover there in July and August. (Mainichi)

"(Nuclear) technology experts I've spoken to say that there are people living in areas where no one should be. It's almost as though they're living inside a nuclear plant," says Suzuki. Based on this and his own radiation readings, he believes the 80-kilometer-radius evacuation advisory issued by the United States government after the meltdowns was "about right," adding that **the government probably decided on the current no-go zones to avoid the immense task of evacuating larger cities like Iwaki and Fukushima.**

The situation at the plant itself is no better, where he says much of the work is simply "for show," fraught with corporate jealousies and secretiveness and "completely different" from the "all-Japan" cooperative effort being presented by the government.

"Reactor makers Toshiba and Hitachi (brought in to help resolve the crisis) each have their own technology, and they don't talk to each other. Toshiba doesn't tell Hitachi what it's doing, and Hitachi doesn't tell Toshiba what it's doing."

Meanwhile, despite there being no concrete data on the state of the reactor cores, claims by the government and TEPCO that the disaster is under control and that the reactors are on-schedule for a cold shutdown by the year's end have **promoted a breakneck work schedule, leading to shoddy repairs and habitual disregard for worker safety,** he said.

"Working at Fukushima is equivalent to being given an order to die," Suzuki quoted one nuclear-related company source as saying. He says **plant workers regularly manipulate their radiation readings by reversing their dosimeters or putting them in their socks, giving them an extra 10 to 30 minutes on-site before they reach their daily dosage limit. In extreme cases, Suzuki said, workers even leave the radiation meters in their dormitories.**

According to Suzuki, TEPCO and the subcontractors at the plant never explicitly tell the workers to take these measures. Instead **the workers are simply assigned projects that would be impossible to**

complete on time without manipulating the dosage numbers, and whether through a sense of duty or fear of being fired, the workers never complain.

Furthermore, the daily radiation screenings are "essentially an act," with the detector passed too quickly over each worker, while "the line to the buzzer that is supposed to sound when there's a problem has been cut," Suzuki said.

One of the reactor buildings at the Fukushima No. 1 nuclear plant destroyed by hydrogen explosions is seen in this photo taken with a hidden camera. (Photo courtesy of Tomohiko Suzuki)

Meanwhile much of the work -- like road repairs -- is purely cosmetic, and projects directly related to cleaning up the crisis such as decontaminating water -- which Suzuki was involved in -- are rife with cut corners, including the use of plastic piping likely to freeze and crack in the winter.

"We are seeing many problems stemming from the shoddy, rushed work at the power plant," Suzuki says.

Despite the lack of progress and cavalier attitude to safety, Suzuki claims the cold shutdown schedule has essentially choked off any new ideas. The crisis is officially under control and the budget for dealing with it has been cut drastically, and many Hitachi and Toshiba engineers that have presented new solutions have been told there is simply no money to try them.

"Yakuza to genpatsu," by Tomohiko Suzuki. (Cover image courtesy of Bungei Shunju)

In sum, Suzuki says what he saw (and photographed with a pinhole camera hidden in his watch) proves the real work to overcome the Fukushima disaster "is just beginning." He lost his own inside look at that work after it was discovered he was a journalist, though officially he was fired because his commute to work was too long.

"The Japanese media have turned away from this issue," he laments, though the story is far from over. (By Robert Irvine, Staff Writer)

A book by Tomohiko Suzuki detailing many of his experiences at the plant and connections between yakuza crime syndicates and the nuclear industry, titled "Yakuza to genpatsu" (the yakuza and nuclear power), was published by Bungei Shunju on Dec. 15.

L'accident nucléaire de Fukushima est désormais considéré comme "terminé"

LEMONDE.FR avec AFP et Reuters | 16.12.11 | 08h26 • Mis à jour le 16.12.11 | 09h10

La procédure d'"arrêt à froid" des réacteurs de la centrale nucléaire de Fukushima, étape essentielle vers un règlement de la pire crise nucléaire depuis Tchernobyl, en 1986, a été menée à bien, a annoncé vendredi 16 décembre le premier ministre,

Yoshihiko Noda. La température à l'intérieur des cuves des réacteurs est désormais maintenue de façon stable sous 100 °C, et que les émissions radioactives sont sous contrôle, mais la crise n'est pas pour autant résolue.

En lui-même, a-t-il ajouté, l'accident dans la centrale est désormais considéré comme terminé, mais il faudra des années encore avant de [démanteler](#) les réacteurs accidentés et [traiter](#) les conséquences de la catastrophe sur l'environnement. *"Même si des incidents imprévisibles surviennent, la situation est telle que les niveaux de radiation dans l'enceinte de la centrale peuvent désormais [être](#) maintenus à un niveau faible"*, a dit le chef du gouvernement japonais.

Vue de la centrale de Fukushima, le 12 novembre 2011.AFP/DAVID GUTTENFELDER

La centrale de Fukushima, située à 240 kilomètres au nord de Tokyo, a été fortement endommagée par le séisme et le tsunami survenus le 11 mars sur l'archipel nippon. Ses systèmes de refroidissement ont cessé de [fonctionner](#), ce qui a entraîné une fusion du combustible et des fuites radioactives. Un "arrêt à froid" signifie que l'eau utilisée pour [refroidir](#) le combustible est maintenue sous son point d'ébullition et permet ainsi d'[éviter](#) une surchauffe.

Ill-prepared TEPCO must heed lessons and warnings

Tokyo Electric Power Company (TEPCO), operator of the stricken Fukushima nuclear plant, has claimed that it had "taken various measures to prevent nuclear disaster" and that the tsunami that hit the plant following the Great East Japan Earthquake on March 11 "far exceeded predictions." However, a

government committee investigating the nuclear crisis has found that the utility had been ill-prepared, even pointing to evidence that the ongoing disaster may have been caused by human error.

According to the committee's earlier findings this past summer, Masao Yoshida, the former chief of the damaged Fukushima No. 1 nuclear plant, had supervised emergency efforts immediately after the crisis began without knowing that the isolation condenser of the No. 1 reactor had shut down. According to the committee's most recent findings, engineers operating the Fukushima No. 1 plant had stopped the high-pressure coolant injection (HPCI) system of the No. 3 reactor -- which was the final chance at cooling the reactor -- without authorization from higher ups. The main issue here is that **TEPCO was not adequately prepared for such a crisis, forcing engineers to take such action based on their own judgment.**

TEPCO's manual on procedures in the case of severe crises was developed with the assumption that any complete power outages at the plant would not last for long. Furthermore, procedures to vent containment vessels to protect them from exploding were not included in the guidelines. The committee's findings suggest that **a lack of disaster readiness led to confusion in the chain of command, and ultimately a failure to take the best course of action.**

Measures against severe nuclear crises were stepped up around the world after the 1979 Three Mile Island incident in the U.S. Japan also considered improved measures, with the Nuclear Safety Commission (NSC) of Japan appealing to nuclear plant operators in 1992 to institute appropriate measures. **Implementation was left up to individual operators, however, and strategies had not been reviewed since then.** Those involved in the nuclear power industry must humbly accept the various warnings that have been presented to them.

People remain afraid of returning to homes near Fukushima plant

FUKUSHIMA (Kyodo) -- People who were evacuated from their residences near the crippled Fukushima Daiichi nuclear power plant remain concerned about the huge obstacles to their returning home despite the government's declaration Friday that the nuclear crisis has been brought under control nine months after its outbreak.

Taisuke Hori, 27, who has fled to Tsukuba, Ibaraki Prefecture, said, "I don't think we will return." His home is located in a no-entry zone set within a 20-kilometer radius of the Fukushima plant damaged by the March 11 earthquake and tsunami disaster.

"I doubt if kids can live safely without concerns no matter how thoroughly the local tracts of land are cleaned up," said Hori, who has children aged 6, 2 and less than one.

Soichi Sampei, 31, who has evacuated to Komoro, Nagano Prefecture and is also from a no-entry zone, angrily questioned how the government could make such a declaration "while radioactive substances remain" in areas around the plant.

Earlier in the day, Prime Minister Yoshihiko Noda said the nuclear accident has been "settled," stating that the plant has achieved a stable state of cold shutdown, defined as a condition in which the bottom part of a reactor pressure vessel is kept below 100 C and exposure from the release of radioactive substances is being significantly contained.

There are calls from among some 20,000 people in the town of Namie, which was forced to evacuate as a whole, for a massive relocation to an area not far away from the town.

Hoji Sampei, 75, said relocation would maintain the bonds of the town's people and keep their hopes for reconstruction of the town alive.

In a survey conducted by the Namie town office last month, some 30 percent of people said they would not return to the town in the future.

Noda vows to speed up radiation decontamination work

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda on Friday reiterated eagerness to speed up efforts to decontaminate areas tainted by radioactive substances, following the declaration of "cold shutdown" at the crippled Fukushima Daiichi nuclear power plant.

Noda pledged to spend more than 1 trillion yen for the time being and ensure over 30,000 workers around April for decontamination work near the radiation-leaking power station, severely damaged by a series of explosions in the immediate aftermath of the March 11 earthquake and tsunami.

"We haven't finished dealing with the accident. We'll make more efforts than before," Noda said at a press conference.

If more funds are necessary to move ahead with decontamination work, the government "will take responsibility to ensure them," he added.

His remarks came after the government announced Friday that the nuclear power plant in Fukushima Prefecture has achieved a stable state of cold shutdown, in a sign that the world's worst nuclear accident since Chernobyl has been brought under control nine months after its outbreak.

A cold shutdown is defined as a situation in which the bottom part of a reactor pressure vessel at a plant is kept below around 100 C and radiation exposure from the release of radioactive substances is significantly held down.

However, radioactive material continues to be released from the Fukushima plant and many residents of nearby areas remain unable to return to their homes.

"The government will do its best so that people who have been forced to leave their home areas can return home as soon as possible and reconstruct their lives," Noda said.

The premier has vowed to bolster efforts to reconstruct Fukushima Prefecture since he took office on Sept. 2, saying, "Without the revival of Fukushima, there will be no revival of Japan."

Daunting tasks await Japan after cold shutdown of Fukushima plant

In this Nov. 12, 2011 file photo, workers in protective suits and masks wait to enter the emergency operation center at the crippled Fukushima No. 1 nuclear power station in Okuma, Japan. (AP Photo/David Guttenfelder)

TOKYO (Kyodo) -- Japan on Friday finally declared a state of cold shutdown at the crisis-hit Fukushima Daiichi nuclear power plant, only to find itself facing a long and thorny road toward the goal of scrapping the stricken reactors and restoring shattered public confidence in the government's nuclear policies.

The country plans to draw on the experience of the 1979 Three Mile Island accident in taking out the nuclear fuel from the plant's Nos. 1 to 3 reactors, but the task will be more challenging than in the U.S. case because the fuel is believed to have melted through the base of the reactor pressure vessels.

"A prolonged and enduring effort will be necessary for the decommissioning, along with work that requires an extremely flexible mind. The government will act responsibly in such medium- to long-term measures," nuclear disaster minister Goshi Hosono told a press conference.

Hosono also said he expects the decommission work to take 30 years or more, which experts think may require top-level technology that would be used for the first time in the world.

It took about 11 years to defuel the Three Mile Island Unit 2, which suffered severe damage to the reactor core. In the case of the Fukushima Daiichi plant disaster, a panel of experts set up under Japan's Atomic Energy Commission said in a recent report the plant operator Tokyo Electric Power Co. should aim to start taking out the fuel within 10 years after the shutdown.

But many uncertainties remain regarding how the next decade will unfold, let alone the next 30 years. Panel head Hajimu Yamana, a Kyoto University professor, said in drafting the report that the panel has decided to propose the goal of commencing within 10 years the work of removing fuel from the damaged reactors, but added it "would not be possible to make a firm commitment to do so."

"At this moment, we cannot say anything for sure until we take a look inside the reactor core," Yamana told reporters in late October.

Before taking the fuel out of the reactors, workers are expected to start within two years removing spent nuclear fuel stored in pools inside the Nos. 1 to 4 reactor buildings. They also must repair the damaged primary containment vessels of the Nos. 1 to 3 reactors so the vessels can be filled with water to block radiation.

But doubts remain over the method of flooding the vessels because the utility known as TEPCO once tried in the past to create a system to cool the reactors and later gave up, while the report said there is currently no alternative method to take out the fuel.

The report, which highlights the tasks TEPCO will have to deal with in the medium to long term, also said **no existing technology is capable of recovering fuel which has melted through a reactor pressure vessel and is accumulating at the outer primary container.**

Tadahiro Katsuta, an associate professor at Meiji University specializing in nuclear engineering and nuclear policy, warns that the government and TEPCO should not rush toward actual decommissioning work without grasping more accurately the conditions of the melted fuel.

"I feel there is a view within the government to 'put a lid on stinky things' (by moving ahead with the process of scrapping)...But much time is needed for preparation, possibly more than 10 years, to get to know where the fuel is located and think about how work can proceed with minimum radiation exposure," he said.

Hiroshi Tasaka, who served as a special adviser to the prime minister for about five months after the nuclear crisis erupted on March 11, has said that a cold shutdown is "just the beginning" of further problems created by the Fukushima accident.

"It is fine that the facility to clean radioactive water (created by cooling the melted fuel) is moving smoothly. But I must mention that **the water treatment process is creating massive amounts of highly radioactive waste, left in places such as filters. It is just moving a problem from one place to another,**" he said.

He also said that there is a more important task than the reinforcement of nuclear safety for the government now, which is to restore public trust in its handling of nuclear issues.

"No matter how much a government spokesman talks about safety now, it will mean nothing to the public if the government is not trusted," said the Tama University professor of nuclear safety and radioactive waste.

The government has decided to separate the nuclear regulatory body from the Ministry of Economy, Trade and Industry, which has also played a role in promoting nuclear power. It is creating a new nuclear safety agency as a step toward enhanced nuclear safety regulation.

But a mere organizational change is not enough, experts say.

"The government must carry out reforms that can ensure the highest level of safety in terms of personnel, organization, system and culture" to help restore public trust, Tasaka said.

He noted the need, for example, to increase the number of personnel of the new regulatory agency to a level closer to the U.S. Nuclear Regulatory Commission, which employs about 4,000 people, and to strictly train regulators to avoid cozy relationships with related organizations.

But Tasaka added that there is still a long list of questions the government should respond to, including how to dispose of high-level radioactive waste, what would be the long-term impact of radioactive

substances released into the environment, and whether nuclear power generation is truly as cheap an energy source as thought earlier.

"Responding to public questions in a sincere manner is where the government should start," Tasaka said.

(Mainichi Japan) December 17, 2011

Condition of Fukushima Daiichi plant declared to be in cold shutdown

TOKYO (Kyodo) -- The following is the current condition of the Fukushima Daiichi nuclear power plant, which paved the way for the government to announce Friday that the complex has achieved a stable state of cold shutdown.

- The temperature at the bottom of the reactor pressure vessels of the crippled Nos. 1 to 3 units is being kept below 100 C, while that of the water in the spent fuel pools of the Nos. 1 to 4 units is being kept below 25 C.
- The amount of radioactive substances currently being released from the reactors equals the radiation level at the boundary of the plant below the government-set target limit of 1 millisievert per year.
- The water circulation system to keep reactors cool has multiple backups. Even if all the equipment fails, water injection can be resumed in about three hours by using fire trucks.
- The radiation level of below 1 millisievert per year can be maintained even in the event water injection into the Nos. 1 to 3 reactors stops for 12 hours.
- A nuclear chain reaction called "recriticality" is unlikely but can be prevented by injecting water containing boric acid.
- A system to cool spent fuel pools has multiple backups. Even if the system fails, it would take at least around 16 days until the water in the No. 4 unit's spent fuel pool, which holds a larger amount of fuel than the other three, drops below the necessary level.
- A system to process highly radioactive water accumulating at the plant is capable of reducing radioactive cesium to below one ten-thousandth of the original level.

(Mainichi Japan) December 17, 2011

IAEA welcomes Japan's announcement of cold shutdown at Fukushima plant

VIENNA (Kyodo) -- The International Atomic Energy Agency on Friday welcomed the Japanese government's announcement that the crippled Fukushima Daiichi nuclear power plant has achieved a stable state of cold shutdown.

Tokyo Electric Power Co., the plant's operator, and the Japanese government have "made significant progress," IAEA Director General Yukiya Amano said in a statement.

Amano also said the IAEA will continue monitoring the status of the plant and radiation data in the wake of the nuclear disaster.

"The agency continues to stand ready to provide necessary assistance to Japan as requested," he said.

(Mainichi Japan) December 17, 2011

Towns seek decommissioning of Hamaoka nuclear power plant

SHIZUOKA (Kyodo) -- The assemblies of two municipalities near the suspended Hamaoka nuclear power plant in Shizuoka Prefecture passed resolutions Friday seeking the decommissioning of the plant or opposing its relaunch.

In Yoshida, located in a 20-kilometer radius of Chubu Electric Power Co.'s power plant, southwest of Tokyo, its town assembly unanimously adopted a resolution calling on the government to scrap the plant, which has five reactors, without restarting any of them and develop alternative energy sources.

In Fujieda, in a 30-km radius of the plant, its town assembly unanimously passed a similar resolution the same day opposing the relaunch of the reactors at the plant unless measures are taken to ensure the "absolute safety" of the residents.

Chubu Electric Power shut down the Hamaoka nuclear plant in May as requested by then Prime Minister Naoto Kan due to fears of a possible major earthquake, after the March 11 earthquake and tsunami triggered the Fukushima Daiichi nuclear plant crisis.

The Hamaoka plant is located at the epicenter of an area forecast to be hit by a magnitude 8-class temblor, called the Tokai earthquake, which the government expects will occur in central Japan sooner or later.

(Mainichi Japan) December 17, 2011

US nuclear head: "cold shutdown" marks milestone

The chairman of the US Nuclear Regulatory Commission says Japan's declaration of a state of cold shutdown at the disabled Fukushima Daiichi nuclear power plant marks an important milestone.

Gregory Jaczko made the comments in an interview with NHK on Saturday, one day before arriving in Japan to inspect the plant for the first time since the March 11th disaster.

Jaczo said he is interested in the next steps the Japanese authorities will take.

He said cleaning up radioactive material is difficult and may take several decades.

He said everyone in the nuclear power industry is interested in getting more detailed information about the condition of the reactors.

Saturday, December 17, 2011 14:52 +0900 (JST)

20 mSv yardstick set for repatriating residents

The Yomiuri Shimbun

A government working group has recommended that people be allowed to live in areas around the crippled Fukushima No. 1 nuclear power plant as long as the accumulated radiation exposure does not reach 20 millisieverts per year.

Drawing on the final report submitted Thursday by the working group, which has been examining how low exposure to radiation can affect the human body, the government has compiled a plan to designate three new zones according to annual radiation exposure, according to officials.

The plan would dissolve the current no-entry and expanded evacuation zones. Areas where the accumulated radiation exposure is less than 20 millisieverts per year would be designated "zones preparing to lift restrictions," to which people can return after decontamination is conducted and living conditions are restored.

In contrast, areas where the accumulated radiation exposure exceeds 50 millisieverts per year would be designated "zones where residency is prohibited for an extended period," where residents cannot return at least five years.

Areas with annual exposure of about 20 millisieverts to 50 millisieverts would be deemed "zones where residency is restricted," which would require several years of decontamination to lower radiation levels to less than 20 millisieverts so people can return.

The government will present this plan Sunday to local governments around the power plant, according to the officials.

A person's risk of death from cancer increases by about 0.5 percent if they are exposed to 100 millisieverts of radiation over an extended period, the report said, drawing on studies conducted among survivors of the atomic bombings of Hiroshima and Nagasaki at the end of World War II.

However, it is difficult to prove scientifically whether the mortality risk is increased through exposure to lower levels of radiation, the report said.

The chance of developing cancer from annual exposure to 20 millisieverts of radiation or less is considered lower than that from smoking and obesity, it said, making it difficult to prove a cause-and-effect link between low-level radiation exposure and developing cancer.

The risk of contracting cancer from smoking is equivalent to being exposed to 1,000 to 2,000 millisieverts of radiation, while that from obesity is equivalent to 200 to 500 millisieverts.

The working group also recommended measures specifically for children, who are considered more vulnerable to radiation. For example, it urged schools to restart classes on their premises only if radiation levels are 1 microsievert or less per hour.

N-plant procedure ignored? / Workers 'didn't check' reactor pressure day before explosion

The Yomiuri Shimbun

A government panel has found that workers at the No. 3 reactor of the crippled Fukushima No. 1 nuclear power plant stopped operation of a high-pressure core cooling system without checking if a substitute pumping system would work on March 13, one day before a hydrogen explosion occurred there, sources said.

By failing to check if the reactor's fire pump could inject water instead of the emergency cooling device, the workers may have failed to follow instructions in the plant's operating manual, according to the panel established to investigate and verify the facts of the nuclear crisis.

After stopping the operation of the high-pressure core cooling system in the early hours of March 13, the workers could not inject water through the fire pump because of the high pressure in the reactor.

As a result, water injection into the reactor was suspended for about 6-1/2 hours before a hydrogen explosion occurred just after 11 a.m. the following day.

The panel will include the actions taken by the reactor's workers in the interim report it is scheduled to release Dec. 26, according to the sources.

The No. 3 reactor lost power due to the March 11 tsunami, and the operation of a reactor core isolation cooling system--another type of emergency cooling device--was suspended at 11:36 a.m. the following day.

As a result, the water level in the reactor fell, which led to the automatic launch of the high-pressure core cooling system at 12:35 p.m.

According to the sources, workers at the reactor stopped the high-pressure core cooling system at 2:42 a.m. on March 13 to switch to the emergency fire pump to inject water.

According to the plant's manual on how to respond to severe accidents, workers must first confirm that there are about seven atmospheres of pressure or less in a reactor core before using a substitute pumping system. The fire pump uses relatively low pressure to inject water.

However, the No. 3 reactor's pressure had jumped to about 40 atmospheres at that time, preventing the fire pump from injecting water to it.

Therefore, the workers tried to revert to the high-pressure core cooling system, only to find it could not be started due to a low battery charge. They then took steps to lower the pressure.

Water was finally pumped into the reactor by fire-extinguishing vehicles at 9:25 a.m. that day. However, it did not prevent the hydrogen explosion from occurring.

The panel has raised questions about the workers' decision to switch from the high-pressure core cooling system to the fire pump without getting instructions from Masao Yoshida, chief of the plant at that time, according to the sources.

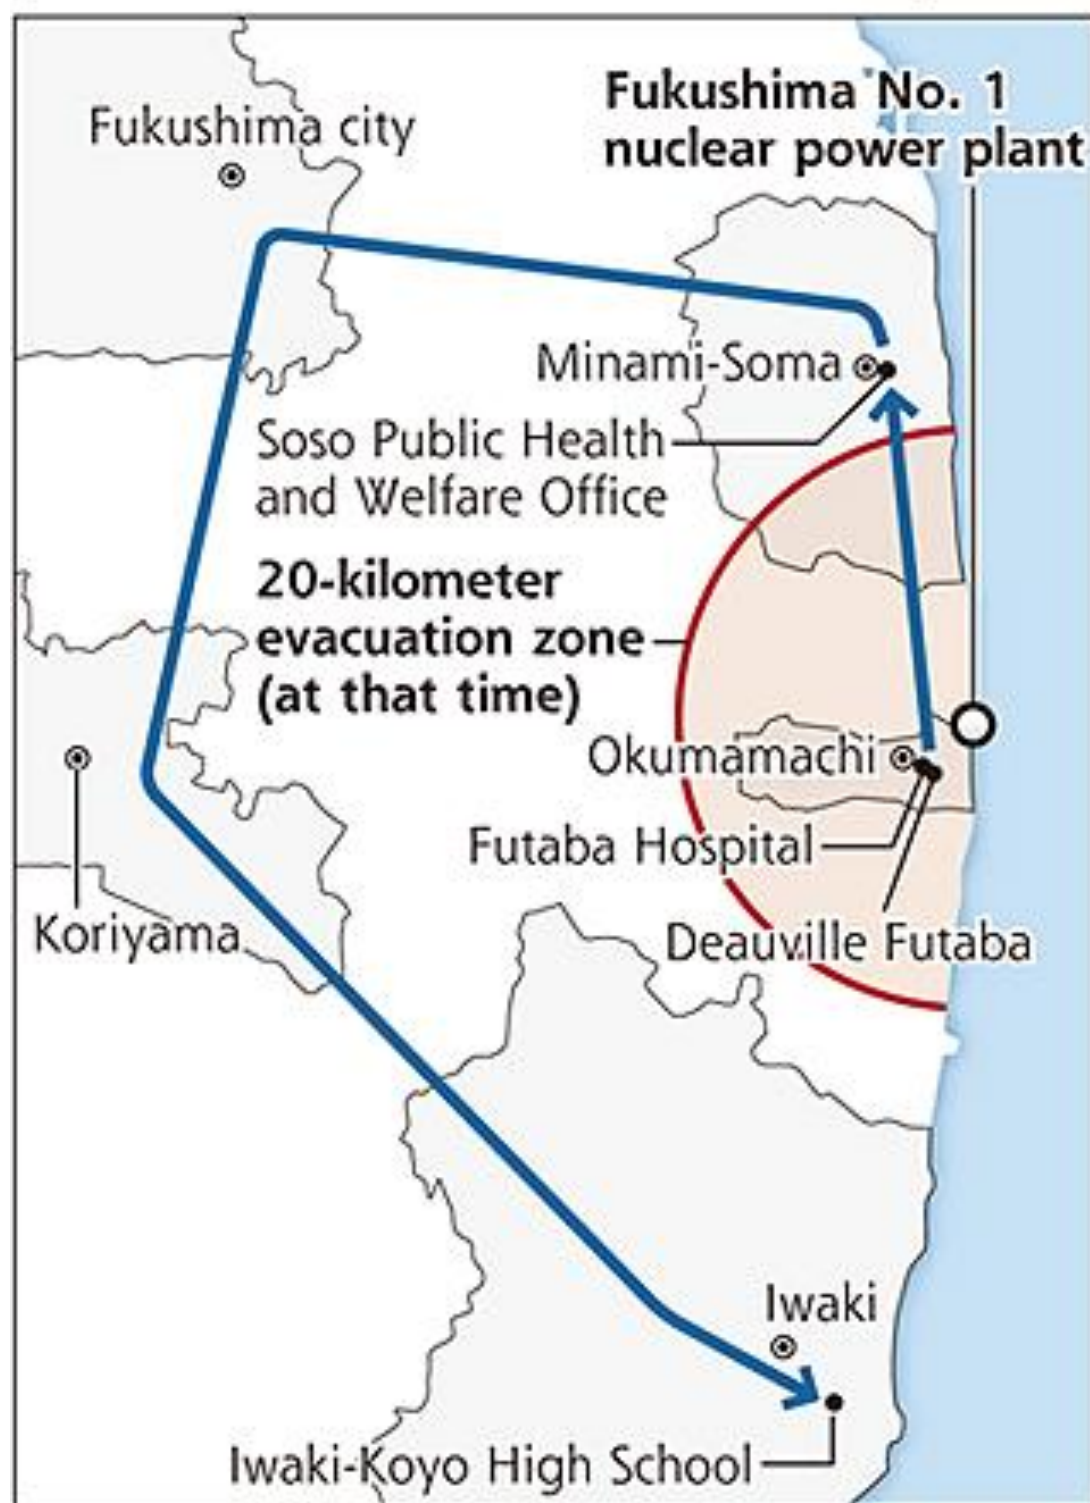

In its interim report released Dec. 2, plant operator Tokyo Electric Power Co. admitted that the high-pressure core cooling system at the No. 3 reactor had been suspended, but did not mention how the workers operated it.

(Dec. 17, 2011)

NUCLEAR CRISIS--9 MONTHS ON / Focus on radiation screenings ended up claiming patients' lives

The Yomiuri Shimbun

March 14 transfer route for patients at Futaba Hospital

This is the second and last installment in a two-part series that looks into problems facing the Nuclear and Industrial Safety Agency, among other issues, and what is needed for a new "nuclear safety agency" to be established in April.

It was the early morning of March 14, three days after the outbreak of the crisis at the Fukushima No. 1 nuclear power plant following the massive earthquake and tsunami. The Soso Public Health and Welfare Office in Minami-Soma, Fukushima Prefecture, was filled with patients and residents transferred from hospitals and homes for the elderly within 20 kilometers of the plant.

These patients--many of whom were bedridden elderly people with serious conditions--boarded buses to leave the government-designated evacuation area. When the buses arrived at the facility, some patients had blood backflow in their intravenous lines, while others had fallen out of their seats.

Earlier, the central government told the Fukushima prefectural government to evacuate about 840 people at medical and other facilities in the 20-kilometer evacuation zone, saying the power plant was "in a critical state."

The prefectural government asked the Self-Defense Forces to transfer the patients to the Soso Public Health and Welfare Office, about 25 kilometers north of the power plant, because it was designated as a radiation screening site.

"We believed they had to undergo radiation screenings first to be accepted at evacuation centers," a prefectural government public health official said.

However, Prof. Yoshio Hosoi of Hiroshima University--an emergency radiation medicine expert who was dispatched to the prefecture in response to the accident--could not help wondering if it was necessary for these patients to undergo the screenings. The professor believed they had probably not been exposed to excessive radiation because they remained indoors after the accident.

In fact, screenings for the 840 patients found none of them had been exposed to a level of radiation high enough for them to require decontamination treatment.

Among them were 132 patients and residents from Futaba Hospital and the Deauville Futaba home for the elderly, both of which were in Okumamachi. After arriving at the welfare office and undergoing radiation screening, they were then moved to Iwaki, in the southern part of the prefecture, via Fukushima city and Koriyama.

They traveled about 200 kilometers during the 12-hour journey before arriving at Iwaki-Koyo High School. Three patients died in transit, while another 11 passed away hours after arriving at the school.

"The public had excessive radiation exposure fears," Hosoi said as to why authorities put more focus on radiation screenings rather than the swift transfer of the patients.

Medical institutions also suffered from such fears.

At the crippled nuclear power plant, 11 workers were injured when a hydrogen explosion occurred at the No. 3 reactor at 11 a.m. on March 14. About three of those requiring hospital treatment were refused by some medical institutions over radiation fears.

The three workers were finally admitted by Fukushima Medical University in the prefectural capital the following day--about 20 hours after the blast. Examinations found none of the workers had been exposed to high levels of radiation.

"Radiation screenings are meant to find those requiring advanced treatment for radiation exposure or decontamination," Hosoi said. "However, the screenings were necessary [for evacuees] to be accepted by residents in the areas to which they have been evacuated."

===

Govt unprepared for screening

The Nuclear Safety Commission was in disarray over the screening.

On March 14, the Fukushima prefectural government raised the standard for designating people requiring full-body decontamination from 13,000 counts per minute (cpm) or more, which was based on its radiation emergency medicine manual, to 100,000 cpm or more. The cpm refers to the number of atoms in a given quantity of radioactive material to decay in one minute.

There were fears that, under the original standard, there would be too many people requiring full-body decontamination, preventing smooth evacuation due to staff shortage.

Also, water necessary for decontamination was in short supply due to suspension of water services.

"Decontamination was difficult in the situation. It was irrational to apply the normal standard to an emergency situation," said Hiroshima University Prof. Koichi Tanigawa, who suggested the prefecture raise the standard.

However, the NSC's Technical Advisory Organization, an emergency panel convened by the commission in a nuclear emergency, announced the same day the previous standard was appropriate.

This resulted in double standards between the central and prefectural governments. There were fears evacuees from Fukushima Prefecture would have been denied entry to evacuation centers in other prefectures, where the standard for full-body decontamination was lower than Fukushima Prefecture.

However, in a sudden reversal, the advisory organization on March 19 approved the increase of the standard to 100,000 cpm.

"To evacuate people to areas outside of the prefecture smoother, the standards should be unified," a panel source said.

"It took us time to understand the situation in the prefecture," NSC Chairman Haruki Madarame, explained.

It was not until April 17, more than one month after the March 11 disaster, when advisory panel investigators visited Fukushima Prefecture for the first time.

Taking the situation into consideration, the NSC began discussions in October aimed at revising screening purposes and standards for full-body decontamination.

===

Radiation Council fell short

While the NSC appeared to lack the ability to respond to the crisis, the Radiation Council of the education ministry was unable to demonstrate its use.

The Education, Culture, Sports, Science and Technology Ministry council consists of 19 experts on radiology.

The council is designed to set standards for people's radiation exposure to prevent radiation-caused health problems.

On March 14, the council was asked by the Health, Labor and Welfare Ministry for advice on raising the radiation exposure limit for workers at the Fukushima No. 1 nuclear power plant to 250 millisieverts from 100 millisieverts, in emergency situations. The council gave their approval the same day, although council members did not meet, but communicated via phone and e-mail.

The members of the council convened on Aug. 4 for the first time after the nuclear accident occurred.

Former council Chairman Takashi Nakamura, professor emeritus at Tohoku University, who participated in the meeting as an observer, said, "Don't you think the council should be more proactive with proposals in emergencies?"

"I guess so," incumbent Chairman Otsura Niwa, replied.

However, legally the council is limited to only giving opinions to ministry inquiries.

When government ministries and agencies were reorganized in 2001, most councils were left with only minimal functions, while others were integrated. Many councils were criticized as merely bureaucratic tools to form ministry policies.

As a result, the Radiation Council lost its ability to make proposals.

The government has already decided to transfer council functions to a new nuclear safety agency scheduled to be launched in April next year. The new agency will be an external bureau of the Environment Ministry. The NSC and the Nuclear and Industrial Safety Agency will also be integrated into the new agency.

A senior Environment Ministry official responsible for drawing up the new agency's organizational structure said, "After the nuclear disaster broke out, the expectation of the Radiation Council's role has changed."

"After the creation of the new agency, we have to combine the functions of the council and the commission to create an organization to quickly respond to the needs of society," he added.

(Dec. 17, 2011)

Editorial: Gov't declares cold shutdown at nuclear plant, but crucial steps lie ahead

Nine months after the outbreak of an unprecedented nuclear disaster at the Fukushima No. 1 Nuclear Power Plant, the government has declared a stable "cold shutdown" at the plant, representing a major milestone in its handling of the disaster.

The public has keenly waited for the nuclear reactors to be brought under stable control, but Japan is still standing on thin ice and is miles away from a situation where it can really declare that the crisis is under control.

In the meantime, rebuilding the lives of residents near the crippled plants has been an urgent critical challenge. On the occasion of its latest political declaration, the government needs to renew its resolve to settle the crisis and achieve regional recovery.

The disaster-hit reactors are certainly now in a more stable condition. However, the phrase "cold shutdown" usually refers to suspension of a sound reactor. The fact that the government is attempting to apply this term in a severe accident in which three reactors have suffered core meltdowns should be called into question. The government should rather explain in detail the possibility of any additional explosions and whether a recriticality accident has been ruled out.

Simulations suggest that nuclear fuel has melted inside the reactor containment vessels, eroding their concrete floors. Although Tokyo Electric Power Co. (TEPCO), the operator of the stricken nuclear plant, has indicated that melted fuel has also been cooled down by water, this is nothing but speculation. We urge the utility and the government to find a way to ascertain the precise condition of the fuel.

Only the No. 1 reactor at the Fukushima plant has had a cover installed over it. Similar covers should be placed over the other reactors as soon as possible. The circulating water cooling system remains hastily arranged, and careful attention needs to be paid to prevent a leakage of water contaminated with radioactive materials.

The treatment of contaminated water, which has been accumulating due to an influx of underground water into reactor buildings, has been another source of concern. The utility must quickly respond to this problem.

While TEPCO has set forth government-approved plans to secure the safety of equipment to keep the nuclear plant in a stable condition over the next three years, the ongoing nuclear crisis has shown that secondary and even tertiary safety devices could fail simultaneously. Officials should take decisive measures to prevent any recurrence of such a crisis.

It is expected that the government will soon reorganize the radiation-contaminated no-go zone and planned evacuation zones around the plant into three zones. Even in areas with low levels of radiation, thorough decontamination work and health checks are needed to ensure residents can return home. Naturally, such efforts by themselves are far from sufficient.

The nuclear crisis has contaminated a farming belt, and it will be difficult for residents to return to their homes without re-establishing new foundations for their livelihood. While Prime Minister Yoshihiko Noda has referred to plans for the government to purchase contaminated land, the nation's politicians face an unprecedented challenge in dealing with areas where residents' homecoming will remain difficult over long periods of time.

The government is set to submit special bills on the recovery of Fukushima during the ordinary Diet session next year. It bears a heavy responsibility to respect the voices of residents and embody Fukushima's recovery from a long-term perspective as it aims to bring the seemingly infinite nuclear crisis under control.

(Mainichi Japan) December 17, 2011

TEPCO faces tough challenges after 'cold shutdown' of Fukushima nuclear reactors

The government declared on Dec. 16 that the Fukushima No. 1 Nuclear Power Plant has been brought to a stable "cold shutdown," paving the way for full-fledged work to decommission the plant's crippled nuclear reactors, but enormous financial difficulties loom for the operator of the nuclear complex.

Officials have determined it is likely to take more than 30 years to decommission the troubled nuclear reactors at the Fukushima nuclear plant, but it is hard to predict the total cost of scrapping the reactors.

"We can't see the whole picture when it comes to the cost of decommissioning the nuclear reactors. We can't imagine expenses spanning 30 to 40 years from now," said a senior official of Tokyo Electric Power Co. (TEPCO), the operator of the nuclear power plant.

The costs will certainly take a heavy toll on TEPCO. The government has started to consider injecting taxpayers' money into the utility in a bid to rescue the beleaguered company, but the company faces managerial problems that are likely to come to a head soon.

The utility has yet to clearly show how to deal with what a senior official of the Federation of Electric Power Companies has described as "work no one on earth has ever done before," and how it would finance this work. Such being the case, pessimism about the future prevails within the company.

Extra annual fuel costs in the range of 1 trillion yen -- resulting from suspension of the plant's nuclear reactors -- weigh heavily on the utility. According to estimates by a government third party panel, it will cost about 1.151 trillion yen to decommission the No. 1 to 4 reactors. If decontamination costs

were added to this amount, the total cost would likely reach several trillion yen. Furthermore, if the costs of decommissioning the Nos. 5 and 6 reactors were included, the financial burden on the utility would become even heavier.

Compensation to people affected by the nuclear crisis will not directly affect the utility financially because the government will foot the bills for compensation through the Nuclear Damage Compensation Facilitation Corporation. But the costs of decontamination and decommissioning the nuclear reactors are weighing on the company, and therefore it is fighting an uphill battle to secure funds by selling its assets and cutting personnel expenses. According to plans unveiled by TEPCO on Dec. 9, it will be able to cut only 2.649 trillion yen over next 10 years.

TEPCO president Toshio Nishizawa said that the company must "reform the profit structure" to secure funds by raising the utility rates and resuming the operation of the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture. But it is difficult to secure public understanding of such moves. Therefore, the worrying prospect that the company will face the risk of insolvency in the business year ending March 2013 is becoming increasingly realistic.

The government and the Nuclear Damage Compensation Facilitation Corporation have already started to discuss injecting public funds into the utility behind the scenes with an eye to incorporating funding into the comprehensive special business plan to be hammered out by next spring.

Nishizawa said he wants to keep TEPCO as a private company, but Economy, Trade and Industry Minister Yukio Edano is reluctant to allow an increase in utility rates. Furthermore, it is unclear when or whether the operation of TEPCO's nuclear reactors can resume. Hence, the utility's options are diminishing day by day.

Former nuclear industry insider speaks out on lessons and disillusionment

Toshio Kitamura stands in front of temporary housing units for those who have been forced out of their homes by the ongoing nuclear disaster, built adjacent to Big Palette Fukushima, a convention center in

Koriyama, Fukushima on Nov. 30. Because of his five pet cats, Kitamura has moved into a rental house, and not a temporary housing unit. (Mainichi)

FUKUSHIMA -- The Great East Japan Earthquake and tsunami that triggered an unprecedented nuclear crisis forced a former nuclear energy advocate from his home due to its proximity to the stricken nuclear power plant, leaving him disillusioned with an industry he had so willingly believed in.

Toshiro Kitamura, 66, now lives in a rental home in the Fukushima Prefecture city of Sukagawa. After he picked me up in his car at JR Sukagawa Station, we headed to Big Palette Fukushima, a large-scale convention center in Koriyama.

"It was so cold here," Kitamura said as he got out of the car.

Immediately after the nuclear disaster at Fukushima No. 1 Nuclear Power Plant broke out, upwards of 2,500 residents of the local municipalities Tomioka and Kawamura were evacuated to the convention center. Kitamura, who had been living in Tomioka for the past 12 years, evacuated there on March 16 and stayed for about a month and a half. At the time, he'd figured he be returning home soon.

Kitamura found employment at Japan Atomic Power Co. (JAPC) in 1967, in the midst of a booming economy. It was a year after JAPC launched operations of Japan's first commercial nuclear power plant, and the year that construction of the Fukushima No. 1 Nuclear Power Plant's No. 1 reactor began. The rapidly growing Japanese economy was demanding an increasingly more stable energy supply.

According to Kitamura, he had no interest in nuclear power as a college student. His degree was in economics, but he was more interested in going into work that would be of help to society than he felt going into business would. It was his search for just such a job that led him to JAPC.

In this undated file photo released by Tokyo Electric Power Co., the Fukushima Daiichi Nuclear Power Plant reactors stand in line intact before the accident in Okuma town in Fukushima Prefecture, northeastern Japan. (AP Photo/Tokyo Electric Power Co.)

Since 2005, after his retirement from the company, Kitamura has been serving as an advisor to Japan Atomic Industrial Forum (JAIF), an organization that conducts symposiums on nuclear power projects

and recruitment events for the nuclear power industry. He no longer stands on the "front lines," however, and had been enjoying life in Tomioka, Fukushima, when the quake disaster struck.

While at JAPC, Kitamura spent many years working at the Tokai and Tsuruga nuclear plants. He was primarily responsible for ensuring the safety of the plants' workers, including checking the durability of handrails and footholds during inspections and before the construction of new plants. Through his job, he gained comprehensive knowledge of nuclear power stations. "Without seeing the whole picture, from the reactors to everything else, you can't manage a plant's safety," he says.

Kitamura was exposed not just to the physical structure of nuclear plants, but to the multilayered relationships of the contractors that take on maintenance work, their subcontractors, and the subcontractors of those subcontractors. He also grew familiar with the insular nature of major power utilities and nuclear reactor manufacturers.

Nuclear power plants were often described as "apartments without toilets," and as such, more spent nuclear fuel was being accumulated with nowhere to put it. The Monju fast-breeder reactor project, whose objective is to utilize reprocessed spent fuel to produce more energy, had been derailed by repeated accidents. More and more concerns regarding nuclear power generation continued to be put on the back burner for the ostensible purpose of securing stable power supply. Kitamura wrote articles for industry journals to sound the alarms that were becoming too loud for him to ignore.

"I thought that the nuclear power industry would reach a stalemate at some point," Kitamura says. "But never did I imagine that such widespread radiation contamination would occur."

Kitamura had experience going to community information sessions to explain the safety of nuclear plants to local residents. He once told a group of residents that "the probability of an accident was very low, at about 1 out of 10,000," to which one attendee responded: "That means there's a possibility that an accident could occur tomorrow, right?" Kitamura had been at a loss for words.

"Now that I think about it, my theory of probability was flawed," Kitamura says, looking back.

After the Fukushima disaster emerged, Kitamura says he was criticized repeatedly by his wife, who told him: "You were so sure that 'an accident on the level of the Three Mile Island accident would never happen in Japan.' I understand that you'd tried to warn the industry, but still." Kitamura says her words stung.

It's easy to say with hindsight on one's side, but even a layperson could've imagined the possibility of nuclear plants being damaged by major quakes and tsunamis in a quake-prone country like Japan with long coastlines. So why couldn't the experts?

"You know why?" Kitamura began, taking another breath before continuing. "It's because experts reached conclusions based merely on statistics that 'in Japan, the country with the world's best record of non-interrupted power supply, it would be very difficult to imagine having no power supply for long periods of time,' and refused to entertain other possibilities. They did not go to the scene to check for themselves whether power could actually be restored. Therein lies the major problem."

Kitamura also points out that the government and power companies dismissed any lessons that could have been learned from the Chernobyl accident, citing the different types of reactors used in the former U.S.S.R. and Japan. As a result of underestimating the potential for disaster, emergency drills were oversimplified, and residents failed to maintain a disaster-ready mentality.

Temporary municipal government offices of the village of Kawauchi and the town of Tomioka are located within the grounds of Big Palette Fukushima. Temporary housing units for those who have evacuated due to the nuclear crisis have also been built there. As we walked among the prefab housing, our conversation turned to Kitamura's life as an evacuee.

Confronted with the reality of the nuclear crisis -- including rations of bread past their expiration date, lack of information from the government, the hollow response of the officials from Tokyo Electric Power Co. (TEPCO), the operator of the stricken plant, and the fear of never being able to return to life as he once knew it -- Kitamura found he could no longer continue to hold on to his old views.

"Having experienced a disaster of this magnitude, isn't it clear that nuclear power is not worth the economic cost? We're entering an age of a declining population, which means dropping demand for energy. No matter how you look at it, it's going to be extremely difficult to make a convincing case for nuclear energy," says Kitamura.

Hopes of living with his wife and cats, in a house with a yard, surrounded by nature, had brought Kitamura to Tomioka 12 years ago. He also found appealing the excellent services provided by the municipal government, made possible by subsidies given to the town by the central government for hosting the Fukushima No. 2 Nuclear Power Plant.

Entry into a 20-kilometer radius of the stricken Fukushima No. 1 Nuclear Power Plant is not permitted, and Kitamura, whose home falls into that area, has only been able to make three short visits to his home since his evacuation. He estimates that the radiation levels around his home will reach at least 40 millisieverts per year, which eliminates any possibility that he'll be able to move back.

"My house is worth nothing now," says Kitamura. "I was planning on selling it to fund our eventual move into a nursing home."

How ironic is it that this former nuclear energy advocate has lost both his current life and future life plans to nuclear energy?

"As someone who once promoted nuclear power, and also as someone who has suffered from the disaster, I believe that I should continue sharing my experiences," Kitamura says. "I have a responsibility to do so."

Since the nuclear crisis emerged, Kitamura has been receiving a greater number of invitations to give lectures. It was only after he became a victim of a nuclear disaster that he finally came to understand

the horrors of the non-critical promotion of nuclear power. The guilt he feels for having been party to that is what propels him now to speak up.

JAIF, where Kitamura now serves as advisor, comprises nuclear power-related companies and municipal governments. Because of this, some anti-nuclear advocates may accuse him of siding with the pro-nuclear camp.

"I anticipate such criticisms," says Kitamura. "But I think it's important for me to criticize the problems of nuclear energy from the inside."

This past October, the former JAPC board member published a book titled "Genpatsu suishinsha no munen" (The disappointment of a former nuclear power advocate).

"Until now, the industry did not have a culture of lending an ear to internal criticism. After the book was published, I received encouraging letters from former insiders of the nuclear power industry thanking me for writing what I did." (By Yoshiaki Ebata, Evening Edition Department)

Hatoyama: Nationalize Fukushima N-plant

The Yomiuri Shimbun

Only by bringing the Fukushima No. 1 nuclear power plant into government hands can scientists thoroughly discover what caused the nuclear crisis, former Prime Minister Yukio Hatoyama says in an article published in the Dec. 15 issue of the British science journal Nature.

In the two-page article coauthored by Hatoyama and Tomoyuki Taira, a fellow Democratic Party of Japan member of the House of Representatives, Hatoyama said the Fukushima plant "must be nationalized so that information can be gathered openly."

"A special science council should be created to help scientists from various disciplines to work together on the analyses," he said. "Through such a council, the technologies needed for decommissioning and decontamination...can be developed."

It is extremely rare for a major science journal to carry an article written by a former prime minister as a cover story, according to an official of Nature Japan.

In the article, Hatoyama criticizes Tokyo Electric Power Co., the operator of the crippled plant, for disclosing only limited information to Diet committees. He also hints at the possibility of recriticality at the plant and says there is still much about the crisis that needs clarification, including the state of the molten fuel within the nuclear reactors.

Hatoyama also says that he and Taira obtained data on samples of contaminated water TEPCO obtained from the basement of the plant's No. 1 reactor and asked an outside research institute to reanalyze them.

Results showed that radionuclide **chlorine 38**, one of the isotopes released during recriticality, "was indeed present," he claims.

TEPCO reported at one point that it found chlorine 38 in the sampled water, but the utility later retracted that statement, saying there was a mistake in the analysis.

Japan says stricken nuclear power plant in cold shutdown

<http://www.reuters.com/article/2011/12/16/us-japan-nuclear-idUSTRE7BF06020111216>

Reuters) - [Japan](#) declared its tsunami-stricken Fukushima nuclear power plant to be in cold shutdown on Friday, taking a major step to resolving the world's worst nuclear crisis in 25 years but some critics questioned whether the plant was really under control.

The Fukushima Daiichi plant, 240 km (150 miles) northeast of Tokyo, was wrecked on March 11 by a huge earthquake and a towering tsunami which knocked out its cooling systems, triggering meltdowns, radiation leaks and mass evacuations.

In making the much-anticipated announcement, Prime Minister Yoshihiko Noda tried to draw a line under the most acute phase of the crisis and highlighted the next challenges: the clean-up and the safe dismantling of the plant, something the government says may take more than 30 years.

"The reactors have reached a state of cold shutdown," Noda told a government nuclear emergency response meeting.

"A stable condition has been achieved," he added, noting radiation levels at the boundary of the plant could now be kept at low levels, even in the event of "unforeseeable incidents."

A cold shutdown is when water used to cool nuclear fuel rods remains below boiling point, preventing the fuel from reheating. One of the chief aims of the plant's operator, Tokyo Electric Power (Tepco), had been to bring the reactors to that state by the year-end.

The declaration of a cold shutdown could have repercussions well beyond the plant. It is a government pre-condition for allowing about 80,000 residents evacuated from within a 20 km (12 mile) radius of the plant to go home.

Both Noda and his environment and nuclear crisis minister Goshi Hosono said that while the government still faced huge challenges, the situation at the plant was under control.

That provoked an angry response from senior local officials, Greenpeace and some reporters even as the Vienna-based U.N. nuclear agency welcomed "significant progress" at the plant.

"We hope that this will be a fresh step towards going back home but it does not change the fact that the path to bringing the crisis under control is long and tough," Fukushima governor Yuhei Sato said, according to the Asahi newspaper website.

Greenpeace dismissed the announcement as a publicity stunt.

"By triumphantly declaring a cold shutdown, the Japanese authorities are clearly anxious to give the impression that the crisis has come to an end, which is clearly not the case," Greenpeace Japan said in a statement.

Hosono acknowledged that there were some areas where it would be difficult to bring people back and said there could be small difficulties here and there, but he told a briefing: "I believe there will be absolutely no situation in which problems escalate and nearby residents are forced to evacuate."

The water temperature in all three of the affected reactors fell below boiling point by September, but Tepco had said it would declare a state of cold shutdown only once it was satisfied that the temperatures and the amount of radiation emitted from the plant remained stable.

Jonathan Cobb, an expert at the British-based World Nuclear Association, said the authorities had been conservative in choosing the timing of the announcement.

"The government has delayed declaration of cold shutdown conditions, one reason being to ensure that the situation at the plant was stable," Cobb said, adding that the evacuation zone should get progressively smaller as more of it was decontaminated.

Kazuhiko Kudo, professor of nuclear engineering at Kyushu University, said authorities needed to determine exactly the status of melted fuel inside the reactors and stabilize a makeshift cooling system, which handles the tens of thousands of tons of contaminated water accumulated on-site.

HUGE COSTS, ANXIETY

The government and Tepco will aim to begin removing the undamaged nuclear rods from the plant's spent fuel pools next year. However, retrieval of fuel that melted down in their reactors may not begin for another decade.

The enormous cost of the cleanup and compensating the victims has drained Tepco financially. **The government may inject about \$13 billion into the company as early as next summer in a de facto nationalization**, sources told Reuters last week.

An official advisory panel estimates **Tepco may have to pay about 4.5 trillion yen (\$57 billion) in compensation in the first two years after the nuclear crisis, and that it will cost 1.15 trillion yen to decommission the plant, though some experts put it at 4 trillion yen (\$51 billion) or even more.**

Japan also faces a massive cleanup task outside the east coast plant if residents are to be allowed to go home. The Environment Ministry says about 2,400 square km (930 square miles) of land around the plant may need to be decontaminated, an area roughly the size of Luxembourg.

The crisis shook the public's faith in nuclear energy and Japan is now reviewing an earlier plan to raise the proportion of electricity generated from nuclear power to 50 percent by 2030 from 30 percent in 2010.

Japan may not immediately walk away from nuclear power, but **few doubt that nuclear power will play a lesser role in future.**

Living in fear of radiation is part of life for residents both near and far from the plant. Cases of excessive radiation in vegetables, tea, milk, seafood and water have stoked **anxiety** despite assurances from public officials that the levels detected are not dangerous.

Chernobyl's experience shows that anxiety is likely to persist for years, with residents living near the former Soviet plant still regularly checking produce for radiation before consuming it 25 years after the disaster.

Les réactions Japonaises à la déclaration du p.m. Noda

Le gouverneur de Fukushima contredit immédiatement la déclaration de M. Noda sur la "maîtrise de l'accident de Fukushima"

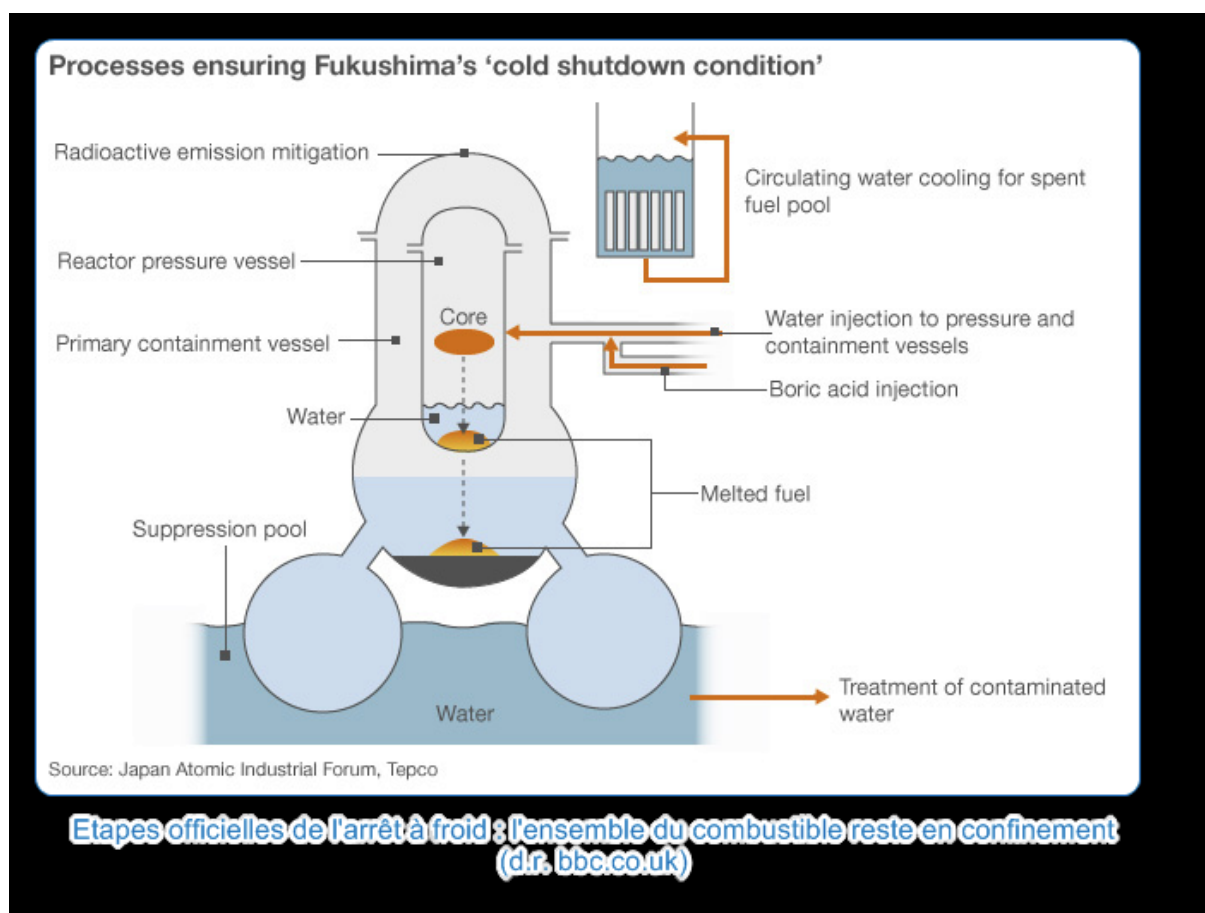

La première réaction à la déclaration effectuée par le Premier ministre du Japon estimant que "l'accident de Fukushima était sous contrôle" ne s'est pas fait attendre : dans un démenti cinglant et immédiat, le Gouverneur de la région de Fukushima à répliqué vertement : "L'accident est loin d'être maîtrisé" avant de détailler les nombreuses interrogations des habitants de la région sur la contamination de l'eau et des différents problèmes non résolus sur le site de la centrale accidentée.

D'autres voix s'élèvent au Japon afin de relativiser l'annonce officielle : ainsi M. Fumiya Tanabe, directeur de l'Institut de Recherche de sécurité sur les systèmes sociaux et techniques, a déclaré : *"Je me sens très mal à l'aise avec cette déclaration [de M. Noda] compte tenu du fait que le combustible n'ait pas conservé son intégrité initiale"*.

Selon Yukio Hatoyama, ancien Premier ministre du Japon, seule une commission scientifique spéciale [comprenez : indépendante] pourrait imaginer et développer les technologies éventuelles de démantèlement des installations et de décontamination. M. Hatomaya estime par ailleurs dans [un article - payant - publié dans nature avant-hier](#) et [synthétisé gratuitement dans le yomiuri daily de ce jour](#) que des éléments techniques récents [présence de chlore-38 = reprise de criticité du combustible] l'amènent à croire que l'accident est loin d'être terminé.

Le professeur Kudo, enseignant l'ingénierie nucléaire à l'université de Kyushu, estime quant à lui que [les autorités se devraient de déterminer précisément le statut du combustible](#) et agir sur le refroidissement à long terme ainsi que sur la gestion des quantités énormes d'eau contaminée stockés sur le site.

Govt speeds rezoning of contaminated areas

Yoshihiro Kiyonaga and Koichi Yasuda / Yomiuri Shimbun Staff Writers

New zoning of radiation-contaminated areas being considered by government

Zoning	Definition	Annual radiation exposure levels on which zoning is based
Zones where residency is prohibited for extended periods	Areas where it will likely take at least five years until residents can return	50 millisieverts or higher
Zones with restricted residency	Areas where it will take some years until annual radiation exposure levels can be lowered to below 20 millisieverts even after decontamination	At least 20 millisieverts but less than 50 millisieverts
Zones being prepared for residents' return	Areas where residents can return if living conditions are restored	Below 20 millisieverts

The entire town of Namiemachi, Fukushima Prefecture, seen here on Dec. 2, is either within the no-entry zone or the expanded evacuation zone.

After declaring that the Fukushima No. 1 nuclear power plant's reactors were in a state of cold shutdown, the government is expediting a review of the zoning of radiation-contaminated areas.

The government has set a rough guideline to **allow residents to return home to places where radiation levels are under 20 millisieverts a year.**

However, the government is expected to continue restricting entry into areas where radiation levels are higher.

Many difficult tasks remain, including how to decommission the damaged reactors--a problem that may take 30 years or longer to complete.

At a meeting of the Nuclear Emergency Response Headquarters on Friday, Prime Minister Yoshihiko Noda emphasized the government would do its best to restore Fukushima Prefecture.

"The accident still forces many people to live in places far from their hometowns. The entire government will strive hard so people will be able to return home and rebuild their lives as soon as possible," he said.

About the announcement of the cold shutdown of the reactors Friday, a source said the government initially considered making the declaration "by the end of November."

The government apparently felt it was desirable to make the declaration as soon as possible to expedite work to have residents return to their hometowns.

The date of the declaration was put off after radioactive xenon was detected in November. Officials suspected a resumption of a chain reaction known as criticality had occurred in the No. 2 reactor.

At present, a 20-kilometer radius from the nuclear plant is designated as a no-entry zone, and places surrounding this zone where radiation levels are feared to reach 20 millisieverts a year are designated as expanded evacuation zones.

The government will rezone the areas on the basis of the estimated annual levels of radiation exposure. They will be:

-- Zones that will be off-limits for extended periods. Radiation levels in these areas will be 50 millisieverts a year or higher and are likely to take five years or longer to decontaminate sufficiently for residents to return.

-- Restricted zones in which radiation levels are at least 20 millisieverts but under 50 millisieverts. Residents may be able to return to these areas in a few years.

-- Zones being prepared for residents' return, where radiation levels are under 20 millisieverts. Residents will be able to return once living environments are restored.

Goshi Hosono, state minister in charge of the nuclear crisis, will visit Fukushima Prefecture on Sunday to explain the new plan to local government heads, as well as government measures to help residents rebuild their lives.

The government is expected to announce the rezoning plan by the end of the year, but it will not be an easy task to realize the return of residents.

Decontamination work has already been delayed because temporary storage sites where contaminated soil will be stored for about three years have been difficult to procure in the affected municipalities.

The start of full-scale decontamination work probably will be delayed by two months until next March.

The government has begun negotiations to construct an interim storage facility for contaminated soil and other waste after storage at temporary sites.

It wants to build the facility in Fukushima Prefecture's Futaba County, an area where residents will be prohibited from entering for an extended period. It plans to purchase land in the area for that purpose.

At a press conference Friday, Noda reiterated his intention to submit a bill to the ordinary Diet session next year that provides for special measures to rebuild and revitalize Fukushima Prefecture.

The bill will include such measures as preferential taxation to help reconstruction in the evacuated areas; measures to eliminate anxiety about health due to radiation; and rebuilding of the water supply and sewage systems and other infrastructure by the central government to improve residents' living conditions.

The government will offer additional assistance when residents are allowed to return home.

(Dec. 18, 2011)

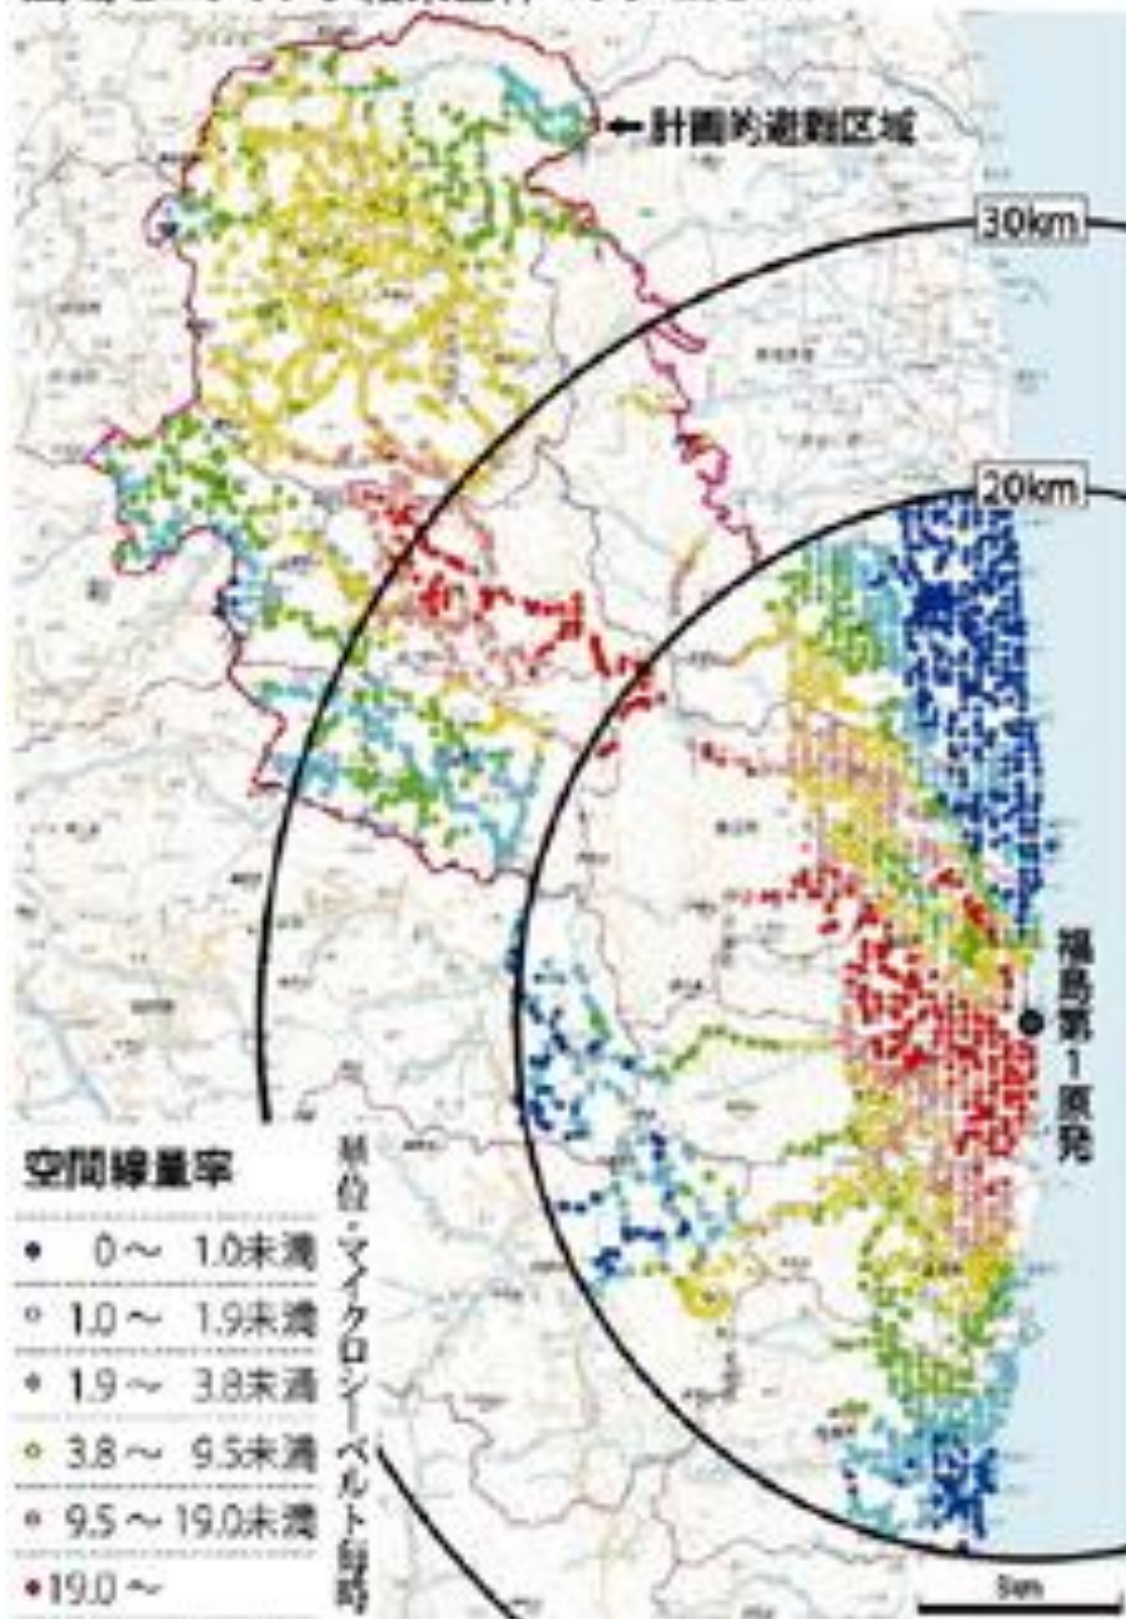

Gov't to reclassify Fukushima no-entry zones possibly in April

TOKYO (Kyodo) -- The government told municipalities around the crippled Fukushima Daiichi nuclear plant on Sunday that it plans to reclassify no-entry zones, possibly on April 1, according to estimated annual radiation exposure, government officials said.

The government plans to reclassify the current two-tier no-entry zones, designated last April, into three categories, including one covering areas with estimated annual radiation exposure of 50 millisieverts or higher to which residents are unlikely to be able to return.

The two other zones would cover areas with an estimated annual radiation exposure of 20 to 50 millisieverts, where residence would be restricted, and areas with an estimated exposure of less than 20 millisieverts, where the government would allow residents to return.

広域モニタリング結果全体マップ(高さ1m)

A government map displaying radiation levels in the area around the Fukushima No. 1 Nuclear Power Plant.

The current no-entry zones cover areas within a 20-kilometer radius of the crippled plant and areas with an estimated annual radiation exposure of 20 millisieverts.

In line with the reclassification, the government plans to step up decontamination efforts and measures to help residents return to areas where radiation levels are relatively low, they said.

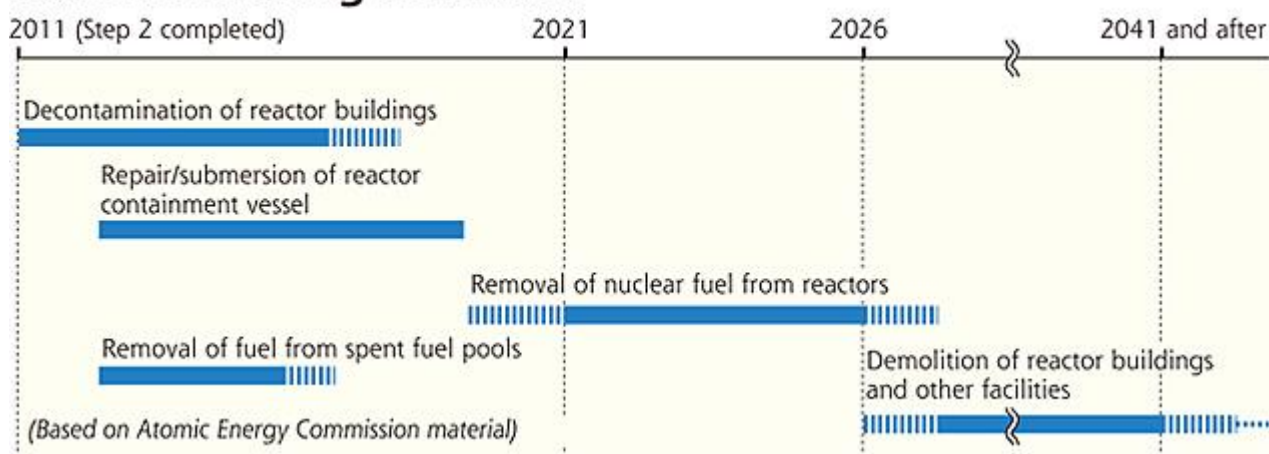

Yukio Edano, minister of economy, trade and industry, Goshi Hosono, nuclear disaster minister, and Tatsuo Hirano, minister in charge of reconstruction in areas affected by the March 11 earthquake and tsunami, notified Fukushima Gov. Yuhei Sato and representatives of 11 other municipal governments near the plant of the plan at a meeting in the city of Fukushima on Sunday.

(Mainichi Japan) December 19, 2011

Prospects murky as N-shutdown eyed

Takashi Hagihara / Yomiuri Shimbun Staff Writer

Decommissioning timetable

Despite the government's announcement that cold shutdown has been achieved, prospects for decommissioning the reactors at the Fukushima nuclear plant remain unclear as **it continues to be difficult to approach them due to high radiation levels.**

With Step 2 of the timetable complete, the government and Tokyo Electric Power Co. have embarked on the long road to shutting down the Nos. 1 to 4 reactors at the crippled plant, by establishing a medium- to long-term crisis management council.

However, the shutdown process is not likely to be completed until well beyond the scheduled date.

The most difficult task is removing the melted nuclear fuel from the reactors. As long as the fuel remains submerged in water, highly radioactive substances are prevented from being released. **The complicated operation to remove the fuel will involve a remote-controlled underwater system.**

A special committee of the Cabinet's Atomic Energy Commission that studies technical issues for decommissioning the reactors released a report on Dec. 7 that said the government and TEPCO will begin removing fuel from the reactors within 10 years.

After all of the fuel is removed, the reactors and buildings are to be demolished. The whole operation is expected to take until at least 2041, according to the report.

In a timetable for decommissioning work to be newly mapped out, the Economy, Trade and Industry Ministry and TEPCO are studying the possibility of achieving complete shutdown within 40 years.

An analysis by TEPCO released at the end of November showed that almost all of the nuclear fuel in the No. 1 reactor had melted, damaging the pressure vessel and eroding the containment vessel's concrete base by up to 65 centimeters.

"We expected [the containment vessel] to be eroded to some extent, but we didn't think it was this bad. Now we have another big problem to tackle," said Hajimu Yamana, the committee's chairman and a professor at Kyoto University.

When nuclear fuel reacts with concrete it turns into fragile clods, which will make operations more difficult. **The amount of fuel to be removed is also expected to increase significantly.**

TEPCO has posted a loss of about 800 billion yen over matters related to the nuclear disaster.

However, **according to the government's third-party committee tasked with overseeing TEPCO's financial situation, the cost of decommissioning the four reactors at the Fukushima plant is estimated at 1.15 trillion yen, and could increase by trillions of yen depending on how the situation develops.**

It is unclear how such a costly operation will be financed should TEPCO be unable to shoulder the financial burden on its own.

(Dec. 18, 2011)

Gov't to tighten laws for nuclear plant operations

TOKYO (Kyodo) -- The government is set to tighten laws and regulations related to nuclear power plants, obliging operators of existing reactors to comply with the latest safety requirements and newly designating a maximum period for the use of reactors, government sources said Sunday.

The government has come up with the plan after weighing safety concerns about old reactors as well as the failure of the operator of the crippled Fukushima Daiichi power plant to properly upgrade safety measures in line with new scientific findings about the risk posed by tsunami, they said.

Prime Minister Yoshihiko Noda's government plans to introduce relevant bills during the parliamentary session starting next month.

The revised laws and regulations will allow the government to order the suspension of a nuclear plant if its operator fails to meet the latest safety requirements, irrespective of the age of the facility, the sources said.

The tighter laws and regulations could force the operators of some reactors to decommission them if they cannot take any measures to meet the new standards, the sources added.

The government is also considering setting the maximum period for the use of a nuclear power station at around 40 years, they said.

The March 11 earthquake and tsunami seriously damaged the six-reactor Fukushima Daiichi nuclear complex that Tokyo Electric Power Co. began operating in the 1970s.

(Mainichi Japan) December 19, 2011

Long road looms for next stage at Fukushima nuke plant

December 17, 2011 - <http://ajw.asahi.com/article/0311disaster/fukushima/AJ201112170019>

With the government declaring Dec. 16 that Step 2 of the road map for bringing the Fukushima No. 1 nuclear power plant under control has been completed, that starts the long and difficult next stage, which could take decades.

Now begins the difficult processes of decontaminating radiation spewed from the plant and decommissioning the reactors.

The work until now demonstrates that officials will have to be prepared for any possibility.

For example, in November, water that had been decontaminated at the plant was found leaking from hoses. Officials of Tokyo Electric Power Co., the operator of the Fukushima plant, said on Dec. 7 that the leaks were caused by weeds that had poked holes into the plastic hoses.

About 4 kilometers of hoses have been placed on the ground in the Fukushima No. 1 nuclear plant to decontaminate water used to cool the reactor cores.

No plans have yet been drawn up to replace that temporary cooling and recycling system with a more permanent one that could withstand prolonged use.

There has also been no work done on processing the radioactive materials that remain after the cooling water has been decontaminated.

Workers at the Fukushima plant have also had to deal with unexpected localized increases in radiation levels as well as the accumulation of high concentrations of hydrogen gas in piping in the plant.

Decontamination of areas around the plant will also be important because reducing radiation levels is a major precondition for allowing evacuees to return to their homes.

Decontamination can only begin as soon as March because Environment Ministry officials said they need to obtain the approval of residents before workers could remove topsoil and cut tree branches in the yards of their homes.

No decision has yet to be made on where to temporarily store the contaminated topsoil that will be removed.

Even after decontamination work begins, other work to restore social services and roads will also have to be completed before residents could realistically expect to return home.

A problem on an even longer span is the decommissioning of the reactors at the Fukushima plant.

The central government and TEPCO are expected to release a road map for decommissioning on Dec. 21.

Sources said the road map would be made up of three stages. In the first stage that would begin next year and last for about three years, spent nuclear fuel would be removed from the storage pools in the reactors. In the second stage, extending from four years down the road to about a decade later, work would be done to repair the containment vessels to allow for the removal of nuclear fuel from the reactor cores.

The main task for the final stage that would commence after about 11 years would be the removal of the melted fuel.

The final stage will involve coming up with an entirely new way of removing the fuel because much of it has likely leaked outside the pressure vessel, an unprecedented situation.

Because TEPCO officials have no idea what the situation within the reactor is actually like, the methods and equipment to be used for removing the fuel will have to take into consideration the extent to which the fuel has melted and leaked out of the pressure vessel.

For that reason, **the road map to be compiled for decommissioning is more like a set of objectives than a plan for dealing with the situation at the Fukushima nuclear plant.**

Contaminated water found in plant's tunnel

http://www3.nhk.or.jp/daily/english/20111219_02.html

The operator of the crippled Fukushima Daiichi nuclear power plant says a large quantity of contaminated water was found in a tunnel below a building storing highly radioactive water.

The Tokyo Electric Power Company, or TEPCO, is investigating how about **230 tons of water flowed**

into the tunnel.

TEPCO says a worker found the pool of water on Sunday. **The water reportedly was about 50 centimeters to 3 meters deep throughout the 54-meter long tunnel.**

The utility says the level of radiation at the surface of the water is 3 millisieverts per hour. It is just a fraction of the level of the highly radioactive water stored in the waste processing facility above.

TEPCO suspects that the radioactive water of the facility may have flowed into the tunnel and was diluted by groundwater.

The utility says the tunnel is not connected to the sea.

The discovery raises questions about TEPCO's inspection and management capabilities because the firm failed to notice the water in the tunnel after the waste processing facility was completed in April.

Cutting Japan's dependency on nuclear power 'basic direction': gov't panel

TOKYO (Kyodo) -- A government panel tasked with compiling a basic framework for Japan's new energy policy said Tuesday it will continue its discussions with the view that reducing Japan's dependence on nuclear power is the "basic direction" to pursue.

In a report that compiled key issues in the panel's discussions to date, the 25-member panel said there are various opinions on how to reduce Japan's dependence on nuclear power and that some members called for clarifying the conditions on which reactor operations can be resumed in order to satisfy the public.

A growing number of reactors in Japan remain idled amid heightened public concerns over the safety of nuclear power after the nuclear accident at the Fukushima Daiichi plant, crippled by the March earthquake and tsunami.

The paper incorporated opinions calling both for early withdrawal from nuclear power generation and for maintaining it at a certain level from a strategic point of view. It also stated opinions both supporting and opposing nuclear fuel recycling, underscoring the gaps between panel members in their views on nuclear power policy.

The panel chaired by Nippon Steel Corp. Chairman Akio Mimura has been considering Japan's future energy portfolio as it is tasked with providing input for the country's next basic energy plan to be compiled by next summer.

(Mainichi Japan) December 20, 2011

New nuclear safety agency to have 500 staff: Hosono

TOKYO (Kyodo) -- Japan's new nuclear safety agency to be launched in April under the Environment Ministry will consist of about 500 staff members and is expected to secure some 50 billion yen in the fiscal 2012 budget, Environment Minister Goshi Hosono said Tuesday.

The figures are larger both in terms of the scale of the organization and the budget compared with the existing nuclear regulatory body, the Nuclear and Industrial Safety Agency, which has around 400 personnel with a budget of about 40 billion yen. NISA, under the industry ministry, will be integrated into the new agency.

The move to **overhaul the country's nuclear safety system** came as public confidence in the agency was shaken in the wake of the nuclear crisis at the Fukushima Daiichi power plant, with **questions raised about whether it is appropriate to have regulators under the industry ministry, which also promotes nuclear power.**

The new nuclear safety agency is expected to focus on enhancing crisis management functions and will also be in charge of conducting health surveys for people affected by the Fukushima accident, which was triggered by the March 11 earthquake and tsunami, according to the environment ministry.

The Finance Ministry plans to compile a draft fiscal 2012 budget for Cabinet approval on Saturday. The Diet is expected to start deliberations on it early next year.

(Mainichi Japan) December 20, 2011

Japan hoping to enhance robot technology in wake of nuclear disaster

TOKYO (Kyodo) -- Nuclear disaster minister Goshi Hosono said Monday he hopes Japan will develop top-class robot technology that could be applied to scrapping the crippled nuclear reactors at the Fukushima Daiichi power plant, after facing criticism that Japanese robots did not prove useful in dealing with the nuclear crisis at the plant.

Mentioning that some people had made "disgraceful" remarks that a Japanese robot had played the violin at the Shanghai Expo in 2010 but had not been deployed at the Fukushima plant, Hosono told the Foreign Correspondents' Club of Japan in Tokyo that Japan's unmanned technology has contributed to collecting radiation-contaminated rubble at the nuclear complex.

"In the 30 to 40 year decommissioning process, we need unmanned technology to take out nuclear fuel...and I want Japan to establish top-class technology in a true sense," Hosono said, adding that the government plans to make Fukushima Prefecture, where the plant is located, a base for such technological development.

Fukushima should also become a base for advanced radiological research and the government should set an ambitious goal such as reducing the cancer rate in the prefecture to the lowest level Japan, Hosono said.

As for schools in Fukushima, he said they should not be reopen until radiation levels drop to 1 microsievert per hour or lower.

The Japanese government announced Friday that the crippled reactors had achieved a stable condition equivalent to a cold shutdown, about nine months after the plant was hit by a magnitude 9.0 earthquake and tsunami.

But decommissioning the Nos. 1 to 4 reactors is expected to be extremely difficult as the nuclear fuel left inside the Nos. 1 to 3 reactors is believed to have melted.

Steps to put residents' lives back in order should be core of Fukushima restoration

Measures to put the lives of disaster victims back in order should be the core of efforts to restore Fukushima Prefecture, hit hard by the triple disasters of the March 11 Great East Japan Earthquake, tsunami and ensuing nuclear crisis.

After declaring that the crippled Fukushima No. 1 Nuclear Power Plant has been brought to a stable condition known as a "cold shutdown," the government has notified affected municipalities in Fukushima Prefecture that it will reorganize evacuation zones into three levels depending on radiation doses.

The government intends to determine the designation of areas affected by the nuclear disaster as early as April 2012 after consulting local municipalities.

Prime Minister Yoshihiko Noda earlier announced that the nuclear crisis has been brought under control, but his announcement only highlights a wide perception gap between the national government and local residents as long as it cannot show evacuees prospects of when they can return to their neighborhoods or how they can make a living.

Many municipalities in Fukushima Prefecture have been unable to launch full-scale work to recover from the disaster as many residents have been evacuated from their neighborhoods and are taking shelter in other areas. Even areas outside evacuation zones face serious problems, such as the need to decontaminate neighborhoods tainted with radioactive substances leaking from the nuclear plant and harmful rumors that agricultural and other products from the areas are contaminated with radiation.

Under the government's new policy, areas currently designated as no-go zones and planned evacuation zones will be divided into three different levels depending on their radiation doses. The government will aim to enable evacuated residents at an early date to return to their homes situated in areas where radiation levels are less than 20 millisieverts a year, which will be newly designated as "evacuation order termination preparation zones."

It is necessary for the government to take different measures in a flexible manner depending on the situation in these areas, regardless of their designation. However, evacuees cannot return to their

neighborhoods unless decontamination and health management of residents are thoroughly carried out and their fears about clothing, food and housing are dispelled.

The mayors of municipalities in affected areas have voiced concern that if a line is drawn strictly according to rules, it could split municipalities and local communities. To relieve their concerns, the central government should hold sufficient consultations individually with local governments over their designation.

Under a bill on special measures for the restoration of disaster-hit areas, which the national government will submit to the Diet in the next regular session, all parts of Fukushima Prefecture would be subject to tax privileges and the national government would build or improve infrastructure in areas where evacuation orders have been lifted. Moreover, the bill will call for the expansion of tax privileges for disaster victims. These measures are necessary, but unless they are implemented in parallel with other livelihood restoration measures such as securing jobs for victims, they will be ineffective.

The government will also be required to consider permanently relocating residents of areas that will be designated as zones where they cannot return for a long period of time. If local governments cannot secure land for the collective relocation of residents, neighboring municipalities will need to accept their relocation. The government's buy-up of land from victims who need to be permanently relocated will be an effective way to extend financial assistance to them.

While the municipalities concerned should play a leading role in rebuilding their disaster-hit areas, the national government needs to create a concrete vision on assistance to the entire prefecture in order to make sure that Fukushima will recover from the disasters. Even if the government works out a plan to make the prefecture a base for the development of renewable energy and high-level medical services, it could end up being a pie in the sky unless it creates economic and social infrastructure in the area.

Some experts have pointed to the need to build and improve a transportation network running from east to west in Fukushima. The national government must fulfill its responsibility to take all possible measures to ensure Fukushima Prefecture residents can restore their areas and their own livelihoods and maintain their communities.

Gov't proposal calls for lower radioactive limit for ordinary food

TOKYO (Kyodo) -- A health ministry proposal for new limits on radioactive cesium found in food calls for a ceiling of 100 becquerels per kilogram for regular food items, one-fifth the current 500-becquerel limit, government sources said Tuesday.

The proposed limits, including an even stricter limit for food items for infants, will be presented to a meeting of a task force under the Health, Labor and Welfare Ministry's food sanitation council on Thursday.

While the ministry expects to enforce the new limits from April, grace periods of between six and nine months will be set for such food items as rice and beef to give both consumers and producers time to be informed of the changes, the sources said.

The proposal calls for a limit of 50 becquerels of cesium per kg of milk or infant food, and a 10-becquerel limit on drinking water, against the current 200-becquerel limit set by the government following the Fukushima Daiichi nuclear disaster in March.

In proposing the new limits, the ministry has lowered the annually allowable radiation exposure by 80 percent -- to 1 millisievert from the current 5 millisieverts.

If a person keeps eating for one year food items containing maximum amounts of cesium allowed under the proposed limits, the total radiation exposure during that period is estimated by the ministry at 0.7 millisievert, below the 1-millisievert ceiling.

The ministry believes such a case is unrealistic and actual levels of radiation will be much lower once the new yardstick is in place, according to the sources.

The proposed 10-becquerel limit on drinking water reflects the fact that water is a necessity of life with no alternative, while the 50-becquerel limit on milk and infant food takes into account that children are particularly susceptible to the effects of radioactive materials.

(Mainichi Japan) December 21, 2011

Governors urge central gov't to address nuclear crisis more promptly

TOKYO (Kyodo) -- The National Governors' Association urged the central government Tuesday to tackle problems and concerns caused by the nuclear disaster at the Fukushima Daiichi power plant more promptly as burdens on evacuees are compounding with time.

In a petition submitted to Economy, Trade and Industry Minister Yukio Edano, the association of prefectural governors said that although it has been more than nine months since the disaster occurred, a number of local residents remain evacuated and an increasing number of families live separately from children due to concerns over radiation.

"Among households with children, there are increasing moves to have their children evacuate to remote areas out of concerns over radiation damage on their health," the association said in the petition, noting that the situation is getting worse.

The association called on the central government to accelerate efforts on decontamination work near the crippled power station and reconstruct affected areas, while taking measures to improve the safety of nuclear power plants in Japan.

Edano said after receiving the petition from Aomori Gov. Shingo Mimura that he takes the governors' calls seriously and that the related issues should be addressed with the government's all-out efforts.

(Mainichi Japan) December 21, 2011

Fire burns ceiling of Tokai village nuclear reactor building

MITO, Japan (Kyodo) -- A fire partially burned the ceiling of a building housing a nuclear reactor at the village of Tokai, Ibaraki Prefecture, on Tuesday, the prefectural government and the reactor's operator said.

The fire broke out at around 9:30 a.m. and was extinguished two hours later, they said, adding the blaze at the research reactor facility did not result in any leakage of radiation into the environment. No one was injured.

The ceiling under the steel plate roof of the building was set alight by sparks during welding work on the roof, Japan Atomic Energy Agency said.

A 110-square-meter area of glass-fiber acoustic absorbent covering the ceiling was burnt, it said.

The reactor core is located in the underground section of the 22-meter-high building. The reactor has been undergoing a periodic check since September.

There was no change in the airborne radiation levels inside and outside the building, it said.

Part of the roof was corroded and "there is a high possibility that the sparks fell through that part onto the ceiling," an agency official said.

The agency started operating the reactor in 1975 for research on nuclear fuel safety. It suspended operation in February, before the March 11 earthquake and tsunami that crippled the Fukushima Daiichi nuclear plant in Fukushima Prefecture, north of Ibaraki.

(Mainichi Japan) December 21, 2011

Gov't, TEPCO set 40-yr work plan toward scrapping Fukushima reactors

TOKYO (Kyodo) -- The government and Tokyo Electric Power Co. said Wednesday that they would seek to finish scrapping the four crippled nuclear reactors at the Fukushima Daiichi power plant in the next 30 to 40 years in a newly unveiled work schedule describing measures to be taken after the plant's stabilization.

Based on the road map toward decommissioning, the plant operator known as TEPCO would start removing the nuclear fuel stored in the spent fuel pools of the Nos. 1 to 4 units within two years and the melted fuel from the Nos. 1 to 3 reactors within 10 years.

At the outset of a meeting held Wednesday between government and TEPCO officials to discuss the issue, industry minister Yukio Edano called on the utility to "move up" the planned work as much as possible to allay concerns of people who are still living as evacuees because of the disastrous radiation-leaking accident at the plant.

The latest move came after the government announced Friday that the plant, hit by the March 11 megaquake and tsunami, has recovered to a stable state, or what it calls a "cold shutdown condition."

According to a government panel report, the spent fuel pools of the Nos. 1 to 4 units contain 3,108 nuclear fuel assemblies. The Nos. 1 to 3 reactors have 1,496 fuel assemblies inside, although many are believed to have melted or been largely damaged.

The fuel of the No. 4 reactor had all been placed inside the spent fuel pool because the reactor was halted for a regular inspection before the March 11 disasters.

In the case of the 1979 accident at the Three Mile Island Unit 2 in the United States, which resulted in a partial meltdown of the reactor core, defueling took about 11 years. Japan's case is expected to be more challenging, given that multiple reactors have suffered meltdown and the fuel is believed to have melted through the base of the reactor pressure vessels.

Fukushima local decontamination costs bust estimates

Workers use high-pressure water cleaners to decontaminate a roof in the city of Fukushima. Some say the method is insufficient. (Mainichi)

FUKUSHIMA -- The prefectural government here has said that radioactive decontamination operations now under way in three municipalities will cost an average of about 1.3 million yen per household, far over the funds allotted.

The figure -- revealed by prefectural environment department head Hiroyuki Aratake in answer to a question in the prefectural assembly -- is for cleanup operations now under way in the cities of Fukushima and Date, and the village of Kawauchi.

Priority decontamination in these areas began in November and has so far consumed some 1.7 billion yen, and the average household cost vastly exceeds the basic prefectural subsidy of 700,000 yen per home allotted to municipalities to decontaminate properties smaller than 400 square meters. The

overrun, Aratake explained, was because large properties in agricultural districts were also covered by the priority decontamination operation.

Workers experiment with draining radioactively contaminated mud from a paddy field, left, onto a tarp-covered adjacent field in Iitate, Fukushima Prefecture, on Aug. 24. (Mainichi)

Regarding the cleanup cost for the some 600,000 homes in the decontamination area, Aratake said that based on the 700,000 yen per household estimate, the total cost would come to about 420 billion yen. This must be covered by the 184.3 billion yen allotted for cleanup in the prefecture's September supplementary budget as well as funds set aside in the central government's third supplementary budget. If it is not enough, the prefecture plans to ask Tokyo to cover the difference.

U.S. nuclear chief says Fukushima plant stable but major task remains

Visiting U.S. Nuclear Regulatory Commission Chairman Gregory Jaczko said Dec. 20 that there was no longer enough energy in the reactors at the crippled Fukushima No. 1 Nuclear Power Plant to produce an offsite release of radiation, but pointed out that a large cleanup task remained.

Jaczko made the comments at a news conference in Tokyo, following the Japanese government's announcement that the plant has completed "step 2" of its roadmap to bring the Fukushima nuclear crisis under control and has achieved cold shutdown conditions at the plant.

The U.S. nuclear safety chief arrived in Japan on Dec. 18, and visited the Fukushima No. 1 and No. 2 nuclear complexes. He said it was a "humbling experience" to see the extent of damage caused by the March 11 earthquake and tsunami, and expressed admiration over the efforts of workers handling the disaster.

Speaking on the announcement of the completion of step 2 in the project, he pointed out that this was just one part of the major task of returning the area to its original state and decommissioning the reactors.

During the news conference, Jaczko commented on the planned establishment of a new nuclear power safety agency in Japan next spring, saying it was pleasing to see a new body with boosted independence and stronger regulation being formed.

After the news conference, Jaczko met with Japanese nuclear disaster minister Goshi Hosono and other officials to discuss Japan's response to the crisis. Hosono expressed appreciation for the help from the U.S. amid the crisis and sought continued support.

"Thanks to the support from the U.S., the onsite accident has been brought under control. If we have assistance from the U.S. in the decommissioning of the reactors, which will take another 30 years or more, we will certainly overcome this," he said.

US expert: time to scrap reactors unknown

A US nuclear expert says it is impossible to predict the time needed to decommission the crippled reactors at the Fukushima Daiichi nuclear plant.

Charles Casto told NHK on Wednesday that the true situation inside the reactors remains unknown. Casto represents a team from the US Nuclear Regulatory Commission dispatched to Japan since the nuclear accident in March.

Casto said that after the accident his team advised the Japanese government to continue injecting sea water into the reactors, as well as fresh water, to cool down spent nuclear fuel.

He also said Japanese authorities failed to provide appropriate information to the US government soon after the accident.

Casto said his team felt deep dissatisfaction with Japan for providing only limited information from a small number of engineers.

Last Friday, Japan declared the Fukushima reactors had reached a state of cold shutdown -- the second phase in the program to bring the facility under control.

Wednesday, December 21, 2011 20:50 +0900 (JST)

Town hosting Fukushima nuke reactors to keep getting power station subsidies

The government intends to continue providing power station-hosting subsidies to the town where the Fukushima No. 1 nuclear plant's shattered reactors are located, Economy, Trade and Industry Minister Yukio Edano has stated.

Local governments with power stations in their jurisdiction can apply for the subsidies, with the amount based on how much electricity the plants produced two fiscal years before the application, among other factors. Under this system, the town of Okuma, Fukushima Prefecture -- which hosts the Fukushima No. 1 plant's wrecked No. 1-4 reactors -- would no longer be eligible for the subsidies in fiscal 2012, as the nuclear disaster hit the plant and the reactors will be decommissioned.

However, "Considering present societal conditions it would be unthinkable not to provide the subsidies to Fukushima (local governments) if applied for," Edano said at a news conference following a Dec. 20 Cabinet meeting. He also stated that the government "is considering revising the subsidy system rules to allow for payments for guaranteeing safety and peace of mind," which would allow money to flow to the Okuma Municipal Government.

The town of Futaba that hosts the Fukushima No. 1 plant's No. 5 and 6 reactors, Naraha hosting the Fukushima No. 2 plant's No. 1 and 2 reactors, and Tomioka where the Fukushima No. 2 power station's No. 3 and 4 reactors are situated are still eligible for the subsidies under the current rules. The Fukushima Prefectural Government is also receiving power station-hosting subsidies, but will reduce its application for fiscal 2012 funds as it has called for all 10 reactors in the prefecture to be shuttered.

3-stage map adopted for decommissioning

The Yomiuri Shimbun

The government and Tokyo Electric Power Co. decided Wednesday on a 30- to 40-year road map for decommissioning the Nos. 1 to 4 reactors at the Fukushima No. 1 nuclear power plant, government officials said.

The decision was made at the first meeting of a council tasked with implementing mid- and long-term measures to decommission the crippled plant.

As the work involves the unprecedented task of removing nuclear fuel that melted through the base of the pressure vessels in the Nos. 1 to 3 reactors, the whole process has been divided into three stages. So-called "assessment points" also have been established, to judge whether work can proceed to the next stage.

The road map was devised by the Natural Resources and Energy Agency, the Nuclear and Industrial Safety Agency and TEPCO. Their work followed the completion on Dec. 16 of Step 2--achieving cold shutdown--in the plan to bring the crisis under control.

In the first phase of the new road map, which is set to start this month and continue until fiscal 2013, removal will begin of nuclear fuel stored in the spent fuel pool of the No. 4 reactor.

In 2012, new equipment will be introduced that can remove the radioactive material that cannot be extracted from contaminated water with the current facilities.

In the second phase, which is scheduled to last from fiscal 2013 to fiscal 2021, all the fuel stored in the spent fuel pools of all the reactors will be removed. Then work will shift to submerging the Nos. 1 to 3 reactors so their melted fuel can be removed.

In the meantime, the existing mechanisms that remove radioactive substances from contaminated water and reuse that water to cool the reactors will be made smaller, so they can be housed within the reactor buildings.

In the third stage, which is set to last from fiscal 2021 until fiscal 2051 at the latest, removal of the melted fuel will be completed. Also, the reactors, reactor buildings and other structures will be dismantled and removed, leaving vacant plots of land where the facilities once stood.

(Dec. 22, 2011)

Local mayors discontent with plan to reclassify no-entry zones

The Yomiuri Shimbun

FUKUSHIMA--Municipal leaders in areas affected by the crisis at the Fukushima No. 1 nuclear power plant have expressed dissatisfaction with the government's plan to reclassify no-entry and expanded evacuation zones into three categories based on annual radiation exposure.

"Our town will be divided [if the plan is implemented]," one leader said.

There are about 109,000 evacuees from both zones and some have given up on trying to return to their hometowns.

After a meeting Sunday with central government leaders, Futabamachi Mayor Katsutaka Idogawa spoke of the likelihood that most of his town will be placed into a category that could prevent the return of residents for up to five years. Futabamachi is one of the municipalities that contains the Fukushima plant.

"We can't keep silent for five years. We have to call for a provisional town in some form," Idogawa said. The town's government offices have moved to Kazo, Saitama Prefecture. As for the location of the provisional town, he said, "It's on a clean slate. I want to discuss the matter with the townspeople," he said.

Mayor Toshitsuna Watanabe of Okumamachi, which is also home to the crippled nuclear power plant, expressed similar concerns and said most areas in his town could be placed into same the category.

"We have the right to live in Okumamachi. The government and Tokyo Electric Power Co. should make the town livable through decontamination," he said.

Namiemachi Mayor Tamotsu Baba said the reclassification would split his town into three areas. "As our town will be separated, we want to take careful measures consulting with the government," he said.

Tomiokamachi Mayor Katsuya Endo said, "The decision is very severe for us as the town will be split and many of the townspeople won't be able to return home." He also expressed dissatisfaction with the government, saying "[The government] did not explain things that are of concern to residents, such as how long it will take for decontamination and what its effects will be."

Minami-Soma Mayor Katsunobu Sakurai said, "The government should understand how hard it is for residents to be divided according to the areas in which they live."

Katsuraomura village head Masahide Matsumoto called on the government to explain why people cannot live in areas with an estimated annual radiation exposure of 20 millisieverts or more.

Akishige Kobata, 74, lives in a temporary housing unit in Aizu-Wakamatsu, Fukushima Prefecture, because his house is located in Okumamachi within a three-kilometer radius of the crippled plant.

At first, Kobata was eager to return home but gave up on the idea when he paid a visit to his house on Sept. 1 and was surprised by the high radiation levels in the area. "I wanted to return home but at that time I thought it was impossible," he said.

Radiation levels around Kobata's house have remained high, and he thinks his house will be included in the zone that prevents the return of residents. "Now I've given up on returning home," he said.

(Dec. 22, 2011)

Gov't should play leading role in decommissioning crippled nuclear reactors

The government should play a leading role in decommissioning nuclear reactors at the tsunami-hit Fukushima No. 1 power plant to ensure the work progresses as quickly as possible.

It is expected to take up to 40 years to decommission and dismantle the reactors at the plant, unprecedentedly long work, according to a plan worked out by the national government and plant operator Tokyo Electric Power Co. (TEPCO).

Due to high levels of radiation, it is extremely difficult for workers to enter the buildings housing the crippled reactors, requiring the development of 14 kinds of new technology, including a remotely-controlled robot, to recover and manage melted fuel.

"We've instructed the plant operator not to delay the work because of high costs," Goshi Hosono, state minister for nuclear accident countermeasures, told a news conference.

Still, some government officials are skeptical of the feasibility of the decommissioning plan. "We don't know whether the reactors can be decommissioned and dismantled in 30 to 40 years until the work is actually done," one of them said.

If the development of necessary technology proves a serious challenge, the time and money required to decommission and dismantle the reactors will certainly increase.

Even if the work can be completed in 30 to 40 years as planned, difficult questions remain as to who will manage the recovered fuel and where.

A total of 1,496 melted fuel rods remain in the plant's No. 1 to 3 reactors while 3,108 fuel rods are kept in the pools for spent nuclear fuel at its No. 1 to 4 reactor buildings. This means that a combined 1,381 tons of radioactive substances need to be stored semi-permanently.

Hosono admitted at the news conference that there are no prospects for what should be done with the fuel.

A newly established government panel will assess progress in the work outlined in the roadmap to decommissioning the reactors at each stage. However, the Agency for Natural Resources and Energy says the panel can assess the progress once a year at the most, raising fears that the work to decommission and dismantle the reactors could be left entirely up to TEPCO.

To achieve the decommissioning of the reactors in the shortest possible period, the government has the responsibility to take the initiative in ensuring that the decommissioning process goes smoothly until the work is completed. (By Takuji Nakanishi, Mainichi Shimbun)

(Mainichi Japan) December 22, 2011

TEPCO omits total cost of decommissioning nuclear reactors from work schedule

Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 Nuclear Power Plant, did not specify the cost of decommissioning the plant's reactors in its work schedule announced Dec. 21 -- apparently to obscure the possibility of the utility becoming insolvent and no longer viable as a company.

The utility, however, will inevitably come under pressure to process and release accounting information on the snowballing costs of decommissioning the No. 1-4 reactors at the plant, which was crippled in the aftermath of the March 11 Great East Japan Earthquake and tsunami.

The government is considering injecting taxpayers' money into the utility and nationalizing it to turn it into an entity dedicated to providing compensation for the nuclear crisis. The government is also poised to launch a full-scale debate on the fate of TEPCO's management with major lenders to the utility.

It is difficult to predict how much it will cost to decommission the four reactors -- a task expected to take up to 40 years and be fraught with difficulties. A government-appointed third-party panel estimated in October that it will cost 1.151 trillion yen to decommission the troubled reactors. TEPCO, meanwhile, has decided to set aside some 940 billion yen for decommissioning.

The utility, however, is aware that the decommissioning costs "are certain to snowball, to the point where an additional allocation of more than 200 billion yen would be far from enough," according to a TEPCO executive. A senior official with the Economy, Trade and Industry Ministry says the utility "would go under instantly if the entire decommissioning costs were processed all at once."

Although TEPCO Vice President Zengo Aizawa said during a news conference on Dec. 21 that the utility was now "working out the details of the costs and would be able to project the decommissioning costs over a two-year period," he stopped short of specifying the total costs required for decommissioning.

During another news conference the same day, Economy, Trade and Industry Minister Yukio Edano reiterated his hard-line stance that the decommissioning costs "should be shouldered by TEPCO as a matter of course." Regarding the possibility that TEPCO, the main entity handling decommissioning work and providing compensation, could become insolvent, Edano said, "We are considering all possible options to support the utility through the Nuclear Damage Liability Facilitation Fund."

The Nuclear Damage Liability Facilitation Fund has been providing financial support to TEPCO in its compensation payments to those affected by the nuclear crisis, but the fund does not envisage monetary support for decommissioning costs. Injecting taxpayers' money into decommissioning has therefore been considered the primary option, though TEPCO has shown a strong desire to retain its own management. Since nationalizing the utility would require support from financial institutions, the government is set to discuss such a possibility with major lenders to the utility.

Town assembly votes to call for shutdown of all reactors in Fukushima Pref.

NIHONMATSU, Fukushima -- The assembly of Namie, Fukushima Prefecture -- a town where all residents have been evacuated along with the municipal government in the wake of the Fukushima nuclear disaster -- voted on Dec. 21 to demand the closure of all 10 reactors in the prefecture.

The motion, carried by a vote of 10 to nine, was the first by a municipal assembly in the Futaba district -- host to the stricken Fukushima No. 1 nuclear plant -- calling for the central government and plant operator Tokyo Electric Power Co. (TEPCO) to put an end to nuclear power in Fukushima Prefecture. The vast majority of Namie Municipal Assembly members have indicated they understand the decommissioning of the 10 reactors at the No. 1 and 2 Fukushima nuclear plants, but concerns over the loss of nuclear-related jobs made the vote a close one.

"Some 170,000 Fukushima Prefecture residents, including all 21,000 from Namie, have been made refugees (by the nuclear disaster), and are beset by fears for their health," the town assembly stated, taking aim at the central government's response to the crisis.

The Namie Municipal Government moved its operations to the prefectural city of Nihonmatsu after the town was ordered evacuated in the wake of the Fukushima No. 1 plant meltdowns.

The town assembly also voted unanimously on Dec. 21 to revoke an invitation to Tohoku Electric Power Co. to build another nuclear power station straddling Namie and the neighboring city of Minamisoma. Both resolutions came on the heels of an Oct. 20 Fukushima Prefectural Assembly decision to petition for the closure of all nuclear reactors in its jurisdiction.

Academic critical of gov't response to nuclear crisis lauded by journal Nature

Tatsuhiko Kodama

University of Tokyo professor Tatsuhiko Kodama, who blasted the government over its response to the Fukushima nuclear crisis, has been selected by British science journal Nature as one of 10 important people this year.

Kodama, 58, appeared in "365 days: Nature's 10," a list in the Dec. 22 edition of the journal featuring 10 "people who mattered this year."

Kodama has visited Fukushima almost every weekend, and cooperated in radiation measurements and decontamination measures. In July, the professor appeared before the House of Representatives Committee on Health, Labor and Welfare, and sharply criticized the government over its response to the crisis at the Fukushima No. 1 nuclear plant, saying, "What on earth is the Diet doing when 70,000 people are wandering about, away from their homes?"

TEPCO builds temporary storage facility for highly radioactive nuclear waste

A temporary storage facility for steel vessels containing nuclear waste, under construction on the premises of the crippled Fukushima nuclear plant, is pictured in early December. (Photo courtesy of Tokyo Electric Power Co.)

Tokyo Electric Power Co. (TEPCO) said on Dec. 21 that it has completed the construction of a temporary storage facility for highly radioactive nuclear waste produced in the process of purifying contaminated water at the crippled Fukushima No. 1 Nuclear Power Plant.

The facility built on the premises of the troubled nuclear power complex is capable of storing up to 744 steel containers, called "vessels," that contain radioactive substances including cesium. Each vessel measures about 1.4 meters in diameter and is about 2.4 to 3.5 meters high.

Contaminated water is purified through vessels that have pumice stones inside that can absorb radioactive substances. Vessels are replaced with new ones when levels of radiation in them get high. TEPCO, the operator of the crippled Fukushima nuclear power station, had to look for storage spaces for vessels filled with highly radioactive nuclear waste. Several vessels need to be replaced each week, and a total of 316 vessels had already been used by Dec. 20.

Used vessels will be placed in the temporary storage facility with a 30-centimeter-thick concrete floor built on a space measuring 40 meters by 210 meters. In addition, the facility will be surrounded by sandbags each measuring 2.4 meters high and 1.6 meters wide to hold the levels of radiation on the fringe of the premises below 1 millisievert per year. TEPCO said the facility is large enough to store vessels that will be used over a one-year period.

(Mainichi Japan) December 22, 2011

Gov't to cut R&D spending on nuclear fuel cycle program based on fast-breeder reactor

The government has decided to slash spending for research and development on the country's nuclear fuel cycle program based on a fast-breeder reactor (FBR) by 25 percent for fiscal 2012 -- a move that will effectively freeze its long-term plan to put the ambitious project to commercial use.

The cut will shave about 10.2 billion yen from the project's research and development, dropping funding to 30 billion yen in fiscal 2012 versus the current fiscal year ending March 2012. The money saved by the government decision will be used to improve technologies related to the environment and nuclear safety such as radioactive substance removal and measures to ensure safety at nuclear facilities in the wake of the crisis at the Fukushima No. 1 nuclear plant. The FBR project has long been a pillar of Japan's energy policy, but now looks effectively frozen as the government responds to calls to reduce the country's reliance on nuclear energy.

A total of 40.2 billion yen was set aside for projects related to the nuclear fuel cycle program in the current fiscal year, including 21.6 billion yen for research and development on the Monju fast-breeder reactor and 10 billion yen for research and development aimed at realizing the "fast-breeder reactor cycle." The government granted the money in the form of a subsidy to the state-run Japan Atomic Energy Agency (JAEA) for its research on an FBR designed to burn plutonium extracted from reprocessed spent nuclear fuel from commercial power plants.

As to the budget for the Monju project, the government will cancel a power output experiment originally scheduled for fiscal 2012, and thereby save 2.2 billion yen. The maintenance and operation costs will be reduced by 1.8 billion yen by cutting personnel and other expenses, and money will be set aside only for the minimal operations needed to maintain the facility. Moreover, all research and development aimed at realizing the fast-breeder reactor will be completely frozen to reduce overall spending by nearly 70 percent, and only 3.3 billion yen will be set aside to cover maintenance costs for the facility.

Theoretically, an FBR can produce more plutonium than it consumes to generate electricity, but the research and development on the Monju reactor has stalled after a string of problems. In November, a government panel tasked with cutting wasteful spending called for a fundamental review of the Monju project, including the possibility of scrapping it. In its review of the country's energy policy to be completed by around the summer of 2012, the government's Energy and Environment Council is expected to discuss what to do with plutonium-thermal power generation together with the nuclear fuel cycle program.

Ministry eyes stricter limits for cesium levels in food

The Yomiuri Shimbun

The health ministry has compiled a plan to revise the current provisional limits for radioactive cesium in food, setting stricter standards that would require drinking water to contain no more than 10 becquerels per kilogram--or one-twentieth of the current limit--according to officials.

The Health, Labor and Welfare Ministry aims to implement the new limits in April next year, the officials said.

Current provisional standards stipulate that milk and dairy products, as well as drinking water, should contain no more than 200 becquerels per kilogram, with the limit for other food items set at 500 becquerels per kilogram. Under the new standards, powdered milk and other food items for babies, in addition to regular milk, should contain no more than 50 becquerels per kilogram. The limit for general foodstuffs will be set at 100 becquerels per kilogram, according to the officials.

The envisioned criteria would be even tougher than those set by the United States and the European Union, officials said. The United States sets 1,200 becquerels per kilogram as the limit for general food items, while limits in the European Union range from 400 to 1,250 becquerels per kilogram.

The ministry will also set a transitional period allowing the current provisional criteria to be applied to rice and other food items that are usually marketed the year after their harvest, the officials added.

In setting stricter limits for radioactive cesium in food, the ministry has taken into account that there has been a decreasing amount of radioactive substances released from the Fukushima No. 1 nuclear power plant in the nine months since the March 11 earthquake and tsunami. It regards the current provisional limits as standards for an emergency period, while the revised criteria can be considered closer to those for a normal time, according to the officials.

The revised limits have been worked out on the assumption that the general public should be exposed to no more than 1 millisievert of radiation per year from food intake--the same limit set by an international organization that has developed food safety standards, according to the officials.

However, these new limits may cause further confusion among consumers because they contradict current provisional standards, according to experts. Moreover, local governments will face additional financial burdens when the new criteria are implemented, they added, because public facilities will have to get new devices to meet them.

Prof. Masayori Ishikawa of Hokkaido University said he welcomed the stricter criteria because they take into account how exposure to radiation over an extended period can affect the human body.

"Nonetheless, it may be difficult for some local governments to immediately respond to the new criteria because there's been a shortage of testing devices," the medical physicist said. "Therefore, it would be necessary [for the government] to set a transition period by allowing relaxed standards to be applied until they are fully prepared."

Meanwhile, Hideaki Karaki, president of Kurashiki University of Science and the Arts, said it would be important for the general public not to regard the stricter criteria as standards ensuring food safety because these limits would be used as the benchmark for authorities to decide the suspension of shipping or selling contaminated foodstuffs.

"Even if you consume food items that contain a little more [radioactive cesium than the new limits], it would pose no health risk unless annual radiation exposure exceeds the allowable level of 1 millisievert per year," the food safety expert said. "Even if some individual food items are found to contain [radioactive substances] beyond the limits, that alone would not immediately threaten the safety of foods in general."

Gov't starring in own show to bring Fukushima nuclear crisis 'under control'

The Fukushima No. 1 Nuclear Power Plant is pictured in this pool photo taken on Nov. 12.

After determining that the damaged Fukushima No. 1 nuclear plant had achieved "cold shutdown conditions," the government announced earlier this month that the nuclear crisis had been brought under control.

"Cold shutdown conditions," however, is a vague phrase, and the government has rewritten the "completed" road map for bringing the crisis under control seven times. It is apparent the government is trying to close the curtain on a performance it has written and acted out to stress to international society that it has brought the crisis under control quickly.

Nine months have now passed since the onset of the disaster. At this time it is worthwhile to look back on crisis management following the outbreak.

At the end of May, an International Atomic Energy Agency (IAEA) delegation speaking to officials of the Ministry of Economy, Trade and Industry noted that the No. 1 plant was in a serious state. The delegation added that while the No. 2 plant had been in a similarly serious state after the March 11 earthquake and tsunami, it had "miraculously" been cooled, offering praise for the handling of the crisis.

In the wake of the tsunami, which also partially knocked out power at the Fukushima No. 2 nuclear plant, workers urgently gathered makeshift cables from the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture and other locations to cool No. 2 plant's four reactors. A large number of workers were brought in and they worked through the night taking down a baseball field fence on the compound to create a heliport, and the headlights of 20 workers' cars were used to guide helicopters carrying the cables. A total of nine kilometers of cable were laid over two days, and workers just managed to cool the plant. Normally such work would have taken 20 days.

The reason the plant was able to employ such human wave tactics was that the March 11 earthquake occurred on a Friday afternoon, and there happened to be several thousand workers from cooperating companies on the premises.

Naohiro Masuda, head of the Fukushima No. 2 nuclear plant, commented, "I shudder to think how it would have been if it had happened on a Saturday."

While all this was going on, power loss at the No. 1 to 4 reactors of the No. 1 nuclear plant prevented officials from cooling nuclear fuel, and the pool holding 1,535 rods of spent nuclear fuel in the No. 4 reactor building started boiling. If the spent rods had melted down, in a worst-case scenario as many as 30 million people in the Tokyo metropolitan area would have had to be evacuated. However, just before the pool went dry, there was a hydrogen explosion in the reactor building that sent water from a neighboring pool into the one holding the spent fuel, and this scenario was averted.

Hydrogen had also been building up in the No. 2 reactor building but an explosion in the neighboring No. 1 reactor building forced open a window in the No. 2 building, releasing the trapped hydrogen and averting another hydrogen explosion. If the pool of the No. 4 reactor building had continued to heat up without water and an explosion had also occurred in the No. 2 reactor, radioactive contamination would be incomparably higher than current levels.

When I interviewed an official from the nuclear plant's operator, Tokyo Electric Power Co. (TEPCO), the official told me, "Bringing the situation under control was possible because this happened in Japan; overseas it would have been impossible."

Naturally, I have the utmost respect for the workers who have tirelessly set about dealing with the situation under the threat of radiation exposure. But let us not forget that a series of coincidences also played a part in Japan's response to the accident.

Another point to consider is that when creating the road map to bring the nuclear crisis under control, the government and TEPCO put off facing root problems and instead focused on bringing the disaster "under control."

The road map for settling the crisis consisted of two steps. Step 1, which was to be carried out between April and July, focused on stably cooling the reactors, while step 2, covering the period between July and January 2012, aimed at achieving "cold shutdown conditions." The government looked to speed up work to have step 2 completed by the end of this year.

One of the goals that TEPCO initially announced for step 2 was filling the reactor containment vessels with water. However, the utility abandoned this plan after it emerged that there were holes in the containment vessels. Eventually, officials decided to delay such measures for five years or more. The company also established a goal under step 2 of "dealing with and reducing the amount of radioactive water" on the site, but when the road map was rewritten, it was decided that there would "ongoing treatment" of contaminated water after the completion of other processes.

The latest announcement that the goals of the road map have been achieved is merely the result of officials lowering their own hurdles. It reminds me of the time during World War II when the Imperial Japanese Army headquarters called the Japanese army's retreat a "shift in position."

The definition of "cold shutdown conditions" is a situation in which the temperature at the bottom of the reactor pressure vessels is below 100 degrees Celsius, and the radiation levels within the grounds of the nuclear complex are under 1 millisievert per year, among other factors. However, the heat gauges onsite have error margins of up to 20 degrees Celsius, and the exact temperature inside the reactors remains unknown. Furthermore, the amount of radiation includes only radiation in the atmosphere, and does not take into account radioactive materials released into the sea -- highlighting the vagueness of the standards.

Even Haruki Madarame, chairman of the Cabinet Office's Nuclear Safety Commission, stated, "We have never used the term 'cold shutdown conditions' before. Applying definitions to a nuclear reactor that has had a meltdown is difficult."

The government view disclosed by nuclear disaster minister Goshi Hosono that "the situation is under control onsite, but not offsite," is based only on circumstantial evidence; no one has actually seen inside the reactors.

We can only deduce that the "conclusion" of the crisis, rather than being based on scientific evidence, comes from placing priority on a political decision to create the impression that the crisis has been brought under control quickly. As the stance of a government that is supposed to protect the lives and property of people, such an approach is questionable.

In a news conference on Dec. 16, TEPCO President Toshio Nishizawa called the completion of the road map for bringing the crisis under control a "milestone," but a "milestone" achieved merely by lowering one's own targets is meaningless. The government bears a continued responsibility to monitor TEPCO until its nuclear reactors are decommissioned, and release all necessary information.

Japan has no need for inflated terms like "under control" and "cold shutdown conditions." It is the job of the government and TEPCO to seek "true control" of the disaster. ("As I see it," by Takuji Nakanishi, Tokyo Science and Environment News Department)

Fukushima nuke plant worker stopped coolant injection over damage fears

A worker at the tsunami-hit Fukushima No. 1 nuclear station manually stopped a coolant injection system in the plant's No. 3 reactor following the disaster for fear that the reactor would be damaged and lead to a radiation leak, its operator said.

Plant operator Tokyo Electric Power Co. (TEPCO) has defended the worker's judgment as appropriate after analyzing the sequence of events and releasing its findings at the order of its government regulator, the Nuclear and Industrial Safety Agency.

The reactor core isolation cooling (RCIC) system of the No. 3 reactor stopped at 11:36 a.m. on March 12, the day after the plant was hit by a massive tsunami triggered by the Great East Japan Earthquake, causing the water level in the reactor to decline.

In response, its high-pressure coolant injection (HPCI) system, powered by a battery, was automatically activated.

However, the pressure in the reactor subsequently lowered below the standards specified by its operation manual, and vibrations increased. The worker in charge stopped the HPCI system and decided to switch to manual injection of water for fear that the trouble could cause radioactive substances to leak from the reactor, according to the utility.

The manager of the power plant received a report on the operation after the HPCI system was manually stopped.

However, a valve to lower the pressure inside the reactor before water was manually injected would not open because all external power had been lost. As a result, water could not be injected into the reactor, causing a meltdown of the core.

The government's fact-finding panel on the nuclear crisis earlier confirmed that **plant workers decided to switch off the HPCI system at their own discretion.**

Tokyo to double local electric power generation capacity

The Tokyo Metropolitan Government is set to double the electric power generation capacity in the capital by 2020, officials said.

The metropolitan government made the decision as the crisis at the tsunami-hit Fukushima No. 1 nuclear plant has highlighted the fragility of the power supply system.

Tokyo will increase power generation capacity in the capital by 3 million kilowatts to approximately 6 million kilowatts by 2020.

Of the 3 million kilowatts, 1 million kilowatts will be generated at a liquefied natural gas power station it plans to build in the capital. The metropolitan authorities also plan to introduce a co-generation system -- a generator that diverts its heat exhaust to run steam turbines or for other functions -- to produce 500,000 kilowatts, and install solar panels on 300,000 houses -- one-sixth of all those in Tokyo -- with a total output of 900,000 kilowatts. Moreover, the metropolitan government plans to set up a public-private infrastructure fund to build power stations with a combined output of 500,000 kilowatts.

These measures will cover about 40 percent of the electricity consumed in Tokyo.

At a regular news conference on Dec. 22, Tokyo Gov. Shintaro Ishihara announced a plan to set up a fund capitalized by institutional investors in Japan and overseas. The new fund will make investment in

companies that launch power-generation businesses. The metropolitan government intends to invest 2 to 3 billion yen in the fund.

Gov't unveils lower radioactive limits for food

TOKYO (Kyodo) -- The health ministry proposed Thursday new limits on radioactive cesium found in food and a task force under its food sanitation council approved the proposed stricter ceilings at a meeting.

It plans to enforce them from April.

The proposal calls for a ceiling of 100 becquerels per kilogram for regular food items such as rice, meat, vegetables and fish, one-fifth the current 500-becquerel limit.

It calls for a limit of 50 becquerels of cesium per kg of milk or infant food, including powdered milk, and a 10-becquerel limit on drinking water, against the current 200-becquerel limit set by the government following the Fukushima Daiichi nuclear disaster in March.

Grace periods of between six and nine months will be set for food items such as rice and beef.

The Health, Labor and Welfare Ministry will refer the proposal to the science ministry's radiation council and hold briefing sessions in seven prefectures, including Fukushima, Tokyo and Osaka, from January and will seek public comment.

(Mainichi Japan) December 23, 2011

Panel sees gov't evacuation order in nuclear crisis as irrational

TOKYO (Kyodo) -- A government panel investigating the nuclear crisis at the Fukushima Daiichi power plant is expected to point out in its upcoming report that the government's evacuation order issued shortly after the accident was irrational, sources close to the matter said Thursday.

The order instructed people living within 20 kilometers of the plant to evacuate. Panel members believe the order led some residents to move to areas where radiation levels were higher and caused confusion, the sources said.

The government's nuclear safety agency and the science ministry had data that would have helped prevent people from unnecessary radiation exposure, but they did not report it to the crisis management center at the prime minister's office, thinking that the data was "merely a hypothetical calculation result," according to the sources.

As a result, people who fled from the coastal area of Fukushima Prefecture to northwest ended up moving to places with higher radiation, because wind blowing at that time raised the radiation level of some areas beyond the 20-km zone, they said.

That situation occurred because the government issued the evacuation order only by considering the distance from the plant, the sources said.

They also said data from a system designed to predict the dispersal of radioactive materials could have served as a reference for evacuation because, although the amount of radiation dose was not accurately predicted, it had given a quite clear picture of areas with high or low radiation levels.

The panel, led by Yotaro Hatamura, a professor emeritus at the University of Tokyo, is expected to release its interim report on the accident on Monday.

Panel slams govt's shoddy info-sharing / Interim report to rip response to N-disaster

The Yomiuri Shimbun

Lack of communication within the Prime Minister's Office and its delays in releasing key information caused serious confusion in the wake of the Great East Japan Earthquake, a government panel investigating the crisis at the Fukushima No. 1 nuclear power plant will assert in an interim report to be released Monday, sources have said.

Established to investigate and verify the facts of the crisis at the Fukushima plant, the panel has found there were many problems not only in the government's information-gathering following the March 11 disaster, but also in its sharing and disclosure of key information, according to the sources.

The panel's interim report also will raise questions regarding the initial response to the disaster by plant operator Tokyo Electric Power Co., saying it failed to understand what was happening at the reactors and make proper decisions on how to react, the sources said.

Just after the quake occurred at 2:46 p.m. on March 11, senior bureaucrats from ministries and agencies arrived at the Prime Minister's Office's crisis management center. Then Prime Minister Naoto Kan and other top government officials gathered at the prime minister's working room on the fifth floor.

The panel's interim report will say the government made important decisions only in consultation with the limited number of senior bureaucrats and TEPCO executives who were present in Kan's room, without sufficient communication with the people in the crisis management center, according to the sources.

Such lack of communication within the Prime Minister's Office prevented the government from taking advantage of the System for Prediction of Environmental Emergency Dose Information, or SPEEDI, a system that predicts the spread of radioactive substances, the sources said.

The report reveals that those on the fifth floor were not aware of SPEEDI's existence and states residents around the crippled plant could have taken better evacuation routes if the government had made the system's data public when issuing instructions, the sources said.

To make matters worse, the government's evacuation orders did not immediately reach local governments near the plant, the panel has found. Therefore, authorities were forced to decide how to evacuate their residents without sufficient information, according to the sources.

The report concludes the government's information disclosure was insufficient at a time of emergency and argues it failed to make immediate announcements of crucial information, such as the nuclear meltdowns at the plant and radiation's impact on human health, the sources said.

Regarding TEPCO's initial response to the crisis, the panel found that neither the utility's headquarters nor the people at the plant understood exactly how the No. 1 reactor's isolation condenser would react to a blackout. As a result, TEPCO took measures on the assumption that the emergency cooling device was still working, despite the fact it stopped following the tsunami, according to the sources.

At the No. 3 reactor, the panel has found, workers stopped operation of a high-pressure core cooling system without consulting their supervisors, before a substitute pumping system was secured.

The report will state that a series of such misunderstandings and misjudgments by the plant's operator delayed the injection of water into the reactors, resulting in the deterioration of their conditions, according to the panel.

(Dec. 23, 2011)

AEC chairman warned people within 170 km of Fukushima plant might need to relocate

The head of the government's nuclear energy panel warned in March that all residents in areas within a 170-kilometer radius of the crippled Fukushima nuclear plant might need to be relocated in a worst-case scenario, sources close to the government have disclosed.

Japan Atomic Energy Commission (AEC) Chairman **Shunsuke Kondo** made the warning in a report numbering about 20 pages, which he compiled on March 25 -- two weeks after the Fukushima No. 1 Nuclear Power Plant was hit by a massive tsunami generated by the Great East Japan Earthquake -- and submitted it to then Prime Minister Naoto Kan.

At the time, the plant had lost its reactor core cooling functions due to the loss of all external power, hydrogen explosions had ripped through the plant's No. 1, 3 and 4 reactor buildings, and radioactive substances were leaking from the No. 2 reactor due to a meltdown. Workers at the plant had no choice but to manually inject water into the reactors to cool down their cores.

Kondo assumed that in a worst-case scenario, another hydrogen explosion could occur in the No. 1, 2 or 3 reactor buildings, raising radiation levels. Continuing aftershocks would prevent workers from cooling down the reactors for an extended period and that all fuel in a pool for spent nuclear fuel in the No. 4 reactor building pool would melt. At the time, the pool held 1,535 fuel rods that could fill two nuclear reactors.

If that happened, Kondo estimated the level of radioactive cesium per square meter of soil in areas within a 170-kilometer radius of the plant would surpass 1.48 million becquerels -- as high as that around the Chernobyl nuclear power plant shortly after the crisis there broke out. Moreover, he estimated areas within 250 kilometers from the plant, including Tokyo and Yokohama, would be contaminated with radioactive substances to a degree that residents would have to be evacuated at least temporarily.

Kondo admitted having compiled the report.

"I assumed the worst-possible case. I've heard that it prompted utilities to strengthen cooling functions at their nuclear plants," he said.

In an interview with the Mainichi in September, Kan said, "All residents would have to be evacuated in areas 100, 200 or even 300 kilometers from the plant if the leak of radioactive substances can't be stopped." He apparently made the remark with Kondo's worst-case scenario in mind.

(Mainichi Japan) December 24, 2011

New radiation limits alarm local entities

Tsuyoshi Nakamura and Tomoko Koizumi / Yomiuri Shimbun Staff Writers

Domestic, overseas limits on radioactive cesium in food

	Drinking water	Milk	General foodstuffs	Food items for babies
Japan (new limits)	10	50	100 (including dairy products)	50
Japan (provisional limits)	200	200 (including dairy products)	500	200 (baby formula)
United States	1,200	1,200	1,200	1,200
European Union*	1,000	1,000	1,250	400
Codex	1,000	1,000	1,000	1,000

Unit: becquerels per kilogram. *Only applied to items produced within the EU. When Japanese agricultural products are imported to the EU, Japan's provisional limits are applied.

Food categories, main items under new limits for radioactive cesium

Food categories	Main food items
Foods for babies	Baby formula, baby food; snacks, juice, lactic acid beverages, supplements for babies and toddlers
Milk	Regular milk, low-fat milk, calcium-fortified processed milk
Drinking water	Tap water, green tea in plastic bottles
General food items	Rice, spinach, beef, dairy products such as cheese and yogurt

The Health, Labor and Welfare Ministry's new limits on radioactive cesium in food items are far more stringent than international standards, alarming local governments in charge of checking for radioactive contamination.

The local governments will be forced to beef up their checking systems to meet the new standards. Observers say it will take some time before the new limits can be strictly enforced.

The stiffer limits, scheduled to be put into force in April next year, will make it necessary for the local entities to acquire expensive high-precision instruments to measure radiation levels, while also considerably adding to the time needed to carry out the examinations, according to the observers.

Following the announcement of the proposal Thursday, after its approval by a relevant council, ministry officials looked proud as they noted that the new limits on radioactive cesium were "scientifically the strictest" to minimize people's exposure to radiation from food.

===

Stiffer than intl criteria

However, as many local government officials tasked with actually testing food items for radiation have expressed concern over the stiffer criteria, twists and turns are expected in the process of implementing the proposed limits.

A senior official of the ministry emphasized the new ceilings on radioactive cesium in food items were "based on the judgment that we should take into account permissible levels [of radioactive substances in food] that have been approved by the relevant international entities."

The new limits were calculated by working backward from the figure of 1 millisievert of radioactive cesium, which is the maximum allowable annual dietary intake for an ordinary person, according to the ministry.

The 1-millisievert annual limit was set by the Codex Alimentarius Commission, a body linked to the U.N. Food and Agricultural Organization and the World Health Organization, which is responsible for setting international food safety standards.

The Codex's highest permissible level of radioactive cesium for general foodstuffs is 1,000 becquerels per kilogram, or 10 times the level now proposed by the health ministry.

This is because the ministry has assumed the "contamination ratios" of food, or the ratios of radiation-contaminated food compared to all food on the market, to be significantly higher than the ratios adopted by food-related international organizations, ministry officials said.

Not only are the ministry-proposed ceilings far stricter than the nation's current provisional regulatory limits, they are also stricter than internationally accepted levels. They were set this way "from the viewpoint of securing all the more the public's safety and reassurance," a senior official said.

The planned tightening of the limits is already puzzling local government officials who are charged with monitoring radioactive cesium in food.

===

Problems with water

Especially problematic is observation of the ceiling of 10 becquerels per kilogram for water, one-twentieth the current 200-becquerel limit. The limit on drinking water has been made particularly strict because everybody needs water and also because water is used for cooking purposes, the ministry said.

To test the quality of tap water, it said local entities should preferably be equipped with high-precision instruments accurate enough to measure radiation levels one-tenth of the new limit for water. In other words, they should be capable of detecting a single-digit level of becquerels.

This has prompted expressions of concern from local governments.

For instance, the Kanagawa prefectural government has been measuring radiation concentrations every day at the prefecture's two major water purification facilities using simple devices with a maximum radiation detection ability of about 10 becquerels per kilogram.

"Although we are considering purchasing a high-precision instrument, it would cost more than 10 million yen per unit and is very heavy. So, we'll have a problem of where to put it," a prefectural official said.

"In addition, the time necessary to complete the check using the new instrument will take twice the current measurement time," the official said.

Manufacturers of precision radiation measuring instruments say they have been flooded with 10 times as many inquiries from local governments and other entities as in an ordinary year.

Shipments of the instruments are expected to be made three to four months after orders are received, they said, making it uncertain whether the equipment can be in place in time for next April as proposed by the ministry, even if local entities do decide to purchase the instruments.

The category of drinking water subject to examination under the ministry's proposal also includes beverages such as bottled green tea.

An official in charge of beverage safety tests for the Kita-Ibaraki municipal government in Ibaraki Prefecture said: "It is extremely hard for us to obtain a high-performance measurement instrument because of our budgetary constraints. We would have no option other than leasing it from an institution outside of our government."

===

100 or 500 before April?

Also in an uncomfortable spot are people involved in the preparation of school lunches for which large volumes of ingredients are used daily.

According to a southern Kanto local organization that has been conducting sample tests for radiation on four to five ingredients for school lunch dishes every day on its own, some of the ingredients are not available until the morning of the day they are served.

An official of the board of education concerned said, "The toughening of the examination standards will be certain to cause the radiation examination time to be substantially longer than at present."

He added, "We are worried whether it will be possible to change the school lunch menu when radiation in excess of the new limits is detected."

The official said he also was concerned about how to run the school lunch service from now until April next year, when the new limits are scheduled to be put in place.

"Given that the new limit for general food items of 100 becquerels per kilogram has been made public, it is hardly conceivable that we can get understanding from parents of schoolchildren about using foodstuffs containing more than 100 becquerels, even if the concentration is less than 500 becquerels in line with the current limits," he said.

"We will have to refrain from using ingredients with radiation exceeding 100 becquerels even before April," according to the official.

(Dec. 25, 2011)

Farmers relieved at new criteria

Nobuhiko Harada / Yomiuri Shimbun Staff Writer

Although the new limits for radioactive cesium in food, which were presented to a meeting of the Health, Labor and Welfare Ministry's Pharmaceutical Affairs and Food Sanitation Council on Thursday, are much stricter than the existing provisional ones, they also appear to take the concerns of farmers into account.

The current provisional standards stipulate that limits for tea leaves and dried shiitake mushrooms should be applied before the items are prepared for consumption with water. In contrast, the new criteria state that these products should be examined after they are brewed or soaked in water--the condition in which they are ready to eat or drink.

According to the ministry, the change is modeled on the approach taken by the Codex Alimentarius Commission, which requires food items to be measured for radiation when they are prepared for consumption.

Some industry associations welcome the new standards.

Tea farmers--who were forced to suspend shipping in some regions in eastern Japan after leaves were found to contain excessive amounts of radioactive materials--have insisted that applying the provisional limits to raw or dried tea leaves does not reflect the reality of how tea is used, citing data that suggests brewed tea contains just one-fiftieth to one-sixtieth the radioactive cesium found in dried tea leaves.

"I think the new criteria reflect our requests," said a senior official at the Chamber of Tea Association of Shizuoka Prefecture. "I'd like the ministry to present a clear measuring method for tea, such as how it should be brewed."

The price for dried shiitake mushrooms, on the other hand, has fallen by nearly 1,000 yen per kilogram from last year, according to a cooperative of shiitake farmers based in Fujieda in the prefecture.

Many schools have been refraining from using the dried mushrooms in school lunches.

Therefore, the industry saw it as a matter of life and death whether the new criteria would stipulate the product should be measured after being soaked in water.

"If you measure dried shiitake mushrooms after they've been soaked in water, [cesium] radiation levels are lower," said a senior member of the cooperative.

In a bid to avoid confusion in the distribution of products along with the introduction of the new criteria, the ministry decided to set a transition period in which the current provisional limits will be applied to certain food items, including rice.

However, details of the transition period may be modified because some members attending Thursday's panel meeting called for a shortened transition period to be set.

(Dec. 25, 2011)

Radiation fears spread to forest industry

SHIROISHI, Miyagi -- Radiation fears stemming from the ongoing crisis at the Fukushima No. 1 Nuclear Power Plant and radiation monitoring activities are raising concern among people handling trees to grow mushrooms and make charcoal.

Forest workers are very concerned about any potential fallout from the nuclear crisis because they have to independently monitor radiation before applying to the plant operator, Tokyo Electric Power Co. (TEPCO), for compensation, unlike farmers and fishermen who have standing in law.

Decontamination work in the mountains is said to be much more difficult than on flat land and some forest workers are considering switching jobs.

The Forestry Agency in October set a ceiling of 150 becquerels per kilogram for raw wood for mushroom cultivation and in November set limits on radioactive cesium found in firewood and charcoal for cooking at 40 becquerels and 280 becquerels, respectively.

The governmental agency advised Tokyo and other prefectures concerned not to market forestry products that exceed those ceilings. While local governments conduct radiation checks on farm and marine products under the Food Sanitation Law, there is no law for contaminated raw wood or charcoal. The agency says it is simply requesting members of the forest products industry to unilaterally check radiation and make redress requests.

"Even if I prepare expensive testing equipment, I can't do business because of a dwindling number of clients," Tomio Takahashi, a 58-year-old forestry operator in Shiroishi, Miyagi Prefecture, near the border with Fukushima Prefecture, said with a sigh.

He started his forest business 35 years ago using wood from southern Miyagi and Fukushima Prefecture to produce and sell raw wood for mushrooms, charcoal and firewood. The nuclear crisis triggered by the March 11 earthquake and tsunami occurred as his firm's annual turnover reached 90 million yen.

His firm is located 70 kilometers away from the Fukushima nuclear power plant. His business partners asked him about radiation contamination and subsequent examinations by an inspection entity of raw wood for shiitake mushrooms found a cesium level of 333 becquerels per kilogram.

Massive cancellations ensued, and one firm said it cannot accept his forest products for the next two years.

Cesium levels of about 1,800 becquerels per kilogram were also found in ash in the firm's charcoal kilns. Takahashi wonders if the firm's six kilns have been contaminated due to the burning of timber. Tearing down the kilns would cost about 30 million yen and disposing of them afterward poses a challenge as well.

"I don't know how long radiation will remain in the mountains," he says, adding he is considering quitting charcoal production because "there is no guarantee when his customers will come back."

The Miyagi Prefectural Government has launched a search for forests with low levels of cesium to pass on information to forest workers and owners.

3 pilot plants to try decontaminating debris in Fukushima

FUKUSHIMA (Kyodo) -- Three decontamination pilot plants will begin operations as early as January in Fukushima Prefecture to seek efficient ways to reduce the amount of radiation there in debris and soil, sources familiar with the matter said Monday.

Under a project of the Japan Atomic Energy Agency, a government-funded research organization, the small plants will be built in Okuma, the town where the crippled Fukushima Daiichi Nuclear Power Station is located, and in Tomioka and Naraha, towns straddled by the Fukushima Daini nuclear plant, the sources said.

The project is designed to advance decontamination in areas affected by radioactive materials emitted in the country's worst nuclear plant accident, as a prerequisite for evacuated residents to return home after the government redraws its evacuation zones, possibly in April.

In Okuma, construction company Kumagai Gumi Co. will set up a plant near the municipal government office to conduct a test to decontaminate soil taken from schools and parks with water using a special washer.

The washed soil will be enclosed in concrete and the radiation effects will be monitored, the sources said.

A worker pushes a wheelbarrow across a baseball diamond after helping scrape off the top layer of contaminated soil at a sports ground in Minamisoma, northeastern Japan, just outside the 20 kilometer exclusion zone around the Fukushima No. 1 Nuclear Power Plant, Saturday, Nov. 19, 2011. (AP Photo/ Greg Baker)

Hitachi Plant Technologies Ltd. will build a plant on a town-run playing field in Tomioka to treat radioactive substances in schoolyard soil using a thermal process. It will also see if the treated soil can be reused safely.

In Naraha, construction company Toda Corp. plans to decontaminate debris by shredding it into small pieces and washing it with water, using some of the roughly 15,400 tons remaining in the town, they said.

Ministry sets guideline to reuse contaminated waste

TOKYO (Kyodo) -- The Environment Ministry presented a guideline Sunday to reuse radioactively contaminated disaster waste generated in nuclear crisis-hit Fukushima Prefecture as construction materials within the prefecture.

The average density of radioactive cesium in the waste should remain 3,000 becquerels per 1 kilogram at the maximum and it should be covered with a 30--centimeter--thick coating of other materials, such as asphalt, gravel and concrete, to be recycled for purposes including building roads, railways and breakwaters, according to the guideline.

The waste should be reused only for public works projects so it could be appropriately handled after completion of construction work, the guideline says, while calling for facility managers to keep preconstruction records on the level of radioactive cesium density and other details -- such as which parts of the waste were used.

The ministry said it estimates that at least 342,000 tons of disaster waste remain in five municipalities around the troubled Fukushima Daiichi nuclear power plant, including Minamisoma and Namie.

Genkai reactor suspended, leaving 6 reactors in service in Japan

FUKUOKA (Kyodo) -- Kyushu Electric Power Co. suspended operation of the No. 4 reactor at its Genkai nuclear power plant in Saga Prefecture late Sunday for a regular checkup, the utility said.

The suspension left only six among 54 commercial reactors in Japan in service in the wake of the nuclear disaster at the Fukushima Daiichi power plant triggered by the March earthquake and tsunami, with operations of all six reactors in Kyushu Electric's service area being suspended.

Kyushu Electric has decided to ask customers to reduce their maximum power usage by more than 5 percent between Monday and Feb. 3.

The suspension of the No. 4 reactor will put the utility's supply capacity at 14.69 million kilowatts in January against the expected maximum power demand of 14.57 million kilowatts, with the reserve rate standing at 0.8 percent, according to the utility.

The rate, however, will fall to minus 2.2 percent if electricity demand grows to the level seen a year earlier, when the area faced a hard winter, it added.

(Mainichi Japan) December 26, 2011

No direct link between soil radiation and contaminated rice: survey

FUKUSHIMA -- High radiation doses in rice produced here are not necessarily linked to soil radiation levels, and could be linked to a lack of potassium and insufficient cultivation of rice paddies, a joint governmental survey has revealed.

The survey, conducted by the Fukushima Prefectural Government and the Ministry of Agriculture, Forestry and Fisheries, inspected the conditions of rice paddies in the prefecture where rice was found to surpass the provisional upper limit of 500 becquerels per kilogram.

An analysis of soil samples showed that the paddies' levels of potassium -- which prevents rice plants from absorbing radioactive cesium -- were only about one-third of the average concentration of potassium in the city of Fukushima.

It was also determined that rice grown in insufficiently cultivated paddies, including those in mountainous areas where rotary tillers are not used, tends to be tainted with higher doses of cesium. This is caused by the rice plants' roots being closer to the soil surface in comparison to those in well-cultivated paddies.

Based on the assumption that unpolished rice absorbs about 10 percent of cesium in the soil, the government allowed rice to be planted in paddies where soil radiation doses were under 5,000 becquerels.

However, rice tainted with nearly 800 becquerels of cesium was found in a paddy that had radiation levels of only 2,321 becquerels -- less than half of the limit allowed by the farm ministry.

In fact, the survey showed that nearly one-fourth of the inspected paddies, where radiation-tainted rice was grown, had radiation levels below the set limit -- a finding that led the Fukushima Prefectural Government to conclude that there is no direct correlation between levels of radiation found in soil and the rice grown in that soil.

Details of new N-agency announced / 485-strong body to tighten safety rules

The Yomiuri Shimbun

Plan for nuclear safety agency

The outline of a new nuclear safety agency to be launched in April with the aim of overhauling the country's nuclear safety regulation system has been unveiled by the Environment Ministry.

One of the senior officials of the new agency, tentatively called the nuclear safety agency, will oversee the response of nuclear power plant operators in the event of emergencies, the ministry said Saturday.

The official will provide supervision and advice to power utilities in the event of an emergency by drawing on the lessons learned from the inadequate initial government response to the crisis at the Fukushima No. 1 nuclear power plant, according to the ministry.

The planned agency will integrate the two existing nuclear safety-related organizations: the Economy, Trade and Industry Ministry's Nuclear and Industry Safety Agency (NISA) and its watchdog organ, the Nuclear Safety Commission of the Cabinet Office.

The new organization will be staffed by 485 people, up about 100 from those staffing NISA, the existing regulatory body.

The increase in staff is needed because the planned agency will take over the functions of the environmental radiation monitoring department of the Education, Culture, Sports, Science and Technology Ministry, the Environment Ministry officials said.

Seven senior officials will become councillors or have higher posts. These will include a "safety measures coordinator" in charge of ensuring the safety of local residents at the time of a disaster, they said.

The administrative arm of the agency will comprise three units: an international cooperation and technological infrastructure unit; a safety screening and inspection unit; and a crisis management administration unit, as well as a general overview department.

The screening and inspection unit will have five "safety regulation supervisors" in response to criticism that safety screening arrangements before the March 11 nuclear accident were inadequate, the officials said.

The supervisors will be in charge of working out safety measures against a range of disasters, including earthquakes and tsunami, they said.

In addition, an independent body, tentatively named the nuclear safety investigation commission, will be created to oversee the overall nuclear regulation system. This body will have about five staff members.

The education ministry's Radiation Council that stipulates radiation ceilings for the prevention of radioactivity-caused health hazards will also be moved to the planned agency.

When the agency is launched, the number of senior vice ministers and parliamentary secretaries at the Environment Ministry will be increased to two, up from one each at present, the officials said.

In a press conference after an extraordinary Cabinet meeting Saturday, Environment Minister Goshi Hosono, who is also state minister in charge of the nuclear crisis, said the new safety agency may offer "the last chance" for the government to restore public confidence in nuclear safety regulations.

"We must clearly break away from the conventional nuclear safety regulations that have often played second fiddle to the promotion of nuclear power generation," Hosono said.

(Dec. 26, 2011)

Fumbling gov't faces huge challenges in 2012

Hiroaki Koide, an assistant professor at the Kyoto University Research Reactor Institute (KURRI), is someone who has made one of the strongest impressions on me among the experts I've spoken to about the ongoing Fukushima nuclear disaster.

The public's views toward Koide have changed by the minute. He went from first being considered a nuclear "maverick" to a "pioneer" and finally to "one polemicist from the anti-nuclear camp." His ever-changing reputation has been symbolic of Japan's wavering between the promotion of nuclear energy and independence from it.

There's a reason why Koide came to mind as the year draws to a close. Last week, a government insider I've known for years wondered aloud whether they couldn't "drag someone like Koide" into the process of drawing up the government's new energy policy.

When I asked Koide about this, however, he responded: "I'm completely disillusioned with politics. No matter what committees are set up, nothing's going to change while politics continues to be carried out the way it is now. I won't accept a position from the government. When it comes to one-on-one public debates, however, I'm willing to go anywhere to participate."

Many of the experts who have been involved in the government's related committees since before the outbreak of the nuclear crisis on March 11 are pro-nuclear energy advocates. The inclusion of some anti-nuclear experts in discussions since March has created a bit of a stir, but they're still vastly outnumbered. Talks remain under the tight control of bureaucrats from the Ministry of Economy, Trade and Industry (METI) and the Ministry of Education, Culture, Sports, Science and Technology (MEXT), as well as staff dispatched from utility companies. The lineup is so skewed to nuclear energy promotion that it even gets a government insider anxious to get "someone like Koide" involved.

The government is now reviewing its energy policy in terms of a management overhaul at the stricken plant's operator, Tokyo Electric Power Co. (TEPCO), and comprehensive reform of the electric power system. It is beginning to look like TEPCO will be nationalized to ensure stable power supply, with the government obtaining at least two-thirds of TEPCO's shares. A final decision about the utility will be reached before account settlements for the fiscal year ending next March are made.

Meanwhile, the most significant point of contention within power system reform is nuclear power generation. The government claims it will present concrete energy policy options to the public next spring, with plans to finalize new policy by summer.

But that just isn't going to be possible. The government may be able to come up with options, but it won't be able to reach a decision. The issue of power reform is not something that the ruling Democratic Party of Japan (DPJ), which has bungled the relocation of U.S. Marine Corps Air Station Futenma and is floundering over the Yamba dam project, can handle.

Winning the public over is the biggest obstacle that lies ahead for the government. There is talk that some in the government and ruling party are advocating a referendum. But the government's planned timing of this process -- spring and summer of next year -- coincides with a critical time for Prime Minister Yoshiko Noda's cherished consumption tax bill. Can the government handle two such massive issues at once?

So what would happen if the debate over energy policy fails to pick up steam, and things proceed with the "nuclear village," a pro-nuclear collection of politicians, bureaucrats, academics and utilities, firmly in charge? A bureaucratic source offered the following vision: "Dependence on nuclear energy for our power supply can stay at (pre-March 11 levels of) 30 percent. This would still be lower than our original goal of achieving 50-percent dependence, so it would count as a 'reduction in nuclear dependence.' It would be acceptable to abandon the Monju fast-breeder project, but nuclear fuel reprocessing plants should be preserved. We would process MOX fuel from plutonium extracted from spent fuel, and export it at the same level as Britain and France."

This scheme is a pipe dream. Nuclear power plants across the country are being stopped for regular inspections, with no clear prospects of them being restarted. No one believes the government's recent announcement that "the crisis has been brought under control." This widespread mistrust is not something that one-sided rhetoric from government or business leaders can dispel.

Protests against an unjust system that forces rural communities to suffer for the power consumption of the country's cities has erupted far and wide. Some municipalities have even begun to return subsidies they received for hosting nuclear power plants to the national government.

If underestimating the public's anger and leaving decisions up to the nuclear village is Noda's political stance, then not just Koide, but also the rest of us, cannot help but be disillusioned. Changes must be made to the lineup of experts tasked to draw up energy policy, but the appeal is unlikely to be heard. Clearly, a possible hike in the consumption tax is not the only controversy that we'll face in the year 2012. (By Takao Yamada, Expert Senior Writer)

Fukushima accident shows need to prepare for the unexpected: panel

TOKYO (Kyodo) -- A government panel investigating the nuclear crisis at the Fukushima Daiichi power plant said Monday the accident shows the need to prepare for unexpected events if the consequences of them happening could be disastrous, referring to the poor emergency responses by the plant operator and the government.

Releasing an interim report following some six months of investigation, the panel said that many problems related to the crisis were linked to the absence of measures to deal with severe nuclear accidents caused by tsunamis as well as the failure to assume that a nuclear crisis could occur in combination with a natural disaster.

"It cannot be denied that people who have been involved in nuclear disaster response and those in charge of managing and operating nuclear power plants have lacked the big-picture viewpoint for seeing nuclear disaster preparedness," the report said.

"In that point, there has been a major problem in nuclear disaster preparedness, which would not allow them to make the excuse that they were not able to handle the situation because...the plant was hit by tsunami waves beyond the scope of their assumptions," it said.

The remarks are in contrast with the outcome of an in-house investigation conducted by plant operator Tokyo Electric Power Co., which blamed the larger-than-expected tsunami for the failure to prevent the world's worst nuclear accident since the 1986 Chernobyl disaster.

With key buildings flooded by tsunami waves more than 10 meters high, the plant located on the Pacific coast in northeastern Japan lost nearly all of its power sources and consequently the ability to cool the reactors and spent fuel pools.

The report by the investigation committee led by Yotaro Hatamura, a professor emeritus at the University of Tokyo, said TEPCO misunderstood and mishandled the situation at the Nos. 1 and 3 reactors, which eventually suffered meltdowns along with the No. 2 reactor.

As for the No. 1 unit, injecting water into the reactor by using fire trucks was delayed mainly because officials at the plant's emergency headquarters mistakenly thought that a cooling system called an isolation condenser was functioning when it was not.

There was "a good chance" the actual situation could have been noticed, the report said, but reactor operators and headquarters staff apparently did not have sufficient knowledge about the equipment itself or how to handle it, which was an "extremely inappropriate" situation for a plant operator.

TEPCO "had not expected a situation in which all power sources would be lost at multiple reactors simultaneously due to an extremely severe natural disaster, and it had not provided enough training and education to respond to this situation," the report said.

In the case of the No. 3 reactor, meanwhile, some workers stopped an emergency cooling system without reporting to senior officials of the plant's headquarters.

If workers had been able to release the pressure in the Nos. 1 and 3 reactors and start injecting water earlier, the reactor cores might not have been damaged as much as currently believed and a smaller amount of radioactive substances might have been emitted, the report said.

The government's response in the early stage of the crisis was also problematic, with communications among officials at the prime minister's office insufficient and the emergency response center in the industry ministry not functioning well in performing its role of gathering information as stipulated in the nuclear disaster response manual.

Members of the industry ministry and the nuclear safety agency were "strongly frustrated by the lack of speed in information provision" by TEPCO, but even so they did not take such actions as sending agency staff to the company's head office, the report said.

The committee also said that the government's evacuation order issued to residents around the plant was not clear enough in that it sounded almost the same as telling them to "just run," and in some cases residents were found to have been evacuated to areas where radioactive substances had spread.

Summarizing its findings, the report said that TEPCO did not take steps to deal with severe accidents caused by tsunami and that nuclear regulators acted similarly. The possibility of such an incident was seen as very low and treated as an "unexpected" issue.

"But even if it is a phenomenon with a very low probability of occurring, it does not mean that you can ignore it. If an irreversible situation is going to happen...measures should be taken to prevent the situation," the report said.

Since launching its investigation in June, the investigation committee had conducting hearings from a total of 456 people as of Dec. 16. It is expected to release its final report next summer.

Gist of investigation report on Fukushima nuclear accident

The following is the gist of the interim report issued Monday by a government panel investigating the nuclear accident at Tokyo Electric Power Co.'s Fukushima Daiichi power plant.

The government:

- failed to communicate well within the prime minister's office.
- had problems gathering information through channels stipulated in the nuclear disaster response manual.
- did not use in issuing evacuation orders data from a computer system to predict the dispersal of released radioactive materials.
- failed to fully use a facility planned to serve as the local headquarters as it was unprepared for a rise in radiation levels.

TEPCO:

- misunderstood the functioning status of the No. 1 reactor's cooling system called the isolation condenser.
- had not trained reactor operators sufficiently to handle the isolation condenser.
- mishandled the No. 3 reactor's emergency cooling system.
- might have been able to lessen the damage of fuel inside the Nos. 1 and 3 reactors if it acted more appropriately.

The investigation committee:

- calls for the need to be prepared for low-probability events if the possible consequences could cause extremely huge damage.
- calls for the need to consider the possibility that a nuclear accident can occur in combination with natural disasters.
- believes that people involved in considering the country's nuclear disaster measures lacked a broader perspective on the issue.
- has so far not confirmed that reactor vessels were damaged by the March 11 earthquake, before being hit by ensuing tsunami waves.

Panel compiles interim report on nuclear accident

A panel looking into the disaster at the Fukushima Daiichi nuclear power plant has severely criticized both the operator and the government for mishandling the accident.

The government panel released an interim report on Monday. Its investigations were based on interviews with about 450 people, including workers at the Tokyo Electric Power Company and government officials.

The report says that the utility itself predicted in 2008 that a tsunami larger than 10 meters high could hit the plant but that it failed to take preventive measures.

The report says that after the plant lost all its electricity following the March 11th earthquake and tsunami, workers mishandled the emergency cooling system at No 1 and 3 reactors.

The report says if fire trucks had been dispatched earlier to pump water into the reactors, there would have been less damage to the fuel rods, and smaller amounts of radioactive substances released into the air.

The report also describes the government's handling of the crisis as problematic.

It says lack of communication within the Prime Minister's Office in Tokyo prevented the government from making use of the so-called SPEEDI system that predicts the spread of radioactive substances.

Data from SPEEDI wasn't used when the government issued evacuation orders to residents living near the crippled Fukushima Daiichi power plant.

The report says the evacuation orders were not precise and failed to promptly reach the municipalities involved.

The panel intends to question Cabinet ministers and others to further learn how the government handled the crisis before it compiles a final report by next summer.

Monday, December 26, 2011 19:47 +0900 (JST)

Editorial: More detailed information needed in final report on nuclear crisis

A fact-finding panel on an accident at the tsunami-hit Fukushima No. 1 Nuclear Power Plant should put more specific and detailed information in its final report on the still ongoing crisis.

The panel released an interim report on the crisis consisting of more than 500 pages on Dec. 26 after reportedly interviewing 456 individuals involved over a total of a 900-hour period.

While the report highlights problems involving plant operator Tokyo Electric Power Co. (TEPCO) and the government's response to the accident, it appears far from satisfying the public. The puzzle has been largely filled with pieces, but still fails to show the entire picture of the accident.

One of the reasons is that the panel has not finished interviewing Cabinet ministers concerned. Shortly after the crisis broke out, top government officials -- including Cabinet members concerned and the chairman of the Nuclear Safety Commission of Japan (NSC) -- as well as TEPCO executives, who were on the fifth floor of the Prime Minister's Office, were making decisions in response to the crisis.

Questions remain as to what these Cabinet ministers, who were playing a leading role in the decision-making, did or failed to do in efforts to bring the crippled plant under control and what problems emerged involving the chain of command. The panel cannot get to the bottom of the crisis unless these questions are answered. The investigators are urged to thoroughly examine these matters before they compile a final report on the crisis.

Another problem with the interim report is its failure to shed light on problems involving the "safety culture" that contributed to the accident.

TEPCO's preparedness for massive tsunami and serious accidents as well as the response to the ongoing crisis were extremely inadequate. The government's Nuclear and Industrial Safety Agency (NISA) was useless in responding to the crisis. The interim report bitterly criticized these problems, but should clarify why these entities have become so incompetent. Specifically, it should shed light on their historical backgrounds, collusive relations between the government and TEPCO and the mental conditions of insiders of these organizations from the viewpoint of group psychology.

The report also failed to completely answer questions that many members of the public have asked since the crisis occurred, such as why the government's prediction of how radiation would spread using the System for Prediction of Environmental Emergency Dose Information (SPEEDI) was not released promptly.

The report only pointed out that the government organizations concerned did not even think of proactively dispatching such information to the public. The panel should clarify whether someone in the government attempted to block the flow of such information or how it should have been utilized to help smoothly evacuate residents from affected areas.

Another problem is that the report took into consideration the position of TEPCO as a private company in considering the utility's inadequate preparedness for serious accidents. Even if there are limits to what it could have done as a private company to prevent such accidents, the panel must keep in mind that TEPCO is primarily responsible for safety measures at its nuclear power stations.

The report's failure to show the entire picture of the Fukushima nuclear crisis may be attributable to the way it was written. Some paragraphs show that the writer of the report mistakenly omitted some specific information in compiling it based on interviews with many people over such a long time. The failure to clarify the subjects of sentences and vague wording obscured the essence of the report.

The panel should take note of these problems in compiling a final report. Specifically, it should consider chronologically listing organizations' and individuals' actions since the nuclear accident so that readers can follow the flow of the response to the crisis.

Physicist Richard Feynman, a member of the fact-finding panel on the explosion of the U.S. space shuttle Challenger in 1986, wrote his personal view on the accident while remaining not bound by the organization's expectations for the panel's report and won sympathy from numerous members of the

public. The fact-finding panel on the Fukushima nuclear crisis should keep this in mind in verifying the facts related to the disaster before issuing a final report.

(Mainichi Japan) December 27, 2011

Many Fukushima evacuees remain reluctant to return to homes near nuclear plant

Municipalities near the crippled Fukushima No. 1 Nuclear Power Plant have started preparations to return to where they were before the outbreak of the nuclear crisis in March following the central government's announcement on Dec. 26 to redraw evacuation zones, but many evacuees are reluctant to return to their homes due in part to fears over long-running effects of radiation.

Local government leaders are trying to persuade evacuees to go back to where they were before the nuclear power station was crippled by tsunami triggered by the Great East Japan Earthquake on March 11, but an increasing number of affected people have become accustomed to their lives in areas where they have taken shelter.

Most of about 3,000 residents of Kawauchi village, whose eastern part falls within a government-designated evacuation zone within a radius of 20 kilometers from the troubled nuclear power complex, evacuated from their homes in the wake of the nuclear crisis. But an emergency evacuation preparation advisory was lifted in late September for the western part of the village where the municipal government building stands. Levels of radiation there are now low.

Kawauchi Mayor Yuko Endo is expected to declare it is safe to return home soon and urge all villagers to return to their homes by building 50 temporary houses in the western part of the village by next April. The local government functions, which have been operating in the Fukushima Prefecture city of Koriyama since the outbreak of the nuclear crisis, are expected to be relocated back to where they were.

According to a survey conducted by the local government in June, 80 percent of the evacuees from the village said they wanted to return to their homes. But a senior local government official said, "If we conduct a survey now, 80 percent of them would say they do not want to return."

"It is unreasonable to tell us to return by next spring," said a 56-year-old woman who lives in temporary housing in Koriyama. Following the nuclear crisis she had moved from one place to another such as relatives' homes and evacuation shelters before settling in a temporary housing unit in June. She has recently found a job at least for the time being. "I have gotten used to life in Koriyama," she said. On the other hand, it remains unclear when or even if the supermarket, hospital and the nursing home she used to work at before the disasters will reopen, as they are in the evacuation zone. "Is the municipal government telling us to fend for ourselves?" she said.

There are 139 people living in the village today. Following the lifting of the designation as an "emergency evacuation preparation zone," more people were expected to return and live there, but ironically nearly 50 people left the village. Mayor Endo said, "If the residents return, shops will reopen

and there will be places to work at. I am afraid of radiation, but I am afraid more of the fact that the villagers' desire to return is fading."

The same is true for Iitate village which created a goal of ensuring all of its villagers return to their homes five years from now. Iitate Mayor Norio Kanno said, "Unless we decontaminate (the village) quickly, people's relationships will fall apart."

Kazuo Ouchi, 53, who works for Japan Agricultural Cooperatives (JA), said, "I want to return, but I don't want my children to return." Ouchi took shelter in Fukushima city with his 10 family members including his parents and wife. His third son and first daughter go to public elementary and junior high school in Kawamata, respectively, but an increasing number of their schoolmates have been changing schools because it takes them one hour for a round trip to their schools. His ageing parents no longer say, "We want to return."

Katsutaka Idogawa, mayor of Futaba which is likely to be designated as a "difficult-to-return zone" under the government's new scheme, is considering a collective relocation of the townspeople to a "temporary town." But the government's functions are still based in Kazo, Saitama Prefecture, and its people have taken shelter all over the country. Such being the case, it is impossible for the mayor to discuss reconstruction with the townspeople and build consensus.

Emi Matsumoto, a 39-year-old housewife, was born and raised in Futaba. She now lives with her twins -- first-grade elementary school students -- in a city-rented housing unit in the Fukushima Prefecture city of Iwaki. Levels of radiation near her home in Futaba are low now, but she said, "Our grandchildren could be affected. I can't take the consequences. On the possible collective relocation of the townspeople, she said, "I can't follow such a plan. The townspeople have spent nine months in the aftermath of the earthquake disasters. The municipal government must consider what steps they should take after listening to voices of individual residents."

TEPCO dissatisfied with panel's view of severe accident measures

TOKYO (Kyodo) -- Tokyo Electric Power Co. showed dissatisfaction Tuesday with a view suggested in an investigation report on the nuclear accident at the Fukushima Daiichi power plant that the utility should have taken precautionary measures to deal with severe nuclear accidents triggered by tsunami.

"It is not exactly right to say that we should have done so before March 11 (when the plant was hit by a huge earthquake and tsunami), although in hindsight the steps we had taken were not sufficient," a TEPCO official told a press conference, a day after a government panel released an interim report on its investigation.

Although TEPCO came up with a study in 2008 that tsunami over 10 meters high may hit the plant, the company justified its decision not to take immediate action because the figure was based on a "hypothetical calculation which did not have any scientific basis."

TEPCO also said that, even before the nuclear crisis, the plant operator was taking steps to deal with severe nuclear accidents that could result in serious damage to the reactor core through such measures as ensuring ways to release pressure from reactor containment vessels.

The report, compiled by the panel led by Yotaro Hatamura, a professor emeritus at the University of Tokyo, said that TEPCO did not take enough precautionary measures in anticipation of a severe accident that could be caused by tsunami like the one that triggered the Fukushima crisis.

"The Investigation Committee is of the view that specific measures against tsunami should have been in place including measures against severe accidents," the report said.

(Mainichi Japan) December 27, 2011

Fukushima rice farmers asking 'until when will this continue?'

FUKUSHIMA -- With the government announcing a possible ban on future rice planting in areas where contaminated rice was detected, farmers in Fukushima Prefecture are on the verge of losing the little hope that has kept them going amidst months of torture.

"What should I do? There's really nothing to be done. I had to receive medicine from my doctor because I can't even sleep at night," says Eiji Watanabe, 62, a farmer from the Yoshikura (former Shibukawa) area in Nihonmatsu.

On Dec. 8, the government banned the shipment of rice harvested in Shibukawa this autumn after detecting radiation doses surpassing the provisional upper limit of 500 becquerels per kilogram in some of the region's paddies. A few weeks later, on Dec. 27, it was announced that rice planting in the region will likely be banned for the next harvest year.

For farmers like Watanabe, however, -- in whose rice radioactive cesium has not been detected -- this means one more year of enormous financial and emotional damage.

Surrounded by six tons of stored rice packages, harvested this autumn, and with nowhere to ship them, Watanabe is at a loss as to what to do. "I understand that they (the government) can't allow the shipment of potentially affected rice, but if we can't plant next year it will be very difficult. I wonder until when this will continue."

Prior to the Fukushima No. 1 Nuclear Power Plant disaster, Watanabe -- the eighth generation of a family of farmers -- used to ship about 50 tons of rice to small shops in Tokyo and other retailers every year. However, in mid-March he received a call from a shop owner, to whom Watanabe had sold rice for 17 years, telling the farmer he can no longer buy his rice. "Customer won't buy it," he was told.

The shop cancelled orders for some nine tons of rice from this year's harvest and 2.7 tons of last year's - the total sales of which usually stand at about 2.98 million yen. Watanabe was also asked to sign a cancellation contract, the postscript of which read: "If the government and Tokyo Electric Power Co. (TEPCO) had taken appropriate measures after the nuclear disaster, we wouldn't have had to do this. The rice had been very popular among our customers."

"The shop owner was apologetic," says Watanabe.

"It is my duty to leave this rich land to my future generations," says Watanabe, whose son -- a university student in Tokyo -- said that one day he would return to Fukushima. "I want to tell this to the authorities: Give me back my land," said Watanabe.

Hiroiyuki Suzuki, a friend of Watanabe's and also a farmer in the neighboring village of Otama, has plans to file a lawsuit against TEPCO, the operator of the crippled power plant, next year, demanding compensation for losses caused by the nuclear crisis. Encouraged by his 61-year-old friend, Watanabe also plans to take part in the lawsuit and has already turned to law books for reference.

Like farmers, officials from the agricultural administration department in Fukushima, a city where rice shipments continue to be banned in two districts, Onami and Watari, can't hide their bewilderment at what to do.

"The majority of inspected rice packages in Onami had radiation of less than 100 becquerels per kilogram. Yet, shipments were banned for the whole area. We don't know how to explain this to farmers," said an official from the department. "Farmers hope that decisions are reached only after every paddy is inspected one by one. If farmers don't produce rice for a whole year, it is unclear whether they can return to normal farming later on. The industry is under threat in the whole area."

"I've lived through bad harvests and droughts, but I've always looked ahead with hope, because I knew there was a future. This time, however, it seems like there's no hope for the next harvest," said Morio Sato, 74, a seventh generation farmer, as his voice choked with sadness.

NISA 'powerless to handle severe accident' / Interim report: Agency merely urged TEPCO to provide information, failed to control situation

Shin Watanabe / Yomiuri Shimbun Staff Writer

An interim report released Monday by a government panel investigating the crisis this year at the Fukushima No. 1 nuclear plant stated that the Nuclear and Industrial Safety Agency (NISA) and other governmental organizations failed to deal with the crisis effectively in their respective capacities and also failed to cooperate with each other.

Ahead of the establishment in April 2012 of a new regulatory body to oversee nuclear safety, many problems with NISA have been revealed.

The interim report by the government's investigation committee said the agency could hardly fulfill its function as the supervisory body in the wake of the accident, referring to its lack of self-awareness in dealing with the issue and actively collecting relevant information.

After the crisis began, the agency played the role of secretariat of the Nuclear Emergency Response Headquarters set up at the Prime Minister's Office. It should have become the core organization for gathering information from various organizations, such as the power plant and its operator, Tokyo Electric Power Co.

However, immediately after the accident, NISA relied on information obtained by staff dispatched by TEPCO's head office to the agency. The staff members got the information from TEPCO's head office by cell phone.

At that time, TEPCO's head office shared information with the local headquarters in Fukushima Prefecture in real time through a videoconference system.

But the agency did not dispatch its officials to TEPCO's head office, which is only about 600 meters away from the agency's office.

As the agency could not obtain sufficient information about the ongoing situation, the Prime Minister's Office apparently initiated its own direct contacts with TEPCO executives and the nuclear power plant staff. This situation led to a muddying of the command channels.

NISA's nuclear safety inspectors, who should have played the role of nuclear watchdog, apparently lacked a strong will to deal with the crisis.

During the accident, four inspectors were at the nuclear power plant. But they temporarily evacuated around 5 a.m. on March 12. They returned to the plant the next morning, but left again on the evening of March 14 because of a hydrogen explosion at the No. 3 reactor before noon that day.

The interim report severely criticized NISA's instructions to TEPCO as having little influence on decision-making at the nuclear power plant, as most of the agency's instructions went no further than urging TEPCO to provide correct information as soon as possible.

Yohishiro Nishiwaki, a visiting professor at the University of Tokyo and former director of the agency's nuclear power inspection division, said: "It's difficult to deal with severe accidents without extensive and sufficient knowledge. But ordinary safety regulations by the agency mainly aim at preventing severe accidents [rather than dealing with severe accidents]."

"The agency lacked both human resources and knowledge to respond to the emergency," Nishiwaki added.

Regarding a new nuclear safety agency set to succeed the current agency, the interim report stated: "It is necessary to develop professional competence to provide appropriate advice and leadership to the responsible personnel and relevant organizations that are in charge of emergency response."

===

Poor communication blamed

The interim report also found the Prime Minister's Office caused greater confusion by making important decisions without sufficient consultations with concerned organizations.

As an example, the interim report described how then Prime Minister Naoto Kan responded to the injection of seawater into the No. 1 reactor on the night of March 12, one day after the Great East Japan Earthquake. He was later criticized for trying to stop the operation out of concern that it would cause a recriticality at the reactor.

According to the interim report, the crisis management center in the basement of the Prime Minister's Office was already aware that the power plant had started the sea water injection when Kan and other top government officials--in the prime minister's working room on the fifth floor--were still discussing concerns about the possible recriticality without being informed of the fact.

The interim report suggested such confusion could have been prevented if the people in the prime minister's working room and the crisis management center had sufficient communication with each other.

While continuing the discussions, Kan issued an instruction at 6:25 p.m. on March 12 that the evacuation zone should be expanded to a radius of 20 kilometers around the plant from the initially designated 10 kilometers.

The interim report found the decision also was related to concerns about the possible recriticality, but the order was issued without consulting concerned ministries and agencies or local governments.

Areas outside the 10-kilometer zone had not been subject to emergency drills before the outbreak of the crisis. Therefore, authorities were not prepared at all to evacuate residents in the newly designated zones. Procedures for briefing concerned local governments and securing shelters were among the missing elements.

As a result, local governments near the crippled plant were forced to decide how to evacuate residents without sufficient information, according to the interim report.

"Residents [near the plant] eventually became very distressed by the mixed messages they were getting," the report stated.

Nobuo Ishihara, who served as deputy chief cabinet secretary at the time of the 1995 Great Hanshin Earthquake, described disaster response as "a battle against time."

"Therefore, the government has to gather all information in an integrated manner," Ishihara said. "The Democratic Party of Japan-led government might have failed to sufficiently communicate with bureaucrats [following the quake] under its slogan of politicians taking the initiative in carrying out policies."

Locals fume at poor N-crisis response

The Yomiuri Shimbun

The interim report on the crisis at the Fukushima No. 1 nuclear power plant has produced an angry backlash toward the poor response by the government and Tokyo Electric Power Co. among people who were forced to evacuate from around the stricken plant.

"We had no idea where we should run to," said Reiko Koizumi, 69, who before the crisis lived with her 36-year-old daughter in the Tajiri district of Namiemachi, Fukushima Prefecture. Her home is inside the 20-kilometer exclusion zone that now surrounds the nuclear plant.

Koizumi said they first fled to the Tsushima district of Namiemachi on March 12 after an explosion rocked one of the plant's reactor buildings. They were not able to get any further because their car ran out of gas, Koizumi said.

In its interim report released Monday, a government panel investigating the cause of the crisis singled out the government's failure to swiftly provide the public with data on the spread of radiation from the System for Prediction of Environmental Emergency Dose Information (SPEEDI).

"If the data had been provided, municipalities and residents could have chosen their evacuation routes and directions more appropriately," the report said.

SPEEDI data released later showed radioactive substances leaking from the plant had been predicted to spread along the path Koizumi and her daughter evacuated.

"We didn't even know SPEEDI existed," said Koizumi, who now lives in Shirakawa in the prefecture.

Hiroki Sato, a 53-year-old employee of the JA agricultural cooperative who lives with his parents, wife and their four children in Minami-Soma, evacuated to the home of his in-laws in Iitatemura on March 13.

"I thought the village was safe because of the mountain between the village and the plant," Sato said.

However, high levels of radiation were later measured in the area, and the entire village was designated part of a planned evacuation area in April.

Sato and his family ended up returning to Minami-Soma, where radiation levels have been lower than in Iitatemura.

"If the SPEEDI data had been released, we would've gone in a different direction," Sato said. "It was terrible risk management."

Criticism has also been voiced from municipal governments affected by the nuclear disaster.

Namiemachi Mayor Tamotsu Baba said, "Our residents could have fled to Yamagata or Niigata prefectures if the SPEEDI data had been available." The village's coastal areas are part of the no-entry zone and its inland mountainous areas are part of the planned evacuation zone.

Katsuya Endo, mayor of Tomiokamachi, also criticized the poor handling of the crisis by the government and the plant operator.

"Their management of the crisis was sorely lacking," he said. "It's like the government and TEPCO never even tried to cooperate in the initial response."

The entire village is now part of the no-go zone.

Radioactive cesium in cedar pollen in Fukushima poses no health hazard: gov't agency

Levels of radiation in cesium contained in cedar pollen in Fukushima Prefecture, which hosts the crippled nuclear power plant, are so low that they will not pose any health hazard, the Forestry Agency said.

The agency released an interim report on levels of radioactive cesium in cedar pollen checked at 87 locations in Fukushima Prefecture. Based on maximum levels of cesium measured at 87 spots in the prefecture, the level of radiation a person can be exposed to by inhaling cedar pollen is 0.000192 microsievert per hour, the agency said. Therefore, there is no need to worry about radiation exposure by inhaling cedar pollen, the agency said.

The agency decided to conduct the survey because people have a "strong interest" in cedar pollen which could contain radioactive cesium due to contamination of forests with cesium emitted from the troubled Fukushima No. 1 Nuclear Power Plant. Cedar pollen itself flies as far as several hundred kilometers.

The agency collected male cedar flowers that release pollen at about 180 locations in eastern Japan including Fukushima Prefecture, and it compiled the interim report focusing on data on radiation levels in male cedar flowers picked in areas close to the troubled nuclear power station in Fukushima Prefecture.

Of the 87 locations in Fukushima Prefecture, male cedar flowers from Namie carried 253,000 becquerels of radioactive cesium per kilogram -- the highest level of all the male cedar flowers sampled in eastern Japan. But one piece of cedar pollen is very light, and even if the agency calculated the level of radiation an adult person is exposed to per hour using the largest amount of cedar pollen in the air detected over the last nine years when data on cedar pollen is available, then that figure is still only 0.000192 of a microsievert. The agency said 2,200 pieces of cedar pollen per 1 cubic meter -- the largest amount of cedar pollen in the air -- were detected in March 2008.

Masahiro Fukushi, professor at the Tokyo Metropolitan University's graduate school conducted a separate but similar survey in November. After analyzing male cedar flowers collected from Okutama, northwestern Tokyo, he found that 93 becquerels of radiation were detected in male cedar flowers per

kilogram. Fukushi said, "This is at a level which we need not worry about its impact on humans. If people are still worried about it, they should wear a mask or goggles to protect against pollen."

Fukushima governor demands TEPCO decommission all its 10 nuke reactors

FUKUSHIMA -- Gov. Yuhei Sato has demanded that Tokyo Electric Power Co. (TEPCO), the operator of the crippled nuclear plant, decommission all its 10 nuclear reactors in the prefecture.

Sato made the demand in a meeting with TEPCO President Toshio Nishizawa at prefectural government headquarters in the city of Fukushima on Dec. 27. Nishizawa stopped short of mentioning the possibility of decommissioning the reactors, and **left the prefectural government without answering questions from reporters.**

Nishizawa visited the Fukushima Prefectural Government's headquarters to report to the governor that the power supplier has completed Step 2 of the road map to bring the tsunami-hit Fukushima No. 1 Nuclear Power Plant under control.

In the meeting, Sato strongly demanded that TEPCO decommission and dismantle all 10 reactors at the utility's Fukushima No. 1 and 2 nuclear plants.

"Fukushima Prefecture will build a society that won't rely on nuclear energy, and demands that all the reactors in the prefecture be decommissioned and dismantled," Sato told Nishizawa.

In response, the TEPCO head only said, "We'll sincerely take measures to ensure safety, pay compensation to those affected by the disaster and decontaminate tainted areas."

Promoter of controversial fast-breeder reactor project appointed to top bureaucratic post

The Education, Culture, Sports, Science and Technology Ministry has decided to appoint a high-ranking official who promoted the controversial project to develop a fast-breeder nuclear reactor to its top bureaucratic post.

The ministry is set to appoint deputy minister Yasutaka Moriguchi as administrative vice minister, effective on Jan. 6.

Since he promoted the Monju fast-breeder reactor project as head of the ministry's nuclear energy division, his appointment as the top bureaucrat in the ministry could have influence on discussions on whether to decommission the reactor.

Education, Culture, Sports, Science and Technology Minister Masaharu Nakagawa said he named Moriguchi as top bureaucrat in the hope that he will deal with the Fukushima nuclear crisis in an appropriate manner.

"We expect he'll properly respond to the nuclear power station accident. Since he is knowledgeable about nuclear energy, he will make realistic judgments with technological matters in mind," the minister said.

Moriguchi joined the now defunct Science and Technology Agency in 1976, and **has worked mainly on nuclear energy and space development.**

In May 1999, when he was director of the Power Reactor Development Division of the agency's Atomic Energy Bureau, Moriguchi appeared in a TV debate program on Monju and underscored the need for the project.

"In the short term, Monju may not be needed. In the long term, however, it'll be necessary to increase plutonium in fast-breeder reactors and burn it. If the use of atomic power is disapproved, then how should we secure an alternative energy source?" he said in the program.

Edano asks TEPCO to mull option of temporary state control

TOKYO (Kyodo) -- Industry minister Yukio Edano told Tokyo Electric Power Co. President Toshio Nishizawa on Tuesday to consider putting the utility under temporary state control as one of the options to fundamentally bolster its financial standing, while warning against the company's moves to resort to electricity bill hikes.

The economy, trade and industry minister made the request to the operator of the Fukushima Daiichi nuclear power plant after the utility sought an additional 689.4 billion yen in aid from a state-backed entity to secure funds for colossal compensation payments to people and companies harmed by the nuclear disaster at the plant. While funds to pay compensation is provided by the Nuclear Damage Liability Facilitation Fund, TEPCO has said that it is in a tough business condition due to growing fuel costs to boost thermal power generation to compensate for lost nuclear power production.

"I think there is the need to fundamentally reinforce TEPCO's financial basis to appropriately handle the accident and the decommission work of (the crippled reactors)," Edano said, adding that he wants TEPCO and the fund to consider crafting a comprehensive special business plan on TEPCO in March "without ruling out any possibility, including temporary state control."

The comprehensive plan is a revised version of the current special business plan, in which the utility promised to cut more than 2.55 trillion yen in costs over 10 years and the government decided to provide about 891 billion yen from the fund during this fiscal year.

Nishizawa said that the utility would craft the comprehensive plan "based on the instructions" given by Edano, but did not elaborate on whether the company is going to accept the injection of public funds.

Edano also told Nishizawa that electricity bill hikes should not be justified "under the banner" that stable electricity supply is needed, in an apparent warning to TEPCO, which announced last week that it will raise electricity charges for corporate users from next April and seek to hike household rates as well.

"An (electricity) rate revision should be conducted in combination with the restoration of public confidence" in TEPCO, said Edano, who would need to approve any household rate increase.

As for TEPCO's request for additional funds from the state-backed entity, Edano said that he wants the utility to step up its efforts to realize swift compensation payments as a precondition for issuing an approval for providing financial assistance.

It is the second time TEPCO has asked for assistance from the entity. TEPCO said it needs more funds than earlier anticipated partly because a government panel has set guidelines for compensation payments to people who evacuated voluntarily in the wake of the world's worst nuclear crisis since the 1986 Chernobyl disaster.

The utility is required to repay the money to the body in the form of what is called "special contributions."

(Mainichi Japan) December 28, 2011

Govt requests sites for waste soil storage

The government has officially requested permission to temporarily store radioactive waste soil in 8 municipalities around the crippled Fukushima Daiichi nuclear plant.

Environment Minister Goshi Hosono on Wednesday met governor Yuhei Sato of Fukushima Prefecture and the mayors of 8 districts of Futaba County.

Hosono said Futaba County was chosen because areas exposed to over 100 millisieverts of radiation per year are concentrated there. He said this makes ordinary decontamination methods impractical.

Hosono said the government will buy up or borrow land on long-term leases to build temporary storage sites.

After the meeting, Governor Sato said it will be very painful for the people of Futaba County to accept the government request. He said the government should adopt great courtesy in explaining its plan to

the relevant municipalities and residents.

The governor said he would decide whether or not to allow the plan after listening to responses from the municipalities.

Wednesday, December 28, 2011

Residents reluctant to accept govt plan

Local residents are reluctant to accept the government's plan to build a temporary facility for storing radioactive soil in Futaba County.

Kazumi Takano, who was evacuated from Futaba to Saitama Prefecture, says he does not know how long it will take for contaminated soil to become safe. His home is located 4.5 kilometers from the crippled Fukushima Daiichi nuclear power plant.

Takano says he objects to the facility being built in the area because there is not enough space to store contaminated soil from other regions in addition to soil from the town.

Haruo Takaoka, whose home is located 7 kilometers from the nuclear plant, says he hopes the storage facility will not be built in his town. But he also says that if no other districts are ready to accept it, there seems to be no other option than to build one somewhere in Futaba County in the light of the urgent situation.

The mayor of Namie town, Tamotsu Baba, says he cannot accept the government's request to build a storage facility in the area.

He says that if the facility is built, evacuees might feel they can no longer return home.

Baba adds that he will discuss the request with officials from other local governments.

Environment Minister Goshi Hosono says he is very sorry to ask the people in the Futaba district to accept the facility. He says he knows that the district has long helped supply power to Tokyo and other areas of Kanto.

Hosono stressed that the government has no choice but to build storage facilities as it proceeds with work to decontaminate radioactive soil. He said he is aware that the government is being criticized for choosing a site in the district, but that he will seek to win the understanding of local residents.

The Environment Ministry will make a final decision about the location of the storage facilities after consulting with officials from Fukushima Prefecture and local governments.

Wednesday, December 28, 2011

Hosono seeks OK for N-storage / Officials in Fukushima Pref. asked to accept temporary waste disposal site

The Yomiuri Shimbun

FUKUSHIMA--Environment Minister Goshi Hosono on Wednesday officially asked Fukushima Prefecture and the heads of eight municipal governments in the prefecture's Futaba County to approve construction of a midterm storage site for radioactive waste in the county.

Hosono met with Fukushima Gov. Yuhei Sato and the mayors of eight towns and villages in the county and told them the central government plans to build the storage facility in the county.

The facility will store waste, including soil, contaminated with radioactive substances released from Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear power plant.

Sato told Hosono he would respect opinions of local residents on whether to accept the request.

If the town and village mayors accept its request, the central government, in cooperation with the local governments, will select a site in the county where the facility will be built.

Hosono met with the governor at 9 a.m. at the prefectural government office building and told Sato: "I can't find words of apology to ask for the construction of the facility in Futaba County. But we'll make all possible efforts to obtain understanding."

Sato said: "It's an extremely hard and severe request. I'll consider it very seriously and will seek opinions of the mayors. I want the central government to carefully explain the project to local residents."

Hosono then met with the mayors of the municipalities--including Okumamachi and Futabamachi, which each include part of the power plant's grounds--in a nearby hotel and told them the plan.

After the meeting, Hosono told reporters, "I received some positive opinions."

Hosono cited two reasons why the facility should be built in the county.

First, the county has some areas where estimated levels of annual exposure to radiation are 100 millisieverts or higher, he said. It will be extremely difficult for residents to return to such areas in the foreseeable future, even if decontamination work is done.

Second, the county is near places where a huge amount of soil contaminated with high levels of radioactive substances will be gathered during decontamination work, said Hosono.

According to a road map the ministry released in October, the basic design of the facility and procurement of the land will be completed by the end of fiscal 2013, and contaminated soil and other waste may begin to arrive in January 2015.

(Dec. 29, 2011)

Japan starts operating new centrifuges for enriching uranium

AOMORI (Kyodo) -- Japan Nuclear Fuel Ltd. started on Wednesday the operation of new, more efficient centrifuges **at its uranium enrichment plant in Rokkasho, Aomori Prefecture.**

After a warm-up operation, the centrifuges -- each capable of processing enrichment four to five times more efficiently than a previous one -- will start producing uranium products around March, the company said.

In one year of operation, the new centrifuges can enrich one-third of uranium required for a 1-gigawatt reactor per year, according to the operator.

Japan Nuclear Fuel plans to replace all old units with new ones over the next decade at the enrichment facility that went on-stream in 1992.

(Mainichi Japan) December 29, 2011

Fukushima plant's backup generator failed in 1991

The operator of the Fukushima Daiichi nuclear plant failed to take preventive measures after a backup generator was inundated by a leaking pipe 20 years ago.

Former employees of the Tokyo Electric Power Company told NHK that the problem occurred in October 1991.

They said water leaked from a pipe and entered the basement of the Number 1 reactor's turbine building. This caused the failure of one of the two backup generators.

A former engineer at the Fukushima plant said he told his superiors that tsunami could damage the emergency generators in the basement, as the turbine buildings are close to the sea.

TEPCO installed doors to block water leaks in the rooms hosting the backup generators, but did not move them above ground to avoid tsunami damage.

The plant's reactor cooling system failed when the emergency generators in the basement were inundated by the March 11th tsunami. All power sources were lost.

Japan's Nuclear Safety Commission says it will revise the safety guidelines for designing nuclear plants and require the installation of additional power sources. [ça n'est pas encore fait, plus de 9 mois après la catastrophe ?]

Thursday, December 29, 2011

TEPCO neglected anti-flood measures at Fukushima plant despite knowing risk

A room housing an emergency power system at the Fukushima No. 1 nuclear plant had been submerged due to a pipe leak 20 years ago, plant operator Tokyo Electric Power Co. (TEPCO) revealed Dec. 29.

The utility's latest revelations indicate that the company had failed to institute measures against flooding despite knowledge that it was possible.

According to TEPCO, the incident took place on Oct. 30, 1991, when seawater used as reactor coolant leaked from a pipe inside the turbine building of the plant's No. 1 reactor. Although the emergency power system room was flooded, the power supply was not cut. The reactor, however, was stopped for the day.

Both the emergency power room and pipe were located on the basement floor of the building. The corroded pipe leaked water at a rate of 20 cubic meters per hour, which penetrated the room with the reactor's emergency power system through the door and holes for cables. Of the two power sources, one was completely submerged, but its drive mechanism remained unaffected.

Water from tsunami following the Great East Japan Earthquake in March this year flooded the power plant's emergency power systems and power switchboards through aboveground openings, disabling them. The reactors subsequently overheated, leading to reactor meltdowns.

(Mainichi Japan) December 30, 2011

Editorial: Gov't should promote renewable energy as myth of nuclear power's cheapness shattered

One of the reactor buildings at the Fukushima No. 1 nuclear plant destroyed by hydrogen explosions is seen in this photo taken with a hidden camera. (Photo courtesy of Tomohiko Suzuki)

"The cost of nuclear power generation is cheap" -- we have repeatedly heard such a line as part of the reasoning for promoting nuclear energy. The myth of the cheapness of nuclear power generation collapsed following the catastrophe at the Fukushima No. 1 Nuclear Power Plant.

A government panel set up in the wake of the nuclear disaster estimates that the cost of nuclear power generation now stands at a minimum of 8.9 yen per kilowatt hour -- 1.5 times higher than the figure presented by utilities and the government before the disaster. If the costs for decontaminating areas affected by radioactive materials, decommissioning the damaged reactors at the Fukushima No. 1 nuclear plant and compensating for damages emanating from the nuclear crisis soar further, the cost of nuclear power generation would be even higher.

Considering the fact that the costs of coal-fired power generation and liquefied natural gas (LNG)-fueled power generation stand at somewhere near 10 yen per kilowatt hour, respectively, the superiority that nuclear power generation had enjoyed in terms of "cost performance" can be said to have been shattered.

Even wind power generation and geothermal power generation could rival with nuclear power generation in terms of cost performance depending on conditions, while the cost of solar power generation is likely to become cheaper in 20 years time. The government should take this opportunity to proceed with full-scale measures to invest in and promote renewable energy sources, which had previously been shunned for their "high costs."

What makes the government panel's latest estimation significantly different from previous calculations is that the panel took into consideration the social costs emanating from nuclear power generation, such as accident risks, on top of the expenses for the construction, operation and maintenance of nuclear power plants as well as their fuel costs.

In hindsight, it was a mistake that we failed to take into account accident risks involving nuclear plants. It shows that the myths of the safety and the cheapness of nuclear power generation were closely intertwined with each other.

The government panel has also indicated that energy savings per household are tantamount to generating power and pointed to the potential of a dispersed power system, to which we should pay renewed attention. The panel's estimates should be indicating the feasibility of the government's policy of cutting down on nuclear power generation.

In the meantime, we should take heed of the fact that the figures currently presented are highly uncertain. Experts were sharply divided in their opinions over how nuclear accident risks should be evaluated when they were discussing how they should calculate the latest estimates. While some experts projected that the odds of such a serious accident as the Fukushima disaster happening were once every 100,000 years, their opinions are way too different from ordinary people's feelings considering the fact that we have seen three major nuclear accidents across the globe -- Three Mile Island in the United States in 1979, Chernobyl in the former Soviet Union in 1986, and Fukushima in 2011 -- over the past several decades.

It should be noted that the government panel has given minimum estimates because it excluded accident probabilities from their estimates for nuclear accident risk-related costs. The panel has also indicated that the cost of the nuclear fuel cycle -- which the government describes as the core of Japan's nuclear energy policy -- is almost twice that of direct disposal. The nuclear fuel cycle program, albeit the large amount of money spent on it, should be reviewed from square one.

The panel's estimates should be examined by people from various quarters in order for Japan to come up with the best mix of energy policies. Those estimates should serve as the first step toward achieving such diverse energy policies.

(Mainichi Japan) December 29, 2011

Gov't request for nuclear storage facility site sends shockwaves through Fukushima

The Watari district of Fukushima city is seen in northeast Japan, Sunday, Nov. 20, 2011. (AP Photo/ Greg Baker)

The government's request that an interim facility to store soil and other waste contaminated with radiation be built somewhere in Futaba county near the crippled nuclear power plant sent ripples of concern through local governments and residents in Fukushima Prefecture.

On Dec. 28, Environment Minister Goshi Hosono met and asked local leaders in Fukushima Prefecture for permission to build an interim storage facility somewhere in Futaba county in which two municipalities host the troubled Fukushima No. 1 Nuclear Power Plant.

Some local residents, particularly those people who want to return to their homes in areas near the nuclear power station, are worried that such a storage facility could stay there permanently. But those residents who have given up hope of returning to their homes have tended to accept the government request.

At the meeting with Hosono in Fukushima city on Dec. 28, Okuma Mayor Toshitsuna Watanabe said, "I will take the proposal seriously and consider it." Katsurao Mayor Masahide Matsumoto said, "We have no option but to accept it because it is needed." Some local residents are paying attention to the fact that there will be no places to dispose of such waste unless the interim storage facility is built, while hoping that new jobs will be created for the construction of the facility.

Nevertheless local leaders and residents are faced with a dilemma. In order for residents to return to their homes, it is necessary to decontaminate their municipalities, but the interim storage facility could hamper residents' efforts to go back to their homes. Namie Mayor Tamotsu Baba said, "Residents will not be able to return because the negative image is so strong." Kawauchi Mayor Yuko Endo voiced concern about the possibility that the interim storage facility could be used permanently. "We want the government to legally guarantee (that the facility will be used only for 30 years)."

Soichi Saito, 62, who lives in a temporary house in Iwaki, is skeptical about the government's intentions, saying, "They say it is an interim storage facility, but I suspect that it will become a final disposal site." He had run a farm in the town of Futaba with his family before the disasters struck northeastern Japan.

His 84-year-old mother, Yoshiko, said with tears in her eyes, "I want to grow sweet and tasty spinach again." But she added, "Even if we go back, we probably won't be able to farm the land because of harmful rumors (about radiation). But I don't want to give up easily because we will disappoint our ancestors."

A 60-year-old farmer, who moved into a temporary house in Aizuwakamatsu from Okuma, said, "Is it fair that we send electricity to Tokyo but waste will be put in Futaba county? If we accept it, no one will be able to live here."

Meanwhile, Masumi Kowata, 56, from Okuma, who lives in a temporary house in Aizuwakamatsu, said, "Even if we use tax money to try to decontaminate high dosage areas, they will not become livable. It is better for us to accept the facility and have the government prepare other places for us to live instead."

When the government plan was unveiled, Kowata was angry, saying, "Is the government going to put more burden on the people of Fukushima?" But when she visited her home briefly, she realized that levels of radiation were so high in the area near her home. "Even if we want to go back, I don't think we will be able to live in our hometown that is tainted by radiation," she said. More and more members of a women's civic group formed in the wake of the disasters have tended to accept the interim storage facility as they now think that it would be needed to facilitate decontamination work, she said.

(Mainichi Japan) December 29, 2011

New Fukushima Daiichi investigation to start

A panel of experts investigating the cause of the accident at Japan's Fukushima Daiichi nuclear plant will begin full-fledged work in January.

The body is independent from the government. It held its first meeting earlier this month and decided to set up 4 working teams.

Chair Kiyoshi Kurokawa says the experts will examine the interim report on the investigation by the government and Tokyo Electric Power Company, the operator of Fukushima Daiichi. Kurokawa adds the panel will focus on problems the government and TEPCO were unable to address.

The experts are also expected to scrutinize the nuclear crisis response by former Prime Minister Naoto Kan and other senior government officials.

In addition, they are supposed to come up with proposals for Japan's future nuclear policy and administrative structure so the recurrence of a major accident would be prevented.

The panel is required by law to submit a report in about 6 months.

Friday, December 30, 2011

City and citizens go from confrontation to cooperation on decontamination work

KASHIWA, Chiba -- In this city where radiation from the Fukushima No. 1 nuclear plant is relatively high, citizens' groups and the municipal government have moved from confrontation to cooperation as they work to decontaminate playgrounds and measure radiation.

Following the meltdowns in Fukushima, the city repeatedly released statements that "The radiation is at a non-problematic level," and citizens grew frustrated with a lack of action. Mothers worried about their children's health came together via word-of-mouth and the Internet, and in June submitted a petition signed by over 10,000 people calling on the city to do something about the radiation.

Surprised city officials responded in July, ordering elementary and junior high schools to decontaminate their grounds. In September, Mayor Hiroyasu Akiyama wrote an apology in a city newsletter reading, "We understand the citizens gave us a scolding for not appropriately addressing their concerns. We sincerely apologize."

In October, young fathers used Twitter and blogs to call for volunteers to do decontamination work. Wearing rubber gloves and masks, they used shovels to remove topsoil at three children's facilities. Representative Teruo Kawada, 36, said, "We want to continue living in Kashiwa with our children. We won't depend only on the government, and we want to do the work cheerfully, not solemnly."

Another group of around 10 people takes radiation measurements in parks using the same methods as city employees. They send the data to the city, which will do cleanup work starting from sites with the highest radiation.

The city is planning a three-year decontamination plan starting from next fiscal year, with costs estimated to pass 3.3 billion yen.

(Mainichi Japan) December 31, 20

Nuclear decontamination law to go into full force Sunday

TOKYO (Kyodo) -- A nuclear decontamination law will go into full effect Sunday, setting the stage for full-fledged efforts to clean up buildings, soil and waste contaminated with radioactive materials in areas affected by the nuclear crisis at the Fukushima Daiichi power plant in Fukushima Prefecture.

The central government will be responsible for the cleanup efforts in a no-go zone around the crippled plant and other evacuation areas in the seaside prefecture also heavily hit by the March 11 earthquake and tsunami.

Under the law, which was partially enacted in August, decontamination plans will be formulated by 102 municipalities in eight prefectures where radiation doses are expected to exceed 1 millisievert a year on top of natural background radiation and that from medical treatment.

The cleanup cost in the areas will be shouldered by the central government. The eight prefectures are Iwate, Miyagi, Fukushima, Ibaraki, Tochigi, Gunma, Saitama and Chiba.

The Environment Ministry is set to launch a 60-odd member office in the city of Fukushima on Sunday to push decontamination work within Fukushima Prefecture, with plans to start in late January the cleanup of infrastructure such as roads and water supply inside the no-go zone and elsewhere.

Full-fledged cleanup work is likely to start at the end of March, ministry officials said.

The ministry hopes to halve annual radiation doses for ordinary people and reduce those for children by 60 percent by the end of August 2013.

Under the law, the state will dispose of ashes from incinerated waste and sludge if they are found to contain more than 8,000 becquerels of radioactive cesium per kilogram.

It will still be necessary to find either space in the affected areas to temporarily keep contaminated soil and waste or landfills for disposal. The central government has recently asked municipalities in the Futaba district in Fukushima Prefecture to host a temporary storage facility for a massive amount of contaminated soil to be removed within the prefecture.

In the prefectures except Fukushima, contaminated waste is to be buried in landfills with plastic liners, but whether local communities will give a nod to the disposal remains to be seen.

(Mainichi Japan) December 31, 2011

JANVIER 2012

Cover-up of estimated costs to dispose of radioactive waste raises serious questions

Revelations that officials from the Agency for Natural Resources and Energy concealed the estimated costs of disposing of spent nuclear fuel highlights the distorted logic of government officials who stick to reprocessing radioactive waste even by lying.

The cover-up is essentially similar to a case in which some high-ranking government officials hid a 2002 Russian diplomatic document in which Moscow offered to accept spent nuclear fuel from Japan, in that both helped promote the reprocessing of radioactive waste at a plant in Rokkasho, Aomori Prefecture.

The government's panel on energy and environmental policies is under mounting pressure to hold thorough and transparent discussions on Japan's new energy policy.

The matter is serious all the more because Masaya Yasui, who was director of the agency's Nuclear Power Policy Planning Division when he instructed his subordinate in April 2004 to conceal the data, currently serves as counselor in charge of reform of nuclear power safety regulations. In other words, **the official who ordered the cover-up of the data is now responsible for working out safety measures at nuclear plants following the accident at the tsunami-hit Fukushima No. 1 Nuclear Power Plant.**

Moreover, Yasui is deeply involved in preparations to split the Nuclear and Industrial Safety Agency from the Economy, Trade and Industry Ministry and reorganize it into a new entity in April.

The ministry's stance to **allow an official who has promoted nuclear energy, even by concealing data, to play a leading role in regulating nuclear power safety** should be called into question.

It surfaced in July 2004 that the government had estimated the costs of disposing of radioactive waste through Mainichi and other reports. A contradiction between the revelations and the government's denial of such data in a Diet session only four months earlier came into a question.

Kazumasa Kusaka, then director general of the Agency for Natural Resources and Energy, told a House of Councillors session in March 2004 that such costs had never been estimated. He was responding to opposition Social Democratic Party leader Mizuho Fukushima, who had asked the government how much it would cost to deal with radioactive waste if it was not reprocessed.

Kusaka as well as Yasui, who wrote the agency head's answer, were subsequently reprimanded for giving an "incorrect" answer to the Diet.

As to the reason for punishing them leniently, then Economy, Trade and Industry Minister Shoichi Nakagawa explained, "Since they had not known the existence of estimated data until recently, the answer was neither a lie nor malicious."

However, now that it has recently come to light that the data was deliberately concealed, the ministry is obliged to reinvestigate the case and reconsider punitive measures against the officials involved. (By Tadashi Kobayashi, Kenji Shimizu and Seiichi Ota, Mainichi Shimbun)

Challenges ahead at Fukushima nuclear plant

The operator of the crippled Fukushima Daiichi Nuclear Power Plant has to juggle two daunting tasks this year.

One is to continue cooling the damaged reactors. The other is to start preparing for decommissioning.

The Japanese government said 2 weeks ago that the reactors at the plant had reached a state of cold shutdown -- the second phase in the program to bring the plant under control.

The government and Tokyo Electric Power Company released a work schedule showing that decommissioning may take 40 years.

The nuclear fuel must be removed from reactors 1, 2, and 3 before the reactors and their buildings are scrapped. Some of the fuel is believed to have melted and fallen through to the containment vessels.

This year, TEPCO will remove debris from the Number 4 reactor building, which was damaged by explosions, so it can start removing spent nuclear fuel.

As part of its preparations for decommissioning, TEPCO will conduct research and develop technology for decontaminating the inside of the reactor buildings and repairing the containment vessels.

The nuclear fuel needs to be cooled as it is still emitting heat. TEPCO plans to halve the length of the 4-kilometer-long pipes used for cooling and treating contaminated water. It also plans to install a new facility to remove radioactive strontium from waste water.

Professor Hisashi Ninokata of the Tokyo Institute of Technology says there is always a risk that contaminated water in the pipes will leak. He says TEPCO should minimize the hazards by preventing groundwater from seeping into buildings and by making the system that filters waste water more compact.

Monday, January 02, 2012 11:58 +0900 (JST)

54% of N-zone evacuees have yet to return

The Yomiuri Shimbun

FUKUSHIMA--Fifty-four percent of evacuees from areas between 20 and 30 kilometers of the Fukushima No. 1 nuclear power plant have yet to return home, three months after the government lifted its emergency evacuation preparation zones.

Due to slow progress in decontamination operations and a lack of job opportunities in the five municipalities in Fukushima Prefecture, 31,600, or 54 percent, out of a total 59,049 evacuees from the areas near the crippled plant continued to live in shelters instead of returning home as of Tuesday.

In Minami-Soma City alone, 22,983, or about 50 percent of 46,744 evacuees from the city, still remain outside the city.

Masahiro Igawa, 33, whose house in the city's Haramachi Ward was swept away by the March 11 tsunami, evacuated to Fukushima City with his wife and four children.

"Though decontamination operations have started, areas around schools still show high radiation levels, and hospitals have not been restored to original conditions. We can't go home even if we want to, out of consideration for our children," he said.

At Omika Primary School in Minami-Soma, 204 students had been expected to register this academic year. But most of the school's district was designated as an emergency evacuation preparation zone, which decreased the number of students to 81 as of Dec. 19.

According to a survey conducted by the city's board of education at the end of November, about 40 percent of parents of the school's students still living outside the city said they will not return for the next academic year. About 30 percent said they were undecided as to whether to return.

Katsushige Hirama, the school's principal, said an unstable employment situation is one of the factors delaying people's return to the city. "In addition to the radiation fears, [children's] parents are facing employment problems," Hirama said.

According to the Hello Work Soso job placement center, which serves Minami-Soma, the ratio of job seekers to jobs in October was 3,194 to 2,870. The number of people who actually obtained a job was 317.

"There are many one-year contract jobs for decontamination or debris removal, but there are few long-term jobs," said Masahiro Kikuchi, a career counselor at the office.

A 37-year-old housewife who along with her family took refuge in Fukuchiyama City, Kyoto Prefecture, from the Minami-Soma's Haramachi Ward, said: "There are no jobs for us if we return home. I also have fears about radiation. Although my parents and relatives are staying in Minami-Soma, we're not going back there."

Many residents from other municipalities also have yet to return home, as decontamination operations have progressed slowly, and schools have not reopened since the disaster.

In the village of Kawauchi in the prefecture, none of 2,675 evacuees have returned home. "Unless there is progress in decontamination work, there's nothing we can do," an official of the village office said.

(Jan. 1, 2012)

Energy agency boss told subordinate to cover up estimated costs to dump nuclear fuel

A division head at the Agency for Natural Resources and Energy instructed a subordinate in April 2004 to conceal the estimated costs for disposing of spent nuclear fuel without reprocessing it, sources involved in the case and a memorandum have revealed.

Two months later, a government advisory panel proposed a system under which electric power consumers would be required to foot approximately 19 trillion yen for the costs of operations at a spent nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture.

Under the current government policy, all spent nuclear fuel is supposed to be reprocessed. However, if the data had been disclosed, it would have revealed that dumping nuclear waste is far cheaper than reprocessing it and could have spurred calls on the government to review its so-called nuclear fuel recycling policy.

It earlier came to light that top officials of Tokyo Electric Power Co. and the Economy, Trade and Industry Ministry had considered withdrawal from the nuclear fuel reprocessing project since 2002.

Masaya Yasui was serving as director of the agency's Nuclear Energy Policy Planning Division when he instructed the cover-up. Yasui, a technical official who had majored in nuclear engineering at the University of Tokyo, has been involved in atomic energy promotion policy for many years.

In other words, those involved in the promotion of nuclear power blocked moves toward abandoning the nuclear fuel recycling project.

However, Yasui denied having instructed the subordinate to cover up the data. "He might have brought such data to me, but I have no recollection of instructing him to cover it up."

In the late 1990s, the then International Trade and Industry Ministry commissioned the Radioactive Waste Management Center, which is now called the Radioactive Waste Management Funding and Research Center, to estimate the costs of disposing of spent nuclear fuel.

In 1998, the center estimated the costs at 4.2 to 6.1 trillion yen, one-fourth to one-third of the approximately 19 trillion yen needed to reprocess nuclear waste.

An April 20, 2004 memorandum, which the Mainichi Shimbun has recently obtained, states, "The subordinate notified director Yasui yesterday of the existence of the estimate. The director ordered the subordinate to 'keep it away from the eyes of the general public.'"

In an interview with the Mainichi, the subordinate admitted that Yasui had instructed him to keep the data somewhere where nobody else could see it.

However, officials of the agency's Nuclear Energy Policy Planning Division did not inform panel members of the existence of the estimated costs. In June of that year, the panel proposed a system under which the approximately 19 billion yen necessary to operate the Rokkasho reprocessing plant would be added to electricity bills.

Based on this, the government worked out the current nuclear power policy outline, which calls for all spent nuclear fuel to be processed and recycled.

2 nuclear safety panel members got 7.1 mil. yen donation from industry

TOKYO (Kyodo) -- The head of the Nuclear Safety Commission of Japan and a member of the government panel received donations totaling 7.1 million yen from the atomic power industry before assuming duties at the watchdog, the two said Monday.

Haruki Madarame, a former University of Tokyo professor who became the commission chief in April 2010, said he received 4 million yen over four years through 2009 from Mitsubishi Heavy Industries Ltd., a major manufacturer of nuclear power reactors.

Seiji Shiroya, another member of the panel who joined the commission at the same time as Madarame, said he received 3.1 million yen from a regional branch of Japan Atomic Industrial Forum Inc. over three years to 2009 while serving as a Kyoto University professor.

The forum consists of power companies and other companies in the nuclear industry.

Madarame said the donations have not influenced the panel's decision-making process. The five-member state commission is tasked with double-checking regulatory measures implemented mainly by the industry and science ministries to ensure nuclear safety.

The donations provided by private entities were intended to promote research at universities, and the money was spent to conduct research and to cover overseas business trip costs, according to the two experts.

Madarame said the panel has made public the minutes of its meetings and that he would leave it up to the public to judge whether such donations were appropriate.

TEPCO says water level in tank at Fukushima nuclear dropped due to quake

Tokyo Electric Power Co. (TEPCO) said on Jan. 2 that the level of water in a tank for the No. 4 reactor at the crippled Fukushima No. 1 Nuclear Power Plant dropped "abnormally" after an earthquake measuring up to 4 on the Japanese scale of 7 struck the Kanto and Tohoku regions on New Year's Day.

TEPCO, the operator of the troubled Fukushima nuclear power station, believes that after the earthquake, a supply of radioactively-contaminated water going from a spent nuclear fuel pool to the tank at the No. 4 reactor stopped when the water flowed oppositely into the reactor containment vessel. TEPCO said the incident did not affect the cooling of the spent nuclear fuel pool.

According to TEPCO, the water level in the tank drops about 1.6 centimeters per hour under normal conditions due mainly to natural evaporation. **But after the earthquake on Jan. 1, the water level was dropping by eight to nine centimeters per hour.** Normally, water in the tank is returned to the pool after going through a heat exchanger and filters to get rid of heat and foreign particles.

Toshiba to launch mobile decontamination system

Japanese electronics maker Toshiba has developed a mobile system to decontaminate areas affected by the accident at the Fukushima Daiichi nuclear plant.

The communities will begin full-scale decontamination work after the government's rules and procedures for the clean-up took effect January 1st.

Toshiba says the equipment can remove up to 97 percent of the radioactive substances from 1.7 tons of contaminated soil and sludge per day.

Toshiba and a Japanese machinery maker have also developed a machine to extract residual low-level radioactive materials from water in reservoirs and sewerage systems.

The 2 devices are based on technologies used to decontaminate the Fukushima plant.

Toshiba says it has already received requests to use the machines in factories. Some local governments have also expressed interest.

The firm says it is trying to reduce the equipment's operating cost and improve its treatment capacity, and hopes to increase production while assessing the demand.

Hosono: Fukushima as center for nuclear safety

Japan's nuclear crisis minister says he wants to make Fukushima Prefecture an international center to promote nuclear safety.

Goshi Hosono spoke Tuesday to NHK and explained a **plan to set up an international institute in Fukushima, where specialists would be trained in nuclear safety and advanced radiological medicine would be studied.** He says training personnel will be one of the major issues to overcome with respect to nuclear safety.

Hosono says the prefecture will be a relevant venue to learn about the basic principles of nuclear safety, as well as the long process of scrapping the reactors at the Fukushima Daiichi plant. The work is expected to take 30 to 40 years.

Hosono says he believes lessons learned from the ongoing nuclear crisis, including the use of medicine for people exposed to radiation, must be made available to the rest of the world.

Hosono also notes his ministry will concentrate on the **development of robots** that will be used to dismantle and dispose of the damaged reactors. The project is expected to rely heavily on robots to remove spent fuel rods and handle other highly radioactive material.

The nuclear crisis minister says he believes Japanese industry will be able to boost their competitiveness by taking advantage of the new technologies that will be developed to deal with the decommissioning of Fukushima Daiichi.

Tuesday, January 03, 2012 22:40 +0900 (JST)

NISA pledges to regain public trust

The head of Japan's nuclear safety agency has called for every possible effort to regain public trust in the government's energy policy.

Hiroyuki Fukano said on Wednesday that he is deeply sorry his agency was not able to prevent the nuclear accident at the Fukushima Daiichi power plant.

He said the agency's officials should remember that many Fukushima residents are still displaced from their homes.

Fukano said it is not easy to regain public trust in nuclear safety. He added it has completely been undermined by the accident and the officials must go back to basics.

The government agency, launched 11 years ago, will be united with the Nuclear Safety Commission and merged into a new nuclear safety body in April.

The new body will face many challenges. The agency was heavily criticized in a government report on the nuclear accident released in December.

The report said agency officials working on the emergency task force at the Fukushima plant evacuated in the initial stages of the accident. It also said the agency's collection and release of information was insufficient.

Wednesday, January 04, 2012 20:04 +0900 (JST)

Futaba mayor opposes radioactive soil storage

The mayor of Futaba Town in Fukushima Prefecture says he opposes the government's plan to build a facility for storing radioactive waste soil in Futaba County.

Mayor Katsutaka Idogawa expressed for the first time his opposition to the facility in his New Year address to town employees on Wednesday.

The mayor said he cannot accept the facility because townspeople who evacuated would not be able to return once it is built.

The central government officially requested late last month that a temporary storage facility for radioactive waste soil be built in Futaba County. The county has eight municipalities, and it is also home to the Fukushima Daiichi nuclear power plant.

The entirety of Futaba Town is designated as a no-entry zone. The residents and the town office have been evacuated to a city in Saitama Prefecture, north of Tokyo.

Wednesday, January 04, 2012 19:09 +0900 (JST)

Fukushima to conduct blanket screening of rice to be harvested in fall

FUKUSHIMA (Kyodo) -- The Fukushima prefectural government plans to conduct blanket screening of rice to be harvested this fall to ensure product safety, following the detection of excessive levels of radioactive cesium in last year's crop in the prefecture hit by a major nuclear crisis, Fukushima officials said Thursday.

The prefecture will subsidize agricultural cooperatives and distributors purchasing high-accuracy instruments that can measure radiation levels quickly, possibly use a fund scheduled to be established to buy the equipment estimated to cost around 2 billion yen, they said.

The Fukushima government expects that more than 100 measuring instruments, each costing about a dozen million yen and equipped with a conveyor belt to facilitate speedy checks of samples, would need to be installed across the prefecture to efficiently examine all rice bags before shipment, according to the officials.

The prefecture also plans to have each rice bag carry a bar code so consumers can trace the results of screening on the Internet, the officials said.

Last October Fukushima Gov. Yuhei Sato declared that newly harvested rice produced in the prefecture, which hosts the radiation-spewing Fukushima Daiichi nuclear power plant, is safe for shipment after tests showed all samples cleared the central government-set allowable limit of 500 becquerels per kilogram for radioactive cesium.

However, excessive levels of contamination were found in rice produced in some areas in the prefecture after the governor's declaration, following additional tests conducted at the request of farmers.

The central government is set to lower the allowable limit for radioactive cesium found in food items from 500 becquerels to 100 becquerels in April, and some manufacturers are now developing an updated model of their conveyor-belt radiation measuring instrument to enhance its accuracy.

(Mainichi Japan) January 5, 2012

Municipalities to be prepared for nuke accidents

More than 130 Japanese municipalities are stepping up preparations for nuclear accidents after the government tripled the size of emergency zones around nuclear plants to 30 kilometers.

Japan's Nuclear Safety Commission expanded the size of the zones from 10 kilometers last November.

The move follows the issue of evacuation orders to areas up to 30 km from the stricken Fukushima plant, far beyond the government's initial expectation.

The expansion includes not only communities hosting nuclear power plants but also surrounding areas, multiplying the number of municipalities involved.

These local governments must now boost disaster preparedness by setting evacuation routes and securing shelters.

Many are reaching out beyond prefectural borders with plans to share food and other goods, and dispatch staff in the event of nuclear disasters.

The government almost tripled the funding for nuclear disaster preparedness to 108-million dollars in a budget plan for the next fiscal year.

But further financial help will be needed for the municipalities within the expanded emergency zone.

Thursday, January 05, 2012 08:59 +0900 (JST)

New nuclear safety agency's performance questioned

The new nuclear safety agency will be tasked with overhauling Japan's nuclear regulations, but has yet to come up with concrete safety rules.

The new agency, which will be launched under the Environmental Ministry in April, faces the challenge of providing supervision and advice to power utilities in the event of an emergency.

The agency will take over the functions of the industry ministry's Nuclear and Industrial Safety Agency. It will also be responsible for the advisory functions of the Cabinet Office's Nuclear Safety Commission.

The new agency is to be staffed with 485 people.

Japan's government has allocated a budget of nearly 650 million dollars for the agency in its financial plan for the next fiscal year, unveiled late last month.

That's up nearly 180 million dollars from this year, a sign that the agency is expected to strengthen crisis management, upgrade its regulations and take on more work.

The government has come under fire for being slow to collect and release existing data after the nuclear accident last March, and for not instructing the operator of the crippled Fukushima plant to prepare for a huge tsunami.

The government says **the new body must secure experienced, professional personnel and cultivate a sharper sense of crisis among officials in addressing safety.**

A Cabinet Ministry senior official preparing for the launch of the new agency says it must protect the people and the environment.

Thursday, January 05, 2012 07:56 +0900 (JST)

Fukushima mayors seek help over waste storage

Municipalities around the troubled Fukushima Daiichi nuclear plant have asked for help from the prefectural government over the central government's plan to temporarily store radioactive waste in the communities.

Representing 8 towns and villages in Futaba County, Tomioka Town Mayor Katsuya Endo made the request when he met Fukushima Governor Yuhei Sato on Thursday.

Endo said the municipalities take the state government's proposal seriously but that it is too much of a burden for them to handle alone.

He asked the prefecture to act in coordination with the municipalities and set up a forum for regular meetings, citing the difficulty they face as a result of mass evacuation from their areas following the nuclear accident.

Governor Sato responded positively to the request and promised to create a forum for talks.

The municipalities are divided over the central government's plan on interim storage of radioactive soil and debris. The mayor of Futaba Town, Katsutaka Idogawa, voiced opposition while some other local leaders say they have no choice but to accept it.

Thursday, January 05, 2012 14:07 +0900 (JST)

Number of hunters in Fukushima Prefecture drops due to nuclear crisis

The Yomiuri Shimbun

The number of registered hunters in Fukushima Prefecture this season plunged about 30 percent from the previous season amid negative effects of the accident at the Fukushima nuclear plant, raising fears of damage to crops due to pests.

As to reasons for the decline, some people who lived in the no-entry zone left guns behind when they evacuated, while others fear that wild animals and birds in the prefecture may be contaminated with radioactive substances.

The hunting season generally falls between mid-November and mid-February, with an extra month for boar hunting.

Local residents who wish to hunt for birds and other animals are required to register with the prefectural government every year to engage in their respective hunting methods, such as the use of firearms or traps.

This season, there were 3,291 applications to register in the prefecture as of Nov. 15, much lower than the 4,779 in the previous season.

Shinichi Yamada, 67, from the town of Namie, who now lives in a house provided by the Iwaki city government, went hunting at least 30 times per season until this season.

But he did not register as a hunter this season because he is not allowed to retrieve guns from his home in the no-entry zone and bring them to his temporary housing unit.

Though he entrusted one gun to an acquaintance, visiting the acquaintance to retrieve his gun would cost him much money and time.

Yamada said, "If my life as an evacuee is prolonged, I may have to give up on trying to get my gun."

Masami Ogawa, 69, of Fukushima City also gave up on hunting this year, as radioactive cesium exceeding the government's interim limit of 500 becquerels per kilogram was detected in the meat of boars and black bears captured in the prefecture.

After the prefectural government warned local residents not to eat the meat of boars and other animals captured in eastern and central parts of the prefecture, he decided not to register.

"It had been one of my great pleasures to see neighbors tasting meat [of game I brought back from hunting]," Ogawa said.

With the decline in the number of hunters, fewer rodents and pests are expected to be killed, raising fears of widespread damage to agricultural crops in the prefecture.

In an effort to avoid this problem, the Nihonmatsu City government started offering 20,000 yen per boar to hunters starting this season.

Though the Date City and Kawamata Town governments have taken similar measures, it is uncertain whether it will be enough to encourage local residents to continue hunting.

Yoshihiko Mizuno, chief of the prefectural government's natural environment preservation section, said: "At this stage, there is nothing we can do to encourage people to register as hunters. We should steadily take measures to prevent damage caused by harmful animals and birds, such as encouraging people to improve fences."

The numbers of hunters in Iwate and Miyagi prefectures have also been on the decline due to impact of the Great East Japan Earthquake.

The number of registered hunters was 2,580 as of Nov. 10 in Iwate Prefecture, down from 2,808 a year ago.

In Miyagi Prefecture, the number was 2,000 as of Nov. 18, down from 2,278 a year ago.

Local government officials said the decreases were mainly a result of people losing their guns in the tsunami, while others decided to retire early in the wake of the disaster.

(Jan. 5, 2012)

Worst scenario during Fukushima crisis was reactor explosion: Hosono

TOKYO (Kyodo) -- The government predicted two weeks after the nuclear crisis erupted at the Fukushima Daiichi power plant in March that the worst scenario would involve an explosion at the No. 1 reactor and the water inside the No. 4 unit's spent fuel pool drying up, nuclear disaster minister Goshi Hosono said Friday.

That scenario, which would have resulted in a more extensive release of radioactive material, was not announced because it was "quite difficult to foresee" at that time, Hosono said, noting the No. 1 reactor's containment vessel was believed to already have been damaged by an explosion inside the building housing the reactor.

"It was only a scenario based on a hypothetical assumption... We refrained from announcing it, as there was a possibility of triggering unnecessary concerns among people," said Hosono, who at the time was serving as a special adviser to then Prime Minister Naoto Kan.

Hosono also said that he was making "preparations to act against any kind of possibility" and "there was nothing wrong" in what he did in dealing with the nuclear crisis.

The scenario was produced on March 25 by Japan Atomic Energy Commission Chairman Shunsuke Kondo, in line with Kan's order.

The nuclear fuel inside the Nos. 1 to 3 reactors is believed to have melted down in the early days of the crisis, triggered by the March 11 mega earthquake and tsunami.

Explosions also took place at the buildings housing the Nos. 1, 3 and 4 reactors, blowing off the roofs and walls of the structures.

The No. 4 unit is different from the three other units, in that all the fuel in the reactor had been placed inside the spent fuel pool because the reactor was halted for a regular inspection before the natural disaster.

(Mainichi Japan) January 6, 2012

Japan to set 40-year limit for operation of nuclear reactors

TOKYO (Kyodo) -- The Japanese government plans to limit the operation of nuclear reactors to 40 years, and to legally require nuclear plant operators to take measures to prepare for severe accidents that could result in serious damage to the reactor core, nuclear disaster minister Goshi Hosono said Friday.

The plan is to be included in a bill to amend a law on the regulation of nuclear reactors and nuclear fuel material, which the government is currently compiling in the wake of the nuclear disaster at the Fukushima Daiichi power plant.

It would be the first time for the country to stipulate the life span of a nuclear reactor, according to government officials. The United States has a similar limit, they added.

The bill is expected to be submitted to parliament during the ordinary Diet session to be convened later this month. The officials, however, did not make clear when they expect the revised law to come into force.

According to the outline of the planned law revision, the government would not allow nuclear reactors to operate for more than 40 years, although there would be exceptions if certain requirements are met.

If a plant operator sought an extension, the government would check the degree of obsolescence of the facility, and the operator's technological ability to appropriately maintain the facility.

But Hosono told a press conference that approved extensions would be "very rare" under the envisioned regulatory reinforcement.

Of Japan's 54 commercial reactors, three are at least 40 years old -- the No. 1 reactors at Tokyo Electric Power Co.'s Fukushima Daiichi plant, Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture, and Kansai Electric Power Co.'s Mihama plant also in Fukui.

As a result of the Fukushima nuclear accident, triggered by the March 11 megaquake and tsunami, three reactors -- including the No. 1 unit -- suffered core meltdowns and released massive amounts of radioactive materials into the environment.

Under current regulation, the government has left it up to utilities whether to take steps against severe nuclear accidents, based on the assumption such disasters cannot happen.

(Mainichi Japan) January 6, 2012

Tunnel full of radioactively-contaminated water found at Fukushima nuclear plant

A massive amount of water contaminated with radiation has been found in a tunnel at a waste treatment facility at the crippled Fukushima No. 1 Nuclear Power Plant, the plant operator said.

The radioactive water amounts to 142 cubic meters, enough to fill 710 drums, and it contains about 100 becquerels of radioactive cesium per liter, according to Tokyo Electric Power Co. (TEPCO). Company officials said that the radioactive water has not leaked into the sea from the tunnel.

TEPCO suspects that the water comes from rain that flowed into the tunnel and got contaminated with radiation.

In late December last year, about 220 cubic meters of radioactive water, enough to fill 1,100 drums, were found in another tunnel on the premises of the power station. The high concentration of radioactive substances in that water led TEPCO to suspect that the water leaked from a facility storing radioactive water from the basement of a reactor building.

(Mainichi Japan) January 7, 2012

Photo exhibition shows pictures of animals left behind in Fukushima no-go zone

SAPPORO -- A photo exhibition showing dozens of pictures of animals left abandoned within the no-go zone around the crippled Fukushima No. 1 Nuclear Power Plant started here on Jan. 6.

The exhibition, being held in an underground passageway near Sapporo Station, puts on display some 60 pictures of pet animals and livestock that were left abandoned within the 20-kilometer zone around the troubled nuclear plant after the nuclear crisis broke out in March last year.

Hiroshi Hoshi, 56, a company executive from Soma, Fukushima Prefecture, who currently lives in Tokyo, took the pictures. By the end of last year, he had taken custody of some 100 animals that were left within the no-go zone. After learning about his activities, some 10 people in Sapporo planned to hold the exhibition, wishing to rescue as many animals as possible.

Among the photos are a picture of a dog whose head got trapped in a fence after it tried to eat food beyond the fence, a cow that starved to death, and a dog weakened by skin disease.

The exhibit is running through 7 p.m. on Jan. 7. Organizers are also asking for donations.

Govt mulls public operations of N-plants

The Yomiuri Shimbun

The government will study whether it should place the management of nuclear power plants in public hands as part of an overhaul of the current system in which private utilities hold managerial authority, it has been learned.

The implementation of reform could drastically change the nation's nuclear policy, which has been in place for more than 40 years.

In addition to the transfer of plant management to a public body, the government will examine the impact of changing the ownership of nuclear plants.

By increasing its authority over nuclear plant management, the government hopes to clarify whether the private or public sector is responsible for a range of matters such as compensation in the event of an accident, as well as to generate support from disgruntled local governments opposed to state plans to restart nuclear reactors.

Economy, Trade and Industry Minister Yukio Edano said the current system must be reformed.

"Nuclear plants are owned by private utilities but the state is responsible for compensation and decontamination work [in the aftermath of a nuclear plant accident]. It can no longer be permitted [for the private sector] to enjoy only the benefits [of the system]," he told The Yomiuri Shimbun.

"The course of action by private utility firms should be determined: either they'll continue to manage nuclear plants while paying huge insurance premiums or they'll relinquish the benefits they currently enjoy and ask the state to bear the cost of compensation [in the event of an accident]," Edano said.

While nuclear power plants are owned and managed by private utilities, the government is responsible for deciding where they should be built and has developed regulations such as safety guidelines. But in the aftermath of the crisis at the Fukushima No. 1 nuclear power plant, the operator of the crippled plant, Tokyo Electric Power Co., found it impossible to pay damages without government assistance.

Given Edano's desire for reform, METI will accelerate discussions by spring and is likely to make conclusions while watching the progress of talks about a revision of the Law on Compensation for Nuclear Damage, scheduled to be concluded this summer.

The law holds utilities liable for unlimited damages, but has proved ineffective because TEPCO cannot pay full compensation for the damages caused by the crisis at Fukushima.

Fukushima exposes contradictions / Nuclear crisis prompts govt to rethink private companies' operation of N-plants

Hiroshi Ikematsu / Yomiuri Shimbun Staff Writer

The government's moves to overhaul the state's nuclear policy were prompted by serious contradictions discovered in that policy, as a result of the nuclear crisis at the Fukushima No. 1 nuclear power plant.

Although the Law on Compensation for Nuclear Damage stipulates that electric companies have unlimited liability in the case of accidents, the government had no choice but to support Tokyo Electric Power Co.'s efforts to pay compensation for damage caused by the Fukushima crisis. Therefore, the government plans to overhaul the law, including a review of utilities' unlimited liability.

If it does so, however, entrusting utility companies with the operation of cost-efficient nuclear power plants, the companies may just siphon off profits and push the risk of accidents onto the state.

Hence, the government likely will review the current system in which electricity companies possess and operate nuclear power plants. There are various options for overhauling the nation's nuclear policy:

-- Bringing the operation and management of nuclear power plants under state control, completely separating the plants from utility firms.

-- Entrusting only the operation of plants to the state.

-- Managing plants through a public organization funded jointly by the public and private sectors.

A new system of managing nuclear power generation may have a serious impact on the earnings of utility firms such as Kansai Electric Power Co. Nuclear power plants provide a large share of KEPCO's profits.

The separation of nuclear power plants from electricity firms may require passage of a resolution at the companies' general meetings for shareholders. However, it is highly possible such resolutions would have difficulty passing.

===

Edano: Fair competition needed

The Yomiuri Shimbun

The following is a Yomiuri Shimbun interview with Economy, Trade and Industry Minister Yukio Edano:

The Yomiuri Shimbun: The crisis at the Fukushima No. 1 nuclear power plant has brought to light problems with the government policy of entrusting the management and operation of nuclear power plants to private utility firms.

Yukio Edano: Electric companies have been collecting revenue from nuclear power plants. But after the outbreak of the nuclear crisis, [Tokyo Electric Power Co.] cannot pay for the damage [by itself] and is using taxpayers' money, which has made it very unclear [where the responsibility lies]. It should be clarified whether they will take all the risks [of operating nuclear plants], or give up the perks they enjoy and ask the government to handle the management.

Concerning who should operate the power plants, we'll hammer out a course of action by summer based on discussions in the Energy and Natural Resources Committee [the economy minister's advisory body] and a decision by electric companies.

Q: The government has proposed four types of reform to force utilities to separate power generation from power transmission and distribution, toward liberalization of the power supply business.

A: It's necessary to set up a system in which [users] can choose electric companies and power rates. The power transmission section [monopolized by electric firms] has become an obstacle to increasing renewable energy sources and the number of new companies entering the business. So we should institute a fair power transmission system.

Japanese utility firms separate the accounting for their power transmission sections, which has hindered [new entrants] from participating in the business for fair competition.

The most likely option is that various enterprises generate power while neutral entities transmit the electricity. Furthermore, it is necessary to greatly strengthen "tie lines" [that connect different electricity systems through which the firms buy and sell electricity]. So, we'd like to intensify public involvement [in the power business.]

Q: What will happen to the temporary state control of TEPCO?

A: Society will not allow that company to rebuild [as a new TEPCO] by casting off its responsibility for such things as compensation for the nuclear crisis and decommissioning the plant. There's a high possibility [the government] will need [to put TEPCO under complete public control] for decommissioning and compensation.

But it is essential for the private sector to shoulder the responsibility to supply electricity. We don't intend [to keep the firm] under state control forever.

Q: What will you do about the management of other electric companies?

A: Other companies' situations are different from that of TEPCO. But the structure--monopolizing local areas' power supply and hindering new entrants--is not socially acceptable. We'd like to create a situation in which winners are determined by the efforts of their management in an environment of fair competition.

(Jan. 7, 2012)

Tiny particles may illuminate reactor cores

The Yomiuri Shimbun

Using particles from space to look into the heart of nuclear reactors--this is the goal of researchers at Nagoya University.

The Yomiuri Shimbun has learned that a team of researchers from the university is developing technology to use elementary particles from space to see into the interiors of crippled reactors at the Fukushima No. 1 nuclear power plant.

Their aim is to establish technology that can obtain images similar to X-rays of what is happening inside the Nos. 1 to 3 reactors, whose cores melted down in the wake of the March 11 earthquake and tsunami.

Tokyo Electric Power Co. plans to start operations to move melted-down nuclear fuel out of the reactors within the coming 10 years as a step toward decommissioning them.

To do so, the power utility must know exactly where the lumps of nuclear fuel are in the reactors. The government has therefore thrown its support behind the critical project at Nagoya University.

The university team is scheduled to launch studies on practical use of the envisaged technology when the amount of radiation being emitted from the reactors is reduced, making it possible for members to work nearby.

The team comprises researchers at the state-run university's Kobayashi-Maskawa Institute for the Origin of Particles and the Universe, and is led by Associate Prof. Mitsuhiro Nakamura of the university.

The researchers are using elementary muon particles in lieu of X-rays. Muon particles are one of 12 kinds of elementary particles that constitute matter. They have properties similar to electrons, but

weigh about 200 times more, and fall to Earth from space at a rate of one particle onto a person's palm per second.

Muon particles have a strong ability to penetrate substances, but are absorbed in proportion to the concentration of those substances. The greater the density of the substance they pass through, the more muon particles are absorbed and the more their number declines, according to the study team.

Observation of muon particles penetrating the reactors will make it possible to determine differences in density within the reactors, the researchers said.

By setting a special film measuring one square meter near each of the reactors, researchers will be able to create an image of their interiors based on the muon particles penetrating the reactors, they said.

As the density of nuclear fuel is higher than steel and other materials used in the reactors, the areas containing the fuel will appear paler than the images of other materials on the special film, making it possible to determine the exact locations and shapes of melted-down nuclear fuel, the researchers said.

The Nagoya University group successfully observed the bottom of the crater of Mt. Showa Shinzan, a volcano in Hokkaido, in collaboration with the University of Tokyo in 2007, obtaining images of magma locations.

Nakamura took the initiative in starting the reactor fluoroscopy project after the March 11 disaster.

The Japan Science and Technology Agency of the Education, Culture, Sports, Science and Technology Ministry has designated the research project as eligible for receiving government subsidies from fiscal 2011 to 2014.

When the fluoroscopy method is applied to reactors, however, the special film may be affected by gamma rays emitted from the reactors, the researchers said. Gamma rays also have strong powers of penetration.

The research team therefore plans to shield the reactors with lead, so only muon particles can be detected.

The exact locations of the melted-down nuclear material in the Nos. 1 to 3 reactors and their container vessels are currently unknown.

Noda wants temporary storage facility in Fukushima

Prime Minister Yoshihiko Noda has asked the governor of Fukushima to allow the government to build a facility in the prefecture to temporarily store radioactive soil.

Noda visited a disaster-hit area for the first time this year and met Fukushima Governor Yuhei Sato at

the prefectural office on Sunday.

Noda said the fight is not over yet, even though he declared last month that the Fukushima Daiichi reactors had reached a state of cold shutdown -- the second phase in the program to bring the plant under control.

He said the government will intensify its efforts to deal with decontamination, compensation and health management issues.

Noda asked Sato to consider the request that Environment Minister Goshi Hosono made late last year to have a storage facility built in Futaba County.

Sato said he would like the government to remember that many people from Fukushima were unable to celebrate the New Year in their hometowns.

He said children are the future of Fukushima and their health must be protected. He urged Noda to provide free medical services to all Fukushima residents under the age of 19.

Sato said the damage caused by **the accident was so severe that it had seriously undermined confidence in the government's nuclear policy.**

He asked Noda to shut down and dismantle all 10 reactors at the Fukushima Daiichi and Fukushima Daini plants as called for in the reconstruction plan.

Sunday, January 08, 2012 22:53 +0900 (JST)

Fukushima governor says accident not yet contained

Fukushima Governor Yuhei Sato has called on the government to deal responsibly with the nuclear accident until the evacuees are able to return home.

The central government and Fukushima held a regular meeting on the prefecture's reconstruction on Sunday. **Sato criticized the declaration made by Prime Minister Yoshihiko Noda in December that the nuclear accident had been contained.**

He said the sentiments of Fukushima residents are very different, and asked the government to understand this.

He said a declaration that the accident has been contained can only be made after all the evacuees return home. He urged the government to deal responsibly with the accident until that time.

Noda replied that the government will swiftly start where it can and rebuild infrastructure that people need for their daily lives.

He said he wants to provide sufficient support to people who are being asked to evacuate for a long

time, and is determined to work for reconstruction with the prefecture, municipalities and the people of Fukushima.

Sunday, January 08, 2012 22:53 +0900 (JST)

Noda hopes to restore healthcare in disaster zone

Japan's Prime Minister Yoshihiko Noda says he hopes to restore healthcare in areas affected by the March 11th disaster and the accident at the Fukushima Daiichi nuclear plant.

Noda visited a private hospital in Minamisoma City, Fukushima Prefecture, on Sunday.

The hospital is 24 kilometers from the damaged plant.

The central government lifted the evacuation advisory for the area last September. **But the hospital is still struggling to find staff to provide medical services for patients.**

Hospital director Yasunori Kikuchi said medical care in the region is on the verge of collapse, despite the lifting of the evacuation advisory.

Noda said it is vital to have a functioning healthcare system in place when people return to rebuild their hometowns in Fukushima Prefecture.

He added that he wants policy-making to reflect the opinions he heard during his visit.

Sunday, January 08, 2012 22:53 +0900 (JST)

2 towns at risk of disappearing / Okuma, Futaba face uncertain future due to nearby crippled N-plant

Yasushi Kaneko / Yomiuri Shimbun Staff Writer

How will the government help the estimated 25,000 people who lived in areas where residency likely will be prohibited for an extended period due to the crisis at the Fukushima No. 1 nuclear power plant?

In particular, Okuma and Futaba towns in Fukushima Prefecture will face extreme hardship because most of their residential areas fall in those areas. The crippled nuclear plant is located in the two towns.

It will be extremely difficult for the municipal governments to restore the towns to their conditions before the disaster. The central government will need to consider providing assistance to the evacuees so they can lead self-reliant lives.

The Education, Culture, Sports, Science and Technology Ministry detected many spots in the two towns where annual levels of exposure to radiation would be 100 millisieverts or higher. This is at least five times higher than the level deemed safe for human habitation.

The ministry measured radiation levels one meter above the ground and monitored the radioactive contamination of soil.

The ministry has regularly measured radiation levels using vehicles and planes in affected prefectures--mainly Fukushima Prefecture but also including Tokyo--with cooperation from local governments.

Air radiation levels were measured at about 3,000 spots in the no-entry zone around the nuclear plant and planned evacuation areas as of Dec. 11. Of them, annual radiation levels of 50 millisieverts or higher were estimated at about 700 spots. **These sites likely will be designated as zones where residency is prohibited for an extended period.**

According to Japan Atomic Energy Agency calculations, it would take more than 50 years for radiation levels at the sites to naturally fall below the safe limit of 20 millisieverts.

Environment Minister Goshi Hosono has said it will be "difficult to lower air radiation levels with conventional decontamination methods" in areas where annual levels are 50 millisieverts or higher. Residing in these areas will be forbidden for an extended period.

The government has only said "it will likely take at least five years" until residents can shift back to these areas. The government has not specified after how many years residents can return--or even if they actually will be able to live there again.

A survey by Fukushima University found that about 60 percent of residents of the two towns wish to return. Many of the evacuees said they cannot make any concrete plans for the future until it becomes clear whether they will be able to return to the towns.

The government needs to properly explain the current conditions in the towns--and the likely fate of the municipalities--to the evacuees.

Government assistance to evacuees mainly comprises measures that assume they will return home, such as construction of temporary housing units in which they can live for two years in principle.

From now, it will be necessary to consider helping evacuees resettle elsewhere by offering assistance in such fields as employment and education, and helping them fit in and form local communities.

The government should present such measures as soon as possible.

Meanwhile, **Futaba Mayor Katsutaka Idogawa has suggested his town might need to move elsewhere.**

"I'll have to ask for a temporary site to which our town will be relocated," he said to reporters.

Okuma and Futaba might have to consider merging with neighboring municipalities to which some residents will move, if the locals consent to such a tieup.

(Jan. 9, 2012)

Renewal after nuclear disaster impossible without sound foundations

All-too-simple calls to move toward renewal by pressing ahead with restitution for victims of the Fukushima nuclear disaster ignore the problem's complexity. Thus far, not even half the households ordered to evacuate by the government because of the disaster have apparently applied for compensation payments from Tokyo Electric Power Co. (TEPCO), the plant's operator.

Resuming nuclear plant operations "once their safety is confirmed" is not the straightforward path that it may appear to be, either, for a safe method of operating nuclear reactors has yet to be established.

Revival and renewal cannot be achieved on such half-baked foundations.

According to news reports over the New Year holiday, TEPCO has received 34,000 non-corporate compensation applications since September 2011. Since approximately 150,000 people from about 70,000 households were subject to mandatory evacuation, more than half those households have yet to submit their claims.

So why have disaster victims been slow to apply for recompense?

"Because the crisis hasn't ended yet," an acquaintance of mine from Fukushima who's evacuated to Yamagata Prefecture says. "We're still in the midst of it."

A self-employed man in his 60s, the evacuee says he was struck by a scene in the Dec. 28 airing of the television drama series "Carnation," set around the World War II era. In the scene, the protagonist listens in a daze to a radio broadcast, in which Emperor Hirohito announces Japan's unconditional surrender in the war.

"The disaster hasn't ended for us," the aforementioned man repeats.

His family has been torn apart. Not only must he go through life with fears about his well-being, so must his children and grandchildren. How is anyone going to take responsibility for that, he wonders, asking himself whether it would be better to consult a lawyer instead of negotiating individually with TEPCO. Though he now has had the liability application papers sent to him, he still hasn't decided what to do.

When the liability claim process began last fall, TEPCO's applications and other papers were deemed too complicated, and the utility was forced to produce new versions. The government-backed Nuclear Damage Liability Facilitation Fund was founded, and lawyers and administrative scriveners began making consultation visits to victims who had been relocated.

As compensation applications were submitted, piles of paperwork accumulated. Some 2,200 staff, of which 800 are TEPCO employees, are now fielding inquiries and conducting data entry at the 14-floor building of TEPCO Systems Corp., a TEPCO subsidiary located in Tokyo's Koto Ward. The process may have been streamlined, but only a small percentage of evacuees have so far applied.

Bigger challenges lie further down the road: damage claims of an unprecedented scale that are expected to be submitted by victims who evacuated voluntarily, as well as those who still live in areas with high levels of radiation. The government has announced that some 1.5 million people from central and northern Fukushima Prefecture are eligible for damages. Meanwhile, there are 500,000 people from the Aizu and Shirakawa regions, which were excluded from compensation eligibility. Damage claims from those beyond the prefecture's borders, in both Japan and overseas, cannot be ignored, either.

Compensating the disaster's victims will be a massive task. Municipal governments, in addition to TEPCO and central government organizations, should also embark on reparative efforts. An attitude in which cost and other logistics are the primary focus will not get us anywhere. Only by taking steady, honest steps can we expect to approach renewal.

The year 2012 will be the year that the government decides what it's going to do about nuclear power.

Will we be able to make it through the summer without resuming operations at nuclear plants? Is a return to thermal power generation acceptable, even if it means emitting more greenhouse gases? Can we get by without our nuclear power plants, especially at a time when Iran's nuclear program is causing tension in the Strait of Hormuz? Are the above reason enough to turn a blind eye to the dangers of nuclear power plants? The government will likely face an election that elucidates the will of the people.

The TEPCO Systems building, where compensation claims are being reviewed, is located on the former site of Eiichi Shibusawa's residence. Known as the father of Japanese capitalism, the Meiji-era industrialist established around 470 companies during his lifetime.

It's an interesting stroke of fate that efforts to clean up the mess left by economic development are taking place in a location associated with Shibusawa, a man who denounced undue profits and placed great value on the public good and morality. We must move forward with the awareness that reviewing Japan's energy policy is not a backward-looking dilemma, but a cutting-edge challenge. (By Takao Yamada, Expert Senior Writer)

(Mainichi Japan) January 9, 2012

Gov't request for temporary storage site displeases Fukushima Pref.

FUKUSHIMA (Kyodo) -- Prime Minister Yoshihiko Noda on Sunday again sought cooperation from Fukushima Prefecture to accept a temporary storage site for contaminated soil and waste from the nuclear crisis at the Fukushima Daiichi power plant, but the prefecture's governor instead expressed strong displeasure at Noda's announcement last month that the crisis has been brought under control.

That announcement was "far from the feeling of the residents in Fukushima Prefecture and those who had to evacuate" from the radiation-contaminated areas, said Fukushima Gov. Yuhei Sato at a meeting to discuss decontamination and reconstruction work in the prefecture. "We can call it under control only when evacuated people can come home."

The governor's comment reflected the strong frustration among people in crisis-hit areas of Fukushima over Noda's announcement in mid-December that the crippled nuclear plant had been brought to a state of "cold shutdown" and that "the accident at the plant itself has been settled."

Following the announcement, the central government asked the Futaba district of Fukushima Prefecture to host a temporary storage facility for contaminated soil and waste to be removed from around the crippled nuclear power plant in the prefecture.

Huge piles of plastic bags containing used radioactive gear and other contaminated waste are seen at the J-Village facility. (Photo courtesy of TEPCO)

Some experts, as well as politicians from both the ruling and opposition camps, have said it was too early to call it settled. The Fukushima prefectural assembly also unanimously passed a resolution demanding the central government retract the announcement.

Some local leaders in eight municipalities of Futaba district have said they would accept to host the planned interim storage, but others, including Futaba town mayor Katsutaka Idogawa, are opposed to the idea. Fukushima Gov. Sato has held a position that the proposal should be examined carefully.

(Mainichi Japan) January 9, 2012

N-zones may keep 25,000 from home

The Yomiuri Shimbun

The homes of about 25,000 evacuees from around the Fukushima No. 1 nuclear power plant are expected to fall within zones where the government will prohibit residency for at least five years, according to government sources.

The number accounts for about 30 percent of evacuees from the current no-entry and expanded evacuation zones.

The government will likely establish the areas where residence is prohibited for at least five years in seven of 11 affected municipalities in Fukushima Prefecture, when it reorganizes the no-entry zone and expanded evacuation zones into three new zones.

About 109,000 people have evacuated from the 11 municipalities, which are wholly or partially inside the no-entry zone and expanded evacuation areas. Of these, about 86,000 people were from the no-entry zone and expanded evacuation zones.

The new zones in which residency will be prohibited for a minimum of five years will cover areas where annual radiation levels are projected to be 20 millisieverts or higher for at least that amount of time. The homes of about 90 percent of the residents of the town of Okuma and about 70 percent of those from the town of Futaba will likely fall under this category.

The sources also revealed that the central government has asked some municipalities to merge.

A no-entry zone currently covers areas within a 20-kilometer radius from the nuclear plant, and places outside the no-entry zone where annual levels of radiation exposure may reach 20 millisieverts are designated as expanded evacuation zones.

As early as April 1, the government plans to reorganize these areas into three new zones--zones where residency is prohibited, zones with restricted residency, and zones being prepared for residents' return.

Based on the latest data from radiation monitoring by the Education, Culture, Sports, Science and Technology Ministry, the government will discuss the plan with the local governments and decide on the new zoning by March.

According to the sources, the central government's decontamination work under a law concerning special measures to cope with environmental pollution caused by radioactive substances will first be implemented in areas where radiation levels are relatively low. The law went into effect Jan. 1.

This will delay the start of decontamination work in zones where residency is prohibited for the time being.

Areas whose current annual radiation levels stand at 50 millisieverts or higher one meter above the ground will likely be designated as zones where residency is prohibited.

According to some projections, including one released by the science ministry on Dec. 11, parts of the towns of Okuma and Futaba as well as the city of Minami-Soma and three other municipalities inside the no-entry zone will likely be designated as zones where residency is prohibited for an extended period. About 23,500 people lived in these areas.

The zones also will likely cover four municipalities currently designated as expanded evacuation zones, including parts of the village of Iitate, in which about 2,000 people lived.

Designations of zones with restricted residency and zones being prepared for residents' return are expected to affect about 30,000 residents each.

But the proposed zoning may split certain municipalities into two different categories. In that case, the central government may consider prioritizing decontamination work in such municipalities, after consulting the local governments concerned, so the entire municipality can be designated as a zone being prepared for residents' return.

Mayor Tamotsu Baba of the town of Namie, which neighbors Okuma and Futaba, said he was asked to consider a merger of the three towns and Katsurao Village into a single municipality.

A senior official of the central government's team to assist nuclear disaster victims reportedly spoke to the mayor regarding the plan in late December, when the official visited the town government office.

Baba quoted the official as saying, "There is a choice of a municipal merger. Why don't you merge [with other municipalities] to improve your infrastructure?"

The mayor said he replied, "I must hear the opinions of the town's residents. I can't just make a snap decision."

(Jan. 9, 2012)

Monju reactor operator paid 109 mil. yen in fees to related bodies

TOKYO (Kyodo) -- The state-run operator of Japan's Monju prototype fast-breeder reactor paid a total of 109 million yen in 2009 to bodies linked to it as "membership fees," raising concern about the use of taxpayers' money for the entity, a ruling party panel found Monday.

The Japan Atomic Energy Agency under the jurisdiction of the Ministry of Education, Culture, Sports, Science and Technology, provided the money between April and September in 2009 to the bodies, at some of which former ministry and agency officials had landed cozy postretirement jobs.

In fiscal 2009, the operator of the Monju reactor received around 185 billion yen in state subsidies, part of which was financed by a tax to promote the development of power resources that is charged on top of utility charges paid by households.

Retired senior bureaucrats often assume highly paid posts at government-affiliated bodies and private-sector firms related to their former areas of supervision under a dubious practice known as "amakudari," literally meaning descent from heaven.

The Democratic Party of Japan panel on administrative reform found that the atomic energy agency provided the fees 124 times for the purpose of supporting the entities in the reported period.

Among the recipients, the Atomic Energy Welfare Association, which offers welfare services to the agency's officials, received around 4 million yen every month between April and September 2009.

The Wakasa Wan Energy Research Center, which conducts research on nuclear power-generation technologies, received 31.5 million yen in September that year. A former director general of the science ministry served as an executive of the center.

A panel member said the operator of the Monju reactor should have reduced its spending to the minimum necessary, but an official of the agency told Kyodo News that it needed to pay the membership fees as part of its operations.

In November, the Government Revitalization Unit, a body tasked with screening wasteful spending, proposed a sweeping review of the long-running program to develop nuclear fuel recycling technology using the Monju reactor. The reactor located in Tsuruga, Fukui Prefecture, has been plagued by a series of mishaps, casting doubt on the project's viability.

Separately, the DPJ panel also found that the National Institute of Information and Communications Technology, which is linked to the Ministry of Internal Affairs and Communications, similarly offered a total of 45.5 million yen to 41 bodies it supports in fiscal 2010.

Among the 41, an entity promoting information and communications technologies received about 5.9 million yen to cover the personnel costs of seconded workers, according to the panel.

The institute said it is up to the Government Revitalization Unit, which has been examining spending by 102 government-linked entities, to decide whether the payments were appropriate.

(Mainichi Japan) January 10, 2012

Fukushima nuclear plant worker in coma after collapsing at site

A worker in his 60s at the Fukushima No. 1 Nuclear Power Plant is in a coma after collapsing at the site, plant operator Tokyo Electric Power Co. (TEPCO) has announced.

The man, an employee of a company cooperating with TEPCO, has been in a state of cardiac and respiratory arrest, the utility said on Jan. 9. The worker had been exposed to 52 microsieverts of radiation on Jan. 9 before collapsing and losing consciousness at the crippled plant that day. TEPCO is trying to confirm how long he has been working at nuclear plants and how much accumulated radiation doses he has been exposed to so far.

According to TEPCO, the man had been pouring concrete since the morning of Jan. 9 in order to manufacture a tank to hold radioactive materials following the treatment of contaminated water emanating from the cooling of nuclear reactors at the plant.

At around 2:20 p.m., the worker complained of sickness and was treated at the plant's medical office. However, he did not recover and was later transferred to a hospital in Iwaki, Fukushima Prefecture, at around 4:30 p.m.

Since the outbreak of the nuclear crisis in March last year, three workers have died of sickness and other causes at the disaster-stricken plant.

Civic group battles to get support for referendums on nuclear power in Tokyo, Osaka

A civic group has been fighting an uphill battle to collect enough signatures for petitions to hold referendums in Tokyo and Osaka on whether Japan should continue to rely on nuclear power despite the ongoing crisis at the Fukushima No. 1 Nuclear Power Plant.

The civil group called "Minnade Kimeyo (Let all of us decide)" started collecting signatures on Dec. 10. The group needs to collect one-fiftieth of all eligible voters in Tokyo and Osaka, respectively. The group has already secured about 50,000 signatures in Osaka before the Jan. 9 deadline -- more than about 43,000 signatures, or one-fiftieth of the eligible voters needed to directly oblige the Osaka mayor to take necessary steps toward holding a referendum. As of Jan. 8, the group had collected only about 78,000 signatures, about one-third of about 210,000 it needs in Tokyo to file the petition.

Considering the possibility of some signatures being judged invalid by the election administration commission, the group has been trying to collect some 300,000 signatures in Tokyo, with actor Taro Yamamoto and other members of the group urging people to sign their names at major railway stations in the capital. The group still needs to collect signatures from more than 130,000 eligible voters by the Feb. 9 deadline, with the exception of local municipalities where signature collecting activities cannot be carried out due to elections for local chiefs.

Eiko Nakamura, 57, one of the organizers of the campaign, said the group had to fight an uphill battle mainly because the government declared in late December that the Fukushima nuclear plant had been brought under control. She said that public interest in the nuclear issue has apparently been fading due to the prevailing mood that nuclear power poses no problem.

About 12,000 people are involved in the campaign to collect signatures, and many of them are housewives and student volunteers. Eri Takada, 48, one of the 32 representatives, said, "I was indifferent to nuclear issues and I had no experience in civic activities. But I started to think about whether there is anything I can do in the wake of the nuclear accident. I want to help create a mechanism in which individuals think about what real affluence is and their wisdom and opinions can be reflected."

(Mainichi Japan) January 10, 2012

EDITORIAL: Resuming tests at Rokkasho plant a bad idea

January 11, 2012 - <http://ajw.asahi.com/article/views/editorial/AJ201201110032>

A test-run is due to resume in mid-January at the nuclear fuel reprocessing plant in the village of Rokkasho, Aomori Prefecture.

In late December, Aomori Governor Shingo Mimura gave a nod to safety measures at the prefecture's nuclear facilities. This effectively became a go-ahead signal for Japan Nuclear Fuel Ltd. to restart the trial operation.

This is not right.

The nuclear disaster at the Fukushima No. 1 plant led to the current government policy to review the nuclear fuel cycle project of reprocessing and extracting used plutonium for recycling.

A report from the Japan Atomic Energy Commission estimates the **costs of used fuel recycling at double the costs of the "direct disposal" method of burying unprocessed fuel underground.**

Resuming the Rokkasho test-run, just when serious debates on nuclear fuel reprocessing are about to begin on the basis of various available data, can only spell one purpose: to establish an operational "track record" to justify the continuation of the fuel recycling project.

The plant began operating on a trial basis in March 2006, but this was suspended in 2008 when problems developed in the process of mixing highly radioactive waste fluid with molten glass in a high-temperature melting furnace for vitrification. Shortly before operations were to resume in March 2011, the Fukushima meltdowns occurred, and the Rokkasho plant has remained idle since.

The plant has a vehicle-mounted power generator, which an Aomori Prefecture investigation committee commended as an effective backup for power outages. In its report, the committee also stressed this plant's differences from nuclear power generation plants, noting, "Unlike at nuclear power generation plants, chemical processes at this fuel reprocessing plant are conducted under ordinary temperature and normal pressure."

The committee is correct on this point. And we are also aware that the **resumption of operations at the plant was requested by the local community.**

However, a review of the entire nuclear energy industry and the debunking of the "myth of safety and low running costs" are what the Fukushima disaster has made mandatory.

We have repeatedly suggested a road map for weaning our society off nuclear power generation. We applaud the government's legal amendment bill that stipulates 40 years as the life expectancy of nuclear reactors.

If our country continues to pursue the "no nuke" route, the whole nuclear fuel cycle will eventually collapse.

Even if a certain degree of reliance on nuclear power generation is to be maintained, the relevance of the used fuel recycling project is already in serious doubt. As for the development of fast-breeder reactors, which is the ultimate purpose of keeping up the nuclear fuel cycle, the prototype Monju has remained virtually idle despite the huge costs spent on it so far. Its commercialization is now nothing more than a pipe dream.

We are having trouble understanding the government's position on the Rokkasho plant. The issue at hand goes to the very core of the nation's nuclear energy policy, and yet Yukio Edano, minister of economy, trade and industry, noted to the effect that the government is no longer in a position to approve or disapprove the resumption of trial operations.

Japan Nuclear Fuel intends to resume the construction of a factory where mixed oxide (MOX) plutonium fuel will be manufactured after reprocessing.

The decision is premature, and the operator must not be allowed to call all the shots.

--The Asahi Shimbun, Jan. 10

Inspectors checked nuke facilities using manuals given by facility makers, users since '03

The Japan Nuclear Energy Safety Organization (JNES) has systematically copied and used entire inspection manual procedures prepared by manufacturers and users of nuclear facilities to inspect nuclear power plants run by those companies since its foundation in October 2003, according to the results of an investigation conducted by JNES's third-party panel.

The third-party panel is expected to submit its report to the JNES on Jan. 12, urging the only legally mandated nuclear inspection body in Japan to carry out inspections independent of manufacturers and users of nuclear facilities in a bid to defuse suspicions over its credibility.

The problem came to light last November when the Mainichi reported on the alleged oversight. The JNES has insisted so far that there was no problem with its inspection system, but it will now certainly come under pressure to review how it inspects nuclear facilities.

The third-party panel, comprising of five experts including scholars, conducted investigations into the JNES by interviewing inspectors and the like. The investigation revealed that since its foundation in 2003 the JNES had systematically asked Global Nuclear Fuel-Japan Co. (JNF-J), a company that makes and processes nuclear fuel, to prepare draft inspection manual procedures, changed nothing but their covers and used the copied documents to inspect JNF-J's nuclear fuel rods.

The third-party panel says in its report, "Inspections are part of the system to ensure safety. Inspections must not be entrusted to business operators." There are cases in which the JNES inspected nuclear facilities and passed them even without looking at inspection manual procedures. Therefore, the third-party panel harshly criticizes the JNES, saying, "Based on what standards has it been carrying out the inspections? The JNES lacks understanding and awareness of inspections."

The report by the third-party panel also refers to the revelations that the JNES had overlooked inadequacies in documents prepared by Kansai Electric Power Co. and failed to inspect some of the facilities during its regular inspections of the Oi Nuclear Power Plant from 2009 to 2010. The issue surfaced last August. The report says, "It is unavoidable for people to think that the JNES gave rubber-stamp approval of inspections by the business operator." The panel is expected to propose that the JNES keep records of meetings with business operators in an effort to have tense relations with them and to step up education and training of inspectors.

The JNES was founded in October 2003 because the government's Nuclear and Industrial Safety Agency (NISA) failed to spot the falsification of inspection results by Tokyo Electric Power Co. That trouble came to light in August 2002. The JNES will come under the jurisdiction of the "Nuclear Safety Agency" to be formed in April after the NISA is dissolved. Therefore, a senior JNES official says, "The fundamental overhaul of the inspection system will be carried out sometime after April."

'Doomsday Clock' moves 1 minute closer to midnight

Hiroshima Peace Memorial Museum Director Koichi Maeda resets the museum's "peace clock" -- which displays the number of days since the last nuclear weapons test -- to 55 on Jan. 10. (Mainichi)

NEW YORK (Kyodo) -- Scientists on Tuesday moved forward the minute hand of the "Doomsday Clock" by one minute to "five minutes to midnight," citing a lack of progress toward a world free of nuclear weapons.

The clock, symbolically measuring the likelihood that mankind will begin a nuclear war, was last moved in January 2010, when its minute hand was pushed back one minute from five to six minutes before midnight in response to U.S. President Barack Obama's April 2009 speech in Prague calling for a nuclear-free world.

The clock is now back to its time in 2007 when it was pushed two minutes closer to midnight, which represents global catastrophe.

The U.S. magazine Bulletin of the Atomic Scientists, which created the clock in 1947 and has since maintained it, said, "The path toward a world free of nuclear weapons is not at all clear, and leadership is failing."

"The world still has approximately 19,500 nuclear weapons, enough power to destroy the Earth's inhabitants several times over," it said in a statement.

The magazine mentioned the nuclear accident at the Fukushima Daiichi power plant in Japan, saying it is disheartening that the world has suffered another calamitous accident in light of over 60 years of improving reactor designs and developing nuclear fission for safer power production.

"The Fukushima disaster raised significant questions that...must be addressed. Safer nuclear reactor designs need to be developed and built, and more stringent oversight, training, and attention are needed to prevent future disasters."

"A major question to be addressed is: How can complex systems like nuclear power stations be made less susceptible to accidents and errors in judgment?"

At a press conference in Washington, the scientists sounded unclear about the impact of the Fukushima crisis, saying that the event could be conducive to enhancing safety of nuclear power stations while also helping boost opposition to nuclear energy, which is viewed as an effective tool to fight global warming.

The magazine has taken a neutral position on nuclear power generation.

The magazine was launched by physicists shocked by 1945 atomic bombings of Japan. The clock, initially set at seven minutes to midnight, was as close as two minutes to midnight in 1953 in the wake of U.S. and Soviet hydrogen bomb tests. It was as far away as 17 minutes to midnight in 1991, when the Cold War era ended.

Gov't tells TEPCO to prepare repair plan for Fukushima Daini equipment

TOKYO (Kyodo) -- The Nuclear and Industrial Safety Agency told Tokyo Electric Power Co. on Wednesday to prepare a report by the end of January on how to repair equipment at its Fukushima Daini nuclear power plant damaged by the March 2011 earthquake and tsunami, a senior agency official said.

The report is needed to "further ensure" the plant will remain in a stable state of cold shutdown, Kenji Matsuoka, chief of the disaster prevention section at the agency, said at a press conference, denying it is aimed at requiring the utility, known as TEPCO, to prepare for restarting the plant.

A cold shutdown is defined as a condition in which the bottom part of a reactor pressure vessel is kept below 100 C and exposure from the release of radioactive substances is being significantly contained.

The Fukushima Daini nuclear power plant was not so fatally damaged as the nearby Fukushima Daiichi plant by the magnitude-9.0 earthquake and subsequent tsunami. In December, the government lifted its declaration of a state of emergency at the Fukushima Daini plant.

But facilities at the plant, including the emergency power generator and the cooling system for spent nuclear fuel pools, have been damaged, according to the agency.

(Mainichi Japan) January 12, 2012

Reactor monitor failure caused by bad maintenance

The operator of a nuclear monitoring system covering Japan says the system malfunctioned last month because of poor maintenance.

The Emergency Response and Support System failed to transmit data to terminal screens at the Nuclear and Industrial Safety Agency for more than 24 hours from December 30th. The agency also failed to notice the problem for more than one hour.

The system monitors pressure, temperature, and other real-time conditions of reactors at nuclear power plants around the country, as well as radiation levels in surrounding areas.

An investigation by the government-affiliated corporation that manages the system revealed that the data-processing functions malfunctioned because of poor maintenance.

The corporation says it will step up its maintenance of the system by rebooting its server software twice a year and introducing an automated alarm system.

Thursday, January 12, 2012 04:33 +0900 (JST)

A major epidemiological study just published in the January 2012 edition of [*The International Journal of Cancer*](#) indicates there is “a possible excess risk” of acute leukemia among children living in close vicinity to French nuclear power plants (NPP). The study called for an “investigation for potential risk factors related to the vicinity of NPP, and collaborative analysis of multisite studies conducted in various countries.”

The study found a doubling of occurrence of childhood leukemia between the years of 2002-2007 among children under 5 years living within 5 km of nuclear plants – similar to the findings of the [German 2008 study](#) by the Cancer Registry in Mainz which found an association between the nearness of residence to nuclear power plants and the risk of childhood leukemia.

The epidemiological study was conducted by a team from the Institut National de la Santé et de la Recherche Médicale, the Institut de Radioprotection et de Sécurité Nucléaire (IRSN) and the National Register of hematological diseases of children in Villejuif. The results marked a surprising and encouraging change at IRSN which had endeavored to discredit earlier French epidemiological studies that had shown an impact of nuclear facilities on health.

From Beyond Nuclear

Iodine pills should be distributed to households near nuclear plants: experts

The intake of potassium iodine tablets immediately after a nuclear accident is effective in preventing the thyroid from being exposed to radiation, and they should be distributed to households near nuclear power plants in advance, a recent nuclear safety commission proposal suggests.

The plan was put together by a subcommittee of the Nuclear Safety Commission (NSC) and was released on Jan. 12.

The committee suggests that the pre-distribution of potassium iodine tablets to households in the Precautionary Action Zone (PAZ), within a 5-kilometer radius of a nuclear power plant, and to those within the Urgent Protective Action Planning Zone (UPZ), within a 30-kilometer radius of a nuclear power plant, is "efficient" or "somewhat efficient" in preventing radiation exposure in case of a nuclear accident.

The committee's proposal further suggests that potassium iodine tablets should also be distributed prior to and during evacuation orders to stay indoors to every household in the Protection Planning Area (PPA), which falls within a 50-kilometer radius from a nuclear plant.

The experts' proposal further reflects local governments' failure to distribute the tablets immediately after the outbreak of the disaster at the Fukushima No. 1 Nuclear Power Plant in March last year.

Although at present, many local municipalities around nuclear plants in Japan have secured potassium iodine tablets and are ready to distribute them to people in affected areas in case of a nuclear disaster, such tablets were hardly utilized following the outbreak of the Fukushima nuclear crisis.

Lack of memory caused breakdown in nuclear plant monitoring system

The government's emergency support system to respond to nuclear plant accidents broke down temporarily late last year when it ran out of memory, the Nuclear and Industrial Safety Agency (NISA) has announced.

NISA said on Jan. 11 that the Emergency Response Support System (ERSS), which monitors the operational conditions of nuclear plants across Japan from NISA and off-site centers, was temporarily suspended **after it ran out of memory for data storage, triggering a breakdown in the system's data processing software.**

The agency said it will reset the memory twice a year and prepare manuals to respond to system abnormalities in order to prevent a recurrence. If any new nuclear disaster had erupted during the freeze, the government's system for predicting the spread of radioactive materials -- the System for Prediction of Environmental Emergency Dose Information (SPEEDI) -- may have failed as it uses data from ERSS.

"We take the fact that it took almost a whole day to restore the (ERSS) system after the glitch occurred very seriously. We will oversee the system steadfastly in order to prevent a recurrence," said a NISA official.

On Dec. 31 last year, NISA announced that an inspector at the Shika Nuclear Power Plant in Shika, Ishikawa Prefecture, noticed that the ERSS display system was not working shortly before noon on Dec. 30. The inspector contacted other nuclear plants, and found that the entire system was not functioning. The system was restored at around 2:30 p.m. on Dec. 31.

The government spent some 15.5 billion yen on the development of the ERSS, but due to power losses the system also failed when the nuclear disaster broke out at the Fukushima No. 1 nuclear plant.

(Mainichi Japan) January 12, 2012

A screen capture of a map released on Nov. 11 by the Ministry of Education, Culture, Sports, Science and Technology displaying accumulated radioactive cesium levels in eastern Japan. (Mainichi)

According to the committee, the System for Prediction of Environment Emergency Dose Information (SPEEDI), which functioned as a reference to the government during its investigation of the merits and demerits of distributing the pills, did not function efficiently and as a result the use of potassium iodine tablets after the Fukushima disaster was minimal.

Potassium iodine tablets are considered "strong medicine" according to the Pharmaceutical Affairs Law, which requires them to be treated with special caution. The NSC subcommittee, however, suggests that laws related to the prescription of potassium iodine tablets, such as the Pharmaceutical Affairs Law and the Medical Practitioners Law, should be revised to smoothen future procedures.

The proposal further suggests that the government should specify concrete guidelines for the intake of the medicine.

The committee's proposal will be incorporated in the government's nuclear disaster preservation guidelines that are expected to be revised this spring at the earliest.

3 nabbed over fake contract for nuclear repair work in Fukui

An aerial view of the Oi Nuclear Power Plant of Kansai Electric Power Co. in Oi, Fukui Prefecture, on Nov. 16, 2010. (Mainichi)

FUKUOKA -- Police have arrested three people for allegedly dispatching a worker to the Oi Nuclear Power Plant in Fukui Prefecture under a falsified contract, sparking a police probe into the yakuza's possible involvement in nuclear-related jobs, investigative sources say.

The Fukuoka and Fukui prefectural police forces on Jan. 12 announced the arrests of Hideo Ichise, 58, of Tsuruga, Fukui Prefecture, Yoshimi Tomita, 59, of Maizuru, Kyoto Prefecture, and Kanae Ikegami, 36, of Kitakyushu's Wakamatsu Ward, on suspicion of violating the Employment Security Law.

Ichise is the Fukui business manager of Taihei Dengyo Kaisha Ltd., a Tokyo-based power plant construction and maintenance firm. He previously served as the firm's Oi operation chief. Tomita is president of Takada Kiko, a plumbing firm in Takahama, Fukui Prefecture, and Ikegami is an executive of Dream, previously known as Soshin Kogyo, a plumbing and housing equipment firm. Police have identified Ikegami as the wife of a gang leader with ties to the Kitakyushu-based crime syndicate Kudo-kai.

Police suspect Soshin Kogyo dispatched workers to nuclear power facilities, thereby providing the Kudo-kai with a source of funds, according to investigative sources. The case has sparked a rare police investigation into the alleged involvement of yakuza in nuclear-related employment in Japan.

According to police investigators, the three were implicated in an unlawful contract scheme in which a male employee of Soshin Kogyo was dispatched to Kansai Electric Power Co.'s Oi plant and forced to engage in repair work under the supervision of Taihei Dengyo from early March to late September in 2010. The three have admitted to the allegations, the sources say.

Fukuoka police and others with knowledge of the case say the fake contract was set up through deals between Soshin Kogyo and Takada Kiko, and between Takada Kiko and Taihei Dengyo. The Fukuoka

and Fukui police forces believe the Soshin Kogyo employee served as a temporary worker in violation of the law, and suspect he may be just one of several temporary staffers sent to nuclear power facilities under bogus contract deals, investigative sources say.

Various temporary agencies have been suspected of siphoning off workers' wages and crime syndicates are suspected of playing a part in dispatching such temporary workers.

The National Police Agency (NPA) has ordered Tokyo Electric Power Co. to cut off ties with crime syndicates in connection with work at the crippled Fukushima No. 1 Nuclear Power Plant. The NPA set up a council with 22 general contractors last July to fight the yakuza's involvement in employment at the Fukushima plant.

Established in 1947, Taihei Dengyo has capital of about 4 billion yen and is listed on the First Section of the Tokyo Stock Exchange. It has built and repaired nuclear power stations across Japan and has been taking part in the work to bring the Fukushima nuclear crisis under control. Its sales in the business year ending in March 2011 came to about 61.8 billion yen.

Nuke administrative agency ordered to produce own inspection manual

The Japan Nuclear Energy Safety Organization (JNES), an incorporated administrative agency tasked with inspecting Japan's nuclear facilities, has been ordered to produce an independent inspection manual and end its reliance on inspection manuals made by nuclear power plant operators.

A third-party panel of the JNES made the request in a report to the agency under the jurisdiction of the Ministry of Economy, Trade and Industry on Jan. 12.

The panel made the request after the JNES has been found to have inspected nuclear power facilities across the country by relying on copies of inspection manuals of nuclear power plant operators.

JNES President Yoshihiro Nakagome said at a news conference he and his agency staff reflect deeply on the practice to duplicate such manuals and use them for inspection purposes. He said his agency will draw up and release a road map for reform and a timeline within one to two weeks.

The third-party panel in its report criticized the JNES for copying the manuals of nuclear power plant operators, baring its dependence on such operators and giving rise to public distrust.

The report also said the agency's training system lacks details and is not systematic, as compared to that of the U.S. Nuclear Regulatory Commission. It recommended strengthening education and training and 12 other remedial steps.

Toshihiko Kashiwagi, president of Omiya Law School in Saitama Prefecture who chaired the third-party panel, said, "Inspections help ensure the safety of nuclear power. The manual procedures represent a basis for inspections." He added that it is not appropriate for the JNES to copy the manuals prepared by nuclear power plant operators and that the agency should write its own manual even if it is laborious.

Nakagome said his agency is full of regret for the suspicious way it has conducted inspections of nuclear facilities and vowed to implement remedial measures at an early date.

300 tons of tainted water found near No. 3 unit at Fukushima plant

TOKYO (Kyodo) -- Around 300 tons of water contaminated with relatively high amounts of radioactive substances has been found in an underground tunnel near the No. 3 unit at the crippled Fukushima Daiichi nuclear power plant, the plant's operator said Thursday.

Tokyo Electric Power Co. said the water in the tunnel, used to lay electric cables, contained 49 to 69 becquerels of radioactive cesium per cubic centimeter, adding that it will check how the contaminated water accumulated in the area.

Some water with lower concentrations of radioactive materials was also found in a tunnel near the No. 1 unit.

The utility known as TEPCO is checking for accumulated pools of water in underground tunnels at the plant after around 220 tons of contaminated water was found on Dec. 18 in a tunnel near a facility on the plant premises for storing highly contaminated water.

On Wednesday, contaminated water was found to have accumulated in two underground tunnels.

(Mainichi Japan) January 13, 2012

All 3 nuclear reactors in Shikoku suspended

IKATA, Ehime -- Operations at all three nuclear reactors in Shikoku have been suspended as the last one was stopped for a regular inspection on Jan. 13.

Shikoku Electric Power Co. suspended operations at the No. 2 reactor of its Ikata Nuclear Power Plant on the night of Jan. 13. Its No. 1 and 3 reactors, which had been shut down for regular inspections,

cannot be reactivated because of the ongoing crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant.

Shikoku Electric Power became the second utility in Japan with no nuclear reactors running, following Kyushu Electric Power Co.

Currently, only five of the 54 commercial nuclear reactors across the country are in operation.

Antinuclear conference calls for full support of victims in Fukushima

YOKOHAMA (Kyodo) -- Citizens, politicians and scientists attending an antinuclear conference called Sunday for sufficient support to be provided to those affected by the nuclear accident at the Fukushima Daiichi power plant.

Participants of the Global Conference for a Nuclear Free World also called for "full transparency" by the Japanese government and the plant operator, Tokyo Electric Power Co., when dealing with the accident and helping victims.

The requests were part of the Yokohama Declaration that more than 10,000 participants from some 30 countries adopted on the second and last day of the event in Yokohama, organized by nongovernmental organizations such as Peace Boat.

Rights should be protected for those affected by the nuclear crisis, including "the right to evacuation, health care, decontamination, compensation and the right to enjoy the same standard of living as before March 11, 2011," said the declaration.

The declaration further urged the government to collect data related to the plant crippled after the March 11 earthquake and tsunami in a "comprehensive" manner.

It also called on Japan not to export nuclear power generation equipment or technology to other countries in Asia, the Middle East, Africa and Europe.

And the declaration said Japanese atomic power plants that are currently idled should not be restarted.

(Mainichi Japan) January 15, 2012

Radioactive gravel likely shipped to over 200 companies

Radioactive gravel thought responsible for high radiation readings in a new apartment complex in Nihonmatsu, Fukushima Prefecture, was likely shipped to over 200 companies, making its way into apartments, bridges, and possibly temporary homes for evacuees, according to government investigators.

The gravel was kept in a part of the town of Namie, in an area near the disaster-hit Fukushima No. 1 Nuclear Power Plant. From the time the nuclear disaster began to the establishment of the area as an evacuation zone on April 22, the company owning the gravel had shipped 5,200 metric tons of it to 19 companies, according to national and local government sources.

Two of the receiving companies were ready-mix concrete companies and the rest were construction companies. However, the gravel was then reportedly sent on to over 200 other companies, where it was used in building materials.

On Jan. 16, Fukushima Prefectural Government officials agreed at a meeting to work to help move residents from the homes affected by the radioactive gravel, investigate the source of the contamination, and check for other places where contaminated building materials may have been used.

After the nuclear disaster began, standards were set for reuse of sludge and debris that may have been irradiated, but none were set for gravel used in concrete. The gravel industry is regulated by the Ministry of Economy, Trade and Industry. The ministry investigated the gravel industry in areas near the plant in May of last year, but after being told that "the businesses have evacuated and no one is making shipments," it took no special measures.

Since the problem with the gravel surfaced, many calls criticizing the slowness of the government's response have reportedly come in to a call center for the national government set up in Fukushima Prefecture.

Kinki University professor Hideo Yamazaki compared the gravel problem to the one of irradiated straw being sent out around the country: "It's exactly the same problem. The stone quarry is inside the evacuation zone, and what happened was something the government could have predicted. It's frustrating that the government does not think about the movement of materials, including gravel. The ones I feel sorry for are the gravel producers. It was impossible for them to notice the contamination at the time of shipping, and it's not right for them to be blamed. The government's actions have all been reactionary, and the locals are paying for it."

(Mainichi Japan) January 16, 2012

Irradiated gravel used for Fukushima condominium

Officials in Fukushima Prefecture say they have detected high levels of radiation in a new building. They say a construction material may have been tainted with radioactive substances from the Fukushima Daiichi nuclear power plant.

The officials say the contamination was found at a 3-story apartment building in Nihonmatsu City that was completed last July.

The city checked the condo for radiation in December after regular monitoring found that children living there had been exposed to higher levels of radiation than other children over a 3-month period.

The city found that the radioactive cesium level on the first floor was 1.24 microsieverts per hour, which is higher than outside.

Radiation levels on the second and third floors were much lower.

The officials say that the gravel used on the first floor came from a stone-crushing site in Namie Town in an evacuation zone near the crippled plant.

The city says it will ask the tenants of the first-floor apartments to move out and will interview the other residents.

The city and the central government will confirm the cause of the contamination and check if gravel from the same site has been used elsewhere.

Sunday, January 15, 2012 22:48 +0900 (JST)

Concrete sold to over 200 firms may be tainted

The Japanese government is investigating the distribution of crushed stones that may contain radioactivity from the accident at the Fukushima Daiichi nuclear power plant. It has found that concrete made of the stones has been sold to more than 200 firms.

The probe comes after radioactive cesium was detected in a new apartment building in Nihonmatsu, Fukushima Prefecture where the concrete was used. Readings of up to 1.24 microsieverts per hour have been recorded inside the building which is higher than outside.

The gravel comes from a quarry in Namie that was designated as an evacuation zone in April.

The quarry operator says it shipped more than 5,000 tons of crushed stones to 19 firms in the weeks after the accident. The government has set no limit on radiation in stones and sand used for construction even after the nuclear accident.

The company president told reporters on Monday that he never imagined that stones from his quarry would cause such a problem and that he wants to apologize to residents of the building for their exposure to radiation.

The economy ministry says 2 of the 19 firms sold concrete made of the stones to more than 200 companies. It believes that the concrete was used in housing construction and on roads.

Monday, January 16, 2012 13:54 +0900 (JST)

Opponents of Hamaoka nuclear plant restart gain momentum

SHIZUOKA -- A growing number of municipalities near the suspended Hamaoka Nuclear Power Plant in Shizuoka Prefecture are up in arms about plans by operator Chubu Electric Power Co. to restart the plant.

Chubu Electric Power shut down the nuclear plant in May as requested by then Prime Minister Naoto Kan due to fears of a possible huge earthquake in the aftermath of the March 11 earthquake and tsunami that triggered the crisis at the Fukushima No. 1 Nuclear Power Plant.

Chubu Electric Power is aiming to restart the plant, southwest of Tokyo, after implementing measures against tsunami, including an 18-meter-tall seawall now under construction.

But many municipalities near the plant, including those within a 10-kilometer radius of the plant known as an emergency planning zone (EPZ) and those within a 30-kilometer radius known as an urgent protective action zone (UPZ), have passed resolutions and opinions opposing the plant's restart.

The city assembly in Makinohara, one of four cities within the 10-kilometer radius of the power plant, spearheaded the campaign against the plan by adopting a resolution last September calling for the decommissioning of the plant citing radiation fears among major firms in the city.

The city assembly in Omaezaki, host to the Hamaoka power station, took steps to counter the move by adopting documents that said that the city, heavily dependent on nuclear power-related revenue and subsidies, was troubled by the decommission appeal.

But the cities of Kikugawa and Kakegawa subsequently approved documents that say they cannot approve of the restart unless they win their residents' understanding.

Other local governments, which will be required to take preparatory steps if designated as parts of the UPZ in the course of a review of the nation's nuclear disaster-prevention system, are also becoming vocal about their opposition to the nuclear plant.

In addition to the city of Shimada, which adopted an anti-restart document in June, the city of Yaizu, home port of the Lucky Dragon No. 5, a tuna fishing boat exposed to nuclear fallout from U.S. thermonuclear testing on Bikini Atoll in 1954, adopted a similar resolution, along with the cities of Fujieda and Fukuroi.

The town assembly in Yoshida, located in a 30-kilometer radius of the power plant, unanimously adopted a resolution and a document urging that the plant be scrapped altogether.

(Mainichi Japan) January 16, 2012

11 people live in no-entry zone within 20 km of Fukushima plant

FUKUSHIMA (Kyodo) -- Eleven people still live in the government-designated no-entry zone within a 20-kilometer radius of the crippled Fukushima Daiichi nuclear power plant despite a threat of radiation exposure, municipalities officials said Sunday.

The 11 from six households -- six males and five females in their 50s to 90s -- remain in the four municipalities of Tamura, Tomioka, Naraha and Kawauchi, all in Fukushima Prefecture, the municipalities said.

Since April 22, the government has banned 78,000 residents from remaining in the 20-km zone, which fully or partially covers nine municipalities, including the four.

The remaining five municipalities of Minamisoma, Futaba, Okuma, Namie and Katsurao are completely deserted.

Their reasons for staying include reluctance to abandon their homes, need to take care of acquaintances in poor health, and desire to take care of a pet. The four municipalities with residents said they have tried in vain to persuade the eleven to evacuate, but they have not forced residents who chose to stay.

A man in his 50s in the city of Tamura fled in the immediate aftermath of the nuclear crisis, but returned home before the government set the no-entry zone, city officials said. He now lives with three others.

An official at the Tamura city government quoted the man as saying, "Two (of the three at his home) are in poor health, so it would be riskier to try moving them from here."

Another male in his 50s, who has lived alone in the town of Tomioka, posted a video message on YouTube, saying electricity and tap water are not available at his residence.

(Mainichi Japan) January 16, 2012

Economy, Trade and Industry Ministry bureaucrats weigh in on nuclear crisis, TPP

Many of the highly debated issues we face today, such as the nuclear disaster at the Fukushima No. 1 Nuclear Power Plant and the subsequent call for reduced dependence on nuclear power, and the government's decision to enter the Trans-Pacific Partnership (TPP) negotiations, are under the jurisdiction of the Ministry of Economy, Trade and Industry (METI). Amid the turmoil, what is going on in the minds of METI bureaucrats?

One mid-ranking bureaucrat seemed to be questioning how far he can stick to his convictions.

In the novel, "Kanryo tachi no natsu" ("The Summer of the Bureaucrats"), author Saburo Shiroyama portrays a group of bureaucrats working at the then-Ministry of International Trade and Industry. The protagonist confronts politicians' egos head on, flatly telling junior bureaucrats that they are employees not of the minister, but of the state.

Goings-on reminiscent of such scenes from the 1975 novel took place until just recently, apparently, but no longer. And yet, more now than ever, we are in urgent need of a bureaucrat with the passion of the protagonist in the abovementioned novel, which all METI bureaucrats are said to have read.

For example, one METI member once called for the abandonment of the nuclear fuel cycle project, saying, "All we're doing is pumping tax money into it, and getting nothing in return." Many in the ministry agreed, the aforementioned mid-ranking bureaucrat explained.

"However," he continued, "we ultimately seem to have been defeated by the power of politics. As a ministry, we're powerless against politicians, and it may be that we lack the nerve to put ourselves on the line to protect colleagues who speak the truth."

So how is the ministry dealing with the current administration and the ruling Democratic Party of Japan (DPJ)?

"The DPJ is harsh toward so-called "shoeki" (benefits to ministries), such as the practice of "amakudari" (literally "descent from heaven," in which former bureaucrats take advisory posts in the private sector in industries they used to regulate). In the next general election, which will take place next year at the latest, however, the DPJ will likely lose, having been unable to live up to their previous campaign promises. You could say we're all holding our breath and trying to make it until then," the mid-ranking bureaucrat explained.

"I get the feeling that compared to 10 years ago, there are fewer bureaucrats with lofty ambitions lamenting the future of the state," he continued, and pointed out that precisely because of this, it was a shame that former METI bureaucrat Shigeaki Koga resigned from the ministry in protest of the bureaucracy's abuse of power and also called for civil-service reform.

"For a long time, the atmosphere at METI was such that people could voice their opinions fairly freely. With Koga's resignation, though, younger bureaucrats will find it difficult to follow in his footsteps."

Objecting to accusations that bureaucrats are guaranteed a certain status and work in environments more stable than the private sector, he said, "I think the guarantee of bureaucrats' status exists so that no matter how difficult a challenge they are presented with by any administration, they can continue as professionals to say what is right or true."

Asked whether that guarantee was proving effective in the ongoing deliberations about the new energy policy, he said, "I hadn't expected such a nuclear disaster. I had been convinced that the reactors themselves, with their multiple defenses, were safe." He continued, "Some bureaucrats personally believe in abolishing or reducing Japan's dependence on nuclear power, but I get the sense that the ministry as a whole is dominated by the attitude of waiting to see how things go. Moreover, the 'nuclear village' comprising cozy relationships between utilities, former public officials who have "descended from heaven" onto private companies, and politicians remain intact. While many METI bureaucrats are going around apologizing to residents in Fukushima Prefecture, the 'nuclear village' elite who have heretofore promoted nuclear power don't even go to Fukushima, and are instead waiting quietly at their desks in Kasumigaseki (in Tokyo's Chiyoda Ward) for the tides of public opinion to change."

Of course, some METI bureaucrats oppose the move to reduce Japan's nuclear dependence.

One male bureaucrat in his 40s said, "If we are to abandon nuclear energy, power generation using alternative energy sources such as natural energy and fossil fuels will come at high costs. This will pose an obstacle to industrial expansion. If the economy slides, wages will drop and unemployment will

probably rise. That's one option, but is the public ready for something like that? It doesn't seem to be, does it?"

Regarding the announcement made by Tokyo Electric Power Co. (TEPCO), operator of the stricken Fukushima No. 1 Nuclear Power Plant, that it will raise industrial electricity prices by about 20 percent, he said, "High electricity bills will provide corporations with a good excuse to go overseas. Domestic power prices are also likely to rise. Ultimately, it will make life harder for the public."

A power policy, however, cannot be implemented without a certain level of the public's support. The ongoing nuclear disaster seems to have made the public more distrusting of bureaucrats, but bureaucrats also seem to be harboring a sense of distrust toward citizens who are easily swayed by those who say what they want to hear.

As for Japan's decision to enter discussions on the TPP? "I fully support it. Those who object to it claim that the TPP will result in 'an influx of genetically-modified food products and cheap produce from the U.S. and destroy Japanese farming,' but that's an insult to consumers. Consumers have the ability to choose not to buy things they are unsure about. This might be an extreme way to put it, but you can't really stop any agricultural system that comes between inexpensive, high-quality items and consumers from being destroyed."

Another METI bureaucrat, a thirtysomething deputy division chief, said the reason for choosing to work at METI was based on "a desire to be exposed to various job sites."

Holding placards reading, "Protect Japanese land and food," farmers from tsunami-hit Miyagi Prefecture shout slogans against the Trans-Pacific Partnership free trade zone (TPP) on Wednesday, Oct. 26, 2011. (AP Photo/Shizuo Kambayashi)

"Of course, Japan should enter TPP negotiations. If it becomes clear after collecting information and making proposals in negotiations that signing on to the agreement would damage national interests, the decision to pull out can be made then."

"The average age of farmers in Japan is about 65. In other words, with or without the debate over the TPP, a strategy addressing the aging population is an urgent matter. Without classifying Japanese agriculture as part of the manufacturing industry and expanding it by targeting foreign markets, it cannot be expected to survive. In fact, there have been instances in which Japanese apples have been bought at high prices in the Middle East. There are a lot of Japanese cultural and service-oriented

industries that can be exported. It's our job to serve as consultants and help entire industries. It's rewarding."

When conversation wandered toward the anti-nuclear protesters camping out in tents in front of the ministry, however, the aforementioned bureaucrat mumbled, "I can't explain it logically, but I'm sorry that such a disaster has taken place."

"I've never been involved in nuclear administration. But I'm a member of the ministry that's responsible for having promoted nuclear power," he added.

Compared to the Finance Ministry bureaucrats who were interviewed for an article published on Nov. 16, 2011, METI bureaucrats gave the impression of being more candid. One bureaucrat characterized the difference thusly: "The Finance Ministry occupies a passive position, so to speak, since it evaluates the budget requests of various other ministries. METI is the opposite. It's an aggressive administrative body whose role is to come up with ways to rejuvenate industries and bring wealth to the country. (By Yoshiaki Ebata, Evening Edition Department)

Decontamination site in no-go area shown to press

Isaku Kotera / Yomiuri Shimbun Staff Writer

MINAMI-SOMA, Fukushima--A decontamination model project at a site in Minami-Soma City, Fukushima Prefecture, is successfully reducing radiation levels by burying contaminated soil, according to officials involved in the project.

The site, which is inside the 20-kilometer radius no-entry zone around Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear power plant, was shown to the media Saturday.

Several heavy machines were used to dig a hole **about 2.5 meters deep** at a city-run sports ground, where contaminated soil will be stored **until it is transferred to a temporary storage facility.**

Waterproof sheets were laid on the bottom of the hole, in which polypropylene bags, each containing two tons of contaminated soil, were stacked three-high.

Radiation levels one centimeter above the hole ranged from 0.24 to 0.26 microsieverts per hour. **Project officials said this was 74 percent to 91 percent lower than the radiation levels of the soil inside the bags.**

The project has been consigned to the Japan Atomic Energy Agency.

An agency official said: "The structure is the same as that in the temporary storage facility. After burying the bags, waterproof sheets will be placed on them, and they will be covered with clean soil. This can lower [radiation levels] by 98 percent."

The Minami-Soma government plans to start its own full-scale decontamination work outside the no-entry zone and expanded evacuation zone in February.

The city government plans to start decontamination work after obtaining approval from residents for locations of temporary storage sites for contaminated soil.

However, the city authorities have not been able to obtain residents' consent to go ahead with the work. Consequently, it is possible the schedule might be delayed.

A city government official in charge of the issue said, "Although the storage period is set for about three years, **residents fear the contaminated soil will be left here forever because the site of the intermediate storage facility hasn't been decided.**"

(Jan. 16, 2012)

NISA to endorse stress test results on Oi nuclear plant

The Yomiuri Shimbun

The Nuclear and Industrial Safety Agency has decided to endorse the results of first-stage stress tests submitted by Kansai Electric Power Co. regarding the Nos. 3 and 4 reactors at its Oi nuclear power plant, sources said.

NISA has received such test results for 12 nuclear reactors. Its judgment regarding the plant in Fukui Prefecture will be the first since stress tests were introduced in July to demonstrate the ability of nuclear power plants to withstand severe earthquakes and tsunamis.

Clearing the first stage of the tests is a prerequisite for reactivating reactors that have been suspended for regular inspections.

NISA will invite experts from the International Atomic Energy Agency by the end of this month to evaluate the test methods.

Then, after the Cabinet Office's Nuclear Safety Commission has confirmed NISA's screening results, Prime Minister Yoshihiko Noda and three ministers concerned will decide whether reactors can be reactivated.

But local residents and governments also must approve reactivation, so it is unclear whether any nuclear reactors will be able to restart this winter.

Only five of the 54 nuclear reactors nationwide are currently operating. If the remaining five are shut down for regular inspections and the idled ones cannot be restarted, all the reactors in the nation will be idle in late April.

NISA is a body under the Economy, Trade and Industry Ministry.

(Jan. 16, 2012)

TEPCO submits results of first stress test

Tokyo Electric Power Company has submitted to the government the results of stress tests on 2 nuclear reactors along the Japan Sea coast.

TEPCO handed over to the Nuclear and Industrial Safety Agency on Monday test results of the No.1 and No.7 reactors at the **Kashiwazaki Kariwa nuclear power plant in Niigata Prefecture.**

It says the tests show that the facilities are capable of surviving an earthquake 1.3 times the strength the plant was designed to withstand. It also says it could endure a tsunami of up to 15 meters - nearly five times that of the safety standard set by the company.

This is the first time TEPCO has filed its test results.

The assessment on the safety of nuclear power plants is a precondition for restarting reactors that have been suspended for regular inspections.

Utilities across Japan have so far submitted stress test results on 14 reactors, which account for nearly 30 percent of the reactors that have been shut down for regular inspections.

TEPCO's senior vice president, Zengo Aizawa told NHK that the utility considers the 2 reactors as being safe.

However, he said the company wants to explain the results to the local authorities and residents, and that it is still not the right time to restart the reactors.

Meanwhile, Niigata Governor Hirohiko Izumida says he questions the wisdom of carrying out such a test when the accident at the Fukushima nuclear plant has not yet been fully inspected.

He says that it's still too early to decide whether to restart the reactors.

Monday, January 16, 2012 19:20 +0900 (JST)

TEPCO announces 17% rise in electricity charges for companies

Tokyo Electric Power Co. headquarters in Tokyo's Chiyoda Ward. (Mainichi)

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Tuesday it will seek an average 17 percent rise in electricity charges for corporate users to finance growing fuel costs stemming from boosting thermal power generation in the wake of the disastrous accident at its Fukushima Daiichi nuclear power plant.

The electricity rate hikes, which take effect April 1, will affect some 240,000 contracts for 50 kilowatts or more, and boost revenue at the company known as TEPCO by 400 billion yen annually.

With all of TEPCO's nuclear reactors expected to be shut down by March for regular checkups or other reasons, TEPCO President Toshio Nishizawa said, "If the current situation continues, we think our business condition would deteriorate further, and at no distant date, fuel procurement and stable supply of electricity may be affected."

"We will continue to do our best to streamline (our operations), but we have to ask for (electricity rate) hikes," Nishizawa said.

Based on the announcement, electricity charges will be lifted by 2.61 yen per kilowatt hour for customers with contracts for less than 2,000 kilowatts, and by 2.58 yen per kwh for customers with contracts for 2,000 kwh or more.

According to the utility, fuel costs for the financial year ending March 31 are expected to increase by about 830 billion yen from the previous year.

TEPCO said in December that it also hopes to raise household electricity bills, but doing so requires government approval, and Economy, Trade and Industry Minister Yukio Edano, whose permission is required, has warned the utility should not easily resort to the measure.

Sources close to the matter have said that TEPCO is considering raising household electricity rates by 10 percent for a certain period from the fall.

The plan is expected to be included in a special business plan for TEPCO, which is to be crafted in March by TEPCO and a state-backed entity providing financial assistance to the utility.

(Mainichi Japan) January 17, 2012

Radioactive concrete found in new condo

The Yomiuri Shimbun

FUKUSHIMA--High levels of radiation have been detected in a condominium building in Nihonmatsu City, Fukushima Prefecture, which was built in July using concrete mixed with material taken from an evacuation zone created in the aftermath of Japan's nuclear crisis, the city announced.

The announcement, released Sunday, says about 1 microsievert of radiation per hour was detected in a room on the first floor of the three-story building, which has tenants living in 12 units.

The city intends to move four households occupying the building's first floor from the condominium and discuss the problem with the central and prefectural governments.

Concrete used to construct the building included broken pieces of stone quarried from Namie Town, which was included in the government's evacuation zone after the Great East Japan Earthquake due to its proximity to the crippled Fukushima No. 1 nuclear power plant.

This section of the town was made an evacuation zone because annual radiation exposure in the area could be 20 millisieverts or higher. The remainder of the town falls within 20 kilometers of the nuclear plant and is a no-entry area due to health risks.

Sources say after the March 11 disaster, 19 companies in the prefecture accepted about 5,200 tons of broken stone pieces, including those used for the building in Nihonmatsu City, mined and shipped from a quarry in Namie Town.

The Economy, Trade and Industry Ministry has been tracing the final destinations of the possibly contaminated building materials.

The high levels of radiation in the condominium building was **discovered thanks to a city survey on the accumulated exposure of radiation among primary and middle school students**. As part of the survey, a dosimeter attached to a female middle school student living on the first floor of the building recorded up to 1.62 millisieverts of radioactivity for a three-month period from September to November.

The city responded by conducting an investigation into the cause of the exposure. In the air one meter from the building's first floor, it detected 1.16 to 1.24 microsieverts of radiation per hour on Dec. 27, reporting the finding to the prefectural government and the Environment Ministry.

Another test this month detected radioactive cesium in various parts of the building including the concrete foundation below the floor.

The amount of radioactivity in rooms on the second and third floors ranged from 0.10 to 0.38 microsievert per hour, lower than that on the first level.

Radioactivity in the air surrounding the building was found to range from 0.7 to 1.0 microsievert per hour.

The first floor's radioactivity is greater than that found outside the building and is estimated to have an annual level of about 10 millisieverts.

The Cabinet Office's Nuclear Emergency Response Headquarters said this quantity does not pose immediate health risks.

The city said **10 of the 12 households living in the building were displaced from Namie Town and Minami-Soma City, also in the prefecture, after the March 11 disaster.**

A male resident in his 30s on the first floor was clearly disappointed when he said, "I have no option other than moving out if the radiation level doesn't decrease."

"We've also suffered," an employee of the business in Nihonmatsu City that constructed the building said. "But due to our concern for the tenants, we'll solve this problem by deciding as soon as possible to whether rebuild the condominium building or ask residents to move out."

The president of the company that sold the pieces of broken stone said they were shipped from the quarry between March 25 to April 22. The latter date is when the area was designated as part of the expanded evacuation zone.

(Jan. 17, 2012)

Government tries to find structures where radioactive gravel was used

The national government will try to find all structures where **5,200 metric tons of highly radioactive gravel** from near the crisis-hit Fukushima No. 1 Nuclear Power Plant was used and measure the radiation levels there, it has been learned.

The gravel is thought to have made its way to around 200 construction-related businesses. The company that mined the gravel kept it in the town of Namie, which was marked for evacuation. Before the designation on April 22, the company shipped the gravel to 19 companies, from which it spread to well over a hundred others.

The national and Fukushima prefectural governments have begun investigating whether irradiated materials from other mining businesses may have also been shipped. According to the Ministry of Economy, Trade and Industry (METI), there are three mining companies near areas recommended to evacuate because of high radiation levels, and it will look into whether there were shipments made after the nuclear disaster began and measure radiation at the mining sites. If high radiation is found, it will request a stop to shipments.

Standards regarding reuse of sludge or debris from near the nuclear plant were put in place after the start of the nuclear disaster, but none were set for gravel used in concrete. In June last year, METI was told by a mining association that mining companies near the plant had already evacuated and were not making shipments, and METI took no special measures.

A METI official said, "Many thought that unlike sludge and rice straw, which accumulate and concentrate radioactive materials, gravel would have low radiation, as it is sourced by blowing up rocks and any dust that rises is doused with water. Looking back now, maybe we should have been more careful."

(Mainichi Japan) January 17, 2012

Concrete material distribution to be probed

Japan's central government and Fukushima Prefecture plan to investigate the distribution of gravel from quarries possibly tainted with radiation from the accident at the Fukushima Daiichi nuclear power plant.

The move comes after higher-than-usual levels of radioactive cesium were detected in concrete used in the construction of an apartment building in Nihonmatsu City.

The concrete was made from crushed stone from a quarry in Namie town, which was designated as an evacuation zone following the nuclear accident.

The state and local governments will investigate the shipments from not only that quarry but 9 other quarries as well.

The quarries are located in and around designated evacuation zones or in places which are identified as radiation hot spots.

It has so far been learned that gravel from the quarry in Namie was sold to at least 200 construction companies and is likely to have been used in the construction of buildings and roads.

Meanwhile, 5 of the 12 families living in the contaminated building say they want to move elsewhere. They were already forced to evacuate their homes near the Fukushima Daiichi plant after the nuclear accident.

Tuesday, January 17, 2012 13:40 +0900 (JST)

Preparations going on for reactor endoscopy

Preparations are under way to use an endoscope to examine the inside of a containment vessel of the damaged No. 2 reactor at the Fukushima Daiichi nuclear power plant.

At the No.1, 2, and 3 reactors of the plant, the nuclear fuel has melted down, but the exact state of the

fuel and details of the inside of the containment vessels are yet to be confirmed. This is causing a big problem for the operator, Tokyo Electric Power Company, in its continued efforts to stabilize the cooling of the reactors and its plans to decommission them. The reactors were damaged by the March 11th earthquake and tsunami.

On Tuesday, **10 groups of 4 workers** each entered the first floor of the No.2 reactor building from the northwestern side. **The workers drilled a hole in the containment vessel to insert an endoscope.** An industrial endoscope that can withstand high levels of radiation will be used.

The utility says the workers were exposed to up to 3 millisieverts of radiation. The company says the workers had rehearsed the job at the No. 5 reactor, the same type as the No.2, in order to minimize their exposure.

TEPCO says Tuesday's operation went smoothly and it will insert the endoscope on Thursday as scheduled. It hopes to gain the first internal view of one of the damaged reactors since the accident.

Tuesday, January 17, 2012 20:26 +0900 (JST)

Gov't urged to clarify where radioactive gravel has been used

The national and Fukushima prefectural governments are required to clarify where and how much radioactive gravel shipped from a rock quarry near the tsunami-hit nuclear power station has been used and how far it was contaminated.

Furthermore, they should take measures to protect people who are feared to be exposed to radiation from such gravel.

Gravel contaminated with radioactive substances, which has been shipped from the quarry in Namie, Fukushima Prefecture, has been used for the construction of apartment complexes and the repair of roads designated as school-commuting routes and irrigation canals.

It has been confirmed that a stone processing company in Fukushima Prefecture had shipped about 5,200 metric tons of gravel from the quarry by April 22 last year when the area was designated as a planned evacuation zone following the outbreak of the nuclear crisis. Ready-mix concrete containing the gravel has been supplied to about 200 construction companies.

Some of the gravel was used for the foundation for an apartment complex in Nihonmatsu that was completed in July last year, and higher levels of radiation than outdoors have recently been detected on its first floor. Moreover, higher levels of radiation have been detected from an irrigation canal in Nihonmatsu, which contained gravel shipped from the same company.

The Fukushima Prefectural Government is poised to measure radiation levels at hundreds of structures containing stone materials shipped from the same quarry, including houses and roads. The work should not be prolonged, considering local residents' concerns. Assistance from the national government is indispensable to conduct a speedy survey.

There are other quarries near areas designated as evacuation recommendation areas. The national and prefectural governments should thoroughly check if contaminated stone materials have been shipped from these firms.

In July last year, it came to light that rice straw stored in contaminated areas had been shipped and beef cows that ate it were contaminated with radiation. The latest case is quite similar to the rice straw contamination. If the central and prefectural governments had been aware of the possibility that stone materials were contaminated with radioactive materials and taken prompt action, the spread of damage from contaminated gravel could have been prevented.

The responsibility of these government bodies for the delay in their response is severe. The Economy, Trade and Industry Ministry received a report late last year that high levels of radiation had been detected at the Nihonmatsu apartment complex, but had not launched a survey on radiation levels until around Jan. 10, highlighting its lack of a sense of crisis.

Once contamination is confirmed, the national and local governments need to implement all possible and necessary measures to prevent local residents and other people from being exposed to the radiation, while checking radiation levels. In doing so, they should consider whether simply shielding contaminated structures is sufficient or if such structures must be removed.

Some 10 of 12 households occupying the Nihonmatsu apartment complex are disaster evacuees. Authorities should look for substitute apartments for them if they desire.

If contaminated houses need to be rebuilt, compensation payments to their residents will emerge as a major problem. The national government, Tokyo Electric Power Co. which operates the crippled nuclear plant, and other relevant entities must not place the blame on each other and cause a delay in relief measures.

(Mainichi Japan) January 18, 2012

Radiation-tainted stones used in paths near housing in Fukushima town

FUKUSHIMA, Japan (Kyodo) -- Radiation-contaminated gravel and stones shipped from a quarry in the evacuation zone near the Fukushima Daiichi nuclear power plant have been used in roads and pathways around houses in a town in Fukushima Prefecture, sources with knowledge of the matter said Wednesday.

The gravel was used for approach lanes to two houses in the town of Kawamata in the prefecture, and asphalt-paved roads owned by the Kawamata municipal government, the sources said.

The gravel using stones in neighboring Namie had been shipped from a quarry company sometime between the occurrence of the nuclear plant crisis, triggered by the March 11 earthquake and tsunami, and the governmental designation of the evacuation zone on April 22, they said.

Namie and parts of Kawamata are located in the evacuation zone set amid the crisis at the Fukushima Daiichi plant.

The latest revelation comes at a time when the government is seeking to identify distribution routes and destinations of such gravel and rocks from the quarry company, as well as other quarries in the area.

The government said Monday it started the probe after it learned in December that a high level of radiation was detected on the first floor of a new condominium in Nihonmatsu, Fukushima, whose concrete foundations were made by incorporating crushed stones from the Namie quarry.

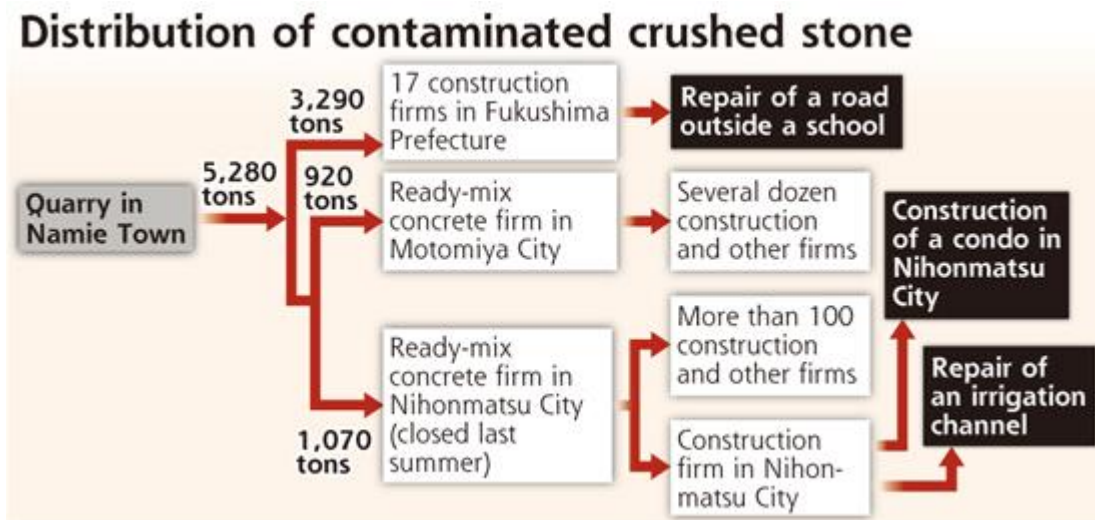

The quarry company, Futaba Saiseiki Kogyo, also said Monday it has shipped a total of 5,280 tons of gravel from Namie to 19 construction companies after the nuclear crisis.

Radiation of up to 1.24 microsieverts per hour, higher than the level outside the condo, was detected after a junior high school girl living in the condo showed cumulative exposure of 1.62 millisieverts in the three months through November.

(Mainichi Japan) January 18, 2012

Building contamination spreads / Radioactive materials used to repair road and waterway in Fukushima

The Yomiuri Shimbun

Contaminated crushed stone pieces taken from a quarry in the government's expanded evacuation zone following the crisis at the Fukushima No. 1 nuclear plant have been used to repair an irrigation channel and a road outside a school in Nihonmatsu City, Fukushima Prefecture.

The discovery was made after authorities began tracking down the whereabouts of 5,280 tons of the material that was quarried from Namie Town, in the same prefecture, after the stones were used in the construction of a condominium building in Nihonmatsu City, which was later found to contain high levels of radiation. The material is proving difficult to track because it has been sold to more than 100 construction companies throughout the prefecture.

One company said it was part of a group of firms that bought and used about eight tons of the crushed stone pieces to pave a road in front of a primary school in the city's south in April. The work was done to repair cracks caused by the March 11 earthquake and covered a total area of about 80 square meters across three locations along the road.

In a test Monday, the primary school found radioactivity in the air around the repaired road ranged from 0.4 to 0.5 microsievert per hour, almost as same as that detected in neighboring areas. But the school has advised students to walk along the side of the road as a precautionary measure.

The city government said the crushed stone was also mixed with fresh concrete used to repair an irrigation channel in April.

It believes the repaired section of the waterway is contaminated with radioactive cesium. A test conducted this month detected 1.62 to 1.97 microsieverts of radiation per hour at the waterway, higher than the 0.7 to 1.0 microsievert of radiation per hour found in surrounding areas.

The Economy, Trade and Industry Ministry said all the crushed stone pieces in question were shipped from Namie Town to two ready-mix concrete companies, one in Nihonmatsu City and the other in Motomiya City, as well as to 17 construction companies in the prefecture.

The ministry said documents suggest the crushed stone was then sold by the Nihonmatsu company to more than 100 other businesses, while the Motomiya company distributed the material to dozens of firms. It is difficult to establish the exact route of the crushed stone, the ministry added.

The Yomiuri Shimbun spoke to 11 of the 17 construction firms that bought the material, and all said they used the crushed stone in Fukushima Prefecture. A senior official of a Kawamata Town company that bought more than 500 tons of the crushed stone, said the material was used to build roads and there was never any speculation that the material had been contaminated by radioactive substances.

Futaba Saiseiki Kogyo Co. is responsible for operating the quarry and shipping the stone pieces. The company's president, Mitsuru Igari, 50, apologized at a press conference Monday. Igari said he feels sorry for what happened and added that he had pride in the work he was doing because he was helping to rehabilitate the area when others were abandoning it.

===

New houses to be checked

The Fukushima prefectural government started discussing Monday a plan to measure radiation inside houses built throughout the prefecture after the March 11 disaster.

The prefectural government will also study whether to conduct radiation measurements at 10 quarries located in evacuation zones or recommended evacuation areas.

(Jan. 18, 2012)

Nuclear reactor operation period could be up to 60 years

TOKYO (Kyodo) -- The Japanese government said Tuesday nuclear power plant operators could extend the operational life of a reactor by up to 20 years beyond the 40-year limit to be newly introduced under the planned revision of nuclear regulations.

The government is currently crafting bills to enhance nuclear safety regulations in the wake of the disastrous accident at the Fukushima Daiichi nuclear power plant, seeking their passage in the upcoming Diet session.

Under the new legislation, utilities would be allowed to operate a nuclear reactor for 40 years, beginning from the day it passed pre-operation inspections. But if approved by the government, a one-time extension of no more than 20 years would be allowed.

In the approval process, the government would examine the degree of obsolescence of the facility and the operator's technological ability to appropriately maintain it.

Government officials said that utilities would be required to clear "tough standards," but details have yet to be made public.

As for the reason for setting a maximum 20-year extension, one government official said he believes that period is "appropriate when considering the global trend" as seen, for example, in the United States.

But he added that the life span of a reactor would basically be 40 years and approved extensions would be "exceptional" cases.

In announcing the plan to set the 40-year limit earlier this month, nuclear disaster minister Goshi Hosono said approved extensions would be "very rare" under the envisioned regulatory reinforcement.

(Mainichi Japan) January 18, 2012

Fujimura: nuke life extension will be limited

Chief Cabinet Secretary Osamu Fujimura says there has been no basic change in the government's policy to limit the life of nuclear power plants to 40 years.

Fujimura was speaking to reporters on Wednesday. He was referring to the plan by a Cabinet Secretariat taskforce to propose extending the life of nuclear power plants up to 60 years.

He said the 40-year restriction remains the pillar of planned revisions in nuclear safety regulations. He said extension of a nuclear plant's life would be allowed in very few, exceptional cases.

Fujimura added that strict conditions will be in place for approving extensions beyond the 40-year limit.

Wednesday, January 18, 2012 14:34 +0900 (JST)

Nuclear power' life extension criticized

Local Japanese officials are voicing criticism over the central government's plan to extend the life of the nation's nuclear power plants to a maximum of 60 years.

Earlier this month, the government proposed that the life of nuclear plants be set at 40 years, based on a review of safety regulations following the disaster at the Fukushima Daiichi plant. But on Tuesday, the government said that in particular cases, operations can be extended by up to another 20 years.

The governor of Niigata Prefecture, Hirohiko Izumida, said the government's wavering will arouse concern among residents.

He called for an examination of the technical failures that led to the Fukushima disaster, and an investigation into whether the problems were related to the age of the reactors.

The governor of Shiga Prefecture, Yukiko Kada, says extending the life of reactors up to 60 years will make the public uneasy about nuclear safety measures.

She says the government must explain the rationale for the extension, as well as how it originally determined that the operations should last 40 or 60 years.

Mayor Tatsuya Murakami of Tokai Village in Ibaraki Prefecture says adding an additional 20 years to the proposed 40-year limit is a compromise measure that guts the substance of the original plan. He says public confidence in nuclear safety regulations will be lost without a definitive standard for the lifespan of power plants.

Wednesday, January 18, 2012 19:10 +0900 (JST)

Designated nuclear inspection body has board members from nuclear industry

Nearly half of the board members of the Nuclear Material Control Center (NMCC), the government-designated body to inspect nuclear materials to prevent sensitive materials from being used for military purposes, come from utility and other companies that are subject to its scrutiny and it has received cash contributions worth tens of millions of yen annually from the companies, it has been learned.

The Ministry of Education, Culture, Sports, Science and Technology, which oversees the NMCC, said, "Problems with something like conducting inspections tolerantly have not occurred." But the NMCC is likely to come under fire for having people from companies in the nuclear industry as its executive officers.

NMCC officials accompany inspectors from the International Atomic Energy Agency (IAEA) on their inspections of about 260 facilities such as utility firms and nuclear fuel manufacturers in Japan. They also conduct inspections on consignment from the Ministry of Education, Culture, Sports, Science and Technology.

Of all the 17 board members at the NMCC, eight are from the nuclear industry. Of the 15 executive board members including the chairman, six are current or former senior officials of utility firms or the Japan Atomic Energy Agency (JAEA). One auditor is a board member of a utility firm while another is a former employee of a manufacturer of nuclear reactors. Most of the NMCC's annual budget of about 2.98 billion yen (fiscal 2010) came from government subsidies. It also receives membership fees (100,000 yen per lot per annum) of about 96 million yen from supporting members. Most of the supporting members are utility firms and nuclear fuel processing firms that are subject to NMCC inspections, but the NMCC does not release the details.

Masahiro Kikuchi, an executive board member of the NMCC, said, "Executive board members (from organizations that are subject to NMCC inspections) are knowledgeable people who give advice on management. They don't have the authority to make pass-or-fail decisions over inspections. Fees from supporting members are not used for inspections."

The NMCC was jointly established with money from the private sector including utility companies in 1972, with the aim of promoting the peaceful use of nuclear energy. In line with administrative reform, the NMCC was designated as an inspection body under the Nuclear Reactors Regulation Law in 1999. Before the NMCC applied for a designated inspection body, seven of its 12 executive board members were those from nuclear-related companies.

Therefore, it did not meet the requirement stipulated in the 1996 Cabinet decision which said the number of executive board members from the same industry must be less than half of the total executive board members. Hence, the NMCC added two seats to the number of its executive board members and picked two university-related persons as new executive board members before applying for the designated inspection body.

nger spreads as radioactive gravel traced to schools, public road

NIHONMATSU, Fukushima -- Anger and anxiety are spreading here after highly radioactive gravel from inside the Fukushima nuclear disaster evacuation zone was traced on Jan. 17 to several construction projects in the city, including at local schools.

The contaminated gravel, quarried in the town of Namie, was first discovered in the concrete at a new apartment block. Since then the material has been traced to repairs to a new school route road, a public pool in a neighboring town and a golf course in the prefecture, among other locations. According to the Nihonmatsu Municipal Board of Education, the stone was used in earthquake-proofing projects at the city's elementary and junior high schools.

Staff at Asahi Elementary School taking radiation readings along the school route detected emissions of 0.36-0.60 microsieverts per hour -- or about the same level as the surrounding area -- and the school held a meeting for parents and guardians on the evening of Jan. 17 to explain how the contaminated gravel had wound up in the new road.

Parents apparently asked that the road be torn up and the contaminated stone taken away, among other demands. Asahi's principal responded that it will "report the situation to the city, and the school is also considering its options."

The president of the golf course, meanwhile, was furious after it was found the gravel the course had been using to repair earthquake damage to its golf cart paths was emitting radiation of 1.6-1.8 microsieverts per hour.

"This is very big trouble," the president said. "I don't know if the course can reopen now."

Radiation levels at the public pool in a town next to Nihonmatsu, however, were apparently lower than the surrounding area.

"We were very surprised, but we are dealing with the situation in a cool manner," the town hall said in a statement.

Meanwhile, Nihonmatsu Mayor Keiichi Miho visited the prefectural and national on-site disaster response headquarters to present seven demands, including safety guarantees and compensation to cover moving costs for tenants of the contaminated apartment block, and creation of standards regulating the shipment of construction materials. The prefectural government accepted the demands and plans to pressure the central government, as well as form its own strategy to make sure contaminated materials like the gravel are not overlooked.

The national and prefectural governments have also decided to check an additional 10 stone companies around the evacuation recommendation zones in the cities of Date and Minamisoma for radioactive contamination.

The Ministry of Economy, Trade and Industry has furthermore begun considering creating radiation standards for building materials.

"We will proceed with emergency discussions on whether a standard is needed with the relevant government offices," economy minister Yukio Edano told reporters at a news conference. Moving on Edano's comments, the government's nuclear disaster countermeasures headquarters is set to cooperate on the issue.

Govt says stress tests were appropriate

Japan's government panel says the safety tests for 2 nuclear reactors were appropriate. It is the first case where the government has given an assessment of such tests.

The Nuclear and Industrial Safety Agency held a meeting of an expert panel on Wednesday to give its assessment of computer-simulated stress tests on 2 reactors at Oi nuclear plant in Fukui Prefecture, along the Japan Sea coast.

People opposed to restarting the reactors staged a protest against the agency's decision not to allow observers at the meeting. So, the agency changed the meeting room and opened discussions after a delay of over 3 hours.

Two of the 8 panel members were absent from the meeting, saying that it is inappropriate to keep out observers.

Industry minister Yukio Edano told reporters that the ministry will release video footage of the meeting on its website as soon as possible.

The agency plans to give its final assessment of the 2 reactors after receiving inspections by the International Atomic Energy Agency later this month.

The government needs to obtain local consent before allowing the resumption of the reactors' operation.

But Fukui Prefecture says stress tests alone are not enough to base a decision on, citing the need for the government to propose new measures based on the accident at the Fukushima Daiichi nuclear plant.

Wednesday, January 18, 2012 22:11 +0900 (JST)

Govt proposes nuclear evacuation scale

Japan's Nuclear Safety Commission has proposed a 3-stage scale for evacuating residents when accidents hit nuclear power plants. It urges immediate evacuation of residents living within about 5 kilometers in the most serious cases.

The commission's task force reached a broad agreement on the plan at a meeting on Wednesday.

An accident will be categorized as a total emergency, an emergency situation involving facility compounds and surrounding areas, or a situation requiring caution. The criteria are based on standards of overseas nuclear safety agencies.

The most serious "total emergency" level will be declared when nuclear fuel is damaged and a release of radioactive substances exceeding government standards is expected.

In the Fukushima Daiichi accident, the authorities are thought to have been unable to accurately predict the amount of radioactive fallout and possible impact.

More discussions on concrete measures to be taken at each accident level are planned ahead of the scheduled launch of a new nuclear safety agency in April.

Wednesday, January 18, 2012 12:50 +0900 (JST)

Nuke safety agency under fire for hasty approval of reactor reactivation

The green light that the nuclear power regulator has given to the reactivation of two reactors before the government issues a final report on the ongoing Fukushima crisis has sparked criticism from citizens' organizations as well as experts.

Questions remain as to how the government will win understanding from local governments that host nuclear plants regarding the reactivation of reactors suspended for regular inspections. The government and power suppliers that own nuclear plants need to overcome a mountain of problems before summer, when demand for electric power will surge.

The Nuclear and Industrial Safety Agency (NISA) has approved the safety assessment that Kansai Electric Power Co. (KEPCO) conducted on the No. 3 and 4 reactors at its Oi Nuclear Power Plant, paving the way for the resumption of operations at these reactors.

During a hearing of the safety assessment, known as a "stress test," citizens groups raised questions about, and bitterly criticized, the way NISA evaluated and approved KEPCO's safety assessment.

"How can you assess the safety of the nuclear plant?" one asked.

"You should allow us to listen to discussions in the meeting room instead of setting up seats for the audience in a separate room," another said.

Experts have raised questions as to the use of the results of the evaluation of the stress tests to deem whether operations at stopped nuclear reactors can be resumed.

"Stress tests are conducted to see how much stress reactors can endure during a severe accident, such as damage to their cores, and doesn't guarantee their safety," says Muneo Morokuzu, professor of nuclear legislation at the University of Tokyo.

The European Union (EU) has conducted stress tests on nuclear reactors since the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant triggered by the March 11 tsunami. However, it has failed to show clear standards for judging whether reactors are safe.

EU officials admit there is no choice but to let regulatory bodies in its respective member countries make judgment at their own discretion.

During deliberations on the results of KEPCO's stress test on Oi's No. 3 and 4 reactors, NISA said that new standards determine whether enough safety measures have been implemented to guarantee that an accident as serious as the Fukushima crisis never happens.

However, NISA-mandated emergency safety measures on reactors to guarantee safety were actually conducted by the electric power companies that own them, which is feared to effectively ensure that all of them will pass the stress tests.

In the meantime, NISA is required to examine power suppliers' assumption of the scale of earthquakes and tsunami that could hit their nuclear power stations based on the current guidelines for the quake resistance of nuclear plants.

However, NISA has only completed its deliberations on such an assumption regarding the No. 1, 5, 6 and 7 reactors at the Kashiwazaki-Kariwa Nuclear Power Plant, the prototype fast-breeder reactor Monju and Japan Nuclear Fuel Ltd.'s spent nuclear fuel reprocessing facility.

Lessons learned from the crisis at the Fukushima plant have not been reflected in NISA's evaluations. Up to 15-meter-high tsunami waves hit the Fukushima nuclear plant, triggering the crisis, even though its operator Tokyo Electric Power Co. assumed that up to 5.7-meter-high tsunami could hit the plant.

Hiromitsu Ino, University of Tokyo professor emeritus on metal materials, expressed anger at NISA's decision.

"It's wrong to draw a conclusion on the safety assessment of nuclear reactors even without setting clear standards for safety. Priority should be placed on reassessing all reactors' safety while taking into consideration lessons learned from the Fukushima crisis," he said. "From the beginning, NISA had intended to give the green light to reactivation."

Professor Morokuzu added, "Comprehensive safety assessment should be conducted, including whether equipment and workers can be mobilized in an appropriate manner in case of unexpected accidents." (By Toshiyasu Kawachi, Tokyo Science and Environment News Department)

Nuclear agency examines reactor test results amid protest

TOKYO (Kyodo) -- The Nuclear and Industrial Safety Agency presented a draft report Wednesday that approves the safety test results on two idled reactors at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture at a meeting with experts, which was temporarily blocked due to a civilian protest over its handling of the screening of the report.

It is the first time the agency has made such an evaluation of safety test results on reactors, submitted by a number of utilities so far. The safety tests are required to resume operations of idled reactors in the wake the nuclear crisis at the Fukushima Daiichi power plant.

The agency will work to finalize the report by hearing what the experts have to say.

The meeting was originally scheduled to start at 4:15 p.m., but the start was delayed until around 8 p.m. due to a protest by citizens who were asked to watch the meeting on a real-time monitor set up in a separate room.

The request had been made as the previous meeting that was open to the public was disrupted by some spectators.

On Wednesday, the government's nuclear safety agency held the meeting in a room different from the one originally planned and did not allow attendance by private citizens, largely those who oppose the resumption of reactors. Some of the experts also boycotted the meeting in protest at the agency's tactics.

At a hastily arranged press conference, industry minister Yukio Edano said it was "totally unacceptable" that an opportunity to discuss reactor safety issues scientifically in a peaceful manner had been disrupted.

Edano, who supervises the nuclear safety agency, also said he accepts that there are various opinions about nuclear power.

"Speaking not as a minister, my personal view on the resumption of the reactors is close to those people who are calling for an unreservedly cautious stance (on the issue)," Edano said.

The Nos. 3 and 4 reactors at the Oi plant have been suspended for regular checkups.

The agency said in the draft report that the utility has taken sufficient measures for the two reactors to prevent the sort of situation seen in the Fukushima complex disaster.

The government has required utilities to conduct safety tests for restarting idled reactors in the wake of the nuclear crisis at the Fukushima Daiichi power plant.

The test results on the two reactors at the Oi plant will still have to be approved afterward by the International Atomic Energy Agency and the Nuclear Safety Commission of Japan as well, before the relevant local government decides whether to approve the reactors' resumption.

Kansai Electric has assessed the two reactors as capable of withstanding an earthquake 1.8 times stronger than the maximum presumed quake for the region, and a tsunami wave up to 11.4 meters high -- or four times higher than the maximum presumed level.

(Mainichi Japan) January 19, 2012

TEPCO uses endoscope to look inside crippled Fukushima reactor

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Thursday that it has passed an industrial endoscope into one of the reactors that suffered meltdown at the Fukushima Daiichi nuclear power plant in the first attempt by the plant operator to directly check the interiors of the crippled reactors.

The outcome of the 70-minute survey into the No. 2 reactor is expected to be announced later in the day. Confirming the state of the melted fuel is likely to be difficult through the investigation, but the utility may be able to gather more information on the reactor's conditions.

According to officials of the utility, known as TEPCO, the industrial endoscope, 8.5 millimeters in diameter, was to have been inserted into the reactor's primary container through a hole located about 2.5 meters from the floor of the building housing the reactor.

The tip of the endoscope is equipped with a 360-degree-view camera and a thermometer to measure the temperature inside the reactor, and possibly the temperature of the water filling the vessel.

TEPCO has been checking the temperature around the reactor pressure vessel, enclosed inside the primary container, to confirm current measurements, which may have a margin of error of around 20 degrees.

The fuel inside the Nos. 1 to 3 reactors is believed to have melted through the pressure vessels and been accumulating in the outer primary containers after the Fukushima plant lost its key functions to cool the reactors in the wake of the earthquake and tsunami on March 11 last year.

TEPCO has installed a new water circulation system to keep cooling the damaged reactors.

(Mainichi Japan) January 19, 2012

TEPCO failed to link data device to backup power

The operator of the crippled Fukushima Daiichi nuclear power plant says it failed to supply emergency electricity to a device that sends information on the reactors to a government nuclear safety agency.

Tokyo Electric Power Company revealed this at a news conference on Thursday.

The device ceased to send real-time data because it was not connected to a backup power supply and lost electricity immediately after the March 11th 2011 earthquake and tsunami.

The device provides key information including reactor temperatures and radioactivity levels near buildings to the government-controlled Emergency Response Support System, or ERSS.

The lack of real-time data may have affected the government's immediate response to the disaster.

TEPCO says it had planned to connect the device to an emergency power source in November 2010 -- 4 months before the March 11th disaster. The utility says it did not complete the procedure as an available cable was too short to connect the device.

TEPCO adds that it discussed a date for connecting the device with the government's Nuclear and Industrial Safety Agency. But TEPCO says it did not see connecting the device to emergency power as an urgent task.

Senior agency official Yoshinori Moriyama says the agency plans to ensure that all nuclear plants across Japan install backup power and that the agency will diversify methods of data transmission.

N-reactor lifespan to be 60 yrs

The Yomiuri Shimbun

Nuclear reactors in operation for more than 30 years

	Names of reactors	Location	Number of full years in operation
Japan Atomic Power Co.	Tsuruga plant's No. 1 reactor	Fukui Pref.	41 years
	Tokai plant's No. 2 reactor	Ibaraki Pref.	33 years
Tokyo Electric Power Co.	Fukushima No. 1 plant's No. 5 reactor	Fukushima Pref.	33 years
	Fukushima No. 1 plant's No. 6 reactor	Fukushima Pref.	32 years
	Reactor Nos. 1-4 of Fukushima No. 1 plant are scheduled for decommissioning.		
Kansai Electric Power Co.	Mihama plant's No. 1 reactor	Fukui Pref.	41 years
	Mihama plant's No. 2 reactor	Fukui Pref.	39 years
	Mihama plant's No. 3 reactor	Fukui Pref.	35 years
	Takahama plant's No. 1 reactor	Fukui Pref.	37 years
	Takahama plant's No. 2 reactor	Fukui Pref.	36 years
	Oi plant's No. 1 reactor	Fukui Pref.	32 years
	Oi plant's No. 2 reactor	Fukui Pref.	32 years
Chugoku Electric Power Co.	Shimane plant's No. 1 reactor	Shimane Pref.	37 years
Shikoku Electric Power Co.	Ikata plant's No. 1 reactor	Ehime Pref.	34 years
Kyushu Electric Power Co.	Genkai plant's No. 1 reactor	Saga Pref.	36 years
	Genkai plant's No. 2 reactor	Saga Pref.	30 years

The government has decided it will allow the nation's nuclear power reactors to continue operations for a maximum of 60 years by extending the legally permitted period by 20 years as an exceptional measure.

The government initially planned to set the operation limit of nuclear reactors to a maximum 40 years in principle, by revising the Nuclear Reactor Regulation Law.

However, the government said a bill to revise the law will include a provision to allow power companies to extend the period only once by 20 years.

If the bill passes in the next ordinary Diet session, nuclear reactors that clear the government's safety examinations will be allowed to operate for up to 60 years since they first started operations after passing prior examinations.

At a Jan. 6 press conference Goshi Hosono, state minister for nuclear power policy and administration, first announced the revision plan, saying: "An extension is an absolutely exceptional case. The government's basic stance is that nuclear reactors should be decommissioned after the 40-year limit."

Hosono, also the environment minister, emphasized at that time that exceptions are no more than exceptions.

However, a senior Environment Ministry official said, "If an exceptional provision is included in the law, there will be a strong tendency to proactively utilize it."

According to the Cabinet Secretariat's Office for the Preparation of Nuclear Safety Regulatory Organization Reform, the exception clause is modeled after a U.S. system, which limits a reactor's operation period to 40 years, but allows extensions of up to 20 years. "Considering worldwide trends, the stipulation to allow an extension period of 20 years is appropriate," an official of the office explained.

The Cabinet likely will approve the bill by the end of this month.

Nuclear plant operators will apply for the actual extension period for each nuclear reactor to the environment minister.

A new nuclear safety agency to be established in April as an external entity of the Environment Ministry will screen the applications.

The new agency will take several factors into consideration, including each facility's deterioration due to age and whether plant operators have the technical competence to ensure the safety of the reactors during their operation periods.

If the criteria are met, the agency will permit an extension of the operational period for a reactor.

So far, there has been no law that restricts the maximum operating period for nuclear power reactors.

The Nuclear and Industrial Safety Agency has been inspecting reactors that started operating more than 30 years ago every 10 years and has allowed operations to continue for reactors that were judged safe.

(Jan. 19, 2012)

Panel: evacuation system unreliable / Government group says SPEEDI cannot accurately predict radiation spread

The Yomiuri Shimbun

A government commission evaluating guidelines on nuclear disaster management released a plan Wednesday asking authorities to refrain from using SPEEDI, a computer system that judges whether residents should evacuate based on its predictions of radioactive fallout after a nuclear accident.

The working group of the Cabinet Office's Nuclear Safety Commission said, "Predictions made by SPEEDI have a large degree of uncertainty, making it unreliable during times of emergency."

The group recommends judgments about evacuations should be made based on data collected, such as radiation levels, rather than using SPEEDI, which makes predictions of "low reliability."

This view is certain to generate discussion because it runs counter to the findings of a government panel in its interim report last month on the crisis at the Fukushima No. 1 nuclear power plant. The panel said, "If key information predicted by SPEEDI had been provided, people could have chosen more appropriate evacuation routes [in the aftermath of the crisis at Fukushima]."

Under current guidelines, evacuations will be ordered when exposure to radioactivity is expected to reach at least 50 millisieverts, based on SPEEDI predictions and accident circumstances. But there was public criticism over the way the nuclear crisis was handled because SPEEDI predictions were not used for evacuation orders in March last year.

The working group examined the way in which SPEEDI operated during the crisis.

It said the system was unable to get information related to reactor cores at the site of the accident and made calculations based on the input of provisional data. The group concluded that the SPEEDI system was unable to make any accurate predictions regarding the area of radioactive contamination as the materials dispersed during the accident changed frequently due to changes in wind direction.

Toshimitsu Honma, chief of the group and director of the Nuclear Safety Research Center, said if the system has no information on the time when radioactive material is released and the quantity dispersed, SPEEDI "can predict nothing more than wind direction."

The working group made two recommendations in its review of the evacuation instructions in accordance with guidelines of the International Atomic Energy Agency.

The first is that specific responses should be established in advance for people living within a five-kilometer radius of a nuclear plant. This should include three options, including immediate evacuation in the event of an accident such as the meltdown of a nuclear core.

Secondly, that judgments regarding the evacuation of people living further away be made based on measured data, such as the amount of radioactivity per hour.

The SPEEDI system is expected to continue to be used in the future, but its function is likely to be limited to providing supplementary information. A member of the group said there will be calls to further evaluate SPEEDI, which has cost more than 13 billion yen in development and maintenance expenses.

(Jan. 19, 2012)

TEPCO captures images inside crippled Fukushima reactor for 1st time

This photo taken by a remote-controlled endoscope and released by Tokyo Electric Power Co. (TEPCO) shows scaffolding, the bottom, and the wall inside the beaker-shaped containment vessel of the No. 2 reactor at the damaged Fukushima Dai-ichi nuclear power plant in Okuma, Fukushima Prefecture, north of Tokyo, Thursday, Jan. 19, 2012. (AP Photo/Tokyo Electric Power Co.)

TOKYO (Kyodo) -- Tokyo Electric Power Co. on Thursday passed an industrial endoscope into one of the reactors that suffered meltdown at the Fukushima Daiichi nuclear power plant in the first attempt by the plant operator to directly check the interiors of the crippled reactors.

The 70-minute examination of the No. 2 reactor showed that the inner temperature of the primary container stood at **44.7 C**, not much different from the figure using existing measuring equipment, but **the surface of the water filling the structure appeared to be less than 4 meters above the bottom, lower than the initial rough estimate.**

Tokyo Electric spokesman Junichi Matsumoto said the result does not affect the current assessment that the reactor has achieved a stable state of cold shutdown, while noting major damage to inner pipes has not been confirmed so far.

The endoscope captured images of water dripping from above apparently because of **condensation**, and paint was seen possibly falling off the inner wall of the container in some areas exposed to high temperatures and humidity over the months since the nuclear disaster erupted following the massive earthquake and tsunami on March 11 last year.

The probe was "the first step" to check the condition inside the reactor, Matsumoto said, but added the high humidity and radiation blurred the image.

He also said that **confirming the state of the melted fuel, a key step toward decommissioning the crippled reactors, would require further technology development.****[in other words they don't know what to do]**

The fuel inside the No. 2 reactor, as well as inside the No. 1 and No. 3 reactors, is believed to have melted through the pressure vessels and been accumulating in the outer primary containers after the Fukushima plant lost its key functions to cool the reactors in the wake of the natural disasters.

The damaged reactors are leaking water continually injected as a coolant, but the utility known as TEPCO has said the fuel is stably cooled by a water circulation system installed after the accident.

This photo taken by a remote-controlled endoscope and released by Tokyo Electric Power Co. (TEPCO) shows structures assumed to be small-size piping or cable conduits inside the beaker-shaped containment vessel of the No. 2 reactor at the damaged Fukushima Dai-ichi nuclear power plant in Okuma, Fukushima Prefecture, north of Tokyo, Thursday, Jan. 19, 2012. (AP Photo/Tokyo Electric Power Co.)

The endoscope, 8.5 millimeters in diameter, was inserted into the reactor's primary container through a hole located about 2 meters from the floor of the building housing the reactor. The length of the inserted portion of the equipment's tube was about 2 meters.

The latest survey by TEPCO was partly aimed at checking the credibility of the temperature data taken with existing equipment, which were believed to have had a margin of error of around 20 degrees.

But the temperature measured by using the endoscope and the existing equipment differed by only 2.1 C, **suggesting that the existing indicators are working quite well.**

The No. 2 reactor was chosen as the first reactor to probe using the endoscope because work there seemed to go more smoothly than at the other two reactors such as in terms of radiation levels.

(Mainichi Japan) January 20, 2012

First video clip of reactor interior released

The operator of the Fukushima Daiichi nuclear power plant has released a video clip taken inside the damaged No.2 reactor for the first time since the accident last year.

Tokyo Electric Power Company recorded 30 minutes of video by running an optical fiber scope, known as an endoscope, through a hole into the reactor's containment vessel Thursday.

The company released an edited version of the video lasting about one minute on Friday. The footage begins inside the aperture leading to the containment vessel, and as the endoscope reaches the interior, white dots caused by gamma rays immediately appear.

Walls and several pipes are also visible, although most of the images are blurry.

TEPCO says white lines seen in the clip are actually condensed vapor from contaminated water falling like rain.

One of the reasons for shooting the video was to determine the depth of water that has collected on the bottom of the vessel.

TEPCO says the water is less than 4 meters deep. The company was able to make this determination because a foothold located at that height is visible on the video.

Friday, January 20, 2012 13:23 +0900 (JST)

TEPCO fails to clearly see inside damaged reactor

The operator of the crippled Fukushima Daiichi nuclear power plant has failed in an attempt to get clear images from inside a damaged reactor using fiber-optic lines.

Tokyo Electric Power Company is trying to determine the state of nuclear fuel inside the plant's Number 1, 2 and 3 reactors. The fuel melted through the wall of each reactor's core units and fell to the bottom of their containment vessels after the March 11th 2011 earthquake and tsunami.

On Thursday, TEPCO inserted an optical fiber scope known as an endoscope through a hole into the containment vessel of the Number 2 reactor.

Photos taken by a camera attached to the endoscope show parts of walls and pipes inside the containment vessel. But the images were blurred, probably due to radiation and vapor from contaminated water, leaving details, including the surface of the contaminated water, unclear.

TEPCO says that the photos showed no serious damage or deformation to walls and pipes.

The utility also measured the temperature of the inside of the vessel for the first time since the disaster at 44.7 degrees Celsius. The figure almost matches the 42.6 degrees already shown by thermometers around the vessel.

It's the first time that TEPCO has examined the inside of a damaged reactor since the disaster. The company says it must understand the state of the reactors before it can complete its shutdown of the plant.

Thursday, January 19, 2012 20:01 +0900 (JST)

Japan to seek data from Ukraine on effects of Chernobyl accident

TOKYO (Kyodo) -- Japan will begin negotiations with Ukraine later this month for an agreement to obtain data on the effects of low-level radiation exposure and soil contamination accumulated by Kiev since the Chernobyl nuclear meltdown of 1986, government officials said Thursday.

The Japanese government will use the data in treating people exposed to radiation in the Fukushima nuclear crisis, the officials said.

The agreement will cover data on the effects of nuclear accidents on human health and the environment as well as the exchange of researchers and engineers, and joint seminars.

With the Fukushima and Chernobyl disasters both given the maximum crisis severity level of 7 on the international scale, Ukraine's detailed data on treatment and contamination will enable Japan to implement "effective measures" to address the effects of radiation from the Fukushima Daiichi nuclear plant crippled by the March 2011 earthquake and tsunami, a Foreign Ministry official said.

Japanese lawmakers asked the Ukrainian government for its cooperation when they visited the country in October last year.

Entering areas located within a 30-kilometer radius of the Chernobyl nuclear power plant in northern Ukraine is still banned as radioactive substances remain widely scattered.

(Mainichi Japan) January 20, 2012

Highly radioactive water found near No.2 reactor

The operator of the Fukushima Daiichi nuclear power plant has found 500 tons of highly radioactive water near the crippled No.2 reactor.

On December 18th, Tokyo Electric Power Company workers found radioactive water in an underground tunnel at a facility to store highly contaminated water.

Under the government's direction, this month TEPCO started checking whether radioactive water is collecting in the plant's other underground facilities.

On Thursday, the utility found around 500 tons of contaminated water in a pit near the No.2 reactor. The pit has a valve which is used for pumping in seawater.

The analysis of the contaminated water shows it has 16,200 becquerels of radioactive cesium per cubic centimeter. That represents the highest level of radioactive substances found in this month's survey.

TEPCO also detected 600 tons of water containing 860 becquerels of radioactive elements per cubic centimeter in a pit near the No.3 reactor.

The utility says the radioactive water is unlikely to have leaked into the ocean as the density of radioactive materials in seawater near the No.2 and No.3 reactors has remained unchanged.

The company plans to determine how the contaminated water collected in the tunnels.

Friday, January 20, 2012 06:24 +0900 (JST)

High levels of radiation detected in ash

The Environment Ministry says high levels of radioactive cesium have been found in ash from firewood kept near the crippled nuclear power plant in Fukushima Prefecture, northeastern Japan.

The ministry informed Fukushima and 7 other prefectures that their municipalities should collect and dispose of contaminated ash.

The ministry burned samples of wood kept in gardens of 2 houses in Nihonmatsu City after being asked by the city last November if using the wood in stoves would pose any problems.

The ministry found that the maximum radioactive cesium level of the ash exceeded 40,000 becquerels per kilogram.

The forestry agency last November notified prefectural authorities nationwide that firewood contaminated with over 40 becquerels of radioactive cesium per kilogram should not be distributed.

The wood in question is said to have been taken from nearby forests by residents before the accident at the Fukushima Daiichi nuclear power plant last March.

Thursday, January 19, 2012 18:14 +0900 (JST)

NISA endorses Oi stress tests / Draft report says Nos. 3, 4 reactors 'ready' for major quake

The Yomiuri Shimbun

The Nuclear and Industrial Safety Agency has prepared a draft report endorsing the results of first-stage stress tests submitted by Kansai Electric Power Co. regarding the Nos. 3 and 4 reactors at its Oi nuclear plant in Fukui Prefecture.

NISA has received test results for 14 domestic reactors, but this is the first report it has drafted on any of the results.

The report was presented Wednesday to a meeting of experts, but the proceedings were delayed when members of an antinuclear citizens group and others forced their way into the venue.

The meeting started 3-1/2 hours later than scheduled due to the disruption, but only four of the eight experts expected to attend were present throughout the entire meeting. Two boycotted because private citizens were barred from attending. Another expert could not participate due to the delay and a fourth left partway through.

Economy, Trade and Industry Minister Yukio Edano held two press conferences regarding the citizens group that caused the turmoil, during which he called their actions "completely unacceptable."

Experts at the meeting raised points related to technology, and NISA is scheduled to hold another meeting Feb. 8.

It will release a final version of its report taking into account such factors as the assessments and advice offered by experts from the International Atomic Energy Agency, who are scheduled to visit Japan from Monday, and the content of the current discussions.

The Cabinet Office's Nuclear Safety Commission will then assess the report, after which Prime Minister Yoshihiko Noda and the three ministers concerned will decide, taking into account the feelings of local authorities, whether the Oi reactors can be restarted.

However, local authorities continue to be reluctant to allow reactivation, so it is unclear whether this process will go smoothly.

Stress tests investigate how well nuclear power plants can withstand earthquakes and tsunami stronger than originally envisioned when the plants were built. They are meant to prove the effectiveness of the emergency safety measures implemented by various utilities after the outbreak of the crisis at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co.

Clearing the first stage of the tests is a precondition for restarting reactors that have been suspended for regular inspections.

KEPCO compiled the results of a first-stage stress test on the Oi plant's No. 3 reactor in October. According to the data, the entire structure could withstand an earthquake intensity of 1.8 times the envisioned figure of 700 gals, and a tsunami of four times the envisioned height of 2.85 meters.

It presented similar results for the first-stage stress test on reactor No. 4 in November.

NISA evaluated such elements of KEPCO's findings as whether its calculation methods were appropriate, and judged that "[the utility] has implemented measures that would prevent a similar crisis should [the Oi plant] be struck by the kind of earthquake or tsunami that hit the Fukushima No. 1 nuclear power plant."

NISA is a body under the Economy, Trade and Industry Ministry.

Radiation of 40 microsieverts per hour detected at Namie quarry

Up to 40 microsieverts of radiation per hour have been detected from gravel at a quarry in Fukushima Prefecture that shipped tainted gravel for construction work, government officials have said.

Officials of the national and Fukushima prefectural governments visited the quarry in the town of Namie near the Fukushima No. 1 nuclear plant -- owned by Futaba Saiseiki Kogyo -- to measure radiation levels.

Between 11 and 40 microsieverts of radiation per hour were detected one meter above gravel held at eight storage sites in the open, while 16 to 21 microsieverts were detected in three locations covered by roofs.

Officials said they will release the results of detailed analysis of the data as early as next week.

About 5,200 metric tons of gravel has been shipped from the quarry and some of it was used in the construction of an apartment complex in Nihonmatsu, Fukushima Prefecture. Ten of 12 households in the complex are disaster evacuees.

Fukushima quarry agents to voluntarily check radiation level

FUKUSHIMA (Kyodo) -- The association of quarry agents in Fukushima Prefecture has asked its members to voluntarily check the radiation doses of their products to ease public concerns over radioactive contamination of building materials, its officials said Saturday.

The move came after high-level radiation was detected in a condominium in Nihonmatsu, Fukushima, whose foundation was made using concrete containing crushed stone collected from a quarry near the troubled Fukushima Daiichi nuclear power plant.

The association has urged its member agents to measure radiation levels of their stone materials at a research facility of the prefectural government, it said.

The group, however, does not set its own criteria for the radiation level, saying it "is not authorized to do so."

The prefectural government, for its part, **asked the central government last May to show the standard radiation level for building materials** in the wake of the nuclear crisis at the Fukushima complex triggered by the March earthquake and tsunami, **but the state has not yet set them.**

Gravel and crushed stone from the quarry in Namie, Fukushima Prefecture, was also found to have been used to reinforce the earthquake resistance of an elementary school building.

Industry minister Yukio Edano has said he will instruct **Tokyo Electric Power Co., the operator of the complex**, to pay compensation for related damage.

(Mainichi Japan) January 21, 2012

Radioactive gravel also used in construction of private house in Fukushima

FUKUSHIMA -- Highly radioactive gravel from inside the Fukushima nuclear disaster evacuation zone that was traced to several construction projects in Fukushima Prefecture, including apartment buildings and local schools, was also used in the construction of a private house here, it has been learned.

According to Nihonmatsu Municipal Government officials, the contaminated gravel was used in the construction of a private house in the capital city Fukushima, which a local Nihonmatsu building company worked on last April.

Radiation levels detected on the first floor of the house were about four times higher than those in outdoor surrounding areas, city officials said.

While outdoor radiation levels stood at 0.2 microsieverts per hour, those detected in the house's foundations were 1.5 to 1.9 microsieverts per hour and 0.8 to 0.85 microsieverts per hour under the house's floor.

People are still currently living in the house.

Meanwhile, radiation levels in the city of Fukushima vary depending on locations. According to the Ministry of Education, Culture, Sports, Science and Technology (MEXT), recent atmospheric reading emissions -- measured at one-meter above ground -- show doses of 1.2 microsieverts per hour.

Amidst public anger and anxiety, the Nihonmatsu Municipal Government has decided to examine all 224 city construction projects in which work began after the triple disasters last year.

As of present, it has been revealed that the contaminated gravel, originally from a quarry in the town of Namie and kept outdoors even after the outbreak of the nuclear disaster, was used in a total of 108 locations, including four local schools.

Radiation levels detected in all four schools, however, are not higher than those measured in their outdoor surroundings.

The Nihonmatsu Municipal Government maintains that with the exception of agricultural canal routes in the city, where detected radiation levels stood higher than in surrounding areas, radiation emissions are not a threat to public safety.

To check whether the contaminated gravel was used in the construction of other private houses, the municipal government will check with construction companies about all residences that were built in Nihonmatsu after the March 11 disasters.

Meanwhile, central and prefectural government officials began a close examination of the gravel in Namie on the morning of Jan. 20. The prefectural government will also conduct radiation emission readings in another 27 gravel pits inside the no-entry and emergency evacuation preparation zones around the crippled Fukushima No. 1 Nuclear Power Plant starting from next week at the earliest.

(Mainichi Japan) January 20, 2012

Contaminated crushed stone found in more houses

More buildings containing crushed stone contaminated with radioactive substances have been found in Fukushima Prefecture.

It is believed that the crushed stone used in concrete was contaminated by the nuclear accident at the Fukushima Daiichi nuclear plant in March last year.

The stone comes from a quarry in Namie Town, which was designated as an evacuation zone following the accident.

Earlier this week, high levels of radioactivity were detected in a new apartment building in Nihonmatsu City.

Government officials say stone from the quarry has been sold to more than 200 construction companies in the prefecture, and **was used at about 1,000 sites.**

Much of it is believed to have been used to repair roads and reinforce river banks, but some was found to have been used to construct or repair at least 49 homes and apartment units in the prefecture.

In one house in Fukushima City, radioactivity levels up to 0.85 microsieverts per hour were detected which are higher than outside the building.

The central and prefectural governments say no health effects have yet been reported, but that they will investigate when the stone was shipped from the quarry and measure radioactivity levels in the newly built and renovated buildings.

Saturday, January 21, 2012 23:30 +0900 (JST)

Hosono explains decontamination steps for Fukushima

Japan's Environment Minister Goshi Hosono says the government will step up its efforts to remove radioactive materials from areas near the crippled Fukushima Daiichi nuclear plant.

In a ceremony to mark the opening of the ministry's new office in Fukushima City, Hosono said the government plans to set up 5 branches of the office in Fukushima Prefecture and increase the number

of staff from the current 69 to 200 in April.

The Fukushima Office for Environmental Restoration is being set up to serve as the government's hub for proceeding with radioactive decontamination work.

Hosono added that a timetable for decontamination steps for the government-designated evacuation zone will be drawn up by the end of March.

After the ceremony, Hosono told reporters that he will do more to obtain consent for the planned construction of an intermediate storage facility for radioactive soil.

Local municipalities have come out against the government's desire to build the facility in the Futaba district near the nuclear plant.

Saturday, January 21, 2012 14:19 +0900 (JST)

Water falling like rain inside N-reactor

The Yomiuri Shimbun

No. 2 reactor at Fukushima No. 1 nuclear power plant

Tokyo Electric Power Co. on Friday released 30 minutes of video footage taken Thursday inside the containment vessel of the Fukushima No. 1 nuclear power plant's No. 2 reactor, the first such images to be released by the utility.

Drops of water fall like rain in the video, which was shot using an industrial endoscope. **The drops were apparently the result of vapor--created by the heat from melted nuclear fuel--that cooled inside the upper part of the reactor containment vessel.**

Strong radiation caused scattered white static in the footage, which displayed the severe environment inside the containment vessel, observers said.

The vessel's pipes did not appear to be significantly damaged, but paint had fallen off the inner wall, due possibly to high temperatures following the outbreak of the nuclear crisis.

The endoscope was inserted about two meters into the containment vessel through a hole about seven meters above the bottom of the containment vessel. **Visibility was about two meters to three meters.**

Melted nuclear fuel is believed to have fallen to the concrete bottom of the containment vessel, but this could not be confirmed.

"Workers can't go into the containment vessel. We need to develop a small robot," said Junichi Matsumoto, acting head of TEPCO's headquarters regarding nuclear plant locations.

Also, the water level inside the reactor was found to be lower than initially estimated. Although TEPCO believed water had collected to a height of 4.5 meters, the examination showed the water height was apparently less than four meters, as the surface of the water was not seen around the iron scaffolding set at a height of four meters.

As one reason why there was less water than TEPCO estimated, the company said the gauge that measures the location of the water's surface did not work accurately.

However, the gauge placed 2.8 meters from the bottom of the vessel indicated a possibility there is water at that level, TEPCO sources said.

"It's quite unlikely nuclear fuel was exposed, as liquid from condensation is dripping down," a TEPCO official said.

(Jan. 21, 2012)

Gov't kept Fukushima crisis worst-case scenario under wraps for months

TOKYO (Kyodo) -- The government kept a worst case scenario for the nuclear crisis at the Fukushima No. 1 power plant under wraps for months after the document was shown to a small group of policymakers in late March, government sources said Saturday.

A private-sector panel looking into the nuclear disaster plans to probe whether the government tried to manipulate information in handling the crisis, by interviewing then Prime Minister Naoto Kan and Goshi Hosono, environment minister who was then adviser to Kan, among other figures. Hosono was in charge of handling the nuclear crisis.

The document, created by Japan Atomic Energy Commission Chairman Shunsuke Kondo at Kan's request, said that in a worst case scenario, radioactive materials would intermittently be released in massive quantities for roughly a year if all workers had to be evacuated from the plant, some 220 kilometers northeast of Tokyo.

After being shown to a small group of senior government officials at Kan's executive office in late March, the document was treated as if it never existed, the sources said, adding that it was not until the end of last year that the document was recognized as an official one.

The document was dated March 25, 2011, two weeks after the massive earthquake and tsunami triggered the country's worst nuclear crisis. It was premised on a scenario in which all plant workers had to be evacuated due to a rise in radiation levels after a hydrogen explosion damaged a containment vessel encasing the plant's No. 1 reactor.

The document said that should such a case occur, residents within a radius of 170 kilometers or more of the plant would be forced to move out, while those within a radius of 250 km of the plant, including Tokyo, would be allowed to leave if they wish.

"It contained such shocking content that we decided to treat it as if it never existed," a senior government official said.

Another government source said, "When the document was presented, there was a discussion about the choice of keeping the existence of the document itself secret."

Kan admitted the existence of a worst case scenario in September, while the government of his successor, Prime Minister Yoshihiko Noda, decided to treat the document as a Cabinet Office document after some parts of it were reported in December.

The atomic energy commission is set up in the Cabinet Office.

At a news conference on Jan. 6, Hosono said, "Because we were told there would be enough time for evacuations (even if things went according to the worst-case scenario), we refrained from disclosing the document for fear its disclosure would cause unnecessary anxieties."

(Mainichi Japan) January 22, 2012

Gov't not adding up nuclear workers' radiation doses when not at work

TOKYO (Kyodo) -- The health ministry has not added up the radiation doses received by workers at the crippled Fukushima Daiichi nuclear power plant while they were evacuated or are not at work,

ministry officials and supporters of the workers said Saturday, prompting concerns about adequacy of the current radiation control.

In a similar manner, the Ministry of Health, Labor and Welfare will not add up radiation doses while workers engage in decontamination efforts around the badly damaged plant in Fukushima Prefecture, which will intensify in the near future.

The ministry currently keeps track of only the radiation doses for nuclear workers when they engage in work. The maximum radiation doses for nuclear workers and those involved in decontamination efforts are 100 millisieverts over five years and 50 millisieverts a year.

The officials said the ministry takes the position that in controlling radiation doses, it makes a distinction between work and personal life because measures taken to alleviate the doses differ between them.

"No matter where they are exposed to radiation, it's the same thing for an individual," said Katsuyasu Iida, who works on securing the health of nuclear plant workers as head of the secretariat for the Tokyo Occupational Safety and Health Center.

Noting that the health ministry is developing a database to record workers' radiation doses separately from the one at the Radiation Effects Association, Iida said that by employing such a database, workers' total radiation doses "should be strictly controlled by adding up doses received when they are not at work."

Those who enter radiation-controlled zones at nuclear plants have a booklet that keeps track of their radiation doses while at work. The data are sent to the Radiation Effects Association in Tokyo to keep track of workers' accumulated doses at whatever plants they go to work at or whatever employer they work for. Those whose radiation doses exceed limits are barred from further work.

All workers at the Fukushima Daiichi plant currently carry dosimeters while they work or move between the plant and an accident response base nearby. Radiation doses during evacuations following the accident and while away from work are being projected on the basis of radiation levels at observation points.

In its report last December, the Fukushima prefectural government estimated that evacuees from 12 municipalities around the plant were externally exposed to up to 19 millisieverts of radiation over the four months from the start of the disaster following the March 11 earthquake and tsunami.

It is also possible that plant workers who lived nearby were exposed to radiation in the period after the start of the accident as they went about their lives.

(Mainichi Japan) January 22, 2012

IAEA experts to check nuclear test results

At the request of the Japanese government, UN nuclear experts will review the safety test results of idled nuclear reactors.

Ten officials of the International Atomic Energy Agency left Vienna on Saturday.

The team is scheduled to carry out a 9-day assessment from Monday. The experts will check to see if the safety tests on idled reactors were conducted correctly.

Passing the safety checks is a prerequisite for the idled reactors to resume operation.

The IAEA delegation will visit Kansai Electric Power Company's Ohi nuclear power plant in Fukui Prefecture, central Japan. They will verify the government's recent approval of the safety test results for 2 reactors there.

Chief delegate and Nuclear Installation Safety Division Director James Lyons said his team's mission is to advise the Japanese government based on international standards. He stressed that the final decision of whether or not to restart idled reactors is up to the Japanese government.

Sunday, January 22, 2012 06:27 +0900 (JST)

No records of nuclear disaster taskforce meetings

It has been revealed that the government's nuclear disaster taskforce did not keep any records of its meetings after the Fukushima Daiichi nuclear power plant accident.

Experts say this is a significant loss, as the minutes could help to prevent mistakes from being repeated.

The taskforce, headed by the prime minister and including all the Cabinet members, was launched on the day of the accident on March 11th last year.

It made important decisions, including the designation of evacuation areas, basic policies on decontamination and restrictions on the shipment of agricultural produce.

NHK asked to see the minutes last November, but it only received a list of agenda items for each of the 21 meetings and found there were no other records.

The person in charge at the government's Nuclear and Industrial Safety Agency, which acts as the secretariat of the taskforce, told NHK that he was too busy to write the minutes.

The public records management act requires minutes of important meetings to be kept, so the government may achieve accountability and the people may verify the process by which decisions are made.

The Cabinet Office, which is responsible for the management of public records, is interviewing the person in charge at the Nuclear and Industrial Safety Agency.

It is also investigating the lack of minutes for the meetings of the joint taskforce of the Tokyo Electric Power Company and the government, which discussed how to deal with the accident.

Sunday, January 22, 2012 23:27 +0900 (JST)

Radioactive crushed stone used in around 60 Fukushima buildings

FUKUSHIMA, Japan (Kyodo) -- The number of houses and condominiums confirmed to have been built using radiation-contaminated crushed stone quarried near the crippled Fukushima Daiichi nuclear plant has reached around 60 in Fukushima Prefecture, government sources said Sunday.

The sources said the total number of buildings could top 100 if more surveys are conducted on the crushed stone that was shipped from a quarry in Namie located near the plant.

A total of 5,725 tons of crushed stone was shipped from the quarry between the start of the crisis triggered by the March 11 earthquake and tsunami, and the designation by the government of the town as an evacuation zone the following month.

The crushed stone, after being processed into concrete, was used in the construction of infrastructure such as housing, roads and river dikes at nearly 1,000 locations in the prefecture after the March disaster, they said.

A governmental survey covering the period between late March and April 12 showed the contaminated concrete was used to build around 60 houses and condominiums. The material was also shipped and used after that date for many more houses and condominiums, the sources said.

The issue emerged after the city of Nihommatsu said Jan. 15 that the radiation exposure reading inside a unit of a new condominium built with concrete that used crushed stone from Namie was higher than outside the building.

(Mainichi Japan) January 23, 2012

IAEA team holds 1st meeting with Japan nuclear agency over safety tests

TOKYO (Kyodo) -- A delegation of the International Atomic Energy Agency tasked with reviewing the adequacy of Japan's safety tests for nuclear power plants held its first meeting Monday with Tokyo's nuclear safety agency.

At the meeting in Tokyo, Shinichi Kuroki, deputy director-general for nuclear power at the Nuclear and Industrial Safety Agency, told 10 officials of the delegation that Japan has been conducting so-called stress tests, modeled after nuclear safety reviews conducted by the European Union, to learn what can be improved after the Fukushima nuclear accident.

"So far we have been evaluating (the tests) by consulting with domestic experts, but we would like to achieve a higher level of safety by also taking into account international expertise," Kuroki said.

"Opinions we will receive will be reflected in our future evaluation methods so we would like you to evaluate (our tests) rigorously," he said.

James Lyons, nuclear installation safety director of the IAEA's nuclear safety and security department who heads the delegation, said he hopes that productive meetings with the agency will help realize an improvement of nuclear power plants not only in Japan but also throughout the world.

The delegation, which includes some external experts, is scheduled to visit Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture on Thursday.

For the Oi plant's No. 3 and 4 reactors, currently idled for regular checkups, the agency has compiled a draft report endorsing the results of first-stage safety tests submitted by the utility serving western Japan.

After receiving the IAEA's review, the agency will finalize its report on the two reactors as early as in February.

After undergoing the checks by the Nuclear Safety Commission of Japan, Prime Minister Yoshihiko Noda and relevant ministers will judge whether to approve restarting the reactors.

Economy, Trade and Industry Minister Yukio Edano has said it is necessary to win a certain level of acceptance from local communities to reactivate idled reactors.

The IAEA delegation is scheduled to end its review mission Jan. 31, and is expected to compile a summary report.

In the wake of the nuclear accident at Tokyo Electric Power Co.'s Fukushima Daiichi power plant, triggered by the March 2011 massive earthquake and tsunami, the government has required utilities to conduct computer simulation-based safety tests to check how well their systems to protect fuel rods can withstand earthquakes, tsunami and the loss of power.

Reactors idled for scheduled checkups are subject to the first round of tests, and all reactors are required to undergo the second round of tests.

(Mainichi Japan) January 23, 2012

IAEA checks Japan's nuclear safety test results

The world's nuclear watchdog has begun reviewing the safety test results for 2 of Japan's halted nuclear reactors.

The team of experts from the International Atomic Energy Agency started their 9-day inspection on Monday. They will advise the Japanese government if the test results and the method used were appropriate.

Ninety percent of Japan's nuclear reactors are offline due to concerns that they could be vulnerable to major earthquakes and tsunamis. Passing the safety checks is a prerequisite for the idled reactors to resume operation.

The team will examine if the computer-simulated tests for 2 reactors at the Ohi nuclear plant in Central Japan were carried out appropriately in line with international standards.

The government's nuclear safety agency said last week that the operator's tests were conducted correctly.

The IAEA team is interviewing the agency on Monday to find out how it cross-checked the utility's test results. The 10-member team will visit the Ohi plant on Wednesday and Thursday to inspect its anti-tsunami measures.

The head of the team, James Lyons, says they will make a comprehensive evaluation of the safety tests and the way the results are assessed.

Japan's nuclear safety agency says it will finalize its assessment of the 2 reactors in early February, after receiving the IAEA report at the end of this month.

Monday, January 23, 2012 13:57 +0900 (JST)

Gov't withheld estimates showing electricity surplus to boost nuclear power: critics

The government withheld an estimate that there would be no electricity shortages in the upcoming summer in an apparent bid to underscore the need to restart nuclear power plants, it has been learned.

Instead of announcing the realistic estimate, the government announced last summer that electric power supply in the summer of 2012 "will be about 10 percent short across the country." **Furthermore, the released government estimate greatly downplayed the supply of renewable energy, disregarding the country's actual energy status.**

"The released government estimate stresses the need to resume operations of nuclear power plants by underestimating the actual supply capacity," a concerned source has told the Mainichi.

Currently, 49 out of 54 commercial nuclear reactors in Japan are under suspension, with five other reactors anticipating regular inspections. **By this summer, the country will have no nuclear reactors in operation unless some of them are restarted.**

The government's Energy and Environment Council compiled the published estimate in July last year as the council was reviewing the country's energy strategy in the aftermath of the nuclear disaster at the Fukushima No. 1 Nuclear Power Plant, which began in March last year. The council calculated that power supply will be 9.2 percent short at the peak of demand on the assumption that the summer of

2012 will be as hot as the summer of 2010, when temperatures hit record highs, and that all nuclear plants will have been suspended by that time.

Aside from the estimate, then Prime Minister Naoto Kan instructed a team assisting him in the National Policy Unit in late June last year to study the actual status of electric power and supply. The team asked the Economy, Trade and Industry Ministry to submit data supporting the government's estimate, including the installed capacity and operating capacity at each power station and the operational status of renewable energy sources by region, and had the ministry recalculate the estimate.

As a result, it was found that **electric power companies were capable of procuring 7.59 million kilowatts through renewable energy under the current law -- equal to the output of about seven nuclear reactors.** However, the released government estimate stated that utilities were unable to provide renewable energy supplies.

In addition, the released estimate apparently deliberately presumed that some of the thermal power plants would be suspended in August -- a peak-demand period -- for regular inspections and also anticipated that there would be no cut in power use at the time of a power crunch through the supply-demand adjustment arrangement with major electricity contractors. The estimate also played down the supply capacity of pumped-storage hydroelectricity, which utilizes night-time surplus power during the daytime.

The recalculation found that the country would have a surplus power supply of up to 6 percent even without a government order for power restrictions if renewable energy supply and other elements were factored in. The recalculated data was compiled in August last year and was reported to Prime Minister Kan, but it was never released to the public.

Satoshi Kusakabe, councilor to the Cabinet Secretariat, who is in charge of the Energy and Environment Council, denied that the government withheld the estimate in order to underscore the need to reactivate suspended nuclear reactors.

"In the nation's decision-making process, we wouldn't be able to later say that we were actually short of power, so we carefully compiled an estimate that had solid figures," he said. "We had no intention of propagating possible supply shortages and cited an increase of renewable energy and thermal power supply as necessary efforts in a countermeasure released in November last year."

Hisashi Kajiyama, research fellow at the Fujitsu Research Institute, who was a member of the team assisting Kan and took part in the recalculation of the estimate, said the initial estimate was biased. "The (released) estimate is based on the extreme presumption that was drawn from claims by utilities. The figures in the estimate led to politicians' remarks approving the restarting of nuclear plants. I assume the Kan administration couldn't release the recalculation because of the chaos in the final days of his administration."

(Mainichi Japan) January 23, 2012

Govt drafts new safety steps for nuclear plants

The Japanese government is calling on local authorities near nuclear power plants to come up with new measures to prepare for possible nuclear accidents.

The government made the request on Monday at a briefing for about 100 local officials on its new draft measures for nuclear accidents. The existing measures have been under review since the accident in Fukushima.

The minister in charge of the nuclear crisis, Goshi Hosono, said the government has renewed its pledge to prevent accidents. He asked the participants to work with the government in drafting new disaster management plans and safety regulations.

The government told the participants that **it plans to increase the number of plant inspectors stationed in the host communities.**

The government will also boost the functions of emergency response centers and relocate them to safer places.

The center near the Fukushima Daiichi nuclear plant became unusable after its accident due to a power outage and high levels of radiation.

The government plans to widen areas for extensive disaster preparedness from the 10-kilometer radius around nuclear plants to a 30-kilometer radius.

The government has asked authorities in the expanded areas to come up with new plans by October.

Some participants said the request is being made at short notice. Others asked the government to show them examples of collaboration among municipalities.

Monday, January 23, 2012 19:14 +0900 (JST)

YIES / Hosono: Contribute to world through decommissioning

Hiromu Namiki / Daily Yomiuri Staff Writer

Japan should contribute to the world by sharing the experience, knowledge and skills it will acquire through decommissioning the Fukushima No. 1 nuclear power plant, Goshi Hosono, state minister for the nuclear crisis, said Monday in Tokyo.

At a lecture meeting of the Yomiuri International Economic Society, Hosono said it is expected to take 30 to 40 years to decommission the plant.

"The skills we acquire during the process of decommissioning, which will be conducted in the most severe environment, can be applied to nuclear power plants all over the world when they are decommissioned. We need to utilize the experience [of the nuclear crisis] for the future of Japan," Hosono said.

Hosono said that among the various steps of decommissioning, removing melted fuel rods from the reactors would be extremely difficult. He said he wants to use robots and other unmanned machines produced by Japanese companies as much as possible when removing the fuel rods, to demonstrate the high level of Japanese technology.

"Japanese technology is now being questioned because of the [Fukushima] crisis," he said.

Hosono, who also serves as environment minister, said the Environment Ministry would boost its efforts to promote renewable energy.

"The ratio of nuclear power generation is rapidly decreasing in generating electricity [since the outbreak of the nuclear crisis]. However, we should never allow the nation to further shift to fossil fuel," Hosono said.

He also said he will call on the public to continue its efforts to save energy. "Whether or not we conduct planned outages this summer, I want to ask people to voluntarily reduce power consumption," Hosono said.

(Jan. 24, 2012)

Minutes of past gov't meetings on Fukushima crisis to be created

TOKYO (Kyodo) -- Japanese industry minister Yukio Edano on Tuesday apologized for the government's failure to take minutes of meetings of a taskforce dealing with the Fukushima nuclear crisis and said that he has instructed the Nuclear and Industrial Safety Agency to compile them soon based on notes taken by meeting attendees.

Edano said at a press conference that although the meetings were held in emergency situations soon after the accident at the Fukushima Daiichi power plant, the government should have created minutes as soon as possible considering the public interest in the matter and the significant social impact that the handling of the accident has.

"As then-Chief Cabinet Secretary and the current Economy, Trade and Industry Minister, I apologize," he said.

The government taskforce was set up on March 11, when a massive earthquake struck wide areas of northeastern and eastern Japan and ensuing tsunami ravaged Pacific coastal areas of northeastern Japan, triggering the nuclear accident at the Fukushima Daiichi power plant.

Various crisis management decisions were made at the taskforce's meetings, such as setting of the evacuation zone and policies for conducting decontamination work after the leakage of radioactive materials from the crippled power plant.

The nuclear safety agency serves as a secretariat for the taskforce. The industry ministry has the agency under its wing.

"I will have (the agency) make utmost effort" to have the minutes ready for release "next month at the latest," Edano said.

(Mainichi Japan) January 24, 2012

Radioactive release from Fukushima plant rises

The operator of the crippled Fukushima Daiichi nuclear plant says the amount of radioactive substances being released from the plant has risen slightly. **It attributes the rise to increased human activities onsite. [??]**

Tokyo Electric has been measuring the levels of radioactive substances released from damaged reactors at the plant since the accident in March.

The level measured onsite was 800-trillion becquerels per hour immediately after the accident.

Readings continued to decline, and in November and December dropped to 60 million becquerels per hour. That is about one 13 millionth the initial level.

But the company says the levels were slightly up to 70 million becquerels per hour in January.

The company says that radioactive materials around the No. 2 reactor, the surrounding of which is still highly contaminated, were **stirred up** by a number of workers going in and out of the building.

They were working to insert an optical fiberscope into the containment vessel as an initial step toward decommissioning the reactor.

Tuesday, January 24, 2012 11:04 +0900 (JST)

Another nuclear reactor going offline

Tokyo Electric Power Company plans to shut down a reactor in Niigata Prefecture, central Japan, for a regular inspection on Wednesday. This means **93% of Japan's nuclear reactors will be out of service.**

When TEPCO shuts down **the No.5 reactor of the Kashiwazaki-kariwa nuclear plant**, its No.6 will be the only active reactor providing power to the Tokyo metropolitan area.

All of TEPCO's nuclear power plants in Fukushima Prefecture are out of service due to the accident at

Fukushima Daiichi. The others in the region are undergoing repairs or regular checkups.

TEPCO will boost the capacity of thermal power plants and ask companies and households to save electricity.

Meanwhile, the company has submitted the results of so-called stress tests on the No.1 and No.7 reactors at the Kashiwazaki-kariwa nuclear power plant.

But the local government refuses to give the go-ahead to restart the reactors. It says there has not yet been an adequate investigation of the Fukushima Daiichi accident.

From Wednesday, 50 of Japan's 54 nuclear reactors will be inactive.

Tuesday, January 24, 2012 06:35 +0900 (JST)

Nuclear power boosters used climate change to ride to energy supremacy

In 1997, in the midst of the international negotiations that would eventually result in the Kyoto Protocol, the Japanese delegation was pondering whether it could realistically accept the protocol's main point: a commitment to a 6 percent decrease in greenhouse gas emissions from 1990 levels. They were also grappling with what such a commitment would mean for Japan's energy supplies.

Strangely enough, though the Japanese delegation was grappling with issues of carbon emissions and energy needs, there was not a single representative of the then Environment Agency on hand. Osamu Watanabe, vice minister at the former Ministry of International Trade and Industry at the time of the talks and now president of Japan Petroleum Exploration Co., sums up Japan's thinking like this:

"Taking nuclear power into account was a prerequisite for accepting the 6 percent reduction. **Speaking for the industry ministry, we thought that the more nuclear power we had, the more we could reduce greenhouse gas emissions.**"

Meanwhile, at the Environment Agency -- which became the Environment Ministry in 2001 -- there were many staff who took a more cautious attitude to the promotion of nuclear power. Their skepticism did not, however, often find effective expression.

"The industry ministry put up a lot of resistance to the Environment Agency getting involved in energy policy," a senior agency official from the time says. "We just couldn't get a word in."

The threat of climate change gained traction in the global imagination after the end of the Cold War. And as warming worries grew, nuclear power became an anti-emissions trump card in the eyes of many, fueling a reactor building spree. Another former Environment Ministry official with long experience in climate change policy told the Mainichi, "Government policy came to incorporate promotion of nuclear power. It was taboo for us to even make an issue of it."

Even after the Kyoto Protocol was agreed on, the Environment Agency and its successor ministry had a very rough road trying to defend climate change policies. The agency tried to organize domestic

support for the protocol's ratification, but was met with fierce opposition from the governing party and business world figures who worried about the effects on industry and condemned the protocol as an "unequal treaty."

"We thought getting the protocol ratified was the greatest environmental policy measure we could take, but drawing on nuclear power never entered our minds," the former senior Environment Ministry official says. It was, however, on the minds of some people in government. When the government finalized its basic principles for climate change policy in March 2002, the document included a provision for "promotion of nuclear power," and set a goal of increasing nuclear power output by 30 percent by 2010.

The Environment Agency also came under direct pressure to fall in line behind nuclear power even before the rumblings around the Kyoto Protocol. Just after the 1992 U.N. Earth Summit in Rio de Janeiro, **as the agency was undertaking revisions to laws providing capital to environmental NGOs, it was forced by the then ruling Liberal Democratic Party (LDP) to insert provisions banning funding to groups that were opposed to nuclear power.** Many senior officials were also cornered by governing party lawmakers demanding the agency back nuclear power.

The push for nuclear power deepened when the Democratic Party of Japan came into power in **2009**. In September that year, then Prime Minister Yukio Hatoyama declared to the world that Japan would cut its greenhouse gas emissions by 25 percent from 1990 levels by the year 2020. Just after that announcement, speaking on the environmental assessment for the construction of a third reactor at Kyushu Electric Power Co.'s Sendai nuclear power plant, the environment minister stated that "to reduce greenhouse gas emissions and to guarantee safety, steady promotion of nuclear power is necessary." **This was the first time official pronouncements in favor of nuclear power were made over an environmental assessment.**

Even leading Japanese climate scientists were given a part to play in nuclear power promotion. University of Tokyo professor emeritus Ryoichi Yamamoto -- a climate change policy advisor to both the Abe and Fukuda administrations -- put together a 2008 report calling for the expansion of nuclear power as a vital part of global warming strategy when he was chairman of an Atomic Energy Commission panel.

"I thought nuclear power would be a powerful tool," Yamamoto says of the report. "But it can't be controlled when there's an accident, so it can't really be called a 'technology.' I've come to understand that there are ethical considerations with destroying the lives of local residents. I regret that I could not point out those issues when I wrote the report."

Furthermore, "I think the government, which seemed to be blocked and drifting on how to get reactor construction moving and the problems of radioactive waste disposal, just latched onto the global warming issue when climate change countermeasures reached a critical juncture. We thought that the risks of global warming were far greater than those of nuclear power, but in this earthquake-prone nation of Japan, the opposite is true."

Setagaya decontamination work continues 3 months after radioactive radium found

The supermarket in Tokyo's Setagaya Ward remains shut down on Jan. 23 due to ongoing decontamination work. (Mainichi)

Efforts to remove highly radioactive radium from the premises of a supermarket in Tokyo's Setagaya Ward still continue three months after two bottles containing radium 226 were discovered in underground soil there.

The Central Union of Agricultural Co-operatives, which has leased the supermarket land to its operator, has to pay for the decontamination work. But it remains unclear when the operation will finish, and the total costs for the work are expected to reach hundreds of millions of yen.

While checking radiation levels in the area, a local resident detected high levels of radiation within the premises of the supermarket on Oct. 28. The Ministry of Education, Culture, Sports, Science and Technology and other parties then started to check the premises for radiation and detected up to 170 microsieverts per hour of radiation at two spots there. Two bottles containing radium were found beneath the asphalt.

Two weeks later, a private company that specializes in decontamination removed the bottles from the ground. Nevertheless, more than 10 spots where the radiation reading reached more than 0.2 microsieverts per hour were later found. Work still continues to dig up the ground and remove radioactive substances from such things as glass chips and replace soil with dirt brought from elsewhere. It is not clear when the work will finish.

After acquiring the supermarket land from a now-defunct school operator in 1973, the Central Union of Agricultural Co-operatives in Tokyo initially used it as a dormitory for its staff and as a car park before leasing it to the operator of the supermarket. An official of the Central Union of Agricultural Co-

operatives said, "We have never possessed any radium, and we don't know why radium was buried there."

According to science ministry officials in charge of regulating radiation, most radium found abandoned had been acquired by individuals kept at their homes or elsewhere before the radiation law took effect in 1958. The discovery of radium within the supermarket land marks the first case in which a radioactive substance has been found without its owner being identified.

The Central Union of Agricultural Co-operatives, the owner of the supermarket land, is supposed to take responsibility for the decontamination work, but a union official said, "Similar things could happen again in the future. We want the government to consider countermeasures such as bearing decontamination costs."

The Office of Radiation Regulations at the science ministry is concerned about the possibility of more radioactive substances being found without their owners being identified as handy radiation measuring devices have become readily available nowadays. A science ministry official said, "Countermeasures have been discussed within the ministry."

Village in Fukushima no-go zone to call for residents to return permanently by March

KAWAUCHI, Fukushima -- Authorities in this village, part of which still stands in the no-go zone around the crippled Fukushima No. 1 Nuclear Power Plant, plan to call on all evacuated residents to return by the end of March, it has been learned.

The local government organized a meeting for residents in January, during which officials explained plans for decontamination procedures and actions that have been taken to secure employment after residents return to the village.

"Most residents seemed to agree with our explanations and plans to a certain extent," said a senior town official, who attended the meeting. Therefore, the municipal government has decided to encourage all residents to return to their homes. After consulting with the municipal assembly and others, the village will report its decision to Fukushima Gov. Yuhei Sato.

On Jan. 31, the municipal government will call on residents to return home, hoping that all evacuees will move back to their homes by the end of March. School and town hall operations will be resumed from April, officials said.

This is the first time for a municipality that fell in the government-designated evacuation zones following the nuclear disaster to announce return plans for its residents.

Kawauchi village, home to approximately 3,000 people, was one of the municipalities that fell within both the government-designated no-go zone and emergency evacuation preparation zones around the troubled nuclear power complex.

Last September, the designation of an emergency evacuation preparation advisory was lifted for the western part of the village. However, even after the advisory was lifted, less than 200 residents returned to their homes. The village's eastern part still remains within the 20-kilometer no-go zone around the damaged nuclear power plant.

All Kawauchi residents evacuated from their homes in the wake of the nuclear crisis, with approximately 80 percent of them currently living in other places within Fukushima Prefecture and 20 percent having moved out of the area.

According to the municipal government's plan, the homes of some 600 households, which fall within the former emergency evacuation preparation zone, will be decontaminated by the end of March. The homes of the approximately 340 remaining households in the zone will be cleaned by the end of the year. Radiation levels, however, in all places there are low, at less than one microsievert per hour.

As for the approximately 160 households whose homes fall within the no-go zone, the local government plans to build temporary housing units in safe areas within the village, where evacuees can restart their lives.

Decontamination of a nursery and schools will be completed within February, officials said, and all administrative organs and other main facilities will resume operations starting from April.

Local authorities also plan to secure employment opportunities for returned residents, including decontamination projects that will offer jobs to some 1,000 people. In the next fiscal year, job openings in metal factories and vegetable cultivating facilities will further expand opportunities, the plan explains.

Meanwhile, however, residents cannot hide their bewilderment over the municipal government's most recent decision.

Shinichi Sakakimoto, 71, a farmer who evacuated to Koriyama in the prefecture following the nuclear disaster, says that he is not sure whether returning home will help him.

"Even if the town hall operates as usual, I don't have a car so it will be very difficult to go shopping to a nearby village," says the man, whose house falls in the former emergency evacuation preparation zone. "I want to go back eventually, but as I won't be able to work on my rice paddies for now, I won't have any income."

A 36-year-old man, whose house falls within the no-go zone, says he thinks the move is too hasty. "I don't believe that the plant has been brought under control. What will happen if another powerful earthquake strikes? This is impossible," he said.

Fukushima panel to finalize report by late July

A government panel says it will finalize by late July its report on the accident at the Fukushima Daiichi nuclear power plant.

The 9-member panel held a closed-door meeting on Wednesday, the first since it released an interim report in December.

Panel leader Yotaro Hatamura told reporters afterwards that the final report will cover items that were not mentioned in the previous one.

He said the panel will conduct hearings with those who were cabinet ministers at the time of the accident to investigate the government's decision-making process.

The panel will also report on measures taken at the nearby Fukushima Daini plant after the March earthquake and tsunami.

Hatamura said his panel wants to know how information on the accident was provided to local residents. He added that it is also important to verify the extent of the damage and how the chain of responsibility was structured.

The panel plans to invite foreign experts to a meeting in late February to discuss what items should be included in the final report.

In its interim report, the panel criticized plant operator Tokyo Electric Power Company for insufficient anti-disaster measures and responses to the accident. The report also described the government's handling of the crisis, such as issuing evacuation orders, as problematic.

Wednesday, January 25, 2012 20:48 +0900 (JST)

Nuclear plants to prepare for faults 5km away

Japan's nuclear safety agency will instruct utilities nationwide to reassess the earthquake resistance of their nuclear power plants to comply with stricter new standards.

The Nuclear and Industrial Safety Agency says utilities should prepare for fault movements that take place 5 kilometers or more from the plants.

The agency will also ask utilities to prepare for an earthquake stronger than the maximum ever recorded in the vicinity of their nuclear facilities.

Officials will continue to refine the quake-resistance standards for nuclear plants after soliciting more opinions from experts.

The new policy follows recent findings by seismologists. The agency says a magnitude 7 earthquake

that struck Fukushima Prefecture in April last year resulted in the movement of a fault that was thought to be inactive. The fault is located about 50 kilometers from the Fukushima Daiichi nuclear power plant.

The agency added that the active fault could have been found earlier if drilling or other surveys had been conducted.

Wednesday, January 25, 2012 19:50 +0900 (JST)

Panel to issue final investigation report on nuclear crisis in July

TOKYO (Kyodo) -- A government-appointed panel investigating the nuclear crisis at the Fukushima Daiichi power plant will compile its final report by the end of July and hopes to end its probe at that point, panel head Yotaro Hatamura, a professor emeritus at the University of Tokyo, said Wednesday.

The panel also announced that it will hold a two-day meeting in Tokyo from Feb. 24 with at least four overseas experts to review the panel's interim report, released in late December.

During their stay in Japan, Richard Meserve, former chairman of the U.S. Nuclear Regulatory Commission, Andre-Claude Lacoste, the chairman of the French nuclear safety authority, and other foreign experts are also expected to visit the actual site of the world's worst nuclear crisis since the 1986 Chernobyl disaster.

In the process of compiling the final report, the panel plans to conduct hearings with key Cabinet ministers involved in dealing with the nuclear crisis if necessary, Shinji Ogawa, chief of the panel's secretariat said, adding, however, that no specific schedule has been set.

Ogawa also said the government's failure to take minutes during meetings of a task force set up to deal with the crisis is not expected to adversely affect the investigative process.

The task force made important decisions, such as setting evacuation zones around the radiation-leaking plant in Fukushima Prefecture, but it was recently revealed that government officials only recorded items like agenda points during the 23 meetings held.

In late December, the panel issued a 500-page interim report highlighting the poor response of the plant's operator Tokyo Electric Power Co. and the government to the nuclear crisis, triggered by the devastating earthquake and tsunami on March 11 last year.

(Mainichi Japan) January 26, 2012

Japan kept silent on worst nuclear crisis scenario

TOKYO (AP) -- The Japanese government's worst-case scenario at the height of the nuclear crisis last year warned that tens of millions of people, including Tokyo residents, might need to leave their

homes, according to a report obtained by The Associated Press. But fearing widespread panic, officials kept the report secret.

The recent emergence of the 15-page internal document may add to complaints in Japan that the government withheld too much information about the world's worst nuclear accident since Chernobyl.

It also casts doubt about whether the government was sufficiently prepared to cope with what could have been an evacuation of unprecedented scale.

The report was submitted to then-Prime Minister Naoto Kan and his top advisers on March 25, two weeks after the earthquake and tsunami devastated the Fukushima Dai-ichi nuclear power plant, causing three reactors to melt down and generating hydrogen explosions that blew away protective structures.

Workers ultimately were able to bring the reactors under control, but at the time, it was unclear whether emergency measures would succeed. Kan commissioned the report, compiled by the Japan Atomic Energy Commission, to examine what options the government had if those efforts failed.

Authorities evacuated 59,000 residents within 20 kilometers (12 miles) of the Fukushima plant, with thousands more were evacuated from other towns later. The report said there was a chance far larger evacuations could be needed.

The report looked at several ways the crisis could escalate -- explosions inside the reactors, complete meltdowns, and the structural failure of cooling pools used for spent nuclear fuel.

It said that each contingency was possible at the time it was written, and could force all workers to flee the vicinity, meaning the situation at the plant would unfold on its own, unmitigated.

Using matter-of-fact language, diagrams and charts, the report said that if meltdowns spiral out of control, radiation levels could soar.

In that case, it said evacuation orders should be issued for residents within and possibly beyond a 170-kilometer (105 mile) radius of the plant and "voluntary" evacuations should be offered for everyone living within 250 kilometers (155 miles) and even beyond that range.

That's an area that would have included Tokyo and its suburbs, with a population of 35 million people, and other major cities such as Sendai, with a million people, and Fukushima city with 290,000 people.

The report further warned that contaminated areas might not be safe for "several decades."

"We cannot rule out further developments that may lead to an unpredictable situation at Fukushima Dai-ichi nuclear plant, where there has been an accident, and this report outlines a summary of that unpredictable situation," says the document, written by Shunsuke Kondo, head of the commission, which oversees nuclear policy.

After Kan received the report, he and other Japanese officials publicly insisted that there was no need to prepare for wider-scale evacuations.

Rumors of the document grew this month after media reports outlined its findings and an outside panel was created to investigate possible coverups. Kyodo News agency described the contents of the document in detail on Saturday.

The government continues to refuse to make the document public. The AP obtained it Wednesday through a government source, who insisted on anonymity because the document was still categorized as internal.

Goshi Hosono, the Cabinet minister in charge of the nuclear crisis, implicitly acknowledged the document's existence earlier this month, but said the government had felt no need to make it public.

"It was a scenario based on hypothesis, and even in the event of such a development, we were told that residents would have enough time to evacuate," Hosono said.

"We were concerned about the possibility of causing excessive and unnecessary worry if we went ahead and made it public," he said. "That's why we decided not to disclose it."

A Japanese government nuclear policy official, Masato Nakamura, said Wednesday that he stood behind Hosono's decisions on the document.

"It was all his decisions," he said. "We do not disclose all administrative documents."

Japanese authorities and regulators have been repeatedly criticized for how they have handled information amid the unfolding nuclear crisis. Officials initially denied that the reactors had melted down, and have been accused of playing down the health risks of exposure to radiation.

In another example, a radiation warning system known as SPEEDI had identified high-risk areas where thousands of people were continuing to live while the reactors were in critical condition. Officials did not use that data to order evacuations; they have since said it was not accurate enough.

The outside panel investigating the government response to the nuclear crisis has been critical, calling for more transparency in relaying information to the public.

"Risk communication during the disaster cannot be said to have been proper at all," it said in its interim report last month.

Possible Tokyo Evacuation Was Kept Secret in Nuclear Crisis

By THE ASSOCIATED PRESS

Published: January 25, 2012 - http://www.nytimes.com/2012/01/26/world/asia/projections-during-nuclear-crisis-included-evacuating-tokyo.html?_r=2

TOKYO (AP) — The Japanese government’s worst-case scenario at the height of the nuclear crisis last year warned that tens of millions of people, including residents of Tokyo, might be forced to leave their homes, according to a report. Fearing widespread panic, officials kept the report secret.

The emergence of the 15-page internal document might add to complaints that the government withheld too much information about the meltdown at the Fukushima Daiichi nuclear plant, the world’s worst nuclear accident since the Chernobyl disaster in 1986.

It also casts doubt about whether the government was sufficiently prepared to handle what could have been an evacuation on an extraordinary scale.

The report was submitted to [Naoto Kan](#), the prime minister at the time, and his top advisers on March 25, two weeks after an [earthquake and tsunami](#) devastated the [Fukushima Daiichi](#) nuclear power plant, causing three reactors to melt down and generating hydrogen explosions that blew away protective structures.

Workers ultimately were able to bring the reactors under control, but at the time it was unclear whether those emergency measures would succeed. Mr. Kan commissioned the report, compiled by the [Japan Atomic Energy Commission](#), to examine what options the government had if those efforts failed.

The authorities evacuated 59,000 residents within 12 miles of the Fukushima plant, and thousands more were evacuated from other towns later. The report said, however, there was a chance that far larger evacuations might be necessary.

The report looked at several ways the crisis could escalate — explosions inside the reactors, complete meltdowns, and the structural failure of cooling pools used for spent nuclear fuel.

Using matter-of-fact language, diagrams and charts, the report said that if meltdowns spiraled out of control, radiation levels could soar.

In that case, it said, evacuation orders should be issued for residents within and possibly beyond a 105-mile radius of the plant and “voluntary” evacuations should be available to everyone living within 155 miles and beyond.

That would have included the Tokyo area, with a population of 35 million people, and other major cities like Sendai, with 1 million people.

The report further warned that contaminated areas might not be safe for “several decades.”

“We cannot rule out further developments that may lead to an unpredictable situation at Fukushima Daiichi nuclear plant, where there has been an accident, and this report outlines a summary of that

unpredictable situation,” said the document, which was written by Shunsuke Kondo, the leader of the atomic energy commission.

After Mr. Kan received the report he and other Japanese officials publicly insisted that there was no need to prepare for more widespread evacuations.

Rumors of the report emerged this month after a panel was created to investigate possible cover-ups. The Kyodo News agency first reported on the contents of the document on Saturday.

Nevertheless, the government continues to refuse to make the document public. Goshi Hosono, the cabinet minister in charge of the nuclear crisis, implicitly acknowledged the document’s existence this month, but said the government had felt no need to make it public.

“Even in the event of such a development, we were told that residents would have enough time to evacuate,” Mr. Hosono said.

IAEA team inspects 2 idled reactors at Oi nuclear plant

TSURUGA (Kyodo) -- A delegation of the International Atomic Energy Agency inspected two idled reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture on Thursday to check whether Japan has conducted reactor stress tests appropriately in the wake of the Fukushima nuclear crisis.

The IAEA team is tasked with reviewing the adequacy of the method adopted by the Nuclear and Industrial Safety Agency for conducting the test, which is a prerequisite for resuming operation of reactors that have gone offline for scheduled checkups.

James Lyons, nuclear installation safety director of the IAEA's nuclear safety and security department who heads the delegation, said at the beginning of its on-site investigation in the coastal town of Oi in central Japan that the team intends to check how Japanese nuclear power plants have dealt with instructions from the NISA to date.

Japan required utilities to take computer simulation-based safety tests, or so-called stress tests, after Tokyo Electric Power Co.'s Fukushima Daiichi power plant suffered a meltdown accident after the March 2011 quake-tsunami disaster, to check how much leeway their nuclear power plants have to withstand earthquakes, tsunami and the loss of power.

At the four-reactor Oi plant, the Nos. 3 and 4 reactors are in the final stage of stress tests.

Amid heavy snow, the IAEA team observed a drill conducted at the power complex for activating an emergency electricity generator. It also checked what steps the Oi plant has taken to enhance its severe-

accident measures following the Fukushima nuclear crisis and received explanations from officials of Kansai Electric about plant equipment and its safety evaluation of the two idled reactors.

The IAEA inspection came after Kansai Electric evaluated the No. 3 and No. 4 reactors as capable of withstanding an earthquake 1.8 times stronger than the maximum presumed quake for the area and a tsunami wave up to 11.4 meters high, four times higher than the maximum presumed level. The NISA has compiled a draft report endorsing the utility's view.

The Vienna-based IAEA sent the delegation at the request of the Japanese government, and the team is expected to present the results of its review Tuesday.

After receiving the IAEA review, the NISA will finalize its report on the two reactors as early as February and have it checked by the Nuclear Safety Commission of Japan.

Prime Minister Yoshihiko Noda and relevant ministers will then judge whether to approve the reactors' restart, but industry minister Yukio Edano who oversees the NISA has said it is necessary to secure a certain level of acceptance from local communities to reactivate idled reactors.

(Mainichi Japan) January 26, 2012

Veteran nuclear experts regret Fukushima crisis, but still see need for reactors

Veteran nuclear experts who were involved in Japan's atomic energy policy for decades are lamenting the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, but maintain that resource-poor Japan needs nuclear power to support its current standard of living in the future.

In late March 2011, soon after the outbreak of the Fukushima nuclear crisis, an email was sent to about 30 leading figures in nuclear circles in Japan. Attached was a file titled: "Urgent proposals in connection with the accident at the Fukushima nuclear power plant," which began with the sentence: "As figures who have been promoting the peaceful use of nuclear power, we find this accident deeply regrettable, and at the same time we deeply apologize to the public."

The proposals were written mainly by three people -- Shojiro Matsuura, former head of the Nuclear Safety Commission (NSC); Kenji Sumita, former acting NSC chief; and Shunichi Tanaka, former acting chairman of the Atomic Energy Commission of Japan. Some nuclear experts rejected the proposals, asking why they had to apologize. But the proposals were eventually undersigned by 16 leading nuclear experts.

Frustrated over the slow response to the nuclear crisis by the government and Tokyo Electric Power Co. (TEPCO), which operates the damaged Fukushima plant, the nuclear experts pointed out that it was essential to gather knowledge and wisdom from society to come up with a comprehensive and strategic response. The rare proposals made by the experts were released at a news conference on April 1 -- the day when many Cabinet ministers shed their disaster working uniforms and once again wore suits to mark the start of full-fledged reconstruction work. In sharp contrast to the Prime Minister's Office, which was trying to appear and sound calm, Tanaka sternly commented: "Reactor cores have melted to

a considerable extent. I never predicted that we would cause the public so much trouble. We are responsible for promoting nuclear power."

So, how did the 16 nuclear experts see the Fukushima nuclear crisis?

Sumita, who played a leading role in handling the JCO criticality accident in 1999, commented: "We have not applied the lessons learned from the JCO accident in the space of 10 years." He added impatiently, "We've heard utility companies saying, 'What that backcountry company did has nothing to do with us. If we took measures, we would also be seen as being irresponsible.'"

Shinzo Saito, former chairman of the Atomic Energy Society of Japan, stated: "There's a lack of communication between the actual site and top executives at the company headquarters. This is what you might call a 'big company disease.'"

Meanwhile, a former member of the Atomic Energy Commission of Japan said, "It's a world in which everyone understands each other and if someone says something, everything is understood. There have been no constructive discussions, and criticism has never been reflected in policy."

Nevertheless, none of the experts clearly stated that Japan could do without nuclear power.

Shoji Nagamiya, former chairman of the Physical Society of Japan, commented: "Nuclear technology is a major asset to human beings. It is a waste to renounce what we have obtained." Hideki Nariai, former chairman of the Atomic Energy Society of Japan, added, "Atomic power is so wonderful. The global competition for energy has started, so we can't talk about getting rid of nuclear power plants."

In the wake of the outbreak of the Fukushima nuclear crisis, the government set up an advisory council on the prevention of nuclear accidents and appointed Matsuura as head of the council. The advisory council compiled proposals in December aimed at preventing a recurrence of the nuclear disaster, and called for a tentatively titled "Nuclear Regulation Agency" to be set up in April to maintain independence from the nuclear-related companies and break away from Japan's "nuclear village" -- the name given to the nation's pro-nuclear collection of politicians, bureaucrats, academics and utilities.

Looking back over his 76 years, Matsuura said, "As a person who lived through an era of insufficient energy supply, I think that if we were to maintain the current standard of living in Japan with the current population, we would need to secure a source of atomic energy and use it to live while ensuring its safety."

These are the characteristics of the "nuclear village" that the veteran nuclear experts pointed out with deep regret in connection with the Fukushima nuclear crisis. The question remains as to whether these characteristics can be altered in the future.

(Mainichi Japan) January 26, 2012

DPJ endorses revised bill to limit life span of nuclear reactor to 40 years

The ruling Democratic Party of Japan (DPJ) endorsed a revised Nuclear Reactor Regulation Law on Jan. 25 to limit the operational life of a nuclear reactor to 40 years in principle with "exceptional cases" of approved extension of up to 20 years.

Stressing that the possible extension of a reactor's life span would be "exceptional," the draft legislation stipulates that if a reactor meets the necessary requirements, the environment minister "can approve" the extension of its operational life of no more than 20 years.

Satoshi Arai, head of the DPJ project team on measures against nuclear accidents, said, "We made it clear that it is extremely difficult to operate nuclear reactors for more than 40 years." The government is expected to make a Cabinet decision on related bills soon as it tries to enforce them on April 1.

On exceptional rules, nuclear disaster minister Goshi Hosono said on Jan. 6 that the government would introduce the 40-year limit on the operational life of a nuclear reactor. He said the government planned to set exceptional rules to approve the extension of a reactor's operational life if requested by nuclear plant operators as long as it has no safety problems after checking the degree of deterioration of nuclear facilities and technological capabilities to ensure safety of nuclear facilities. But Hosono did not say for how long the operational life of a reactor could be extended.

However, while Hosono was on an overseas trip, bureaucrats in charge of handling the issue explained that "the extension of up to 20 years can be approved." Amid the confusion, Hosono stressed in Washington D.C. on Jan. 18 that it would be difficult to operate a nuclear reactor for more than 40 years.

According to bills the government presented to a DPJ joint meeting on Jan. 23, the environment minister "has to approve (the extension) if a reactor is deemed to comply with requirements." But the wording was modified after DPJ lawmakers lashed out at the proposal, saying it could be taken to mean a nuclear reactor can be operated for 60 years.

(Mainichi Japan) January 26, 2012

IAEA inspects Ohi nuclear plant

A team of International Atomic Energy Agency inspectors has observed a tsunami drill at a nuclear power plant along the Japan Sea coast.

The 10-member team visited the Ohi plant in Fukui Prefecture on Thursday to assess safety measures of the operator, Kansai Electric Power Company.

The utility carried out a drill based on a scenario in which a tsunami cuts the plant off from its outer power supply. Such an outage took place at the Fukushima Daiichi plant last March.

The utility last year reported to the state the outcome of stress tests at the Ohi plant's No. 3 and 4 reactors, saying **they could safely withstand tsunamis up to 11 meters high.**

The government's Nuclear and Industrial Safety Agency concluded that the tests were conducted appropriately.

Team leader James Lyons said the inspectors were convinced that the agency solidly examined the steps taken by the operator.

The inspectors are to finalize their report on January 31st.

Thursday, January 26, 2012 20:01 +0900 (JST)

Fukushima decontamination plan worked out

Japan's Environment Ministry has compiled a **2-year plan to complete decontamination** of some evacuation zones around the troubled Fukushima Daiichi nuclear plant.

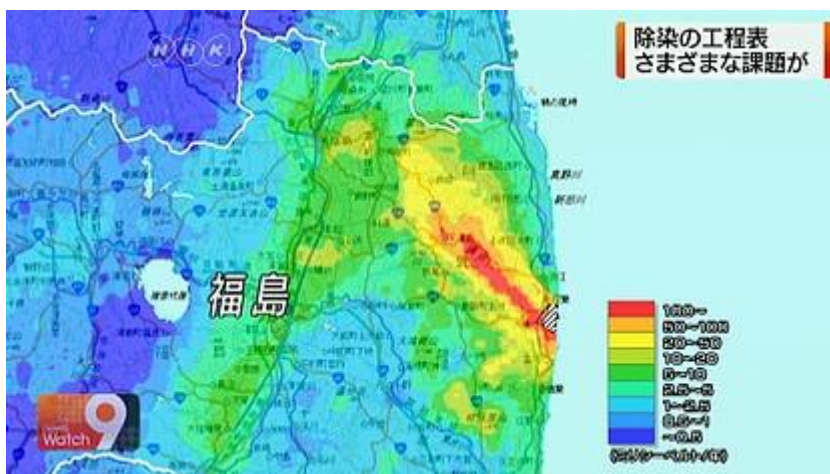

The ministry said on Thursday that the plan is part of an effort to allow evacuees to soon return home from the government's exclusion zone and another mandatory evacuation zone covering 11 municipalities.

A deadline of March 2014 is set for areas with radiation levels up to 50 millisieverts a year.

The ministry says **the plan puts top priority on schools, parks and other facilities for children, as well as hospitals and fire departments.**

The ministry hopes to finalize the schedule by March after consultations with the municipalities.

For areas with radiation levels above 50 millisieverts a year, the ministry says it will implement decontamination model projects to decide how to handle the issue.

Thursday, January 26, 2012 21:02 +0900 (JST)

Japan aims to end decontamination work in some evacuation areas by 2014

TOKYO (Kyodo) -- The Environment Ministry said Thursday it plans to complete decontamination activities in part of the evacuation zones around the crippled Fukushima Daiichi nuclear power plant by March 2014 but left unclear when evacuees would be able to return to their homes.

The ministry plans to start cleaning houses, offices, farm lands and others located in areas with an annual radiation dose of up to 50 millisieverts from around July, according to a road map unveiled the same day. Ministry officials said the government intends to bring the radiation level down to 20 millisieverts or lower.

But the government did not show a detailed cleanup schedule for areas over 50 millisieverts, saying it will consider what to do with such heavily polluted lands after seeing the outcome of decontamination demonstration projects.

"Our main goal is to make it possible for evacuees to return to their homes as early as possible," Environment Minister Goshi Hosono said after the ministry unveiled a decontamination road map, adding that achieving the return of residents affected by a huge nuclear accident is "an unprecedented attempt" in the world.

As for when evacuees would be able to return, Hosono told reporters he would "cautiously make a decision" considering the opinions of the local governments and the people.

"I want to act in line with the wishes of the people as much as possible, but we should not rush them to return when preparation is not enough, including infrastructure and decontamination," he said.

The road map has been created as the government has decided to reclassify existing evacuation zones around the plant into three categories this spring, now that the plant has been brought to a stable state of cold shutdown.

Under the new classification, an area over 50 millisieverts would be designated as a zone where it would be difficult for evacuees to return for a long period, while an area exceeding 20 millisieverts and up to 50 millisieverts would be categorized as a zone where habitation is restricted.

Areas with 20 millisieverts or less would be a zone where the government would allow residents to return in stages.

The government is directly in charge of the decontamination of the evacuation zones.

The Environment Ministry officials said that about 27,000 hectares are seen to be subject to decontamination, including about 9,200 hectares that are expected to be categorized as the "difficult-to-return" zone.

Currently, there are two types of evacuation zones -- namely the no-entry zone set in the 20-kilometer radius of the plant as well as areas outside the no-go zone where radiation exposure is feared to reach 20 millisieverts a year.

(Mainichi Japan) January 27, 2012

Suspect cattle still untested / Location of nearly 3,000 cows in radiation scare remains unknown

The Yomiuri Shimbun

The Health, Labor and Welfare Ministry has been unable to track the distribution routes of nearly 3,000 cows whose meat is suspected to contain high levels of radioactive cesium, ministry officials said.

The ministry wanted to inspect the meat of 4,626 beef cattle from 15 prefectures because it suspected the animals were fed rice straw contaminated by radioactive substances released at the outbreak of the crisis at the Fukushima No. 1 nuclear plant.

The meat of 1,630 cows--about 35 percent--had been inspected as of Wednesday, but the ministry says **the distribution routes of the remaining 2,996 animals remains unknown.**

The ministry ordered the inspections in July last year, after discovering that beef from cows shipped from Fukushima Prefecture contained high levels of radioactive cesium.

Later that month, the ministry asked prefectural governments to conduct inspections and release the identification numbers of cows that were suspected to have been fed rice straw exceeding the government provisional limit of 300 becquerels per kilogram. **The local governments carried out the inspections based on information on cattle sales by dealers and wholesalers.**

But the ministry believes that some beef from among the 2,996 cattle had already been consumed by July. It also believes that suspect beef was consumed following instructions to test the meat, because checks were not carried out in time.

Beef from the 4,626 cows is known to have been shipped from 15 prefectures spanning from Hokkaido to Shimane Prefecture.

From July to October, the beef from 1,585 animals had been inspected, and meat from another 45 animals was tested in November, according to reports from prefectural governments. But there have been no inspections of beef from the remaining cattle.

The results from the inspections show meat from 105 cattle in six prefectures--6.4 percent of the 1,630 animals tested--had radioactive cesium exceeding the government's provisional limit of 500 becquerels per kilogram.

By prefecture, 54 of the 105 cows were bred in Miyagi and 21 were shipped from Fukushima. Iwate had 16, followed by Tochigi with 10. Two each were from Yamagata and Akita.

"It took time for the local governments to conduct inspections when more than one prefecture were involved in the beef's shipment and distribution," a ministry official said.

A major factor contributing to the failure of local governments to specify the distribution routes for such a large number of cattle was probably the fact that **the inspections were not legally binding**, the official added.

The Iwate prefectural government has not determined the routes of more than 60 percent of the 529 cows it was ordered to inspect. "As more time passes, we face more difficulties in following up where these cattle were distributed," a prefectural government official said. "But we'll continue our inspections as part of efforts to secure food safety."

Hisa Anan, the chief of the secretariat of the National Liaison Committee of Consumers' Organization, said: "It's irretrievably damaging that some people have consumed the uninspected beef. The government should provide an accurate explanation to consumers."

Hideaki Karaki, an expert in food safety and professor emeritus at the University of Tokyo, said the nation's meat distribution system makes it difficult for authorities to conduct investigations because carcasses are cut into parts that are sent to different areas. "To make matters worse, inspections were delayed and only began four months after the nuclear crisis," he said.

But Karaki said people should be calm despite fears that consumers have eaten the tainted beef. "People would not suffer any health damage unless they consumed a considerable amount of the meat," he said.

(Jan. 27, 2012)

2 Frenchmen busted for forging passes to shoot inside Fukushima's no-go zone

FUKUSHIMA -- Police have sent papers to prosecutors on two French cameramen for forging passes that they used to enter and film in the no-go zone around the crippled Fukushima nuclear plant, it has been learned.

According to police, the pair scanned passes of workers at the Fukushima nuclear power plant, using a computer to forge passes of their own.

Their actions were uncovered when a police officer on patrol in the area spotted the two while they were filming and questioned them.

The Frenchmen were among a group of five men accused of entering the zone without permission to shoot the current conditions at the crippled nuclear plant between Nov. 30 last year and Jan. 3 this year.

Police have sent papers to prosecutors on all five, accusing them of violating the Disaster Countermeasures Basic Act and the Act on Special Measures Concerning Nuclear Emergency Preparedness. The two Frenchmen are additionally accused of using forged private documents.

According to police, there are unpatrolled roads leading into the no-entry zone, which people have used to enter the restricted area.

There have been over 100 trespassing cases by residents and other locals up until now, including cases in which residents have attempted to enter the zone to check on their houses, police said. From a humanitarian standpoint, however, police have not charged any of them, but instead requested that they write explanatory reports for their actions.

(Mainichi Japan) January 27, 2012

Japan's plutonium stockpile builds as nuke fuel cycle policy hits dead end

Japan's stockpile of plutonium had reached 45 metric tons by the end of 2010, inviting suspicion from the international community about what Japan intended to do with the fissile material. As a result, much hope has been pinned on a MOX fuel reactor being built in northern Japan to eventually consume that excess plutonium.

MOX fuel is a mix of plutonium and different uranium oxides produced as waste by conventional reactors, and the Japanese government had hopes that plants that can burn it -- like one now under construction by the firm J-Power in Oma, Aomori Prefecture -- would become the foundations of a new nuclear fuel cycle. That cycle, which would see the spent fuel from conventional nuclear plants used again in MOX-burning plants, has yet to come close to fruition. Meanwhile, reprocessing of spent fuel into plutonium has continued apace, making the entire program a symbol of policy inconsistency.

First of all, the only example of a functioning "full MOX" reactor -- one that burns MOX fuel exclusively -- has been an experimental reactor in France. Furthermore, a MOX fuel reactor core tends to have a smaller margin for error during shutdowns than a uranium-burning core. As such, MOX fuel reactor maker Hitachi-GE Nuclear Energy has said it has increased the capacity of safety valves that bleed off reactor vessel pressure during an emergency by 5 percent and developed high-efficiency control rods -- measures that will allow improvements to existing light boiling water reactors.

"Reactors must be tested and meet minimum standards before they can be used, which requires a certain amount of development funds," explains a Hitachi-GE Nuclear Energy official.

Another MOX option is so-called "pluthermal" reactors, which burn some of the reprocessed fuel. However, the only countries in the world still pursuing the technology are France and Japan.

"Resource-wise, pluthermal reactors have nearly no merit," says former Kyoto University Research Reactor Institute lecturer Keiji Kobayashi.

Furthermore, spent MOX fuel contains many elements that can't be dissolved in the nitric acid used during fuel reprocessing. Disposing of the waste adds to the technology's costs, while a practical disposal method has yet to be developed.

Meanwhile, the chances of directly disposing of plutonium by burying it underground in Japan are just about zero. As such, if "full MOX" reactors don't get up and running, there will be no way for the country to consume the plutonium. On the other hand, if these reactors do go on line, Japan will end up with increasing amounts of spent MOX fuel it has no way of dealing with. In the background of this dilemma is the possible cancelation of the MOX-fueled Monju fast-breeder reactor in Fukui Prefecture.

All in all, Japan's nuclear fuel cycle policy has gone down a blind alley, and shows no signs of finding its way out.

Famed Aomori fishing port lives in shadow of new MOX fuel nuclear plant

J-Power's "full MOX" nuclear plant is seen under construction in Oma, Aomori Prefecture, on Dec. 27, 2011. (Mainichi)

OMA, Aomori -- This town at the top of Aomori Prefecture is known nationwide for its tuna, and indeed the first tuna fish auctioned at Tokyo's Tsukiji Market in 2012 was hauled in by Oma fishermen. There is, however, something else afoot here that has thus far escaped much attention: the building of a MOX fuel-based nuclear plant.

Construction of the reactor was started in 2008 by the Tokyo-based energy firm J-Power, and is designed to burn only MOX fuel -- a mix of plutonium and different oxides of uranium produced as waste from conventional reactors. Called a "full MOX" reactor, it will be the world's first light-water

reactor of its kind to go into commercial service. It is also projected to have the greatest electricity output of any reactor in Japan, at more than 1.38 million kilowatts, and is a major link in Japan's nuclear fuel cycle policy.

The technology faces some serious hurdles, however. For one, the plutonium in the fuel is highly toxic. Furthermore, control rods are less effective in light-water reactor cores burning MOX fuel instead of conventional uranium fuel, while spent MOX fuel also generates more heat and radiation, as well as large amounts of highly radioactive waste. So far, no processing methods have been devised.

In July 2010, the citizens of Hakodate, Hokkaido -- about 18 kilometers across the water from Oma -- filed a lawsuit demanding that permission for construction of the MOX plant be revoked.

"It is technologically hasty and extremely dangerous to build a commercial MOX reactor without even going through the steps of constructing experimental and test reactors," the suit stated. It was also pointed out that this first "full MOX" commercial plant was J-Power's inaugural foray into nuclear power of any kind.

The road to bringing a nuclear station to Oma began in 1976, when the town chamber of commerce and industry petitioned the municipal council to conduct a survey on possible sites for a plant. It also happened to be a time of poor tuna catches.

"It happened in the context of economic anxiety," says one 66-year-old former postal worker who has been fighting the nuclear plant since the beginning. The tuna, however, eventually came back. "If the tuna catch then had been like it is now, Oma would never have invited the plant here," he says.

Antinuclear activists refuse to move tents from gov't land

TOKYO (Kyodo) -- Antinuclear activists rejected a call by the industry ministry to remove their tents from its precincts by 5 p.m. Friday, and continued a four-month-old occupation of ministry grounds to press their demand for the closure of all nuclear power plants in Japan.

The activists said they will not move the tents until the government promises not to allow idled nuclear reactors to resume operating. The ministry said it will not try to evict the activists by force but continue to ask them to remove the tents voluntarily.

On Friday, hundreds of people attended a gathering of antinuclear activists in front of the Ministry of Economy, Trade and Industry, chanting "stop nuclear power plants" and "give us back Fukushima."

Setsuko Kuroda, 61, who attended the gathering from Fukushima Prefecture, said, "Please do not take down our activity's important symbol. What should be taken down are not these tents but the nuclear plants."

The tents were set up last September on the grounds of the trade and industry ministry in Tokyo's Kasumigaseki district, where many government offices are concentrated.

The ministry on Tuesday urged the protesters in writing to remove the tents, citing safety as a reason following a small fire late last year caused by a gasoline-powered generator used by the activists.

Since the radiation-leaking disaster at the Fukushima Daiichi power plant following last March's massive earthquake and tsunami, scenes of civilians holding antinuclear demonstrations in front of the ministry have become commonplace.

The ministry oversees the electricity industry, including the crippled plant's operator Tokyo Electric Power Co., and has the Nuclear and Industrial Safety Agency under its wing.

(Mainichi Japan) January 28, 2012

Govt failed to keep records of key nuke meetings

TOKYO (AP) -- Japan's deputy prime minister acknowledged Friday that the government failed to take minutes of 10 meetings last year on the response to the country's disasters and nuclear crisis and called for officials to compile reports on the meetings retroactively.

The missing minutes have become a hot political debate, with opposition lawmakers saying they are necessary to provide a transparent record of the government's discussion after the March 11 earthquake and tsunami touched off the worst nuclear accident since Chernobyl in 1986.

Deputy Prime Minister Katsuya Okada confirmed Friday at a news conference that the minutes were not fully recorded at the time and called for them to be written up, retroactively, by the end of February. Three of the meetings during the chaotic period had no record at all, not even an agenda, including a government nuclear crisis meeting headed by the prime minister.

Okada has set up a panel to investigate the extent of the problem and its cause.

The missing minutes are the latest example of the government missteps in disclosing information.

Japanese authorities and regulators already have been repeatedly criticized for how they handled information amid the unfolding nuclear crisis. Officials initially denied that the reactors had melted down, and have been accused of playing down the health risks of exposure to radiation.

The government also kept secret a worst-case scenario that tens of millions of people, including Tokyo residents, might need to leave their homes, according to a report obtained recently by The Associated Press.

An outside panel investigating the government response to the nuclear crisis has been critical, calling for more transparency in relaying information to the public.

"Needless to say, keeping records at these meetings is extremely important," Okada said. "Each minister should keep that in mind."

Okada rejected speculation that the nuclear crisis meetings may have intentionally left unrecorded to avoid responsibility. He said the oversights were "unfortunate" developments during the chaotic time

when the Fukushima Dai-ichi nuclear power plant rapidly deteriorated and three of its reactors spiraled into meltdowns.

He said reconstruction of the minutes would be possible through notes and recordings kept by officials who attended the meetings.

Japan's public records law requires minutes or summaries at key government meetings, but not all of them.

(Mainichi Japan) January 28, 2012

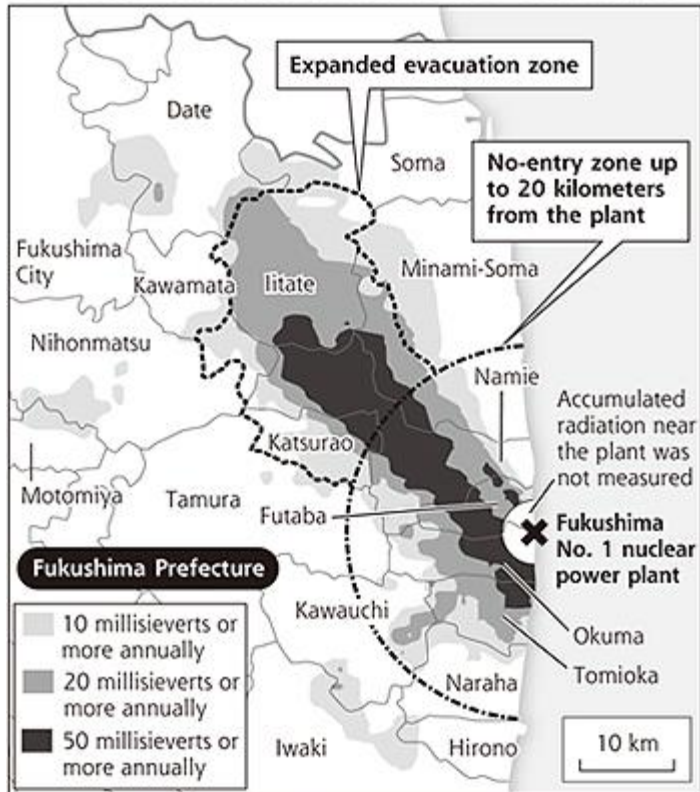

Less polluted areas to come 1st / Govt releases decontamination schedule for Fukushima Prefecture

The Yomiuri Shimbun

Timetable for decontamination work

Annual ambient radiation estimates

The map shows radiation doses near the Fukushima No. 1 nuclear power plant based on air monitoring in October and November by the Education, Culture, Sports, Science and Technology Ministry. The colored regions do not correspond to areas where residency is prohibited or limited for extended periods.

The government will prioritize decontamination work in areas of Fukushima Prefecture where the annual level of radiation exposure is 20 millisieverts or less, as part of efforts to allow residents of those areas to return home as soon as possible, according to a timetable released by the Environment Ministry.

The ministry on Thursday unveiled its timetable for decontamination operations in the no-entry and expanded evacuation zones in the prefecture. Entry is limited in these areas following the outbreak of the nuclear crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

The no-entry and expanded evacuation zones have been deemed "decontamination special zones" to be decontaminated under the government's direct control. **They are to be reorganized into three zones as of April 1 in accordance with their annual levels of radiation exposure.**

The new categories will be:

- Zones being prepared for residents' return. Annual radiation exposure is 20 millisieverts or lower, and residents are expected to be able to return following the completion of decontamination.
- Zones with restricted residency. Annual radiation exposure is 20 millisieverts to 50 millisieverts, and residents are expected to be able to return in a few years.

-- Zones where residency is prohibited for an extended period. Annual radiation exposure is more than 50 millisieverts and it is expected to be more than five years before residents can return home.

The government plans to complete decontamination work in areas with annual radiation exposure of 20 millisieverts to 50 millisieverts by lowering the level to 20 millisieverts or less--a level at which residence is allowed--by March 2014.

However, the ministry did not present a concrete plan for the zones with annual radiation levels of more than 50 millisieverts.

Regarding the zones being prepared for residents' return, the government plans to proceed with decontaminating the areas with higher levels of radiation exposure. It will start decontaminating areas with the highest levels of radiation exposure, from 10 millisieverts to 20 millisieverts, starting around March and aims to complete the operation by the end of this year.

The government will start work in areas with annual radiation exposure of 5 millisieverts to 10 millisieverts once a number of conditions are fulfilled, such as gaining approval from residents. It plans to launch these operations on a full-scale basis around June, and continue through March 2013, according to the timetable.

Regarding the areas with the lowest levels of radiation--from 1 millisievert to 5 millisieverts--full-scale decontamination work will start from around summer, and is scheduled to be completed at the end of March 2014.

However, the government will prioritize decontamination at schools, parks and other places where children gather, and densely populated urban districts and hospitals.

Regarding the zones being prepared for residents' return, the government plans to urge people to return after lowering the radiation level as much as possible.

Meanwhile, the government plans to begin a full-scale decontamination operation in the zones with restricted residency starting around autumn and finish at the end of March 2014.

Based on the outcome of decontamination work conducted at the end of last year by the Self-Defense Forces, the government believes it is possible to reduce annual radiation exposure in the zones to 20 millisieverts or lower, according to the ministry.

However, the timetable did not indicate final target levels of radiation in the zones.

"We're conducting a model project to verify the effect of decontamination. After seeing the results, we plan to incorporate a target level of radiation in the timetable by March this year," an official of the ministry's Environmental Management Bureau said.

Regarding the zones where residency is prohibited for extended periods, the government said it plans to study decontamination measures and other steps.

"By conducting a model project for decontamination, we plan to establish efficient and effective decontamination technologies and measures to ensure safety of workers," the official said.

Carrying out decontamination operations in the zones is expected to be extremely difficult. The government is considering buying or leasing land from residents of these areas.

"A project to have residents return home following a nuclear crisis of this magnitude is unprecedented in the world, so we have to overcome quite high hurdles. We'll make a careful judgment about the timing for residents to return home after considering the opinions of local government heads and residents," Environment Minister Goshi Hosono said.

(Jan. 28, 2012)

Free care for Fukushima kids rejected

The Yomiuri Shimbun

FUKUSHIMA--The government has turned down a request by the Fukushima prefectural government to make medical care free for prefectural residents aged 18 and under.

Tatsuo Hirano, state minister for disaster reconstruction and disaster management, met with Fukushima Gov. Yuhei Sato at the Fukushima prefectural office Saturday to tell him of the government's decision.

"It's necessary to handle this issue carefully because it affects the basis of the medical system," Hirano said. "It would be difficult to implement."

Sato said the government's decision was "extremely regrettable," but indicated he would accept it and instead consider having the prefectural government shoulder the costs itself.

"As a prefectural government, we'll positively consider [making medical care free] ourselves," he said.

Hirano also briefed Sato about the government's plan to provide about 40 billion yen in the second fiscal 2011 supplementary budget for funds the prefecture plans to set up, including money that would be used to help Fukushima Prefecture residents stay healthy and on measures to alleviate damage caused by radiation fears.

(Jan. 29, 2012)

Kawauchi govt heading home / Village 1st to return among those forced out by Fukushima N-crisis

The Yomiuri Shimbun

FUKUSHIMA--The government of a village forced to relocate due to the Fukushima nuclear crisis will return to the village in April, it has been learned, a move it hopes also will encourage residents to come back.

The village of Kawauchi in Fukushima Prefecture will be the first of the nine town and village governments that evacuated their offices to return to its original municipality.

The village functions were moved to Koriyama City in the prefecture because a section of Kawauchi fell inside the government-designated no-entry zone around the crippled Fukushima No. 1 nuclear plant, and the rest was named an emergency evacuation preparation area.

The Kawauchi municipal government has decided it will officially issue a statement Tuesday urging village residents to return.

Kawauchi Mayor Yuko Endo told village assembly members and administrative district leaders about the return plan Friday. Public schools and the village-run clinic will reopen in April.

Most of Kawauchi's 3,000 residents had to evacuate--some to other prefectures--after the March 11 quake and tsunami triggered the crisis at the nuclear plant. Although the emergency evacuation preparation area status was lifted in late September, public facilities and many shops remain closed. Only about 200 people have come back to the village.

In November, the municipal government started decontamination work in the village. It plans to finish decontaminating public facilities and homes of families with children by the end of March, and has set a target of completing the work for the entire emergency evacuation preparation area by the end of December.

Of about 940 houses in this area, the village plans to finish decontaminating about 150 within March. The remainder should be completed by the end of 2012.

The village will ask the central government to complete its decontamination work in the 20-kilometer no-entry zone this year.

(Jan. 29, 2012)

Radiation testing on school lunches differs

The Yomiuri Shimbun

FUKUSHIMA--Municipalities are carrying out tests for radioactive substances on ingredients used in school lunches, but parents are worried whether their children are adequately protected as the tests are conducted in various ways.

According to data compiled by the Fukushima prefectural board of education, 33 of the 59 municipalities in the prefecture test school lunches for radiation.

Using two radiation measuring instruments, the Koriyama municipal government checks school lunches only once a week, although ingredients left over from lunches on the other four school days also are tested. This means that some tests are carried out after the schoolchildren have eaten their lunch.

On Monday, the Sukagawa municipal government will use five measuring instruments to test ingredients two days before lunches are served to children.

The city has set an original limit of up to 10 becquerels per kilogram for lunch ingredients, much stricter than the Health, Labor and Welfare Ministry's new limit for general food items of 100 becquerels per kilogram, which is scheduled to be introduced in April.

Parents are puzzled why some local governments conduct tests after the children have already eaten lunch, while others do so before lunch.

"It's strange why municipalities use different testing methods," a 37-year-old woman living in Koriyama said. "They should test the ingredients before children have lunch."

The woman, who has a 7-year-old daughter, said that in the wake of the disaster at the Fukushima No. 1 nuclear power plant she stopped her daughter from drinking milk with her school lunch.

The Koriyama official said it could not conduct tests before children ate lunch because of the shortage of measuring instruments. But it will start conducting prelunch tests in late February after it purchases two more instruments.

The frequency of tests and imposing becquerel limits on school food also differ depending on the municipality.

The city of Fukushima, which conducts tests just before food is cooked, carries out tests in turn among four school lunch centers and 26 facilities, including primary and middle schools.

The Fukushima municipal government conducts tests about once a week, and has set a limit of 350 becquerels per kilogram.

In Minami-Soma, where part of the city is designated as a no-entry zone, the municipal government started carrying out tests on five school days after lunch from Jan. 16.

The Tomioka municipal government in neighboring Gunma Prefecture is conducting tests only twice a month for cooked school lunch dishes as its agricultural products are checked beforehand to ensure they are safe.

Shinobu Iida, 45, a representative of the group Fukushima Mothers Meeting, said: "Tests should be conducted before schoolchildren eat their lunches. If a strict limit of less than 5 becquerels is introduced, which is the standard for other nations, Fukushima-made agricultural products could be used without fear."

Ryugo Hayano, an expert in nuclear physics at the University of Tokyo, said: "Tests on ingredients before meals engender a sense of safety, but tests after a meal can help prevent long-term internal exposure. With continuous tests on the actual quantity of food served in school dishes, it's possible to gather data about how much children should eat."

(Jan. 29, 2012)

IAEA to set up Fukushima office to share info on nuclear crisis

DAVOS, Switzerland (Kyodo) -- The International Atomic Energy Agency plans to open a branch office in Japan's Fukushima Prefecture to promote international information sharing about the crisis at the Fukushima Daiichi nuclear plant, IAEA chief Yukiya Amano said Saturday.

The plan is being considered at the request of the Japanese government, Amano told Kyodo News in the Swiss resort of Davos, where the annual meeting of the World Economic Forum is being held, noting that the IAEA intends to open the office by the end of this year.

"We have told the Japanese government that the IAEA stands ready to cooperate," Amano said.

The Japanese government apparently expects the IAEA office will enable Tokyo to utilize knowledge of experts at the Vienna-based nuclear watchdog in containing the crisis, and will help it disseminate information about the Fukushima accident and related decontamination work.

"While the headquarters in Vienna will continue to deal with issues related to the decontamination and disposal of spent nuclear fuels, we'll be able to have close contact" with people in Fukushima by opening the local office, said Amano.

The details of the office, including its site, will be decided later, he added.

Japanese Foreign Minister Koichiro Gamba said on Jan. 22 that the government had asked the IAEA to open an office in Fukushima Prefecture.

The IAEA currently has regional offices in Tokyo and Toronto.

(Mainichi Japan) January 29, 2012

Frozen water blamed for leaks at Fukushima plant

Tokyo Electric Power Company has found water leaks in 14 locations at the Fukushima Daiichi nuclear plant.

The utility says the leaks apparently occurred after frozen water ruptured the pipes and the leaked water did not contain any radioactive materials.

Tokyo Electric said about 40 liters of water leaked from a cooling system for a spent fuel pool at the No.4 reactor on Sunday, but the flow stopped when workers closed the valve.

The company said **the leak forced the system to stop for one hour and 40 minutes**, but the pool's temperature did not rise.

Tokyo Electric said 7 tons of water had leaked from the No.6 reactor.

The temperature fell to minus 8 degrees Celsius on Sunday morning near the damaged plant.

Ruptured pipes caused 3 water leaks on the previous day.

Tokyo Electric official Junichi Matsumoto admitted that **the utility failed to take sufficient steps to prevent frozen pipes**. He said it will take quick action to protect the pipes from the cold weather.

Sunday, January 29, 2012

Radiation study of wildlife planned in Fukushima

Japan will launch a comprehensive study to monitor the impact of radiation exposure on wild animals and plants around the damaged nuclear plant in Fukushima.

Fukushima Prefecture requested the study, which will be conducted by the Environment Ministry with the cooperation of the National Institute of Radiological Sciences.

Levels of radioactive cesium in wildlife will be tested at 25 locations, both at land and sea. The proposed testing sites include places with high levels of radiation and areas with less radiation for comparison purposes.

The species to be studied include Japanese red pine and bristlegrass, as well as rats, frogs, and mussels.

They were picked from species designated by the International Commission on Radiological Protection, an organization which deals with effects linked to exposure to radiation.

Collection of some species has already begun. Researchers will check plant and animal appearance, chromosomes, and reproductive function for the influence of any radioactivity from the damaged plant. The rate of germination of seeds will also be studied.

The ministry suggests that the study would have to take into account the effects of weather and other factors on the growth of wildlife. But it says it hopes to provide new insights by accumulating a sizable amount of data.

The ministry plans to compile an interim report by March 2013.

Sunday, January 29, 2012

Gov to purchase new cesium detection equipment

Japan's health ministry will subsidize half the cost of installing highly sensitive radioactive cesium detectors in an effort to strengthen food safety standards nationwide.

Subsidies will be distributed to local governments around the country and tougher safety standards will take effect in April.

Under the new safety standards, general food products will be allowed to contain 100 becquerels of cesium per kilogram, an 80% reduction from the current permissible level.

Baby food and milk will be allowed to contain 50 becquerels and drinking water just 10 becquerels.

The guidelines state if a conventional test detects half the radiation safety level in any food item, then that item should be subject to a stricter screening method.

The health ministry decided that more sensitive equipment is needed, which can detect levels as low as 25 becquerels of cesium.

Some of the devices currently installed in local government offices are unable to measure low levels of cesium or are too slow at taking measurements.

Sunday, January 29, 2012

TEPCO ordered to prevent water leaks at reactors

Japan's nuclear safety agency has instructed the operator of the Fukushima Daiichi nuclear plant to prevent water leaks at the plant.

The move follows the discovery of water leaks on Sunday in 14 locations at the damaged plant.

Tokyo Electric Power Company says about 40 liters of water leaked from a cooling system for a spent fuel pool at the No. 4 reactor, forcing the system to stop for one hour and 40 minutes. The utility also says that 7 tons of water leaked from the No. 6 reactor.

The company says that the leakages apparently occurred after frozen water in pipes loosened the pipes' connections or broke some parts.

The company adds that the leaked water did not contain radioactive materials or had already been processed to remove them.

Similar water leaks occurred in 3 locations at the plant on the previous day.

Responding to the agency's call for preventive measures, TEPCO has decided to conduct frequent checks on early mornings when temperatures often drop below zero and protect pipes from the cold with insulation materials or heaters, if necessary.

The utility says measures are already in place to protect critical systems, such as those used for cooling reactors.

Monday, January 30, 2012

More water leaks found at Fukushima nuclear plant

More water leaks have been found at the troubled Fukushima Daiichi nuclear power plant.

Tokyo Electric Power Company told reporters on Monday morning that it has discovered 2 additional water leaks at the nuclear plant.

This comes after it was announced on Sunday that **nearly 8 tons of water** was found to have leaked in 14 locations at the plant.

One of the 2 new findings involves about 30 liters of water that has leaked from a device that is removing salt from contaminated water. The other leak is from a valve of a pipe that is injecting water into a reactor.

TEPCO says leaked water has neither spilled out of the plant, nor flowed into the sea.

The utility firm is trying to determine whether water in some of the pipes froze and cracked the pipes, or loosened the pipes' connections.

It plans to quickly implement preventive measures, including carrying out more patrols early in the morning and **wrapping insulation around the pipes and other equipment. !!!!!!!**

The temperature on Monday morning around the plant dropped to minus 8.7 degrees Celsius.

Monday, January 30, 2012

Japan-made robots ready for Fukushima mission

Japanese researchers have completed the development of 2 new robots for work at the troubled Fukushima Daiichi nuclear power plant.

The robots, built by researchers at Chiba Institute of Technology and other organizations, will succeed Japan's first and sole domestic robot that has been used at the damaged reactor buildings since the nuclear crisis began in March 2011.

The first model began its mission at the power plant in June to measure radioactivity inside buildings and take video footage. But, in October, the device got stuck after becoming tangled in cables.

The new models are about the same size as the first one, but they have 6 rolling belts each that allow them to move freely over debris and up and down staircases.

The robots are designed to prevent themselves from getting tangled in cables. They are also connected through wireless communications, in case one, or both, fail to communicate with the main controller through their cables.

One of the 2 robots is equipped with a new device that allows more accurate measurements of radiation levels. The other carries a new scanner to measure 3-dimensional space.

The 2 robots will be deployed at the Fukushima power plant by mid-March.

Monday, January 30, 2012

Japan's nuclear stress tests deemed consistent with IAEA standards

TOKYO (Kyodo) -- An International Atomic Energy Agency fact-finding team said Tuesday that Japan's nuclear stress tests, a key step for restarting reactors following the Fukushima nuclear crisis, are "generally consistent" with IAEA safety standards.

On the last day of its nine-day mission to Japan to review the tests at nuclear power plants, the IAEA delegation conveyed its findings to the government's Nuclear and Industrial Safety Agency, while also making some recommendations to improve the tests's effectiveness.

"The conclusion of the team is that NISA's instructions and review process for the comprehensive safety assessments are generally consistent with IAEA safety standards," the delegation said in its preliminary report.

Tokyo introduced the stress tests after the meltdown at Tokyo Electric Power Co.'s Fukushima Daiichi power plant in the wake of the March quake-tsunami disaster, to check how much leeway the nation's nuclear power plants have to withstand earthquakes, tsunami and the loss of power.

To confirm if the test method is consistent with global safety standards, the government asked the Vienna-based body to verify them.

But there remains criticism among some local governments hosting nuclear power plants and experts that the stress tests need to reflect the findings that the government's accident investigation team has yet to compile on the Fukushima nuclear crisis.

NISA earlier compiled a draft report endorsing results of first-round stress tests that Kansai Electric Power Co. submitted with regard to the No. 3 and 4 reactors at its Oi power plant in Fukui Prefecture. The two reactors are currently idled for scheduled checkups.

The government's nuclear safety agency is set to finalize the report after studying the IAEA's findings, and will have it checked by the Nuclear Safety Commission of Japan.

James Lyons, nuclear installation safety director of the IAEA's Nuclear Safety and Security Department who heads the delegation, said at a press conference that deciding whether to restart the reactors is up to the Japanese government.

Currently, only three of Japan's 54 commercial reactors are operating. Japanese reactors must shut down for maintenance every 13 months, and so far no idled reactor has passed the stress tests, a prerequisite for resuming operations.

If no idled reactors get approval to restart, Japan will be without any operating reactors by the end of April.

Cabinet approves bills to enhance Japan's nuclear regulations

TOKYO (Kyodo) -- Japan's Cabinet approved bills Tuesday aimed at enhancing nuclear safety regulations following the accident at the Fukushima Daiichi atomic power plant, including a plan to place in principle a 40-year limit on the operation of reactors.

The envisioned regulations leave the possibility of extending a reactor's operational life by up to another 20 years, but the wording in the bills has been clarified in the process of crafting them so that such an extension would be "extremely difficult" to achieve, according to ruling party members.

The bills are also intended to require plant operators to take measures to prevent massive release of radioactive substances into the environment when an accident occurs, while allowing authorities to order the suspension of reactors if facilities do not comply with updated technological standards based on the latest findings.

The bills are expected to be introduced to the ongoing parliamentary session, with the government hoping to launch the new regulatory framework from April, when fiscal 2012 begins.

Under the framework, a new nuclear regulatory agency under the Environment Ministry plays a central role in nuclear safety issues, bringing an end to a situation in which various organizations, such as the science ministry, are involved in the issue.

The current setup of the nuclear safety agency under the Economy, Trade and Industry Ministry, which has the role of promoting nuclear power, has been criticized for lax government supervision of nuclear facilities, and a slow response to the Fukushima accident, triggered by the earthquake and tsunami on March 11 last year.

The government also plans to create a five-member nuclear safety investigation committee, which will oversee the new nuclear agency and would carry out investigations when nuclear accidents occur.

In the course of compiling the bills, the ruling Democratic Party of Japan members have pointed out the need to clarify the portion related to the reactors' operational life amid concerns that the clause on the extension could serve as a "loophole" in continuing the operation of reactors beyond the 40-year-limit.

Reflecting such discussions, one of the bills said that "the period in which reactors can be operated is 40 years" from the day it passes inspection prior to operation, and that authorities "can permit" a one-time extension of no more than 20 years when reactors clear certain safety standards.

Its draft had said that authorities "should permit" an extension when the standards are cleared, according to the DPJ lawmakers.

The government plans to check such aspects as how far reactors have deteriorated with age when deciding extensions, but details are yet to be decided.

Environment Minister Goshi Hosono told a press conference he believes the bills will gain the support of other political parties, considering the "importance" of the issue.

(Mainichi Japan) January 31, 2012

Wind power station planned in place of nuclear plant in Wakayama town

WAKAYAMA -- A company partially financed by Tokyo Electric Power Co. (TEPCO) is planning to build a wind power station in the Wakayama Prefecture town of Hidaka, which has abandoned plans to host a nuclear power plant, it has been learned.

The town is likely to accept the wind power project, with Mayor Yoshio Naka earlier having declared: "The age of nuclear power stations is over."

If the company receives local approval, it will apply to the Wakayama Prefectural Government and other relevant bodies to begin developing the town's Oura district, aiming to launch commercial operation of the power station in 2014. In addition, as a countermeasure against a tsunami that experts predict is highly likely to occur soon in the earthquake-prone Tokai, Tonankai, or Nankai regions, the company will use soil left over from construction to prepare land for temporary housing, and the town will also build a heliport in the area.

The project is being promoted by Tokyo-based Eurus Energy Holdings Corp., the biggest wind farm company in Japan, which is financed by TEPCO and Toyota Tsusho Corp. It plans to build seven wind turbines with a generating capacity of 2,000-2,300 kilowatts in an elevated mountain area, and sell the electricity it produces to Kansai Electric Power Co. The power station will be able to supply electricity for 8,500 to 10,000 homes.

In 1967, the mayor of Hidaka unveiled proposals for the construction of a nuclear power plant. Ahead of the construction work, Kansai Electric Power Co. in 1988 presented the local fisheries cooperative with about 700 million yen. However, divisions over the plans erupted among relatives in the cooperative, and the conflict even spread to wedding ceremonies, funerals, and boat-launching ceremonies. In the 1990s, a mayor opposed to the project was elected, and Naka, who continued that line from 2002, approached Kansai Electric Power Co. soon after assuming office seeking a halt to the project.

In 2005 the government lifted designation of the area as an important site for the development of nuclear power, and the Oura district and the southern Ao district are currently designated as prefectural nature parks.

It is predicted that a powerful Tokai, Tonankai or Nankai region earthquake could bring a tsunami more than 4 meters in height into the area in 30 minutes. After the Great East Japan Earthquake in March 2011, the town was pressured to revise its disaster prevention plans to envisage a magnitude 9-level earthquake, and in line with the establishment of a wind power station, disaster prevention measures are being promoted in the town. Using soil left over from the construction of wind turbines, an area of land measuring about 5,000 square meters will be prepared to make room for a shelter and temporary housing for about 80 households. To secure water in the event of an earthquake, valves allowing the distribution of water to be halted will be placed on water tanks in the district, and new tanks to supply water to temporary housing units will be set up.

(Mainichi Japan) January 31, 2012

Govt plans Fukushima decontamination test-run

Japan's Environment Ministry has unveiled a model project designed to decontaminate areas with high levels of radiation around the crippled Fukushima Daiichi nuclear plant.

In a test-run for a wider clean-up, the ministry will first try to decontaminate 3 closed sections of a national expressway running through the no-entry zone near the plant.

The ministry last week announced a 2-year plan to decontaminate by March 2014 some evacuation zones where radiation levels have dropped below 50 millisieverts per year.

Radiation levels over a total 5 kilometers of expressway slated for the new project have ranged from a little to substantially above 50 millisieverts a year.

The ministry plans to assess the project's effectiveness in a test-run from the middle of March through July.

Furnace malfunction hobbles Aomori spent nuke fuel reprocessing plant (= entrave)

AOMORI -- A furnace malfunction at a nuclear fuel reprocessing plant here has stalled a planned trial run of the facility, throwing the future of Japan's nuclear cycle policy into doubt.

Yoshihiko Kawai, president of plant operator Japan Nuclear Fuel Ltd. (JNFL), announced at a regular press briefing on Jan. 30 that a problem with a furnace at the Rokkasho Reprocessing Plant has **forced a halt to the preparatory work for a test of the plant before it officially goes into operation.** The furnace is designed to mix molten glass with highly radioactive liquid waste.

The cause of the malfunction has yet to be determined, with **no prospect of restoring the equipment to operation in the near term,** JNFL said. The technical impasse could prompt calls for a review of the country's nuclear fuel cycle policy, under which spent fuel from conventional nuclear reactors would be reprocessed into MOX plutonium-uranium mixed-oxide fuel for so-called "pluthermal" and "full MOX" reactors.

The plant has repeatedly delayed a full-scale trial run since December 2008 due to a spate of troubles. JNFL had taken various corrective measures before starting to check the status of the furnace on Jan. 24 ahead of the planned test.

According to Kawai, plant workers began work with the plant's "B-System" furnace, which has no history of use in trials and is separate from the plant's "A-System," which caused trouble four years ago.

On Jan. 24, when workers started melting beads made from a mixture of glass and nonradioactive mock liquid waste in the furnace and pouring the molten material into a container below, they found the flow gradually slowing down, threatening to block the furnace outlet. Workers suspended the procedure three times and stirred the furnace interior in an attempt to restore function, but the glitch has not yet been fixed. Furthermore, unidentified and unexpected black particles each measuring several millimeters were found in the outflow.

"We will continue our restoration work for a while so that we can recover the equipment and ascertain the cause of the problem in a careful manner," said Kawai. The president also said he would make **efforts to remain on-schedule for a trial run in early February and the completion of the plant in October, ruling out the possibility of suspending the furnace for inspections at the moment.** Regarding the furnace problem's possible effects on the mounting calls for a review of the nation's nuclear fuel cycle policy, Kawai said, "It is important to proceed with our work carefully and without too much strain. We want everyone to understand the situation in terms of advancing the debate as well."

Following plant trouble in 2008, the company has repeatedly conducted experiments using a test furnace in Ibaraki Prefecture and struggled to improve operating methods and devices. In the wake of the nuclear disaster at the Fukushima No. 1 nuclear plant in March 2011, the company had its safety measures updated and approved by Aomori Gov. Shingo Mimura in December that year, ahead of preparations for the plant trial.

President Kawai had stressed in October last year that keeping the nuclear fuel cycle business going "is necessary from the perspective of environmental conservation as well" if compared to burying spent fuel and waste. **He had also said the closure and disassembly of the plant could cost some 1.4 trillion yen, on top of the approximately 2.2 trillion yen that was spent on its construction.** [soyons honnête, c'est ça le problème]

The construction of the Rokkasho reprocessing plant, which ultimately aims to recycle nuclear fuel by extracting plutonium and uranium from spent nuclear fuel, began in 1993 for a planned completion in 1997. **However, an array of troubles, including technical problems and exposure of one worker to high-level radioactive liquid waste, have forced JNFL to postpone official completion as many as 18 times.**

While the government has clearly set forth the promotion of the nuclear fuel cycle in the nation's Framework for Nuclear Energy Policy, protests against the policy have heightened since the outbreak of the Fukushima nuclear disaster. The prototype "Monju" fast-breeder reactor in Fukui Prefecture, which is aimed at efficiently utilizing reprocessed nuclear fuel, has no prospect of restarting. As such, the Japan Atomic Energy Commission has embarked on a full-scale review of the nuclear fuel cycle policy. **The total amount of spent nuclear fuel at nuclear power plants across Japan currently stands at some 14,000 metric tons, with nowhere to go unless reprocessing gets under way.**

FEVRIER 2012

(jusqu'au 12 février 2011. Après cette date, se reporter aux articles publiés dans le blog *Fukushima Is Still News*, rassemblés dans 16 volumes thématiques : voir le catalogue des livres à télécharger à la fin de ce livre.)

Editorial: Nuclear regulatory reform must weed out entrenched interests

Bills relating to a shift in the nation's nuclear power policy were approved by the Cabinet on Jan. 31. In addition to the establishment of a new nuclear regulatory agency under the Environment Ministry, the government is aiming to legislate the lifespan of nuclear reactors, and require plant operators to outline specific measures against severe nuclear accidents.

Significant harm has been done by allowing the Nuclear and Industrial Safety Agency (NISA), an administrative body tasked to regulate nuclear power safety, to exist under the umbrella of the Ministry of Economy, Trade and Industry (METI), a major promoter of nuclear power. Divorcing nuclear regulation from nuclear promotion and centralizing regulatory duties into one agency stands to reason. Changing the agency's name from the originally proposed "nuclear power safety agency" to "nuclear power regulatory agency" is likewise pertinent, considering the new agency's nature.

However, the mere alteration of a name and rearrangement of an organization will not result overnight in a highly independent agency specializing in regulation. Because many of the new agency staff members are likely to come from NISA, specific measures are necessary to secure the independence of the new body.

It remains unclear how a nuclear safety investigation committee, envisaged in one of the bills approved by the Cabinet, will contribute toward ensuring the safety of nuclear power. Since the Cabinet Office's Nuclear Safety Commission (NSC) lost the confidence of the Japanese public over its response to the ongoing nuclear disaster, the new committee cannot expect to gain it back without demonstrating its independence and competence.

The handling of the continuing nuclear crisis has been problematic particularly due to the government's lack of readiness, which has generated suspicions that the disaster could have been mitigated had the government been more capable of crisis management. Crisis management will be an important duty of the new regulatory agency, and must be attended to adequately.

Meanwhile, some things have slipped through the centralization of regulatory responsibilities. Safety research conducted by the Japan Atomic Energy Agency (JAEA) and the inspections and other safeguards implemented by the Ministry of Education, Culture, Sports, Science and Technology to prevent the diversion of nuclear material toward the production of nuclear weapons will not fall under the jurisdiction of the new regulatory agency. It remains to be seen how these tasks will be integrated into the new scheme.

Included in the latest bills are the designation of a 40-year lifespan for nuclear reactors and the implementation of "back-fit" measures that would hold existing reactors to the latest technological standards. The government claims that the combination of these two mandates would make it extremely difficult for reactors to continue running more than 40 years. The bills, however, include special exemptions allowing reactors to operate for up to 60 years. Stringent criteria must be set to prevent "exceptions" from undermining the rule.

We hope also that the proposed legal reforms lead to a stronger nuclear disaster prevention scheme. In the case of the Fukushima disaster, the off-site emergency response center failed to function. A fundamental review of Japan's nuclear crisis preparedness is imperative. Along with an expansion of disaster protection zones emphasizing nuclear disaster countermeasures, there is a pressing need to reassess national and regional disaster prevention plans.

Numerous corporations and organizations make up the national framework that had heretofore promoted nuclear power, and their role in "amakudari" -- literally "descent from heaven," referring to the practice of former bureaucrats taking advisory posts in industries they previously regulated -- has been pointed out. For effective regulations to gain ground, it is important to extend reform to such organizations with entrenched interests.

Radioactive water leaking from inside Fukushima No. 4 reactor

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that it has found radioactive water leaking from a broken pipe connected to the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, about 6 liters of water were found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The utility is looking into the cause of the damage to the pipe and believes it may have some connection with the recent cold weather or the explosions that took place at the plant in the early phase of the nuclear crisis.

The density of radioactive substances included in the water is estimated at 35.5 becquerels per cubic centimeter, according to TEPCO.

Kawauchi village in Fukushima calls on evacuees to return home

Villagers clean the kitchen of their home during a brief visit - their first since the March 11 earthquake and tsunami - to their house located near the Fukushima Dai-ichi nuclear power plant, in Kawauchi, Fukushima prefecture, northern Japan, Tuesday, May 10, 2011. (Pool Photo)

FUKUSHIMA, Japan (Kyodo) -- The mayor of Kawauchi, a village in Fukushima Prefecture whose residents were forced to relocate following the nearby nuclear power plant crisis, called on some 2,600 evacuated villagers Tuesday to return home permanently.

"Let's return starting with those who are ready," Yuko Endo said at a press conference in Fukushima city, marking the first declaration among the nine town and village governments in the prefecture which evacuated their offices that it will return to its original location.

"There are matters of concern but there is no reason why we shouldn't take the first step forward," Endo added.

Chief Cabinet Secretary Osamu Fujimura said at a separate press conference that the declaration is an "important first step toward residents' returning to their home village," and added that the central government will "actively support" the Kawauchi village government's effort.

Kawauchi had about 2,990 residents before Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant was crippled by the earthquake and tsunami disaster of March 11, 2011.

About 75 percent of the villagers currently reside in the prefectural city of Koriyama where the Kawauchi government has relocated its functions because the village was partially designated as a no-entry zone set up by the central government around the nuclear power plant while the rest was categorized as an emergency evacuation preparation area.

In addition, a total of 542 Kawauchi residents were residing in 26 prefectures other than Fukushima as of Friday, while some 200 have returned to their homes since the central government lifted its evacuation advisory for the emergency preparation area of the village last September.

In November, the village government began decontamination work for schools and other public facilities in the hope of declaring in December that it would return to the village.

But the declaration was delayed for about a month as decontamination work is taking longer than expected. The work is expected to be completed by the end of March, paving the way for resumption of the village government, schools and other operations at the start of fiscal 2012 on April 1.

Most sections of the village are safe as radiation levels are less than 1 microsievert per hour, according to the Kawauchi government.

But the chances of all residents returning to the village are low in view of lingering radiation concerns.

(Mainichi Japan) February 1, 2012

1,704 people seek shutdown of Genkai nuclear plant in largest group suit

SAGA, Japan (Kyodo) -- A total of 1,704 people from across Japan, the largest number of plaintiffs in a pending nuclear-related suit, sued the government and the operator of the Genkai nuclear power plant in Saga Prefecture on Tuesday, demanding that all four reactors at the plant be halted.

In the suit filed with the Saga District Court against the state and Kyushu Electric Power Co., the plaintiffs from Saga and 28 other prefectures assert the reactors are dangerous and make them feel insecure amid the Fukushima nuclear crisis.

They are also seeking compensation of 10,000 yen each per month covering the period from March 2011, when the crisis erupted at Tokyo Electric Power Co.'s Fukushima Daiichi power plant, until Kyushu Electric suspends operation of the Genkai plant.

"We want the judges to agree that the safety dogma regarding nuclear reactors has collapsed during the trial," said Akira Hasegawa, the plaintiffs' leader and former president of Saga University.

Kyushu Electric said it would look into the suit and act "appropriately." The Ministry of Economy, Trade and Industry declined to comment, saying it has yet to study the complaint.

Another group of around 300 residents also sued Kyushu Electric last month demanding that the utility suspend operation of the Genkai plant.

(Mainichi Japan) February 1, 2012

IAEA OK's stress test review process

The Yomiuri Shimibun

U.N. nuclear experts gave the green light Tuesday to the Nuclear and Industrial Safety Agency's review process of so-called stress tests for nuclear reactors.

"NISA's instructions to power plants and its review process for the comprehensive safety assessments [stress tests] are generally consistent with IAEA safety standards," said James Lyons, the leader of the 10-member team from the International Atomic Energy Agency.

He handed NISA Director General Hiroyuki Fukano a preliminary report summarizing its review of NISA's approach to stress tests conducted by electric power companies.

The Japanese government asked the IAEA to check the review process to increase the tests' credibility.

Stress tests are conducted by power companies to check the safety levels of nuclear power reactors against huge earthquakes and tsunamis that exceed prior estimates.

The delegation conducted an on-site inspection at the Oi nuclear power plant's Nos. 3 and 4 reactors in Oi Town in Fukui Prefecture. NISA had already approved the results of stress tests conducted by Kansai Electric Power Co. for both reactors.

The preliminary summary listed four "good practices" by NISA. These include power plant operators' prompt response in addressing emergency safety measures at nuclear power plants based on NISA's instructions following the March 11 accident and a notable level of transparency in consultations with interested parties in relation to stress tests and the agency's review process.

On the other hand, the team identified 11 issues that need to be improved upon. They recommended that NISA should conduct meetings with interested parties near the nuclear facilities that are subject to stress tests in addition to its current activities. The team also recommended that NISA should ensure provisions to mitigate severe accidents are addressed more comprehensively when carrying out secondary assessments of stress tests.

Based on the delegation's preliminary summary, NISA will compile a review report reflecting the IAEA's evaluation on the Oi plant's Nos. 3 and 4 reactors, and submit to the Cabinet Office's Nuclear Safety Commission as early as February.

The commission will check for problems in NISA's review process by setting up a special review panel.

Based on the results of the panel's review and the intent of local governments involved, Prime Minister Yoshihiko Noda and three other concerned ministers will make a final decision on whether to restart the reactors.

(Feb. 1, 2012)

No minutes kept on past govt disaster meets

The Yomiuri Shimbun

The government has not kept minutes of conferences held on eight natural disasters, including the Great Hanshin Earthquake in January 1995, it was learned Tuesday. These meetings were held by emergency response teams created by the government in the aftermath of the disasters.

The latest revelation follows an earlier finding that no minutes were recorded on government conferences held to develop countermeasures in the aftermath of the Great East Japan Earthquake and the crisis at the Fukushima No. 1 nuclear plant. The eight disasters also include an eruption at Mt. Usu in Hokkaido in 2000, an explosion in 2000 on the volcanic island of Miyakejima in Tokyo and the 2004 Niigata Prefecture Chuetsu Earthquake.

(Feb. 1, 2012)

Hope growing for indoor farming in disaster-hit Tohoku region

The Yomiuri Shimbun

Moves to build indoor "vegetable factories" are growing in disaster-hit areas as a measure to revive local agriculture businesses.

In many coastal areas damaged by seawater in the March 11 tsunami, the topsoil has been stripped away in the course of removing disaster debris. The factories, using hydroponic techniques, would enable farmers to cultivate produce without soil.

This has also drawn attention in nuclear crisis-stricken Fukushima Prefecture as a method to produce vegetables in enclosed facilities with an eye toward preventing radiation contamination.

In Sendai, Butai Farm Co., a company growing rice and vegetables on the Sendai Plain and other locations, plans to build an about 20-hectare vegetable factory, the nation's largest. About 30 hectares of the company's farmland were flooded by the tsunami, resulting in losses of more than 200 million yen. Faced with this, Butai Farm President Nobuo Hariu, 50, formed a study group with a major food company and other entities in December to launch the new agriculture initiative.

Hariu said the planned factory could produce more than 100 times the amount of rice as traditional methods in the same area. According to the study group, costs to build the factory would total more than 5 billion yen, but the group has concluded the initiative would be profitable as it can skip work to desalinate soil and make it easier to block radiation.

The group also plans to build facilities to monitor radiation and generate solar power near the factory. The overall area of the compound is expected to be 50 hectares. It plans to start production from next fiscal year after leasing farmland from those affected by the disaster.

"This is a good opportunity to change conventional agriculture," Hariu said. "I'd like to pave the way to the future for the disaster-hit areas and change the current image of agriculture."

He is planning to hire about 500 people, including young farmers, for the project.

Major restaurant chain Saizeria Co. also built a vegetable factory and has started growing tomatoes in a 1.2-hectare facility in Wakabayashi Ward, Sendai, last month. According to Saizeria, the factory's productivity is three times more than that of outdoor farming. It has employed 11 local farmers aged 21 to 42 as trainees.

Meanwhile, the city of Minami-Soma, Fukushima Prefecture, part of which has been designated as a no-entry zone since the nuclear crisis broke out, plans to allocate about 120 million yen in its first draft budget for fiscal 2012 to build a similar factory, where not only vegetables but also flowers, fruit and other farm produce can be grown. The city aims to turn around its agriculture sector, which currently centers on rice production, and create a platform to grow vegetables in winter. It said it also wants to use produce from the factory for school lunches.

The city government plans to take advantage of the central government's subsidies for disaster reconstruction to build the factory in the tsunami-hit coastal area in the city. To prevent soil from being contaminated with radiation, produce will be cultivated in fully enclosed, sterile conditions.

The city plans to complete construction of the plant's first 300-square-meter facility as early as July and publicly seek participants in the initiative such as farming companies. It aims to build more facilities and expand the compound to about 10 hectares within about five years.

Yukinobu Sato, 57, representative of a farming corporation in the city that saw 80 percent of its 45-hectare farmland damaged by the tsunami, has high hopes for the municipality's move.

"As we've also suffered from harmful rumors [due to the nuclear crisis], we've found it difficult to get through the current situation with conventional agriculture," Sato said. "Cultivation under fully closed, antiseptic conditions has potential. I want to consider participating in the initiative."

(Feb. 1, 2012)

TEPCO says 8.5 tons of water leaked from Fukushima No. 4 reactor

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that 8.5 tons of radioactive water leaked from the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant because a pipe connected to the reactor dropped off, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, water was found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The total amount of leakage from the reactor was initially estimated to be 6 liters, but the utility revised the figure later Wednesday, adding that the leakage appears to have started at around 5 p.m. Monday.

The pipe may have dropped off because water inside increased in volume as it turned into ice due to cold temperatures.

The utility plans to check whether there are similar cases in the other crippled reactors.

The Nos. 1 to 3 reactors have fuel inside, which is believed to have melted in the early phase of the nuclear crisis because the plant lost its cooling functions following the natural disasters.

The No. 4 unit also lost the function to cool its spent fuel pool, but no serious damage is believed to have occurred in the fuel stored there.

(Mainichi Japan) February 2, 2012

Nuclear safety agency proposes new safeguards

The government's nuclear agency has made a new proposal to bolster safety at nuclear power plants.

The proposal calls for nuclear plant operators to install various types of backup power generators.

At the Fukushima Daiichi plant, the loss of all power sources in the earthquake and tsunami last March led to meltdowns at its reactors.

The proposal also asks operators to waterproof reactor-cooling facilities to prevent high waves from flooding the buildings.

As for an emergency cooling system to prevent core meltdowns, the proposal recommends the system should be automatically activated in emergencies.

They also stressed the need to secure communication tools such as a TV conference system that can be used in emergencies.

The Nuclear and Industrial Safety Agency presented the 30-point proposal at an expert meeting on Wednesday.

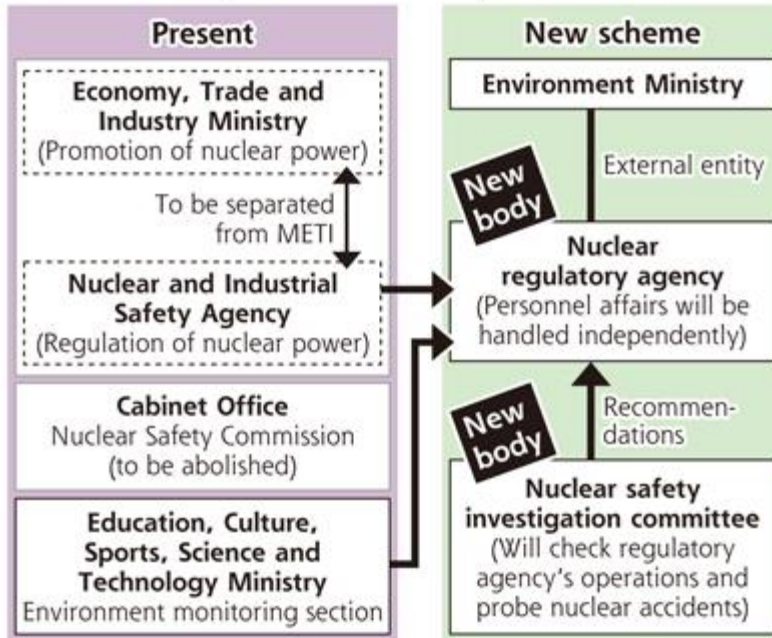

The agency plans to use the expert input to outline a concrete list of new safety measures by the end of March.

Thursday, February 02, 2012 12:03 +0900 (JST)

Feasibility key for revamped N-safety scheme / New plan obliges operators to take further safety measures; govt could intervene if steps not taken

Koichi Yasuda and Yoshihiro Kiyonaga / Yomiuri Shimbun Staff Writers

Nuclear power safety framework

After bills aimed at strengthening nuclear safety regulations were submitted to the Diet on Tuesday, the primary focus has now become how the government plans to ensure nuclear safety under a new framework.

Goshi Hosono, state minister in charge of nuclear policy and administration, backed the government's safety plans drawn up based on lessons from the crisis at the Fukushima No. 1 nuclear power plant.

"If we take people's stern opinions and international scrutiny into consideration, establishing a new safety framework is essential," Hosono said Tuesday. "This is a drastic reform."

The pair of bills includes one to overhaul the current nuclear safety scheme and another to create a nuclear safety investigation committee. Following criticism from home and abroad that the current nuclear watchdog--the Nuclear and Industrial Safety Agency--operates under the Economy, Trade and Industry Ministry that promotes nuclear power, the government plans to launch on April 1 a new nuclear regulatory agency as an external body under the Environment Ministry.

The thrust of the bills is that they legally oblige utilities to take safety precautions and measures to handle a severe accident and allow the government to be more involved in ensuring nuclear safety. Currently, utility firms implement safety measures on their own.

The government's move to revamp the nuclear safety framework came mainly as a result of Tokyo Electric Power Co.'s underestimating the threat of a devastating tsunami and its overconfidence that a serious nuclear accident would not take place. As such factors worsened the situation at Fukushima, the government has apparently concluded that nuclear safety cannot be ensured if such matters are left to the utilities.

The three pillars of the two-bill package are implementing measures against serious nuclear accidents; setting up a so-called backfit system; and setting a 40-year cap on the operation of nuclear reactors. The new laws will restrict power utilities' property rights and business operations to some extent.

The bills oblige utilities to take safety measures, such as installing backup power in preparation for a situation in which a reactor is damaged or other serious nuclear accidents occur, and ensuring a sufficient cooling system.

The backfit system will reflect new safety measures on existing nuclear plants based on the latest expert research on earthquakes and tsunami. The bills stipulate the government can order utilities to halt, revamp or fix their operations if sufficient safety steps are not taken.

Legislating for the first time the life span of nuclear reactors, the government has set the maximum period of operation at "40 years from the day [the reactor] passes an inspection."

University of Tokyo Prof. Hideaki Shiroyama, an expert in public administration, said: "The current law that regulates nuclear reactors centers primarily on preventing a nuclear crisis. So establishing new laws that incorporate measures to ensure public safety from radiation on the assumption that a nuclear accident occurs has great significance."

===

Bills likely to face rough going

The government wants the nuclear regulatory bills to become law by the end of March, but expected resistance from opposition parties could mean the bills are in for a rough ride, observers said.

The opposition parties are calling for revisions to the bills, particularly in regard to the independence of a planned nuclear regulatory agency and the life span of nuclear reactors.

The main opposition Liberal Democratic Party has not yet consolidated its position toward the bills because party members are split over the issue. Some LDP members oppose the government's plan to establish the regulatory agency as an external bureau of the Environment Ministry.

At an LDP meeting Jan. 20, a lawmaker argued against that plan, saying the new agency should be independent from the Environment Ministry because the ministry is not neutral.

New Komeito has not decided on its stance either, but the party favors bolstering regulatory measures. The name of the planned agency is said to have been proposed by the party, so the government and ruling parties are expected to step up efforts to persuade Komeito to support the bills.

Your Party, for its part, is calling for the establishment of an administrative commission empowered to introduce regulations and decide on personnel matters independently, in line with Article 3 of the National Government Organization Law. As a result, Your Party likely will oppose the government-proposed bills in the Diet.

Your Party Secretary General Kenji Eda told a news conference Tuesday that the planned regulatory agency should be "an administrative commission that is independent from the Cabinet, takes a fair and neutral position and can exercise strong authority over ministries and agencies."

Evacuated village to reopen from April

The Yomiuri Shimbun

FUKUSHIMA--The mayor of a village near the crippled Fukushima No. 1 nuclear power plant declared Tuesday that local authorities would return in April, and urged residents who have evacuated due to the nuclear crisis to come back.

Kawauchi Mayor Yuko Endo said public facilities, such as schools and clinics, will also resume services in the village.

This is the first time one of the nine municipalities that fell in the government-designated evacuation zones has declared it will return. Most of Kawauchi's 3,000 residents evacuated elsewhere in Fukushima Prefecture--or outside the prefecture--after the nuclear crisis erupted in March.

"I hope residents will return in two or three years," Endo said.

Starting this month, the Kawauchi government will survey residents about their thoughts on returning, and hold meetings with them. The village government will provide dosimeters to returning residents.

Endo plans to move the village government back to its original location on March 24 and 25, and to resume administrative operations in April.

The Kawauchi government office has temporarily been relocated to Koriyama in the prefecture. Many Kawauchi residents have been staying in temporary housing units in Koriyama, and some of the village's services will still be offered in the city even after April.

Kawauchi has been divided into two zones since the nuclear crisis began--the 20-kilometer no-entry zone around the crippled nuclear plant, and the former emergency evacuation preparation zone.

Initially, the mayor planned to declare the return after decontamination work had lowered radiation levels in the village to less than one millisievert a year. However, decontamination work has been delayed partly by heavy snowfall, and it is likely that only public facilities and houses of families with children will be decontaminated by the end of March.

The village government said radiation levels in many residential areas have fallen below one microsievert per hour.

In Tuesday's declaration, Endo accepted that some residents had concerns about returning to the village.

"Those who can return will return," he said. "Those who are still anxious can return after watching the situation for a while."

Although the designation of the emergency evacuation preparation zone was lifted in September, only slightly more than 200 residents have returned to the village.

Declaration 'just the beginning' / Mayor's plea for villagers to return to Kawauchi draws mixed reactions

The Yomiuri Shimbun

FUKUSHIMA--"The declaration to return home is just the beginning," said Yuko Endo, mayor of Kawauchi, Fukushima Prefecture, in a speech at a press conference encouraging residents who had evacuated amid the Fukushima No. 1 nuclear power plant crisis to return to the village.

The Kawauchi government will reopen the village office and schools in April to prepare for the residents' return. But a complete return of evacuees is problematic, as decontamination work is ongoing.

Parts of Kawauchi fall within the nuclear plant's 20-kilometer no-entry zone, and some residents are concerned about the village's decision. "We can't return home yet," one said.

Tsunehiro Takano, the village's fifth administrative district leader, attended the same press conference as Endo Tuesday at the Fukushima prefectural government's office. Takano, 62, is also chairman of all the administrative district leaders in the village.

"Only people who want to return to Kawauchi should do so and go first. It's important to prepare an environment acceptable to other residents. If nobody returns to the village, no one will end up [following the first returnees]," Takano emphasized.

"It is also our generation that should commit ourselves to decontamination work," he added.

But Norimoto Igari, Kawauchi's third administrative district leader, had a different view.

"Most of the residents, including me, don't want to return," the 68-year-old said.

His administrative district consists of many elderly people living alone.

"If stores don't reopen, elderly people without vehicles will face difficulties buying food," Igari warned.

Hiroichi Watanabe is the village's second administrative district leader and a rice farmer. The village government will order the village's farmers to refrain from planting rice this year.

"We farmers wonder what the point of hurriedly returning to Kawauchi is if we can't sell our rice," Watanabe said.

The answer is more straightforward for Nobuichi Kobayashi, leader of the eighth administrative district, which falls completely within the no-entry zone.

"We can't return," Kobayashi, 66, said.

The municipal government will build temporary housing units in Kawauchi for residents such as Kobayashi. However, according to Kobayashi, "Unless decontamination begins soon, the number of residents who refuse to return will increase."

===

Few kids want to return

Kawauchi has one nursery school, one primary school and one middle school. According to a survey by the village government, only 30 of 210 children want to return to school in Kawauchi from April.

Yoshinobu Ishii, the village schools' superintendent, said, "Even though the student numbers are few, we won't drop the level of our education."

The board of education intends to maintain a class for each grade instead of introducing composite classes comprising students from different grades.

It will also in April transfer the village-run cram school Kogakujuku from Koriyama, Fukushima Prefecture, to the village. Catering to students from the fifth grade of primary school to the third year of middle school, Kogakujuku was operating before the March 11 disaster.

According to the board of education, radiation levels in the Kawauchi Middle School yard dropped to 0.2 microsievert per hour in December, and 0.14 microsievert per hour at Kawauchi Primary School after decontamination had been carried out.

A 34-year-old woman living with her husband, 8-year-old daughter and 5-year-old son in a temporary housing unit in Koriyama after evacuating from her home in the no-entry zone, said: "Even though we can return, we'll have to live in temporary housing. It's difficult for us to return until all the decontamination has been completed."

Govt sticks to 40-year limit for nuclear reactor operations

The Yomiuri Shimbun

The proposed legal controls of nuclear power plants have many obscure elements in their basic reasoning and criteria.

One of these elements is whether setting an operation period limit of 40 years is reasonable.

Although the government has said the limit was decided on based on precedents set by the West, concrete data proving this has yet to be shown. There is also no convincing explanation about a provision that "allows for an extension of a plant's operations by a maximum of 20 years."

Some observers are also critical of a backfit system that would reflect the latest safety measures on nuclear power plants. They argue that the system could be a loophole in the new legislation and insist that the system will leave it unclear which party is subject to a suspension order.

Goshi Hosono, state minister in charge of nuclear power policy and administration, reiterated at a press conference Tuesday that in principle, any nuclear reactor cannot operate for more than 40 years.

Therefore, it is highly likely that the No. 1 reactor at Japan Atomic Power Co.'s Tsuruga power plant and the No. 1 reactor at Kansai Electric Co.'s Mihama power plant will be decommissioned as they have been operating for over 40 years.

However, details of the new system have yet to be decided. According to a Cabinet Secretariat official, concrete criteria will be "discussed by experts after the [new] nuclear regulatory agency is launched."

Prof. Shigeru Takahashi at Hitotsubashi University, a specialist in laws regulating science and technology, said: "Appropriate criteria is indispensable to securing safety. It's important to hear various opinions [in determining the criteria]. It's also necessary to open up the process."

Drawing up the new criteria and publicizing the laws is expected to take about 10 months. The new regulation system will likely start replacing the current one in February 2013.

Based on new laws, the agency's chief will be authorized to implement regulatory and control measures on nuclear power plants.

"Even if [the reactors] are regulated under the laws, what is ultimately important is which party will perform the task," said Tetsunari Iida, executive director of the Institute for Sustainable Energy Policies, an incorporated nonprofit organization. "The agency's independence will be ensured by choosing the most appropriate person who isn't afraid to say 'no' to both the government and power companies."

Hosono said at the press conference: "I'll choose the first head of the agency from the private sector. I have no intention of choosing a bureaucrat."

However, there are many things that still need to be accomplished before the new agency's inauguration on April 1.

===

KEPCO president bewildered

OSAKA--"I want [the government] to clarify their reasoning and the basis behind [the 40-year operating limit on nuclear reactors]," a bewildered KEPCO President Makoto Yagi said at a press conference Tuesday.

Of KEPCO's 11 nuclear power reactors, the No. 1 reactor at its Mihama plant already reached the 40-year limit in November 2010, but is still running. The plant's No. 2 reactor will reach the limit in July.

Yagi said: "If we, by any chance, apply for a limit extension [for reactors], we will need to go through some procedures and make technical preparations. So I hope [the government] will give us some transition time."

Restarting nuclear reactors faces opposition from local residents

February 01, 2012 - http://ajw.asahi.com/article/behind_news/politics/AJ201202010040

The central government is smoothing the way for restarting nuclear power reactors, but gaining the go-ahead from local officials and residents is anything but guaranteed.

The International Atomic Energy Agency said Jan. 31 that Japan's appraisal methods for stress tests conducted by electric power companies are generally appropriate, but **recommended improvements** in seven areas.

A 10-member IAEA delegation, which spent about a week in Japan, submitted an outline of its report to the Nuclear and Industrial Safety Agency.

"We received objective [??] advice from an international organization on our country's nuclear power regulation and evaluation, which has lost public confidence," nuclear accident minister Goshi Hosono said at a news conference.

The same day, the Cabinet submitted to the Diet a bill on nuclear safety reforms, which calls for the creation of a nuclear regulatory agency on April 1.

The new agency, under the Environment Ministry, would take over the authority for nuclear power regulation from the NISA and other government organizations.

The bill would limit the operational life of nuclear power reactors to 40 years in principle, extending it up to 20 years in exceptional cases.

The government hopes to restart by summer some of the nuclear power reactors currently shut down.

Prime Minister Yoshihiko Noda has said that if no reactors are restarted, and no effective countermeasures are taken, electricity supplies will fall about 10 percent short of demand this summer.

Officials hope that the IAEA's endorsement of the stress test appraisal methods and the new legislation on nuclear power regulation will help win consent from local officials and residents for restarting those reactors.

Only three of Japan's 54 nuclear power reactors are in operation because those shut down for regular maintenance cannot be restarted due to concerns following the disaster at the Fukushima No. 1 nuclear power plant.

The three on line will be shut down by the end of April.

The NISA will begin final appraisal of stress tests conducted by Kansai Electric Power Co. on the No. 3 and No. 4 reactors at the Oi nuclear power plant in Fukui Prefecture.

In its draft evaluation, the agency said the test results were appropriate.

A NISA official said the IAEA's recommendation for improvements will not affect the final appraisal of the stress tests for the two reactors.

The NISA will discuss the results of appraisal after hearing from experts on Feb. 8, and submit its report to the Nuclear Safety Commission of Japan.

The commission, which is under the jurisdiction of the Cabinet Office, will convene a meeting of 10 or so experts to discuss the results.

After the commission's evaluation, Noda, Hosono, Chief Cabinet Secretary Osamu Fujimura and industry minister Yukio Edano will decide whether the reactors can be restarted.

But gaining the approval of local officials and residents will be essential to the process.

Fukui prefectural government officials have said the stress tests are insufficient as conditions for restarting the nuclear reactors. They called on the central government to present new safety standards based on the accident at the Fukushima No. 1 plant, triggered by the Great East Japan Earthquake last March.

"Stress tests are computer simulations," Governor Issei Nishikawa said Jan. 11. "They are insufficient as a basis to judge whether reactors can be restarted."

"The government must establish provisional safety standards based on the lessons from the (Fukushima) accident and evaluate the safety of nuclear power plants."

Hirohiko Izumida, governor of Niigata Prefecture, which hosts Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant, has also said that stress tests are insufficient as conditions for restarting reactors.

"It is meaningless to conduct tests without examining what happened at the Fukushima No.1 plant," Izumida said.

Some of the measures included in the bill on nuclear safety reforms will not be implemented until summer 2013, because it will take up to 15 months to establish detailed standards.

Hiroshi Kawauchi, a Lower House member of the ruling Democratic Party of Japan, said the government should discuss the restart of reactors only after fundamental safety measures are put in place.

Views are also divided among Cabinet ministers.

Fujimura has said the government will judge whether reactors will be restarted as early as February, but Edano has been wary, asking, "Are we allowed to restart reactors while neglecting safety and security?"

Fukushima farmers furious over lack of consideration in decontamination subsidies

FUKUSHIMA -- Municipalities and farmers in Fukushima Prefecture are furious at the national government for ignoring the state of local farmland in extending subsidies for decontamination of areas tainted with radioactive substances.

"A huge machine like that can't enter my rice paddy," lamented a farmer who saw a large machine and a tractor during a demonstration of decontamination work at a rice paddy in Koori, Fukushima Prefecture, in mid-December last year.

The same month, the Environment Ministry worked out guidelines for decontamination, which stipulate that local municipalities should decontaminate areas tainted with radioactive substances from the crippled Fukushima No. 1 Nuclear Power Plant.

Under the guidelines, the national government can extend subsidies for decontamination, on condition that large machines equipped with special agricultural devices are used, that 30-45 centimeters of surface soil is replaced by subsoil, and that about 30 centimeters of surface soil is plowed. The ministry says airborne radiation dosages can be effectively reduced by doing so.

The Fukushima Municipal Government has worked out a specific plan to decontaminate all local farmland between this month and March next year in order to ensure the safety of agricultural products and prevent residents' external exposure to radiation. Shipments of rice grown in some areas of the city have been prohibited because radioactive cesium in excess of the provisional limit set by the national government has been detected.

However, the municipal government has deemed it difficult to replace thick layers of surface soil with subsoil or to plow large portions of farmland according to the guidelines, because most local farmland is divided into small plots and large machinery cannot enter such land. For the time being, the municipal government has decided to plow a layer of surface soil about 12 centimeters deep, using agricultural machinery that local farmers possess.

The national government has offered to extend subsidies to cover the costs of buying zeolite used to absorb radioactive substances only if the surface soil is replaced and plowed in accordance with the Environment Ministry guidelines.

The Fukushima Municipal Government is poised to demand that the central government subsidies cover the purchase of zeolite even if the requirements are not met, on the grounds that spraying zeolite over farmland can help reduce the contamination of agricultural products through radioactive cesium.

However, bureaucratic red tape has posed a stumbling block to such subsidies.

The Environment Ministry, which is aiming primarily to reduce airborne radiation, insists that reducing agricultural products' radiation levels is beyond its jurisdiction.

"Decontamination is aimed at preventing ordinary people's external exposure to radiation. We're aware of the need to prevent agricultural products from being contaminated with radiation, but it's outside our jurisdiction," a ministry official said.

The Agriculture, Forestry and Fisheries Ministry says it is experimenting with various decontamination methods, including those to be employed in small areas of farmland where large machinery cannot be used. If some of these methods prove effective, the ministry will urge the Environment Ministry to incorporate them in its guidelines.

One farmer in his 50s, who owns about 40 hectares of farmland, is furious at the national government for merely discussing plans decided on paper.

He said he was told by an agricultural equipment leasing company that it could lease heavy machinery to him on a contract no shorter than six years.

"It's difficult to introduce large machines such as those weighing six tons into my farmland, and it's also unrealistic even for those who have large areas of farmland to do so," the farmer said. "A desk-based plan that doesn't suit the actual state of farmland is meaningless."

Researchers produce device to create biofuel from contaminated lumber

Visiting professor Masaru Ichikawa stands by ethanol-making equipment at Tokyo University of Agriculture. (Mainichi)

A device that can decontaminate radioactive lumber and efficiently create bioethanol from it has been developed by researchers at Tokyo University of Agriculture.

Masaru Ichikawa, a visiting professor at the university who was involved in the development of the machine, touted its usefulness as irradiated lumber and sludge from Fukushima Prefecture continue to accumulate.

"It can kill two birds with one stone and make a positive out of this momentous disaster. I hope it contributes to revival efforts," he said.

In joint research with other universities, Ichikawa in 2009 developed a method of producing bioethanol from lumber and straw that proved more efficient than existing methods. After the lumber or straw is dried and pulverized, it is vaporized into carbon monoxide and hydrogen with water vapor whose temperature ranges between 800 and 1,000 degrees Celsius. A metal catalyst is then applied to produce ethanol with 97 percent purity.

With this method, around 500 kilograms of bioethanol can be produced per metric ton of source material -- four times more than through other methods -- providing hope for the production of low-cost bioethanol.

Ichikawa noted that radioactive cesium from a nuclear accident vaporizes at around 800 degrees Celsius. He improved production of bioethanol by introducing a filter to pick up cesium as the source

materials were being vaporized. In testing he confirmed that 99 percent of cesium was picked up by the filter. Next he wants to try the machine on actual contaminated lumber from Minamisoma, Fukushima Prefecture.

Ichikawa says that according to calculations, 10 kilograms worth of filters should be enough to process around 100,000 metric tons of lumber. Other materials that can be processed include sludge and leaves, neither of which are currently being decontaminated in Fukushima Prefecture. Furthermore, vast amounts of forest there are being left in a contaminated state.

"This technology could solve problems relating to radiation decontamination," says Ichikawa.

Chernobyl experts hopeful on Fukushima

Oleg Nasvit, principal expert of Ukraine's National Institute for Strategic Studies Environmental and Technogenic Safety Department, speaks during an interview with The Associated Press in Tokyo Thursday, Feb. 2, 2012. (AP Photo/Koji Sasahara)

TOKYO (AP) -- Ukrainian nuclear experts say Japanese evacuated from around the stricken Fukushima nuclear plant should be able to return to their homes - unlike the Chernobyl site, which remains inside a wide no-go zone a quarter-century after the accident there.

The public may eventually be able to visit the Fukushima Dai-ichi nuclear power plant, where three reactor cores melted after a tsunami last March 11 knocked out the cooling systems, Oleg Nasvit, a nuclear physicist and radiation expert at Kiev's National Institute for Strategic Studies, said in an interview with The Associated Press.

Ukrainian government officials Nasvit and Dmytro Bobro said a crucial lesson from the 1986 Chernobyl disaster is that the government needs to tell people the truth so that they can make informed decisions about their future.

"Residents can understand the consequences and make realistic decisions only based on accurate information," Bobro said on a visit to Japan to attend a seminar on the Fukushima crisis sponsored by the Japanese government.

Japanese authorities and regulators have been repeatedly criticized for how they handled information during the unfolding nuclear crisis. Officials initially denied that the reactors had melted down, and have been accused of playing down the health risks of exposure to radiation. An outside panel investigating the government response to the nuclear crisis has also called for more transparency in relaying information to the public.

After declaring that the Fukushima plant was stable in December, Japan has set guidelines that allow residents to return to areas with contamination levels below 20 millisieverts per year - about three CAT-scans - which it says is safe, although a further reduction is required.

More than 100,000 people were displaced from a 12-mile (20-kilometer) no-entry zone.

Any decision on whether to allow residents to return should be based on radiation dose levels rather than distance from the plant, Nasvit said.

"If people like to return and they will have a dose of less than 20 millisieverts per year, according to international standards this is possible," Nasvit said. "This is not about this circle of 20 kilometers but it is about the radiological situation. If this is from the radiological point of view permissible, why not return part of this territory to people?"

But further decontamination efforts are a must, he said.

This week, the chief of Kawauchi village, which straddles the exclusion zone around the Fukushima plant, told more than 2,500 residents that returning to areas of the town outside the no-go zone would be safe during an ongoing radioactive decontamination. Mayor Yuko Endo said offices, schools and other public facilities will reopen in April.

About one-third of Kawauchi village lies within the exclusion zone and remains off-limits. Many residents whose homes were outside the exclusion zone chose to move out of the town. They showed mixed reactions, split between their desire to return to their homes and a fear of the effects of radiation on their health, especially for children.

The Chernobyl accident on April 26, 1986, spewed a cloud of radioactive fallout over much of Europe and forced hundreds of thousands from their homes in heavily hit areas of Ukraine, Belarus and western Russia. It has left forests and farmland still contaminated, offering a warning to the Japanese of the potential long-term effects of their own disaster at the Fukushima Dai-ichi nuclear plant.

The Chernobyl accident fostered deep mistrust among many in the affected areas because Soviet leaders waited for days to tell people about the accident, evacuate them from contaminated areas and warn them how to reduce health risks.

The Chernobyl explosion released about 400 times more radiation than the U.S. atomic bomb dropped over Hiroshima. The U.N. World Health Organization said among the 600,000 people most heavily exposed to radiation at Chernobyl, 4,000 more cancer deaths than average are expected.

Japan's government has said that it will take up to 40 years to fully decommission the Fukushima plant, but it is unknown how long it will take to decontaminate the vicinity or how much longer soil, water, air and food sampling must continue.

It may be a long process, but the operator and the government should tackle the problem quickly, based on science, not emotion, the Ukrainian experts said.

"We should not pass the problem on to the next generation," Bobro said.

(Mainichi Japan) February 3, 2012

Japan asks IAEA nuclear crisis support network to add new category

TOKYO (Kyodo) -- Japan has proposed that an international support network for cooperation in responding to nuclear emergencies add the category of bringing an accident under control, sources familiar with the matter said Thursday.

The proposal for the International Atomic Energy Agency's Response Assistance Network was made at an IAEA meeting held in Austria from Tuesday through Thursday, the sources said.

The RANET, with which member nations register their institutions capable of providing support for addressing nuclear emergencies, currently has seven categories such as radiation measurement, environmental contamination research and decontamination.

If the Japanese proposal is accepted, member nations will work together to settle a nuclear accident by providing necessary equipment.

Japan made the proposal in the wake of the nuclear accident at the Fukushima Daiichi power plant crippled by the March 11, 2011 earthquake and tsunami disaster.

RANET, which was founded in 2005 and has 19 members including Japan, the United States and France, will decide whether to accept the proposal before the IAEA's annual meeting to be held possibly in September.

(Mainichi Japan) February 3, 2012

Indictment of contractors exposes illicit work at nuke plants

FUKUOKA -- Three people and two firms were indicted Feb. 2 on charges of dispatching a worker to the Oi Nuclear Power Plant in Fukui Prefecture under a falsified contract in violation of the Employment Security Law.

Those indicted by the Kokura Local Public Prosecutors Office are Hideo Ichise, 58, of Tsuruga, Fukui Prefecture, Yoshimi Tomita, 59, of Maizuru, Kyoto Prefecture, and Kanae Ikegami, 36, of Kitakyushu's Wakamatsu Ward. Prosecutors also indicted Taihei Dengyo Kaisha Ltd., a Tokyo-based power plant construction and maintenance firm, and Takada Kiko, a plumbing firm in Takahama, Fukui Prefecture.

The Kokura Summary Court on Feb. 2 fined Ichise and Tomita and the two firms 500,000 yen each and Ikegami 250,000 yen. Ichise is the Fukui business manager of Taihei Dengyo, and he previously served as the firm's Oi operation chief. Tomita is president of Takada Kiko while Ikegami is an executive of Dream, previously known as Soshin Kogyo, a plumbing and housing equipment firm. She is also the wife of a gang leader with ties to the Kitakyushu-based crime syndicate Kudo-kai.

"Many documents showing illegal labor were found, one after another, during our search. They proved **many years of shady deals**," says a senior officer with the Fukuoka Prefectural Police. **The case sheds light on not just one firm or one nuclear power plant but the nuclear power industry as a whole.**

Sixty-one-year-old Masaki Yoshimura (pseudonym) in Kitakyushu was dispatched to many nuclear power plants in Japan while working for a construction company for a period of 14 years that ended seven years ago. There were many companies involved in his work between his employer and general contractors such as nuclear power plant manufacturers. One of those companies was Taihei Dengyo.

Repairing plumbing was the main part of his job, but instructions came from different companies depending on which nuclear power plants he was working at. Electric power companies, operators of nuclear power plants, paid general contractors a daily pay of 100,000 yen, but Yoshimura got only 18,000 yen. More than 80 percent of his daily wage was siphoned off.

"It's the world of siphoning off. It's a system in which big companies make money handsomely," he says.

The nuclear job scandal involving Taihei Dengyo uncovered the fact that **illegal labor supports nuclear power businesses**. **Fake contracts and unlicensed dispatches of workers are peppered with acts of siphoning off pay.** These practices have put laborers in an unstable position and invited crime syndicates' involvement.

"The Geiger counters quickly sound, so you can't work for so long. Fifty to 100 people have to work together. People at the bottom of society are there," Yoshimura says.

Radiation zones are divided into a scale from A to D, and workers assigned to D, the highest radiation zone, have to wear protective gear and layers of gloves. "Competent workers brought with them other workers' Geiger counters so they would not to exceed the dosage limits and to improve their work efficiency," Yoshimura said.

Stopping a nuclear reactor for just one day reportedly results in a loss to the owner of 100 million yen. A retired electric power company official says, "Electric power companies have repeatedly requested shorter inspections. But **to shorten checks without changing the number of items to inspect, you have to either cut corners or force workers to work throughout the night,**" he says.

According to the Japan Nuclear Energy Safety Organization, **about 90 percent of some 83,000 nuclear power plant workers who were exposed to radiation in fiscal 2009 were not employed directly by nuclear power plant operators. Their average radiation dosage was 3.6 times the level suffered by employees of those operators.**

The Committee on Poverty of the Japan Federation of Bar Associations last year conducted a survey of nuclear power plant workers. Lawyer Tatsuo Watanabe, a member of the committee, says, "From an ethical point of view, we should check unlawful labor at nuclear power plants that is being done for economical reasons."

More than 1,000 workers are necessary for a regular inspection of a nuclear reactor, but postings for these jobs do not show up at job-placement offices. Most part-time nuclear workers find employment through personal connections and introductions. A labor bureau official says: "(The connections) are extra careful to not hurt the electric power companies. Those with strong personal connections have strong solidarity and are tightlipped. They are in a world of their own."

(Mainichi Japan) February 3, 2012

Safety checks to begin at Fukushima Daiichi plant

Japan's nuclear safety agency will begin inspecting the Fukushima Daiichi nuclear plant from Monday to see if it can safely remain in a state of cold shutdown.

Officials from the Nuclear and Industrial Safety Agency plan to check equipment and contingency preparations by examining manuals and interviewing workers during their three-week inspections.

Among the seven types of equipment to be checked is a reactor cooling system that recycles decontaminated water from the facility.

Another is a nitrogen-injection system to prevent hydrogen explosions within the disabled reactors.

Agency officials say they will open the onsite inspections to the media. The checks will be the first safety tests required under law since the March 11th accident.

The government declared on December 16th that the Fukushima Daiichi reactors had achieved a state of cold shutdown.

This means reactor temperatures have stabilized below 100 degrees Celsius, and the release of radioactive substances has been contained.

Friday, February 03, 2012 18:02 +0900 (JST)

Falsified labor deals rampant at Japan's nuke plants, says suspect

A power plant construction and maintenance firm has falsified worker contracts for temporary labor at nuclear plants across Japan for years, according to statements by one of the company's employees charged with involvement in the fraudulent agreements.

Hideo Ichise, 58, and two other people were indicted on Feb. 2 for the dispatch of a worker to the Oi nuclear plant in Fukui Prefecture under a false contract, a violation of the Employment Security Law. Ichise's employer Taihei Dengyo Kaisha Ltd. -- where he now serves as business manager after a stint as the firm's Oi operations chief -- along with Fukui Prefecture-based plumbing company Takada Kiko were also charged.

Investigators have discovered a dossier on falsified worker contracts at more than 30 Taihei Dengyo branches, further suggesting the firm has been involved in illicit labor deals involving nuclear power plants across the country.

Police have furthermore discovered cases of various personnel agencies siphoning off the wages of temporary workers at nuclear plants, while involvement of the Kitakyushu-based crime syndicate Kudo-kai has also been uncovered.

According to investigative sources, Ichise said, "We have participated in (illicit nuclear labor practices at the Oi plant) for many years. We have been doing the same thing at other nuclear power plants."

Taihei Dengyo's operating officer was also quoted as telling police, "Our company alone cannot hire many workers, so we (falsified labor contracts) knowing it was illegal."

Other sources involved in work at nuclear power plants have provided similar information, including one Saga Prefecture man in his 50s who worked at the Genkai Nuclear Power Plant there during regular inspections about three years ago. He was dispatched to a construction company by a temp agent called simply "boss." Although there was ostensibly a contract with the construction company and the man worked directly under a construction company employee, "boss" apparently took 5,000 yen out of his 13,000-yen daily wage.

A year earlier, the Saga man had also worked at the Genkai plant during a regular check as an employee of an electrical firm for about two months. A fellow worker in his 50s had to take more than two weeks off after injuring his ankle at the plant but had to pay his own medical bills.

In this case, the Saga man worked under the guise of the electrical firm. "There were gangsters among those bosses, and sometimes two bosses raked off my wages," the Saga man recalls.

A temporary personnel agency operator says, "Parent companies send us requests for a certain number of workers, and we submit a list of people who then go and work under those parent companies at nuclear power plants. We give the workers their wages after deducting our share." Another agent told the Mainichi, "There are times when gangsters are involved in recruiting workers. It is easy for us to hire them because they save us the trouble."

It is not clear why such unlawful labor practices have been overlooked. An inspector at a labor standards office stated, "It is very difficult to get a full picture of the labor practices at nuclear power plants because corporate parent-subsidary relations change depending on their line of work. It is also

difficult to conduct surprise on-site inspections of nuclear power plants because advance notification is necessary as part of antiterrorism measures."

Economy, Trade and Industry Minister Yukio Edano instructed electric power companies to abide by the law and bar crime syndicates from involvement in work at nuclear power plants. However Takayoshi Yoroi, a professor emeritus of labor law at Ryukoku University, says, "Falsified labor contracts have been rampant for so long. If the government is dead serious about stamping them out, nuclear power plants will stop running. Power companies and general contractors simply have to directly hire workers, but I wonder if they have the determination to do so."

Plowing technique to fight spread of radiation demonstrated

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na010000c.htm>

IWAKI, Fukushima -- A plowing technique being considered to fight the spread of radiation was demonstrated here on Feb. 2, though some farmers on hand were disappointed.

In the demonstration, four large machines dug up earth from around 30 centimeters deep to replace potentially contaminated topsoil and reduce the amount of radiation crops absorb from it.

According to a prefectural official, radiation readings in the field were 0.3 to 0.42 microsieverts on Feb. 1, and 0.23 to 0.3 microsieverts after the plowing. "There was an effect," the official said.

Around 150 people including local farmers gathered to watch the demonstration. Some farmers complained, however, that "expensive machines are necessary" for the plowing technique, and that an overall decontamination plan for the city's fields has still not been decided on.

More leaks found at crippled Japan nuclear plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2g00m0dm015000c.html>

This photo provided by and annotated by Tokyo Electric Power Co. (TEPCO) shows where radioactive water leaked from the tank of a decontamination device at the tsunami-crippled Fukushima Dai-ichi nuclear power plant in Okuma town, Fukushima prefecture, north of Tokyo, Friday, Feb. 3, 2012. (AP Photo/Tokyo Electric Power Co.)

TOKYO (AP) -- Leaks of radioactive water have become more frequent at Japan's crippled nuclear power plant less than two months after it was declared basically stable.

The problem underlines the continuing challenges facing Tokyo Electric Power Co. as it attempts to keep the Fukushima Dai-ichi nuclear plant under control. A massive earthquake and tsunami badly damaged the plant last March, resulting in the melting of three reactor cores.

Workers spotted a leak Friday at a water reprocessing unit which released enough beta rays to cause radiation sickness, TEPCO spokesman Junichi Matsumoto said. He said no one was injured and the leak stopped after bolts were tightened on a tank.

Matsumoto said TEPCO also found that 8.5 tons of radioactive water had leaked earlier in the week after a pipe became detached at Unit 4, one of the plant's six reactors. The company earlier had estimated that only a few gallons (liters) had leaked.

He said officials are investigating the cause of that leak, but that it was unlikely the pipe had been loosened by the many aftershocks that have hit the plant.

The structural integrity of the damaged Unit 4 reactor building has long been a major concern among experts because a collapse of its spent fuel cooling pool could cause a disaster worse than the three reactor meltdowns.

Cold winter weather has also caused water inside pipes to freeze elsewhere at the plant, resulting in leaks in at least 30 locations since late January, Matsumoto said.

Officials have not detected any signs of radioactive water from the leaks reaching the surrounding ocean. Sandbag walls have been built around problem areas as a precaution.

More than 100,000 people around the plant fled their homes after the disaster due to radiation fears.

The government announced in December that the plant had reached "a cold shutdown condition" and is now essentially stable.

On Monday, six inspectors from the government's Nuclear and Industrial Safety Agency will begin an inspection of the plant to ensure its continued stability. They will study the reactors' cooling functions and measures to prevent explosions and nuclear chain reactions, among other steps to keep the plant under control, officials said.

US univ. to monitor wildlife in Fukushima

A US research team will conduct a long-term study on the impact of radiation exposure on wild animals and plants around the Fukushima Daiichi nuclear power plant.

The team from University of South Carolina, led by Professor Timothy Mousseau, will begin the study in Fukushima Prefecture and other areas of Japan in May.

The team has been studying the impact of radioactive fallout from the Chernobyl nuclear accident on wildlife around the plant for more than 13 years.

Its study shows a decrease in the number of birds and insects, as well as abnormalities in animals even in areas with low radiation levels of one to 3 microsieverts per hour.

The team says long-term research is likely to shed light on the impact of low-level radiation from the Fukushima accident on wildlife and that it hopes to cooperate with Japanese researchers.

Professor Mousseau will visit Fukushima later this month in preparation for the study. He says generational change of animals, such as birds, is quicker than that of humans and will provide clues to the impact of radiation on human genes.

Govt eyes relaxation of rules on construction of renewable energy plants

The Yomiuri Shimbun

The government is considering relaxing regulations on building solar power plants and other renewable energy facilities to promote their use in the country, according to government sources.

A Government Revitalization Unit subpanel tasked with discussing deregulation and system reforms intends to exempt solar power generation plants from acreage restrictions in the Factory Location Law.

The subpanel, chaired by Sumitomo Corp. Chairman Motoyuki Oka, has drawn up a plan to relax regulations in 183 energy-related fields. The Government Revitalization Unit is chaired by Prime Minister Yoshihiko Noda.

The reform plan would make it easier to build and promote large-scale solar power generation facilities, known as megasolar plants.

The government intends to approve the plan at a Cabinet meeting by the end of March and take necessary legislative measures, the sources said.

The subpanel has discussed deregulatory measures for encouraging the use of renewable energy since September last year, amid concerns of a prolonged power shortage in the wake of the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

The deregulation plan covers solar, geothermal and wind power, as well as other renewable energy sources.

The government hopes the measures will encourage the private sector to enter the renewable energy business and help boost the country's economy.

Currently, the Factory Location Law requires parties wishing to build a solar power plant to submit the plan to relevant local governments if the land on which it is built is more than 9,000 square meters or the facility is greater than 3,000 square meters.

The law also limits the size of a power plant to 50 percent of its land acreage. For instance, a facility built on 9,000 square meters of land should not exceed 4,500 square meters.

If solar plants are exempted from the rules, it would be possible to build larger plants and thereby generate power more efficiently.

Concerning geothermal and wind power generation, the government plans to relax regulations in the Natural Parks Law that restrict the building of renewable energy plants in national parks and quasi-national parks.

Such parks, with their rich natural environment, are seen as suitable sites for geothermal and wind power generation.

The government plans to allow for the construction of power plants in such parks if certain conditions are met.

Concerning hydroelectric power generation, the government intends to relax regulations in the River Law that restrict water intake, to increase the number of small-scale hydroelectric power plants. It also plans to simplify procedures for obtaining water usage rights.

The government also plans to review regulations on the specifications and procurement of next-generation smart meters--which are said to increase energy efficiency--to promote their widespread use.

Survey: 2.3% of farmers produce rice above cesium safety standard

February 04, 2012 - http://ajw.asahi.com/article/0311disaster/life_and_death/AJ201202040050

About 2.3 percent of farmers in Fukushima Prefecture yielded rice with radioactive cesium levels exceeding the government's new safety standard, according to prefectural government officials.

The new standard of 100 becquerels per kilogram will take effect in April, replacing the provisional standard of 500 becquerels per kg.

The results of the Fukushima prefectural government's emergency survey, released on Feb. 3, will be used by the central government to decide on areas where farming will be banned this year.

But farmers in areas around the crippled Fukushima No. 1 nuclear power plant are growing impatient with the central government's indecision on the matter. They are also worried that no one will buy their produce over fears of radiation contamination.

According to the survey, which covered about 23,000 rice-growing households in 29 cities, towns and villages, contamination levels exceeded the new standard in rice grown by 545 farmers in 12 municipalities, many of them in northern Fukushima Prefecture.

The survey also showed rice cultivated by 38 farmers in three cities had readings above 500 becquerels per kg.

Radiation levels in rice grown by 84.3 percent of farmers were below measurable limits, according to the survey.

The prefecture conducted the survey after radioactive cesium levels higher than the provisional standard were found in rice grown in the Onami district of Fukushima, the prefectural capital, in November.

The central government said it will prohibit the planting of seeds in areas that are heavily contaminated. But it has not decided which areas should face such restrictions under the new standard.

Agriculture minister Michihiko Kano said in a news conference on Feb. 3 that the government should not impose limits on planting.

"We should respect the feelings of farmers," he said.

A farm ministry official also said the decision for this year would be extremely tough because the lines marking sections under restriction must be drawn within areas where contamination levels are publicized.

The government banned planting last year in areas from where residents had evacuated. But officials at municipalities have already announced plans to go ahead with planting this year, even in areas where contamination levels have exceeded the new limit.

The prefectural chapter of Japan Agricultural Co-operatives is seeking permission to plant in sections of areas where this year's rice crop will likely clear the new safety standard. The chapter said rice paddies will be decontaminated and other measures taken before the planting starts.

The JA group is expected to forbid planting in areas where radiation levels are expected to remain above the safety limit.

In addition, the Fukushima city government is calling on the central government to permit the planting of rice crops that will be used for purposes other than for food.

"If farmers are not allowed to grow rice (this year), it will reduce their willingness to produce," an official in the city's agriculture section said. "Rice fields will also become run-down."

The city governments of Date and Motomiya have already said they will allow farmers to grow rice, in principle, while requiring decontamination of their rice paddies.

However, decontamination work could cause a new problem for the farmers, according to local officials.

"If rice fields are dug up too deeply, they may not be fit for growing the crop with too many rocks turning up," an official said.

The heavily contaminated village of Kawauchi, meanwhile, said it will not allow any planting.

Rice farmers are divided.

A 58-year-old farmer in Date said contamination levels found in his rice were up to slightly more than 100 becquerels per kg under the survey.

He has already ordered seeds and fertilizers for his rice crops this year.

"Unless I can plant this year, my rice paddies will be overrun with weeds," he said. "The fields would not be restored to the original condition for five or 10 years."

He said he is frustrated by the lack of any long-term perspective by authorities over his livelihood.

"Is (the restriction) for just this year or for many more years?" he said. "It would mean a lifetime if the restriction is put in place until there is no more cesium contamination."

Saburo Watanabe, a farmer in Aizubange, where all rice crops were found to be safe, said planting should be banned in areas where contamination levels exceed the new safety standard. He said the image of rice grown in Fukushima Prefecture must be protected.

“Consumers tend to think all rice crops from Fukushima Prefecture are the same,” said Watanabe, 58, who cultivates rice in a 12-hectare field.

He said most of his rice from last year remained unsold.

A 56-year-old farmer in Nihonmatsu said, “I want to grow rice, but we will be in trouble with unsold rice if we push for it and face another bad result.”

The rice in his district in Nihonmatsu was found with contamination levels above the new limit.

573 deaths 'related to nuclear crisis'

The Yomiuri Shimbun

A total of 573 deaths have been certified as "disaster-related" by 13 municipalities affected by the crisis at the crippled Fukushima No. 1 nuclear power plant, according to a Yomiuri Shimbun survey.

This number could rise because certification for 29 people remains pending while further checks are conducted.

The 13 municipalities are three cities--Minami-Soma, Tamura and Iwaki--eight towns and villages in Futaba County--Namie, Futaba, Okuma, Tomioka, Naraha, Hirono, Katsurao and Kawauchi--and Kawamata and Iitate, all in Fukushima Prefecture.

These municipalities are in the no-entry, emergency evacuation preparation or expanded evacuation zones around the nuclear plant, which suffered meltdowns soon after the March 11 disaster.

A disaster-related death certificate is issued when a death is not directly caused by a tragedy, but by fatigue or the aggravation of a chronic disease due to the disaster. If a municipality certifies the cause of death is directly associated to a disaster, a condolence grant is paid to the victim's family. If the person was a breadwinner, 5 million yen is paid.

Applications for certification have been filed for 748 people, and 634 of them have been cleared to undergo screening.

Of the 634, 573 deaths were certified as disaster-related, 28 applications were rejected, four cases had to reapply because of flawed paperwork, and 29 remain pending.

In Minami-Soma, a screening panel of doctors, lawyers and other experts examined 251 applications and approved 234 of them. The panel judged two deaths were not eligible for certification and 15 were put on hold.

"During our examination of the applications, we gave emphasis to the conditions at evacuation sites and how they spent their days before they died," a city government official said. "However, the screening process was difficult in cases when people had stayed in evacuation facilities for an extended time and when there was little evidence of where they had been taking shelter."

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](http://www.japantimes.co.jp/text/nn20120208f1.html) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that the situation is far from resolved and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the spent fuel pools sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the fuel pool is now directly exposed to the outside environment after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.

Making matters worse, the government doesn't have any place to permanently store it, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, the simulation was "so shocking" that top government officials decided to keep the paper secret by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

Edano key person in Japan's nuclear future, but keeps true intentions hidden 5 ?

<http://mdn.mainichi.jp/perspectives/news/20120206p2a00m0na002000c.html>

Economy, Trade and Industry Minister Yukio Edano recently revealed in a magazine interview that the prime minister for whom he holds the highest regard is Kantaro Suzuki. I found the mention of a taciturn, sage-like military chancellor by an eloquent lawyer-turned-minister striking.

Suzuki was the prime minister of Japan when it surrendered to end World War II. He was the one who brought the war to a close. So what will Edano end?

"Modernity," he promptly responded when I posed the question to him last weekend.

And what did he mean by "modernity"?

"A society of standardized mass production."

Was that the same as bringing nuclear power to an end?

"Nuclear power is not (our biggest challenge). Rather, energy conservation is."

The aforementioned interview spanned 20 pages in the most recent issue of the magazine G2, and addressed a wide range of topics -- including disillusionment with regime change, energy policy, the Constitution, and Democratic Party of Japan (DPJ) bigwig Ichiro Ozawa. The common thread throughout the entire interview, however, was "the abandonment of modernity." As the interviewer, Katsuyuki Yakushiji, a professor of sociology at Toyo University and a former chief editor of the Asahi Shimbun's political news section, challenged Edano on his highly conceptual remarks.

"So what do you mean by modernization?" Yakushiji asked.

Edano answered: "The economic development process in which we achieve affluence by selling products to other countries."

"Are the things that the DPJ views as problematic, including the widening gap between the rich and the poor and rising unemployment, signs of the contradictions arising (from continued modernization)?" Yakushiji pushed further.

"Countries that have achieved modernity are chased by countries who are newly reaching modernity. When these modern countries try to compete on the same footing as up-and-coming countries, their societies deteriorate. What (former Prime Minister Junichiro) Koizumi did was just that. I think such issues need to be overcome through the creation of a 'postmodern' social system."

Though Suzuki and Edano may seem to have nothing in common at first glance, their similarities become clearer when one focuses on a certain characteristic: they're both key figures in deciding national policy whose real intentions are difficult to read.

Suzuki became prime minister in April 1945, nearing the end of World War II. Cabinet members comprised military and "pro-peace" factions, and the legend goes that Suzuki, a former naval officer, did not reveal his true intentions. Instead, he committed himself to saving the face of those pushing for more fighting, while artfully leading the way to peace.

How about Edano? When it comes down to it, is he for nuclear power, or against it? People on both sides are desperately trying to figure out what lies in the minister's heart of hearts.

Of Japan's 54 nuclear reactors, only three are now running. If they, too, undergo scheduled inspections, all 54 will be out of operation by late April, with no prospects of restarting. Edano had been expected to pour his efforts into talking local municipalities into giving the go-ahead for the restarts, but in a newspaper interview published on Jan. 27, he suggested that Japan would get by fine without nuclear power.

At a press conference on Jan. 18, Edano also made the comment: "Emotionally, I lean toward the notion that we should be as cautious as possible regarding the resumption of operations (of nuclear reactors)." This is the same person, however, who has given his permission to the export of Japan's nuclear technology, and stands by the government's new growth strategy under which the exports will be carried out.

Edano and the DPJ are at the center of contradiction and chaos. Pressed about this, he responded: "The Meiji Restoration was also a time of confusion. Turbulent times themselves are not a problem. What's important is whether our actions lead to the construction of a new era."

It was in explaining to his interviewer that he is currently not aiming to become prime minister that Edano mentioned Suzuki. Suzuki only agreed to take the helm of the Cabinet at the recommendation of the Emperor's advisers and coaxing from the Emperor himself.

"People sought out by the specific era should become prime minister," Edano said. "They are the ones who accomplish great things."

Will this era be calling on Edano? (By Takao Yamada, Expert Senior Writer)

Temperature rises at Fukushima No.2 reactor

The operator of the Fukushima Daiichi nuclear plant says the temperature in the No.2 reactor remains high despite the injection of additional water.

A thermometer at the bottom of the reactor showed 73.3 degrees Celsius on Monday morning. It was **around 45 degrees on January 27th and 71.7 degrees at 4 PM on Sunday.**

Tokyo Electric Power Company began injecting 10.6 tons of water per hour from around 1:30 AM on Monday. **That's one ton more per hour than before.**

The utility says 2 other thermometers placed at the bottom of the reactor have been giving readings of about 44 degrees.

It says the flow of water in the reactor may have changed after plumbing work, causing difficulties in cooling the nuclear fuel.

In December last year, the government and TEPCO declared the 3 reactors at the Fukushima Daiichi plant had been successfully put into a state of cold shutdown as their temperatures had fallen below 100 degrees. But the situation inside the reactors remains unknown.

TEPCO says the regulations set after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

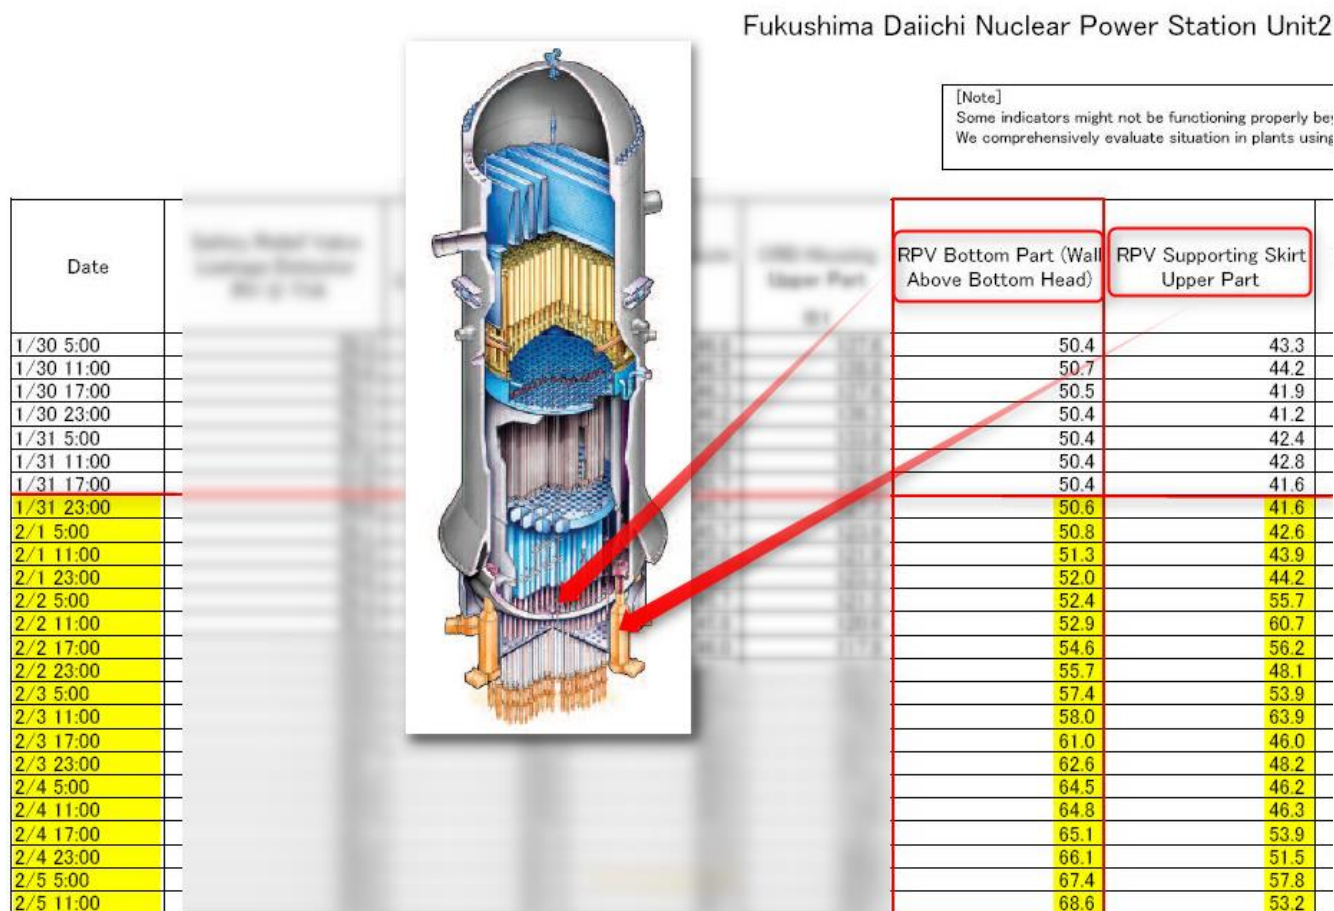

So it says the No.2 reactor is still in the state of cold shutdown.

Fukushima : la température de l'ex-unité n°. 2 en nette hausse - autant pour l'arrêt à froid"

<http://www.gen4.fr/blog/2012/02/fukushima-la-temp%C3%A9rature-de-lex-unit%C3%A9-n-2-en-nette-hausse-autant-pour-larr%C3%AAt-%C3%A0-froid-1.html>

Plusieurs capteurs de température signalent une augmentation importante et récente de température dans le bas de l'ex-réacteur n°. 2

Les températures des capteurs *RPV Bottom Part* et *RPV Supporting Skirt* dont les emplacements sont indiqués ci-dessus indiquent une augmentation constante de la température mesurée en ces points **depuis très précisément le 31 janvier à 2300I** (I=JST=heure de Tokyo). Les températures relevées sont passées respectivement de 50.4 à 68.6° C (+36%) et de 41.6 à 53.2°C (+28%).

Il va être difficile à l'opérateur d'utiliser une nouvelle fois la vieille astuce du "capteur déficient" (*CRD Housing Upper Part*) sur ce coup-là puisque les informations reprises par 2 capteurs différents et proches convergent. Comme d'habitude, **Tepco ne sait pas trop ce qui peut bien se passer à l'intérieur de ce machin et essaye juste de tourner un robinet pour voir si "ça donne"**. Voilà une approche aussi scientifique que celle de la poule tombant sur un miroir et admirant son reflet en s'exclamant : "Que cet objet est beau !"

Je vous fais grâce du communiqué de Tepco qui est aussi précis qu'une localisation de flaque de corium égarée ; sachez simplement que l'accroissement de la température leur semble arithmétique et non géométrique, ce qui apparemment les rassure **mais nous, pas trop**.

Il semblerait que, de l'avis de certains employés Tepco intervenant sur le site, la situation de l'unité n°. 2 soit actuellement encore plus préoccupante que celle de l'unité n°. 4 que nous avons évoquée dans un billet hier.

Arrêt à froid, qu'ils disaient ?

EDIT du 6/2 : La température affichée par le capteur RPV/BP continue à augmenter malgré l'augmentation de 1m3/h d'eau "injectée". La température affichée est de 73.3°C à 0700I (source : <http://www3.nhk.or.jp/news/genpatsu-fukushima/20120206/index.html>, japonais)

Govt to create more decontamination bases **2 ?**

http://www3.nhk.or.jp/daily/english/20120206_11.html

The Environment Ministry plans to decontaminate more public facilities in Fukushima Prefecture to use them as bases for cleaning up radioactive substances.

The government wants to decontaminate no-entry and evacuation zones around the damaged Fukushima Daiichi plant. It hopes to create a safe environment so that residents can return to the area.

The ministry has designated 16 facilities, including schools and assembly halls, as bases for decontamination. Four municipal offices were cleaned up in December.

The operation is to be completed next month.

The government plans to begin radiation monitoring in these zones in a few months, and begin the decontamination process this summer.

Kyushu men sent to Fukushima nuke plant under falsified labor deals

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na013000c.html>

As efforts to tame the crisis at the Fukushima No. 1 nuclear plant continue, laborers from as far as Kyushu have been dispatched there under illegal labor deals and forced to work inside at least one of the crippled plant's highly contaminated reactor buildings.

A man in his 40s from Nagasaki Prefecture recently related how he carried lead sheets weighing some 20 kilograms each up as high as the sixth floor of one building. A Geiger counter dangling from his neck sounded noisily and his mask misted over as temperatures climbed above 30 degrees Celsius.

"I was really angry because I was treated like a slave," Yosuke Nakayama, a pseudonym, said of his some 40 days at the Fukushima plant, starting in July last year.

The lead sheets were installed inside the plant's No. 1 reactor building to block radiation. Nakayama, however, was not angry about the hard work, but about the treatment he received upon returning home to Nagasaki.

He said he was paid 11,000 yen per day he worked for a company six layers down in a seven-layer outsourcing pyramid, with only the top-tier firm receiving orders directly from plant operator Tokyo Electric Power Co. He had been promised 14,000 yen per day, and had also been assured he would not have to enter the reactor buildings.

When Nakayama demanded an explanation for the 3,000 yen difference, his subcontractor mentioned the name of a Fukuoka-based crime syndicate.

"We don't care if yakuza show up," the contractor said, apparently threatening him.

A third-tier company to which Nakayama's employer dispatched laborers via two other firms has been slapped with administrative punishments twice for its ties to crime syndicates.

Contacted by the Mainichi, Nakayama's employer acknowledged the dispatch of workers without a license. "We received about 13,000 yen from a fifth-tier firm and we'd lose money unless we deduct expenses," the company said.

Businesspeople familiar with the Kyushu Electric Power Co.'s Genkai Nuclear Power Plant in Saga Prefecture say a significant number of laborers have been sent to Fukushima.

A utility work firm in Saga has been recruiting laborers from across Kyushu since last December, ostensibly for work at nuclear plants in Kyushu and Shikoku. The names of about 20 laborers are written on the firm's white board, along with their destination: "Fukushima No. 1."

An executive of the firm says it started sending laborers to Fukushima in response to requests from its business partners. "People from Kyushu are in demand because they're serious. We will send them again if requested."

A Saga man in his 30s did a job similar to Nakayama's at the Fukushima plant after being dispatched from a seventh-tier firm. He contacted the company after seeing a posting at a job-placement office and got the Fukushima job.

He received about 300,000 yen for some 40 days of work, and absorbed a radiation dose of some 10 millisieverts. "There are no jobs in my hometown, so it can't be helped," he says, adding he is waiting for another Fukushima assignment.

Nobel Prize winner Oe stresses Japan's ethical responsibility for ending nuclear program

<http://mdn.mainichi.jp/mdnnews/news/20120208p2a00m0na011000c.html>

Kenzabu Oe, Nobel Prize laureate in literature, said Feb. 8 that Japan has an "ethical responsibility" for abandoning nuclear power in the aftermath of the Fukushima nuclear disaster, just as the country renounced war under the postwar Constitution.

During a press conference at the Foreign Correspondents' Club of Japan (FCCJ), Oe called for an immediate end to nuclear power generation and warned that Japan would suffer another nuclear catastrophe if it tries to resume nuclear power plant operations. "It's important to make a decision now" to abandon nuclear power, he said.

Satoshi Kamata, the founder of the "Sayonara Nuclear Power Plants" campaign, said at the press conference with Oe and Keiko Ochiai -- author, radio personality, and founder and manager of the Crayon House bookstores for children -- that they and other members of the initiative will hold rallies in Tokyo, Niigata, Matsue, Shizuoka, Matsuyama, Sapporo and Saga on Feb. 11 to protest against restarting nuclear reactors.

Kamata, a freelance journalist who has covered the nation's nuclear industry extensively and been a leading critic of Japan's "nuclear village" establishment, said his group will deliver a petition to local governments hosting nuclear plants or located near them to help pursue a society not dependent on nuclear energy.

"What has become clear from the Fukushima nuclear disaster and later developments is this hard fact: there is no nuclear energy that is safe," the petition says. "In other words, nuclear technology and humanity cannot coexist."

The antinuclear group says it has many supporters for its campaign, including Minamisoma Mayor Katsunobu Sakurai in Fukushima Prefecture and Tokai Village Mayor Tatsuya Murakami in Ibaraki Prefecture, in addition to film director Yoji Yamada, actress Sayuri Yoshinaga and other high-profile personalities.

Kamata said his group has collected 5 million signatures so far in a petition calling for a nuclear-free Japan. The campaign is aiming for 10 million names. The group will hold a rally in Koriyama, Fukushima, on March 11, the first anniversary of the Great East Japan Earthquake and tsunami which triggered the crisis at the Fukushima No. 1 Nuclear Power Plant, and a rally in Yoyogi Park in Tokyo on July 16, which the group hopes will draw 100,000 people. (By Shiro Yoneyama, Staff Writer)

US approves 1st reactor construction in 34 years

The US Nuclear Regulatory Commission has approved construction of the first new power reactors in the country in more than 3 decades.

The plan to build 2 reactors at the Vogtle plant in the southern state of Georgia was approved by a majority vote on Thursday.

Unit 3 and Unit 4 at the Vogtle site will be the first reactors built in the US for 34 years. The new models were designed by Westinghouse Electric, a US unit of Toshiba.

Construction could begin as early as this year. If all goes well, the reactors are expected to start operation in 2016.

The US stopped building nuclear plants after the Three Mile Island accident in 1979.

The administration of President Barack Obama says it will take in the lessons learned from the accident at Japan's Fukushima Daiichi power plant. But Obama is sticking to his policy of promoting nuclear power as a way of reducing dependence on oil.

Tsunami was up to 21 meters in Fukushima

<http://www.yomiuri.co.jp/dy/national/T120208006430.htm>

The tsunami that hit Fukushima Prefecture on March 11 was particularly high--possibly up to 21 meters--along the coast in the center of the prefecture where the Fukushima No. 1 nuclear power plant is located, a survey has found.

The height of the tsunami was previously assumed to have been about 15 meters at the nuclear plant, but this could not be confirmed because the area within a 20-kilometer radius of the plant is designated a no-entry zone.

Researchers including Shinji Sato, a professor at the University of Tokyo, obtained permission from local governments to enter this zone, and for the first time since the tsunami, were able to survey coastal areas Monday and Tuesday.

They found that areas struck by higher tsunami were concentrated on the coast in the prefecture's center. For example, at Tomioka, which is eight kilometers south of the nuclear plant, a tsunami height of 21.1 meters was observed.

The maximum height was 10 meters along much of the coast in the prefecture's south.

"It is necessary to do more research on what caused the tsunami to hit the central part of the prefecture particularly hard," Sato said.

Nuclear agency to finalize report endorsing Oi reactors stress tests

<http://mdn.mainichi.jp/mdnnews/news/20120209p2g00m0dm019000c.html>

TOKYO (Kyodo) -- The government's nuclear safety agency decided Wednesday to soon finalize a draft report endorsing the results of stress tests on two idled reactors at Kansai Electric Power Co.'s Oi power plant in western Japan.

It will be the first time the Nuclear and Industrial Safety Agency or NISA has validated results of reactor stress tests submitted so far by utilities nationwide.

NISA made the decision after presenting and hearing opinions on the draft at a meeting with experts. Its finalized report will then be checked by the Nuclear Safety Commission of Japan.

The Japanese government introduced the stress tests on reactors after the Fukushima nuclear crisis. For utilities, passing the test is a prerequisite for restarting reactors idled for scheduled checkups.

If the commission validates the report, the agency plans to explain the test results to Fukui Prefecture where the Oi nuclear power plant is located.

The government will then decide whether to authorize the restart of the reactors while taking into account local communities' responses. The Fukui prefectural government is cautious about allowing them to operate again.

Given the safety agency's decision, Fukui Gov. Issei Nishikawa reiterated his stance of not allowing the reactors' restart on the basis only of the outcome of the stress tests, saying, "It is the basic premise that a provisional safety standard that reflects lessons learned from Tokyo Electric's Fukushima Daiichi nuclear accident be set up."

For Kansai Electric, which serves western Japan area including Osaka and Kyoto, there have been concerns over electricity supply constraints as 10 of its 11 reactors are currently offline. The utility's only operating reactor, the No. 3 unit at the Takahama power plant also in Fukui, is set to undergo periodic maintenance later this month.

In its draft report, the nuclear safety agency endorsed Kansai Electric's evaluation that the Nos. 3 and 4 reactors at the Oil plant are capable of withstanding an earthquake 1.8 times stronger than the most powerful quake presumed for the area and a tsunami wave up to 11.4 meters high, four times higher than the maximum presumed level.

But NISA also said it needs to confirm the utility's further investigation of tsunami that occurred in the past in nearby areas as well as active faults' connectivity.

Overall, NISA said the Oi plant's Nos. 3 and 4 reactors have taken sufficient measures to prevent the sort of situation seen at Tokyo Electric Power Co.'s Fukushima Daiichi power plant even if they were hit by the same size of earthquake and tsunami that hit the plant in Fukushima Prefecture.

Only three of Japan's 54 commercial reactors are currently in operation as reactors which once enter periodic maintenance, held every 13 months, need to pass the stress test to resume operation.

If no reactors secure approval to restart, Japan will have no operating reactors by the end of April.

The government required utilities to take the stress tests following meltdowns at the Fukushima Daiichi complex, triggered by the March 2011 earthquake and tsunami, in order to check the ability of the country's nuclear power plants to withstand such natural disasters.

At Wednesday's meeting, some experts questioned the agency's endorsement of Kansai Electric's stress tests.

Masashi Goto, a former nuclear power plant design engineer, said that the stress tests are "totally meaningless" as a tool to check the safety of reactors as NISA has yet to decide how much leeway the reactors should have to withstand earthquakes and tsunami.

A NISA official said the level of reactors' ability to withstand emergency on their own, or without help from the outside, as well as the utility's efforts to improve their safety are among key factors that served as basis for the agency's evaluation of stress test results.

NISA's previous meeting with the experts in January was temporarily disrupted due to protests by some citizens, including antinuclear power activists, who were asked not to observe the meeting in the same room with attendants.

NISA continued not to allow general citizens to observe the meeting directly this time and made them watch the meeting through a monitor in a different room. A number of citizens staged antinuclear campaigns in front of the Economy, Trade and Industry Ministry building where the meeting took place.

A delegation from the International Atomic Energy Agency said last week while in Japan that the safety agency's nuclear stress tests are generally consistent with IAEA safety standards, but it also made some recommendations to NISA to improve the effectiveness of the stress tests.

Panel: All N-plant staff should have ID checks

<http://www.yomiuri.co.jp/dy/national/T120210006052.htm>

A committee of the Cabinet Office's Atomic Energy Commission plans to urge the government to require that nuclear facility operators verify the identity of all workers, in an effort to protect the sites against possible terrorist attacks, it has been learned.

It has come to light that Tokyo Electric Power Co.--the operator of the crippled Fukushima No. 1 nuclear power plant--does not have an adequate system to check the identities of those who access the site.

The utility has been unable to confirm the whereabouts of 10 people who worked at the site after the March 11 earthquake and tsunami triggered the crisis at the plant.

The government is expected to finally start taking serious steps against possible terrorist attacks targeting nuclear facilities as part of its review of safety measures in response to the nuclear crisis.

After the Sept. 11, 2001, terrorist attacks in the United States, nuclear power plants around the world implemented stricter security measures against possible sabotage. The International Atomic Energy Agency revised its guideline titled "The Physical Protection of Nuclear Material and Nuclear Facilities" in February last year, which stipulates that "the identity of all persons entering [facilities] should be verified."

The United States and European countries require nuclear facility operators to examine workers' past records, including checks for criminal activity and drug abuse. In contrast, Japan has had almost no concrete discussions on this issue, mainly because of an emphasis on protecting private information.

When workers enter protected areas at nuclear facilities in Japan, they usually do so in pairs so they can keep watch on each other.

More than 3,000 workers have been engaged in daily recovery activities at the Fukushima No. 1 nuclear power plant since the outbreak of the crisis. TEPCO conducted follow-up investigations into those who had worked at the site and discovered that the whereabouts of 10 workers could not be confirmed.

Moreover, poor security in most areas of the plant except for the central control room has also been identified as a problem. Areas near power supplies and cooling systems could be easily targeted in a terrorist attack, which could possibly result in a core meltdown, according to sources.

Therefore, the committee has decided the government should make it mandatory for nuclear facility operators to verify the identity of all workers in line with the IAEA guideline. This would cover not only employees of nuclear power plant operators, but also those from other companies working for the utilities, the sources said.

Over 100,000 signatures collected for Tokai nuclear plant scrapping

MITO (Kyodo) -- Civic groups submitted to the Ibaraki governor on Friday about 51,000 signatures and a petition demanding that the Tokai No. 2 nuclear power station be scrapped, bringing the total number of signatures they have collected against the plant operation to more than 100,000.

Last November, about 50,000 signatures against the resumption of the plant's operation, halted since last year, were already submitted to Ibaraki Gov. Masaru Hashimoto.

The petition submitted Friday urges the prefectural government not to allow the Tokai power station to resume operation, saying, "We should not allow a recurrence of the irretrievable sacrifice and loss as experienced in the Fukushima Daiichi nuclear power plant accident."

Having received the signatures and the petition, Katsuyoshi Tan in charge of the prefecture's crisis management said, "The (central) government has not yet announced its decision on resuming operations (of idled nuclear reactors), so we are undecided."

Civic groups are encouraging the prefecture to make "independent" decisions instead of waiting for the central government's policies.

The groups said they used the Internet and took to the streets to gather the signatures and will try to gather more.

Fukushima No. 2 reactor temperature up to 82C, but not critical: TEPCO

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm020000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Sunday the temperature at the bottom of the No. 2 reactor at its crippled Fukushima No. 1 nuclear plant rose further to 82 C, but the reactor has not gone critical.

While the thermometer reading at shortly after 2 p.m. marked a new high since the reactor attained a cold shutdown in December, the utility known as TEPCO said it has confirmed that sustained nuclear reactions are not taking place in the reactor as **no radioactive xenon has been detected inside its containment vessel.**

TEPCO reported the latest development immediately to the Nuclear and Industrial Safety Agency of the Economy, Trade and Industry Ministry as the temperature exceeded the limit of 80 C designated by the company's safety regulation for maintaining a cold shutdown, it said.

It is considered desirable to keep the temperature below 80 C, while the bottom of a reactor pressure vessel must be kept below 100 C in a stable cold shutdown, in view of the margin of error of thermometers, according to TEPCO officials.

TEPCO plans to increase the amount of water injected as a coolant by 3 tons per hour and pour 1 ton of boric acid later Sunday to prevent any event of criticality.

As a reason for what is causing the temperature rise, TEPCO said it is possible the water flow is unstable and thus failing to cool the reactor stably, while also saying it will check the thermometer for any irregularities. The temperature was measured at 78.3 C at 10 a.m. and fell to 75.4 C at 11 a.m.

The decline occurred after TEPCO on Saturday night increased the amount of water being injected into the reactor to 14.6 tons per hour from 13.6 tons, after seeing the temperature rise to 73.3 C at 9 p.m. It reached 74.9 C at 11 p.m. Saturday. The temperature readings began rising on Feb. 1.

One of the three thermometers at the bottom of the reactor's pressure vessel stayed between 67 C and 71 C from Friday evening to Saturday evening after hitting 73.3 C on Monday.

Readings from two other thermometers that check the temperature at the bottom of the No. 2 reactor vessel were around 35 C, TEPCO said.

The Nos. 1 to 3 reactors at the Fukushima No. 1 plant in northeastern Japan experienced meltdowns as a result of the loss of key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

Temperature rising at No.2 reactor

http://www3.nhk.or.jp/daily/english/20120212_12.html

The temperature at the No.2 reactor of the Fukushima Daiichi nuclear power plant **keeps rising even after the injection of more cooling water on Saturday night.**

The plant operator, Tokyo Electric Power Company, or TEPCO, says a thermometer at the bottom of the reactor registered 78.3 degrees Celsius at 10 AM on Sunday.

The reading began to rise in late January to around 70 degrees. TEPCO pumped in more water to push down the temperature, but it rose again on Saturday night to 74.9 degrees.

The temperature continued to climb on Sunday morning to hit its highest level since last December, when the government and TEPCO declared all the reactors were at a state of cold shutdown, with their temperatures below 100 degrees.

TEPCO denied the possibility of nuclear criticality, saying 2 other thermometers at the bottom of the reactor show temperatures at around 35 degrees.

It adds that continuous nuclear fission would generate radioactive xenon, but gas samples collected from near the reactor found the element below the detection limit.

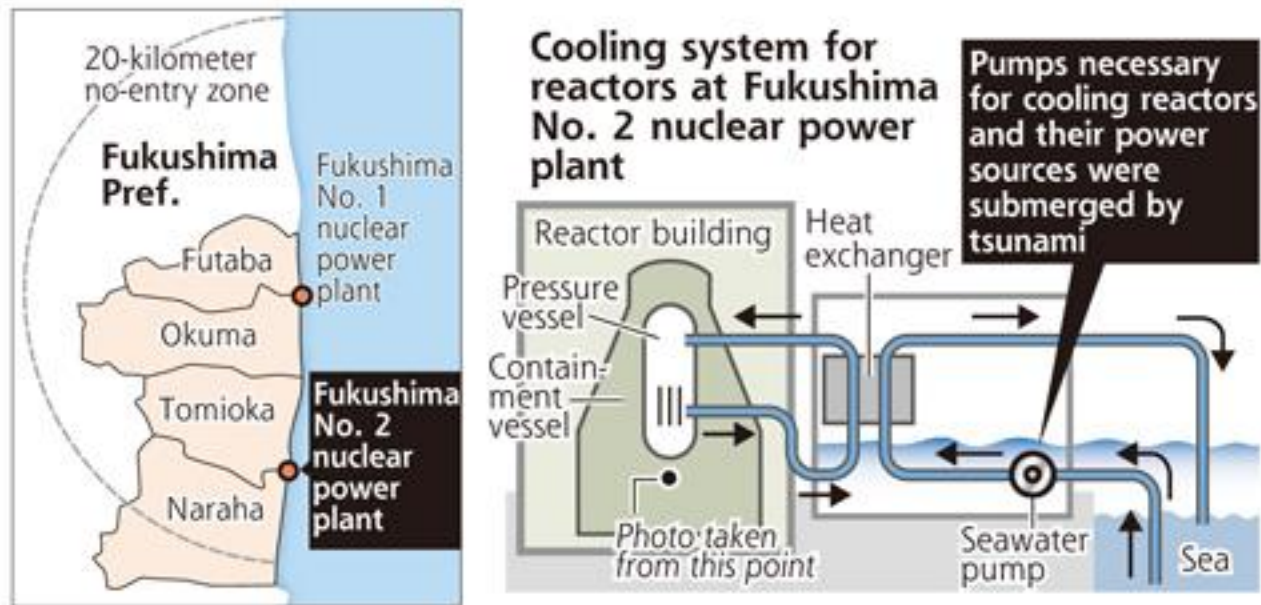

TEPCO is set to dump in boric acid to prevent any nuclear criticality later on Sunday and increase the volume of cooling water by 3 tons per hour.

Under new guidelines, **the company must keep reactor temperatures at 80 degrees or below, given thermometers' margin of error of up to 20 degrees.**

February 10, 2012

Fukushima No. 2 plant was 'near meltdown'

The Yomiuri Shimbun

FUKUSHIMA--The Fukushima No. 2 nuclear power plant was "near meltdown" after being hit by tsunami following the Great East Japan Earthquake on March 11, according to the head of the plant.

The No. 2 plant, on the border of Naraha and Tomioka towns in Fukushima Prefecture, was opened to the media Wednesday for the first time since the disaster. It is **12 kilometers from the Fukushima No. 1 nuclear power plant**, which suffered a meltdown. Both facilities are operated by Tokyo Electric Power Co.

Plant chief Naohiro Masuda, in charge of plant operations since the crisis, told reporters Wednesday, "The No. 2 plant almost suffered the same fate as No. 1 [which led to a severe crisis]."

On March 11, a **9-meter-high tsunami** struck the No. 2 plant, while the No. 1 plant was hit by a 13-meter-high tsunami. The tsunami caused the No. 2 plant's seawater pumps, used to cool reactors, to fail. Of the plant's four reactors, three were in danger of meltdown.

Luckily, one external high-voltage power line still functioned, allowing plant staff in the central control room to monitor data on internal reactor temperatures and water levels.

By March 15, the No. 2 plant's four reactors reached a state of cold shutdown without any leakage of radioactive materials.

"[At that point, the situation at the No. 2 plant] was considerably different from the No. 1 plant where it was difficult to know what was going on," Masuda, 53, said.

However, **despite intense efforts by all employees, it took a long time to stabilize the reactors.**

On March 11, **about 2,000 employees** of the No. 2 plant worked to stabilize the reactors. Some employees connected **200-meter sections of cable, each weighing more than a ton, over a distance of nine kilometers.**

Masuda noted the timing of the disaster was critical in saving the plant.

"We were lucky it happened on a Friday afternoon [and not on a weekend]," he said.

Masuda pointed out only 40 employees would have been at the plant if the earthquake had occurred in the evening or on a weekend.

"[In that case] it would be have been difficult for us to deal with the disaster," he said.

The Fukushima prefectural government conducted an on-site inspection at the No. 2 plant on Wednesday and repeated a request to TEPCO to decommission the facility.

Masuda did not elaborate and said, "At the moment, I can only say we'll maintain a state of cold shutdown."

The No. 2 plant's No. 1 reactor began operating in 1982. Following the Great East Japan Earthquake, a Nuclear Emergency Situation Declaration was issued for both the No. 1 and No. 2 plants. The declaration was lifted for the No. 2 plant in December.

February 09, 2012

Prefectural team makes 1st inspection of Fukushima No. 2 nuke plant

<http://mdn.mainichi.jp/mdnnews/news/20120209p2a00m0na009000c.html>

A team of Fukushima prefectural officials visited the Fukushima No. 2 nuclear plant on Feb. 8, marking the first prefectural inspection of the plant since the March 11, 2011 disasters forced it to shut down.

"Right now, the most important tasks are to keep the reactors in cold shutdown and cool the spent fuel rods while preparing safety measures to deal with any unexpected problems," said the deputy head of

the prefecture's living environment division following the inspection. "I felt that work there to maintain emergency power supplies and prevent flooding of the plant buildings was progressing."

The reactors at the Fukushima No. 2 plant -- about 11 kilometers south of the disaster-struck Fukushima No. 1 nuclear complex -- stopped automatically when the Great East Japan Earthquake hit and are now in cold shutdown, but the plant was very nearly the site of a second nuclear crisis.

In circumstances similar to those at the No. 1 plant, the cooling systems in three of Fukushima No. 2's four reactors failed when the March 11 tsunami hit and knocked out their backup generators. Unlike the situation at the No. 1 plant, however, staff at the No. 2 station managed to patch into external power before the reactor cores could seriously overheat.

In December last year, the government's Nuclear and Industrial Safety Agency officially declared the nuclear emergency at the plant over, while Tokyo Electric Power Co. -- operator of both the Fukushima No. 1 and 2 plants -- has submitted a plan to the agency for maintaining cold shutdown.

Fukushima Prefecture is calling for the shutdown of all nuclear stations in the prefecture, including Fukushima No. 2.

However, Fukushima No. 2 plant director Naohiro Masuda suggested it's too soon to discount restarting the reactors there, saying, "Under present circumstances, it's impossible to say how the reactors here will be dealt with in the future. For now, we have to maintain a steady cold shutdown by transitioning from the temporary cooling equipment we now have in place to proper, permanent equipment."

Temperature inside reactor stops rising

<http://www.yomiuri.co.jp/dy/national/T120208005861.htm>

The abnormal rise in temperature in a reactor at the Fukushima No. 1 nuclear power plant has stopped, apparently because more water has been injected into the crippled reactor, according to Tokyo Electric Power Co.

TEPCO said the temperature at the base of the No. 2 reactor's pressure vessel had **fallen to 68.5 C at 5 p.m. Tuesday after earlier peaking at 73 C.** However, **the cause of the increased temperature remained unclear.**

Junichi Matsumoto, acting head of TEPCO's headquarters regarding nuclear plant locations, said increasing the amount of water injected hourly into the reactor by three tons to 13.5 tons since 4:30 a.m. Tuesday seemed to be having an effect.

"[The temperature] has begun falling after peaking," Matsumoto said.

Keeping the temperature at the base of the reactors at 100 C or less is a stable state known as cold shutdown. Reaching cold shutdown was a precondition for enabling the government to declare in December that the crisis at the nuclear plant had been brought under control.

TEPCO's guideline stipulates the temperature should be kept at 80 C or lower to allow for possible measurement errors.

The reactor will need to be monitored carefully because the condition inside the reactor's inner part containing melted nuclear fuel is not clear, and the reason for the temperature rise has yet to be pinpointed.

Currently, cooling water is injected into the No. 2 reactor via two piping systems--the coolant water supply system that can deliver water to the vessel's base, and the reactor core water spray system that aims water directly at the reactor core.

The temperature in the pressure vessel's base began rising from 45 C around Jan. 26, when the water injection balance of the two systems was changed several times during pipe repair work.

One of three thermometers installed around the base recorded a temperature increase of nearly 30 C over a little more than 10 days, reaching as high as 73 C at one time.

According to TEPCO, the volume of water being injected was far less than usual. It is possible that the way water was injected into the reactor might have changed around the time of the pipe repairs, and that water did not reach some of the fuel.

TEPCO also speculated that the fuel, which had melted and then solidified, might have cracked due to some shock or dropped down and changed shape.

February 08, 2012

TEPCO injects more water into reactor

<http://www.yomiuri.co.jp/dy/national/T120207005567.htm>

Tokyo Electric Power Co. has increased the amount of water being injected into the No. 2 reactor at the Fukushima No. 1 nuclear power plant because the temperature at the base of the pressure vessel has been rising, the company said Tuesday.

The 13.5 tons being injected each hour to cool the reactor--an increase of three tons--is the most since the government announced the crippled plant had achieved a stable state of cold shutdown in December.

According to the utility, after increasing the amount of water being injected at 4:30 a.m. Tuesday, the temperature at the vessel's base has been fairly constant: It was 72.2 C at 5 a.m. and 69 C at 10 a.m. The temperature at the base of the vessel had been 45 C as of Jan. 27, but began rising earlier this month. TEPCO is investigating the cause of the higher temperature.

Temperature decreasing inside Fukushima reactor

http://www3.nhk.or.jp/daily/english/20120208_26.html

Tokyo Electric Power Company says it has been able to lower the temperature inside the No.2 reactor at the troubled Fukushima Daiichi nuclear power plant by increasing the amount of water being injected into it.

TEPCO had been struggling to deal with rising temperatures inside the reactor. A thermometer located at the bottom of the reactor read 45 degrees Celsius on January 27th, but rose to over 70 degrees on Sunday. The cause is unknown, and two other thermometers at the reactor have shown no such increase.

TEPCO said on Wednesday that the temperature inside the reactor was 66.7 degrees at 5 AM, 5.5 degrees lower than a day earlier. The temperature gradually declined after the company increased the rate of water injection by 3 tons to 13.5 tons per hour on Tuesday.

Such a high rate of injection has not been used since just after the nuclear crisis began last March.

TEPCO says the temperature inside the reactor rose slightly to 68 degrees at 10 AM, but it is still dropping overall.

The utility cannot determine the exact situation inside the reactor or the cause of the temperature rise.

The utility says it will continue to monitor the situation closely while maintaining the current rate of water injection.

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](http://www.japantimes.co.jp/text/nn20120208f1.html) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that the situation is far from resolved and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the **spent fuel pools** sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the **fuel pool is now directly exposed to the outside environment** after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.

Making matters worse, the government doesn't have any place to permanently store it, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, the simulation was "so shocking" that top government officials decided to keep the paper secret by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

February 07, 2012

Temperature remains high at damaged reactor

http://www3.nhk.or.jp/daily/english/20120207_21.html

An unknown rise in temperature at one of the reactors at the damaged Fukushima nuclear plant is troubling its operator. Tokyo Electric says the temperature hasn't gone down even after it increased the volume of cooling water on Tuesday.

One of the thermometers at the bottom of reactor No. 2 at the Fukushima Daiichi plant gradually rose to about 70 degrees Celsius since January 27th. It had stayed around 45 degrees before.

In an effort to lower the temperature, the operator increased the amount of water sprayed on the nuclear fuel by 3 tons to 13.5 tons per hour Tuesday morning.

But Tokyo Electric said readings were down only about 3 degrees after some 5 hours of operation, hardly showing signs of improvement.

The utility said the flow of water in the reactor may have changed after plumbing work in late January, causing difficulties in cooling part of the melted nuclear fuel.

It added that no temperature rise has been observed at 2 other thermometers in the same reactor and that it will continue to carefully monitor the reactor.

TEPCO has been unable to visually confirm conditions inside the reactors since the nuclear disaster last March because of high radiation.

TEPCO increases water injection in reactor showing temperature rise

<http://mdn.mainichi.jp/mdnnews/news/20120207p2g00m0dm147000c.html>

TOKYO (Kyodo) -- Workers at the crippled Fukushima Daiichi power plant on Tuesday raised the amount of water injected into the No. 2 reactor to the highest level since the plant achieved a stable state of cold shutdown in December, as concerns grew over the rising temperature recently detected at the bottom of the reactor's pressure vessel.

Following the move, the temperature measured at the same spot on the vessel dropped to 69.0 C at 10 a.m. from 72.2 C logged at 5 a.m., Junichi Matsumoto, spokesman for plant operator Tokyo Electric Power Co. told a press conference, but added that the company needs more time to assess the effect of the latest step.

"It is difficult to judge whether the temperature is rising or dropping unless we monitor the development for about a day," Matsumoto said.

TEPCO said it increased the amount of injected water at 4:24 a.m. Tuesday. **The No. 2 reactor is now being cooled with the injection of 13.5 tons of water per hour, up from 10.5 tons.**

Nuclear disaster minister Goshi Hosono told a press conference that TEPCO is making utmost efforts to lower the temperature.

Touching on last month's change in the amount of coolant water at the No. 2 reactor for pipe replacement, which is believed to have affected the temperature, Hosono said, "This was a process to enhance stability, but it has become clear that there is a possibility of (replacement work) creating an unstable situation temporarily."

"We have to consider in an even more careful way," he said.

TEPCO's Matsumoto said he believes the No. 2 reactor is maintaining a state of cold shutdown, because the temperature is not rising continuously. Readings on two other thermometers checking the temperature of the bottom of the pressure vessel were around 40 C as of 10 a.m.

A cold shutdown is defined by the Japanese government as a situation in which the bottom part of a reactor pressure vessel is kept below around 100 C and radiation exposure from the release of radioactive substances is significantly held down.

At the Fukushima Daiichi plant in northeastern Japan, the Nos. 1 to 3 reactors have suffered meltdowns as a result of the loss of their key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

TEPCO is now injecting water into the three crippled reactors through a new water circulation system installed after the accident.

February 06, 2012

Temperature at No.2 reactor remains high

http://www3.nhk.or.jp/daily/english/20120206_29.html

Attempts to cool the temperature in the No. 2 reactor of the disabled Fukushima Daiichi nuclear power plant have only partially succeeded despite the injection of more cooling water.

The temperature in the reactor has gradually risen from about 45 degrees Celsius registered on January 27th.

In the past 4 days, the temperature has climbed more than 20 degrees to above 70 degrees.

The plant operator, Tokyo Electric Power Company began pumping more water into the reactor at around 1:30 AM on Monday. But at 7 AM, the temperature stood at 73.3 degrees and at 5 PM, 69.2 degrees.

The utility firm says 2 other thermometers elsewhere in the reactor gave readings of about 44 degrees.

TEPCO says the rise in temperatures indicate that the flow of water in the reactor may have changed direction after plumbing work, and is no longer able to properly cool down the melted down nuclear fuel.

However, the utility says radioactive xenon has not been detected in gases around the reactor, and that nuclear criticality is not taking place.

The government and TEPCO announced in December that the 3 troubled reactors at the Fukushima plant had reached a state of cold shutdown with their temperatures below 100 degrees. But the situation inside the reactors remains unclear.

New regulations established after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

TEPCO says it will increase the amount of water being injecting into the reactor to see if the temperature in the reactor drops.

The government's Nuclear and Industrial Safety Agency says there is a need for a comprehensive study to determine whether the reactor is actually in a state of cold shutdown. It says a brief reading of over 80 degrees on one of the thermometers does not necessarily mean there is trouble in the cooling system.

Meanwhile, the Chairman of the Nuclear Safety Commission, Haruki Madarame, says that a recurrence of nuclear criticality is unlikely.

But he criticized TEPCO and the nuclear safety agency for their handling of the matter. He says they are failing to properly explain the state of the reactors to the people.

Temperature rises at Fukushima No.2 reactor

http://www3.nhk.or.jp/daily/english/20120206_17.html

The operator of the Fukushima Daiichi nuclear plant says the temperature in the No.2 reactor remains high despite the injection of additional water.

A thermometer at the bottom of the reactor showed 73.3 degrees Celsius on Monday morning. It was around **45 degrees on January 27th and 71.7 degrees at 4 PM on Sunday.**

Tokyo Electric Power Company began injecting 10.6 tons of water per hour from around 1:30 AM on Monday. **That's one ton more per hour than before.**

The utility says 2 other thermometers placed at the bottom of the reactor have been giving readings of about 44 degrees.

It says the flow of water in the reactor may have changed after plumbing work, causing difficulties in cooling the nuclear fuel.

In December last year, the government and TEPCO declared the 3 reactors at the Fukushima Daiichi plant had been successfully put into a state of cold shutdown as their temperatures had fallen below 100 degrees. But the situation inside the reactors remains unknown.

TEPCO says the regulations set after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

So it says the No.2 reactor is still in the state of cold shutdown.

February 04, 2012

More leaks found at crippled Japan nuclear plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2g00m0dm015000c.html>

TOKYO (AP) -- Leaks of radioactive water have become **more frequent** at Japan's crippled nuclear power plant less than two months after it was declared basically stable.

The problem underlines the continuing challenges facing Tokyo Electric Power Co. as it attempts to keep the Fukushima Dai-ichi nuclear plant under control. A massive earthquake and tsunami badly damaged the plant last March, resulting in the melting of three reactor cores.

Workers spotted a leak Friday at a water reprocessing unit which released enough beta rays to cause radiation sickness, TEPCO spokesman Junichi Matsumoto said. He said no one was injured and the leak stopped after bolts were tightened on a tank.

Matsumoto said TEPCO also found that 8.5 tons of radioactive water had leaked earlier in the week after a pipe became detached at Unit 4, one of the plant's six reactors. The company earlier had estimated that only a few gallons (liters) had leaked.

He said officials are investigating the cause of that leak, but that it was unlikely the pipe had been loosened by the many aftershocks that have hit the plant.

The structural integrity of the damaged Unit 4 reactor building has long been a major concern among experts because a collapse of its spent fuel cooling pool could cause a disaster worse than the three reactor meltdowns.

Cold winter weather has also caused water inside pipes to freeze elsewhere at the plant, resulting in leaks in at least 30 locations since late January, Matsumoto said.

Officials have not detected any signs of radioactive water from the leaks reaching the surrounding ocean. **Sandbag walls have been built around problem areas as a precaution.** [don't worry, everything is safe]

More than 100,000 people around the plant fled their homes after the disaster due to radiation fears.

The government announced in December that the plant had reached "a cold shutdown condition" and is now essentially stable.

On Monday, six inspectors from the government's Nuclear and Industrial Safety Agency will begin an inspection of the plant to ensure its continued stability. They will study the reactors' cooling functions and measures to prevent explosions and nuclear chain reactions, among other steps to keep the plant under control, officials said.

February 03, 2012

NHK World English

Safety checks to begin at Fukushima Daiichi plant

Japan's nuclear safety agency will begin inspecting the Fukushima Daiichi nuclear plant from Monday to see if it can safely remain in a state of cold shutdown.

Officials from the Nuclear and Industrial Safety Agency plan to check equipment and contingency preparations by examining manuals and interviewing workers during their three-week inspections.

Among the seven types of equipment to be checked is a reactor cooling system that recycles decontaminated water from the facility.

Another is a nitrogen-injection system to prevent hydrogen explosions within the disabled reactors.

Agency officials say they will open the onsite inspections to the media. The checks will be the first safety tests required under law since the March 11th accident.

The government declared on December 16th that the Fukushima Daiichi reactors had achieved a state of cold shutdown.

This means reactor temperatures have stabilized below 100 degrees Celsius, and the release of radioactive substances has been contained.

February 02, 2012

TEPCO says 8.5 tons of water leaked from Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120202p2g00m0dm028000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that 8.5 tons of radioactive water leaked from the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant because a pipe connected to the reactor dropped off, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, water was found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The total amount of leakage from the reactor was initially estimated to be 6 liters, but the utility revised the figure later Wednesday, adding that the leakage appears to have started at around 5 p.m. Monday.

The pipe may have dropped off because water inside increased in volume as it turned into ice due to cold temperatures.

The utility plans to check whether there are similar cases in the other crippled reactors.

The Nos. 1 to 3 reactors have fuel inside, which is believed to have melted in the early phase of the nuclear crisis because the plant lost its cooling functions following the natural disasters.

The No. 4 unit also lost the function to cool its spent fuel pool, but no serious damage is believed to have occurred in the fuel stored there.

Radioactive water leaking from inside Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120201p2g00m0dm150000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that it has found radioactive water leaking from a broken pipe connected to the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, about 6 liters of water were found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The utility is looking into the cause of the damage to the pipe and believes it may have some connection with the recent cold weather or the explosions that took place at the plant in the early phase of the nuclear crisis.

The density of radioactive substances included in the water is estimated at 35.5 becquerels per cubic centimeter, according to TEPCO.

Govt plans Fukushima decontamination test-run

Japan's Environment Ministry has unveiled a model project designed to decontaminate areas with high levels of radiation around the crippled Fukushima Daiichi nuclear plant.

In a test-run for a wider clean-up, the ministry will first try to decontaminate 3 closed sections of a national expressway running through the no-entry zone near the plant.

The ministry last week announced a 2-year plan to decontaminate by March 2014 some evacuation zones where radiation levels have dropped below 50 millisieverts per year.

Radiation levels over a total 5 kilometers of expressway slated for the new project have ranged from a little to substantially above 50 millisieverts a year.

The ministry plans to assess the project's effectiveness in a test-run from the middle of March through July.

January 30, 2012

More water leaks found at Fukushima nuclear plant

NHK World English

More water leaks have been found at the troubled Fukushima Daiichi nuclear power plant.

Tokyo Electric Power Company told reporters on Monday morning that it has discovered 2 additional water leaks at the nuclear plant.

This comes after it was announced on Sunday that **nearly 8 tons of water** was found to have leaked in 14 locations at the plant.

One of the 2 new findings involves about 30 liters of water that has leaked from a device that is removing salt from contaminated water. The other leak is from a valve of a pipe that is injecting water into a reactor.

TEPCO says leaked water has neither spilled out of the plant, nor flowed into the sea.

The utility firm is trying to determine whether water in some of the pipes froze and cracked the pipes, or loosened the pipes' connections.

It plans to quickly implement preventive measures, including carrying out more patrols early in the morning and **wrapping insulation around the pipes and other equipment.** !!!!!!!

The temperature on Monday morning around the plant dropped to minus 8.7 degrees Celsius.

January 29, 2012

TEPCO ordered to prevent water leaks at reactors

Japan's nuclear safety agency has instructed the operator of the Fukushima Daiichi nuclear plant to prevent water leaks at the plant.

The move follows the discovery of water leaks on Sunday in 14 locations at the damaged plant.

Tokyo Electric Power Company says about 40 liters of water leaked from a cooling system for a spent fuel pool at the No. 4 reactor, forcing the system to stop for one hour and 40 minutes. The utility also says that 7 tons of water leaked from the No. 6 reactor.

The company says that the leakages apparently occurred after frozen water in pipes loosened the pipes' connections or broke some parts.

The company adds that the leaked water did not contain radioactive materials or had already been processed to remove them.

Similar water leaks occurred in 3 locations at the plant on the previous day.

Responding to the agency's call for preventive measures, TEPCO has decided to conduct frequent checks on early mornings when temperatures often drop below zero and protect pipes from the cold with insulation materials or heaters, if necessary.

The utility says measures are already in place to protect critical systems, such as those used for cooling reactors.

Frozen water blamed for leaks at Fukushima plant

Tokyo Electric Power Company has found water leaks in 14 locations at the Fukushima Daiichi nuclear plant.

The utility says the leaks apparently occurred after frozen water ruptured the pipes and the leaked water did not contain any radioactive materials.

Tokyo Electric said about 40 liters of water leaked from a cooling system for a spent fuel pool at the No.4 reactor on Sunday, but the flow stopped when workers closed the valve.

The company said **the leak forced the system to stop for one hour and 40 minutes**, but the pool's temperature did not rise.

Tokyo Electric said 7 tons of water had leaked from the No.6 reactor.

The temperature fell to minus 8 degrees Celsius on Sunday morning near the damaged plant.

Ruptured pipes caused 3 water leaks on the previous day.

Tokyo Electric official Junichi Matsumoto admitted that **the utility failed to take sufficient steps to prevent frozen pipes**. He said it will take quick action to protect the pipes from the cold weather.

Radioactive waste site opened to media in Okuma

<http://www.yomiuri.co.jp/dy/national/T120210006056.htm>

OKUMA, Fukushima--The government, for the first time, has allowed the media to cover operations to move waste contaminated by radioactive substances to a **baseball stadium being used for temporary storage in the Ottozawa district in Okuma**, Fukushima Prefecture.

The contaminated waste was collected in the government-led model decontamination project conducted in the town.

On Thursday, the bags containing the waste were moved to the site and piled in two designated areas at the town-run stadium, about three kilometers away from the power plant.

Radiation levels exceeded 70 microsieverts per hour in certain areas of the Ottozawa district, the highest level among the government-monitored locations.

Workers in protective clothing and masks used cranes to pile up **bags with the contaminated soil and grass, each weighing about a ton**.

A worker said, "Protective clothing hampers our breathing and it's tough to work because my hands are freezing in these rubber gloves."

Before placing the bags, **four layers of sheeting, including a water-resistant sheet, were spread on the ground to block radiation leaks**. [since when has water-resistant material been able to block radiation ?]

Later, the pile will be covered by three layers of sheets and soil.

An official at the Japan Atomic Energy Agency, which handled the operation, said, "It's possible to block 98 percent of radiation [using this system]."

February 09, 2012

Radioactive waste disposal site unveiled to reporters

<http://mdn.mainichi.jp/mdnnews/news/20120209p2a00m0na013000c.html>

A temporary storage site for radioactive waste generated under a model decontamination project around the disaster-struck Fukushima No. 1 nuclear plant was unveiled to reporters on Feb. 9.

To prevent radioactive materials from contaminating groundwater, temporary disposal sites are lined with waterproof sheets. Materials produced in the decontamination operation -- including earth and plant matter -- are categorized, packed into thick bags and lifted into the disposal site by crane.

"We are building these (temporary disposal) sites in such a way that, even when full of waste, radiation levels won't rise in the surrounding area," a Japan Atomic Energy Agency official in charge of the operation stated.

The model decontamination project started in November last year in 12 municipalities in and around the exclusion zone to find the most effective decontamination and disposal techniques.

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](#) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that **the situation is far from resolved** and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the spent fuel pools sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the fuel pool is now directly exposed to the outside environment after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.

Making matters worse, the government doesn't have any place to permanently store it, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, **the simulation was "so shocking" that top government officials decided to keep the paper secret** by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

February 06, 2012

Govt to create more decontamination bases

http://www3.nhk.or.jp/daily/english/20120206_11.html

The Environment Ministry plans to decontaminate more public facilities in Fukushima Prefecture to use them as bases for cleaning up radioactive substances.

The government wants to decontaminate no-entry and evacuation zones around the damaged Fukushima Daiichi plant. It hopes to create a safe environment so that residents can return to the area.

The ministry has designated 16 facilities, including schools and assembly halls, as bases for decontamination. Four municipal offices were cleaned up in December.

The operation is to be completed next month.

The government plans to begin radiation monitoring in these zones in a few months, and begin the decontamination process this summer.

February 04, 2012

Tokyo gov't unveils transport of incinerated radioactive sludge from sewage plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na006000c.html>

Tokyo on Feb. 2 invited reporters to see how ash from incinerated sludge -- including some contaminated with radioactive substances -- is shipped from a sewage plant to be buried at a disposal site outside a breakwater in Tokyo Bay.

The Tokyo Metropolitan Government started burying ash from the incinerator at Akishima in the Tama region of suburban Tokyo in late October last year. In December, it procured gear to separate air from the incinerated sludge and load it into tanker trucks. The Bureau of Sewerage then started transporting the ash from the Tamagawa Joryu Water Reclamation Center to the disposal site.

During the press tour, journalists watched the material being loaded onto the tankers. Radioactive cesium levels in the ash are apparently far below national standards at 1,000 to 2,000 becquerels per kilogram.

The Akishima sewage plant stopped shipping the ash out in May last year and subsequently built up as much as some 420 metric tons of it. The plant will be completely rid of the ash by mid-February.

A total of about 2,600 tons of incinerated sludge are held at six other sewage plants in the Tama region, and the metropolitan government will send the separation gear to those plants to move the ash to the disposal site.

Atomic energy commission to recommend background checks for nuclear workers

<http://mdn.mainichi.jp/mdnnews/news/20120211p2a00m0na002000c.html>

The Japan Atomic Energy Commission (JAEC) on Feb. 10 put together a draft report recommending energy companies be made to do background checks on employees working at important nuclear facilities or with nuclear materials.

Specifics are expected to be ironed out by a new government atomic energy regulatory organ to be established in April.

In January of last year, the International Atomic Energy Agency (IAEA) released a recommendation that the trustworthiness of nuclear employees be checked, and according to the JAEC, background checks on nuclear employees are already performed in most major countries. Such checks were considered in Japan in 2004 by the Ministry of Economy, Trade and Industry, but were not implemented over privacy concerns.

After the meltdowns at the Fukushima No. 1 nuclear plant, the JAEC recommended checks because "implementing counterterrorism measures for nuclear facilities, which can cause serious damage to society, is an urgent matter."

One obstacle to the checks is that it is difficult for power companies to check on workers' criminal records or debts, so police and other authorities would have to help. Furthermore, Tokyo Electric Power Co. could not confirm the identities of some of the workers who had been sent to the Fukushima No. 1 plant in recent background checks, and the JAEC has admitted it would be difficult to put the checks into practice.

Approval near for Oi reactors / Agency says stress test evaluations at N-plant were adequate

<http://www.yomiuri.co.jp/dy/national/T120209006930.htm>

A government nuclear safety agency has submitted a final draft of an evaluation report that approves the stress test results of the Nos. 3 and 4 reactors at the Oi nuclear power plant in Oi, Fukui Prefecture, to a meeting attended by experts.

The Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency has virtually completed its evaluation of the assessment of the reactors run by Kansai Electric Power Co. The agency's approval of the evaluation is one of the preconditions for the government's goal of resuming operations at the reactors.

The reactors have remained out of service after being taken off-line for regular safety checkups.

KEPCO had reported to NISA their stress test results show safety levels at the reactors are appropriate.

At the meeting, NISA officials heard a range of opinions from nuclear experts on the final draft.

NISA will soon compile a final evaluation report and will submit it to the Cabinet Office's Nuclear Safety Commission, which will examine the adequacy of the evaluation.

Prime Minister Yoshihiko Noda and three Cabinet members will decide whether to allow the reactors to resume their operations based on the results of the commission's examination of NISA's report and the opinions of local governments in Fukui Prefecture.

Fukui Gov. Issei Nishikawa requested the government to make the safety criteria based on the knowledge and lessons learned from the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in the wake of the Great East Japan Earthquake last year.

The government will hold explanation sessions with local governments and residents to improve their understanding about the reactors' possible resumption of operations.

When NISA submitted its final draft to the meeting, some experts required that it be modified.

But NISA plans to continue with plans to complete its final evaluation report because "The report's main objective--deciding that the Oi reactors' safety assessment results are appropriate--will not change," a senior NISA official said.

NISA's final draft says an accident with a severity similar to the problems experienced at the Fukushima No. 1 nuclear plant will not occur at the Oi plant.

The draft also incorporates recommendations made by a delegation from the International Atomic Energy Agency that recently visited Japan.

KEPCO is now researching active faults around the Oi nuclear power plant and past large-scale tsunamis that have been recorded in historical documents.

The final draft also touches on the possibility that the stress test results will change depending on KEPCO's research.

[February 08, 2012](#)

N-safety unit to be housed with METI

<http://www.yomiuri.co.jp/dy/national/T120207005565.htm>

The Environment Ministry is likely to start operations of a new external nuclear regulatory agency to be launched in April at an annex of the Economy, Trade and Industry Ministry that oversees the current nuclear safety body, sources said.

The government wants to establish the new watchdog at a new location to rule out any conflict of interest that the body might have by being associated with METI, a promoter of nuclear power.

But because of difficulties in finding a home for the agency, the government will for the time being likely house the new watchdog at the current Nuclear and Industrial Safety Agency (NISA) premises.

The government has already been criticized because NISA, a nuclear regulator, works under the auspices of METI, and this proximity is seen as having contributed to the crisis at the Fukushima No. 1 nuclear power plant.

Most of NISA's functions will be absorbed by the new agency, which will be staffed by about 500 people.

According to the sources, the new agency will probably be relocated as early as this summer.

Premises housing the new watchdog need sufficient earthquake resistance, must be situated on a lower floor and located near the Prime Minister's Office. Because there are also plans for a new nuclear safety investigation committee to be set up with the agency, at least 6,000 square meters of space is required, the sources said.

The sources said the Environment Ministry found a suitable private building in Tokyo's Shiodome area, but was unable to coordinate the move.

One reason for the ministry's struggle to find suitable premises is that bills to enable the creation of the new nuclear agency and the committee have yet to be passed in the Diet.

"If we decide on the location before Diet deliberations [on the bills], opposition parties would criticize us, saying we're disrespecting the Diet," a senior ministry official said.

Air radiation drops after snowfall / But decontamination necessary, levels will rise once snow melts, experts say

<http://www.yomiuri.co.jp/dy/national/T120207005622.htm>

The Fukushima prefectural government has received many inquiries because air radiation levels across the prefecture following the crisis at the Fukushima No. 1 nuclear power plant declined considerably late January and have since remained constant, perhaps due to fallen snow blocking radiation above the ground.

According to monitoring by the Education, Culture, Sports, Science and Technology Ministry and others, the rate of decline was particularly large in the Akougi district in Namie and the Nagadoro district in Iitate, located in the expanded evacuation zone around the nuclear plant.

Radiation measuring found that the Akougi district had a reading of 19.7 microsieverts per hour in the morning of Jan. 25, down from 30 microsieverts per hour recorded in the morning of Jan. 18.

Air radiation levels also decreased to 5.9 microsieverts per hour from 10 microsieverts per hour over the same period in the Nagadoro district.

It is believed there were no major changes in air radiation levels before Jan. 18 and after Jan. 25.

According to the ministry's Nuclear Emergency Response Headquarters, the decline can be attributed only to snowfall since decontamination operations were not conducted in the areas at the time.

The Fukushima Meteorological Observatory said snow accumulation is not monitored in Namie and Iitate, but temperatures and other factors suggest the town and the village had snow from Jan. 20 to 22.

The prefectural emergency response headquarters said radiation levels also declined in the city of Fukushima. While such levels measured 0.84 microsievert per hour at 6 p.m. on Jan. 21 when snow began to fall, at 9 p.m. on Jan. 22, after snowfall, radiation levels in the air measured 0.62 microsievert per hour.

Farmer Masuo Kaneko, 63, who evacuated to the city from Nagadoro district, said after reading the newspapers he thought the radiation levels were dropping rapidly. But he was disappointed to hear the decline was due to snowfall.

"I expected radiation levels to halve in about two years time," he said.

Tokyo Institute of Technology Associate Professor Keiji Saneyoshi said air radiation levels may halve if about 20 centimeters of snow falls in certain areas. "Yet decontamination work needs to continue since the levels will rise again once the snow melts," Saneyoshi said.

Cesium detected in worms near Fukushima plant

http://www3.nhk.or.jp/daily/english/20120208_04.html

Researchers say high levels of radioactive cesium have been detected in earthworms caught in areas around the damaged Fukushima Daiichi plant.

The researchers from the Forestry and Forest Products Research Institute checked cesium levels in earthworm samples they collected at 3 locations.

The institute says about 19,000 becquerels of cesium per kilogram of worms were detected in Kawauchi Village 30 kilometers from the plant, about 1,000 becquerels in Otama Village, 70 kilometers from the plant, and 290 in Tadami Town, 130 kilometers away.

The institute says the cesium levels rise in proportion to the radioactive levels of top soil containing decomposed leaves, the worms' feed.

The reading in Kawauchi was higher than the 146,000 becquerels per kilogram detected in a wild boar in Fukushima Prefecture. The radioactive level in the animal is 30 times the official limit.

The chief researcher at the institute, Motohiro Hasegawa, says **boars, birds and other forest animals feed on earthworms**. He says **the radioactive impact on these creatures will need to be constantly monitored to prevent contamination through the food chain**.

Gov't to set up radiation yardstick for shipping Fukushima stones

<http://mdn.mainichi.jp/mdnnews/news/20120207p2g00m0dm102000c.html>

TOKYO (Kyodo) -- The Japanese government plans to set up a radiation yardstick for shipping stones given the detection of a relatively high level of radiation in gravel, used as building materials, from near the crippled Fukushima Daiichi nuclear power plant, industry minister Yukio Edano said Tuesday.

The government will set up a panel to create such a standard by the end of next month. **The yardstick is expected to apply mainly to quarries in Fukushima Prefecture,** but details will be discussed at the panel's meetings.

The government has been checking distribution routes of crushed stones from quarries in Fukushima since the detection of the building materials suspected to have been radioactively contaminated.

The gravel used was shipped from a quarry within the evacuation zone near the stricken plant sometime between the beginning of the nuclear crisis and the government's designation of the evacuation zone on April 22.

The crisis was triggered by the earthquake and tsunami on March 11.

So far, a relatively high level of radiation has been detected at 22 locations in Fukushima Prefecture, mostly resident houses, according to government checkups, jointly conducted by local municipalities.

Crushed stones suspected to have been radioactively contaminated may have been used at more than 1,000 construction sites, and so far the measurement of radiation levels has been conducted at **only 10 percent of them.**

The government will speed up its radiation check process to complete it by the end of March, Edano said.

February 06, 2012

High radioactive cesium levels detected in worms 20 km from nuke plant

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na008000c.html>

Radioactive cesium registering some 20,000 becquerels per kilogram has been found in worms 20 kilometers from the damaged Fukushima No. 1 nuclear plant.

The cesium was detected by a team including Motohiro Hasegawa, chief researcher in soil zoology at Japan's Forestry and Forest Products Research Institute. **Worms are a source of food for many wild animals, and it is feared that radiation could gradually accumulate in the bodies of animals throughout the food chain.**

The research team's findings will be announced at a meeting of the Ecological Society of Japan, to commence in the Shiga Prefecture city of Otsu on March 17.

Researchers dug up between 40 and 100 worms in national forests in the Fukushima Prefecture village of Kawauchi, which lies partly in the exclusion zone around the nuclear plant; the village of Otama, located 60 kilometers from the plant; and the town of Tadami, about 150 kilometers from the plant, between late August and late September last year.

The worms in Kawauchi registered 20,000 becquerels per kilogram of radiation. In Otama the level was around 1,000 becquerels per kilogram, while in Tadami 290 becquerels per kilogram was recorded.

The airborne radiation dose in Kawauchi at the time of the investigation was 3.11 microsieverts per hour, while in Otama, it was 0.33 microsieverts per hour, and in Tadami it was 0.12 microsieverts per hour. **The figures show radioactive cesium concentration was greatest in the areas where airborne radiation dosage was highest.**

In surveys conducted by the Forestry Agency between August and September last year, radioactivity of 1.38 million becquerels per square meter of soil was measured in Kawauchi, compared with between about 80,000 and 120,000 becquerels in Otama, and 20,000 becquerels in Tadami.

Much of the radioactive substances released from the plant in the nuclear disaster remains on fallen leaves. It is thought that worms have ingested the organic matter formed from the breakdown of these leaves.

Govt to measure radiation levels in no-fly zone

http://www3.nhk.or.jp/daily/english/20120206_08.html

Japan's government will measure radiation levels around the troubled Fukushima Daiichi nuclear plant as a step toward revising the no-fly zone over the site.

No aircraft has been allowed to fly within a 20-kilometer radius of the plant since the nuclear accident.

The government says it will revise the no-fly zone as it confirmed in December that the nuclear reactors have now reached a state of cold shutdown.

Starting Monday and continuing for several days, helicopters flying at an altitude of about 300 meters will collect air samples around the plant to measure radiation levels.

There are no specific standards on radiation levels for the designation of no-fly zones. The government plans to revise its earlier decision based on data collected during the flights.

Plowing technique to fight spread of radiation demonstrated

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na010000c.htm>

IWAKI, Fukushima -- A plowing technique being considered to fight the spread of radiation was demonstrated here on Feb. 2, though some farmers on hand were disappointed.

In the demonstration, four large machines dug up earth from around 30 centimeters deep to replace potentially contaminated topsoil and reduce the amount of radiation crops absorb from it.

According to a prefectural official, radiation readings in the field were 0.3 to 0.42 microsieverts on Feb. 1, and 0.23 to 0.3 microsieverts after the plowing. "There was an effect," the official said.

Around 150 people including local farmers gathered to watch the demonstration. Some farmers complained, however, that "expensive machines are necessary" for the plowing technique, and that an overall decontamination plan for the city's fields has still not been decided on.

US univ. to monitor wildlife in Fukushima

http://www3.nhk.or.jp/daily/english/20120204_05.html

A US research team will conduct a long-term study on the impact of radiation exposure on wild animals and plants around the Fukushima Daiichi nuclear power plant.

The team from University of South Carolina, led by Professor Timothy Mousseau, will begin the study in Fukushima Prefecture and other areas of Japan in May.

The team has been studying the impact of radioactive fallout from the Chernobyl nuclear accident on wildlife around the plant for more than 13 years.

Its study shows a decrease in the number of birds and insects, as well as abnormalities in animals even in areas with low radiation levels of one to 3 microsieverts per hour.

The team says long-term research is likely to shed light on the impact of low-level radiation from the Fukushima accident on wildlife and that it hopes to cooperate with Japanese researchers.

Professor Mousseau will visit Fukushima later this month in preparation for the study. He says generational change of animals, such as birds, is quicker than that of humans and will provide clues to the impact of radiation on human genes.

Japan's nuclear stress tests deemed consistent with IAEA standards

<http://mdn.mainichi.jp/mdnnews/news/20120131p2g00m0dm081000c.html>

TOKYO (Kyodo) -- An International Atomic Energy Agency fact-finding team said Tuesday that Japan's nuclear stress tests, a key step for restarting reactors following the Fukushima nuclear crisis, are "generally consistent" with IAEA safety standards.

On the last day of its nine-day mission to Japan to review the tests at nuclear power plants, the IAEA delegation conveyed its findings to the government's Nuclear and Industrial Safety Agency, while also making some recommendations to improve the tests's effectiveness.

"The conclusion of the team is that NISA's instructions and review process for the comprehensive safety assessments are generally consistent with IAEA safety standards," the delegation said in its preliminary report.

Tokyo introduced the stress tests after the meltdown at Tokyo Electric Power Co.'s Fukushima Daiichi power plant in the wake of the March quake-tsunami disaster, to check how much leeway the nation's nuclear power plants have to withstand earthquakes, tsunami and the loss of power.

To confirm if the test method is consistent with global safety standards, the government asked the Vienna-based body to verify them.

But there remains criticism among some local governments hosting nuclear power plants and experts that the stress tests need to reflect the findings that the government's accident investigation team has yet to compile on the Fukushima nuclear crisis.

NISA earlier compiled a draft report endorsing results of first-round stress tests that Kansai Electric Power Co. submitted with regard to the No. 3 and 4 reactors at its Oi power plant in Fukui Prefecture. The two reactors are currently idled for scheduled checkups.

The government's nuclear safety agency is set to finalize the report after studying the IAEA's findings, and will have it checked by the Nuclear Safety Commission of Japan.

James Lyons, nuclear installation safety director of the IAEA's Nuclear Safety and Security Department who heads the delegation, said at a press conference that deciding whether to restart the reactors is up to the Japanese government.

Currently, only three of Japan's 54 commercial reactors are operating. Japanese reactors must shut down for maintenance every 13 months, and so far no idled reactor has passed the stress tests, a prerequisite for resuming operations.

If no idled reactors get approval to restart, Japan will be without any operating reactors by the end of April.

Tokyo gov. opposes 'N-vote'

<http://www.yomiuri.co.jp/dy/national/T120211003443.htm>

Tokyo Gov. Shintaro Ishihara has spoken against establishing an ordinance to hold a referendum among residents of the capital on whether the operation of nuclear power plants should be allowed.

"It's impossible to create such an ordinance, and I have no intention of doing so," Ishihara said during a regular press conference Friday.

Ishihara's comments came as it appeared likely a citizens advocacy group that aims to bring about the referendum in Tokyo would succeed in its campaign to collect the number of signatures legally required to directly petition the metropolitan government to establish an ordinance.

The citizens group is called "Let's Decide Together/Citizen-initiated National Referendum on Nuclear Power."

Ishihara criticized activity against nuclear power, saying: "The most troublesome thing among humans is sentiment. Because Japanese have the trauma of atomic bombs, people speak [against nuclear power plants] out of fear.

"The progress of human beings has been achieved through their own development of technology, overcoming setbacks and failures."

If the group submits a direct petition for a referendum ordinance to the governor, Ishihara will have to submit a bill for the ordinance to the Tokyo Metropolitan Assembly with his opinion attached.

The assembly will then deliberate whether to create such an ordinance.

<http://mdn.mainichi.jp/mdnnews/news/20120212p2a00m0na007000c.html>

From atomic bombings to nuclear disaster: director turns camera toward Fukushima

Director Hidetaka Inazuka, known for his documentary on the late double atomic bomb survivor Tsutomu Yamaguchi, has turned his attention toward Fukushima Prefecture, covering the prefecture in a new film on people exposed to radiation from the crippled Fukushima No. 1 Nuclear Power Plant.

The 61-year-old filmmaker's new work is titled "Fukushima 2011: Hibaku ni Sarasareta Hitobito no Kiroku" (Fukushima 2011: Records of people exposed to radiation). It follows survivors of the atomic bombing of Hiroshima and Nagasaki who are now living in Fukushima, as well as the people facing radioactive contamination of their hometowns. The film is **due to be screened across Japan from mid-March**. It will also be shown at the Los Angeles Japanese Film Festival in April.

One subject of the new documentary is a man in his 80s who survived the atomic bombing of Hiroshima at an army barracks in the city.

"Even when there were explosions at the nuclear power plant I didn't feel scared. I've been hit by a bombing before, and it's 30 kilometers (from my place to the nuclear plant)," he says.

After the war, the man took up dairy farming, but the nuclear disaster triggered by the March 2011 Great East Japan Earthquake and tsunami forced him to abandon his business.

"I had 46 cows, but I sold them off for 800,000 yen. I can get by for a year or two, but there's no telling what's in store after that. I think about my children and grandchildren every day," he tells the camera.

In April last year, Inazuka visited the United States for a screening of his documentary "Twice Bombed: A Legacy of Yamaguchi Tsutomu." The film traces Yamaguchi's activities speaking about surviving the atomic bombings of both Hiroshima and Nagasaki. Yamaguchi died in 2010 at the age of 93. The documentary was well received in the United States, but after the outbreak of the Fukushima nuclear disaster, Japanese people in the U.S. complained that the effects of radiation were not being properly communicated in Japan.

Hearing such complaints, Inazuka recalled the words of Yamaguchi: "The world in which people live must be nuclear-free. We can't prevent (nuclear) accidents with current technology. If we don't become nuclear-free, the downfall of mankind will draw closer."

In May last year, Inazuka visited Fukushima Prefecture, and he focused his camera on the people in the municipality of Iitate before the whole village was evacuated, as well as on people in the city of Soma and other areas where many were killed by the March 11, 2011 tsunami. The film covers people's efforts to restore and revitalize their hometowns, where bonds between families and communities have been severed as a result of the disaster.

Included in the film is 69-year-old Hiromi Sato, a restaurant operator in the city of Minamisoma.

"My neighbors starting leaving, and everyone sent me emails saying 'get out of there' so I started to get scared," she says. "But I didn't want to live in a shelter." She reopened her restaurant after the "Golden Week" string of public holidays in May 2011.

"There are various circumstances among the people who stay, those who leave, and those who return," Inazuka says. "I want to cover the people who are confronting the issues of life wholeheartedly."

Nobel laureate, citizens call for abolition of nuclear power

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm021000c.html>

TOKYO (Kyodo) -- An antinuclear civic group led by **Nobel literature laureate Kenzaburo Oe** and other celebrities held rallies in Tokyo and Niigata Prefecture on Saturday calling for the abolition of nuclear reactors in the aftermath of radiation leaks at the Fukushima No. 1 power plant.

Addressing the protesters gathered at Yoyogi Park in Tokyo, who numbered around 12,000, according to the organizers, Oe insisted on the abolishment of nuclear reactors.

"We will be handing nuclear waste generated from the nuclear reactors to our grandchildren. This is unethical conduct," Oe said.

The rallies were held as part of the group's campaign to collect 10 million signatures against nuclear power to submit it to the prime minister and the chiefs of both chambers of the Diet. The executive committee for the "10 Million People's Action to say Goodbye to Nuclear Power Plant" campaign said earlier it has gathered about 4 million signatures so far in sympathy with its goal to abolish all 54 commercial reactors in Japan.

Taro Yamamoto, an actor who is known as an anti-nuclear advocate, also took part in the rally.

"If a massive earthquake occurs now, our country will be finished. We cannot have the nuclear reactors resume their operations," he told the protesters.

On March 11, the first anniversary since the disastrous earthquake and tsunami prompted the worst nuclear crisis since Chernobyl at Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant, the group plans to hold a rally in Koriyama in Fukushima Prefecture.

Citizens group runs full-page anti-nuclear ad in Mainichi

<http://mdn.mainichi.jp/mdnnews/news/20120211p2a00m0na004000c.html>

The ad carried in the Feb. 11 morning edition of the Mainichi Shimbun.

A citizens group formed by intellectuals Shinichi Nakazawa, Tatsuru Uchida, and writer Seiko Ito ran a full-page anti-nuclear power ad in the Feb. 11 edition of the Mainichi Shimbun.

The ad reads in large print, "We aim for a Japan with no nuclear power plants." Nakazawa says the ad "is valuable in that it makes the opinions of people below the surface (of public discourse) visible through newspapers."

The ad was endorsed by some 150 people, mainly musicians and others in the arts, as well as around 20 organizations.

"To be ethical towards the future, we have to change direction," says Ito.

TEPCO has paid 229.2 billion yen in damages for nuclear crisis

<http://mdn.mainichi.jp/mdnnews/news/20120210p2a00m0na007000c.html>

Tokyo Electric Power Co. (TEPCO), operator of the crippled Fukushima No. 1 nuclear plant, has paid approximately 229.2 billion yen in damages to victims so far, a company executive said.

As of Feb. 7, the company had received about 86,500 claims for compensation for financial losses the applicants say were caused by the nuclear disaster triggered by the March 11, 2011 tsunami. The company has paid compensation to about 45,900 of the applicants -- about 30,000 individuals and 15,900 companies and other organizations -- through settlements, managing director Naomi Hirose told the government's nuclear crisis damage dispute examination panel on Feb. 9.

If compensation paid earlier by the utility as a provisional measure is included, the figure rises to some 370.5 billion yen.

Municipalities dissatisfied with gov't's rice-planting restriction: survey

<http://mdn.mainichi.jp/mdnnews/news/20120210p2a00m0na011000c.html>

FUKUSHIMA -- Of the 12 local municipalities where rice harvested in 2011 was found to have cesium levels that would prohibit them from planting rice this spring, 11 are critical of the government's stand, a Mainichi survey has found.

The national government's new radiation standard of 100 becquerels per kilogram is set to take effect in April. The current provisional limit is 500 becquerels per kilogram.

Over 100 becquerels of radioactive cesium per kilogram of rice has been found in 12 municipalities in Fukushima Prefecture. Eleven of these municipalities are dissatisfied with the planting restriction in districts where cesium levels fell between 100 and 500 becquerels per kilogram, and four are appealing for permission to plant rice in districts where cesium levels surpass the current provisional maximum of 500 becquerels per kilogram.

The Ministry of Agriculture, Forestry and Fisheries is set to incorporate the demands of various municipalities in drawing up planting regulations this month, but it appears reaching an agreement that will satisfy all parties will be difficult.

The agriculture ministry has already announced plans to restrict the 2012 planting of rice in districts where over 500 becquerels of radioactive cesium per kilogram of rice has been detected. As for areas where rice was found to have cesium levels between 100 and 500 becquerels per kilogram, the ministry is in talks with local municipalities to restrict planting in areas with large concentrations of farms exceeding 100 becquerels, and to permit planting in less concentrated areas.

Of the 12 municipalities affected and surveyed, the city of Nihonmatsu did not submit responses. The remaining 11 cities, towns and villages said they want planting to continue in areas where between 100 and 500 becquerels of cesium per kilogram of rice was found, citing farmers' diminishing motivation to work and deteriorating farm conditions as reasons to do so. "The population is quickly aging, and it wouldn't be practical for (the national government) to come back to us several years later and tell us we can start planting again," an Otama village official said.

With the exception of farms in the cities of Fukushima, Date and Nihonmatsu, where over 500 becquerels of cesium per kilogram of rice was detected, only a few farms in the remaining nine municipalities were found to have rice with over 100 becquerels of cesium per kilogram. In the village of Nishigo, only three of 483 farmers there harvested rice with over 100 becquerels per kilogram, with the maximum being 155 becquerels. Local officials believe that if farms are thoroughly decontaminated prior to planting, and once testing of all bags of rice begins as planned in fiscal 2012, the risks of any contaminated rice reaching the market can be avoided.

The cities of Fukushima and Date, along with the towns of Kawamata and Kunimi, said that planting should not be restricted for farms with rice exceeding 500 becquerels of cesium per kilogram. Fukushima city officials seek permission to grow rice for research purposes, while Date city officials emphasize that rice farmers live for rice cultivation, even if prices are lowered. Meanwhile, Kunimi officials stated that if rice planting is going to be restricted this year, "the national government should shoulder the burden of decontamination so that there is hope for 2013 and beyond."

In November 2011, rice harvested in the Onami district of the city of Fukushima was found to have more than the provisional permissible amount of radioactive cesium. Emergency tests were subsequently conducted on rice from 23,247 farms in 29 municipalities. Over 100 becquerels of cesium per kilogram of rice was found from some of the farms in 12 cities, towns, and villages.

February 09, 2012

Govt asks Fukushima to restrict rice planting

<http://www.yomiuri.co.jp/dy/national/T120208005350.htm>

FUKUSHIMA--The government has asked local municipalities in Fukushima Prefecture to refrain from planting rice this year in districts where radioactive cesium exceeding the government's new limit was found in last year's harvests, according to government sources.

The restriction applies to districts in which rice harvests cultivated in 2011 were found to contain **100 becquerels per kilogram or more of radioactive cesium**.

Some of last year's harvests of unpolished rice in the prefecture were found to contain radioactive cesium exceeding the government's previous interim limit of 500 becquerels per kilogram.

Results of research by the prefectural government showed that rice harvests containing radioactive cesium over the new limit of 100 becquerels per kilogram were found in 583 farming households in 65 districts in 12 municipalities.

The prefectural government said about 59,000 farming households in 371 districts in 48 municipalities in the prefecture planted rice in 2011.

The research was conducted on 23,247 households in 151 districts in 29 municipalities in the prefecture.

If the central government's plan is implemented, the restriction will likely be imposed on most of the districts, with a few exceptions.

The central government in December decided restrictions would be necessary if levels of radioactive cesium in harvests exceeded the interim limit.

For cases in which the amount of radiation exceeds the new limit, the central government said it would consult the prefectural and municipal governments.

Officials from the Agriculture, Forestry and Fisheries Ministry visited the Date city government office on Friday to brief Date officials on the restrictions on rice cultivation.

The ministry officials said the government wants to restrict rice planting in six districts where 500 becquerels per kilogram or more of radioactive cesium were detected, and six additional districts where between 100 becquerels and 500 becquerels were detected. The town comprises 21 districts.

But the officials also told the city government that the restriction may not be imposed in districts with levels of radioactive substances above the new limit if the number of questionable spots were limited and if there was clear evidence of a reduction in the quantity of radioactive cesium.

Based on such criteria, **about 850 hectares, or more than 60 percent, of all rice paddies in the city will be restricted from growing rice this year.**

However, in two affected districts, the detected levels exceeded the new limit in only one or two rice paddies, and the amount of excess cesium was limited.

An official of the ministry said the restriction would not apply to the two districts if it could be shown that "proper cultivation would prevent contamination [of the rice]."

The central government's policy was reported to the city's assembly on Tuesday.

Mayor Shoji Nishida opposed the restrictions, saying the city could not accept the central government's request. "The measure will rob farmers of their morale and increase the amount of unused farmland," the mayor said.

He indicated an intention to work with nearby municipal governments, including the Fukushima city government, to urge the central government to allow rice planting in all areas in the prefecture.

Ministry officials also visited the Kunimi town government in the prefecture on Friday.

Kunimi officials said the ministry officials presented the plan to restrict rice cultivation in the town's districts where 100 becquerels or more of radioactive cesium were detected in last year's rice harvests.

The ministry officials told the town government that in principle the restrictions would apply to those districts, and showed which ones would be subject to the curbs.

February 08, 2012

70% of nuclear reactor hosts cautious on restart

http://www3.nhk.or.jp/daily/english/20120208_28.html

An NHK survey has found that more than 70 percent of Japanese municipalities that host nuclear power plants are cautious about restarting the reactors.

51 of Japan's 54 nuclear reactors are currently out of operation. Restarting them would require the approval of local municipalities.

NHK surveyed 29 municipalities, excluding those in Fukushima Prefecture.

5 of them, or 17 percent, said they would give the go-ahead for the reactors to resume operation. But 21 municipalities, or 72 percent, said they wouldn't allow it, or that they cannot yet decide.

Municipalities that expressed caution said they cannot be sure whether the reactors are really safe, and cited the difficulty of persuading residents while the government has yet to decide on its nuclear policy.

Asked what is needed beside stress tests to restart the reactors, 48 percent said a satisfactory investigation into the accident at Fukushima Daiichi plant, and understanding by local residents. 38 percent cited new government safety regulations.

The municipalities stressed their concern over reactor safety, and demanded more government accountability.

Child population drops in disaster-hit prefectures

http://www3.nhk.or.jp/daily/english/20120208_05.html

The number of children has significantly decreased in 3 Japanese prefectures hit by the March 11th disaster.

The Education Ministry says the child population as of May 1st in Iwate, Miyagi and Fukushima fell by more than 27,000 from a year earlier to about 834,000.

Fukushima saw the biggest fall of 5.8 percent, or more than 17,000, followed by a decrease of 2.3 percent in Iwate and minus 1.7 percent in Miyagi.

The ministry says the nuclear accident at the Fukushima Daiichi plant is to blame for an 11-percent decline in the number of kindergarteners and a nearly 8-percent drop in the elementary school population in the prefecture.

It says smaller children are more vulnerable to radiation and are likely to have been evacuated to other prefectures.

The child population in the 3 prefectures had been falling even before the disaster due to the low birthrate.

February 06, 2012

1.5-fold rise eyed for nuke plant operators' payments to damages fund

<http://mdn.mainichi.jp/mdnnews/news/20120206p2g00m0dm003000c.html>

TOKYO (Kyodo) -- The government has decided on a plan to require that Japan's 12 nuclear power plant operators contribute a total of 150 billion yen annually from fiscal 2012 to a state-backed facility to help Tokyo Electric Power Co. meet huge compensation payments over the crisis at its Fukushima Daiichi nuclear plant, one and a half times the initially planned amount, sources familiar with the matter said Sunday.

The government will ask for larger contributions than previously sought because of growing calls for smooth compensation payments to victims of the crisis triggered by the earthquake and tsunami on March 11, 2011, the sources said.

The contribution program is intended to divide the burden from the Fukushima crisis among all nuclear reactor operators and covers nine of Japan's 10 electric power companies, excluding Okinawa Electric Power Co., which does not operate a nuclear power plant. The fund also covers Japan Atomic Power Co., Electric Power Development Co. and Japan Nuclear Fuel Ltd.

The government will finalize details of the program, including the planned increase in contributions, by the end of fiscal 2011 to March 31.

Contributions by the 12 companies became mandatory with the establishment of the Nuclear Damage Liability Facilitation Fund on Sept. 12. For fiscal 2011, the 12 companies are required to contribute a total of just over 70 billion yen to the state-backed fund for the period since its establishment.

Tokyo Electric would contribute 50 billion yen to the fund annually, the highest among the 12 companies, starting in fiscal 2012, and Kansai Electric Power Co. would contribute the second-largest sum of 25.8 billion yen as it operates more nuclear plants than other utilities.

Other expected contributions include 13.8 billion yen from Kyushu Electric Power Co., 13.0 billion yen from Chubu Electric Power Co. and 8.7 billion yen from Tohoku Electric Power Co.

There is opposition among government officials to increasing contributions to the fund amid concern that utilities could be prompted to raise electricity charges, the sources said. But the government intends to go ahead with the increase, expecting that electricity charges will be held in check as the Ministry of Economy, Trade and Industry is reviewing utilities' calculation of costs for setting power bills.

February 05, 2012

573 deaths 'related to nuclear crisis'

<http://www.yomiuri.co.jp/dy/national/T120204003191.htm>

A total of 573 deaths have been certified as "disaster-related" by 13 municipalities affected by the crisis at the crippled Fukushima No. 1 nuclear power plant, according to a Yomiuri Shimbun survey.

This number could rise because certification for 29 people remains pending while further checks are conducted.

The 13 municipalities are three cities--Minami-Soma, Tamura and Iwaki--eight towns and villages in Futaba County--Namie, Futaba, Okuma, Tomioka, Naraha, Hirono, Katsurao and Kawauchi--and Kawamata and Iitate, all in Fukushima Prefecture.

These municipalities are in the no-entry, emergency evacuation preparation or expanded evacuation zones around the nuclear plant, which suffered meltdowns soon after the March 11 disaster.

A disaster-related death certificate is issued when a death is not directly caused by a tragedy, but by fatigue or the aggravation of a chronic disease due to the disaster. If a municipality certifies the cause of death is directly associated to a disaster, a condolence grant is paid to the victim's family. If the person was a breadwinner, 5 million yen is paid.

Applications for certification have been filed for 748 people, and 634 of them have been cleared to undergo screening.

Of the 634, 573 deaths were certified as disaster-related, 28 applications were rejected, four cases had to reapply because of flawed paperwork, and 29 remain pending.

In Minami-Soma, a screening panel of doctors, lawyers and other experts examined 251 applications and approved 234 of them. The panel judged two deaths were not eligible for certification and 15 were put on hold.

"During our examination of the applications, we gave emphasis to the conditions at evacuation sites and how they spent their days before they died," a city government official said. "However, the screening process was difficult in cases when people had stayed in evacuation facilities for an extended time and when there was little evidence of where they had been taking shelter."

Survey: 2.3% of farmers produce rice above cesium safety standard

http://ajw.asahi.com/article/0311disaster/life_and_death/AJ201202040050

About 2.3 percent of farmers in Fukushima Prefecture yielded rice with radioactive cesium levels exceeding the government's new safety standard, according to prefectural government officials.

The new standard of 100 becquerels per kilogram will take effect in April, replacing the provisional standard of 500 becquerels per kg.

The results of the Fukushima prefectural government's emergency survey, released on Feb. 3, will be used by the central government to decide on areas where farming will be banned this year.

But farmers in areas around the crippled Fukushima No. 1 nuclear power plant are growing impatient with the central government's indecision on the matter. They are also worried that no one will buy their produce over fears of radiation contamination.

According to the survey, which covered about 23,000 rice-growing households in 29 cities, towns and villages, contamination levels exceeded the new standard in rice grown by 545 farmers in 12 municipalities, many of them in northern Fukushima Prefecture.

The survey also showed rice cultivated by 38 farmers in three cities had readings above 500 becquerels per kg.

Radiation levels in rice grown by 84.3 percent of farmers were below measurable limits, according to the survey.

The prefecture conducted the survey after radioactive cesium levels higher than the provisional standard were found in rice grown in the Onami district of Fukushima, the prefectural capital, in November.

The central government said it will prohibit the planting of seeds in areas that are heavily contaminated. But it has not decided which areas should face such restrictions under the new standard.

Agriculture minister Michihiko Kano said in a news conference on Feb. 3 that the government should not impose limits on planting.

“We should respect the feelings of farmers,” he said.

A farm ministry official also said the decision for this year would be extremely tough because the lines marking sections under restriction must be drawn within areas where contamination levels are publicized.

The government banned planting last year in areas from where residents had evacuated. But officials at municipalities have already announced plans to go ahead with planting this year, even in areas where contamination levels have exceeded the new limit.

The prefectural chapter of Japan Agricultural Co-operatives is seeking permission to plant in sections of areas where this year’s rice crop will likely clear the new safety standard. The chapter said rice paddies will be decontaminated and other measures taken before the planting starts.

The JA group is expected to forbid planting in areas where radiation levels are expected to remain above the safety limit.

In addition, the Fukushima city government is calling on the central government to permit the planting of rice crops that will be used for purposes other than for food.

“If farmers are not allowed to grow rice (this year), it will reduce their willingness to produce,” an official in the city’s agriculture section said. “Rice fields will also become run-down.”

The city governments of Date and Motomiya have already said they will allow farmers to grow rice, in principle, while requiring decontamination of their rice paddies.

However, decontamination work could cause a new problem for the farmers, according to local officials.

“If rice fields are dug up too deeply, they may not be fit for growing the crop with too many rocks turning up,” an official said.

The heavily contaminated village of Kawauchi, meanwhile, said it will not allow any planting.

Rice farmers are divided.

A 58-year-old farmer in Date said contamination levels found in his rice were up to slightly more than 100 becquerels per kg under the survey.

He has already ordered seeds and fertilizers for his rice crops this year.

“Unless I can plant this year, my rice paddies will be overrun with weeds,” he said. “The fields would not be restored to the original condition for five or 10 years.”

He said he is frustrated by the lack of any long-term perspective by authorities over his livelihood.

“Is (the restriction) for just this year or for many more years?” he said. “It would mean a lifetime if the restriction is put in place until there is no more cesium contamination.”

Saburo Watanabe, a farmer in Aizubange, where all rice crops were found to be safe, said planting should be banned in areas where contamination levels exceed the new safety standard. He said the image of rice grown in Fukushima Prefecture must be protected.

“Consumers tend to think all rice crops from Fukushima Prefecture are the same,” said Watanabe, 58, who cultivates rice in a 12-heactare field.

He said most of his rice from last year remained unsold.

A 56-year-old farmer in Nihonmatsu said, “I want to grow rice, but we will be in trouble with unsold rice if we push for it and face another bad result.”

The rice in his district in Nihonmatsu was found with contamination levels above the new limit.

Evacuated village to reopen from April

<http://www.yomiuri.co.jp/dy/national/T120201006980.htm>

FUKUSHIMA--The mayor of a village near the crippled Fukushima No. 1 nuclear power plant declared Tuesday that local authorities would return in April, and urged residents who have evacuated due to the nuclear crisis to come back.

Kawauchi Mayor Yuko Endo said public facilities, such as schools and clinics, will also resume services in the village.

This is the first time one of the nine municipalities that fell in the government-designated evacuation zones has declared it will return. Most of Kawauchi's 3,000 residents evacuated elsewhere in Fukushima Prefecture--or outside the prefecture--after the nuclear crisis erupted in March.

"I hope residents will return in two or three years," Endo said.

Starting this month, the Kawauchi government will survey residents about their thoughts on returning, and hold meetings with them. The village government will provide dosimeters to returning residents.

Endo plans to move the village government back to its original location on March 24 and 25, and to resume administrative operations in April.

The Kawauchi government office has temporarily been relocated to Koriyama in the prefecture. Many Kawauchi residents have been staying in temporary housing units in Koriyama, and some of the village's services will still be offered in the city even after April.

Kawauchi has been divided into two zones since the nuclear crisis began--the 20-kilometer no-entry zone around the crippled nuclear plant, and the former emergency evacuation preparation zone.

Initially, the mayor planned to declare the return after decontamination work had lowered radiation levels in the village to less than one millisievert a year. However, decontamination work has been delayed partly by heavy snowfall, and it is likely that only public facilities and houses of families with children will be decontaminated by the end of March.

The village government said radiation levels in many residential areas have fallen below one microsievert per hour.

In Tuesday's declaration, Endo accepted that some residents had concerns about returning to the village.

"Those who can return will return," he said. "Those who are still anxious can return after watching the situation for a while."

Although the designation of the emergency evacuation preparation zone was lifted in September, only slightly more than 200 residents have returned to the village.

Declaration 'just the beginning' / Mayor's plea for villagers to return to Kawauchi draws mixed reactions

<http://www.yomiuri.co.jp/dy/national/T120201006236.htm>

FUKUSHIMA--"The declaration to return home is just the beginning," said Yuko Endo, mayor of Kawauchi, Fukushima Prefecture, in a speech at a press conference encouraging residents who had evacuated amid the Fukushima No. 1 nuclear power plant crisis to return to the village.

The Kawauchi government will reopen the village office and schools in April to prepare for the residents' return. But a complete return of evacuees is problematic, as decontamination work is ongoing.

Parts of Kawauchi fall within the nuclear plant's 20-kilometer no-entry zone, and some residents are concerned about the village's decision. "We can't return home yet," one said.

Tsunehiro Takano, the village's fifth administrative district leader, attended the same press conference as Endo Tuesday at the Fukushima prefectural government's office. Takano, 62, is also chairman of all the administrative district leaders in the village.

"Only people who want to return to Kawauchi should do so and go first. It's important to prepare an environment acceptable to other residents. If nobody returns to the village, no one will end up [following the first returnees]," Takano emphasized.

"It is also our generation that should commit ourselves to decontamination work," he added.

But Norimoto Igari, Kawauchi's third administrative district leader, had a different view.

"Most of the residents, including me, don't want to return," the 68-year-old said.

His administrative district consists of many elderly people living alone.

"If stores don't reopen, elderly people without vehicles will face difficulties buying food," Igari warned.

Hiroichi Watanabe is the village's second administrative district leader and a rice farmer. The village government will order the village's farmers to refrain from planting rice this year.

"We farmers wonder what the point of hurriedly returning to Kawauchi is if we can't sell our rice," Watanabe said.

The answer is more straightforward for Nobuichi Kobayashi, leader of the eighth administrative district, which falls completely within the no-entry zone.

"We can't return," Kobayashi, 66, said.

The municipal government will build temporary housing units in Kawauchi for residents such as Kobayashi. However, according to Kobayashi, "Unless decontamination begins soon, the number of residents who refuse to return will increase."

===

Few kids want to return

Kawauchi has one nursery school, one primary school and one middle school. According to a survey by the village government, only 30 of 210 children want to return to school in Kawauchi from April.

Yoshinobu Ishii, the village schools' superintendent, said, "Even though the student numbers are few, we won't drop the level of our education."

The board of education intends to maintain a class for each grade instead of introducing composite classes comprising students from different grades.

It will also in April transfer the village-run cram school Kogakujuku from Koriyama, Fukushima Prefecture, to the village. Catering to students from the fifth grade of primary school to the third year of middle school, Kogakujuku was operating before the March 11 disaster.

According to the board of education, radiation levels in the Kawauchi Middle School yard dropped to 0.2 microsievert per hour in December, and 0.14 microsievert per hour at Kawauchi Primary School after decontamination had been carried out.

A 34-year-old woman living with her husband, 8-year-old daughter and 5-year-old son in a temporary housing unit in Koriyama after evacuating from her home in the no-entry zone, said: "Even though we

can return, we'll have to live in temporary housing. It's difficult for us to return until all the decontamination has been completed."

Kawauchi village in Fukushima calls on evacuees to return home

<http://mdn.mainichi.jp/mdnnews/news/20120201p2g00m0dm113000c.html>

FUKUSHIMA, Japan (Kyodo) -- The mayor of Kawauchi, a village in Fukushima Prefecture whose residents were forced to relocate following the nearby nuclear power plant crisis, called on some 2,600 evacuated villagers Tuesday to return home permanently.

"Let's return starting with those who are ready," Yuko Endo said at a press conference in Fukushima city, marking the first declaration among the nine town and village governments in the prefecture which evacuated their offices that it will return to its original location.

"There are matters of concern but there is no reason why we shouldn't take the first step forward," Endo added.

Chief Cabinet Secretary Osamu Fujimura said at a separate press conference that the declaration is an "important first step toward residents' returning to their home village," and added that the central government will "actively support" the Kawauchi village government's effort.

Kawauchi had about 2,990 residents before Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant was crippled by the earthquake and tsunami disaster of March 11, 2011.

About 75 percent of the villagers currently reside in the prefectural city of Koriyama where the Kawauchi government has relocated its functions because the village was partially designated as a no-entry zone set up by the central government around the nuclear power plant while the rest was categorized as an emergency evacuation preparation area.

In addition, a total of 542 Kawauchi residents were residing in 26 prefectures other than Fukushima as of Friday, while some 200 have returned to their homes since the central government lifted its evacuation advisory for the emergency preparation area of the village last September.

In November, the village government began decontamination work for schools and other public facilities in the hope of declaring in December that it would return to the village.

But the declaration was delayed for about a month as decontamination work is taking longer than expected. The work is expected to be completed by the end of March, paving the way for resumption of the village government, schools and other operations at the start of fiscal 2012 on April 1.

Most sections of the village are safe as radiation levels are less than 1 microsievert per hour, according to the Kawauchi government.

But the chances of all residents returning to the village are low in view of lingering radiation concerns.

TEPCO provided radiation map to U.S. before Japanese public

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm019000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. provided a contamination survey map of its crippled Fukushima No. 1 nuclear plant to the U.S. nuclear regulator nearly a month before its official disclosure to the public in Japan in late April last year, company officials said.

The revelation follows a series of revelations that the government data from the System for Prediction of Environmental Emergency Dose Information and the Japan Meteorological Agency's data on the projected radiation spread were provided to the United States and other international institutes before disclosure of the information in Japan.

TEPCO started making the map which described the amount of radiation at up to 150 spots around the buildings in the power plant site on March 22 and provided it the same day to the U.S. Nuclear Regulatory Commission at the request of its staff members dispatched to Japan after the March 11 earthquake and tsunami triggered the nuclear crisis, the officials said.

TEPCO officials and NRC staffers continued to share updated versions of the map almost every day via e-mail, they said.

TEPCO only started providing the data to Japan's Nuclear and Industrial Safety Agency on March 23. It waited until April 24 to make the map public, only after the media reported details of the map a day before.

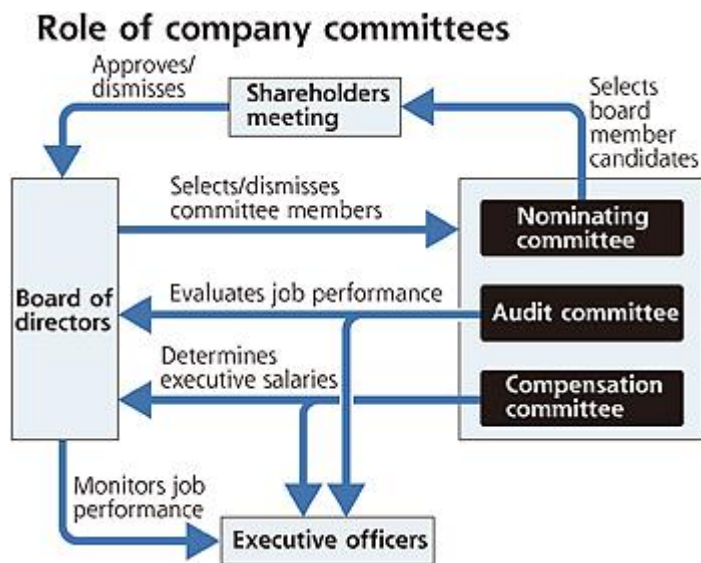

An official at TEPCO's public relations department said the company had provided data on the radiation amount at the Fukushima No. 1 complex at press conferences even before the official disclosure of the map, adding the utility "received advice" from the NRC.

<http://www.yomiuri.co.jp/dy/national/T120210006779.htm>

Govt to make TEPCO more transparent / 3 committees to oversee management

The Yomiuri Shimbun

The government plans to require Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear power plant, to introduce a committee governance structure to increase management transparency.

The policy is included in the draft comprehensive special business plan, which will be compiled by the government's Nuclear Damage Liability Facilitation Fund and TEPCO in March.

TEPCO Chairman Tsunehisa Katsumata is set to resign to take responsibility for the nuclear crisis. His successor will be recruited from outside the company to increase the transparency of TEPCO's management.

TEPCO tentatively decided Thursday to accept the fund's demand that it hold a one-third stake in the utility through a capital injection using taxpayers' money.

With the veto power that comes with a one-third stake, the fund will be able to overturn decisions in shareholders meetings concerning TEPCO's management policy.

The government decided TEPCO's opaque management practices--including high labor costs and donations as part of its expenses that are used to determine electricity charges--need to be changed if the utility is to regain public trust.

By making it possible for outside entities to oversee TEPCO's management system, the government aims to make it easier to gain the public's understanding over using public funds to assist TEPCO.

In addition to introducing a committee system, the draft plan for new management will introduce an internal company system to encourage TEPCO's internal divisions to compete with one another to reduce costs.

Concerning a financial assistance scheme for TEPCO, the fund will inject 1 trillion yen as additional capital while banks will loan a total of 1 trillion yen.

Alternatively, the banks could buy TEPCO's bonds, instead of extending loans.

To minimize the burden on the banks, hundreds of billions of yen out of the 1 trillion yen will be set aside as a line of credit from which TEPCO would be able to borrow money when necessary.

The fund plans to present the scheme to banks in the near future.

On Thursday night, a TEPCO executive said, "We assume the government wants to hold at least one-third [of a stake in TEPCO] through the injection of capital, as that percentage comes with veto power."

However, the government demands at least a majority of voting rights in TEPCO, which still leaves some gaps between the two parties' positions.

Under the committee-company system, TEPCO will have three committees within the board of directors--the nominating committee, which selects and dismisses members of the board; the audit committee overseeing the work of board members; and the compensation committee, which determines board members' salaries.

For all three committees, more than half of the members will be outside directors.

Under the system, executive officers will be appointed to carry out separate functions of business operations from the board of directors, which oversees management.

Pro-nuclear energy town councillor's firm had 700 million yen in nuke plant contracts

<http://mdn.mainichi.jp/mdnnews/news/20120207p2a00m0na023000c.html>

TAKAHAMA, Fukui -- A town assembly member here calling for the continuation of nuclear power is also president of a company that has received at least 700 million yen in nuclear-related construction contracts, it has been learned.

Akio Awano, 62, is vice-speaker of the municipal assembly of Takahama, which hosts a Kansai Electric Power Co. nuclear plant. He is also part of a local organization promoting nuclear power plants.

According to the Fukui Prefectural Government and other sources, Awano's firm, a metal processing company, has around 15 employees and earned about 200 million yen in fiscal 2010. It has an office in the Takahama nuclear plant and has expanded its business on a diet of nuclear plant-related construction.

Construction records show that Kansai Electric began contracting Awano's firm directly in the 1990s, and has forked out some 536 million yen to the company for 67 jobs in the past five years. Furthermore, Awano's company took 66 subcontracted jobs at the utility over the same period. Most local construction businesses get at most about 15 power company jobs per year.

In September of last year, Awano submitted a written statement seeking continuation of nuclear power generation, including the restart of Takahama plant reactors off-line for regular inspections. The statement was approved by an overwhelming majority of the town assembly.

However, Fukui Gov. Issei Nishikawa has said, "Unless the national government submits new safety standards reflecting the knowledge gained from the Fukushima nuclear disaster, I cannot agree" to a restart of the reactors. Oi and Mihama, two other towns in Fukui Prefecture also hosting nuclear facilities, have not passed resolutions in favor of restarting reactors.

Awano has defended himself by saying, "I submitted the statement after looking at the country's energy situation and judging that nuclear power is necessary. My actions as an assembly member and my management of the company are completely separate, and I was not influenced by the construction contracts."

The No. 1, 2, and 4 reactors at the Takahama plant are off-line for inspections. In January Kansai Electric submitted a safety evaluation of the No. 1 reactor to the Nuclear and Industrial Safety Agency, a prerequisite for it to be restarted. The agency and the Nuclear Safety Commission of Japan will look at the evaluation and Prime Minister Yoshihiko Noda will make a decision on the restart based on local opinions.

Kansai Electric has declined to comment on individual contracts, saying only that its business partners are "evaluated and registered in a fair manner, with the most appropriate company for a construction job chosen and contracted."

Nuke plant operators paid \$2 bil. to localities

http://www3.nhk.or.jp/daily/english/20120206_27.html

Newly disclosed documents show that nuclear power plant operators in Japan have paid more than 2 billion dollars to local authorities hosting their facilities **over the past 4 decades**.

NHK obtained information about the payments from 44 prefectures and municipalities based on the information disclosure system.

The information shows that the payments have reached 2.1 billion dollars since construction of nuclear plants began in the late 1960s.

Of the amount, Tokyo Electric Power Company which operates the disabled Fukushima Daiichi nuclear plant paid nearly 460 million dollars. Other utilities have continued making payments ever since the accident at the plant.

Power companies pay the money to promote the construction of nuclear plants. Some local governments ask for donations to invest the money in the regional economies.

The utilities view the payments as part of the cost of generating power and pass the expense on in utility fees.

But an economy ministry panel said last week that the payments should not be counted as a cost.

Host communities have spent the money in various ways. They include public works projects, events and scholarships as well as statues of animation characters and promotional videos.

The host communities also receive subsidies from the central government, but the payments decrease in stages. Until 2003, they were only allowed to use the money to construct public facilities.

The payments are apparently convenient for some communities that are struggling to find ways to maintain the facilities.

Kyushu men sent to Fukushima nuke plant under falsified labor deals

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na013000c.html>

As efforts to tame the crisis at the Fukushima No. 1 nuclear plant continue, laborers from as far as Kyushu have been dispatched there under illegal labor deals and forced to work inside at least one of the crippled plant's highly contaminated reactor buildings.

A man in his 40s from Nagasaki Prefecture recently related how he carried lead sheets weighing some 20 kilograms each up as high as the sixth floor of one building. A Geiger counter dangling from his neck sounded noisily and his mask misted over as temperatures climbed above 30 degrees Celsius.

"I was really angry because I was treated like a slave," Yosuke Nakayama, a pseudonym, said of his some 40 days at the Fukushima plant, starting in July last year.

The lead sheets were installed inside the plant's No. 1 reactor building to block radiation. Nakayama, however, was not angry about the hard work, but about the treatment he received upon returning home to Nagasaki.

He said he was paid 11,000 yen per day he worked for a company six layers down in a seven-layer outsourcing pyramid, with only the top-tier firm receiving orders directly from plant operator Tokyo Electric Power Co. He had been promised 14,000 yen per day, and had also been assured he would not have to enter the reactor buildings.

When Nakayama demanded an explanation for the 3,000 yen difference, his subcontractor mentioned the name of a Fukuoka-based crime syndicate.

"We don't care if yakuza show up," the contractor said, apparently threatening him.

A third-tier company to which Nakayama's employer dispatched laborers via two other firms has been slapped with administrative punishments twice for its ties to crime syndicates.

Contacted by the Mainichi, Nakayama's employer acknowledged the dispatch of workers without a license. "We received about 13,000 yen from a fifth-tier firm and we'd lose money unless we deduct expenses," the company said.

Businesspeople familiar with the Kyushu Electric Power Co.'s Genkai Nuclear Power Plant in Saga Prefecture say a significant number of laborers have been sent to Fukushima.

A utility work firm in Saga has been recruiting laborers from across Kyushu since last December, ostensibly for work at nuclear plants in Kyushu and Shikoku. The names of about 20 laborers are written on the firm's white board, along with their destination: "Fukushima No. 1."

An executive of the firm says it started sending laborers to Fukushima in response to requests from its business partners. "People from Kyushu are in demand because they're serious. We will send them again if requested."

A Saga man in his 30s did a job similar to Nakayama's at the Fukushima plant after being dispatched from a seventh-tier firm. He contacted the company after seeing a posting at a job-placement office and got the Fukushima job.

He received about 300,000 yen for some 40 days of work, and absorbed a radiation dose of some 10 millisieverts. "There are no jobs in my hometown, so it can't be helped," he says, adding he is waiting for another Fukushima assignment.

February 04, 2012

Falsified labor deals rampant at Japan's nuke plants, says suspect

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na016000c.html>

A power plant construction and maintenance firm has falsified worker contracts for temporary labor at nuclear plants across Japan for years, according to statements by one of the company's employees charged with involvement in the fraudulent agreements.

Hideo Ichise, 58, and two other people were indicted on Feb. 2 for the dispatch of a worker to the Oi nuclear plant in Fukui Prefecture under a false contract, a violation of the Employment Security Law. Ichise's employer Taihei Dengyo Kaisha Ltd. -- where he now serves as business manager after a stint as the firm's Oi operations chief -- along with Fukui Prefecture-based plumbing company Takada Kiko were also charged.

Investigators have discovered a dossier on falsified worker contracts at more than 30 Taihei Dengyo branches, further suggesting the firm has been involved in illicit labor deals involving nuclear power plants across the country.

Police have furthermore discovered cases of various personnel agencies siphoning off the wages of temporary workers at nuclear plants, while involvement of the Kitakyushu-based crime syndicate Kudo-kai has also been uncovered.

According to investigative sources, Ichise said, "We have participated in (illicit nuclear labor practices at the Oi plant) for many years. We have been doing the same thing at other nuclear power plants."

Taihei Dengyo's operating officer was also quoted as telling police, "Our company alone cannot hire many workers, so we (falsified labor contracts) knowing it was illegal."

Other sources involved in work at nuclear power plants have provided similar information, including one Saga Prefecture man in his 50s who worked at the Genkai Nuclear Power Plant there during regular inspections about three years ago. He was dispatched to a construction company by a temp agent called simply "boss." Although there was ostensibly a contract with the construction company and the man worked directly under a construction company employee, "boss" apparently took 5,000 yen out of his 13,000-yen daily wage.

A year earlier, the Saga man had also worked at the Genkai plant during a regular check as an employee of an electrical firm for about two months. A fellow worker in his 50s had to take more than two weeks off after injuring his ankle at the plant but had to pay his own medical bills.

In this case, the Saga man worked under the guise of the electrical firm. "There were gangsters among those bosses, and sometimes two bosses raked off my wages," the Saga man recalls.

A temporary personnel agency operator says, "Parent companies send us requests for a certain number of workers, and we submit a list of people who then go and work under those parent companies at nuclear power plants. We give the workers their wages after deducting our share." Another agent told the Mainichi, "There are times when gangsters are involved in recruiting workers. It is easy for us to hire them because they save us the trouble."

It is not clear why such unlawful labor practices have been overlooked. An inspector at a labor standards office stated, "It is very difficult to get a full picture of the labor practices at nuclear power plants because corporate parent-subsidiary relations change depending on their line of work. It is also difficult to conduct surprise on-site inspections of nuclear power plants because advance notification is necessary as part of antiterrorism measures."

Economy, Trade and Industry Minister Yukio Edano instructed electric power companies to abide by the law and bar crime syndicates from involvement in work at nuclear power plants. However

Takayoshi Yoroi, a professor emeritus of labor law at Ryukoku University, says, "Falsified labor contracts have been rampant for so long. If the government is dead serious about stamping them out, nuclear power plants will stop running. Power companies and general contractors simply have to directly hire workers, but I wonder if they have the determination to do so."

February 03, 2012

Indictment of contractors exposes illicit work at nuke plants

<http://mdn.mainichi.jp/mdnnews/news/20120203p2a00m0na018000c.html>

FUKUOKA -- Three people and two firms were indicted Feb. 2 on charges of dispatching a worker to the Oi Nuclear Power Plant in Fukui Prefecture under a falsified contract in violation of the Employment Security Law.

Those indicted by the Kokura Local Public Prosecutors Office are Hideo Ichise, 58, of Tsuruga, Fukui Prefecture, Yoshimi Tomita, 59, of Maizuru, Kyoto Prefecture, and Kanae Ikegami, 36, of Kitakyushu's Wakamatsu Ward. Prosecutors also indicted Taihei Dengyo Kaisha Ltd., a Tokyo-based power plant construction and maintenance firm, and Takada Kiko, a plumbing firm in Takahama, Fukui Prefecture.

The Kokura Summary Court on Feb. 2 fined Ichise and Tomita and the two firms 500,000 yen each and Ikegami 250,000 yen. Ichise is the Fukui business manager of Taihei Dengyo, and he previously served as the firm's Oi operation chief. Tomita is president of Takada Kiko while Ikegami is an executive of Dream, previously known as Soshin Kogyo, a plumbing and housing equipment firm. She is also the wife of a gang leader with ties to the Kitakyushu-based crime syndicate Kudo-kai.

"Many documents showing illegal labor were found, one after another, during our search. They proved **many years of shady deals**," says a senior officer with the Fukuoka Prefectural Police. **The case sheds light on not just one firm or one nuclear power plant but the nuclear power industry as a whole.**

Sixty-one-year-old Masaki Yoshimura (pseudonym) in Kitakyushu was dispatched to many nuclear power plants in Japan while working for a construction company for a period of 14 years that ended seven years ago. There were many companies involved in his work between his employer and general contractors such as nuclear power plant manufacturers. One of those companies was Taihei Dengyo.

Repairing plumbing was the main part of his job, but instructions came from different companies depending on which nuclear power plants he was working at. Electric power companies, operators of nuclear power plants, paid general contractors a daily pay of 100,000 yen, but Yoshimura got only 18,000 yen. More than 80 percent of his daily wage was siphoned off.

"It's the world of siphoning off. It's a system in which big companies make money handsomely," he says.

The nuclear job scandal involving Taihei Dengyo uncovered the fact that **illegal labor supports nuclear power businesses**. **Fake contracts and unlicensed dispatches of workers are peppered with acts**

of siphoning off pay. These practices have put laborers in an unstable position and invited crime syndicates' involvement.

"The Geiger counters quickly sound, so you can't work for so long. Fifty to 100 people have to work together. People at the bottom of society are there," Yoshimura says.

Radiation zones are divided into a scale from A to D, and workers assigned to D, the highest radiation zone, have to wear protective gear and layers of gloves. "Competent workers brought with them other workers' Geiger counters so they would not to exceed the dosage limits and to improve their work efficiency," Yoshimura said.

Stopping a nuclear reactor for just one day reportedly results in a loss to the owner of 100 million yen. A retired electric power company official says, "Electric power companies have repeatedly requested shorter inspections. But to shorten checks without changing the number of items to inspect, you have to either cut corners or force workers to work throughout the night," he says.

According to the Japan Nuclear Energy Safety Organization, about 90 percent of some 83,000 nuclear power plant workers who were exposed to radiation in fiscal 2009 were not employed directly by nuclear power plant operators. Their average radiation dosage was 3.6 times the level suffered by employees of those operators.

The Committee on Poverty of the Japan Federation of Bar Associations last year conducted a survey of nuclear power plant workers. Lawyer Tatsuo Watanabe, a member of the committee, says, "From an ethical point of view, we should check unlawful labor at nuclear power plants that is being done for economical reasons."

More than 1,000 workers are necessary for a regular inspection of a nuclear reactor, but postings for these jobs do not show up at job-placement offices. Most part-time nuclear workers find employment through personal connections and introductions. A labor bureau official says: "(The connections) are extra careful to not hurt the electric power companies. Those with strong personal connections have strong solidarity and are tightlipped. They are in a world of their own."

Editorial: Nuclear regulatory reform must weed out entrenched interests

<http://mdn.mainichi.jp/perspectives/news/20120201p2a00m0na004000c.html>

Bills relating to a shift in the nation's nuclear power policy were approved by the Cabinet on Jan. 31. In addition to the establishment of a new nuclear regulatory agency under the Environment Ministry, the government is aiming to legislate the lifespan of nuclear reactors, and require plant operators to outline specific measures against severe nuclear accidents.

Significant harm has been done by allowing the Nuclear and Industrial Safety Agency (NISA), an administrative body tasked to regulate nuclear power safety, to exist under the umbrella of the Ministry of Economy, Trade and Industry (METI), a major promoter of nuclear power. Divorcing nuclear

regulation from nuclear promotion and centralizing regulatory duties into one agency stands to reason. Changing the agency's name from the originally proposed "nuclear power safety agency" to "nuclear power regulatory agency" is likewise pertinent, considering the new agency's nature.

However, the mere alteration of a name and rearrangement of an organization will not result overnight in a highly independent agency specializing in regulation. Because many of the new agency staff members are likely to come from NISA, specific measures are necessary to secure the independence of the new body.

It remains unclear how a nuclear safety investigation committee, envisaged in one of the bills approved by the Cabinet, will contribute toward ensuring the safety of nuclear power. Since the Cabinet Office's Nuclear Safety Commission (NSC) lost the confidence of the Japanese public over its response to the ongoing nuclear disaster, the new committee cannot expect to gain it back without demonstrating its independence and competence.

The handling of the continuing nuclear crisis has been problematic particularly due to the government's lack of readiness, which has generated suspicions that the disaster could have been mitigated had the government been more capable of crisis management. Crisis management will be an important duty of the new regulatory agency, and must be attended to adequately.

Meanwhile, some things have slipped through the centralization of regulatory responsibilities. Safety research conducted by the Japan Atomic Energy Agency (JAEA) and the inspections and other safeguards implemented by the Ministry of Education, Culture, Sports, Science and Technology to prevent the diversion of nuclear material toward the production of nuclear weapons will not fall under the jurisdiction of the new regulatory agency. It remains to be seen how these tasks will be integrated into the new scheme.

Included in the latest bills are the designation of a 40-year lifespan for nuclear reactors and the implementation of "back-fit" measures that would hold existing reactors to the latest technological standards. The government claims that the combination of these two mandates would make it extremely difficult for reactors to continue running more than 40 years. The bills, however, include special exemptions allowing reactors to operate for up to 60 years. Stringent criteria must be set to prevent "exceptions" from undermining the rule.

We hope also that the proposed legal reforms lead to a stronger nuclear disaster prevention scheme. In the case of the Fukushima disaster, the off-site emergency response center failed to function. A fundamental review of Japan's nuclear crisis preparedness is imperative. Along with an expansion of disaster protection zones emphasizing nuclear disaster countermeasures, there is a pressing need to reassess national and regional disaster prevention plans.

Numerous corporations and organizations make up the national framework that had heretofore promoted nuclear power, and their role in "amakudari" -- literally "descent from heaven," referring to the practice of former bureaucrats taking advisory posts in industries they previously regulated -- has been pointed out. For effective regulations to gain ground, it is important to extend reform to such organizations with entrenched interests.

Fukushima No. 2 reactor temperature up to 82C, but not critical: TEPCO

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm020000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Sunday the temperature at the bottom of the No. 2 reactor at its crippled Fukushima No. 1 nuclear plant rose further to 82 C, but the reactor has not gone critical.

While the thermometer reading at shortly after 2 p.m. marked a new high since the reactor attained a cold shutdown in December, the utility known as TEPCO said it has confirmed that sustained nuclear reactions are not taking place in the reactor as **no radioactive xenon has been detected inside its containment vessel.**

TEPCO reported the latest development immediately to the Nuclear and Industrial Safety Agency of the Economy, Trade and Industry Ministry as the temperature exceeded the limit of 80 C designated by the company's safety regulation for maintaining a cold shutdown, it said.

It is considered desirable to keep the temperature below 80 C, while the bottom of a reactor pressure vessel must be kept below 100 C in a stable cold shutdown, in view of the margin of error of thermometers, according to TEPCO officials.

TEPCO plans to increase the amount of water injected as a coolant by 3 tons per hour and pour 1 ton of boric acid later Sunday to prevent any event of criticality.

As a reason for what is causing the temperature rise, TEPCO said it is possible the water flow is unstable and thus failing to cool the reactor stably, while also saying it will check the thermometer for any irregularities. The temperature was measured at 78.3 C at 10 a.m. and fell to 75.4 C at 11 a.m.

The decline occurred after TEPCO on Saturday night increased the amount of water being injected into the reactor to 14.6 tons per hour from 13.6 tons, after seeing the temperature rise to 73.3 C at 9 p.m. It reached 74.9 C at 11 p.m. Saturday. The temperature readings began rising on Feb. 1.

One of the three thermometers at the bottom of the reactor's pressure vessel stayed between 67 C and 71 C from Friday evening to Saturday evening after hitting 73.3 C on Monday.

Readings from two other thermometers that check the temperature at the bottom of the No. 2 reactor vessel were around 35 C, TEPCO said.

The Nos. 1 to 3 reactors at the Fukushima No. 1 plant in northeastern Japan experienced meltdowns as a result of the loss of key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

Temperature rising at No.2 reactor

http://www3.nhk.or.jp/daily/english/20120212_12.html

The temperature at the No.2 reactor of the Fukushima Daiichi nuclear power plant **keeps rising even after the injection of more cooling water on Saturday night.**

The plant operator, Tokyo Electric Power Company, or TEPCO, says a thermometer at the bottom of the reactor registered 78.3 degrees Celsius at 10 AM on Sunday.

The reading began to rise in late January to around 70 degrees. TEPCO pumped in more water to push down the temperature, but it rose again on Saturday night to 74.9 degrees.

The temperature continued to climb on Sunday morning to hit its highest level since last December, when the government and TEPCO declared all the reactors were at a state of cold shutdown, with their temperatures below 100 degrees.

TEPCO denied the possibility of nuclear criticality, saying 2 other thermometers at the bottom of the reactor show temperatures at around 35 degrees.

It adds that continuous nuclear fission would generate radioactive xenon, but gas samples collected from near the reactor found the element below the detection limit.

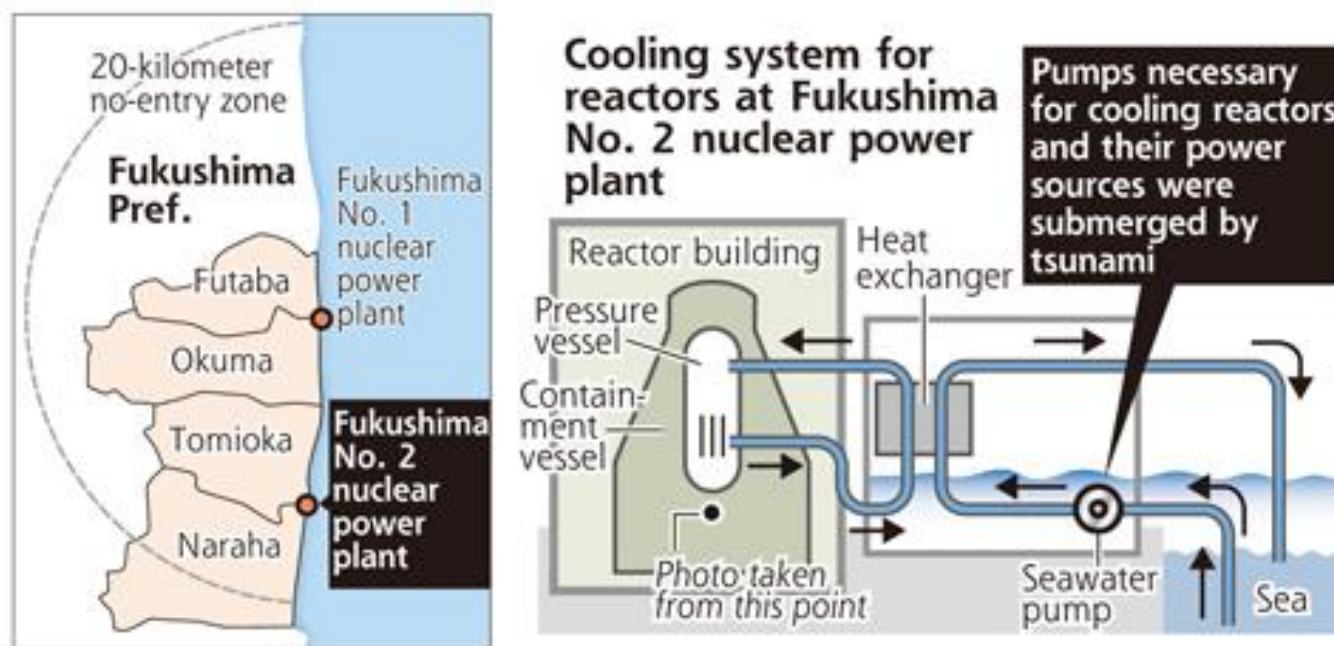

TEPCO is set to dump in boric acid to prevent any nuclear criticality later on Sunday and increase the volume of cooling water by 3 tons per hour.

Under new guidelines, **the company must keep reactor temperatures at 80 degrees or below**, given thermometers' margin of error of up to 20 degrees.

February 10, 2012

Fukushima No. 2 plant was 'near meltdown'

The Yomiuri Shimibun

FUKUSHIMA--The Fukushima No. 2 nuclear power plant was "near meltdown" after being hit by tsunami following the Great East Japan Earthquake on March 11, according to the head of the plant.

The No. 2 plant, on the border of Naraha and Tomioka towns in Fukushima Prefecture, was opened to the media Wednesday for the first time since the disaster. It is **12 kilometers from the Fukushima No. 1 nuclear power plant**, which suffered a meltdown. Both facilities are operated by Tokyo Electric Power Co.

Plant chief Naohiro Masuda, in charge of plant operations since the crisis, told reporters Wednesday, "The No. 2 plant almost suffered the same fate as No. 1 [which led to a severe crisis]."

On March 11, a **9-meter-high tsunami** struck the No. 2 plant, while the No. 1 plant was hit by a 13-meter-high tsunami. The tsunami caused the No. 2 plant's seawater pumps, used to cool reactors, to fail. Of the plant's four reactors, three were in danger of meltdown.

Luckily, one external high-voltage power line still functioned, allowing plant staff in the central control room to monitor data on internal reactor temperatures and water levels.

By March 15, the No. 2 plant's four reactors reached a state of cold shutdown without any leakage of radioactive materials.

"[At that point, the situation at the No. 2 plant] was considerably different from the No. 1 plant where it was difficult to know what was going on," Masuda, 53, said.

However, **despite intense efforts by all employees, it took a long time to stabilize the reactors.**

On March 11, **about 2,000 employees** of the No. 2 plant worked to stabilize the reactors. Some employees connected **200-meter sections of cable, each weighing more than a ton, over a distance of nine kilometers.**

Masuda noted the timing of the disaster was critical in saving the plant.

"We were lucky it happened on a Friday afternoon [and not on a weekend]," he said.

Masuda pointed out only 40 employees would have been at the plant if the earthquake had occurred in the evening or on a weekend.

"[In that case] it would be have been difficult for us to deal with the disaster," he said.

The Fukushima prefectural government conducted an on-site inspection at the No. 2 plant on Wednesday and repeated a request to TEPCO to decommission the facility.

Masuda did not elaborate and said, "At the moment, I can only say we'll maintain a state of cold shutdown."

The No. 2 plant's No. 1 reactor began operating in 1982. Following the Great East Japan Earthquake, a Nuclear Emergency Situation Declaration was issued for both the No. 1 and No. 2 plants. The declaration was lifted for the No. 2 plant in December.

February 09, 2012

Prefectural team makes 1st inspection of Fukushima No. 2 nuke plant

<http://mdn.mainichi.jp/mdnnews/news/20120209p2a00m0na009000c.html>

A team of Fukushima prefectural officials visited the Fukushima No. 2 nuclear plant on Feb. 8, marking the first prefectural inspection of the plant since the March 11, 2011 disasters forced it to shut down.

"Right now, the most important tasks are to keep the reactors in cold shutdown and cool the spent fuel rods while preparing safety measures to deal with any unexpected problems," said the deputy head of the prefecture's living environment division following the inspection. "I felt that work there to maintain emergency power supplies and prevent flooding of the plant buildings was progressing."

The reactors at the Fukushima No. 2 plant -- about 11 kilometers south of the disaster-struck Fukushima No. 1 nuclear complex -- stopped automatically when the Great East Japan Earthquake hit and are now in cold shutdown, but the plant was very nearly the site of a second nuclear crisis.

In circumstances similar to those at the No. 1 plant, the cooling systems in three of Fukushima No. 2's four reactors failed when the March 11 tsunami hit and knocked out their backup generators. Unlike the situation at the No. 1 plant, however, staff at the No. 2 station managed to patch into external power before the reactor cores could seriously overheat.

In December last year, the government's Nuclear and Industrial Safety Agency officially declared the nuclear emergency at the plant over, while Tokyo Electric Power Co. -- operator of both the Fukushima No. 1 and 2 plants -- has submitted a plan to the agency for maintaining cold shutdown.

Fukushima Prefecture is calling for the shutdown of all nuclear stations in the prefecture, including Fukushima No. 2.

However, Fukushima No. 2 plant director Naohiro Masuda suggested it's too soon to discount restarting the reactors there, saying, "Under present circumstances, it's impossible to say how the reactors here will be dealt with in the future. For now, we have to maintain a steady cold shutdown by transitioning from the temporary cooling equipment we now have in place to proper, permanent equipment."

Temperature inside reactor stops rising

<http://www.yomiuri.co.jp/dy/national/T120208005861.htm>

The abnormal rise in temperature in a reactor at the Fukushima No. 1 nuclear power plant has stopped, apparently because more water has been injected into the crippled reactor, according to Tokyo Electric Power Co.

TEPCO said the temperature at the base of the No. 2 reactor's pressure vessel had **fallen to 68.5 C at 5 p.m. Tuesday after earlier peaking at 73 C.** However, **the cause of the increased temperature remained unclear.**

Junichi Matsumoto, acting head of TEPCO's headquarters regarding nuclear plant locations, said increasing the amount of water injected hourly into the reactor by three tons to 13.5 tons since 4:30 a.m. Tuesday seemed to be having an effect.

"[The temperature] has begun falling after peaking," Matsumoto said.

Keeping the temperature at the base of the reactors at 100 C or less is a stable state known as cold shutdown. Reaching cold shutdown was a precondition for enabling the government to declare in December that the crisis at the nuclear plant had been brought under control.

TEPCO's guideline stipulates the temperature should be kept at 80 C or lower to allow for possible measurement errors.

The reactor will need to be monitored carefully because the condition inside the reactor's inner part containing melted nuclear fuel is not clear, and the reason for the temperature rise has yet to be pinpointed.

Currently, cooling water is injected into the No. 2 reactor via two piping systems--the coolant water supply system that can deliver water to the vessel's base, and the reactor core water spray system that aims water directly at the reactor core.

The temperature in the pressure vessel's base began rising from 45 C around Jan. 26, when the water injection balance of the two systems was changed several times during pipe repair work.

One of three thermometers installed around the base recorded a temperature increase of nearly 30 C over a little more than 10 days, reaching as high as 73 C at one time.

According to TEPCO, the volume of water being injected was far less than usual. It is possible that the way water was injected into the reactor might have changed around the time of the pipe repairs, and that water did not reach some of the fuel.

TEPCO also speculated that the fuel, which had melted and then solidified, might have cracked due to some shock or dropped down and changed shape.

February 08, 2012

TEPCO injects more water into reactor

<http://www.yomiuri.co.jp/dy/national/T120207005567.htm>

Tokyo Electric Power Co. has increased the amount of water being injected into the No. 2 reactor at the Fukushima No. 1 nuclear power plant because the temperature at the base of the pressure vessel has been rising, the company said Tuesday.

The 13.5 tons being injected each hour to cool the reactor--an increase of three tons--is the most since the government announced the crippled plant had achieved a stable state of cold shutdown in December.

According to the utility, after increasing the amount of water being injected at 4:30 a.m. Tuesday, the temperature at the vessel's base has been fairly constant: It was 72.2 C at 5 a.m. and 69 C at 10 a.m. The temperature at the base of the vessel had been 45 C as of Jan. 27, but began rising earlier this month. TEPCO is investigating the cause of the higher temperature.

Temperature decreasing inside Fukushima reactor

http://www3.nhk.or.jp/daily/english/20120208_26.html

Tokyo Electric Power Company says it has been able to lower the temperature inside the No.2 reactor at the troubled Fukushima Daiichi nuclear power plant by increasing the amount of water being injected into it.

TEPCO had been struggling to deal with rising temperatures inside the reactor. A thermometer located at the bottom of the reactor read 45 degrees Celsius on January 27th, but rose to over 70 degrees on Sunday. The cause is unknown, and two other thermometers at the reactor have shown no such increase.

TEPCO said on Wednesday that the temperature inside the reactor was 66.7 degrees at 5 AM, 5.5 degrees lower than a day earlier. The temperature gradually declined after the company increased the rate of water injection by 3 tons to 13.5 tons per hour on Tuesday.

Such a high rate of injection has not been used since just after the nuclear crisis began last March.

TEPCO says the temperature inside the reactor rose slightly to 68 degrees at 10 AM, but it is still dropping overall.

The utility cannot determine the exact situation inside the reactor or the cause of the temperature rise.

The utility says it will continue to monitor the situation closely while maintaining the current rate of water injection.

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](http://www.japantimes.co.jp/text/nn20120208f1.html) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that the situation is far from resolved and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the **spent fuel pools** sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the **fuel pool is now directly exposed to the outside environment** after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.

Making matters worse, the government doesn't have any place to permanently store it, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, the simulation was "so shocking" that top government officials decided to keep the paper secret by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

February 07, 2012

Temperature remains high at damaged reactor

http://www3.nhk.or.jp/daily/english/20120207_21.html

An unknown rise in temperature at one of the reactors at the damaged Fukushima nuclear plant is troubling its operator. Tokyo Electric says the temperature hasn't gone down even after it increased the volume of cooling water on Tuesday.

One of the thermometers at the bottom of reactor No. 2 at the Fukushima Daiichi plant gradually rose to about 70 degrees Celsius since January 27th. It had stayed around 45 degrees before.

In an effort to lower the temperature, the operator increased the amount of water sprayed on the nuclear fuel by 3 tons to 13.5 tons per hour Tuesday morning.

But Tokyo Electric said readings were down only about 3 degrees after some 5 hours of operation, hardly showing signs of improvement.

The utility said the flow of water in the reactor may have changed after plumbing work in late January, causing difficulties in cooling part of the melted nuclear fuel.

It added that no temperature rise has been observed at 2 other thermometers in the same reactor and that it will continue to carefully monitor the reactor.

TEPCO has been unable to visually confirm conditions inside the reactors since the nuclear disaster last March because of high radiation.

TEPCO increases water injection in reactor showing temperature rise

<http://mdn.mainichi.jp/mdnnews/news/20120207p2g00m0dm147000c.html>

TOKYO (Kyodo) -- Workers at the crippled Fukushima Daiichi power plant on Tuesday raised the amount of water injected into the No. 2 reactor to the highest level since the plant achieved a stable state of cold shutdown in December, as concerns grew over the rising temperature recently detected at the bottom of the reactor's pressure vessel.

Following the move, the temperature measured at the same spot on the vessel dropped to 69.0 C at 10 a.m. from 72.2 C logged at 5 a.m., Junichi Matsumoto, spokesman for plant operator Tokyo Electric Power Co. told a press conference, but added that the company needs more time to assess the effect of the latest step.

"It is difficult to judge whether the temperature is rising or dropping unless we monitor the development for about a day," Matsumoto said.

TEPCO said it increased the amount of injected water at 4:24 a.m. Tuesday. The No. 2 reactor is now being cooled with the injection of 13.5 tons of water per hour, up from 10.5 tons.

Nuclear disaster minister Goshi Hosono told a press conference that TEPCO is making utmost efforts to lower the temperature.

Touching on last month's change in the amount of coolant water at the No. 2 reactor for pipe replacement, which is believed to have affected the temperature, Hosono said, "This was a process to enhance stability, but it has become clear that there is a possibility of (replacement work) creating an unstable situation temporarily."

"We have to consider in an even more careful way," he said.

TEPCO's Matsumoto said he believes the No. 2 reactor is maintaining a state of cold shutdown, because the temperature is not rising continuously. Readings on two other thermometers checking the temperature of the bottom of the pressure vessel were around 40 C as of 10 a.m.

A cold shutdown is defined by the Japanese government as a situation in which the bottom part of a reactor pressure vessel is kept below around 100 C and radiation exposure from the release of radioactive substances is significantly held down.

At the Fukushima Daiichi plant in northeastern Japan, the Nos. 1 to 3 reactors have suffered meltdowns as a result of the loss of their key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

TEPCO is now injecting water into the three crippled reactors through a new water circulation system installed after the accident.

February 06, 2012

Temperature at No.2 reactor remains high

http://www3.nhk.or.jp/daily/english/20120206_29.html

Attempts to cool the temperature in the No. 2 reactor of the disabled Fukushima Daiichi nuclear power plant have only partially succeeded despite the injection of more cooling water.

The temperature in the reactor has gradually risen from about 45 degrees Celsius registered on January 27th.

In the past 4 days, the temperature has climbed more than 20 degrees to above 70 degrees.

The plant operator, Tokyo Electric Power Company began pumping more water into the reactor at around 1:30 AM on Monday. But at 7 AM, the temperature stood at 73.3 degrees and at 5 PM, 69.2 degrees.

The utility firm says 2 other thermometers elsewhere in the reactor gave readings of about 44 degrees.

TEPCO says the rise in temperatures indicate that the flow of water in the reactor may have changed direction after plumbing work, and is no longer able to properly cool down the melted down nuclear fuel.

However, the utility says radioactive xenon has not been detected in gases around the reactor, and that nuclear criticality is not taking place.

The government and TEPCO announced in December that the 3 troubled reactors at the Fukushima plant had reached a state of cold shutdown with their temperatures below 100 degrees. But the situation inside the reactors remains unclear.

New regulations established after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

TEPCO says it will increase the amount of water being injecting into the reactor to see if the temperature in the reactor drops.

The government's Nuclear and Industrial Safety Agency says there is a need for a comprehensive study to determine whether the reactor is actually in a state of cold shutdown. It says a brief reading of over 80 degrees on one of the thermometers does not necessarily mean there is trouble in the cooling system.

Meanwhile, the Chairman of the Nuclear Safety Commission, Haruki Madarame, says that a recurrence of nuclear criticality is unlikely.

But he criticized TEPCO and the nuclear safety agency for their handling of the matter. He says they are failing to properly explain the state of the reactors to the people.

Temperature rises at Fukushima No.2 reactor

http://www3.nhk.or.jp/daily/english/20120206_17.html

The operator of the Fukushima Daiichi nuclear plant says the temperature in the No.2 reactor remains high despite the injection of additional water.

A thermometer at the bottom of the reactor showed 73.3 degrees Celsius on Monday morning. It was around **45 degrees on January 27th and 71.7 degrees at 4 PM on Sunday.**

Tokyo Electric Power Company began injecting 10.6 tons of water per hour from around 1:30 AM on Monday. **That's one ton more per hour than before.**

The utility says 2 other thermometers placed at the bottom of the reactor have been giving readings of about 44 degrees.

It says the flow of water in the reactor may have changed after plumbing work, causing difficulties in cooling the nuclear fuel.

In December last year, the government and TEPCO declared the 3 reactors at the Fukushima Daiichi plant had been successfully put into a state of cold shutdown as their temperatures had fallen below 100 degrees. But the situation inside the reactors remains unknown.

TEPCO says the regulations set after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

So it says the No.2 reactor is still in the state of cold shutdown.

February 04, 2012

More leaks found at crippled Japan nuclear plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2g00m0dm015000c.html>

TOKYO (AP) -- Leaks of radioactive water have become **more frequent** at Japan's crippled nuclear power plant less than two months after it was declared basically stable.

The problem underlines the continuing challenges facing Tokyo Electric Power Co. as it attempts to keep the Fukushima Dai-ichi nuclear plant under control. A massive earthquake and tsunami badly damaged the plant last March, resulting in the melting of three reactor cores.

Workers spotted a leak Friday at a water reprocessing unit which released enough beta rays to cause radiation sickness, TEPCO spokesman Junichi Matsumoto said. He said no one was injured and the leak stopped after bolts were tightened on a tank.

Matsumoto said TEPCO also found that 8.5 tons of radioactive water had leaked earlier in the week after a pipe became detached at Unit 4, one of the plant's six reactors. The company earlier had estimated that only a few gallons (liters) had leaked.

He said officials are investigating the cause of that leak, but that it was unlikely the pipe had been loosened by the many aftershocks that have hit the plant.

The structural integrity of the damaged Unit 4 reactor building has long been a major concern among experts because a collapse of its spent fuel cooling pool could cause a disaster worse than the three reactor meltdowns.

Cold winter weather has also caused water inside pipes to freeze elsewhere at the plant, resulting in leaks in at least 30 locations since late January, Matsumoto said.

Officials have not detected any signs of radioactive water from the leaks reaching the surrounding ocean. **Sandbag walls have been built around problem areas as a precaution.** [don't worry, everything is safe]

More than 100,000 people around the plant fled their homes after the disaster due to radiation fears.

The government announced in December that the plant had reached "a cold shutdown condition" and is now essentially stable.

On Monday, six inspectors from the government's Nuclear and Industrial Safety Agency will begin an inspection of the plant to ensure its continued stability. They will study the reactors' cooling functions and measures to prevent explosions and nuclear chain reactions, among other steps to keep the plant under control, officials said.

February 03, 2012

NHK World English

Safety checks to begin at Fukushima Daiichi plant

Japan's nuclear safety agency will begin inspecting the Fukushima Daiichi nuclear plant from Monday to see if it can safely remain in a state of cold shutdown.

Officials from the Nuclear and Industrial Safety Agency plan to check equipment and contingency preparations by examining manuals and interviewing workers during their three-week inspections.

Among the seven types of equipment to be checked is a reactor cooling system that recycles decontaminated water from the facility.

Another is a nitrogen-injection system to prevent hydrogen explosions within the disabled reactors.

Agency officials say they will open the onsite inspections to the media. The checks will be the first safety tests required under law since the March 11th accident.

The government declared on December 16th that the Fukushima Daiichi reactors had achieved a state of cold shutdown.

This means reactor temperatures have stabilized below 100 degrees Celsius, and the release of radioactive substances has been contained.

TEPCO says 8.5 tons of water leaked from Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120202p2g00m0dm028000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that 8.5 tons of radioactive water leaked from the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant because a pipe connected to the reactor dropped off, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, water was found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The total amount of leakage from the reactor was initially estimated to be 6 liters, but the utility revised the figure later Wednesday, adding that the leakage appears to have started at around 5 p.m. Monday.

The pipe may have dropped off because water inside increased in volume as it turned into ice due to cold temperatures.

The utility plans to check whether there are similar cases in the other crippled reactors.

The Nos. 1 to 3 reactors have fuel inside, which is believed to have melted in the early phase of the nuclear crisis because the plant lost its cooling functions following the natural disasters.

The No. 4 unit also lost the function to cool its spent fuel pool, but no serious damage is believed to have occurred in the fuel stored there.

Radioactive water leaking from inside Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120201p2g00m0dm150000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that it has found radioactive water leaking from a broken pipe connected to the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, about 6 liters of water were found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The utility is looking into the cause of the damage to the pipe and believes it may have some connection with the recent cold weather or the explosions that took place at the plant in the early phase of the nuclear crisis.

The density of radioactive substances included in the water is estimated at 35.5 becquerels per cubic centimeter, according to TEPCO.

NHK World English

Govt plans Fukushima decontamination test-run

Japan's Environment Ministry has unveiled a model project designed to decontaminate areas with high levels of radiation around the crippled Fukushima Daiichi nuclear plant.

In a test-run for a wider clean-up, the ministry will first try to decontaminate 3 closed sections of a national expressway running through the no-entry zone near the plant.

The ministry last week announced a 2-year plan to decontaminate by March 2014 some evacuation zones where radiation levels have dropped below 50 millisieverts per year.

Radiation levels over a total 5 kilometers of expressway slated for the new project have ranged from a little to substantially above 50 millisieverts a year.

The ministry plans to assess the project's effectiveness in a test-run from the middle of March through July.

More water leaks found at Fukushima nuclear plant

NHK World English

More water leaks have been found at the troubled Fukushima Daiichi nuclear power plant.

Tokyo Electric Power Company told reporters on Monday morning that it has discovered 2 additional water leaks at the nuclear plant.

This comes after it was announced on Sunday that **nearly 8 tons of water** was found to have leaked in 14 locations at the plant.

One of the 2 new findings involves about 30 liters of water that has leaked from a device that is removing salt from contaminated water. The other leak is from a valve of a pipe that is injecting water into a reactor.

TEPCO says leaked water has neither spilled out of the plant, nor flowed into the sea.

The utility firm is trying to determine whether water in some of the pipes froze and cracked the pipes, or loosened the pipes' connections.

It plans to quickly implement preventive measures, including carrying out more patrols early in the morning and **wrapping insulation around the pipes and other equipment.** !!!!!!!

The temperature on Monday morning around the plant dropped to minus 8.7 degrees Celsius.

January 29, 2012

TEPCO ordered to prevent water leaks at reactors

Japan's nuclear safety agency has instructed the operator of the Fukushima Daiichi nuclear plant to prevent water leaks at the plant.

The move follows the discovery of water leaks on Sunday in 14 locations at the damaged plant.

Tokyo Electric Power Company says about 40 liters of water leaked from a cooling system for a spent fuel pool at the No. 4 reactor, forcing the system to stop for one hour and 40 minutes. The utility also says that 7 tons of water leaked from the No. 6 reactor.

The company says that the leakages apparently occurred after frozen water in pipes loosened the pipes' connections or broke some parts.

The company adds that the leaked water did not contain radioactive materials or had already been processed to remove them.

Similar water leaks occurred in 3 locations at the plant on the previous day.

Responding to the agency's call for preventive measures, TEPCO has decided to conduct frequent checks on early mornings when temperatures often drop below zero and protect pipes from the cold with insulation materials or heaters, if necessary.

The utility says measures are already in place to protect critical systems, such as those used for cooling reactors.

Frozen water blamed for leaks at Fukushima plant

Tokyo Electric Power Company has found water leaks in 14 locations at the Fukushima Daiichi nuclear plant.

The utility says the leaks apparently occurred after frozen water ruptured the pipes and the leaked water did not contain any radioactive materials.

Tokyo Electric said about 40 liters of water leaked from a cooling system for a spent fuel pool at the No.4 reactor on Sunday, but the flow stopped when workers closed the valve.

The company said **the leak forced the system to stop for one hour and 40 minutes**, but the pool's temperature did not rise.

Tokyo Electric said 7 tons of water had leaked from the No.6 reactor.

The temperature fell to minus 8 degrees Celsius on Sunday morning near the damaged plant.

Ruptured pipes caused 3 water leaks on the previous day.

Tokyo Electric official Junichi Matsumoto admitted that **the utility failed to take sufficient steps to prevent frozen pipes**. He said it will take quick action to protect the pipes from the cold weather.

January 28, 2012

Less polluted areas to come 1st / Govt releases decontamination schedule for Fukushima Prefecture

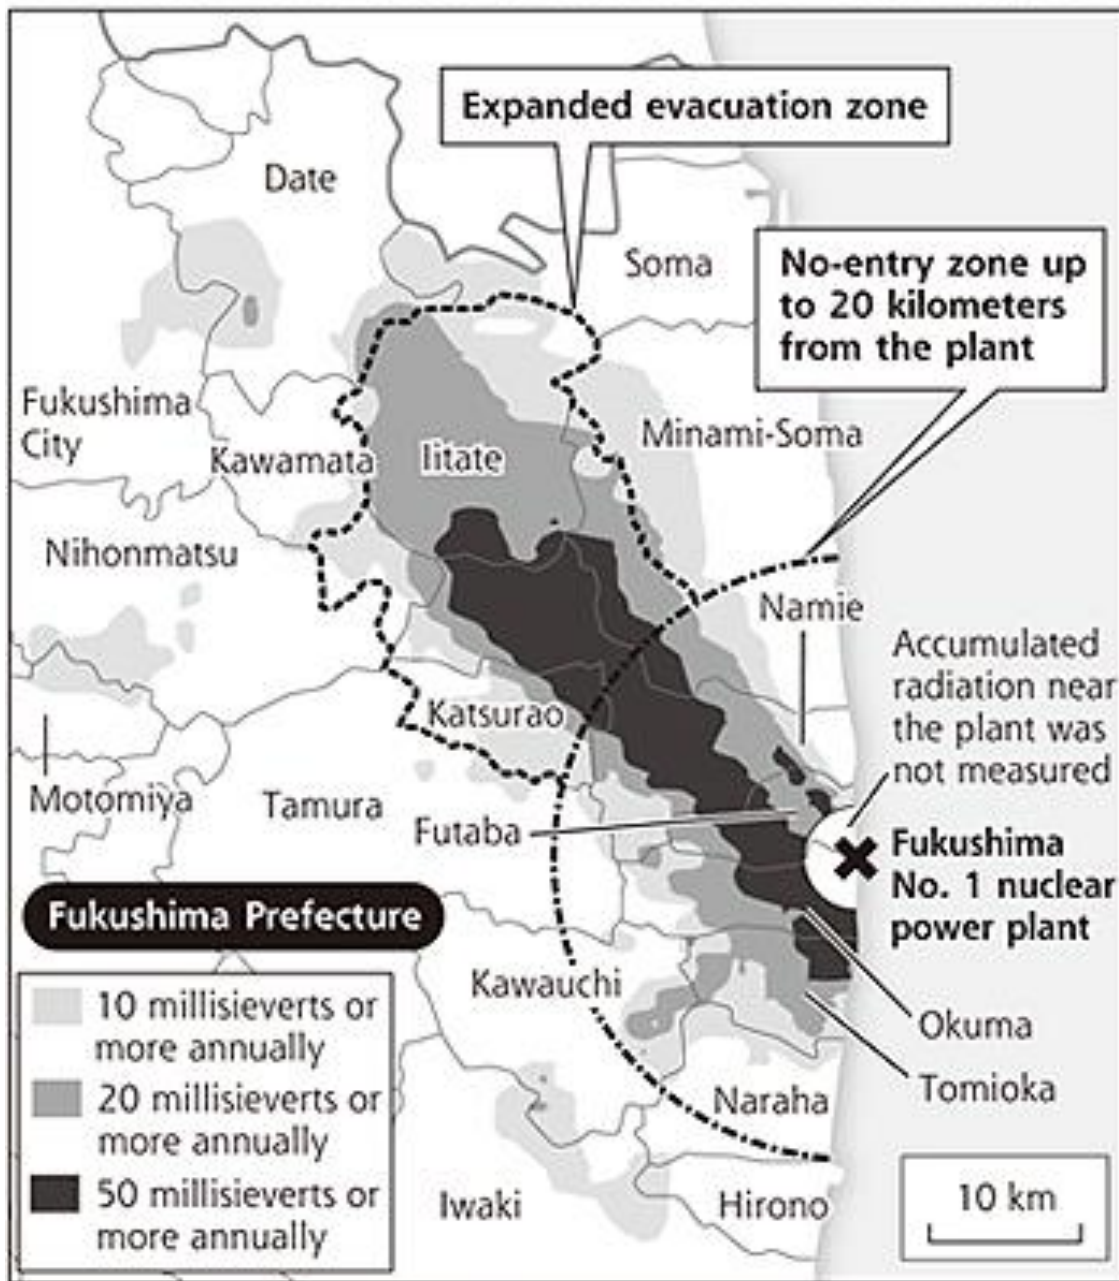

<http://www.yomiuri.co.jp/dy/national/T120127006480.htm>

Timetable for decontamination work

As annual radiation exposure levels in areas within the expanded evacuation zone are feared to be as high as 20 millisieverts, the areas are expected to be reclassified as areas with restricted residency or where residency is prohibited for extended periods.

Annual ambient radiation estimates

The map shows radiation doses near the Fukushima No. 1 nuclear power plant based on air monitoring in October and November by the Education, Culture, Sports, Science and Technology Ministry. The colored regions do not correspond to areas where residency is prohibited or limited for extended periods.

The government will prioritize decontamination work in areas of Fukushima Prefecture where the annual level of radiation exposure is 20 millisieverts or less, as part of efforts to allow residents of those areas to return home as soon as possible, according to a timetable released by the Environment Ministry.

The ministry on Thursday unveiled its timetable for decontamination operations in the no-entry and expanded evacuation zones in the prefecture. Entry is limited in these areas following the outbreak of the nuclear crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

The no-entry and expanded evacuation zones have been deemed "decontamination special zones" to be decontaminated under the government's direct control. **They are to be reorganized into three zones as of April 1 in accordance with their annual levels of radiation exposure.**

The new categories will be:

-- Zones being prepared for residents' return. Annual radiation exposure is 20 millisieverts or lower, and residents are expected to be able to return following the completion of decontamination.

-- Zones with restricted residency. Annual radiation exposure is 20 millisieverts to 50 millisieverts, and residents are expected to be able to return in a few years.

-- Zones where residency is prohibited for an extended period. Annual radiation exposure is more than 50 millisieverts and it is expected to be more than five years before residents can return home.

The government plans to complete decontamination work in areas with annual radiation exposure of 20 millisieverts to 50 millisieverts by lowering the level to 20 millisieverts or less--a level at which residence is allowed--by March 2014.

However, **the ministry did not present a concrete plan for the zones with annual radiation levels of more than 50 millisieverts.**

Regarding the zones being prepared for residents' return, the government plans to proceed with decontaminating the areas with higher levels of radiation exposure. It will start decontaminating areas with the highest levels of radiation exposure, from 10 millisieverts to 20 millisieverts, starting around March and aims to complete the operation by the end of this year.

The government will start work in areas with annual radiation exposure of 5 millisieverts to 10 millisieverts once a number of conditions are fulfilled, such as gaining approval from residents. It plans to launch these operations on a full-scale basis around June, and continue through March 2013, according to the timetable.

Regarding the areas with the lowest levels of radiation--from 1 millisievert to 5 millisieverts--full-scale decontamination work will start from around summer, and is scheduled to be completed at the end of March 2014.

However, **the government will prioritize decontamination at schools, parks and other places where children gather, and densely populated urban districts and hospitals.**

Regarding the zones being prepared for residents' return, the government plans to urge people to return after lowering the radiation level as much as possible.

Meanwhile, the government plans to begin a full-scale decontamination operation in the zones with restricted residency starting around autumn and finish at the end of March 2014.

Based on the outcome of decontamination work conducted at the end of last year by the Self-Defense Forces, **the government believes** it is possible to reduce annual radiation exposure in the zones to 20 millisieverts or lower, according to the ministry.

However, **the timetable did not indicate final target levels of radiation in the zones.**

"We're conducting a model project to verify the effect of decontamination. After seeing the results, we plan to incorporate a target level of radiation in the timetable by March this year," an official of the ministry's Environmental Management Bureau said.

Regarding the zones where residency is prohibited for extended periods, the government said it plans to study decontamination measures and other steps.

"By conducting a model project for decontamination, we plan to establish efficient and effective decontamination technologies and measures to ensure safety of workers," the official said.

Carrying out decontamination operations in the zones is expected to be extremely difficult. The government is considering buying or leasing land from residents of these areas.

"A project to have residents return home following a nuclear crisis of this magnitude is unprecedented in the world, so we have to overcome quite high hurdles. We'll make a careful judgment about the timing for residents to return home after considering the opinions of local government heads and residents," Environment Minister Goshi Hosono said.

Japan's nuclear stress tests deemed consistent with IAEA standards

<http://mdn.mainichi.jp/mdnnews/news/20120131p2g00m0dm081000c.html>

TOKYO (Kyodo) -- An International Atomic Energy Agency fact-finding team said Tuesday that Japan's nuclear stress tests, a key step for restarting reactors following the Fukushima nuclear crisis, are "generally consistent" with IAEA safety standards.

On the last day of its nine-day mission to Japan to review the tests at nuclear power plants, the IAEA delegation conveyed its findings to the government's Nuclear and Industrial Safety Agency, while also making some recommendations to improve the tests's effectiveness.

"The conclusion of the team is that NISA's instructions and review process for the comprehensive safety assessments are generally consistent with IAEA safety standards," the delegation said in its preliminary report.

Tokyo introduced the stress tests after the meltdown at Tokyo Electric Power Co.'s Fukushima Daiichi power plant in the wake of the March quake-tsunami disaster, to check how much leeway the nation's nuclear power plants have to withstand earthquakes, tsunami and the loss of power.

To confirm if the test method is consistent with global safety standards, the government asked the Vienna-based body to verify them.

But there remains criticism among some local governments hosting nuclear power plants and experts that the stress tests need to reflect the findings that the government's accident investigation team has yet to compile on the Fukushima nuclear crisis.

NISA earlier compiled a draft report endorsing results of first-round stress tests that Kansai Electric Power Co. submitted with regard to the No. 3 and 4 reactors at its Oi power plant in Fukui Prefecture. The two reactors are currently idled for scheduled checkups.

The government's nuclear safety agency is set to finalize the report after studying the IAEA's findings, and will have it checked by the Nuclear Safety Commission of Japan.

James Lyons, nuclear installation safety director of the IAEA's Nuclear Safety and Security Department who heads the delegation, said at a press conference that deciding whether to restart the reactors is up to the Japanese government.

Currently, only three of Japan's 54 commercial reactors are operating. Japanese reactors must shut down for maintenance every 13 months, and so far no idled reactor has passed the stress tests, a prerequisite for resuming operations.

If no idled reactors get approval to restart, Japan will be without any operating reactors by the end of April.

Govt plans Fukushima decontamination test-run

NHK World English

Japan's Environment Ministry has unveiled a model project designed to decontaminate areas with high levels of radiation around the crippled Fukushima Daiichi nuclear plant.

In a test-run for a wider clean-up, the ministry will first try to decontaminate 3 closed sections of a national expressway running through the no-entry zone near the plant.

The ministry last week announced a 2-year plan to decontaminate by March 2014 some evacuation zones where radiation levels have dropped below 50 millisieverts per year.

Radiation levels over a total 5 kilometers of expressway slated for the new project have ranged from a little to substantially above 50 millisieverts a year.

The ministry plans to assess the project's effectiveness in a test-run from the middle of March through July.

February 01, 2012

Radioactive water leaking from inside Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120201p2g00m0dm150000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that it has found radioactive water leaking from a broken pipe connected to the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, about 6 liters of water were found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The utility is looking into the cause of the damage to the pipe and believes it may have some connection with the recent cold weather or the explosions that took place at the plant in the early phase of the nuclear crisis.

The density of radioactive substances included in the water is estimated at 35.5 becquerels per cubic centimeter, according to TEPCO.

Kawauchi village in Fukushima calls on evacuees to return home

<http://mdn.mainichi.jp/mdnnews/news/20120201p2g00m0dm113000c.html>

FUKUSHIMA, Japan (Kyodo) -- The mayor of Kawauchi, a village in Fukushima Prefecture whose residents were forced to relocate following the nearby nuclear power plant crisis, called on some 2,600 evacuated villagers Tuesday to return home permanently.

"Let's return starting with those who are ready," Yuko Endo said at a press conference in Fukushima city, marking the first declaration among the nine town and village governments in the prefecture which evacuated their offices that it will return to its original location.

"There are matters of concern but there is no reason why we shouldn't take the first step forward," Endo added.

Chief Cabinet Secretary Osamu Fujimura said at a separate press conference that the declaration is an "important first step toward residents' returning to their home village," and added that the central government will "actively support" the Kawauchi village government's effort.

Kawauchi had about 2,990 residents before Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant was crippled by the earthquake and tsunami disaster of March 11, 2011.

About 75 percent of the villagers currently reside in the prefectural city of Koriyama where the Kawauchi government has relocated its functions because the village was partially designated as a no-entry zone set up by the central government around the nuclear power plant while the rest was categorized as an emergency evacuation preparation area.

In addition, a total of 542 Kawauchi residents were residing in 26 prefectures other than Fukushima as of Friday, while some 200 have returned to their homes since the central government lifted its evacuation advisory for the emergency preparation area of the village last September.

In November, the village government began decontamination work for schools and other public facilities in the hope of declaring in December that it would return to the village.

But the declaration was delayed for about a month as decontamination work is taking longer than expected. The work is expected to be completed by the end of March, paving the way for resumption of the village government, schools and other operations at the start of fiscal 2012 on April 1.

Most sections of the village are safe as radiation levels are less than 1 microsievert per hour, according to the Kawauchi government.

But the chances of all residents returning to the village are low in view of lingering radiation concerns.

Editorial: Nuclear regulatory reform must weed out entrenched interests

<http://mdn.mainichi.jp/perspectives/news/20120201p2a00m0na004000c.html>

Bills relating to a shift in the nation's nuclear power policy were approved by the Cabinet on Jan. 31. In addition to the establishment of a new nuclear regulatory agency under the Environment Ministry, the government is aiming to legislate the lifespan of nuclear reactors, and require plant operators to outline specific measures against severe nuclear accidents.

Significant harm has been done by allowing the Nuclear and Industrial Safety Agency (NISA), an administrative body tasked to regulate nuclear power safety, to exist under the umbrella of the Ministry of Economy, Trade and Industry (METI), a major promoter of nuclear power. Divorcing nuclear regulation from nuclear promotion and centralizing regulatory duties into one agency stands to reason. Changing the agency's name from the originally proposed "nuclear power safety agency" to "nuclear power regulatory agency" is likewise pertinent, considering the new agency's nature.

However, the mere alteration of a name and rearrangement of an organization will not result overnight in a highly independent agency specializing in regulation. Because many of the new agency staff members are likely to come from NISA, specific measures are necessary to secure the independence of the new body.

It remains unclear how a nuclear safety investigation committee, envisaged in one of the bills approved by the Cabinet, will contribute toward ensuring the safety of nuclear power. Since the Cabinet Office's Nuclear Safety Commission (NSC) lost the confidence of the Japanese public over its response to the ongoing nuclear disaster, the new committee cannot expect to gain it back without demonstrating its independence and competence.

The handling of the continuing nuclear crisis has been problematic particularly due to the government's lack of readiness, which has generated suspicions that the disaster could have been mitigated had the government been more capable of crisis management. Crisis management will be an important duty of the new regulatory agency, and must be attended to adequately.

Meanwhile, some things have slipped through the centralization of regulatory responsibilities. Safety research conducted by the Japan Atomic Energy Agency (JAEA) and the inspections and other safeguards implemented by the Ministry of Education, Culture, Sports, Science and Technology to prevent the diversion of nuclear material toward the production of nuclear weapons will not fall under the jurisdiction of the new regulatory agency. It remains to be seen how these tasks will be integrated into the new scheme.

Included in the latest bills are the designation of a 40-year lifespan for nuclear reactors and the implementation of "back-fit" measures that would hold existing reactors to the latest technological standards. The government claims that the combination of these two mandates would make it

extremely difficult for reactors to continue running more than 40 years. The bills, however, include special exemptions allowing reactors to operate for up to 60 years. Stringent criteria must be set to prevent "exceptions" from undermining the rule.

We hope also that the proposed legal reforms lead to a stronger nuclear disaster prevention scheme. In the case of the Fukushima disaster, the off-site emergency response center failed to function. A fundamental review of Japan's nuclear crisis preparedness is imperative. Along with an expansion of disaster protection zones emphasizing nuclear disaster countermeasures, there is a pressing need to reassess national and regional disaster prevention plans.

Numerous corporations and organizations make up the national framework that had heretofore promoted nuclear power, and their role in "amakudari" -- literally "descent from heaven," referring to the practice of former bureaucrats taking advisory posts in industries they previously regulated -- has been pointed out. For effective regulations to gain ground, it is important to extend reform to such organizations with entrenched interests.

TEPCO says 8.5 tons of water leaked from Fukushima No. 4 reactor

<http://mdn.mainichi.jp/mdnnews/news/20120202p2g00m0dm028000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Wednesday that 8.5 tons of radioactive water leaked from the No. 4 reactor of the crisis-hit Fukushima Daiichi power plant because a pipe connected to the reactor dropped off, but added that the liquid has not flowed outside the reactor building.

At the time of the devastating earthquake and tsunami last March 11, the reactor's fuel rods were in its spent fuel pool due to maintenance work that was taking place. The water contains radioactive materials as it is mixed up with water that is in contact with the fuel in the spent fuel tank.

According to the utility known as TEPCO, water was found to have leaked onto the floor of the No. 4 unit building at 10:30 p.m. Tuesday. The leak was stopped at 10:43 p.m. by closing a valve, officials said.

The total amount of leakage from the reactor was initially estimated to be 6 liters, but the utility revised the figure later Wednesday, adding that the leakage appears to have started at around 5 p.m. Monday.

The pipe may have dropped off because water inside increased in volume as it turned into ice due to cold temperatures.

The utility plans to check whether there are similar cases in the other crippled reactors.

The Nos. 1 to 3 reactors have fuel inside, which is believed to have melted in the early phase of the nuclear crisis because the plant lost its cooling functions following the natural disasters.

The No. 4 unit also lost the function to cool its spent fuel pool, but no serious damage is believed to have occurred in the fuel stored there.

Evacuated village to reopen from April

<http://www.yomiuri.co.jp/dy/national/T120201006980.htm>

FUKUSHIMA--The mayor of a village near the crippled Fukushima No. 1 nuclear power plant declared Tuesday that local authorities would return in April, and urged residents who have evacuated due to the nuclear crisis to come back.

Kawauchi Mayor Yuko Endo said public facilities, such as schools and clinics, will also resume services in the village.

This is the first time one of the nine municipalities that fell in the government-designated evacuation zones has declared it will return. Most of Kawauchi's 3,000 residents evacuated elsewhere in Fukushima Prefecture--or outside the prefecture--after the nuclear crisis erupted in March.

"I hope residents will return in two or three years," Endo said.

Starting this month, the Kawauchi government will survey residents about their thoughts on returning, and hold meetings with them. The village government will provide dosimeters to returning residents.

Endo plans to move the village government back to its original location on March 24 and 25, and to resume administrative operations in April.

The Kawauchi government office has temporarily been relocated to Koriyama in the prefecture. Many Kawauchi residents have been staying in temporary housing units in Koriyama, and some of the village's services will still be offered in the city even after April.

Kawauchi has been divided into two zones since the nuclear crisis began--the 20-kilometer no-entry zone around the crippled nuclear plant, and the former emergency evacuation preparation zone.

Initially, the mayor planned to declare the return after decontamination work had lowered radiation levels in the village to less than one millisievert a year. However, decontamination work has been delayed partly by heavy snowfall, and it is likely that only public facilities and houses of families with children will be decontaminated by the end of March.

The village government said radiation levels in many residential areas have fallen below one microsievert per hour.

In Tuesday's declaration, Endo accepted that some residents had concerns about returning to the village.

"Those who can return will return," he said. "Those who are still anxious can return after watching the situation for a while."

Although the designation of the emergency evacuation preparation zone was lifted in September, only slightly more than 200 residents have returned to the village.

Declaration 'just the beginning' / Mayor's plea for villagers to return to Kawauchi draws mixed reactions

<http://www.yomiuri.co.jp/dy/national/T120201006236.htm>

FUKUSHIMA--"The declaration to return home is just the beginning," said Yuko Endo, mayor of Kawauchi, Fukushima Prefecture, in a speech at a press conference encouraging residents who had evacuated amid the Fukushima No. 1 nuclear power plant crisis to return to the village.

The Kawauchi government will reopen the village office and schools in April to prepare for the residents' return. But a complete return of evacuees is problematic, as decontamination work is ongoing.

Parts of Kawauchi fall within the nuclear plant's 20-kilometer no-entry zone, and some residents are concerned about the village's decision. "We can't return home yet," one said.

Tsunehiro Takano, the village's fifth administrative district leader, attended the same press conference as Endo Tuesday at the Fukushima prefectural government's office. Takano, 62, is also chairman of all the administrative district leaders in the village.

"Only people who want to return to Kawauchi should do so and go first. It's important to prepare an environment acceptable to other residents. If nobody returns to the village, no one will end up [following the first returnees]," Takano emphasized.

"It is also our generation that should commit ourselves to decontamination work," he added.

But Norimoto Igari, Kawauchi's third administrative district leader, had a different view.

"Most of the residents, including me, don't want to return," the 68-year-old said.

His administrative district consists of many elderly people living alone.

"If stores don't reopen, elderly people without vehicles will face difficulties buying food," Igari warned.

Hiroichi Watanabe is the village's second administrative district leader and a rice farmer. The village government will order the village's farmers to refrain from planting rice this year.

"We farmers wonder what the point of hurriedly returning to Kawauchi is if we can't sell our rice," Watanabe said.

The answer is more straightforward for Nobuichi Kobayashi, leader of the eighth administrative district, which falls completely within the no-entry zone.

"We can't return," Kobayashi, 66, said.

The municipal government will build temporary housing units in Kawauchi for residents such as Kobayashi. However, according to Kobayashi, "Unless decontamination begins soon, the number of residents who refuse to return will increase."

===

Few kids want to return

Kawauchi has one nursery school, one primary school and one middle school. According to a survey by the village government, only 30 of 210 children want to return to school in Kawauchi from April.

Yoshinobu Ishii, the village schools' superintendent, said, "Even though the student numbers are few, we won't drop the level of our education."

The board of education intends to maintain a class for each grade instead of introducing composite classes comprising students from different grades.

It will also in April transfer the village-run cram school Kogakujuku from Koriyama, Fukushima Prefecture, to the village. Catering to students from the fifth grade of primary school to the third year of middle school, Kogakujuku was operating before the March 11 disaster.

According to the board of education, radiation levels in the Kawauchi Middle School yard dropped to 0.2 microsievert per hour in December, and 0.14 microsievert per hour at Kawauchi Primary School after decontamination had been carried out.

A 34-year-old woman living with her husband, 8-year-old daughter and 5-year-old son in a temporary housing unit in Koriyama after evacuating from her home in the no-entry zone, said: "Even though we can return, we'll have to live in temporary housing. It's difficult for us to return until all the decontamination has been completed."

Safety checks to begin at Fukushima Daiichi plant

Japan's nuclear safety agency will begin inspecting the Fukushima Daiichi nuclear plant from Monday to see if it can safely remain in a state of cold shutdown.

Officials from the Nuclear and Industrial Safety Agency plan to check equipment and contingency preparations by examining manuals and interviewing workers during their three-week inspections.

Among the seven types of equipment to be checked is a reactor cooling system that recycles decontaminated water from the facility.

Another is a nitrogen-injection system to prevent hydrogen explosions within the disabled reactors.

Agency officials say they will open the onsite inspections to the media. The checks will be the first safety tests required under law since the March 11th accident.

The government declared on December 16th that the Fukushima Daiichi reactors had achieved a state of cold shutdown.

This means reactor temperatures have stabilized below 100 degrees Celsius, and the release of radioactive substances has been contained.

Indictment of contractors exposes illicit work at nuke plants

<http://mdn.mainichi.jp/mdnnews/news/20120203p2a00m0na018000c.html>

FUKUOKA -- Three people and two firms were indicted Feb. 2 on charges of dispatching a worker to the Oi Nuclear Power Plant in Fukui Prefecture under a falsified contract in violation of the Employment Security Law.

Those indicted by the Kokura Local Public Prosecutors Office are Hideo Ichise, 58, of Tsuruga, Fukui Prefecture, Yoshimi Tomita, 59, of Maizuru, Kyoto Prefecture, and Kanae Ikegami, 36, of Kitakyushu's Wakamatsu Ward. Prosecutors also indicted Taihei Dengyo Kaisha Ltd., a Tokyo-based power plant construction and maintenance firm, and Takada Kiko, a plumbing firm in Takahama, Fukui Prefecture.

The Kokura Summary Court on Feb. 2 fined Ichise and Tomita and the two firms 500,000 yen each and Ikegami 250,000 yen. Ichise is the Fukui business manager of Taihei Dengyo, and he previously served as the firm's Oi operation chief. Tomita is president of Takada Kiko while Ikegami is an executive of Dream, previously known as Soshin Kogyo, a plumbing and housing equipment firm. She is also the wife of a gang leader with ties to the Kitakyushu-based crime syndicate Kudo-kai.

"Many documents showing illegal labor were found, one after another, during our search. They proved **many years of shady deals,**" says a senior officer with the Fukuoka Prefectural Police. **The case sheds light on not just one firm or one nuclear power plant but the nuclear power industry as a whole.**

Sixty-one-year-old Masaki Yoshimura (pseudonym) in Kitakyushu was dispatched to many nuclear power plants in Japan while working for a construction company for a period of 14 years that ended seven years ago. There were many companies involved in his work between his employer and general contractors such as nuclear power plant manufacturers. One of those companies was Taihei Dengyo.

Repairing plumbing was the main part of his job, but instructions came from different companies depending on which nuclear power plants he was working at. Electric power companies, operators of nuclear power plants, paid general contractors a daily pay of 100,000 yen, but Yoshimura got only 18,000 yen. More than 80 percent of his daily wage was siphoned off.

"It's the world of siphoning off. It's a system in which big companies make money handsomely," he says.

The nuclear job scandal involving Taihei Dengyo uncovered the fact that **illegal labor supports nuclear power businesses. Fake contracts and unlicensed dispatches of workers are peppered with acts of siphoning off pay.** These practices have put laborers in an unstable position and invited crime syndicates' involvement.

"The Geiger counters quickly sound, so you can't work for so long. Fifty to 100 people have to work together. People at the bottom of society are there," Yoshimura says.

Radiation zones are divided into a scale from A to D, and workers assigned to D, the highest radiation zone, have to wear protective gear and layers of gloves. "Competent workers brought with them other

workers' Geiger counters so they would not to exceed the dosage limits and to improve their work efficiency," Yoshimura said.

Stopping a nuclear reactor for just one day reportedly results in a loss to the owner of 100 million yen. A retired electric power company official says, "Electric power companies have repeatedly requested shorter inspections. But to shorten checks without changing the number of items to inspect, you have to either cut corners or force workers to work throughout the night," he says.

According to the Japan Nuclear Energy Safety Organization, about 90 percent of some 83,000 nuclear power plant workers who were exposed to radiation in fiscal 2009 were not employed directly by nuclear power plant operators. Their average radiation dosage was 3.6 times the level suffered by employees of those operators.

The Committee on Poverty of the Japan Federation of Bar Associations last year conducted a survey of nuclear power plant workers. Lawyer Tatsuo Watanabe, a member of the committee, says, "From an ethical point of view, we should check unlawful labor at nuclear power plants that is being done for economical reasons."

More than 1,000 workers are necessary for a regular inspection of a nuclear reactor, but postings for these jobs do not show up at job-placement offices. Most part-time nuclear workers find employment through personal connections and introductions. A labor bureau official says: "(The connections) are extra careful to not hurt the electric power companies. Those with strong personal connections have strong solidarity and are tightlipped. They are in a world of their own."

Plowing technique to fight spread of radiation demonstrated

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na010000c.htm>

IWAKI, Fukushima -- A plowing technique being considered to fight the spread of radiation was demonstrated here on Feb. 2, though some farmers on hand were disappointed.

In the demonstration, four large machines dug up earth from around 30 centimeters deep to replace potentially contaminated topsoil and reduce the amount of radiation crops absorb from it.

According to a prefectural official, radiation readings in the field were 0.3 to 0.42 microsieverts on Feb. 1, and 0.23 to 0.3 microsieverts after the plowing. "There was an effect," the official said.

Around 150 people including local farmers gathered to watch the demonstration. Some farmers complained, however, that "expensive machines are necessary" for the plowing technique, and that an overall decontamination plan for the city's fields has still not been decided on.

US univ. to monitor wildlife in Fukushima

http://www3.nhk.or.jp/daily/english/20120204_05.html

A US research team will conduct a long-term study on the impact of radiation exposure on wild animals and plants around the Fukushima Daiichi nuclear power plant.

The team from University of South Carolina, led by Professor Timothy Mousseau, will begin the study in Fukushima Prefecture and other areas of Japan in May.

The team has been studying the impact of radioactive fallout from the Chernobyl nuclear accident on wildlife around the plant for more than 13 years.

Its study shows a decrease in the number of birds and insects, as well as abnormalities in animals even in areas with low radiation levels of one to 3 microsieverts per hour.

The team says long-term research is likely to shed light on the impact of low-level radiation from the Fukushima accident on wildlife and that it hopes to cooperate with Japanese researchers.

Professor Mousseau will visit Fukushima later this month in preparation for the study. He says generational change of animals, such as birds, is quicker than that of humans and will provide clues to the impact of radiation on human genes.

.

But there remains criticism among some local governments hosting nuclear power plants and experts that the stress tests need to reflect the findings that the government's accident investigation team has yet to compile on the Fukushima nuclear crisis.

NISA earlier compiled a draft report endorsing results of first-round stress tests that Kansai Electric Power Co. submitted with regard to the No. 3 and 4 reactors at its Oi power plant in Fukui Prefecture. The two reactors are currently idled for scheduled checkups.

The government's nuclear safety agency is set to finalize the report after studying the IAEA's findings, and will have it checked by the Nuclear Safety Commission of Japan.

James Lyons, nuclear installation safety director of the IAEA's Nuclear Safety and Security Department who heads the delegation, said at a press conference that deciding whether to restart the reactors is up to the Japanese government.

Currently, only three of Japan's 54 commercial reactors are operating. Japanese reactors must shut down for maintenance every 13 months, and so far no idled reactor has passed the stress tests, a prerequisite for resuming operations.

If no idled reactors get approval to restart, Japan will be without any operating reactors by the end of April.

Falsified labor deals rampant at Japan's nuke plants, says suspect

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na016000c.html>

A power plant construction and maintenance firm has falsified worker contracts for temporary labor at nuclear plants across Japan for years, according to statements by one of the company's employees charged with involvement in the fraudulent agreements.

Hideo Ichise, 58, and two other people were indicted on Feb. 2 for the dispatch of a worker to the Oi nuclear plant in Fukui Prefecture under a false contract, a violation of the Employment Security Law. Ichise's employer Taihei Dengyo Kaisha Ltd. -- where he now serves as business manager after a stint as the firm's Oi operations chief -- along with Fukui Prefecture-based plumbing company Takada Kiko were also charged.

Investigators have discovered a dossier on falsified worker contracts at more than 30 Taihei Dengyo branches, further suggesting the firm has been involved in illicit labor deals involving nuclear power plants across the country.

Police have furthermore discovered cases of various personnel agencies siphoning off the wages of temporary workers at nuclear plants, while involvement of the Kitakyushu-based crime syndicate Kudo-kai has also been uncovered.

According to investigative sources, Ichise said, "We have participated in (illicit nuclear labor practices at the Oi plant) for many years. We have been doing the same thing at other nuclear power plants."

Taihei Dengyo's operating officer was also quoted as telling police, "Our company alone cannot hire many workers, so we (falsified labor contracts) knowing it was illegal."

Other sources involved in work at nuclear power plants have provided similar information, including one Saga Prefecture man in his 50s who worked at the Genkai Nuclear Power Plant there during regular inspections about three years ago. He was dispatched to a construction company by a temp agent called simply "boss." Although there was ostensibly a contract with the construction company and the man worked directly under a construction company employee, "boss" apparently took 5,000 yen out of his 13,000-yen daily wage.

A year earlier, the Saga man had also worked at the Genkai plant during a regular check as an employee of an electrical firm for about two months. A fellow worker in his 50s had to take more than two weeks off after injuring his ankle at the plant but had to pay his own medical bills.

In this case, the Saga man worked under the guise of the electrical firm. "There were gangsters among those bosses, and sometimes two bosses raked off my wages," the Saga man recalls.

A temporary personnel agency operator says, "Parent companies send us requests for a certain number of workers, and we submit a list of people who then go and work under those parent companies at nuclear power plants. We give the workers their wages after deducting our share." Another agent told the Mainichi, "There are times when gangsters are involved in recruiting workers. It is easy for us to hire them because they save us the trouble."

It is not clear why such unlawful labor practices have been overlooked. An inspector at a labor standards office stated, "It is very difficult to get a full picture of the labor practices at nuclear power plants because corporate parent-subsidiary relations change depending on their line of work. It is also difficult to conduct surprise on-site inspections of nuclear power plants because advance notification is necessary as part of antiterrorism measures."

Economy, Trade and Industry Minister Yukio Edano instructed electric power companies to abide by the law and bar crime syndicates from involvement in work at nuclear power plants. However Takayoshi Yoroi, a professor emeritus of labor law at Ryukoku University, says, "Falsified labor contracts have been rampant for so long. If the government is dead serious about stamping them out, nuclear power plants will stop running. Power companies and general contractors simply have to directly hire workers, but I wonder if they have the determination to do so."

Tokyo gov't unveils transport of incinerated radioactive sludge from sewage plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na006000c.html>

Tokyo on Feb. 2 invited reporters to see how ash from incinerated sludge -- including some contaminated with radioactive substances -- is shipped from a sewage plant to be buried at a disposal site outside a breakwater in Tokyo Bay.

The Tokyo Metropolitan Government started burying ash from the incinerator at Akishima in the Tama region of suburban Tokyo in late October last year. In December, it procured gear to separate air from the incinerated sludge and load it into tanker trucks. The Bureau of Sewerage then started transporting the ash from the Tamagawa Joryu Water Reclamation Center to the disposal site.

During the press tour, journalists watched the material being loaded onto the tankers. Radioactive cesium levels in the ash are apparently far below national standards at 1,000 to 2,000 becquerels per kilogram.

The Akishima sewage plant stopped shipping the ash out in May last year and subsequently built up as much as some 420 metric tons of it. The plant will be completely rid of the ash by mid-February.

A total of about 2,600 tons of incinerated sludge are held at six other sewage plants in the Tama region, and the metropolitan government will send the separation gear to those plants to move the ash to the disposal site.

More leaks found at crippled Japan nuclear plant

<http://mdn.mainichi.jp/mdnnews/news/20120204p2g00m0dm015000c.html>

TOKYO (AP) -- Leaks of radioactive water have become **more frequent** at Japan's crippled nuclear power plant less than two months after it was declared basically stable.

The problem underlines the continuing challenges facing Tokyo Electric Power Co. as it attempts to keep the Fukushima Dai-ichi nuclear plant under control. A massive earthquake and tsunami badly damaged the plant last March, resulting in the melting of three reactor cores.

Workers spotted a leak Friday at a water reprocessing unit which released enough beta rays to cause radiation sickness, TEPCO spokesman Junichi Matsumoto said. He said no one was injured and the leak stopped after bolts were tightened on a tank.

Matsumoto said TEPCO also found that 8.5 tons of radioactive water had leaked earlier in the week after a pipe became detached at Unit 4, one of the plant's six reactors. The company earlier had estimated that only a few gallons (liters) had leaked.

He said officials are investigating the cause of that leak, but that it was unlikely the pipe had been loosened by the many aftershocks that have hit the plant.

The structural integrity of the damaged Unit 4 reactor building has long been a major concern among experts because a collapse of its spent fuel cooling pool could cause a disaster worse than the three reactor meltdowns.

Cold winter weather has also caused water inside pipes to freeze elsewhere at the plant, resulting in leaks in at least 30 locations since late January, Matsumoto said.

Officials have not detected any signs of radioactive water from the leaks reaching the surrounding ocean. Sandbag walls have been built around problem areas as a precaution. [don't worry, everything is safe]

More than 100,000 people around the plant fled their homes after the disaster due to radiation fears.

The government announced in December that the plant had reached "a cold shutdown condition" and is now essentially stable.

On Monday, six inspectors from the government's Nuclear and Industrial Safety Agency will begin an inspection of the plant to ensure its continued stability. They will study the reactors' cooling functions and measures to prevent explosions and nuclear chain reactions, among other steps to keep the plant under control, officials said.

Survey: 2.3% of farmers produce rice above cesium safety standard

http://ajw.asahi.com/article/0311disaster/life_and_death/AJ201202040050

About 2.3 percent of farmers in Fukushima Prefecture yielded rice with radioactive cesium levels exceeding the government's new safety standard, according to prefectural government officials.

The new standard of 100 becquerels per kilogram will take effect in April, replacing the provisional standard of 500 becquerels per kg.

The results of the Fukushima prefectural government's emergency survey, released on Feb. 3, will be used by the central government to decide on areas where farming will be banned this year.

But farmers in areas around the crippled Fukushima No. 1 nuclear power plant are growing impatient with the central government's indecision on the matter. They are also worried that no one will buy their produce over fears of radiation contamination.

According to the survey, which covered about 23,000 rice-growing households in 29 cities, towns and villages, contamination levels exceeded the new standard in rice grown by 545 farmers in 12 municipalities, many of them in northern Fukushima Prefecture.

The survey also showed rice cultivated by 38 farmers in three cities had readings above 500 becquerels per kg.

Radiation levels in rice grown by 84.3 percent of farmers were below measurable limits, according to the survey.

The prefecture conducted the survey after radioactive cesium levels higher than the provisional standard were found in rice grown in the Onami district of Fukushima, the prefectural capital, in November.

The central government said it will prohibit the planting of seeds in areas that are heavily contaminated. But it has not decided which areas should face such restrictions under the new standard.

Agriculture minister Michihiko Kano said in a news conference on Feb. 3 that the government should not impose limits on planting.

“We should respect the feelings of farmers,” he said.

A farm ministry official also said the decision for this year would be extremely tough because the lines marking sections under restriction must be drawn within areas where contamination levels are publicized.

The government banned planting last year in areas from where residents had evacuated. But officials at municipalities have already announced plans to go ahead with planting this year, even in areas where contamination levels have exceeded the new limit.

The prefectural chapter of Japan Agricultural Co-operatives is seeking permission to plant in sections of areas where this year’s rice crop will likely clear the new safety standard. The chapter said rice paddies will be decontaminated and other measures taken before the planting starts.

The JA group is expected to forbid planting in areas where radiation levels are expected to remain above the safety limit.

In addition, the Fukushima city government is calling on the central government to permit the planting of rice crops that will be used for purposes other than for food.

“If farmers are not allowed to grow rice (this year), it will reduce their willingness to produce,” an official in the city’s agriculture section said. “Rice fields will also become run-down.”

The city governments of Date and Motomiya have already said they will allow farmers to grow rice, in principle, while requiring decontamination of their rice paddies.

However, decontamination work could cause a new problem for the farmers, according to local officials.

“If rice fields are dug up too deeply, they may not be fit for growing the crop with too many rocks turning up,” an official said.

The heavily contaminated village of Kawauchi, meanwhile, said it will not allow any planting.

Rice farmers are divided.

A 58-year-old farmer in Date said contamination levels found in his rice were up to slightly more than 100 becquerels per kg under the survey.

He has already ordered seeds and fertilizers for his rice crops this year.

“Unless I can plant this year, my rice paddies will be overrun with weeds,” he said. “The fields would not be restored to the original condition for five or 10 years.”

He said he is frustrated by the lack of any long-term perspective by authorities over his livelihood.

“Is (the restriction) for just this year or for many more years?” he said. “It would mean a lifetime if the restriction is put in place until there is no more cesium contamination.”

Saburo Watanabe, a farmer in Aizubange, where all rice crops were found to be safe, said planting should be banned in areas where contamination levels exceed the new safety standard. He said the image of rice grown in Fukushima Prefecture must be protected.

“Consumers tend to think all rice crops from Fukushima Prefecture are the same,” said Watanabe, 58, who cultivates rice in a 12-hectare field.

He said most of his rice from last year remained unsold.

A 56-year-old farmer in Nihonmatsu said, “I want to grow rice, but we will be in trouble with unsold rice if we push for it and face another bad result.”

The rice in his district in Nihonmatsu was found with contamination levels above the new limit.

573 deaths 'related to nuclear crisis'

<http://www.yomiuri.co.jp/dy/national/T120204003191.htm>

A total of 573 deaths have been certified as "disaster-related" by 13 municipalities affected by the crisis at the crippled Fukushima No. 1 nuclear power plant, according to a Yomiuri Shimbun survey.

This number could rise because certification for 29 people remains pending while further checks are conducted.

The 13 municipalities are three cities--Minami-Soma, Tamura and Iwaki--eight towns and villages in Futaba County--Namie, Futaba, Okuma, Tomioka, Naraha, Hirono, Katsurao and Kawauchi--and Kawamata and Iitate, all in Fukushima Prefecture.

These municipalities are in the no-entry, emergency evacuation preparation or expanded evacuation zones around the nuclear plant, which suffered meltdowns soon after the March 11 disaster.

A disaster-related death certificate is issued when a death is not directly caused by a tragedy, but by fatigue or the aggravation of a chronic disease due to the disaster. If a municipality certifies the cause of death is directly associated to a disaster, a condolence grant is paid to the victim's family. If the person was a breadwinner, 5 million yen is paid.

Applications for certification have been filed for 748 people, and 634 of them have been cleared to undergo screening.

Of the 634, 573 deaths were certified as disaster-related, 28 applications were rejected, four cases had to reapply because of flawed paperwork, and 29 remain pending.

In Minami-Soma, a screening panel of doctors, lawyers and other experts examined 251 applications and approved 234 of them. The panel judged two deaths were not eligible for certification and 15 were put on hold.

"During our examination of the applications, we gave emphasis to the conditions at evacuation sites and how they spent their days before they died," a city government official said. "However, the screening process was difficult in cases when people had stayed in evacuation facilities for an extended time and when there was little evidence of where they had been taking shelter."

February 06, 2012

High radioactive cesium levels detected in worms 20 km from nuke plant

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na008000c.html>

Radioactive cesium registering some 20,000 becquerels per kilogram has been found in worms 20 kilometers from the damaged Fukushima No. 1 nuclear plant.

The cesium was detected by a team including Motohiro Hasegawa, chief researcher in soil zoology at Japan's Forestry and Forest Products Research Institute. **Worms are a source of food for many wild animals, and it is feared that radiation could gradually accumulate in the bodies of animals throughout the food chain.**

The research team's findings will be announced at a meeting of the Ecological Society of Japan, to commence in the Shiga Prefecture city of Otsu on March 17.

Researchers dug up between 40 and 100 worms in national forests in the Fukushima Prefecture village of Kawauchi, which lies partly in the exclusion zone around the nuclear plant; the village of Otama,

located 60 kilometers from the plant; and the town of Tadami, about 150 kilometers from the plant, between late August and late September last year.

The worms in Kawauchi registered 20,000 becquerels per kilogram of radiation. In Otama the level was around 1,000 becquerels per kilogram, while in Tadami 290 becquerels per kilogram was recorded.

The airborne radiation dose in Kawauchi at the time of the investigation was 3.11 microsieverts per hour, while in Otama, it was 0.33 microsieverts per hour, and in Tadami it was 0.12 microsieverts per hour. **The figures show radioactive cesium concentration was greatest in the areas where airborne radiation dosage was highest.**

In surveys conducted by the Forestry Agency between August and September last year, radioactivity of 1.38 million becquerels per square meter of soil was measured in Kawauchi, compared with between about 80,000 and 120,000 becquerels in Otama, and 20,000 becquerels in Tadami.

Much of the radioactive substances released from the plant in the nuclear disaster remains on fallen leaves. It is thought that worms have ingested the organic matter formed from the breakdown of these leaves.

February 06, 2012

Temperature at No.2 reactor remains high

http://www3.nhk.or.jp/daily/english/20120206_29.html

Attempts to cool the temperature in the No. 2 reactor of the disabled Fukushima Daiichi nuclear power plant have only partially succeeded despite the injection of more cooling water.

The temperature in the reactor has gradually risen from about 45 degrees Celsius registered on January 27th.

In the past 4 days, the temperature has climbed more than 20 degrees to above 70 degrees.

The plant operator, Tokyo Electric Power Company began pumping more water into the reactor at around 1:30 AM on Monday. But at 7 AM, the temperature stood at 73.3 degrees and at 5 PM, 69.2 degrees.

The utility firm says 2 other thermometers elsewhere in the reactor gave readings of about 44 degrees.

TEPCO says the rise in temperatures indicate that the flow of water in the reactor may have changed direction after plumbing work, and is no longer able to properly cool down the melted down nuclear fuel.

However, the utility says radioactive xenon has not been detected in gases around the reactor, and that nuclear criticality is not taking place.

The government and TEPCO announced in December that the 3 troubled reactors at the Fukushima plant had reached a state of cold shutdown with their temperatures below 100 degrees. But the situation inside the reactors remains unclear.

New regulations established after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

TEPCO says it will increase the amount of water being injecting into the reactor to see if the temperature in the reactor drops.

The government's Nuclear and Industrial Safety Agency says there is a need for a comprehensive study to determine whether the reactor is actually in a state of cold shutdown. It says a brief reading of over 80 degrees on one of the thermometers does not necessarily mean there is trouble in the cooling system.

Meanwhile, the Chairman of the Nuclear Safety Commission, Haruki Madarame, says that a recurrence of nuclear criticality is unlikely.

But he criticized TEPCO and the nuclear safety agency for their handling of the matter. He says they are failing to properly explain the state of the reactors to the people.

Temperature rises at Fukushima No.2 reactor

http://www3.nhk.or.jp/daily/english/20120206_17.html

The operator of the Fukushima Daiichi nuclear plant says the temperature in the No.2 reactor remains high despite the injection of additional water.

A thermometer at the bottom of the reactor showed 73.3 degrees Celsius on Monday morning. It was around **45 degrees on January 27th and 71.7 degrees at 4 PM on Sunday.**

Tokyo Electric Power Company began injecting 10.6 tons of water per hour from around 1:30 AM on Monday. **That's one ton more per hour than before.**

The utility says 2 other thermometers placed at the bottom of the reactor have been giving readings of about 44 degrees.

It says the flow of water in the reactor may have changed after plumbing work, causing difficulties in cooling the nuclear fuel.

In December last year, the government and TEPCO declared the 3 reactors at the Fukushima Daiichi plant had been successfully put into a state of cold shutdown as their temperatures had fallen below 100 degrees. But the situation inside the reactors remains unknown.

TEPCO says the regulations set after the state of cold shutdown was achieved require the utility to keep temperatures inside the reactors below 80 degrees.

So it says the No.2 reactor is still in the state of cold shutdown.

1.5-fold rise eyed for nuke plant operators' payments to damages fund

<http://mdn.mainichi.jp/mdnnews/news/20120206p2g00m0dm003000c.html>

TOKYO (Kyodo) -- The government has decided on a plan to require that Japan's 12 nuclear power plant operators contribute a total of 150 billion yen annually from fiscal 2012 to a state-backed facility to help Tokyo Electric Power Co. meet huge compensation payments over the crisis at its Fukushima Daiichi nuclear plant, one and a half times the initially planned amount, sources familiar with the matter said Sunday.

The government will ask for larger contributions than previously sought because of growing calls for smooth compensation payments to victims of the crisis triggered by the earthquake and tsunami on March 11, 2011, the sources said.

The contribution program is intended to divide the burden from the Fukushima crisis among all nuclear reactor operators and covers nine of Japan's 10 electric power companies, excluding Okinawa Electric Power Co., which does not operate a nuclear power plant. The fund also covers Japan Atomic Power Co., Electric Power Development Co. and Japan Nuclear Fuel Ltd.

The government will finalize details of the program, including the planned increase in contributions, by the end of fiscal 2011 to March 31.

Contributions by the 12 companies became mandatory with the establishment of the Nuclear Damage Liability Facilitation Fund on Sept. 12. For fiscal 2011, the 12 companies are required to contribute a total of just over 70 billion yen to the state-backed fund for the period since its establishment.

Tokyo Electric would contribute 50 billion yen to the fund annually, the highest among the 12 companies, starting in fiscal 2012, and Kansai Electric Power Co. would contribute the second-largest sum of 25.8 billion yen as it operates more nuclear plants than other utilities.

Other expected contributions include 13.8 billion yen from Kyushu Electric Power Co., 13.0 billion yen from Chubu Electric Power Co. and 8.7 billion yen from Tohoku Electric Power Co.

There is opposition among government officials to increasing contributions to the fund amid concern that utilities could be prompted to raise electricity charges, the sources said. But the government intends to go ahead with the increase, expecting that electricity charges will be held in check as the Ministry of Economy, Trade and Industry is reviewing utilities' calculation of costs for setting power bills.

Nuke plant operators paid \$2 bil. to localities

http://www3.nhk.or.jp/daily/english/20120206_27.html

Newly disclosed documents show that nuclear power plant operators in Japan have paid more than 2 billion dollars to local authorities hosting their facilities **over the past 4 decades**.

NHK obtained information about the payments from 44 prefectures and municipalities based on the information disclosure system.

The information shows that the payments have reached 2.1 billion dollars since construction of nuclear plants began in the late 1960s.

Of the amount, Tokyo Electric Power Company which operates the disabled Fukushima Daiichi nuclear plant paid nearly 460 million dollars. Other utilities have continued making payments ever since the accident at the plant.

Power companies pay the money to promote the construction of nuclear plants. Some local governments ask for donations to invest the money in the regional economies.

The utilities view the payments as part of the cost of generating power and pass the expense on in utility fees.

But an economy ministry panel said last week that the payments should not be counted as a cost.

Host communities have spent the money in various ways. They include public works projects, events and scholarships as well as statues of animation characters and promotional videos.

The host communities also receive subsidies from the central government, but the payments decrease in stages. Until 2003, they were only allowed to use the money to construct public facilities.

The payments are apparently convenient for some communities that are struggling to find ways to maintain the facilities.

Kyushu men sent to Fukushima nuke plant under falsified labor deals

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na013000c.html>

As efforts to tame the crisis at the Fukushima No. 1 nuclear plant continue, laborers from as far as Kyushu have been dispatched there under illegal labor deals and forced to work inside at least one of the crippled plant's highly contaminated reactor buildings.

A man in his 40s from Nagasaki Prefecture recently related how he carried lead sheets weighing some 20 kilograms each up as high as the sixth floor of one building. A Geiger counter dangling from his neck sounded noisily and his mask misted over as temperatures climbed above 30 degrees Celsius.

"I was really angry because I was treated like a slave," Yosuke Nakayama, a pseudonym, said of his some 40 days at the Fukushima plant, starting in July last year.

The lead sheets were installed inside the plant's No. 1 reactor building to block radiation. Nakayama, however, was not angry about the hard work, but about the treatment he received upon returning home to Nagasaki.

He said he was paid 11,000 yen per day he worked for a company six layers down in a seven-layer outsourcing pyramid, with only the top-tier firm receiving orders directly from plant operator Tokyo Electric Power Co. He had been promised 14,000 yen per day, and had also been assured he would not have to enter the reactor buildings.

When Nakayama demanded an explanation for the 3,000 yen difference, his subcontractor mentioned the name of a Fukuoka-based crime syndicate.

"We don't care if yakuza show up," the contractor said, apparently threatening him.

A third-tier company to which Nakayama's employer dispatched laborers via two other firms has been slapped with administrative punishments twice for its ties to crime syndicates.

Contacted by the Mainichi, Nakayama's employer acknowledged the dispatch of workers without a license. "We received about 13,000 yen from a fifth-tier firm and we'd lose money unless we deduct expenses," the company said.

Businesspeople familiar with the Kyushu Electric Power Co.'s Genkai Nuclear Power Plant in Saga Prefecture say a significant number of laborers have been sent to Fukushima.

A utility work firm in Saga has been recruiting laborers from across Kyushu since last December, ostensibly for work at nuclear plants in Kyushu and Shikoku. The names of about 20 laborers are written on the firm's white board, along with their destination: "Fukushima No. 1."

An executive of the firm says it started sending laborers to Fukushima in response to requests from its business partners. "People from Kyushu are in demand because they're serious. We will send them again if requested."

A Saga man in his 30s did a job similar to Nakayama's at the Fukushima plant after being dispatched from a seventh-tier firm. He contacted the company after seeing a posting at a job-placement office and got the Fukushima job.

He received about 300,000 yen for some 40 days of work, and absorbed a radiation dose of some 10 millisieverts. "There are no jobs in my hometown, so it can't be helped," he says, adding he is waiting for another Fukushima assignment.

Govt to create more decontamination bases

http://www3.nhk.or.jp/daily/english/20120206_11.html

The Environment Ministry plans to decontaminate more public facilities in Fukushima Prefecture to use them as bases for cleaning up radioactive substances.

The government wants to decontaminate no-entry and evacuation zones around the damaged Fukushima Daiichi plant. It hopes to create a safe environment so that residents can return to the area.

The ministry has designated 16 facilities, including schools and assembly halls, as bases for decontamination. Four municipal offices were cleaned up in December.

The operation is to be completed next month.

The government plans to begin radiation monitoring in these zones in a few months, and begin the decontamination process this summer.

Temperature remains high at damaged reactor

http://www3.nhk.or.jp/daily/english/20120207_21.html

An unknown rise in temperature at one of the reactors at the damaged Fukushima nuclear plant is troubling its operator. Tokyo Electric says the temperature hasn't gone down even after it increased the volume of cooling water on Tuesday.

One of the thermometers at the bottom of reactor No. 2 at the Fukushima Daiichi plant gradually rose to about 70 degrees Celsius since January 27th. It had stayed around 45 degrees before.

In an effort to lower the temperature, the operator increased the amount of water sprayed on the nuclear fuel by 3 tons to 13.5 tons per hour Tuesday morning.

But **Tokyo Electric said readings were down only about 3 degrees after some 5 hours of operation, hardly showing signs of improvement.**

The utility said the flow of water in the reactor may have changed after plumbing work in late January, causing difficulties in cooling part of the melted nuclear fuel.

It added that no temperature rise has been observed at 2 other thermometers in the same reactor and that it will continue to carefully monitor the reactor.

TEPCO has been unable to visually confirm conditions inside the reactors since the nuclear disaster last March because of high radiation.

TEPCO increases water injection in reactor showing temperature rise

<http://mdn.mainichi.jp/mdnnews/news/20120207p2g00m0dm147000c.html>

TOKYO (Kyodo) -- Workers at the crippled Fukushima Daiichi power plant on Tuesday raised the amount of water injected into the No. 2 reactor to the highest level since the plant achieved a stable state of cold shutdown in December, as concerns grew over the rising temperature recently detected at the bottom of the reactor's pressure vessel.

Following the move, the temperature measured at the same spot on the vessel dropped to 69.0 C at 10 a.m. from 72.2 C logged at 5 a.m., Junichi Matsumoto, spokesman for plant operator Tokyo Electric Power Co. told a press conference, but added that the company needs more time to assess the effect of the latest step.

"It is difficult to judge whether the temperature is rising or dropping unless we monitor the development for about a day," Matsumoto said.

TEPCO said it increased the amount of injected water at 4:24 a.m. Tuesday. **The No. 2 reactor is now being cooled with the injection of 13.5 tons of water per hour, up from 10.5 tons.**

Nuclear disaster minister Goshi Hosono told a press conference that TEPCO is making utmost efforts to lower the temperature.

Touching on last month's change in the amount of coolant water at the No. 2 reactor for pipe replacement, which is believed to have affected the temperature, Hosono said, "This was a process to enhance stability, but it has become clear that there is a possibility of (replacement work) creating an unstable situation temporarily."

"We have to consider in an even more careful way," he said.

TEPCO's Matsumoto said he believes the No. 2 reactor is maintaining a state of cold shutdown, because the temperature is not rising continuously. Readings on two other thermometers checking the temperature of the bottom of the pressure vessel were around 40 C as of 10 a.m.

A cold shutdown is defined by the Japanese government as a situation in which the bottom part of a reactor pressure vessel is kept below around 100 C and radiation exposure from the release of radioactive substances is significantly held down.

At the Fukushima Daiichi plant in northeastern Japan, the Nos. 1 to 3 reactors have suffered meltdowns as a result of the loss of their key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

TEPCO is now injecting water into the three crippled reactors through a new water circulation system installed after the accident.

Gov't to set up radiation yardstick for shipping Fukushima stones

<http://mdn.mainichi.jp/mdnnews/news/20120207p2g00m0dm102000c.html>

TOKYO (Kyodo) -- The Japanese government plans to set up a radiation yardstick for shipping stones given the detection of a relatively high level of radiation in gravel, used as building materials, from near the crippled Fukushima Daiichi nuclear power plant, industry minister Yukio Edano said Tuesday.

The government will set up a panel to create such a standard by the end of next month. **The yardstick is expected to apply mainly to quarries in Fukushima Prefecture,** but details will be discussed at the panel's meetings.

The government has been checking distribution routes of crushed stones from quarries in Fukushima since the detection of the building materials suspected to have been radioactively contaminated.

The gravel used was shipped from a quarry within the evacuation zone near the stricken plant sometime between the beginning of the nuclear crisis and the government's designation of the evacuation zone on April 22.

The crisis was triggered by the earthquake and tsunami on March 11.

So far, a relatively high level of radiation has been detected at 22 locations in Fukushima Prefecture, mostly resident houses, according to government checkups, jointly conducted by local municipalities.

Crushed stones suspected to have been radioactively contaminated may have been used at more than 1,000 construction sites, and so far the measurement of radiation levels has been conducted at only 10 percent of them.

The government will speed up its radiation check process to complete it by the end of March, Edano said.

February 07, 2012

Pro-nuclear energy town councillor's firm had 700 million yen in nuke plant contracts

<http://mdn.mainichi.jp/mdnnews/news/20120207p2a00m0na023000c.html>

TAKAHAMA, Fukui -- A town assembly member here calling for the continuation of nuclear power is also president of a company that has received at least 700 million yen in nuclear-related construction contracts, it has been learned.

Akio Awano, 62, is vice-speaker of the municipal assembly of Takahama, which hosts a Kansai Electric Power Co. nuclear plant. He is also part of a local organization promoting nuclear power plants.

According to the Fukui Prefectural Government and other sources, Awano's firm, a metal processing company, has around 15 employees and earned about 200 million yen in fiscal 2010. It has an office in the Takahama nuclear plant and has expanded its business on a diet of nuclear plant-related construction.

Construction records show that Kansai Electric began contracting Awano's firm directly in the 1990s, and has forked out some 536 million yen to the company for 67 jobs in the past five years. Furthermore, Awano's company took 66 subcontracted jobs at the utility over the same period. Most local construction businesses get at most about 15 power company jobs per year.

In September of last year, Awano submitted a written statement seeking continuation of nuclear power generation, including the restart of Takahama plant reactors off-line for regular inspections. The statement was approved by an overwhelming majority of the town assembly.

However, Fukui Gov. Issei Nishikawa has said, "Unless the national government submits new safety standards reflecting the knowledge gained from the Fukushima nuclear disaster, I cannot agree" to a restart of the reactors. Oi and Mihama, two other towns in Fukui Prefecture also hosting nuclear facilities, have not passed resolutions in favor of restarting reactors.

Awano has defended himself by saying, "I submitted the statement after looking at the country's energy situation and judging that nuclear power is necessary. My actions as an assembly member and my management of the company are completely separate, and I was not influenced by the construction contracts."

The No. 1, 2, and 4 reactors at the Takahama plant are off-line for inspections. In January Kansai Electric submitted a safety evaluation of the No. 1 reactor to the Nuclear and Industrial Safety Agency, a prerequisite for it to be restarted. The agency and the Nuclear Safety Commission of Japan will look at the evaluation and Prime Minister Yoshihiko Noda will make a decision on the restart based on local opinions.

Kansai Electric has declined to comment on individual contracts, saying only that its business partners are "evaluated and registered in a fair manner, with the most appropriate company for a construction job chosen and contracted."

Govt to measure radiation levels in no-fly zone

http://www3.nhk.or.jp/daily/english/20120206_08.html

Japan's government will measure radiation levels around the troubled Fukushima Daiichi nuclear plant as a step toward revising the no-fly zone over the site.

No aircraft has been allowed to fly within a 20-kilometer radius of the plant since the nuclear accident.

The government says it will revise the no-fly zone as it confirmed in December that the nuclear reactors have now reached a state of cold shutdown.

Starting Monday and continuing for several days, helicopters flying at an altitude of about 300 meters will collect air samples around the plant to measure radiation levels.

There are no specific standards on radiation levels for the designation of no-fly zones. The government plans to revise its earlier decision based on data collected during the flights.

February 7, 2012

N-safety unit to be housed with METI

<http://www.yomiuri.co.jp/dy/national/T120207005565.htm>

The Environment Ministry is likely to start operations of a new external nuclear regulatory agency to be launched in April at an annex of the Economy, Trade and Industry Ministry that oversees the current nuclear safety body, sources said.

The government wants to establish the new watchdog at a new location to rule out any conflict of interest that the body might have by being associated with METI, a promoter of nuclear power.

But because of difficulties in finding a home for the agency, the government will for the time being likely house the new watchdog at the current Nuclear and Industrial Safety Agency (NISA) premises.

The government has already been criticized because NISA, a nuclear regulator, works under the auspices of METI, and this proximity is seen as having contributed to the crisis at the Fukushima No. 1 nuclear power plant.

Most of NISA's functions will be absorbed by the new agency, which will be staffed by about 500 people.

According to the sources, the new agency will probably be relocated as early as this summer.

Premises housing the new watchdog need sufficient earthquake resistance, must be situated on a lower floor and located near the Prime Minister's Office. Because there are also plans for a new nuclear safety investigation committee to be set up with the agency, at least 6,000 square meters of space is required, the sources said.

The sources said the Environment Ministry found a suitable private building in Tokyo's Shiodome area, but was unable to coordinate the move.

One reason for the ministry's struggle to find suitable premises is that bills to enable the creation of the new nuclear agency and the committee have yet to be passed in the Diet.

"If we decide on the location before Diet deliberations [on the bills], opposition parties would criticize us, saying we're disrespecting the Diet," a senior ministry official said.

Air radiation drops after snowfall / But decontamination necessary, levels will rise once snow melts, experts say

<http://www.yomiuri.co.jp/dy/national/T120207005622.htm>

The Fukushima prefectural government has received many inquiries because air radiation levels across the prefecture following the crisis at the Fukushima No. 1 nuclear power plant declined considerably late January and have since remained constant, perhaps due to fallen snow blocking radiation above the ground.

According to monitoring by the Education, Culture, Sports, Science and Technology Ministry and others, the rate of decline was particularly large in the Akougi district in Namie and the Nagadoro district in Iitate, located in the expanded evacuation zone around the nuclear plant.

Radiation measuring found that the Akougi district had a reading of 19.7 microsieverts per hour in the morning of Jan. 25, down from 30 microsieverts per hour recorded in the morning of Jan. 18.

Air radiation levels also decreased to 5.9 microsieverts per hour from 10 microsieverts per hour over the same period in the Nagadoro district.

It is believed there were no major changes in air radiation levels before Jan. 18 and after Jan. 25.

According to the ministry's Nuclear Emergency Response Headquarters, the decline can be attributed only to snowfall since decontamination operations were not conducted in the areas at the time.

The Fukushima Meteorological Observatory said snow accumulation is not monitored in Namie and Iitate, but temperatures and other factors suggest the town and the village had snow from Jan. 20 to 22.

The prefectural emergency response headquarters said radiation levels also declined in the city of Fukushima. While such levels measured 0.84 microsievert per hour at 6 p.m. on Jan. 21 when snow began to fall, at 9 p.m. on Jan. 22, after snowfall, radiation levels in the air measured 0.62 microsievert per hour.

Farmer Masuo Kaneko, 63, who evacuated to the city from Nagadoro district, said after reading the newspapers he thought the radiation levels were dropping rapidly. But he was disappointed to hear the decline was due to snowfall.

"I expected radiation levels to halve in about two years time," he said.

Tokyo Institute of Technology Associate Professor Keiji Saneyoshi said air radiation levels may halve if about 20 centimeters of snow falls in certain areas. "Yet decontamination work needs to continue since the levels will rise again once the snow melts," Saneyoshi said.

[February 08, 2012](#)

70% of nuclear reactor hosts cautious on restart

http://www3.nhk.or.jp/daily/english/20120208_28.html

An NHK survey has found that more than 70 percent of Japanese municipalities that host nuclear power plants are cautious about restarting the reactors.

51 of Japan's 54 nuclear reactors are currently out of operation. Restarting them would require the approval of local municipalities.

NHK surveyed 29 municipalities, **excluding those in Fukushima Prefecture.**

5 of them, or 17 percent, said they would give the go-ahead for the reactors to resume operation. But 21 municipalities, or 72 percent, said they wouldn't allow it, or that they cannot yet decide.

Municipalities that expressed caution said they cannot be sure whether the reactors are really safe, and cited the difficulty of persuading residents while the government has yet to decide on its nuclear policy.

Asked what is needed beside stress tests to restart the reactors, 48 percent said a satisfactory investigation into the accident at Fukushima Daiichi plant, and understanding by local residents. 38 percent cited new government safety regulations.

The municipalities stressed their concern over reactor safety, and demanded more government accountability.

Child population drops in disaster-hit prefectures

http://www3.nhk.or.jp/daily/english/20120208_05.html

The number of children has significantly decreased in 3 Japanese prefectures hit by the March 11th disaster.

The Education Ministry says the child population as of May 1st in Iwate, Miyagi and Fukushima fell by

more than 27,000 from a year earlier to about 834,000.

Fukushima saw the biggest fall of 5.8 percent, or more than 17,000, followed by a decrease of 2.3 percent in Iwate and minus 1.7 percent in Miyagi.

The ministry says the nuclear accident at the Fukushima Daiichi plant is to blame for an 11-percent decline in the number of kindergarteners and a nearly 8-percent drop in the elementary school population in the prefecture.

It says smaller children are more vulnerable to radiation and are likely to have been evacuated to other prefectures.

The child population in the 3 prefectures had been falling even before the disaster due to the low birthrate.

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](http://www.japantimes.co.jp/text/nn20120208f1.html) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that **the situation is far from resolved** and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the spent fuel pools sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the fuel pool is now directly exposed to the outside environment after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but **the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.**

Making matters worse, **the government doesn't have any place to permanently store it**, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, **the simulation was "so shocking" that top government officials decided to keep the paper secret** by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

Cesium detected in worms near Fukushima plant

http://www3.nhk.or.jp/daily/english/20120208_04.html

Researchers say high levels of radioactive cesium have been detected in earthworms caught in areas around the damaged Fukushima Daiichi plant.

The researchers from the Forestry and Forest Products Research Institute checked cesium levels in earthworm samples they collected at 3 locations.

The institute says about 19,000 becquerels of cesium per kilogram of worms were detected in Kawauchi Village 30 kilometers from the plant, about 1,000 becquerels in Otama Village, 70 kilometers from the plant, and 290 in Tadami Town, 130 kilometers away.

The institute says the cesium levels rise in proportion to the radioactive levels of top soil containing decomposed leaves, the worms' feed.

The reading in Kawauchi was higher than the 146,000 becquerels per kilogram detected in a wild boar in Fukushima Prefecture. The radioactive level in the animal is 30 times the official limit.

The chief researcher at the institute, Motohiro Hasegawa, says **boars, birds and other forest animals feed on earthworms**. He says **the radioactive impact on these creatures will need to be constantly monitored to prevent contamination through the food chain**.

Tokyo gov. opposes 'N-vote'

<http://www.yomiuri.co.jp/dy/national/T120211003443.htm>

Tokyo Gov. Shintaro Ishihara has spoken against establishing an ordinance to hold a referendum among residents of the capital on whether the operation of nuclear power plants should be allowed.

"It's impossible to create such an ordinance, and I have no intention of doing so," Ishihara said during a regular press conference Friday.

Ishihara's comments came as it appeared likely a citizens advocacy group that aims to bring about the referendum in Tokyo would succeed in its campaign to collect the number of signatures legally required to directly petition the metropolitan government to establish an ordinance.

The citizens group is called "Let's Decide Together/Citizen-initiated National Referendum on Nuclear Power."

Ishihara criticized activity against nuclear power, saying: "The most troublesome thing among humans is sentiment. Because Japanese have the trauma of atomic bombs, people speak [against nuclear power plants] out of fear.

"The progress of human beings has been achieved through their own development of technology, overcoming setbacks and failures."

If the group submits a direct petition for a referendum ordinance to the governor, Ishihara will have to submit a bill for the ordinance to the Tokyo Metropolitan Assembly with his opinion attached.

The assembly will then deliberate whether to create such an ordinance.

Nobel Prize winner Oe stresses Japan's ethical responsibility for ending nuclear program

<http://mdn.mainichi.jp/mdnnews/news/20120208p2a00m0na011000c.html>

Kenzaburo Oe, Nobel Prize laureate in literature, said Feb. 8 that Japan has an "ethical responsibility" for abandoning nuclear power in the aftermath of the Fukushima nuclear disaster, just as the country renounced war under the postwar Constitution.

During a press conference at the Foreign Correspondents' Club of Japan (FCCJ), Oe called for an immediate end to nuclear power generation and warned that Japan would suffer another nuclear catastrophe if it tries to resume nuclear power plant operations. "It's important to make a decision now" to abandon nuclear power, he said.

Satoshi Kamata, the founder of the "Sayonara Nuclear Power Plants" campaign, said at the press conference with Oe and Keiko Ochiai -- author, radio personality, and founder and manager of the Crayon House bookstores for children -- that they and other members of the initiative will hold rallies in Tokyo, Niigata, Matsue, Shizuoka, Matsuyama, Sapporo and Saga on Feb. 11 to protest against restarting nuclear reactors.

Kamata, a freelance journalist who has covered the nation's nuclear industry extensively and been a leading critic of Japan's "nuclear village" establishment, said his group will deliver a petition to local governments hosting nuclear plants or located near them to help pursue a society not dependent on nuclear energy.

"What has become clear from the Fukushima nuclear disaster and later developments is this hard fact: there is no nuclear energy that is safe," the petition says. "In other words, nuclear technology and humanity cannot coexist."

The antinuclear group says it has many supporters for its campaign, including Minamisoma Mayor Katsunobu Sakurai in Fukushima Prefecture and Tokai Village Mayor Tatsuya Murakami in Ibaraki Prefecture, in addition to film director Yoji Yamada, actress Sayuri Yoshinaga and other high-profile personalities.

Kamata said his group has collected 5 million signatures so far in a petition calling for a nuclear-free Japan. The campaign is aiming for 10 million names. The group will hold a rally in Koriyama, Fukushima, on March 11, the first anniversary of the Great East Japan Earthquake and tsunami which triggered the crisis at the Fukushima No. 1 Nuclear Power Plant, and a rally in Yoyogi Park in Tokyo on July 16, which the group hopes will draw 100,000 people. (By Shiro Yoneyama, Staff Writer)

US approves 1st reactor construction in 34 years

The US Nuclear Regulatory Commission has approved construction of the first new power reactors in the country in more than 3 decades.

The plan to build 2 reactors at the Vogtle plant in the southern state of Georgia was approved by a majority vote on Thursday.

Unit 3 and Unit 4 at the Vogtle site will be the first reactors built in the US for 34 years. The new models were designed by Westinghouse Electric, a US unit of Toshiba.

Construction could begin as early as this year. If all goes well, the reactors are expected to start operation in 2016.

The US stopped building nuclear plants after the Three Mile Island accident in 1979.

The administration of President Barack Obama says it will take in the lessons learned from the accident at Japan's Fukushima Daiichi power plant. But Obama is sticking to his policy of promoting nuclear power as a way of reducing dependence on oil.

February 09, 2012

Govt asks Fukushima to restrict rice planting

<http://www.yomiuri.co.jp/dy/national/T120208005350.htm>

FUKUSHIMA--The government has asked local municipalities in Fukushima Prefecture to refrain from planting rice this year in districts where radioactive cesium exceeding the government's new limit was found in last year's harvests, according to government sources.

The restriction applies to districts in which rice harvests cultivated in 2011 were found to contain **100 becquerels per kilogram or more of radioactive cesium**.

Some of last year's harvests of unpolished rice in the prefecture were found to contain radioactive cesium exceeding the government's previous interim limit of 500 becquerels per kilogram.

Results of research by the prefectural government showed that rice harvests containing radioactive cesium over the new limit of 100 becquerels per kilogram were found in 583 farming households in 65 districts in 12 municipalities.

The prefectural government said about 59,000 farming households in 371 districts in 48 municipalities in the prefecture planted rice in 2011.

The research was conducted on 23,247 households in 151 districts in 29 municipalities in the prefecture.

If the central government's plan is implemented, the restriction will likely be imposed on most of the districts, with a few exceptions.

The central government in December decided restrictions would be necessary if levels of radioactive cesium in harvests exceeded the interim limit.

For cases in which the amount of radiation exceeds the new limit, the central government said it would consult the prefectural and municipal governments.

Officials from the Agriculture, Forestry and Fisheries Ministry visited the Date city government office on Friday to brief Date officials on the restrictions on rice cultivation.

The ministry officials said the government wants to restrict rice planting in six districts where 500 becquerels per kilogram or more of radioactive cesium were detected, and six additional districts where between 100 becquerels and 500 becquerels were detected. The town comprises 21 districts.

But the officials also told the city government that the restriction may not be imposed in districts with levels of radioactive substances above the new limit if the number of questionable spots were limited and if there was clear evidence of a reduction in the quantity of radioactive cesium.

Based on such criteria, **about 850 hectares, or more than 60 percent, of all rice paddies in the city will be restricted from growing rice this year.**

However, in two affected districts, the detected levels exceeded the new limit in only one or two rice paddies, and the amount of excess cesium was limited.

An official of the ministry said the restriction would not apply to the two districts if it could be shown that "proper cultivation would prevent contamination [of the rice]."

The central government's policy was reported to the city's assembly on Tuesday.

Date Mayor Shoji Nishida opposed the restrictions, saying the city could not accept the central government's request. **"The measure will rob farmers of their morale and increase the amount of unused farmland,"** the mayor said.

He indicated an intention to work with nearby municipal governments, including the Fukushima city government, to urge the central government to allow rice planting in all areas in the prefecture.

Ministry officials also visited the Kunimi town government in the prefecture on Friday.

Kunimi officials said the ministry officials presented the plan to restrict rice cultivation in the town's districts where 100 becquerels or more of radioactive cesium were detected in last year's rice harvests.

The ministry officials told the town government that in principle the restrictions would apply to those districts, and showed which ones would be subject to the curbs.

Tsunami was up to 21 meters in Fukushima

<http://www.yomiuri.co.jp/dy/national/T120208006430.htm>

The tsunami that hit Fukushima Prefecture on March 11 was particularly high--possibly up to 21 meters--along the coast in the center of the prefecture where the Fukushima No. 1 nuclear power plant is located, a survey has found.

The height of the tsunami was previously assumed to have been about 15 meters at the nuclear plant, but this could not be confirmed because the area within a 20-kilometer radius of the plant is designated a no-entry zone.

Researchers including Shinji Sato, a professor at the University of Tokyo, obtained permission from local governments to enter this zone, and for the first time since the tsunami, were able to survey coastal areas Monday and Tuesday.

They found that areas struck by higher tsunami were concentrated on the coast in the prefecture's center. For example, at Tomioka, which is eight kilometers south of the nuclear plant, a tsunami height of 21.1 meters was observed.

The maximum height was 10 meters along much of the coast in the prefecture's south.

"It is necessary to do more research on what caused the tsunami to hit the central part of the prefecture particularly hard," Sato said.

Temperature inside reactor stops rising

<http://www.yomiuri.co.jp/dy/national/T120208005861.htm>

The abnormal rise in temperature in a reactor at the Fukushima No. 1 nuclear power plant has stopped, apparently because more water has been injected into the crippled reactor, according to Tokyo Electric Power Co.

TEPCO said the temperature at the base of the No. 2 reactor's pressure vessel had **fallen to 68.5 C at 5 p.m. Tuesday after earlier peaking at 73 C.** However, **the cause of the increased temperature remained unclear.**

Junichi Matsumoto, acting head of TEPCO's headquarters regarding nuclear plant locations, said increasing the amount of water injected hourly into the reactor by three tons to 13.5 tons since 4:30 a.m. Tuesday seemed to be having an effect.

"[The temperature] has begun falling after peaking," Matsumoto said.

Keeping the temperature at the base of the reactors at 100 C or less is a stable state known as cold shutdown. Reaching cold shutdown was a precondition for enabling the government to declare in December that the crisis at the nuclear plant had been brought under control.

TEPCO's guideline stipulates the temperature should be kept at 80 C or lower to allow for possible measurement errors.

The reactor will need to be monitored carefully because the condition inside the reactor's inner part containing melted nuclear fuel is not clear, and the reason for the temperature rise has yet to be pinpointed.

Currently, cooling water is injected into the No. 2 reactor via two piping systems--the coolant water supply system that can deliver water to the vessel's base, and the reactor core water spray system that aims water directly at the reactor core.

The temperature in the pressure vessel's base began rising from 45 C around Jan. 26, when the water injection balance of the two systems was changed several times during pipe repair work.

One of three thermometers installed around the base recorded a temperature increase of nearly 30 C over a little more than 10 days, reaching as high as 73 C at one time.

According to TEPCO, the volume of water being injected was far less than usual. It is possible that the way water was injected into the reactor might have changed around the time of the pipe repairs, and that water did not reach some of the fuel.

TEPCO also speculated that the fuel, which had melted and then solidified, might have cracked due to some shock or dropped down and changed shape.

February 08, 2012

TEPCO injects more water into reactor

<http://www.yomiuri.co.jp/dy/national/T120207005567.htm>

Tokyo Electric Power Co. has increased the amount of water being injected into the No. 2 reactor at the Fukushima No. 1 nuclear power plant because the temperature at the base of the pressure vessel has been rising, the company said Tuesday.

The 13.5 tons being injected each hour to cool the reactor--an increase of three tons--is the most since the government announced the crippled plant had achieved a stable state of cold shutdown in December.

According to the utility, after increasing the amount of water being injected at 4:30 a.m. Tuesday, the temperature at the vessel's base has been fairly constant: It was 72.2 C at 5 a.m. and 69 C at 10 a.m. The temperature at the base of the vessel had been 45 C as of Jan. 27, but began rising earlier this month. TEPCO is investigating the cause of the higher temperature.

Temperature decreasing inside Fukushima reactor

http://www3.nhk.or.jp/daily/english/20120208_26.html

Tokyo Electric Power Company says it has been able to lower the temperature inside the No.2 reactor at the troubled Fukushima Daiichi nuclear power plant by increasing the amount of water being injected into it.

TEPCO had been struggling to deal with rising temperatures inside the reactor. A thermometer located at the bottom of the reactor read 45 degrees Celsius on January 27th, but rose to over 70 degrees on Sunday. The cause is unknown, and two other thermometers at the reactor have shown no such increase.

TEPCO said on Wednesday that the temperature inside the reactor was 66.7 degrees at 5 AM, 5.5 degrees lower than a day earlier. The temperature gradually declined after the company increased the rate of water injection by 3 tons to 13.5 tons per hour on Tuesday.

Such a high rate of injection has not been used since just after the nuclear crisis began last March.

TEPCO says the temperature inside the reactor rose slightly to 68 degrees at 10 AM, but it is still dropping overall.

The utility cannot determine the exact situation inside the reactor or the cause of the temperature rise.

The utility says it will continue to monitor the situation closely while maintaining the current rate of water injection.

Nuke dangers nowhere near resolved: Kan's crisis adviser

By [REIJI YOSHIDA](http://www.japantimes.co.jp/text/nn20120208f1.html) - <http://www.japantimes.co.jp/text/nn20120208f1.html>

In December, Prime Minister Yoshihiko Noda announced the "conclusion" of the meltdown crisis at the Fukushima No. 1 nuclear plant, saying Tokyo Electric Power Co. was managing to keep the three crippled reactors cool, as well as the facility's spent fuel pools.

But a former special adviser to Naoto Kan, who was prime minister when the crisis started, warned that the situation is far from resolved and said Fukushima has exposed a raft of serious nuclear problems that Japan will have to confront for years.

"I would say (the crisis) just opened Pandora's box," Hiroshi Tasaka, who has a doctorate in nuclear engineering and is now a professor at Tama University, said in a recent interview with The Japan Times.

He was one of a select group who glimpsed the secret worst-case scenario document written up by the Japan Atomic Energy Commission on March 25 that was later reportedly quashed by the government.

According to the scenario, the biggest risk during the meltdown crisis wasn't the reactors themselves but the **spent fuel pools** sitting atop them, particularly the one above reactor 4, which still contains about 1,500 nuclear fuel assemblies, Tasaka said.

Unlike reactors 1, 2 and 3, the No. 4 unit was offline for regular checks when disaster struck on March 11 and thus didn't suffer a meltdown. But its fuel rods were in the pool outside the reactor, and its coolant water fell dangerously low.

Adding to the danger is that the **fuel pool is now directly exposed to the outside environment** after a hydrogen explosion blew off the upper part of the reactor building on March 15, Tasaka noted.

The potential heat from the pool was also much higher than other pools because 204 of the 1,535 assemblies were still "new ones" that had been temporarily removed from reactor 4 for regular checks.

The Fukushima crisis has highlighted the dangers of spent fuel pools, which are outside the robust primary containment vessels of the reactors themselves, Tasaka said.

Under the current circumstances, the nation has no prospect of starting up the experimental high-level nuclear waste processing facility in Rokkasho, Aomori Prefecture, because of both technical difficulties and the sentiments of antinuclear activists.

This means utilities must store their spent fuel assemblies in cooling pools at their respective reactor sites as a "temporary measure." This situation greatly increased the danger at Fukushima No. 1 on March 11.

"The storage capacities of the spent fuel pools at the nation's nuclear power plants are reaching their limits," Tasaka wrote in a new book, "Kantei Kara Mita Genpatsu Jiko No Shinjitu" ("The Truth About the Nuclear Accident as Viewed From the Prime Minister's Office").

According to Tasaka, the utilities' fuel pools were about 70 percent full on average in 2010, but the figure was 80 percent at Fukushima No. 1.

The makeshift cooling systems set up at Fukushima No. 1 to stabilize the stricken reactors and fuel pools have greatly reduced the possibility of another catastrophe, Tasaka said, but the ad hoc system for decontaminating the coolant water is nevertheless generating large amounts of highly contaminated waste every day.

Making matters worse, the government doesn't have any place to permanently store it, he wrote.

Tasaka is also deeply concerned about the "groundless optimism" displayed by bureaucrats and business leaders as they rush to restart dozens of reactors that remain halted for safety checks since March 11.

"I understand quite well the intentions of the government, which now wants to send out a message of hope. But at this stage, all the risks should be put on the table," he said.

The nation's nuclear regulators must carry out drastic reforms to regain the people's trust. This is an imperative for the government if it wants to keep pushing nuclear power, Tasaka said.

He recalled viewing the government's worst-case scenario in late March. He was officially appointed special adviser to the prime minister on March 29.

The document detailed a hypothetical Fukushima crisis worst case: Eventual contamination from the plant would require the government to assist residents in the Tokyo area to evacuate if they wanted to voluntarily "migrate," based on the same evacuation protocols adopted for the 1986 Chernobyl accident.

The scenario assumed another hydrogen explosion would occur in the reactor 1 building and radiation would force all of the workers at the plant to evacuate.

All of the pools storing hundreds of nuclear fuel assemblies would eventually lose their cooling ability and the assemblies would melt down and breach the pools.

According to Kyodo News, the simulation was "so shocking" that top government officials decided to keep the paper secret by treating it as a mere personal document of Japan Atomic Energy Commission Chairman Shunsuke Kondo, who compiled the simulation. The government only gave it official recognition at the end of December, according to Kyodo.

More than 10 months after he saw the worst-case scenario paper, Tasaka is still not sure if such scary information should immediately be made public during a nuclear plant crisis.

The assumed worst case was extreme and people did not need to immediately flee the Tokyo area even in March or April, Tasaka said. Disclosing the simulation could have caused panic in the capital, he said.

Tasaka was obliged to keep secret what he learned through his work at the prime minister's office and was not in a position to decide what information was to be made public during the crisis.

He said he decided to start talking about the worse-case scenario only after Kan mentioned some of its highlights during an interview with the media in September.

Tasaka believes the media and government should lay some ground rules in advance on what sensitive information should be made clear in a nuclear crisis.

Prefectural team makes 1st inspection of Fukushima No. 2 nuke plant

<http://mdn.mainichi.jp/mdnnews/news/20120209p2a00m0na009000c.html>

A team of Fukushima prefectural officials visited the Fukushima No. 2 nuclear plant on Feb. 8, marking the first prefectural inspection of the plant since the March 11, 2011 disasters forced it to shut down.

"Right now, the most important tasks are to keep the reactors in cold shutdown and cool the spent fuel rods while preparing safety measures to deal with any unexpected problems," said the deputy head of the prefecture's living environment division following the inspection. "I felt that work there to maintain emergency power supplies and prevent flooding of the plant buildings was progressing."

The reactors at the Fukushima No. 2 plant -- about 11 kilometers south of the disaster-struck Fukushima No. 1 nuclear complex -- stopped automatically when the Great East Japan Earthquake hit and are now in cold shutdown, but the plant was very nearly the site of a second nuclear crisis.

In circumstances similar to those at the No. 1 plant, the cooling systems in three of Fukushima No. 2's four reactors failed when the March 11 tsunami hit and knocked out their backup generators. Unlike the situation at the No. 1 plant, however, staff at the No. 2 station managed to patch into external power before the reactor cores could seriously overheat.

In December last year, the government's Nuclear and Industrial Safety Agency officially declared the nuclear emergency at the plant over, while Tokyo Electric Power Co. -- operator of both the Fukushima No. 1 and 2 plants -- has submitted a plan to the agency for maintaining cold shutdown.

Fukushima Prefecture is calling for the shutdown of all nuclear stations in the prefecture, including Fukushima No. 2.

However, Fukushima No. 2 plant director Naohiro Masuda suggested it's too soon to discount restarting the reactors there, saying, "Under present circumstances, it's impossible to say how the reactors here will be dealt with in the future. For now, we have to maintain a steady cold shutdown by transitioning from the temporary cooling equipment we now have in place to proper, permanent equipment."

Nuclear agency to finalize report endorsing Oi reactors stress tests

<http://mdn.mainichi.jp/mdnnews/news/20120209p2g00m0dm019000c.html>

TOKYO (Kyodo) -- The government's nuclear safety agency decided Wednesday to soon finalize a draft report endorsing the results of stress tests on two idled reactors at Kansai Electric Power Co.'s Oi power plant in western Japan.

It will be the first time the Nuclear and Industrial Safety Agency or NISA has validated results of reactor stress tests submitted so far by utilities nationwide.

NISA made the decision after presenting and hearing opinions on the draft at a meeting with experts. Its finalized report will then be checked by the Nuclear Safety Commission of Japan.

The Japanese government introduced the stress tests on reactors after the Fukushima nuclear crisis. For utilities, passing the test is a prerequisite for restarting reactors idled for scheduled checkups.

If the commission validates the report, the agency plans to explain the test results to Fukui Prefecture where the Oi nuclear power plant is located.

The government will then decide whether to authorize the restart of the reactors while taking into account local communities' responses. The Fukui prefectural government is cautious about allowing them to operate again.

Given the safety agency's decision, Fukui Gov. Issei Nishikawa reiterated his stance of not allowing the reactors' restart on the basis only of the outcome of the stress tests, saying, "It is the basic premise that a provisional safety standard that reflects lessons learned from Tokyo Electric's Fukushima Daiichi nuclear accident be set up."

For Kansai Electric, which serves western Japan area including Osaka and Kyoto, there have been concerns over electricity supply constraints as 10 of its 11 reactors are currently offline. The utility's only operating reactor, the No. 3 unit at the Takahama power plant also in Fukui, is set to undergo periodic maintenance later this month.

In its draft report, the nuclear safety agency endorsed Kansai Electric's evaluation that the Nos. 3 and 4 reactors at the Oil plant are capable of withstanding an earthquake 1.8 times stronger than the most powerful quake presumed for the area and a tsunami wave up to 11.4 meters high, four times higher than the maximum presumed level.

But NISA also said it needs to confirm the utility's further investigation of tsunami that occurred in the past in nearby areas as well as active faults' connectivity.

Overall, NISA said the Oi plant's Nos. 3 and 4 reactors have taken sufficient measures to prevent the sort of situation seen at Tokyo Electric Power Co.'s Fukushima Daiichi power plant even if they were hit by the same size of earthquake and tsunami that hit the plant in Fukushima Prefecture.

Only three of Japan's 54 commercial reactors are currently in operation as reactors which once enter periodic maintenance, held every 13 months, need to pass the stress test to resume operation.

If no reactors secure approval to restart, Japan will have no operating reactors by the end of April.

The government required utilities to take the stress tests following meltdowns at the Fukushima Daiichi complex, triggered by the March 2011 earthquake and tsunami, in order to check the ability of the country's nuclear power plants to withstand such natural disasters.

At Wednesday's meeting, some experts questioned the agency's endorsement of Kansai Electric's stress tests.

Masashi Goto, a former nuclear power plant design engineer, said that the stress tests are "totally meaningless" as a tool to check the safety of reactors as NISA has yet to decide how much leeway the reactors should have to withstand earthquakes and tsunami.

A NISA official said the level of reactors' ability to withstand emergency on their own, or without help from the outside, as well as the utility's efforts to improve their safety are among key factors that served as basis for the agency's evaluation of stress test results.

NISA's previous meeting with the experts in January was temporarily disrupted due to protests by some citizens, including antinuclear power activists, who were asked not to observe the meeting in the same room with attendants.

NISA continued not to allow general citizens to observe the meeting directly this time and made them watch the meeting through a monitor in a different room. A number of citizens staged antinuclear campaigns in front of the Economy, Trade and Industry Ministry building where the meeting took place.

A delegation from the International Atomic Energy Agency said last week while in Japan that the safety agency's nuclear stress tests are generally consistent with IAEA safety standards, but it also made some recommendations to NISA to improve the effectiveness of the stress tests.

Radioactive waste disposal site unveiled to reporters

<http://mdn.mainichi.jp/mdnnews/news/20120209p2a00m0na013000c.html>

A temporary storage site for radioactive waste generated under a model decontamination project around the disaster-struck Fukushima No. 1 nuclear plant was unveiled to reporters on Feb. 9.

To prevent radioactive materials from contaminating groundwater, temporary disposal sites are lined with waterproof sheets. Materials produced in the decontamination operation -- including earth and plant matter -- are categorized, packed into thick bags and lifted into the disposal site by crane.

"We are building these (temporary disposal) sites in such a way that, even when full of waste, radiation levels won't rise in the surrounding area," a Japan Atomic Energy Agency official in charge of the operation stated.

The model decontamination project started in November last year in 12 municipalities in and around the exclusion zone to find the most effective decontamination and disposal techniques.

Approval near for Oi reactors / Agency says stress test evaluations at N-plant were adequate

<http://www.yomiuri.co.jp/dy/national/T120209006930.htm>

A government nuclear safety agency has submitted a final draft of an evaluation report that approves the stress test results of the Nos. 3 and 4 reactors at the Oi nuclear power plant in Oi, Fukui Prefecture, to a meeting attended by experts.

The Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency has virtually completed its evaluation of the assessment of the reactors run by Kansai Electric Power Co. The agency's approval of the evaluation is one of the preconditions for the government's goal of resuming operations at the reactors.

The reactors have remained out of service after being taken off-line for regular safety checkups.

KEPCO had reported to NISA their stress test results show safety levels at the reactors are appropriate.

At the meeting, NISA officials heard a range of opinions from nuclear experts on the final draft.

NISA will soon compile a final evaluation report and will submit it to the Cabinet Office's Nuclear Safety Commission, which will examine the adequacy of the evaluation.

Prime Minister Yoshihiko Noda and three Cabinet members will decide whether to allow the reactors to resume their operations based on the results of the commission's examination of NISA's report and the opinions of local governments in Fukui Prefecture.

Fukui Gov. Issei Nishikawa requested the government to make the safety criteria based on the knowledge and lessons learned from the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in the wake of the Great East Japan Earthquake last year.

The government will hold explanation sessions with local governments and residents to improve their understanding about the reactors' possible resumption of operations.

When NISA submitted its final draft to the meeting, some experts required that it be modified.

But NISA plans to continue with plans to complete its final evaluation report because "The report's main objective--deciding that the Oi reactors' safety assessment results are appropriate--will not change," a senior NISA official said.

NISA's final draft says an accident with a severity similar to the problems experienced at the Fukushima No. 1 nuclear plant will not occur at the Oi plant.

The draft also incorporates recommendations made by a delegation from the International Atomic Energy Agency that recently visited Japan.

KEPCO is now researching active faults around the Oi nuclear power plant and past large-scale tsunamis that have been recorded in historical documents.

The final draft also touches on the possibility that the stress test results will change depending on KEPCO's research.

TEPCO has paid 229.2 billion yen in damages for nuclear crisis

<http://mdn.mainichi.jp/mdnnews/news/20120210p2a00m0na007000c.html>

Tokyo Electric Power Co. (TEPCO), operator of the crippled Fukushima No. 1 nuclear plant, has paid approximately 229.2 billion yen in damages to victims so far, a company executive said.

As of Feb. 7, the company had received about 86,500 claims for compensation for financial losses the applicants say were caused by the nuclear disaster triggered by the March 11, 2011 tsunami. The company has paid compensation to about 45,900 of the applicants -- about 30,000 individuals and 15,900 companies and other organizations -- through settlements, managing director Naomi Hirose told the government's nuclear crisis damage dispute examination panel on Feb. 9.

If compensation paid earlier by the utility as a provisional measure is included, the figure rises to some 370.5 billion yen.

Municipalities dissatisfied with gov't's rice-planting restriction: survey

<http://mdn.mainichi.jp/mdnnews/news/20120210p2a00m0na011000c.html>

FUKUSHIMA -- Of the 12 local municipalities where rice harvested in 2011 was found to have cesium levels that would prohibit them from planting rice this spring, 11 are critical of the government's stand, a Mainichi survey has found.

The national government's new radiation standard of 100 becquerels per kilogram is set to take effect in April. The current provisional limit is 500 becquerels per kilogram.

Over 100 becquerels of radioactive cesium per kilogram of rice has been found in 12 municipalities in Fukushima Prefecture. Eleven of these municipalities are dissatisfied with the planting restriction in districts where cesium levels fell between 100 and 500 becquerels per kilogram, and four are appealing for permission to plant rice in districts where cesium levels surpass the current provisional maximum of 500 becquerels per kilogram.

The Ministry of Agriculture, Forestry and Fisheries is set to incorporate the demands of various municipalities in drawing up planting regulations this month, but it appears reaching an agreement that will satisfy all parties will be difficult.

The agriculture ministry has already announced plans to restrict the 2012 planting of rice in districts where over 500 becquerels of radioactive cesium per kilogram of rice has been detected. As for areas where rice was found to have cesium levels between 100 and 500 becquerels per kilogram, the ministry is in talks with local municipalities to restrict planting in areas with large concentrations of farms exceeding 100 becquerels, and to permit planting in less concentrated areas.

Of the 12 municipalities affected and surveyed, the city of Nihonmatsu did not submit responses. The remaining 11 cities, towns and villages said they want planting to continue in areas where between 100 and 500 becquerels of cesium per kilogram of rice was found, citing farmers' diminishing motivation to work and deteriorating farm conditions as reasons to do so. "The population is quickly aging, and it wouldn't be practical for (the national government) to come back to us several years later and tell us we can start planting again," an Otama village official said.

With the exception of farms in the cities of Fukushima, Date and Nihonmatsu, where over 500 becquerels of cesium per kilogram of rice was detected, only a few farms in the remaining nine municipalities were found to have rice with over 100 becquerels of cesium per kilogram. In the village of Nishigo, only three of 483 farmers there harvested rice with over 100 becquerels per kilogram, with the maximum being 155 becquerels. Local officials believe that if farms are thoroughly decontaminated prior to planting, and once testing of all bags of rice begins as planned in fiscal 2012, the risks of any contaminated rice reaching the market can be avoided.

The cities of Fukushima and Date, along with the towns of Kawamata and Kunimi, said that planting should not be restricted for farms with rice exceeding 500 becquerels of cesium per kilogram. Fukushima city officials seek permission to grow rice for research purposes, while Date city officials emphasize that rice farmers live for rice cultivation, even if prices are lowered. Meanwhile, Kunimi officials stated that if rice planting is going to be restricted this year, "the national government should shoulder the burden of decontamination so that there is hope for 2013 and beyond."

In November 2011, rice harvested in the Onami district of the city of Fukushima was found to have more than the provisional permissible amount of radioactive cesium. Emergency tests were subsequently conducted on rice from 23,247 farms in 29 municipalities. Over 100 becquerels of cesium per kilogram of rice was found from some of the farms in 12 cities, towns, and villages.

Radioactive waste site opened to media in Okuma

<http://www.yomiuri.co.jp/dy/national/T120210006056.htm>

OKUMA, Fukushima--The government, for the first time, has allowed the media to cover operations to move waste contaminated by radioactive substances to a **baseball stadium being used for temporary storage in the Ottozawa district in Okuma**, Fukushima Prefecture.

The contaminated waste was collected in the government-led model decontamination project conducted in the town.

On Thursday, the bags containing the waste were moved to the site and piled in two designated areas at the town-run stadium, about three kilometers away from the power plant.

Radiation levels exceeded 70 microsieverts per hour in certain areas of the Ottozawa district, the highest level among the government-monitored locations.

Workers in protective clothing and masks used cranes to pile up **bags with the contaminated soil and grass, each weighing about a ton.**

A worker said, "Protective clothing hampers our breathing and it's tough to work because my hands are freezing in these rubber gloves."

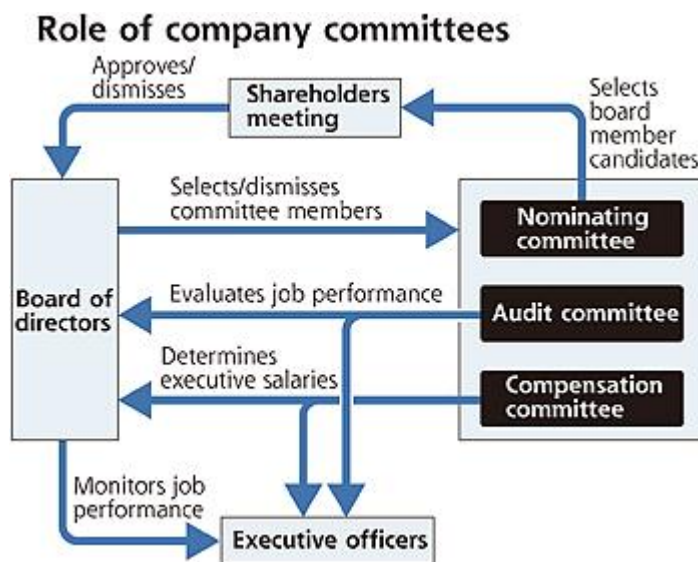

Before placing the bags, **four layers of sheeting, including a water-resistant sheet, were spread on the ground to block radiation leaks.** [since when has water-resistant material been able to block radiation ?]

Later, the pile will be covered by three layers of sheets and soil.

An official at the Japan Atomic Energy Agency, which handled the operation, said, "It's possible to block 98 percent of radiation [using this system]."

Govt to make TEPCO more transparent / 3 committees to oversee management

<http://www.yomiuri.co.jp/dy/national/T120210006779.htm>

The government plans to require Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear power plant, to introduce a committee governance structure to increase management transparency.

The policy is included in the draft comprehensive special business plan, which will be compiled by the government's Nuclear Damage Liability Facilitation Fund and TEPCO in March.

TEPCO Chairman Tsunehisa Katsumata is set to resign to take responsibility for the nuclear crisis. His successor will be recruited from outside the company to increase the transparency of TEPCO's management.

TEPCO tentatively decided Thursday to accept the fund's demand that it hold a one-third stake in the utility through a capital injection using taxpayers' money.

With the veto power that comes with a one-third stake, the fund will be able to overturn decisions in shareholders meetings concerning TEPCO's management policy.

The government decided TEPCO's opaque management practices--including high labor costs and donations as part of its expenses that are used to determine electricity charges--need to be changed if the utility is to regain public trust.

By making it possible for outside entities to oversee TEPCO's management system, the government aims to make it easier to gain the public's understanding over using public funds to assist TEPCO.

In addition to introducing a committee system, the draft plan for new management will introduce an internal company system to encourage TEPCO's internal divisions to compete with one another to reduce costs.

Concerning a financial assistance scheme for TEPCO, the fund will inject 1 trillion yen as additional capital while banks will loan a total of 1 trillion yen.

Alternatively, the banks could buy TEPCO's bonds, instead of extending loans.

To minimize the burden on the banks, hundreds of billions of yen out of the 1 trillion yen will be set aside as a line of credit from which TEPCO would be able to borrow money when necessary.

The fund plans to present the scheme to banks in the near future.

On Thursday night, a TEPCO executive said, "We assume the government wants to hold at least one-third [of a stake in TEPCO] through the injection of capital, as that percentage comes with veto power."

However, the government demands at least a majority of voting rights in TEPCO, which still leaves some gaps between the two parties' positions.

Under the committee-company system, TEPCO will have three committees within the board of directors--the nominating committee, which selects and dismisses members of the board; the audit committee overseeing the work of board members; and the compensation committee, which determines board members' salaries.

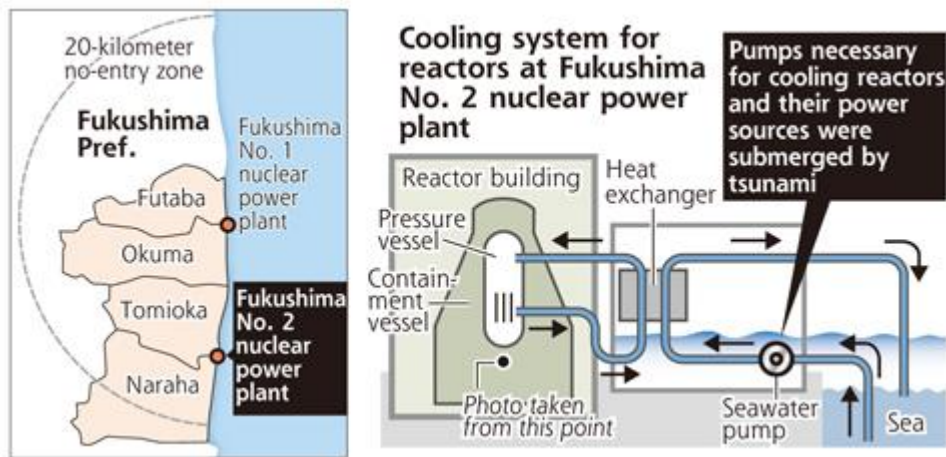

For all three committees, more than half of the members will be outside directors.

Under the system, executive officers will be appointed to carry out separate functions of business operations from the board of directors, which oversees management.

February 10, 2012

Fukushima No. 2 plant was 'near meltdown'

The Yomiuri Shimbun

FUKUSHIMA--The Fukushima No. 2 nuclear power plant was "near meltdown" after being hit by tsunami following the Great East Japan Earthquake on March 11, according to the head of the plant.

The No. 2 plant, on the border of Naraha and Tomioka towns in Fukushima Prefecture, was opened to the media Wednesday for the first time since the disaster. It is **12 kilometers from the Fukushima No. 1 nuclear power plant**, which suffered a meltdown. Both facilities are operated by Tokyo Electric Power Co.

Plant chief Naohiro Masuda, in charge of plant operations since the crisis, told reporters Wednesday, "The No. 2 plant almost suffered the same fate as No. 1 [which led to a severe crisis]."

On March 11, a **9-meter-high tsunami** struck the No. 2 plant, while the No. 1 plant was hit by a 13-meter-high tsunami. The tsunami caused the No. 2 plant's seawater pumps, used to cool reactors, to fail. Of the plant's four reactors, three were in danger of meltdown.

Luckily, one external high-voltage power line still functioned, allowing plant staff in the central control room to monitor data on internal reactor temperatures and water levels.

By March 15, the No. 2 plant's four reactors reached a state of cold shutdown without any leakage of radioactive materials.

"[At that point, the situation at the No. 2 plant] was considerably different from the No. 1 plant where it was difficult to know what was going on," Masuda, 53, said.

However, **despite intense efforts by all employees, it took a long time to stabilize the reactors.**

On March 11, **about 2,000 employees** of the No. 2 plant worked to stabilize the reactors. Some employees connected **200-meter sections of cable, each weighing more than a ton, over a distance of nine kilometers.**

Masuda noted the timing of the disaster was critical in saving the plant.

"We were lucky it happened on a Friday afternoon [and not on a weekend]," he said.

Masuda pointed out only 40 employees would have been at the plant if the earthquake had occurred in the evening or on a weekend.

"[In that case] it would be have been difficult for us to deal with the disaster," he said.

The Fukushima prefectural government conducted an on-site inspection at the No. 2 plant on Wednesday and repeated a request to TEPCO to decommission the facility.

Masuda did not elaborate and said, "At the moment, I can only say we'll maintain a state of cold shutdown."

The No. 2 plant's No. 1 reactor began operating in 1982. Following the Great East Japan Earthquake, a Nuclear Emergency Situation Declaration was issued for both the No. 1 and No. 2 plants. The declaration was lifted for the No. 2 plant in December.

February 11, 2012

Atomic energy commission to recommend background checks for nuclear workers

<http://mdn.mainichi.jp/mdnnews/news/20120211p2a00m0na002000c.html>

The Japan Atomic Energy Commission (JAEC) on Feb. 10 put together a draft report recommending energy companies be made to do background checks on employees working at important nuclear facilities or with nuclear materials.

Specifics are expected to be ironed out by a new government atomic energy regulatory organ to be established in April.

In January of last year, the International Atomic Energy Agency (IAEA) released a recommendation that the trustworthiness of nuclear employees be checked, and according to the JAEC, background checks on nuclear employees are already performed in most major countries. Such checks were

considered in Japan in 2004 by the Ministry of Economy, Trade and Industry, but were not implemented over privacy concerns.

After the meltdowns at the Fukushima No. 1 nuclear plant, the JAEC recommended checks because "implementing counterterrorism measures for nuclear facilities, which can cause serious damage to society, is an urgent matter."

One obstacle to the checks is that it is difficult for power companies to check on workers' criminal records or debts, so police and other authorities would have to help. Furthermore, Tokyo Electric Power Co. could not confirm the identities of some of the workers who had been sent to the Fukushima No. 1 plant in recent background checks, and the JAEC has admitted it would be difficult to put the checks into practice.

February 11, 2012

Panel: All N-plant staff should have ID checks

<http://www.yomiuri.co.jp/dy/national/T120210006052.htm>

A committee of the Cabinet Office's Atomic Energy Commission plans to urge the government to require that nuclear facility operators verify the identity of all workers, in an effort to protect the sites against possible terrorist attacks, it has been learned.

It has come to light that Tokyo Electric Power Co.--the operator of the crippled Fukushima No. 1 nuclear power plant--does not have an adequate system to check the identities of those who access the site.

The utility has been unable to confirm the whereabouts of 10 people who worked at the site after the March 11 earthquake and tsunami triggered the crisis at the plant.

The government is expected to finally start taking serious steps against possible terrorist attacks targeting nuclear facilities as part of its review of safety measures in response to the nuclear crisis.

After the Sept. 11, 2001, terrorist attacks in the United States, nuclear power plants around the world implemented stricter security measures against possible sabotage. The International Atomic Energy Agency revised its guideline titled "The Physical Protection of Nuclear Material and Nuclear Facilities" in February last year, which stipulates that "the identity of all persons entering [facilities] should be verified."

The United States and European countries require nuclear facility operators to examine workers' past records, including checks for criminal activity and drug abuse. In contrast, Japan has had almost no concrete discussions on this issue, mainly because of an emphasis on protecting private information.

When workers enter protected areas at nuclear facilities in Japan, they usually do so in pairs so they can keep watch on each other.

More than 3,000 workers have been engaged in daily recovery activities at the Fukushima No. 1 nuclear power plant since the outbreak of the crisis. TEPCO conducted follow-up investigations into those who had worked at the site and discovered that the whereabouts of 10 workers could not be confirmed.

Moreover, poor security in most areas of the plant except for the central control room has also been identified as a problem. Areas near power supplies and cooling systems could be easily targeted in a terrorist attack, which could possibly result in a core meltdown, according to sources.

Therefore, the committee has decided the government should make it mandatory for nuclear facility operators to verify the identity of all workers in line with the IAEA guideline. This would cover not only employees of nuclear power plant operators, but also those from other companies working for the utilities, the sources said.

Over 100,000 signatures collected for Tokai nuclear plant scrapping

MITO (Kyodo) -- Civic groups submitted to the Ibaraki governor on Friday about 51,000 signatures and a petition demanding that the Tokai No. 2 nuclear power station be scrapped, bringing the total number of signatures they have collected against the plant operation to more than 100,000.

Last November, about 50,000 signatures against the resumption of the plant's operation, halted since last year, were already submitted to Ibaraki Gov. Masaru Hashimoto.

The petition submitted Friday urges the prefectural government not to allow the Tokai power station to resume operation, saying, "We should not allow a recurrence of the irretrievable sacrifice and loss as experienced in the Fukushima Daiichi nuclear power plant accident."

Having received the signatures and the petition, Katsuyoshi Tan in charge of the prefecture's crisis management said, "The (central) government has not yet announced its decision on resuming operations (of idled nuclear reactors), so we are undecided."

Civic groups are encouraging the prefecture to make "independent" decisions instead of waiting for the central government's policies.

The groups said they used the Internet and took to the streets to gather the signatures and will try to gather more.

Citizens group runs full-page anti-nuclear ad in Mainichi

<http://mdn.mainichi.jp/mdnnews/news/20120211p2a00m0na004000c.html>

The ad carried in the Feb. 11 morning edition of the Mainichi Shimbun.

A citizens group formed by intellectuals Shinichi Nakazawa, Tatsuru Uchida, and writer Seiko Ito ran a full-page anti-nuclear power ad in the Feb. 11 edition of the Mainichi Shimbun.

The ad reads in large print, "We aim for a Japan with no nuclear power plants." Nakazawa says the ad "is valuable in that it makes the opinions of people below the surface (of public discourse) visible through newspapers."

The ad was endorsed by some 150 people, mainly musicians and others in the arts, as well as around 20 organizations.

"To be ethical towards the future, we have to change direction," says Ito.

TEPCO provided radiation map to U.S. before Japanese public

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm019000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. provided a contamination survey map of its crippled Fukushima No. 1 nuclear plant to the U.S. nuclear regulator nearly a month before its official disclosure to the public in Japan in late April last year, company officials said.

The revelation follows a series of revelations that the government data from the System for Prediction of Environmental Emergency Dose Information and the Japan Meteorological Agency's data on the projected radiation spread were provided to the United States and other international institutes before disclosure of the information in Japan.

TEPCO started making the map which described the amount of radiation at up to 150 spots around the buildings in the power plant site on March 22 and provided it the same day to the U.S. Nuclear Regulatory Commission at the request of its staff members dispatched to Japan after the March 11 earthquake and tsunami triggered the nuclear crisis, the officials said.

TEPCO officials and NRC staffers continued to share updated versions of the map almost every day via e-mail, they said.

TEPCO only started providing the data to Japan's Nuclear and Industrial Safety Agency on March 23. It waited until April 24 to make the map public, only after the media reported details of the map a day before.

An official at TEPCO's public relations department said the company had provided data on the radiation amount at the Fukushima No. 1 complex at press conferences even before the official disclosure of the map, adding the utility "received advice" from the NRC.

<http://mdn.mainichi.jp/mdnnews/news/20120212p2a00m0na007000c.html>

From atomic bombings to nuclear disaster: director turns camera toward Fukushima

Director Hidetaka Inazuka, known for his documentary on the late double atomic bomb survivor Tsutomu Yamaguchi, has turned his attention toward Fukushima Prefecture, covering the prefecture in a new film on people exposed to radiation from the crippled Fukushima No. 1 Nuclear Power Plant.

The 61-year-old filmmaker's new work is titled "Fukushima 2011: Hibaku ni Sarasareta Hitobito no Kiroku" (Fukushima 2011: Records of people exposed to radiation). It follows survivors of the atomic bombing of Hiroshima and Nagasaki who are now living in Fukushima, as well as the people facing radioactive contamination of their hometowns. The film is **due to be screened across Japan from mid-March**. It will also be shown at the Los Angeles Japanese Film Festival in April.

One subject of the new documentary is a man in his 80s who survived the atomic bombing of Hiroshima at an army barracks in the city.

"Even when there were explosions at the nuclear power plant I didn't feel scared. I've been hit by a bombing before, and it's 30 kilometers (from my place to the nuclear plant)," he says.

After the war, the man took up dairy farming, but the nuclear disaster triggered by the March 2011 Great East Japan Earthquake and tsunami forced him to abandon his business.

"I had 46 cows, but I sold them off for 800,000 yen. I can get by for a year or two, but there's no telling what's in store after that. I think about my children and grandchildren every day," he tells the camera.

In April last year, Inazuka visited the United States for a screening of his documentary "Twice Bombed: A Legacy of Yamaguchi Tsutomu." The film traces Yamaguchi's activities speaking about surviving the atomic bombings of both Hiroshima and Nagasaki. Yamaguchi died in 2010 at the age of 93. The documentary was well received in the United States, but after the outbreak of the Fukushima nuclear disaster, Japanese people in the U.S. complained that the effects of radiation were not being properly communicated in Japan.

Hearing such complaints, Inazuka recalled the words of Yamaguchi: "The world in which people live must be nuclear-free. We can't prevent (nuclear) accidents with current technology. If we don't become nuclear-free, the downfall of mankind will draw closer."

In May last year, Inazuka visited Fukushima Prefecture, and he focused his camera on the people in the municipality of Iitate before the whole village was evacuated, as well as on people in the city of Soma and other areas where many were killed by the March 11, 2011 tsunami. The film covers people's efforts to restore and revitalize their hometowns, where bonds between families and communities have been severed as a result of the disaster.

Included in the film is 69-year-old Hiromi Sato, a restaurant operator in the city of Minamisoma.

"My neighbors starting leaving, and everyone sent me emails saying 'get out of there' so I started to get scared," she says. "But I didn't want to live in a shelter." She reopened her restaurant after the "Golden Week" string of public holidays in May 2011.

"There are various circumstances among the people who stay, those who leave, and those who return," Inazuka says. "I want to cover the people who are confronting the issues of life wholeheartedly."

Nobel laureate, citizens call for abolition of nuclear power

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm021000c.html>

TOKYO (Kyodo) -- An antinuclear civic group led by Nobel literature laureate Kenzaburo Oe and other celebrities held rallies in Tokyo and Niigata Prefecture on Saturday calling for the abolition of nuclear reactors in the aftermath of radiation leaks at the Fukushima No. 1 power plant.

Addressing the protesters gathered at Yoyogi Park in Tokyo, who numbered around 12,000, according to the organizers, Oe insisted on the abolishment of nuclear reactors.

"We will be handing nuclear waste generated from the nuclear reactors to our grandchildren. This is unethical conduct," Oe said.

The rallies were held as part of the group's campaign to collect 10 million signatures against nuclear power to submit it to the prime minister and the chiefs of both chambers of the Diet. The executive

committee for the "10 Million People's Action to say Goodbye to Nuclear Power Plant" campaign said earlier it has gathered about 4 million signatures so far in sympathy with its goal to abolish all 54 commercial reactors in Japan.

Taro Yamamoto, an actor who is known as an anti-nuclear advocate, also took part in the rally.

"If a massive earthquake occurs now, our country will be finished. We cannot have the nuclear reactors resume their operations," he told the protesters.

On March 11, the first anniversary since the disastrous earthquake and tsunami prompted the worst nuclear crisis since Chernobyl at Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant, the group plans to hold a rally in Koriyama in Fukushima Prefecture.

Fukushima No. 2 reactor temperature up to 82C, but not critical: TEPCO

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm020000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Sunday the temperature at the bottom of the No. 2 reactor at its crippled Fukushima No. 1 nuclear plant rose further to 82 C, but the reactor has not gone critical.

While the thermometer reading at shortly after 2 p.m. marked a new high since the reactor attained a cold shutdown in December, the utility known as TEPCO said it has confirmed that sustained nuclear reactions are not taking place in the reactor as **no radioactive xenon has been detected inside its containment vessel.**

TEPCO reported the latest development immediately to the Nuclear and Industrial Safety Agency of the Economy, Trade and Industry Ministry as the temperature exceeded the limit of 80 C designated by the company's safety regulation for maintaining a cold shutdown, it said.

It is considered desirable to keep the temperature below 80 C, while the bottom of a reactor pressure vessel must be kept below 100 C in a stable cold shutdown, in view of the margin of error of thermometers, according to TEPCO officials.

TEPCO plans to increase the amount of water injected as a coolant by 3 tons per hour and pour 1 ton of boric acid later Sunday to prevent any event of criticality.

As a reason for what is causing the temperature rise, TEPCO said it is possible the water flow is unstable and thus failing to cool the reactor stably, while also saying it will check the thermometer for any irregularities. The temperature was measured at 78.3 C at 10 a.m. and fell to 75.4 C at 11 a.m.

The decline occurred after TEPCO on Saturday night increased the amount of water being injected into the reactor to 14.6 tons per hour from 13.6 tons, after seeing the temperature rise to 73.3 C at 9 p.m. It reached 74.9 C at 11 p.m. Saturday. The temperature readings began rising on Feb. 1.

One of the three thermometers at the bottom of the reactor's pressure vessel stayed between 67 C and 71 C from Friday evening to Saturday evening after hitting 73.3 C on Monday.

Readings from two other thermometers that check the temperature at the bottom of the No. 2 reactor vessel were around 35 C, TEPCO said.

The Nos. 1 to 3 reactors at the Fukushima No. 1 plant in northeastern Japan experienced meltdowns as a result of the loss of key cooling functions in the wake of the devastating earthquake and tsunami on March 11 last year.

Temperature rising at No.2 reactor

http://www3.nhk.or.jp/daily/english/20120212_12.html

The temperature at the No.2 reactor of the Fukushima Daiichi nuclear power plant **keeps rising even after the injection of more cooling water on Saturday night.**

The plant operator, Tokyo Electric Power Company, or TEPCO, says a thermometer at the bottom of the reactor registered 78.3 degrees Celsius at 10 AM on Sunday.

The reading began to rise in late January to around 70 degrees. TEPCO pumped in more water to push down the temperature, but it rose again on Saturday night to 74.9 degrees.

The temperature continued to climb on Sunday morning to hit its highest level since last December, when the government and TEPCO declared all the reactors were at a state of cold shutdown, with their temperatures below 100 degrees.

TEPCO denied the possibility of nuclear criticality, saying 2 other thermometers at the bottom of the reactor show temperatures at around 35 degrees.

It adds that continuous nuclear fission would generate radioactive xenon, but gas samples collected from near the reactor found the element below the detection limit.

TEPCO is set to dump in boric acid to prevent any nuclear criticality later on Sunday and increase the volume of cooling water by 3 tons per hour.

Under new guidelines, **the company must keep reactor temperatures at 80 degrees or below**, given thermometers' margin of error of up to 20 degrees.

PANACHES RADIOACTIFS :**Quels sont les risques attendus sur la France ?**

Au vu du nombre impressionnant de demandes qu'elle a reçues, et plus encore de l'inquiétude exprimée par la plupart des messages, la CRIIRAD a décidé de rédiger un texte d'information destiné à rassurer, autant qu'il est possible, les personnes qui l'ont interpellée sans pour autant aller au-delà de ce que permettent les données disponibles. C'est difficile car les données utilisables sont encore très rares. C'est d'autant plus choquant que des résultats d'analyse existent mais qu'ils ne sont pas publiés. Nous reviendrons dans un prochain communiqué sur les nombreux dysfonctionnements qui provoquent depuis 10 jours notre indignation et notre colère.

INFORMATION TARDIVE

La CRIIRAD tient tout d'abord à présenter ses excuses pour n'avoir pas répondu plus tôt aux très nombreuses demandes d'information qu'elle reçoit depuis plusieurs jours. Ses excuses s'adressent tout spécialement :

- **à ses adhérents** qui habitent très majoritairement la France et à qui la CRIIRAD aurait dû prioritairement envoyer des informations. C'est en effet grâce à leur soutien que la CRIIRAD s'est créée et qu'elle continue d'exister aujourd'hui.
- **à la Région Rhône-Alpes, aux départements de la Drôme, de l'Isère, aux municipalités d'Avignon, de Romans-sur-Isère, de Valence (et environs), de Montélimar (et environs), à la communauté de communes du Pays-Roussillonnais.** C'est grâce à leur soutien financier qu'existe dans la vallée du Rhône un réseau de balises de surveillance de la radioactivité de l'air indépendant de l'Etat, des exploitants et des services officiels. Ce réseau s'est constitué malgré l'opposition farouche de l'Etat français. La situation n'a pas forcément changé. C'est en tout cas ce que suggère l'échec inattendu du projet d'implantation d'une 6^{ème} balise en Haute-Savoie. La municipalité d'Annecy et le SILA (syndicat mixte du lac d'Annecy) avaient donné leur accord, mais le projet a ensuite été abandonné... après une réunion avec la Préfecture et l'IRSN.

LE CHOIX DE LA CRIIRAD

Etant donné les niveaux de risque auxquels sont exposées les populations japonaises, nous avons décidé de concentrer nos efforts sur la situation au Japon, sachant évidemment que les panaches radioactifs n'arriveraient sur la France que postérieurement et que les concentrations en produits radioactifs auraient considérablement décru. En parallèle, des recherches ont immédiatement été lancées sur les réseaux de mesures implantés aux Etats-Unis, au Canada et au Mexique afin de disposer d'une évaluation intermédiaire des niveaux de contamination des panaches avant leur arrivée sur l'Europe.

Ce jour 21 mars, la situation au Japon reste la priorité de la CRIIRAD : les rejets radioactifs continuent, ils peuvent s'aggraver à tout instant ; les conditions météorologiques sont en outre défavorables et pourraient le rester jusqu'à mercredi minuit au minimum (heure de Tokyo) ; les mesures de protection qui ont été prises sont insuffisantes ; les niveaux de contamination dans les produits à risque sont très élevés et bien au-delà des zones proches de la centrale (nous avons travaillé tout le week-end pour contrer les informations erronées diffusées à ce sujet).

Le présent document vient en complément. Il s'efforce de faire le point sur les niveaux de contamination attendus en France. Dès lors que le travail d'analyse de notre laboratoire pourra commencer, l'information sera plus facile à élaborer.

LA PROGRESSION DES MASSES D'AIR CONTAMINE EN DIRECTION DE L'EUROPE

Les mécanismes qui diminuent de la radioactivité de l'air

La centrale nucléaire de Fukushima Daiichi rejette dans l'atmosphère, depuis 10 jours, tout un cocktail de produits radioactifs. Schématiquement, 3 mécanismes concourent à abaisser les niveaux de contamination et par conséquent les niveaux de risque :

1/ les émissions radioactives sont progressivement diluées dans des volumes d'air de plus en plus importants. Ceci conduit évidemment à une baisse de la concentration de l'air en produits radioactifs (ou plus exactement à une baisse de l'activité de l'air qui s'exprime en Bq/m³). L'air que les populations sont susceptibles de respirer est ainsi de moins en moins radioactif.

Note : c'est ce que Roger Belbéoch appelle la démocratisation du risque : les niveaux d'exposition sont plus faibles mais un bien plus grand nombre de personnes est touché.

2/ les produits radioactifs présents dans l'air se déposent progressivement au sol, ce qui conduit à appauvrir progressivement le panache et à abaisser d'autant sa dangerosité. Deux mécanismes convergent : **les dépôts secs**, qui se produisent en permanence, quelles que soient les conditions météorologiques, et **les dépôts humides**, plus intenses, qui sont provoqués par la pluie ou la neige. En tombant, elles lessivent en effet les masses d'air contaminé, précipitant au sol (ou sur les océans) les particules radioactives en suspension (aérosols) et les gaz solubles (c'est le cas des iodes radioactifs). Il faut espérer à ce propos que les panaches radioactifs restent le plus longtemps possible sur le Pacifique et l'Atlantique où l'impact des retombées est moindre d'un point de vue sanitaire.

3/ l'activité des produits radioactifs diminue dans le temps : pour certains, comme le césium 137 ou le krypton 85, très lentement ; pour d'autres, assez rapidement. Le rythme de décroissance est déterminé par la période radioactive de chaque radionucléide. Celle de l'iode 131 est de 8 jours. Cela signifie qu'en 1 période, soit 8 jours, l'activité initiale est divisée par 2 ; en 2 périodes, soit 16 jours, par 4 ; en 3 périodes, par 8, etc.

NB : la période radioactive ne suffit pas à déterminer le temps pendant lequel un produit radioactif reste dangereux. Il faut également tenir compte de l'activité initiale. Si l'activité initiale de l'iode est de 80 Bq, un mois plus tard, soit après 4 périodes, elle sera divisée par 16. Il ne restera « que » 5 Bq ; mais si l'activité initiale est de 8 000 Bq, un mois plus tard, il reste encore 500 Bq.

L'impact de ces 3 mécanismes – dilution, dépôts, désintégration – augmente évidemment avec le temps et la distance.

Le passage des panaches radioactifs sur l'Amérique du Nord

Via l'océan pacifique, la France est située à près de 15 000 km des côtes japonaises. En utilisant le logiciel HYSPLIT du NOAA américain (<http://ready.arl.noaa.gov/HYSPLIT.php>), la CRIIRAD a modélisé les trajectoires des rejets émis à Fukushima (voir pdf « trajectoires » ci-joint). Il s'agit du parcours des produits radioactifs rejetés le 12 mars à 12h TU (soit 21h Japon). La simulation est basée sur les données météorologiques du 12 mars 12h TU au 21 mars 06h00 TU archivées par le NOAA. Trois trajectoires sont considérées en fonction de l'altitude de départ des radionucléides : en vert notamment la trajectoire des particules radioactives émise à 50 mètres de hauteur (en bleu 500 mètres, en rouge 1 000 mètres, assez peu réaliste dans le cas de Fukushima).

Selon cette modélisation, les premiers rejets radioactifs de la centrale de Fukushima Daiichi devaient atteindre la côte ouest des Etats-Unis et du Canada vers les 17-18 mars.

Nous avons alors recherché des sites Internet susceptibles de donner des résultats d'analyse ce qui nous aurait permis d'établir un bilan intermédiaire des niveaux de contamination et de risque. En suivant l'évolution des concentrations tout au long de la traversée des Etats-Unis, nous espérons pouvoir anticiper plus précisément l'impact sur la France.

Nous avons effectivement trouvé des résultats, notamment auprès de l'Environmental Protection Agency (voir lien ci-dessous). Malheureusement, ces résultats ne portent pas sur l'activité volumique mais sur les taux d'émission bêta et gamma des dépôts collectés sur des filtres à air. Ils ne permettent d'apprécier ni les risques d'inhalation de radionucléides, ni l'intensité des dépôts au sol. L'évolution dans le temps de ces paramètres montre en revanche une augmentation qui est, selon toutes probabilités, liée au passage de masses d'air contaminé, vu sa cohérence avec les dates qui figurent sur les modélisations de trajectoires.

Site d'accès aux données :

<http://www.epa.gov/japan2011/rert/radnet-data.html>

Les données analysées par la CRIIRAD concernent les stations de mesure suivantes :

Etat de l'Alaska :

- Anchorage
- Juneau

Etat de Washington :

- Seattle

Etat de Californie :

- San Francisco
- Anaheim

Les estimations publiées par l'IRSN

L'IRSN a annoncé qu'en France, l'activité de l'air en **césium 137** serait de l'ordre de **1 mBq/m³**.

Pour quantifier les rejets, l'IRSN indique qu'il « *n'a pas de données de mesure directe sur la composition et l'ampleur des rejets radioactifs, mais dispose d'informations techniques sur les installations accidentées.* », précisant : « *l'interprétation de ces informations a permis à l'IRSN d'élaborer des scénarios probables de dégradation des 3 réacteurs depuis le 12 mars, en s'assurant de leur cohérence avec les mesures de débit de dose obtenues sur le site. L'IRSN a également retenu l'hypothèse que ces rejets se poursuivent jusqu'au 20 mars.* ». A noter que le dossier scientifique associé n'a pas été publié.

A partir des rejets estimés par l'IRSN, Météo France a simulé la dispersion des rejets radioactifs à très grande distance, projetée jusqu'au 26 mars.

Pour visualiser la modélisation : http://www.irsn.fr/FR/popup/Pages/irsn-meteo-france_19mars.aspx

Selon cette simulation, le panache radioactif devrait atteindre la France à partir du 23 ou du 24 mars. L'IRSN précise que « *Les concentrations attendues à terme, d'après cette modélisation, pourraient être de l'ordre de 0,001 Bq/m³ en France métropolitaine et dans les départements d'outre-mer de l'hémisphère nord. Comme attendu, l'hémisphère sud n'est pas significativement affecté par cette dispersion à grande échelle.* »

http://www.irsn.fr/FR/Actualites_presse/Actualites/Pages/20110319_simulation_dispersion_panache_radioactif.aspx

ESTIMATION PRELIMINAIRE DES NIVEAUX DE RISQUE PAR LA CRIIRAD

Sur la base des éléments qu'elle a pu collecter, la CRIIRAD considère que :

- **le risque d'irradiation¹ par les masses d'air contaminé sera négligeable** (les personnes qui disposent d'un radiamètre ne devraient pas mesurer d'augmentation du bruit de fond ambiant mais nous invitons les personnes qui sont équipées à le vérifier : une mesure vaut mieux qu'une prévision) ;
- **le risque associé à l'inhalation des aérosols et halogènes radioactifs présents dans l'air devrait être très faible** (voir note)² . **Les calculs de dose précisés ci-dessous indiquent que la mise en œuvre de contre-mesures, notamment la prise de comprimés d'iode stable³, n'est pas justifiée.**

Nous avons essayé d'estimer les niveaux de dose résultant de l'inhalation des radionucléides dont la présence est documentée : césium 137, césium 134, iode 131, iode 132, iode 133 et tellure 132. Le premier calcul a été conduit pour une activité de 1 mBq/m³ pour le césium 137 (estimation donnée par l'IRSN) et de 125 mBq/m³ pour l'iode 131 (sur la base du rapport isotopique mesuré par TEPCO devant la centrale de Fukushima Daiichi le 19 mars 2011 à 12h - heure locale). Le calcul a été effectué en supposant que les panaches radioactifs restent présents sur la France pendant 1 semaine et sans que leur activité diminue.

Conclusion : une personne (adulte ou enfant) qui respirerait l'air contaminé 7 jours durant, recevrait une dose de rayonnement **inférieure à 1 µSv**, soit un niveau de dose négligeable ;

En prenant une marge de sécurité par rapport à l'évaluation de l'IRSN (soit 10 mBq/m³ en césium 137 au lieu de 1 mBq/m³), les doses s'élèvent à **2 µSv pour l'adulte et à 8 µSv pour l'enfant**.

- **le risque d'irradiation des personnes par les produits radioactifs déposés sur les sols sera négligeable, n'induisant aucune augmentation mesurable du bruit de fond ambiant** (là encore ceci pourra être facilement vérifié par des mesures radiamétriques) ;
- **le risque lié à l'ingestion d'eau ou d'aliments contaminés par les retombées radioactives devrait rester limité. Le laboratoire de la CRIIRAD évaluera le plus rapidement possible les quantités de radioactivité déposées au sol (dépôts sec et dépôts liés aux précipitations) afin de vérifier les ordres de grandeurs attendus dans les aliments et de donner, si nécessaire, des conseils adaptés.**

En conclusion, le passage des masses d'air contaminé sur la France ne doit pas générer trop d'inquiétude. Cependant, compte tenu du manque crucial de données, la CRIIRAD est contrainte de laisser certaines affirmations au conditionnel. Ceci devrait pouvoir être corrigé très rapidement.

Son laboratoire a procédé, dès aujourd'hui, sur plusieurs de ses balises à des prélèvements de filtres à poussières et de filtres à charbon actif afin de vérifier que l'air que nous respirons n'est pas encore contaminé.

Les premiers résultats, qui concernent la balise implantée à Romans-sur-Isère, dans la Drôme, confirment l'absence de contamination mesurable dans l'air jusqu'à la date du prélèvement, le lundi 22 mars 2011 à 10 heures : pas de césium 137 dans le filtre aérosols, ni d'iode 131 dans la cartouche à charbon actif.

¹ Il s'agit de l'exposition des personnes aux rayonnements émis par les produits radioactifs présents dans les panaches et qui se désintègrent. Un peu comme on peut être exposé aux rayonnements ultra-violets émis par le soleil. Il n'y a pas d'incorporation de produits radioactifs ;

² Sous réserve cependant que les radionucléides significatifs sur le plan dosimétrique, **mais qui n'ont pas fait l'objet de mesures**, restent dans les rapports attendus. Il s'agit notamment des isotopes du strontium et du plutonium.

³ En revanche, le contexte actuel peut amener chacun à réfléchir à l'équilibre de son régime alimentaire et à vérifier s'il n'est pas carencé en iode (la thyroïde a besoin d'iode stable pour fabriquer les hormones nécessaires au bon fonctionnement de l'organisme). Rappelons également que lorsque la thyroïde est carencée en iode, elle fixe d'autant plus l'iode radioactif.

Ces contrôles seront intensifiés dans les jours à venir de façon à confirmer aussi rapidement que possible (et le cas échéant à corriger) les informations rassurantes données ci-dessus.

Si les conditions météorologiques le permettent, seront également effectuées des analyses d'eau de pluie qui renseigneront sur l'ordre de grandeur des dépôts au sol. Dans tous les cas, il sera procédé à des mesures des dépôts secs afin de vérifier le niveau de risque pour la chaîne alimentaire.

Rappelons que la contamination des aliments type lait, fromage, viande ne s'effectue qu'avec un certain délai : la CRIIRAD disposera d'ici là de données chiffrées et tous les résultats seront rendus publics.

ACTIVITE DE L'AIR EN IODE 131

Le résultat publié par l'IRSN – et peut-être par d'autres laboratoires européens – sous-évalue très probablement le niveau réel de la contamination.

En effet, d'après les informations recueillies par la CRIIRAD, l'air a été échantillonné à partir d'un FILTRE A AEROSOLS qui ne permet pas de piéger l'iode présent dans l'air SOUS FORME GAZEUSE. La CRIIRAD considère que l'iode gazeux pourrait constituer une part importante, probablement majoritaire, de l'iode radioactif présent dans les masses d'air contaminé par les rejets de la centrale nucléaire de FUKUSHIMA DAIICHI.

Concernant l'Europe, l'incidence de cette question sur l'évaluation des risques est très limitée. Au Japon en revanche les conséquences pourraient être graves.

Dans tous les cas, il est indispensable que les laboratoires documentent leur méthodologie de prélèvement afin que chacun puisse apprécier la portée des résultats qui sont diffusés.

Depuis hier, un certain nombre de communiqués font état de l'arrivée des masses d'air contaminé sur l'Europe. Les résultats concernent le plus souvent l'activité volumique de l'air en iode 131.

Ce samedi 26 mars, L'IRSN vient d'annoncer qu'une « **première mesure positive vient d'être obtenue** par le laboratoire spécialisé de l'institut sur un prélèvement d'air effectué du 21 au 24 mars au sommet du Puy de Dôme (63). **La concentration d'iode 131 ainsi mesurée correspond à un niveau de trace dans l'atmosphère, et ne représente aucun danger environnemental ou sanitaire.** ».

Le résultat de l'analyse figure dans le **bulletin d'information n°3 du 26 mars 2011**. Extrait ci-dessous.

Les analyses réalisées à ce jour sur les prélèvements les plus récents effectués par l'IRSN indiquent que :

- des traces d'iode 131 ($0,012 \text{ mBq/m}^3$ en moyenne sur la période de prélèvement de 4 jours) ont été mesurées dans l'air prélevé entre le 21 et 24 mars par la station de l'IRSN installée au sommet du Puy de Dôme. Elles révèlent pour la première fois la présence en France d'éléments radioactifs rejetés lors de l'accident de la centrale de Fukushima. L'arrivée de la masse d'air faiblement contaminé a probablement eu lieu au cours de la journée du 24 mars, comme le prévoit la modélisation de la dispersion atmosphérique à l'échelle mondiale réalisée par Météo France. Dans ce cas, la concentration pour la journée du 24 mars pourrait être de l'ordre de $0,04 \text{ mBq/m}^3$. **Cette valeur est plus faible que celles observées le 23 mars en Europe du Nord (quelques dixièmes de mBq./m^3 - voir ci-dessous).** Ceci peut s'expliquer par le délai de transport de la masse d'air vers la France et il est probable que les prochains prélèvements d'air en France, actuellement en cours, indiqueront des valeurs comparables à celles d'Europe du Nord. Les autres radionucléides présents dans les rejets de l'accident de Fukushima, notamment le césium 137, n'ont pas été détectés dans le prélèvement d'air du Puy de Dôme car leur concentration dans l'air reste encore inférieure aux limites de détection des appareils de mesure utilisés ;

Moyennée sur 3 jours : du 21 mars au 24 mars, l'activité en iode 131 de l'air sur le Puy-de-Dôme serait de $12 \text{ } \mu\text{Bq/m}^3$. L'IRSN estime que cela correspond à une activité d'environ $40 \text{ } \mu\text{Bq/m}^3$ pour la journée du 24 mars.

Aucune précision n'étant apportée sur le type de dispositif de filtration utilisé pour échantillonner l'air, la CRIIRAD a recherché les caractéristiques de la station de prélèvement. La station de mesure du Puy-de-Dôme fait partie du réseau OPERA (Observatoire Permanent de la Radioactivité de l'environnement). Une pompe à haut débit (300 m³/h) aspire l'air et le force à travers un filtre fixe afin de collecter les **aérosols** (micro ou nano-poussières atmosphériques). Les filtres sont ensuite envoyés à l'IRSN pour analyse en laboratoire.

CONCLUSION DE LA CRIIRAD :

1/ la présentation des résultats d'analyse est incorrecte : il est indispensable de préciser que la mesure n'a porté que sur l'activité de iode 131 particulaire et qu'il s'agit donc d'une estimation par défaut.

2/ les résultats publiés sous-évaluent très probablement l'activité réelle de l'air en iode 131. Pour savoir si le chiffre réel est 2 fois, 3 fois, 4 fois, 5 fois, 10 fois plus élevé, il faut disposer de résultats d'analyse portant sur des filtres spécifiques qui piègent les formes gazeuses de l'iode. (le laboratoire de la CRIIRAD utilise pour sa part des cartouches à charbon actif).

3/ l'iode est l'un des radionucléides les plus importants du point de vue de la radioprotection. Pour ne pas sous-évaluer les risques, il est indispensable de tenir compte des spécificités de son comportement. C'est d'autant plus important pour un organisme qui est l'expert de l'Etat et qui donne aux autorités les éléments sur lesquels s'appuyer pour la protection radiologique des personnes. Dans la situation présente, l'incidence est minime mais en cas de contamination élevée, les conséquences peuvent être graves.

RAPPEL

Dans son communiqué du 17 mars sur la contamination préoccupante de l'air à Tokyo, la CRIIRAD posait déjà la question de la méthodologie de prélèvement. Elle avait en effet utilisé les analyses du Tokyo Metropolitan Industrial Technology Research Institute, analyse effectuées sur les poussières atmosphériques. Les résultats révélaient un rapport de 4 à 5 entre l'iode 131 et le césium 137.

Résultats moyennés sur les 42 heures de suivi :

- **Iode 131 : 14,9 Bq/m³**
- **Césium 137 : 3,2 Bq/m³**

Résultats concernant le maximum enregistré à Tokyo, le 15 mars, sur les poussières prélevées à 11h :

- **Iode 131 : 241 Bq/m³**
- **Césium 137 : 60 Bq/m³**

La CRIIRAD avait conduit des calculs de dose à partir de ces chiffres mais en soulignant qu'ils sous-évaluaient probablement et peut-être fortement la réalité des risques. Pour rappel :

*« Il faut cependant souligner que **les chiffres utilisés pour les calculs sous-évaluent très probablement l'activité réelle de l'air.** L'air a, en effet, été échantillonné à partir de filtres à poussières. Pour obtenir un bilan complet, il faudrait disposer de résultats sur des filtres à charbon actif **capables de piéger les gaz, et notamment les formes moléculaires et organiques de l'iode.** Elles peuvent représenter une part importante, voire majoritaire, de l'iode présent. Cette information doit être obtenue d'urgence. »*

Lien vers le communiqué CRIIRAD du 17 mars.

Le laboratoire de la CRIIRAD poursuit ses analyses.

L'incident de Fukushima Daiichi

1. Conception de l'installation

► Fukushima Daiichi (Centrale I)

- ◆ Tranche I - GE Mark I BWR (439 MW), En service depuis 1971
- ◆ Tranches II-IV - GE Mark I BWR (760 MW), En service depuis 1974

L'incident de Fukushima Daiichi

1. Conception de l'installation

► Structure du bâtiment

- ◆ Bâtiment en béton
- ◆ Plancher de service en bardage métallique

nucleartourist.com

► Enceinte de confinement

- ◆ Puits sec en forme de poire
- ◆ Puits humide en forme de tore

en.wikipedia.org/wiki/Browns_Ferry_Nuclear_Power_Plant

L'incident de Fukushima Daiichi

1. Conception de l'installation

► Plancher de service

L'incident de Fukushima Daiichi

1. Conception de l'installation

- Manutention de la coupole de fermeture de l'enceinte de confinement

L'incident de Fukushima Daiichi

1. Conception de l'installation

► Plancher de service du réacteur
(construction en acier)

► Bâtiment réacteur en béton
(confinement secondaire)

Ligne vapeur vive
Eau alimentaire

► Cœur du réacteur

► Cuve du réacteur

► Enceinte (Puits sec)

► Enceinte (Puits humide) /
Chambre de Condensation

L'incident de Fukushima Daiichi

2. Progression de l'accident

► 11.3.2011 14:46 - Séisme

- ◆ Magnitude 9
- ◆ Ecrroulement du réseau de transport d'électricité du nord Japon
- ◆ Les réacteurs eux-mêmes sont globalement non endommagés

► Arrêt Automatique Réacteur

- ◆ La puissance issue de la fission de l'uranium cesse
- ◆ Production de chaleur due à la décroissance radioactive des produits de fission
 - After Scram ~6%
 - After 1 Day ~1%
 - After 5 Days ~0.5%

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ Isolement du confinement
 - ◆ Fermeture de toutes les traversées enceinte non importantes pour la sûreté
 - ◆ Séparation de la salle des machines
 - ◆ Si l'isolement enceinte fonctionne, un rejet massif précoce de produits de fissions est hautement improbable
- ▶ Démarrage des groupes diesels
 - ◆ Les systèmes d'injection de sécurité sont alimentés
- ▶ L'installation est dans un état stable et sûr

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ 11.3. 15:41 Le tsunami frappe la centrale
 - ◆ Conception de la centrale pour une hauteur de tsunami de 6,5m
 - ◆ Hauteur réelle du Tsunami >7m
 - ◆ Inondation des
 - Groupes électrogènes diesel et/ou
 - Bâtiment essentiel d'eau de service pour le refroidissement des diesels
- ▶ Perte totale des alimentations électriques
 - ◆ Défaut de mode commun sur les sources électriques
 - ◆ Ne restent que les batteries
 - ◆ Défaillance de tous les systèmes de d'injection de sécurité sauf un

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé reste disponible
 - ◆ La vapeur issue du réacteur entraîne une turbine
 - ◆ La vapeur est condensée dans le puits humide
 - ◆ La turbine entraîne une pompe
 - ◆ L'eau du puits humide est pompée vers le réacteur
 - ◆ Cela nécessite :
 - La disponibilité des batteries
 - La température dans le puits humide doit rester $< 100^{\circ}\text{C}$
- ▶ Comme il n'y a pas de retrait de chaleur dans le bâtiment, la pompe de refroidissement en mode isolé peut fonctionner indéfiniment.

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé s'arrête
 - ◆ 11.3. 16:36 sur tranche 1 (Batteries vides)
 - ◆ 14.3. 13:25 sur tranche 2 (Défaillance de la pompe)
 - ◆ 13.3. 2:44 sur la tranche 3 (Batteries vides)
- ▶ La puissance résiduelle produit toujours de la vapeur dans la cuve
 - ◆ La pression augmente
- ▶ Ouverture des vannes de dépressurisation
 - ◆ Décharge vers le puits humide
- ▶ Baisse du niveau liquide dans la cuve

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé s'arrête
 - ◆ 11.3. 16:36 sur tranche 1 (Batteries vides)
 - ◆ 14.3. 13:25 sur tranche 2 (Défaillance de la pompe)
 - ◆ 13.3. 2:44 sur la tranche 3 (Batteries vides)
- ▶ La puissance résiduelle produit toujours de la vapeur dans la cuve
 - ◆ La pression augmente
- ▶ Ouverture des vannes de dépressurisation
 - ◆ Décharge vers le puits humide
- ▶ Baisse du niveau liquide dans la cuve

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé s'arrête
 - ◆ 11.3. 16:36 sur tranche 1 (Batteries vides)
 - ◆ 14.3. 13:25 sur tranche 2 (Défaillance de la pompe)
 - ◆ 13.3. 2:44 sur la tranche 3 (Batteries vides)
- ▶ La puissance résiduelle produit toujours de la vapeur dans la cuve
 - ◆ La pression augmente
- ▶ Ouverture des vannes de dépressurisation
 - ◆ Décharge vers le puits humide
- ▶ Baisse du niveau liquide dans la cuve

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé s'arrête
 - ◆ 11.3. 16:36 sur tranche 1 (Batteries vides)
 - ◆ 14.3. 13:25 sur tranche 2 (Défaillance de la pompe)
 - ◆ 13.3. 2:44 sur la tranche 3 (Batteries vides)
- ▶ La puissance résiduelle produit toujours de la vapeur dans la cuve
 - ◆ La pression augmente
- ▶ Ouverture des vannes de dépressurisation
 - ◆ Décharge vers le puits humide
- ▶ Baisse du niveau liquide dans la cuve

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La pompe de refroidissement en mode isolé s'arrête
 - ◆ 11.3. 16:36 sur tranche 1 (Batteries vides)
 - ◆ 14.3. 13:25 sur tranche 2 (Défaillance de la pompe)
 - ◆ 13.3. 2:44 sur la tranche 3 (Batteries vides)
- ▶ La puissance résiduelle produit toujours de la vapeur dans la cuve
 - ◆ La pression augmente
- ▶ Ouverture des vannes de dépressurisation
 - ◆ Décharge vers le puits humide
- ▶ Baisse du niveau liquide dans la cuve

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ La mesure du niveau liquide indiquée ici est le niveau tassé. Le véritable niveau est supérieur du fait des bulles de vapeur présentes dans le liquide (émulsion)
- ▶ ~50% du coeur découvert
 - ◆ La température des gaines augmente, sans dégât significatif au coeur
- ▶ ~2/3 du coeur découvert
 - ◆ La température des gaines dépasse ~900°C
 - ◆ Gonflement / rupture des gaines
 - ◆ Relâchement de produits de fission par les ruptures de gaines

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ ~3/4 du coeur découvert
 - ◆ Les gaines dépassent ~1200°C
 - ◆ Le zirconium des gaines commence à brûler en atmosphère vapeur
 - ◆ $\text{Zr} + 2\text{H}_2\text{O} \rightarrow \text{ZrO}_2 + 2\text{H}_2$
 - ◆ La réaction exothermique chauffe encore plus le coeur
 - ◆ Production d'hydrogène
 - Tranche 1: 300-600kg
 - Tranches 2/3: 300-1000kg
 - ◆ L'hydrogène est poussé dans le puits humide, le puits humide se décharge dans le puits sec (soupape)

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ A ~1800°C [Tranches 1,2,3]
 - ◆ Fusion des gaines
 - ◆ Fusion de la structure des éléments
- ▶ A ~2500°C [Tranches 1,2]
 - ◆ Rupture des crayons combustible
 - ◆ Couche de débris dans le coeur
- ▶ A ~2700°C [Tranche 1]
 - ◆ Fusion d'eutectiques Uranium-Zirconium
- ▶ La restauration de l'injection d'eau arrête l'accident sur les 3 tranches
 - ◆ TR 1: 12.3. 20:20 (27h sans eau)
 - ◆ TR 2: 14.3. 20:33 (7h sans eau)
 - ◆ TR 3: 13.3. 9:38 (7h sans eau)

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ Relâchement de produits de fission durant la fusion
 - ◆ Xénon, Césium, Iode,...
 - ◆ Uranium/Plutonium reste en coeur
 - ◆ Des produits de fission se condensent sous forme d'aérosols entraînés par l'air
- ▶ Décharge au travers de vannes dans l'eau de la chambre de condensation
 - ◆ La piscine piège une partie des aérosols dans l'eau
- ▶ Le xénon et le reste des aérosols pénètrent dans le puits sec
 - ◆ Le dépôt d'aérosols sur les surfaces favorise la décontamination de l'air

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ Enceinte de confinement
 - ◆ Dernière barrière entre les produits de fission et l'environnement
 - ◆ Epaisseur des murs ~3cm
 - ◆ Pression de calcul 4-5bar
- ▶ Pression réelle jusqu'à 8 bars
 - ◆ Gaz d'inertage normal (azote)
 - ◆ Hydrogène issu de l'oxydation du cœur
 - ◆ Chambre de condensation en ébullition (comme une cocotte)
- ▶ Dépressurisation de l'enceinte
 - ◆ Tranche 1 : 12.3. 4:00
 - ◆ Tranche 2 : 13.3 00:00
 - ◆ Tranche 3 : 13.3. 8.41

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ Avantages et inconvénients de la dépressurisation de l'enceinte
 - ◆ Retire de l'énergie du bâtiment réacteur (seule solution restante)
 - ◆ Réduction de la pression à ~4 bar
 - ◆ Rejet de petites quantités d'aérosols (iode, césium ~0.1%)
 - ◆ Rejet de gaz rares
 - ◆ Rejet d'hydrogène
- ▶ Le mélange gazeux est rejeté vers le plancher de service du réacteur
 - ◆ L'hydrogène est inflammable

L'incident de Fukushima Daiichi

2. Progression de l'accident

► Tranches 1 et 3

- ◆ L'hydrogène brûle au niveau du plancher de service du réacteur
- ◆ Destruction du bardage
- ◆ La bâtiment en béton renforcé semble intact
- ◆ Spectaculaire mais impact sûreté faible

L'incident de Fukushima Daiichi

2. Progression de l'accident

► Tranche 2

- ◆ L'hydrogène brûle dans le bâtiment réacteur
- ◆ Endommagement probable de la chambre de condensation (eau fortement contaminée)
- ◆ Rejet de gaz incontrôlé de l'enceinte
- ◆ **Rejet de produits de fission**
- ◆ Evacuation temporaire du site
- ◆ Les débits de dose locaux très élevés sur site du fait de la rupture gênent les travaux de réparation

► Aucune information claire sur le comportement différent de la tranche 2

L'incident de Fukushima Daiichi

2. Progression de l'accident

- ▶ Etat actuel des réacteurs
 - ◆ Coeur endommagé en tranches 1,2,3
 - ◆ Bâtiments endommagés du fait d'incendies divers en tranches 1-4
 - ◆ Cuves du réacteur remplis avec des pompes mobiles sur toutes les tranches
 - ◆ A minima, enceinte de confinement remplie sur la tranche 1
- ▶ Poursuite du refroidissement des réacteur via rejet vapeur à l'atmosphère
- ▶ Désormais, seuls de petits rejets de produits de fission peuvent être envisagés

L'incident de Fukushima Daiichi

3. Rejets radioactifs

► Directement sur le site

◆ Avant explosion de la tranche 2

- Inférieur à 2mSv / h
- Essentiellement du au rejet de gaz rares
- Balises côté ouest. La mesure peut être sous-estimée du fait du vent.

◆ Après explosion de la tranche 2 (endommagement de l'enceinte)

- Valeurs pics temporaires 12mSv / h
- (Origine pas complètement éclaircie)
- Valeurs pics locales sur le site jusqu'à 400mSv /h (rupture enceinte / fragments?)
- Dose stable actuelle sur le site à 5mSv /h
- Beaucoup plus à l'intérieur des bâtiments

◆ La limitation du temps d'exposition des intervenants est nécessaire

L'incident de Fukushima Daiichi

3. Rejets radioactifs

L'incident de Fukushima Daiichi

3. Rejets radioactifs

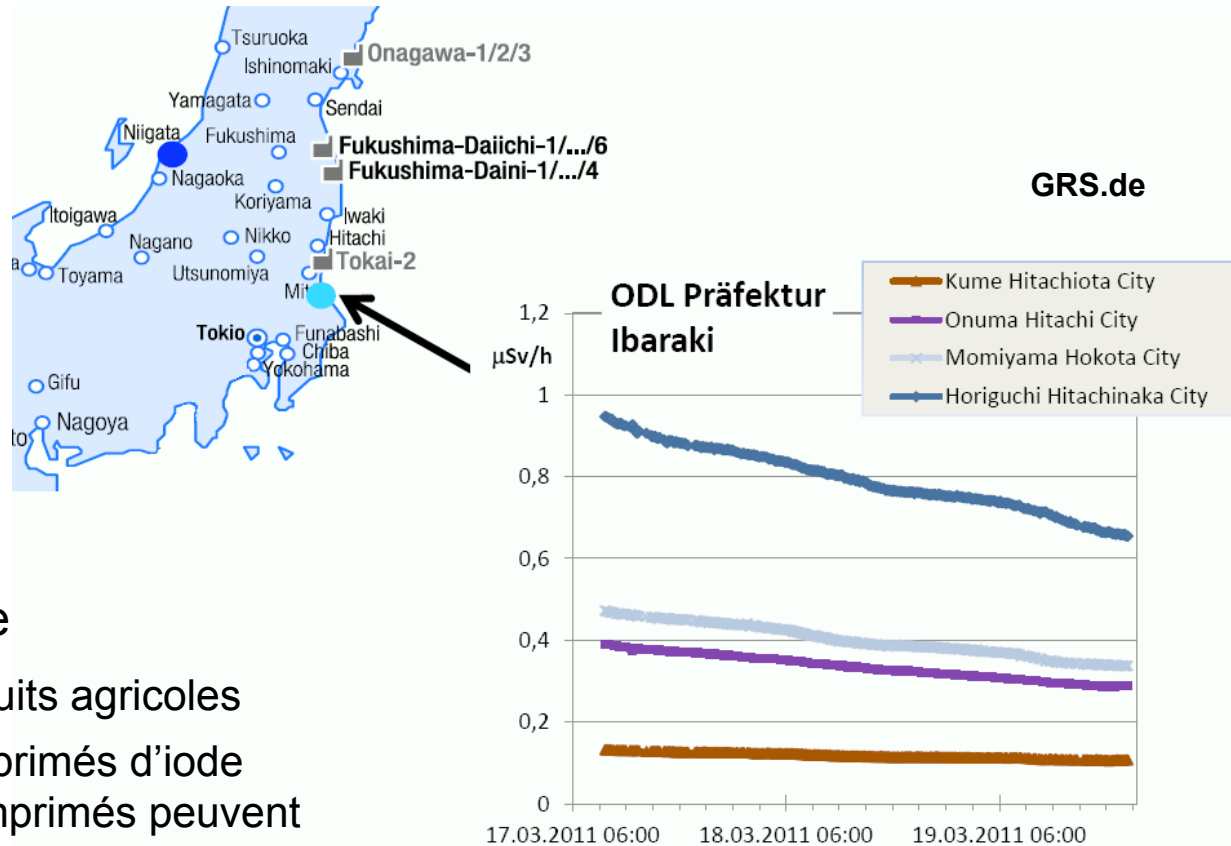

- ▶ En dehors du site
 - ◆ Comme les bâtiments réacteurs sont globalement intacts
=> rejet réduit d'aérosols (pas comme Tchernobyl)
 - ◆ Les produits de fission sont relâchés via la vapeur
=> augmentation des aérosols rapide, mais une large fraction tombe à proximité du site
 - ◆ La dose à l'extérieur du site est principalement due aux gaz rares
 - ◆ Transport / diffusion par le vent, baisse de la dose dans le temps
 - ◆ Pas de "retombée" des gaz rares, donc pas de forte contamination locale des sols

- ▶ ~20km autour du site
 - ◆ Les évacuations sont adaptées
 - ◆ Des débits de dose maximaux de 0,3mSv/h ont été mesurés sur de courtes périodes
 - ◆ Destruction de produits végétaux / animaux possible cette année
 - ◆ Evacuation permanente de la zone probablement non nécessaire

L'incident de Fukushima Daiichi

3. Rejets radioactifs

- ~50km autour du site
 - ◆ Contrôle des produits agricoles
 - ◆ Utilisation de comprimés d'iode (Attention, les comprimés peuvent interférer avec les traitements cardiaques)

L'incident de Fukushima Daiichi

4. Piscines de désactivation

- ▶ La piscine de désactivation est située sur le plancher de service
 - ◆ Du fait de la maintenance, tous les éléments du coeur de la tranche 4 étaient en piscine de désactivation
 - ◆ Assèchement des piscines
 - Tranche 4: en 10 jours
 - Tranches 1-3,5,6 en quelques semaines
 - ◆ **Fuites des piscines du fait du séisme ?**
- ▶ Conséquences
 - ◆ Fusion du coeur en air
 - ◆ Presque pas de rétention des produits de fission
 - ◆ Rejets importants

L'incident de Fukushima Daiichi

4. Piscines de désactivation

- ▶ La piscine de désactivation est située sur le plancher de service
 - ◆ Du fait de la maintenance, tous les éléments du coeur de la tranche 4 étaient en piscine de désactivation
 - ◆ Assèchement des piscines
 - Tranche 4: en 10 jours
 - Tranches 1-3,5,6 en quelques semaines
 - ◆ **Fuites des piscines du fait du séisme ?**
- ▶ Conséquences
 - ◆ Fusion du coeur en air
 - ◆ Presque pas de rétention des produits de fission
 - ◆ Rejets importants

L'incident de Fukushima Daiichi

4. Piscines de désactivation

- ▶ La piscine de désactivation est située sur le plancher de service
 - ◆ Du fait de la maintenance, tous les éléments du coeur de la tranche 4 étaient en piscine de désactivation
 - ◆ Assèchement des piscines
 - Tranche 4: en 10 jours
 - Tranches 1-3,5,6 en quelques semaines
 - ◆ **Fuites des piscines du fait du séisme ?**
- ▶ Conséquences
 - ◆ Fusion du coeur en air
 - ◆ Presque pas de rétention des produits de fission
 - ◆ Rejets importants
 - ◆ **Il n'est pas clair actuellement s'il y a déjà eu des rejets depuis les piscines**

L'incident de Fukushima Daiichi

5. Sources d'information

► Bonnes sources d'information

◆ Gesellschaft für Reaktorsicherheit [GRS.de]

- A jour
- Publication des données radiologiques
- Traduction en allemand des pages web en japonais ou anglais

◆ Japan Atomic Industrial Forum [jaif.or.jp/english/]

- Etat courant des tranches
- Des mesures issues des réacteurs (pression et niveau)

◆ Tokyo Electric Power Company [Tepco.co.jp]

- Etat des travaux de réparation
- Victimes

► Il est probable que trop peu d'information soit diffusée par TEPCO, l'exploitant de la centrale

ADDITIONAL QUESTIONS/GENERAL COMMITTEE

DISCUSSION 146

ADJOURN

P R O C E E D I N G S

(1:03:34 p.m.)

CHAIR ABDEL-KHALIK: The meeting will now come to order. This is a meeting of the Advisory Committee on Reactor Safeguards, Subcommittee on Fukushima. I'm Said Abdel-Khalik, Chairman of the Subcommittee.

ACRS Members in attendance are Sieber, Banerjee, Ray, Powers, Armijo, Stetkar, Ryan, Shack, Brown, and Corradini. Our consultant, Tom Kress, is also present. Dr. Edwin Hackett, Executive Director of ACRS is the Designated Federal Official for this meeting.

The Subcommittee will review information regarding the events of the Fukushima site in Japan. We will hear presentations from representatives of the Nuclear Energy Institute, and the U.S. Department of Energy.

We have received written comments from Mr. Donivan Porterfield of Los Alamos, New Mexico regarding today's meeting. Copies of his comments have been provided to the members and consultant.

We have also received a request from Mr. Arnold Gundersen to provide oral comments. Mr. Gundersen will be given time to provide his comments

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 following the scheduled presentations. The entire
2 meeting will be open to the public.

3 The Subcommittee will gather information,
4 analyze relevant issues and facts, and formulate
5 proposed positions and actions, as appropriate for
6 deliberations by the full Committee.

7 The rules for participation in today's
8 meeting have been announced as part of the notice of
9 this meeting previously published in the Federal
10 Register. There is a phone bridge line for members of
11 the public. To preclude interruption of the meeting,
12 the phone will be placed in a listen-only mode during
13 the presentations and Committee discussions.

14 A transcript of the meeting is being kept
15 and will be made available as stated in the Federal
16 Register notice. Therefore, we request that
17 participants in this meeting use the microphones
18 located throughout the meeting room when addressing
19 the Subcommittee.

20 The participants should first identify
21 themselves and speak with sufficient clarity and
22 volume so that they can be readily heard. I see we
23 have been joined by Dr. Rempe, also.

24 We will now proceed with the meeting, and
25 I call upon Mr. Pietrangelo, Senior Vice President and

1 Chief Nuclear Officer for the Nuclear Energy Institute
2 to begin. Tony.

3 MR. PIETRANGELO: Well, thanks for the
4 opportunity to chat with you today. I do not have a
5 formal presentation, and I'd much rather keep this as
6 a dialogue with the Committee Members. I'm as
7 interested in your insights into Fukushima as the
8 NRC's and anyone else's because, quite frankly, we
9 still do not have a lot of data yet about what
10 transpired on March 11th and since then.

11 So, before I get into what we're doing as
12 an industry, I'd just ask is there anything in
13 particular that the Committee is interested in hearing
14 about from an industry perspective on Fukushima, and
15 then I can direct my remarks towards that.

16 MEMBER POWERS: Well, it seems to me the
17 thing the Committee would be most interested in is
18 whether the industry has identified or has processes
19 in place to identify weaknesses in design, procedures,
20 capabilities revealed by Fukushima that might be
21 present in our plants.

22 MR. PIETRANGELO: Okay.

23 MEMBER ARMIJO: I have a general question.

24 MR. PIETRANGELO: Sure.

25 MEMBER ARMIJO: The extent to which the

1 NEI or the industry has effective information sources
2 with the Japanese utilities.

3 MEMBER SIEBER: Yes, I might add to that.
4 I read all the NEI bulletins, which I consider very
5 helpful, and I would be curious as to where that
6 information that you published came from, and your
7 opinion as to its accuracy and timeliness. And the
8 extent to which we can rely on that information as one
9 of the many building blocks for our analysis of what
10 happened at Fukushima, what needs to be done here.
11 And what changes need to be made with regard to the
12 United States' fleet of nuclear reactors.

13 MR. PIETRANGELO: Okay.

14 CHAIR ABDEL-KHALIK: Yes, Mike.

15 MEMBER RYAN: Tony, I'd be interested in
16 your comments on gaps in information with regard to
17 worker exposure analysis, to public dose analysis.
18 For example, as some data that I've seen on exposure
19 rates, but that's not directly helpful for assessing
20 dose. And how do we get to the measurements we've
21 seen and real dose assessments to real people both in
22 and out of the plants. Thank you.

23 CHAIR ABDEL-KHALIK: To add to a long
24 list, Tony --

25 MR. PIETRANGELO: How long do I have?

1 (Laughter.)

2 MEMBER POWERS: I suspect many of them
3 won't have --

4 CHAIR ABDEL-KHALIK: I mean, we just had
5 INPO IER 11-1, 11-2. We had NRC Bulletin 2011-01.
6 There were the inspections that were recently
7 performed by the Resident Inspectors. And,
8 originally, as part of the implementation of the
9 mitigating strategies a comprehensive inspection was
10 presumably done in 2008, and these were incorporated
11 in the Reactor Oversight process as part of that
12 triennial fire protection inspection.

13 MR. PIETRANGELO: Right.

14 CHAIR ABDEL-KHALIK: Perhaps, your
15 perspective on the effectiveness of these processes
16 that had been going on for a while in light of the
17 findings of the recent inspections made by the
18 Resident Inspectors, and whatever industry responses
19 were provided to INPO in response to IER 11-1 and 11-
20 2.

21 MR. PIETRANGELO: Okay.

22 MEMBER CORRADINI: Do you want more, or
23 are you okay?

24 (Laughter.)

25 CHAIR ABDEL-KHALIK: And you can address

1 these issues in any logical order you may deem
2 appropriate.

3 MR. PIETRANGELO: Okay. I've got half a
4 dozen bullets here. I'm going to try to put them in
5 some semblance of order here. And, again, question
6 any time. Let's keep this as a dialogue.

7 First of all, the event itself, March
8 11th. We, basically, went into our emergency response
9 mode at NEI as to the NRC and INPO. We were
10 fortunate, I think, as an industry here that following
11 the BP rig explosion, Deepwater Horizon, last year, we
12 kind of did a Lessons Learned on that for how we would
13 apply that to our industry if we had an event like
14 that in our country, and revised our emergency plan
15 and response center, actually did a tabletop last
16 October as a result of that.

17 And just from a pure industry perspective
18 that, I think, put us in a much better position to be
19 able to carry out what we're supposed to do in a
20 response mode like that in terms of setting up
21 communications, coordinating our role with INPO's and
22 EPRI's. Basically, the roles broke down as follows:
23 INPO was responsible for getting as much data on the
24 ground in Fukushima as they could through the TEPCO
25 Center of WANO, the World Association of Nuclear

1 Operators, as well as through TEPCO, which is a member
2 of both INPO, and NEI, and EPRI. So, we had some of
3 those contacts.

4 We were responsible for keeping abreast of
5 what regulatory actions were, as well as from a media
6 and government communications outreach, all the data
7 you saw, I think we were sending out every three or
8 four hours updates to the information we had from the
9 sources I mentioned, but we had NHK English version up
10 on our screen, CNN, all the cable news networks, so it
11 was really a compilation of all of that, that we were
12 trying to assemble that information and provide what
13 we thought was the most credible. Usually, if you're
14 just hearing it from one source or news service that's
15 not much to go on.

16 I think that that continues to some extent
17 today; although you're seeing, I think, more analysis
18 of information from Fukushima by the print journalists
19 taking more time to get into the stories. But,
20 certainly, we had a major role for our industry in
21 terms of communication, so we had daily noon
22 conference calls with all the Chief Nuclear Officers
23 in the industry, as well as the Board of Directors of
24 INPO, and other advisory committees around the
25 industry. That went on for about three or four weeks.

1 We are down to a weekly summary now based
2 on information we're getting through some of the
3 Japanese associations. And I agree with what I think
4 the EDO has said about the situation at Fukushima,
5 "While static, certainly far from stable." And
6 that'll be three, six, nine months before they
7 establish cooling and containment to be able to go to
8 cold shutdown.

9 And I think we knew from the beginning
10 that until that cooling loop was established, this was
11 not going to be a stable situation. And you can feed
12 and bleed for a long time, and they're showing that
13 you can. But, obviously, that's not the preferred
14 method of dealing with the event.

15 And I understand they're setting up
16 temporary systems now at Fukushima to plug into,
17 hopefully, some existing piping that can establish the
18 cooling to bring those units to cold shutdown.

19 But I want to stress that our efforts thus
20 far, and I'll go through some of the activities we
21 have underway. It's going to take quite some time to
22 get a full understanding of what transpired at
23 Fukushima, months if not years to get some of the
24 data, to understand the differences in design,
25 differences in operational practices, training,

1 emergency response, et cetera.

2 So, we're having to -- we've adopted kind
3 of a roughly right premise that based on the
4 observations we've seen, this is what we think -- we
5 think it's roughly right that this was the cause, and
6 we need to move forward on that basis, because if you
7 waited to get a full understanding of everything that
8 transpired there, you wouldn't do anything for maybe
9 three, four, five years. So, I don't think that's an
10 acceptable response either.

11 Let's see. Let's start with the actions
12 the industry took almost immediately after Fukushima.
13 The accident happened on Friday, March 11th. On
14 Monday, the Chief Nuclear -- the following Monday, the
15 Chief Nuclear Officers in the industry confer and
16 agree on a set of actions under the INPO Executive
17 Advisory Group, which is all the Chief Nuclear
18 Officers, to do four sets of walkdowns at the plants.
19 These were focused on some of the measures we put in
20 place for the B5B order that was later codified in 10
21 CFR 50.54(h)(h). Those walkdowns were completed by,
22 I believe, the end of April, so we got out fairly
23 early on those walkdowns.

24 There have been many, many observations
25 from those walkdowns of the measures we took. And

1 some of them are, I'll call them some non-compliance
2 issues that the staff in the subsequent Temporary
3 Instruction that was issued, saw the same things that
4 the licensee found in the walkdowns. But I think what
5 a lot of people don't understand is that the measures
6 put in place after 9/11 were specifically targeted at
7 aircraft impact, and large fires and explosions.

8 So, for example, some of the portable
9 equipment that was staged to provide contingency
10 measures assuming quadrants of the plant had been
11 destroyed by aircraft impact, that equipment was
12 staged such that it would not be impacted by the
13 aircraft impact. You keep it far enough from the
14 plant so that the airplane didn't take out your
15 contingency measures, as well. But we weren't
16 thinking about floods, we weren't thinking about
17 earthquakes, we weren't thinking about hurricanes or
18 tornados when that equipment was staged.

19 So, I think one of the key Lessons Learned
20 from Fukushima was that you can have a multi-unit
21 event, and the other element of the B5B measures was
22 that it was based on a single event response, an
23 aircraft hitting a unit. So, the strategies were by
24 unit, not by station.

25 So, given -- I think an irrefutable Lesson

1 Learned is that you can have a single event, natural
2 phenomena, or potentially other event that affects
3 multiple units at a single station. And that's an
4 area of potential improvement for us, is to expand
5 what was done per the B5B measures to a multi-unit
6 strategy. And that also takes into consideration some
7 of the natural phenomena that the plant could
8 potentially expect to see given where it's located.

9 We shouldn't jump to conclusions with
10 that, though. I mean, some of the observations were
11 while this -- where you put the portable diesel-driven
12 fire pump could be subject to a flood there. That's
13 a good observation, potential enhancement, but I think
14 the -- some lead to a -- well, we ought to harden the
15 structures around some of the portable equipment make
16 it seismically qualified, hurricane-proof, tornado-
17 proof, et cetera.

18 Personally, I don't think that makes any
19 sense whatsoever. We built the plant to withstand that
20 natural phenomenon, and the assumption is, is that
21 that phenomena takes out everything at the plant, such
22 that you need these measures. Why would you expect
23 the same kinds of structures that you put in place at
24 the plant to protect your portable? So, that's
25 leading us to consider offsite response strategies

1 with equipment, perhaps regionally where a lot of
2 plants are located where you'd have that equipment
3 available in a timely way, but not subject to the same
4 natural phenomena and/or terrorist attack that the
5 plant would be subjected to.

6 MEMBER CORRADINI: If I might just build
7 on that. So, does that kind of open the door to
8 thinking from a probabilistic standpoint both manmade
9 and natural disasters, and how you might consider
10 staging or doing things, whether it be operator action
11 or predetermined, so that you'd actually start
12 thinking through this.

13 I guess I'm kind of going further -- in my
14 mind, I'm going further than this, but in some sense
15 to try to risk-inform --

16 MR. PIETRANGELO: You can to a certain
17 extent.

18 MEMBER CORRADINI: Okay.

19 MR. PIETRANGELO: I call it event-inform.

20 MEMBER CORRADINI: That's fine. That's
21 fine.

22 MR. PIETRANGELO: If you're not subject to
23 tsunamis, you don't build a tsunami wall, for example.
24 And there's natural phenomena associated with each
25 site.

1 MEMBER CORRADINI: I'm okay in Wisconsin.

2 MR. PIETRANGELO: You're okay in
3 Wisconsin, hopefully. But you do it smart. And I
4 think that's what we're trying to do out of the box
5 here, is be smart about how we look at -- really, this
6 is an additional layer of defense-in-depth that was
7 put in place after 9/11 for a very specific reason.
8 And I think my take based on Fukushima is, that's an
9 additional layer that could be enhanced and expanded
10 to deal with the multi-unit aspect of it, as well as
11 consider natural phenomena and being smart about where
12 you stage the equipment, be it on site or off site.

13 MEMBER CORRADINI: The reason I asked the
14 question in that regard is that, if you think about it
15 from the possible events in any one specific site --

16 MR. PIETRANGELO: Right.

17 MEMBER CORRADINI: -- you might look at
18 one and say I should move the diesels from low to
19 high, but then some other event may -- that's what I
20 was trying to get to.

21 MR. PIETRANGELO: Okay.

22 CHAIR ABDEL-KHALIK: Now, you indicated
23 that what -- the logic, if you put these things in a
24 hardened facility, whatever took the plant out might
25 do the same thing.

1 MR. PIETRANGELO: Right.

2 CHAIR ABDEL-KHALIK: And that sort of
3 leads you to the idea of offsite staging of equipment,
4 perhaps regional staging of equipment.

5 MR. PIETRANGELO: Right.

6 CHAIR ABDEL-KHALIK: Would these equipment
7 then be under the control of an industry organization,
8 or would they still be under the control of individual
9 utilities?

10 MR. PIETRANGELO: That remains to be seen.
11 I think each station is going to have -- going to need
12 to have a strategy for how they would respond. I
13 could see a public/private partnership with the U.S.
14 Government to try to do this.

15 Early on, we're thinking well, there's a
16 lot of Army bases around the country where you could
17 stage this equipment, and they would have the
18 transportation equipment to deliver it, as well. So,
19 that's a possible thought.

20 A lot of the plants along the Atlantic
21 corridor are relatively close together, and a number
22 of companies could come together and form a regional
23 compact to all use the same equipment. We've done
24 that for transformers and other -- we call it pooled
25 inventory management for long lead time, hard to get

1 components that you would need to come back from an
2 outage, and so forth. So, there's a lot of thinking
3 in that regard.

4 The other, I think, irrefutable Lessons
5 Learned from Fukushima was that they clearly could not
6 cope with a station blackout condition long enough to
7 preclude fuel damage.

8 Now, that leads us to questions on our own
9 station blackout implementation here in the country.
10 Based on the plants' configurations, they did coping
11 assessments for two, four, eight hours. You might say
12 well, why the Fukushima? That doesn't even pass the
13 red-face test for being able to cope. But I think you
14 heard at the Commission briefing at the end of March
15 that in the United States, at least, with probably
16 3,500 reactor years of operating experience, we've had
17 one station blackout in 1990 for about 44 minutes at
18 Plant Vogtle during an outage. And it was a truck
19 backed into a transformer in the switchyard. One
20 diesel failed to start, and the other diesel was down
21 for maintenance, station blackout.

22 Now, they were able to restart the diesel
23 that failed to start in 44 minutes, and restored AC
24 power. But that's the only station blackout we've had
25 in the United States. That doesn't mean it can't

1 happen here from some other combination of events.
2 We've had several events, hurricane, Hurricane I
3 believe it was Andrew in Florida, Turkey Point was on
4 diesels for quite some time, a week or two. We just
5 had Browns Ferry go through some very significant
6 tornados, and were on their emergency diesel
7 generators at three units.

8 Our diesel generators are very, very
9 reliable. One of the first issues I worked at NuMark
10 when I came to Washington was on diesel generator
11 reliability. That was a key part of the station
12 blackout implementation. And we tracked that in the
13 Reactor Oversight process for the mitigating systems
14 performance index. We had very, very high diesel
15 generator reliability, and in the index you can track
16 that. I think the reliability is upwards of 99.7
17 percent, something in that range.

18 That doesn't say you can't have a common
19 mode failure across all the diesels that potentially
20 could make them non-functional, but I think, and what
21 we've been saying pretty consistently from the get-go
22 is that we cannot say an event like Fukushima could
23 never happen here. It could happen here. It's very,
24 very remote based on the reviews that were done when
25 the plants were licensed, and the subsequent

1 improvements made over the years, both by requirements
2 imposed by the NRC, as well as initiatives taken by
3 the industry. But it doesn't matter at the end of the
4 day. We have to be prepared for an emergency like
5 this, whether it was tsunami, seismic event, terrorist
6 attack, operator error, manufacturing defect,
7 whatever, we want to keep these symptom-based events
8 that we can respond to no matter what the event.

9 MEMBER RAY: Tony, I just want to make an
10 observation. You made a point well taken about
11 diesels. They've always had pretty stringent tech
12 specs.

13 MR. PIETRANGELO: Right.

14 MEMBER RAY: And I guess as somebody who's
15 operated a plant for a long time, I would say that's
16 got something to do with how reliable they are, the
17 fact that you've got very stringent LCOs, required
18 surveillance testing.

19 MR. PIETRANGELO: Right. For those who
20 don't know, diesels are tested on a monthly basis at
21 the power plants to start and load run, I guess for
22 approximately two hours, Harold. If you fail that
23 test, you are inoperable, and you are in a tech spec
24 action state.

25 MEMBER RAY: And it's a short one.

1 MR. PIETRANGELO: Right. Now, just in
2 terms of insights with diesels, before the Vogtle
3 event, some of the indicators we tracked as an
4 industry rewarded doing diesel outage and maintenance
5 during shutdown. We don't do that any more because of
6 a simple risk insight that doing the diesel
7 maintenance at power, if you did lose AC power, at
8 least you'd have some steam to drive turbine-driven
9 feed pumps and other pumps for core cooling and other
10 cooling. So, we went from doing diesel maintenance
11 from during an outage to on line.

12 I think that's a major improvement, and
13 it's one of the ways we've managed to reduce, I think,
14 outage duration across the industry, is by doing more
15 and more maintenance on line, stringent tech spec
16 still in place. I think the maintenance rule and the
17 configuration risk management requirement in that
18 greatly facilitated that, and told us when it was okay
19 to take things out and when it wasn't. So, we've been
20 managing that risk like that since the mid-90s.

21 Let's get back to station blackout for a
22 second. So, we have the two, four, and eight coping
23 duration. I would stress that that's a licensing basis
24 number. It doesn't, necessarily, mean that that's the
25 time that that licensee or that plant can cope with

1 loss of all AC power.

2 I have one example. One of our members
3 about stripping battery load, non-essential battery
4 loads once you're on batteries following station
5 blackout, that he could operate what he needed to for
6 core cooling for 32 hours.

7 MEMBER SHACK: Does he have a procedure to
8 do that, or he's figuring that out on the fly?

9 MR. PIETRANGELO: Figuring that out now.

10 MEMBER CORRADINI: So, that really is a
11 Lesson Learned. It's alternative means of operator
12 action to extend.

13 MR. PIETRANGELO: Right. I'll get into
14 kind of the whole framework for that in a second. But
15 I'm stressing that the two, four, eight was based on
16 that plant's assessment with very -- using approved
17 guidance, I think that we developed, that the staff
18 endorsed on how to do the assessment, and how you
19 wound up with your number.

20 MEMBER STETKAR: Tony, can I -- talking
21 about station blackout, I'm aware of some plants who
22 have in place at least guidelines, if not formal
23 procedures, to induce a station blackout under certain
24 fire scenarios. Is the industry rethinking that?

25 MR. PIETRANGELO: I haven't heard that

1 one. Induced station blackout?

2 MEMBER STETKAR: Some induce station
3 blackout. There are not many plants, but there are
4 some.

5 MR. PIETRANGELO: That's a first for me.
6 I haven't heard that.

7 MEMBER POWERS: It's, actually, getting
8 surprisingly large number of them.

9 MEMBER STETKAR: Depending on who you talk
10 to, you get different counts, but it's not zero.

11 MEMBER POWERS: Non-zero. Oh,
12 interesting.

13 MEMBER STETKAR: And that's a little bit
14 of what Mike was asking about before in terms of this
15 integrated thought that actions that are deemed
16 prudent for one specific focus of an event may not be
17 prudent in a more integrated --

18 MR. PIETRANGELO: In a more holistic look.

19 MEMBER STETKAR: -- view of risk.

20 MR. PIETRANGELO: Right.

21 CHAIR ABDEL-KHALIK: You may also be aware
22 that as a result of this Vogtle station blackout
23 event, Vogtle established what is called a "Power
24 Options Book," which, essentially, gives the operators
25 a list of all different ways of getting power from

1 Point A to Point B under all conceivable
2 circumstances. And is that something that the rest of
3 the industry is following up on?

4 MR. PIETRANGELO: What we did back then,
5 and I was actually the Project Manager on the shutdown
6 guidelines for NuMark, turned into an industry
7 initiative that we all adopted. There were guidelines
8 in there for key safety functions, AC power was one of
9 them. They were very high level, but it allowed the
10 licensees, I think, a lot of room to develop measures
11 to meet the high-level principles for the key safety
12 functions. So, I'm not surprised to hear that a plant
13 went to that length to identify ways that they could
14 restore AC power.

15 I can't say everybody has done the same
16 thing as Southern has at Vogtle, but I suspect there's
17 measures in place to restore AC power even per station
18 blackout, as well as some of the guidance we put in
19 place.

20 All right. Back to station blackout. So,
21 we think there may be some room for extended coping
22 beyond what you were licensed to in your coping
23 assessment simply by looking at means to, whether it's
24 shutdown essential loads on the batteries, or do other
25 things.

1 The other thing that we think we have but
2 don't know how to take credit for yet are the B5B
3 measures we put in place. That's a catalogue of
4 contingency measures to back up key safety functions,
5 core cooling, containment integrity, and spent fuel
6 pool cooling.

7 And you don't know what you're going to
8 have available after you got hit by aircraft, and you
9 assume a quadrant of the plant was wiped out, so these
10 contingency measures go all around the plant looking
11 at those key safety functions, and identifying in
12 advance measures you could take to restore those
13 functions until you got AC power back, or whatever.

14 Again, I don't know how long, having not
15 assessed this, and we don't have any -- I'll say not
16 only do we not have guidance, we don't have approved
17 guidance for how we would assess how those B5B
18 measures could be used to extend the per station
19 blackout coping duration. But I think it's an
20 important fact to know before we start trying to
21 develop enhancements to those measures. You have to
22 have a starting point.

23 And we know we've got the licensed coping
24 duration from the station blackout rule. We know there
25 are certain things we can do to potentially extend

1 that, and we know we have the B5B measures as another
2 way to expand or extend coping duration.

3 But the key is you have to have sufficient
4 coping duration such that you can put some form of
5 mitigating capability in place to preclude core
6 damage. And, again, that's the essential Lesson
7 Learned from Fukushima, is they could not do that long
8 enough before they got cooling --

9 CHAIR ABDEL-KHALIK: I guess I'm trying to
10 understand the statement you made that we don't know
11 how to take credit for the B5B equipment. Do you mean
12 because we don't know what's going to be available, or
13 we don't know --

14 MR. PIETRANGELO: I think those
15 assumptions -- there are several assumptions one will
16 have to make to say whether I can employ this measure
17 versus that measure. And depending on the event, the
18 external phenomena, or aircraft impact -- maybe it's
19 just because I'm sensitive to it because I worked in
20 Washington for 22 years with the NRC, but I'm
21 uncomfortable going forward with some form of
22 assessment of that as a step in a plan to enhance my
23 overall layer of defense-in-depth without some
24 regulatory buy-in to the method we use to do that, and
25 what we could take credit for in expanded or enhanced

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 measures.

2 MEMBER CORRADINI: So, you want to do it
3 in a reasoned fashion. That's what I heard you just
4 say.

5 MR. PIETRANGELO: In other words, we want
6 to do it in a reasoned fashion.

7 (Laughter.)

8 MEMBER CORRADINI: But I do think what
9 Said is asking, I think is a fair point, because I
10 think your concern, or your thinking through this in
11 whether it be available equipment that has been
12 considered in certain situations, or operator actions
13 that could be done, but you don't want them to be done
14 extemporaneously, but in some sort of planned thinking
15 process.

16 MR. PIETRANGELO: Right.

17 MEMBER CORRADINI: All kind of goes into
18 the idea of thinking through what you called events
19 that are possible, maybe not be probable, but events
20 possible how you attack --

21 MR. PIETRANGELO: Right. And both the
22 things I'm talking about, station blackout and B5B
23 54(h) (h) (2) are regulations.

24 CHAIR ABDEL-KHALIK: Right.

25 MR. PIETRANGELO: So, the NRC is,

1 necessarily, going to be interested in how we
2 implement those regulations, or how they might be
3 enhanced. So, I don't want to -- the worst thing that
4 could happen is that we run out and do what we think
5 we need to do without some kind of, I think, input
6 from the regulator, or oversight from the regulator,
7 because it's all at risk of doing it all over again,
8 or paving over it later with something different that
9 someone else had a different idea.

10 So, that's why we're looking forward to
11 interactions after the 90-day short-term response. We
12 want to make sure that we can effectively implement
13 anything, any new enhancement or requirement that
14 comes out of the NRC's process. It doesn't do us any
15 good to get requirements that we can't implement
16 effectively. That's in no one's interest, or to jump
17 out ahead, spend resources, and then have to do it all
18 over again.

19 MEMBER CORRADINI: Right.

20 MR. PIETRANGELO: So, I think there's a
21 natural complementary interaction that's going to be
22 needed after we get through this 90-day initial
23 review.

24 CHAIR ABDEL-KHALIK: But that doesn't
25 preclude sort of the possibility of pre sort of

1 conceptual thinking about --

2 MR. PIETRANGELO: Yes, and we're doing
3 that.

4 CHAIR ABDEL-KHALIK: -- what approaches
5 one can take in these unforeseen circumstances --

6 MR. PIETRANGELO: Right.

7 CHAIR ABDEL-KHALIK: -- in terms of
8 defining the problems, in terms of critical safety
9 functions, et cetera that would need to be maintained
10 regardless of the event.

11 MR. PIETRANGELO: Yes, considerations that
12 would go into extending the coping durations with B5B
13 measures that we could probably turn into a guidance
14 document.

15 Let me step back for a moment and give you
16 some context around this thinking. I would say the
17 first month after March 11th, we were still in crisis
18 response mode, and not thinking about what we're going
19 to here, necessarily. It wasn't until, I think, the
20 situation became more static in Japan that we started
21 focusing more on what we're going to do here in the
22 U.S. as an industry response.

23 So, about a month after that, that's kind
24 of where my attention turned. We were lucky,
25 fortunate that we have industry organizations set up

1 to try to fashion a holistic industry response, not
2 just NEI. We've got Institute of Nuclear Power
3 Operations, as well as the Electric Power Research
4 Institute, and there are several activities that we've
5 done over the years with our sister organizations that
6 have been very successful by pulling together an
7 industry response, not just a regulatory response
8 through NEI. So, that's what we set out to do.

9 We set up a Steering Committee for the
10 industry organizations comprised, primarily, of Chief
11 Nuclear Officers from various plants, as well as the
12 senior executives from each industry organization.
13 We've established a charter for that group. We're
14 putting the finishing touches on a strategic plan,
15 guiding principles, and some building blocks that each
16 organization will be the lead on. And I'll go through
17 that very quickly.

18 I mean, the charter, there's -- let's see,
19 about 13 people on this group were chartered to
20 develop a strategic plan, articulation of strategic
21 goal, structure, and process for defining the
22 industry's overall response to Fukushima. We want to
23 insure that identified issues are appropriately
24 coordinated between industry organizations, and that
25 lead and supporting roles are established. And I'll

1 get into how we're going to coordinate that in a
2 moment. And then three, monitor the status of action
3 plans on key issues to insure priorities and schedules
4 are consistent with the strategic plan. And this
5 probably most importantly, and that the overall impact
6 on operating plants is balanced and appropriate to our
7 prime focus, which is excellence in plant operation.

8 So, we're going to be doing a lot of work
9 post Fukushima in response. And our first strategic
10 goal speaks to this, and that we can't do it at the
11 expense of the safety focus at the current plants.
12 We've got 104 operating plants in this country. That
13 has to be our first priority. It always has been. And
14 even though we have to do a lot of work, we've got to
15 be careful not to put a burden on that stations in the
16 Fukushima response that dilutes the safety focus from
17 current operations.

18 You see, many of the companies have set up
19 separate groups just to make sure that you don't have
20 a adverse impact on, say plant operations. We've done
21 the same at NEI. I've got a separate group now just
22 devoted to Fukushima-related events. I'll probably
23 matrix across our organization to get the necessary
24 expertise we need. INPO has done the same thing, EPRI
25 has done the same thing. So, I think everyone is kind

1 of on the same page in terms of there's a lot of work
2 to do, we need to get organized to pull it off, but it
3 cannot be at the expense of the current plants.

4 This was our cumulative effects issue
5 before Fukushima and the number of requirements, both
6 self-imposed by the industry and from the NRC that we
7 thought were starting to dilute the safety focus at
8 the plants. And Fukushima can be cumulative effects
9 on steroids, if you're not careful, so we've got to
10 deal with these decisively, deliberately, but not at
11 the expense of current plant safety.

12 Let me run through the strategic goals
13 we've established. These have been through the NEI
14 Executive Committee, the INPO Board, and the EPRI
15 Board, so these are -- I feel pretty safe in talking
16 about these.

17 MEMBER STETKAR: Tony, when you move the
18 paper be careful because it hits the microphone.

19 MR. PIETRANGELO: Oh, sorry. The first
20 goal -- I'll just read you kind of the lead-in. Our
21 primary objective is to improve nuclear safety by
22 learning and applying the lessons from the Fukushima
23 Daiichi nuclear accidents. In response, the U.S.
24 nuclear industry has established the following
25 strategic goals to maintain, and where necessary,

1 provide added defense-in-depth for critical safety
2 functions of core cooling, spent fuel cooling, and
3 containment integrity.

4 The first strategic goal is that our
5 workforce remains focused on safety and operational
6 excellence at all the plants, maintains the
7 appropriate sensitivity to their emergency response
8 roles, particularly in light of the increased work
9 that the response of the Fukushima event will
10 represent.

11 So, that's really INPO's building block,
12 is let's -- we cannot lose our focus on safe operation
13 at the plants. There's never a good time to have an
14 event at your plant. This is a particularly bad time
15 to have events at your plant in light of Fukushima.

16 Now, we'll get into more of the issues.
17 And this is kind of based on the roughly right, what
18 we think happened and observations that warrant
19 attention. It remains to be seen what actions we'll
20 take from these. We don't have action plans developed
21 for these, but they're clearly areas that we're going
22 to examine in some detail.

23 First, the goal -- these are kind of
24 outcomes. Time lines for emergency response
25 capability to insure continued core cooling,

1 containment integrity, and spent fuel pool cooling are
2 synchronized to preclude fission product barrier
3 degradation following station blackout. And all that
4 means is, you've got to have enough coping duration
5 such that you can get your mitigating measures in
6 place before fuel damage. And those have to be
7 synchronized.

8 This is also not going to be, in our
9 observation, a one-size-fits-all exercise given that
10 the plants are so different in terms of the natural
11 phenomena they see, their designs, their
12 configurations. We want to try to keep this
13 performance-based such that the station has enough
14 flexibility to fashion a response that meets that goal
15 in whatever time it takes.

16 MEMBER CORRADINI: So, this would be -- I
17 guess, just to make sure I understand, so this would,
18 potentially, lead to differences in the emergency
19 procedure guides?

20 MR. PIETRANGELO: Plant-by-plant?

21 MEMBER CORRADINI: Plant-by-plant.

22 MR. PIETRANGELO: Yes.

23 MEMBER CORRADINI: Okay.

24 CHAIR ABDEL-KHALIK: May lead to proximity
25 of staging points.

1 MR. PIETRANGELO: That's correct. That's
2 correct. And, again, I think -- we'll get into that
3 later. Next one.

4 CHAIR ABDEL-KHALIK: Before you --

5 MR. PIETRANGELO: Yes?

6 CHAIR ABDEL-KHALIK: Since this document
7 is apparently --

8 (Simultaneous speech.)

9 MR. PIETRANGELO: -- from you, Mike.

10 (Laughter.)

11 CHAIR ABDEL-KHALIK: Approved by your
12 Board, is this a document that you can share with us?

13 MR. PIETRANGELO: We hope to make it
14 public some time in June. There's a lot of other
15 verbiage that goes around these pieces. These goals
16 are pretty well set, though.

17 CHAIR ABDEL-KHALIK: Okay.

18 MR. PIETRANGELO: The second one, U.S.
19 nuclear industry is capable of responding effectively
20 to any significant event in the U.S. with the response
21 being scalable to support an international event, as
22 appropriate.

23 MEMBER CORRADINI: Can I understand that?
24 Is that in response, because Admiral Ellis I think at
25 the NEA Assembly made some suggestions. Is that --

1 MR. PIETRANGELO: No.

2 MEMBER CORRADINI: -- coordinated with
3 that? That's not the same thing.

4 MR. PIETRANGELO: No, I think this one is
5 more about -- we were trying to provide support to
6 TEPCO following the event, as was just about everybody
7 else in the world. It took a while to organize our
8 industry through the federal government with NRC, with
9 the OEM. I'm sure Dr. Kelly will probably talk about
10 that in his presentation. It took a while to get that
11 supply chain formed up.

12 We should have that ready as an industry
13 here for an event in the U.S., as well as to help
14 someone internationally. How we can help, have that
15 organized, have the supply chain ready to go. We
16 shouldn't have to take another week to get all that
17 together while the event is happening, so that's what
18 that means.

19 CHAIR ABDEL-KHALIK: So, this is a
20 statement of the goal.

21 MR. PIETRANGELO: Yes. It's kind of a
22 desired outcome.

23 CHAIR ABDEL-KHALIK: Right. But is there
24 a time line associated with that?

25 MR. PIETRANGELO: Not yet. There's going

1 to be action plans associated with these. We'll put
2 milestones, responsibility and accountability. That's
3 coming, but these are -- we spent the last month
4 trying to make sure we have the goals and outcomes
5 right.

6 The next one, severe accident management
7 guidelines, B5B response strategies, and external
8 event response plans are effectively integrated to
9 insure stations are capable of a symptom-based
10 response to events that could impact multiple units at
11 a single site. Lots of words, but I think pretty
12 simple concept.

13 If you looked at the current structure of
14 design-basis for external events, EOPs, SAMGs,
15 emergency plans, B5B is somewhere over here.

16 CHAIR ABDEL-KHALIK: Training.

17 MR. PIETRANGELO: Training, yes. You
18 shouldn't ask the operator to go to 13 different
19 places in response to an event to get guidance. That
20 should be an integrated well thought through holistic
21 thing, so I think the intent there is to effect that.
22 And it could be, you've got your station blackout
23 coping duration, potentially extended coping
24 durations, SAMGs, and that should be an integrated
25 piece and the transition should be smooth for an

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 operator.

2 The next one, margins for protection from
3 external events are sufficient based on the last
4 hazards analyses and historical data. That's
5 happening right now with GI 199 on seismic. It also
6 could be a potential, and another natural phenomena,
7 be it flood, tornado, or hurricanes.

8 This is making sure that we have margin
9 that we're comfortable with from the design-basis
10 events, and looking at the latest data.

11 MEMBER ARMIJO: What I'm missing, Tony, is
12 response to a natural disaster, huge natural disaster
13 which would give you seismic plus flooding.

14 MR. PIETRANGELO: Yes.

15 MEMBER ARMIJO: Or take out infrastructure
16 that you were counting on for transportation, not only
17 just electrical power, but just a whole number of
18 things, people dying, families at risk.

19 MR. PIETRANGELO: Right.

20 MEMBER ARMIJO: Is the NEI assessment
21 going to think in terms of that kind of a situation,
22 because that's what happened in Japan.

23 MR. PIETRANGELO: Right. And that's why,
24 when I said before about the assessments one would do
25 whether it's for extended coping duration or emergency

1 planning, what assumptions do you make to fashion your
2 plan? And I think we've all got to be on the same
3 page with that.

4 This particular goal, I think, is really
5 our prevention goal. Is there something we can do
6 from a prevention standpoint from natural phenomena?
7 Because I think, and based on at least my experience
8 and the exhaustive reviews when the plants were
9 licensed for these natural phenomena, I'm not sure
10 there's a lot we're going to find here. But if there
11 is something we can do from a prevention standpoint
12 that makes sense, we should do it.

13 But to your point, I can always get one
14 upped on --

15 MEMBER ARMIJO: NO, I know that. That's
16 an infinite --

17 MR. PIETRANGELO: Right.

18 MEMBER ARMIJO: -- possibility.

19 MR. PIETRANGELO: I can always get one
20 upped, and I'd rather -- I'd feel more comfortable
21 with mitigating strategies that is not dependent,
22 necessarily, on the event, but responding to the
23 symptoms, and being able to do something about it.

24 MEMBER ARMIJO: Flexibility.

25 MR. PIETRANGELO: Right.

1 MEMBER ARMIJO: So, that you can --

2 MR. PIETRANGELO: Yes. Yes.

3 MEMBER POWERS: Tony, you mentioned
4 several times already the exhaustive review that's
5 done in the course of licensing these plants with
6 respect to both internal events, and external events.

7 MR. PIETRANGELO: Right.

8 MEMBER POWERS: Do you have any reason to
9 believe that there was a less exhaustive review done
10 for the Fukushima and the Japanese plants?

11 MR. PIETRANGELO: Not at this time. I
12 don't have enough information about that yet.

13 MEMBER POWERS: Okay.

14 MR. PIETRANGELO: I'll be honest with you,
15 we don't really understand the regulatory differences
16 yet from the way the Japanese license --

17 MEMBER POWERS: Are you going to try to
18 look in -- because it strikes me that that's one area
19 where one could make some progress now, not dependent
20 on understanding the plant, to see if there are any
21 differences. The Japanese system is very similar to
22 our's, that would lead to oversights, perhaps, or
23 probably the most interesting task, especially when we
24 think about all of our plants, is the evolution in
25 knowledge on the vulnerabilities to, or the

1 frequencies with which natural events of large
2 magnitude might occur, and how one factors that into
3 the updating of the FSAR, which we all know moves
4 about once a year.

5 MR. PIETRANGELO: Right.

6 MEMBER POWERS: That looks like a route
7 where your group and those that are associated with
8 NEI could make real progress without having to get
9 into the plant itself --

10 MR. PIETRANGELO: Right.

11 MEMBER POWERS: -- and see things, which
12 is going to go at the rate it's going to go.

13 MR. PIETRANGELO: Yes. We've got a lot of
14 stuff to do. I'm hoping that our own regulator will
15 be interested in the differences between our system
16 and the Japanese system, and understand those
17 differences about methodologies were acceptable there
18 versus here.

19 I was at Senate hearing, and questions
20 from one of the Senators to the EDO was, do you know
21 what the differences are? Not yet we don't. Says
22 well, whatever they did there didn't work, or required
23 there didn't work. So, if we're doing the same thing,
24 that's a reasonable question.

25 MEMBER POWERS: You say it didn't work,

1 but the truth is that we do a judgment on what's
2 adequate protection.

3 MR. PIETRANGELO: Right.

4 MEMBER POWERS: There is always going to
5 be some finite probability of an event, and it can be
6 a single event that goes beyond what we think is
7 adequate protection.

8 MR. PIETRANGELO: See, I don't think we
9 know -- we think we know that these were beyond
10 design-basis for the tsunami and earthquake that -- we
11 think that, but we don't know what methodology they
12 used, how --

13 MEMBER POWERS: That's right. That's
14 right. And that -- we have to know not only what
15 methodology, but would we have used a different
16 methodology, or is there anything that's flawed about
17 that methodology --

18 MR. PIETRANGELO: Correct.

19 MEMBER POWERS: -- or anything that's
20 flawed about our methodology? It still could come out
21 that --

22 MR. PIETRANGELO: Right.

23 MEMBER POWERS: -- when events go beyond
24 those methodologies, to know --

25 MR. PIETRANGELO: Right.

1 MEMBER POWERS: Ignorance, or whatever it
2 is, I mean, there are things that we don't know about.
3 Mother Nature can always surprise us.

4 MR. PIETRANGELO: Yes, and I think that's
5 why we do the additional layer of defense-in-depth for
6 those scenarios --

7 MEMBER POWERS: Absolutely. We definitely
8 do that.

9 MR. PIETRANGELO: Okay. Two more. These
10 are, I think, somewhat maybe redundant to one of
11 these, but we wanted to make sure that they were clear
12 in the goals; spent fuel pool cooling and makeup
13 functions are adequate during periods of high heat
14 load in the spent fuel pool, and during extended
15 station blackout conditions.

16 We have not given the same level of
17 attention to spent fuel pools here as we have the
18 reactors, and that's just a fact. The second INPO IER
19 that went out specifically looked at spent fuel pool
20 cooling. And it really is using the same measures we
21 put in place 20 years ago for outages, and backups,
22 and safety functions when you were taking equipment
23 out of service for outages.

24 And then the last one, primary containment
25 protective strategies can effectively manage and

1 mitigate post-accident conditions, including pressure
2 and elevated hydrogen concentrations. This one is, I
3 think, one of the ones where we need a lot more
4 information about what happened in Japan. We're
5 seeing a lot of speculation about venting, what they
6 did, what didn't work, what worked, when they did it,
7 et cetera. But it's all speculative at this point.

8 I think we've got to have a very, very
9 firm understanding of the designs there, the
10 procedures they used, what additional measures after
11 losing electric power they had for operating those
12 valves.

13 I think one of the observations from our
14 walkdowns is that we can improve the accessibility to
15 these valves. You shouldn't have to be Spiderman to
16 go try to manually operate this valve after some
17 natural phenomenon. Okay? So, improving the
18 accessibility to key equipment I think is going to be
19 important, as well.

20 So, those are the goals. Again, these are
21 kind of desired outcomes. We kind of thought of these
22 in a way that, where do we want to be in five years
23 when this is all over? These would all be good
24 outcomes, I think.

25 We also put some guiding principles

1 together. These are more process-driven, how we want
2 to conduct the reviews both generically across the
3 industry, as well as at the plants.

4 The first one is, insure equipment and
5 guidance, and has been supplemented, as necessary,
6 improves response effectiveness. This gets to the
7 controls one places on that equipment that's there for
8 emergencies. Do we have to expand it, enhance it, et
9 cetera?

10 The second, address guidance, equipment,
11 and training to assure long-term viability of safety
12 improvements. I think this is another observation
13 from the walkdowns, is that there were not
14 prescriptive controls placed on the measures put in
15 place for B5B. And in some cases during the
16 walkdowns, you found the equipment wouldn't work.
17 Well, that's not acceptable. That's not acceptable.
18 So, we have to have the guidance, training, et cetera
19 in place such that the long-term viability of that
20 measure is maintained.

21 We want to insure response strategies are
22 performance-based, risk-informed, and account for
23 unique site characteristics. This is the one-size
24 doesn't fit all. Maintain a strong interface with our
25 regulators to insure regulatory actions are consistent

1 with safety significance, and can be complied with in
2 an efficient manner. We want to make sure we can
3 effectively implement any additional regulatory
4 requirements, be that adequate protection, or
5 enhancements.

6 We want to coordinate with federal, state,
7 local government and their emergency response
8 organizations on industry actions to improve overall
9 emergency response effectiveness. This gets to the
10 regional, make sure you're bringing in your partners.
11 And there were, actually, a lot of discussions after
12 9/11. We did comprehensive reviews that were
13 conducted with state and local officials on the
14 plants, the equipment they needed. Did they have
15 familiarity with the site, if they were asked to come
16 in and help, whether it was a terrorist attack, or
17 another event.

18 And, finally, we want to communicate
19 aggressively what we're doing. We didn't go into a
20 shell after the event happened. We tried to go
21 forward with the information we had and try to provide
22 context to what we were seeing coming out of Japan.
23 I think we did that in a pretty good way based on the
24 information we had. And it's hard not to speculate
25 sometimes about what you're seeing, and we tried not

1 to. But we want to make sure that we communicate.

2 The document I'm speaking of also names
3 all the stakeholders that we need to pay attention to
4 as we implement this. And it's a pretty broad list,
5 including plant employees. They need to know the
6 actions the industry is taking as a whole, all the way
7 from plant employees to other industry organizations,
8 to the general public, media, Congress, our
9 regulators, state and local officials. There's a lot
10 of stakeholders in this enterprise, and we want to
11 make sure we communicate and what we're doing.

12 Let me go back to the questions you asked.
13 We've got this set up. It's in place now. The next
14 step is, we're assigning leads and supporting roles
15 for accomplishing these goals. We're going to expect
16 the lead organizations to come back with action plans
17 and milestones, so we can flesh this plan out and get
18 into the substance.

19 CHAIR ABDEL-KHALIK: And when this plan is
20 finalized, would you share it with us?

21 MR. PIETRANGELO: This is more of the
22 internal sausage-making we do. We'll share it.
23 There'll be a public version of this plan that will
24 include this stuff that I went through. But in terms
25 -- we did not contemplate sharing all the action

1 plans.

2 I think when we get into after the 90-day
3 NRC review, and there's more stakeholder interaction,
4 a lot of these things will come to light through the
5 public meetings we have.

6 CHAIR ABDEL-KHALIK: Okay. Thank you.

7 MR. PIETRANGELO: First question was,
8 identify weaknesses either in design, procedures, or
9 capabilities. At least from a -- at this point, I'm
10 kind of where the staff is in their review. We
11 haven't seen any fatal flaws yet in terms of our
12 design. I think we see areas enhancements that would
13 improve margins to withstand events like these. But
14 there's no ah-hah moment yet about some preventive
15 measure we could take that would preclude this.

16 Certainly, we have to look at our, as the
17 goal pointed out, kind of integrating our procedures
18 and capabilities to respond to a multi-unit event. So,
19 I think that's one of the weaknesses we see, is we
20 need a multi-unit strategy.

21 We talked about where we got our info,
22 talked about sources of info from Japan. I don't have
23 a lot on the gaps in worker exposure. I would point
24 you to testimony that Dr. John Boyse gave at the House
25 Science and Technology Committee I think a week or two

1 ago that's very, very good, puts this in context with
2 respect to worker doses, as well as public exposure
3 from the event.

4 MEMBER CORRADINI: Can I just ask a
5 question about that, because I think Mike's question
6 was both worker dose and public exposure. Because the
7 one thing, I guess a big question in my mind was, is
8 if you think about it working from the outside in,
9 something that's reported commonly on all the websites
10 is activity.

11 MR. PIETRANGELO: Right.

12 MEMBER CORRADINI: But what I think would
13 help from a communication standpoint is a breakdown in
14 terms of where is that activity coming from, and some
15 very clear pathway so somebody can see that, and
16 understand the effect. And I think Professor Boyse,
17 I didn't hear him in this session, but I heard him in
18 some other public -- some radio, where he went through
19 and discussed this for worker. But I think Mike's
20 point I thought was both worker, as well as offsite,
21 because to me from a health effects standpoint, the
22 further you draw the boundary, the more you can
23 essentially speak to what we already know.

24 In some sense no matter how -- you used
25 the term, I can't remember how you said it, but I

1 would call however sketchy what occurred internally of
2 the plant events were.

3 MR. PIETRANGELO: At least today, I can't
4 shed a lot of light on this piece.

5 MEMBER BROWN: Could I backtrack to your
6 design information piece for a minute?

7 MR. PIETRANGELO: Sure.

8 MEMBER BROWN: After reading all the stuff
9 and the information coming out, if you're going to
10 take corrective actions or procedures, or mitigating
11 actions to do stuff, you really have to have some type
12 of monitoring data coming out of the plant that you
13 have some reliance on, like water levels, or
14 pressures, or temperatures, et cetera. And in reading
15 your early reports, there were assumptions made based
16 on the outputs of the instrumentation that they had in
17 place that what appears to be now at the later stages
18 not exactly correct, like water levels were lower than
19 what anticipated and, therefore, there was greater
20 levels of fuel damage.

21 And I'm not aware of any requirements, I'm
22 saying that in the broad term, of having a limited set
23 of hardened instrumentation which would provide a
24 better feel during these events which would not,
25 necessarily, be reliant on -- it could be electrically

1 powered if they had their own little --

2 (Simultaneous speech.)

3 MR. PIETRANGELO: -- batteries or
4 something.

5 MEMBER BROWN: Well, they'd have to maybe
6 even their own batteries, not the ones that just last
7 for eight hours. I mean, you'd have to have some
8 really -- instruments, typically, do not take
9 humongous amounts of power. It's not like running
10 pumps or things like that.

11 MR. PIETRANGELO: Right.

12 MEMBER BROWN: Or mechanical-type things,
13 just gauges where they could be put in, or those that
14 don't depend on -- a level indication that doesn't
15 depend on a reference leg, which you may not --

16 MR. PIETRANGELO: Have.

17 MEMBER BROWN: You may not have it any
18 more.

19 MR. PIETRANGELO: Right.

20 MEMBER BROWN: So, that was a thing that
21 struck me, is assumptions were being made, mitigating
22 actions were being taken for the in-plant. Even the
23 knowledge of what the spent fuel pool levels were
24 seemed to be questionable, and that -- I had not seen
25 anybody addressing that, and I didn't hear you say

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 anything about that during the -- in your all's
2 consideration --

3 MR. PIETRANGELO: I think that's an
4 excellent point. I think as we go through the
5 strategies and what you think you need, obviously, if
6 you're the operator you want some level of indication
7 of what you're doing, and what's going where, is it
8 going where it should go, is the valve open or not.
9 So, I think when we look at what the loads are on the
10 batteries, it has to include key instrumentation.

11 I think another step would be to try to,
12 as you said, maybe harden or enhance that capability.
13 Just in spent fuel pools alone, I know a lot of
14 control rooms do not have spent fuel pool level
15 indication, and they check it on an operator round.

16 MEMBER BROWN: And/or temperature.

17 MR. PIETRANGELO: Right.

18 MEMBER POWERS: I don't want to deter you
19 in looking for opportunities to improve your
20 instrumentation. I would point out that this is the
21 third major accident I've had the joy of going
22 through, and every one of them people said gee, if we
23 only had better instrumentation of this sort or that
24 sort. And in many cases, we've upgraded the
25 instrumentation, and what I found out subsequently was

1 not terribly useful to us, and it's not useful for the
2 next accident. I'm not sure we can out-guess the
3 accident when it comes to instrumentation.

4 MR. PIETRANGELO: Yes.

5 MEMBER POWERS: I think it's --

6 MEMBER BROWN: Well, I'm not trying to
7 out-guess --

8 MEMBER POWERS: I think the --

9 MEMBER BROWN: You have to have something
10 there.

11 MEMBER POWERS: Well, the trouble is the
12 accident is defined by the failure of the systems that
13 you have in place, so you chase your tail a little
14 bit. I think these response things that you talk about
15 after the event where you can respond to its symptoms
16 rather than trying to say well, if I have this kind of
17 accident, I'm going to need this kind -- the trouble,
18 I don't think you can out-guess the system.

19 MEMBER BLEY: But there's something in
20 what you'd said a little earlier about staging grounds
21 for equipment, that sorts of things, having portable
22 equipment that could be moved in that leans toward
23 flexibility such that no matter what happens, if it's
24 something they haven't thought of, you'd have the
25 equipment to be flexible.

1 The same approach could be taken with
2 respect to instruments. And, in fact, one plant we
3 worked with some years ago actually developed in-house
4 very simple procedures for ways to be flexible with
5 looking at instrumentation. In fact, they wrote up
6 and practiced being able, if they had no power, no
7 instrument power to get -- go out to the parking lot
8 and steal batteries out of cars and use bridge
9 circuits, and where to do it, and train on it so that
10 they wouldn't be thinking about it. So, flexibility,
11 to me, seems key. And I agree with Dana, we're not
12 going to out-guess Mother Nature on this.

13 MR. PIETRANGELO: I agree.

14 MEMBER BLEY: It's nice to have things
15 that are flexible. And of course, Charlie, a few
16 things, you might have a minimal set that you harden.

17 MEMBER BROWN: Fundamental things like
18 levels and temperatures, and some pressures that
19 they're not out-guessing anything, but they'll give
20 you at least a plant condition --

21 MEMBER BLEY: But even here it wasn't so
22 much hardening. It was not having power to do things.
23 And if they'd had flexible arrangements in place,
24 maybe they could have done a lot more with what they
25 had.

1 MEMBER REMPE: Or having some sensors that
2 could go to, for example, thermocouples that were
3 valid for higher temperature ranges, even though they
4 weren't intended for that purpose. That would be
5 useful.

6 MR. PIETRANGELO: They key safety
7 functions that don't go away. I take your point. But
8 I take your point, as well, and I agree with it, that
9 flexibility is key here, because you don't know the
10 event -- the hand you're going to dealt at the time.
11 That's why we want to kind of keep this performance-
12 based and flexible in terms of the response measures,
13 because they have to be. You don't know what event
14 you're going to get.

15 But the key safety functions, we need to
16 protect and enhance. So, at least from an
17 instrumentation standpoint, I'd try to focus on those,
18 making sure I had instrumentation that the operators
19 could use.

20 CHAIR ABDEL-KHALIK: Please continue.

21 MR. PIETRANGELO: Let's see. That's about
22 all I had.

23 CHAIR ABDEL-KHALIK: Okay. Well, let me
24 just go and see if there are questions posed at the
25 beginning, if Tony had addressed them, or you still

1 have questions that you would like to pose for him.

2 MEMBER CORRADINI: Do you have a plan, Mr.
3 Chair -- when --

4 CHAIR ABDEL-KHALIK: I think the agenda
5 calls for Tony to be here until 2:30.

6 MEMBER CORRADINI: Okay.

7 CHAIR ABDEL-KHALIK: So, we have time.

8 MEMBER CORRADINI: I guess the one thing
9 that was mentioned, at least the one thing that pops
10 in my head, the one thing that was mentioned, I don't
11 know if it was Mike or someone else, I do think that
12 from NEI's perspective on this, the ability, maybe it
13 was Jack, the ability to identify -- if you have an
14 observation or something that you're -- because I've
15 been watching your weekly now, but previously hourly,
16 or every few hour updates, to the extent that a member
17 of the public can find out where you got it from, I
18 think is very important. The openness as to this is
19 what you saw, and here's where I can go look at it
20 myself, because I think, at least in this environment,
21 this culture that we are in, the public not only wants
22 to know, they want to know where you knew it from.

23 MR. PIETRANGELO: Let me just say, we
24 don't have any special source.

25 MEMBER CORRADINI: No, I understand that.

1 Not so much that, it's just that a way to dig through
2 it, I think -- because the one thing, I guess, I --
3 the one Lesson Learned that I came through, I mean,
4 Dana mentioned three accidents. Thirty-two years ago
5 when we started the information was not easily
6 gathered. This time almost 180 degrees opposite of
7 TMI. The information was flowing out so quickly, and
8 you weren't sure what the source was, and you were
9 looking for verification or validation of it. So, I
10 think that kind of is the biggest Lesson Learned here,
11 is that in the environment we're in now, any sort of
12 event, forget about if it's a nuclear event, any sort
13 of event, you're going to get this flood of
14 information, a lot of it will be not very valuable.

15 MR. PIETRANGELO: Right.

16 MEMBER CORRADINI: So, the connection back
17 to a source so that people will try to understand it,
18 I think is beneficial.

19 MR. PIETRANGELO: Okay. Yes, I'm
20 encouraged that IAEA team is there on the ground now,
21 and they're trying to put a time line together, get a
22 set of facts that everybody can agree to would be
23 very, very helpful, such that we could use -- everyone
24 could use that without a doubt, and no question about
25 its validity or authenticity.

1 But, again, the two irrefutable things I
2 take is multi-unit event, couldn't cope long enough.
3 Other than that, I think a lot of what's happened is
4 pure speculation, especially with the pools, let alone
5 what's happened in the reactor vessels. And we had
6 reports that Unit 4 spent fuel pool was gone early.
7 I saw a picture last week, looked pretty in-tact to
8 me, with fuel --

9 (Simultaneous speech.)

10 MR. PIETRANGELO: Looked like one of our
11 pools.

12 MEMBER SHACK: But they're going to go
13 build a concrete structure to support it.

14 MR. PIETRANGELO: Yes, shore it up on one
15 side.

16 MEMBER SHACK: So you understand why the
17 spent fuel pool seemed to dry out so quickly?

18 MR. PIETRANGELO: I don't know if it did.

19 MEMBER SHACK: Well --

20 MR. PIETRANGELO: I don't know if it did.
21 We know just from the Kashiwazaki earthquake in 2007,
22 you get a sloshing effect, they lost about a meter of
23 water from those pools.

24 MEMBER SHACK: Oh, they did? Okay.

25 MR. PIETRANGELO: And there was a report,

1 there was 36 workers in the reactor building at the
2 time of the earthquake, and they came out of the
3 building drenched. They were at the fuel pool floor
4 and they came out drenched, so that was probably a
5 pretty good splash. I don't know how much inventory
6 they lost as a result of that.

7 I mean, we had guys trying to do
8 calculations about how long it would take to evaporate
9 and boil down that inventory, but what was your
10 starting point? Right? You had to assume you lost
11 something as a result of the earthquake. Especially
12 in Unit 4, we didn't know if the gate was up for the
13 refueling or not, whether that survived the
14 earthquake, and that was another path that would
15 almost get you down to the top of the actual fuel.
16 So, just a lot of assumptions that were going into
17 these calculations to try to figure out what the heck
18 was going on.

19 MEMBER ARMIJO: So, how are you --

20 MR. PIETRANGELO: And we still don't know.

21 MEMBER ARMIJO: Are you going to get
22 answers to that, all those kinds of just straight
23 factual stuff? Do you have --

24 MR. PIETRANGELO: I'm relying on the IAEA
25 team that's over there right now, and I'm hoping the

1 NRC has a person on that team that's going to --

2 MEMBER ARMIJO: You will get your
3 information through the IAEA team? You don't have
4 direct contacts with your counterparts in Japan then.

5 MR. PIETRANGELO: There have been various
6 -- I mean, EPRI leadership was over there last week,
7 did a tour of Hamaoka, and went to the Daini site
8 where TEPCO is staging a lot of the people, and
9 materiel for Daiichi. So, we have had missives over
10 there to try to even offer help in the organization in
11 terms of project management for the task they have at
12 hand, getting to cold shutdown and then a big
13 decontamination activity. But it's -- I would say the
14 focus is still on the ground, because it's not a
15 stable situation, and not yet on getting that
16 information out to everybody. I think that will happen
17 over time. I think it's done more effectively if one
18 organization like IAEA does it versus every country
19 trying to get their set of facts.

20 We're not getting anything more than --
21 during the first few days of the event, I'd call over
22 here just to trade notes on what we were hearing
23 versus what information the NRC was getting, and they
24 weren't getting any better information than we were.
25 So, I think everybody was in the same boat in that

1 regard.

2 CHAIR ABDEL-KHALIK: I asked a question
3 about NRC Bulletin 2011-01, INPO IERs, and the
4 inspections that were performed in response to the
5 Temporary Instruction. The question was meant in the
6 vein of, are we asking licensees to do the same thing
7 several times when they should be spending their time
8 sort of doing the strategic thinking that is required,
9 rather than sort of redoing things three different
10 times?

11 MR. PIETRANGELO: Well, the walkdowns that
12 the industry did were self-initiated. I think the
13 Temporary Instruction came out after that, was a good
14 hand-in-glove fit about inspecting what we were doing
15 in the walkdowns and what we were finding. Those all
16 went into inspection reports that were made public and
17 summarized.

18 The Bulletin, I think, my understanding of
19 it is to make sure that you fix the items or non-
20 compliances that were found in the 30-day time period,
21 or tell us what you're going to do within 30 days. And
22 then I think the 60-day response is more targeted at
23 the controls you have over those extreme -- over those
24 measures for extreme events, what training, what
25 surveillance, what periodicity of maintenance, that

1 kind of thing, because that was not prescriptive in
2 the requirement.

3 And I'll be honest with you, we're looking
4 at establishing our own kind of generic template for
5 well, how often should we be testing and exercising
6 training, because of the question you just asked. I
7 mean, we had a discussion with someone, it's not gold-
8 plated, but it might have to be silver-plated. We
9 goldplate design-basis tech specs, all those things
10 for a good reason. These are for very extreme low
11 probability things, should you afford the same
12 measures over those kinds of things as you do for the
13 more likely day-to-day events? That's risk-informed
14 thinking, I think. Harold?

15 MEMBER RAY: Well, Tony, you made some
16 comments that I certainly resonate with about seamless
17 transition from normal operating and emergency
18 procedures to severe accidents.

19 MR. PIETRANGELO: Yes.

20 MEMBER RAY: One thing that's come up in
21 our discussions here, completely unrelated, has
22 nothing to do with Fukushima. But it does have to do
23 with the intervention of, I'll call it management, and
24 what role they play in a severe accident, and whether
25 they can play any role if they're not licensed to

1 operate the plant, for example. Is any of that kind of
2 discussion taking place?

3 MR. PIETRANGELO: Yes. Well, in terms of
4 understanding differences from what appears to have
5 happened in Japan versus how we would do it here.

6 MEMBER RAY: Well, yes. But, I mean, let
7 me be more specific. What role does the TSC have in
8 saying it's time to move to a different strategy, or
9 not, as the case may be, or even higher levels of
10 management. It seems like that's going to have to be
11 on the table here.

12 MR. PIETRANGELO: Well, I think one of the
13 differences we see today with the way our operators
14 are trained, licensed, and what they execute is the
15 authority is with the shift supervisor in the control
16 room. They're going to make the decision to vent or
17 not vent based on their procedures and executing them.
18 And you're not going to seek senior management
19 approval in your organization, nor from the federal
20 government.

21 MEMBER RAY: Well, that's the way it
22 stands today. I'm just wondering are we comfortable
23 with that, and are we going to look at that again, or
24 is it pretty well set as far as you're concerned?
25 Because, I mean, that's my understanding of the rules,

1 too.

2 MR. PIETRANGELO: Yes. I don't know I want
3 to have it any other way, Harold, than the authority
4 has to be --

5 MEMBER RAY: Okay. That's fine with me.

6 MR. PIETRANGELO: -- with the plant, and
7 the trained, licensed operator following their
8 procedures. I mean, that's --

9 MEMBER RAY: We've had some folks suggest
10 that maybe there was a role for upper management to
11 play when these things develop. And I've been trying
12 to ask questions about that, so that's why I asked you
13 the question.

14 MR. PIETRANGELO: I'm not even sure we let
15 upper management in the control room.

16 (Laughter.)

17 MEMBER SIEBER: Well, that's the
18 established protocol right now. And I think it's the
19 right one, because these people are trained to do that
20 job, and have the wherewithal to do it, and have the
21 most information. And I would like to reserve more
22 distant management with less knowledge and less
23 experience get involved in prescribing detailed
24 actions that people are to take.

25 I do have another question, though. You

1 know, what you have described to us is a lot of short-
2 term actions, investigations, procedure changes, you
3 know, things like that. And I think in order to get
4 an immediate improvement, that's what you start on
5 first. But is anybody in industry looking toward
6 design issues for the plants that may be modified to
7 prevent some things?

8 For example, the hardened vents, either
9 they leaked or some other pathway leaked, or they
10 didn't work because you ended up with three reactor
11 buildings that exploded. There are other issues that
12 sort of hint at design issues in these plants that at
13 least ought to be evaluated, because software fixes
14 and extra training in a staged diesel some place isn't
15 going to do everything.

16 MR. PIETRANGELO: Right.

17 MEMBER SIEBER: Who is looking at that,
18 and to what extent?

19 MR. PIETRANGELO: Yes. I think the
20 walkdowns were -- those are the short-term actions,
21 but I think some of the corrective actions that come
22 out of that are certainly, I mean, from a flood
23 protection standpoint, just for your design-basis
24 flooding analyses, make sure your seals are
25 functional, watertight doors, all that kind of stuff.

1 That has to be rechecked, and if you find some
2 deficiencies, you need to fix those. And that's what
3 the Bulletin, I think, is trying to drive, is
4 corrective actions commensurate with their
5 significance.

6 The other piece that I mentioned before is
7 like improving the accessibility to those key
8 equipment like the hardened vents, so that if you do
9 get in that situation they are more readily
10 accessible. You've got the nitrogen bottle staged to
11 be able to operate the valve, et cetera, the right
12 fittings there, that kind of thing. In the short term,
13 I think that's what we need to focus on.

14 MEMBER SIEBER: And I think there are some
15 policy issues out there, too. For example, the
16 government's been collecting from electricity
17 ratepayers for years, and years, and years as part of
18 their electric bill to establish long-term spent fuel
19 geologic storage. And we are making virtually no
20 progress even though the money has been spent in that
21 area, and we end up with a large inventory of spent
22 fuel located at plant sites stored where under normal
23 conditions it's completely safe, but there ought to be
24 some policy alternative to try to resolve that
25 situation. Do you agree or disagree with that?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MR. PIETRANGELO: I agree, and if there's
2 any silver lining to this horrible event, is that
3 we've got a Blue Ribbon Commission looking at long-
4 term national policy on used fuel.

5 MEMBER SIEBER: Right.

6 MR. PIETRANGELO: We're going to see their
7 draft recommendations here I think in July, and final
8 recommendations by the end of the year.

9 A lot of times you have these Blue Ribbon
10 Commissions that make recommendations that stay on the
11 shelf and nobody does anything with them.

12 MEMBER SIEBER: Right.

13 MR. PIETRANGELO: I think Fukushima really
14 puts a spotlight on the aspect of used fuel
15 management. We need a national integrated used fuel
16 management policy. And to the extent Fukushima shines
17 some light on that and the urgency of getting on with
18 this. I don't think it's an urgent today issue, it's
19 a longer term issue, but we need to start taking
20 definitive steps towards some national goal and
21 policy.

22 MEMBER SIEBER: I was a young man when
23 this first became an issue, and I'm not longer younger
24 and the issue is --

25 (Laughter.)

1 CHAIR ABDEL-KHALIK: You correctly
2 identified sort of the fact that, in general, we have
3 been looking at issues on a unit-specific basis rather
4 than sitewide basis. And has the industry started
5 thinking about the licensing implications of this if
6 we change the paradigm of licensing rather than
7 looking at it from a licensing of an individual unit,
8 instead we look at it from the perspective -- from a
9 sitewide perspective?

10 MR. PIETRANGELO: We do do that to a
11 certain extent now. I'll note with new plant
12 construction at Vogtle and Scana, you're doing heavy
13 construction next to an operating plant. I think from
14 a security standpoint we've looked at that very, very
15 carefully, and the need to account for that with the
16 security measures at the operating plant. I think
17 you're suggesting something broader.

18 CHAIR ABDEL-KHALIK: Right.

19 MR. PIETRANGELO: I thought about it a
20 little bit, not a lot, and the context was totally
21 different for me. I was thinking it for small modular
22 reactors versus big plants. But the same could be --
23 there are some plants that share turbine decks, share
24 control rooms, share refueling floors.

25 CHAIR ABDEL-KHALIK: Right.

1 MR. PIETRANGELO: So, I think that's a
2 legitimate area to investigate and look into.

3 CHAIR ABDEL-KHALIK: Shared switchyards.

4 MR. PIETRANGELO: Switchyards, right.

5 MEMBER REMPE: Said?

6 CHAIR ABDEL-KHALIK: Yes?

7 MEMBER REMPE: I'd be interested in your
8 perspective about resolving some -- the long-term
9 resolution of some uncertainties. You have mentioned
10 the spent fuel pool Unit 4, for example, and there are
11 several scenarios being thought about, whether there
12 was hydrogen from three versus water sloshing out, and
13 there's other things about some sort of flammable
14 liquid.

15 To really get the answer to that might be
16 important on what we think about doing in the future.
17 And there's other issues like saltwater. Does
18 industry have a perspective and an opinion that they
19 plan to maybe promote, find some answers, as they go
20 through it?

21 MR. PIETRANGELO: Absolutely. I think
22 that's -- from day one when we all got together to
23 start thinking about what we were going to do, an
24 emphasis on needing a more detailed understanding of
25 precisely what happened, timeline, actions, condition,

1 as best we can get it. And I think the fuel pools --

2 MEMBER REMPE: Some of it may require
3 going in and getting some sort of sampling, etcetera.

4 MR. PIETRANGELO: And that's probably
5 years.

6 MEMBER REMPE: Yes.

7 MR. PIETRANGELO: Unfortunately. But it
8 took a long time on the TMI lessons learned. It is
9 probably going to take a long time for this as well.
10 But nonetheless, we should get that information,
11 because I think it will obviously inform our efforts
12 going forward.

13 CHAIRMAN ABDEL-KHALIK: Go ahead.

14 MEMBER POWERS: One of the challenges --
15 the benefits that we have derived from the TMI
16 incident was doing the diagnostics on -- post-accident
17 diagnostics. And we were -- the problem is the very
18 middle of the data you derive from dissecting a
19 damaged reactor is of use to those cleaning up the
20 reactor, and their imperative is to clean it up as
21 quickly as possible at as low a cost as possible.

22 And they are disinterested in it rupturing
23 their activities to acquire diagnostic information
24 that may be of use to us in validating models of how
25 accidents degrade and things like that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 At TMI, we operated very much in the
2 blind, because we didn't know very much about severe
3 accidents at that time. We know marginally more, I
4 presume, now than we did. And so we don't have to
5 operate nearly so blind, but we are still going to be
6 under the pressures of time and the schedules of those
7 doing the cleanup, if there is no recognized value to
8 getting that information, and a well-developed
9 strategy for getting that information, interfering as
10 little as possible.

11 I think it would be exceptionally useful
12 if NEI could add its weight to encouraging all
13 interested parties in developing a good plan for what
14 information we get, how it will be used, and
15 encouraging those responsible for the cleanup to
16 recognize that value.

17 MR. PIETRANGELO: Yes, that's an excellent
18 point. And we have had that discussion just about
19 domestically when we find flaws of indications and
20 people want to do the weldover without knowing --
21 finding out exactly the extent. And I think we've got
22 our protocol down now where we don't do that until we
23 find out as much as we can.

24 MEMBER POWERS: Well, I may --

25 MR. PIETRANGELO: Yes.

1 MEMBER POWERS: -- this country for small
2 things, but -- and a big thing, there is so much money
3 involved, and time is money here.

4 MR. PIETRANGELO: Yes. But I think it's
5 given that TEPCO has several other operating plants of
6 a similar design in that country. They are going to
7 want the lessons learned, perhaps more than anybody,
8 for their own reasons. And I don't see why there
9 would be any reason not to share that with
10 international --

11 MEMBER POWERS: I don't think it's
12 sharing. It's having --

13 MR. PIETRANGELO: A plan in advance.

14 MEMBER POWERS: Yes, a plan in advance --

15 MR. PIETRANGELO: Right.

16 MEMBER POWERS: -- that recognizes this
17 drive that is going to go on to clean up as quickly as
18 possible. Both parties have to recognize that.

19 MR. PIETRANGELO: Right.

20 MEMBER POWERS: And at the same time, we
21 still need to get the information. There is so much
22 information we did not get at TMI, quite frankly
23 because we ran out of money, and because we were not
24 well planned. And the drive to completion was just
25 very, very heavy pressure, and you have to be very

1 sympathetic with people.

2 MR. PIETRANGELO: Right. That's a
3 balance.

4 MEMBER POWERS: Yes.

5 MR. PIETRANGELO: Well, I totally agree
6 with your point, though.

7 MEMBER STETKAR: Tony, in light of that,
8 you mentioned that there's an IAEA team on the ground
9 now. And my impression from what you said is that you
10 are relying, to a greater or lesser extent, on them to
11 do a lot of the detailed forensics.

12 MR. PIETRANGELO: Initially at least.

13 MEMBER STETKAR: Okay. Well, I guess my
14 question, in light of what Dana was discussing, is,
15 who in the U.S. is coordinating with that team? In
16 other words, if there is valuable information --

17 MR. PIETRANGELO: Right.

18 MEMBER STETKAR: -- that should be
19 preserved, at a relative -- you know, at this stage of
20 the process, three months, two and a half months --

21 MR. PIETRANGELO: Right.

22 MEMBER STETKAR: -- after the event, that
23 could be lost because of cleanup efforts and things,
24 who was working with that team if they are now the
25 point international team for --

1 MR. PIETRANGELO: Right.

2 MEMBER STETKAR: -- collecting --

3 MR. PIETRANGELO: In our plan, we have
4 actually got an international coordination building
5 block in that plan that EPRI and INPO share the lean
6 on.

7 MEMBER STETKAR: Okay. But you mentioned
8 that that plan will be eventually developed and
9 perhaps published by the end of this year. I'm
10 talking about, you know, some time in the next two or
11 three months in real time.

12 MR. PIETRANGELO: Yes. Well, EPRI was
13 there last week, and I think, in my mind, it would be
14 the right industry organization to say, "Here is kind
15 of the questions we have been doing research on for a
16 number of years, that this information" --

17 MEMBER STETKAR: Well, the question is --

18 MR. PIETRANGELO: -- "light on."

19 MEMBER STETKAR: -- in your mind that
20 sounds right, but in real time who is doing it? I
21 mean, does EPRI have the lead? Does EPRI know that it
22 has the lead?

23 MEMBER CORRADINI: I guess John's question
24 -- I guess more provocatively, so if tomorrow somebody
25 said, "You really shouldn't clean that up. That might

1 be some valuable information there," or could make the
2 final decision to clean it up or to -- or to leave it
3 there for forensics value -- that's what I guess John
4 is asking.

5 MEMBER STETKAR: Well, it's -- in some
6 sense. I mean, I'm not advocating delaying, but at
7 least if someone thoughtful thought that information
8 prior to cleanup might be useful, collecting as much
9 information prior to cleanup should be, you know,
10 given some priority.

11 And if, you know, at least from the U.S.
12 perspective, if I can cast it that way, given an
13 information flow to us to sort of enhance our
14 understanding of severe accident -- event progression
15 or severe accident phenomena, who has the lead today?

16 MR. PIETRANGELO: I'm going to take that
17 question. That's a good one, given the time. I'm
18 really glad the ACRS is involved in this, and I know
19 -- I've heard -- don't know, but heard that you all
20 have wanted to be more engaged on the Fukushima and
21 the planning. And I know the staff is under duress
22 right now to get this 90-day review done.

23 But I know if there is any subsequent
24 actions that come out of that I trust that this
25 Committee is going to be engaged in looking at those

1 and providing your expertise to that, because this is
2 something we all need to work on. It's very
3 important.

4 There's a lot of lessons to be learned
5 here, and the more we can get I think a consensus from
6 all communities on what is fact and what is real
7 versus kind of what is speculative, I think is very,
8 very helpful going forward. So --

9 CHAIRMAN ABDEL-KHALIK: Thank you very
10 much.

11 MR. PIETRANGELO: -- appreciate the
12 opportunity to chat with you today.

13 CHAIRMAN ABDEL-KHALIK: We intend to do
14 that.

15 MR. PIETRANGELO: Okay.

16 CHAIRMAN ABDEL-KHALIK: And we thank you
17 very much for taking the time to meet with us today.

18 MR. PIETRANGELO: My pleasure. Thanks.

19 CHAIRMAN ABDEL-KHALIK: Thank you. At
20 this time, we will move to the next presentation. Dr.
21 John Kelly from DOE will give us a presentation on
22 DOE's perspective.

23 DR. KELLY: Thank you, Mr. Chairman. So
24 are my slides loaded, do you know?

25 CHAIRMAN ABDEL-KHALIK: I believe they

1 are. And if you can --

2 DR. KELLY: I know a couple of the people
3 here.

4 MEMBER POWERS: Who are you again?

5 (Laughter.)

6 DR. KELLY: Well, I can't remember exactly
7 -- I think Dana maybe initiated this request back a
8 month or so ago, because he knew that I was heading up
9 the Department of Energy Nuclear Energy Office's work
10 on the Fukushima event. And so -- but the focus I
11 think at this point needs to be, what did DOE do in
12 the last two months on this?

13 And the forward-looking thing we are --
14 you know, our position right now is we need to learn
15 a lot more about what happened and why it happened,
16 and if we can lay that foundational base of
17 understanding, then lessons learned will flow from
18 that.

19 So here is the plant, you know, before the
20 accident. I think everyone has seen that. And then,
21 the -- you know, the extreme devastation that occurred
22 within the first few days after the tsunami, and then
23 the hydrogen explosions in the various buildings
24 greatly damaged all of the facilities.

25 You know, the timeline that we know is the

1 earthquake happened at 2:00 in the afternoon. About
2 an hour later the tsunami hit. It was a magnitude
3 approximate nine on the -- and the tsunami was about
4 14 feet, and their design base I think was about six
5 meters.

6 Many thousands of people perished, and,
7 you know, I think one thing that I recognized was that
8 when we had the big earthquake or whatever, and
9 thousands of people were killed, we always had this
10 assumption that the -- whatever happened in the
11 nuclear plant wouldn't be as important as all the
12 other human devastation. Apparently, that's, you
13 know, not valid.

14 But hundreds of -- over 100,000 people
15 were homeless, without food, water, evacuated,
16 etcetera. It wasn't just because of the nuclear
17 accident.

18 So we are still uncertain about how much
19 damage was done by the earthquake, and that
20 information is still coming out as they inspect the
21 other reactor buildings and the units that weren't
22 damaged. Units 5 and 6 did not meltdown, so they can
23 go in and see what damage occurred there.

24 But we're pretty sure that the grid lines
25 were knocked down by the earthquake. That led to the

1 loss of offsite power. And then, diesel generators
2 operated, but when the tsunami came in and we have,
3 you know, some simulations now looking at that, the
4 diesel generator rooms were flooded, and this knocked
5 out the diesel generators leading to basically long-
6 term station blackout, without heat sink as well.

7 MEMBER CORRADINI: John, you mentioned 5
8 and 6, so maybe -- if this is the wrong time, you can
9 hold us back. So in 5 and 6, has there been internal
10 inspections of the building such that they know where
11 the water went, or if any water made it into a lot of
12 the compartments?

13 DR. KELLY: You know, I don't know the
14 answer to that.

15 MEMBER CORRADINI: Because I think you
16 have actually started bringing up questions that --

17 DR. KELLY: That we've been following,
18 yes.

19 MEMBER CORRADINI: -- five or six weeks
20 ago we were asking staff about, too, about a
21 comparative point, maybe due to elevation things were
22 different there. But then, given that, what sort of
23 things they found when they were inspecting internals
24 of it. So at this point, still a question mark.

25 DR. KELLY: Still a question mark. But we

1 are pretty sure that there are, you know, various
2 inspections going on to assess earthquake damage. In
3 terms of tsunami damage, that seems like something
4 they would also be interested in.

5 MEMBER CORRADINI: Okay.

6 MEMBER ARMIJO: Well, similarly, for the
7 Daini sites, which survived, and it was a tsunami as
8 severe where they're at higher elevations --

9 DR. KELLY: Well, the tsunami was I think
10 worse, but they were up at higher elevations.

11 MEMBER ARMIJO: Yes. You know, some
12 quantitative stuff like that would be --

13 DR. KELLY: They barely survived I think.
14 You know, the indication -- I don't know if you know
15 Dr. Omato, Japan Atomic Energy Commission. He and I
16 spoke a few weeks ago. They did not loose all offsite
17 power, so they had one line still remaining. And
18 then, they were able to bridge that line to the units
19 onsite. So it was through that mechanism that they
20 were able to maintain power.

21 MEMBER CORRADINI: I guess I would -- just
22 to follow Sam's question, I guess it was -- was it
23 Onagawa that was at a much higher elevation? It was
24 on cliffs.

25 DR. KELLY: Right.

1 MEMBER CORRADINI: And F2 was in a bay
2 region, so even though the tsunami was worse there, it
3 was mitigated by the bay? Or is that still a big
4 question?

5 DR. KELLY: Onagawa or --

6 MEMBER CORRADINI: No.

7 DR. KELLY: -- Fukushima 2?

8 MEMBER ARMIJO: Daini.

9 MEMBER CORRADINI: Daini, excuse me. I
10 guess that's back to --

11 DR. KELLY: I think what saved Daini was
12 the fact that they did not completely lose connection
13 to the grid. At least that's what Dr. Omato reported
14 to me.

15 MEMBER SHACK: But is the implication of
16 that that they had lost their emergency diesels? They
17 do seem to need them.

18 DR. KELLY: I think that was the
19 implication.

20 MEMBER SHACK: Okay.

21 DR. KELLY: Maybe I'll say a little bit
22 more when I -- I can talk to it as I go through here.
23 So station blackout occurred due to the earthquake at
24 the Fukushima Daiichi plants.

25 Loss of emergency diesels due to the

1 tsunami -- now, they had both water-cooled and air-
2 cooled diesel generators, so they had added redundancy
3 some time before. I think people were talking -- I
4 can't remember, because we talk about this all the
5 time, but they had done extensive relooks at seismic
6 hazards and tsunami hazards within the last five years
7 I think it was.

8 What Dr. Omato explained was that there
9 are four fault lines off the coast, and in their
10 modeling they never assumed that they would all
11 operate at the same time. And so these four in
12 harmony went up and down generating massive earthquake
13 and tsunami. So the fault lines were known. The fact
14 that they would work together I think was overlooked
15 in the analysis.

16 Eventually, they were able to maintain
17 some control for a while, but there is, you know,
18 speculation now that there was damage. There was a
19 report earlier this week that the Unit 1 was cooling
20 too rapidly. The isolation condenser was working.
21 The operators turned it off, because they were afraid
22 that it was going -- some kind of thermal transient,
23 thermal shock.

24 And then, when the tsunami hit, they
25 weren't able to restore the isolation condenser, which

1 part -- you know, we need to confirm all of these
2 things, but it's sort of pointing to why it actually
3 melted down faster than severe accident codes would
4 have said.

5 MEMBER CORRADINI: That was because the
6 isolation -- it was isolated.

7 DR. KELLY: Yes. There is one valve that
8 needs to be turned, apparently, and so --

9 MEMBER STETKAR: John, everybody is -- I
10 have to apologize, because I haven't had a chance to
11 really look at lot of the details, and I'm kind of a
12 detail-oriented guy. But people focus on the tsunami
13 effects on the diesels themselves, which obviously
14 were vulnerable to the flooding.

15 It's my understanding that a lot of the
16 switchgear was down in the basement of the turbine
17 building. So even if the diesels had survived, would
18 they have been able to provide electrical power to
19 anything? Do you know that?

20 DR. KELLY: I don't know that, but I've
21 heard that, indeed, you know, it wasn't just the
22 diesels themselves. The diesels might have been many,
23 many, many meters above the tsunami level, but --

24 MEMBER STETKAR: I don't know how the --

25 DR. KELLY: -- the actual layout of --

1 MEMBER STETKAR: -- switchgear itself,
2 emergency power sources are, whether they -- the
3 switchgear --

4 DR. KELLY: Okay. You don't know.

5 MEMBER STETKAR: I don't know.

6 DR. KELLY: I haven't been able to find
7 that --

8 MEMBER STETKAR: I just don't remember,
9 because the Secretary of Energy and I went up to
10 Millstone a week after the accident, because we
11 thought it would be a good idea to walk around a
12 similar plant that we could walk around in, and so we
13 got a pretty good tour.

14 You could actually envision how this
15 happened, because the diesel generator room there has,
16 you know, the vent to release combustible gas or the
17 combustion gases afterwards. So up at the top, they
18 have designed it for a very large hurricane tidal
19 swell on Long Island Sound. But if you miss that, you
20 know, there's a clear path for water to go right into
21 the building. And I suspect that water, mixed in with
22 electrical equipment, is, you know, a high probability
23 of failure at that point.

24 And then, furthermore, the diesel fuel
25 tanks were -- which were outside were also washed

1 away. So even if -- you know, their supply of fuel
2 was gone as well.

3 Yes.

4 MEMBER SIEBER: I might comment -- not
5 only the diesels and the switchgear, but also the
6 pumps themselves.

7 DR. KELLY: Right.

8 MEMBER SIEBER: In order to get suction
9 head, pumps are usually placed low, and they are
10 driven by electric motors. They are vulnerable to
11 flood. And so if there's more issues than just having
12 the power supply and the switchgear, you have to have
13 the equipment --

14 DR. KELLY: Right.

15 MEMBER SIEBER: -- safe, too.

16 DR. KELLY: So I think we know core
17 overheated, cladding oxidized, melt produced hydrogen.
18 Hydrogen escaped from the containment. There is -- it
19 was either vented or the head seals leaked, or some
20 combination of that. And so Units 1, 2, and 3 all
21 had, you know, explosions or deflagrations, and there
22 was an explosion/deflagration in Unit 4.

23 And I'll talk -- I heard you speaking
24 earlier about the -- what we know the about spent fuel
25 pool 4, and I have some of -- I'll talk a little bit

1 about the analysis that we did and the conclusions we
2 rely on.

3 MEMBER CORRADINI: But given the
4 qualitative stepping through, as you have done, there
5 are still large uncertainties as to, was there
6 hardened vents? If the hardened vents failed, if
7 there was a change in procedure, if, if -- there is
8 still a good bit of --

9 DR. KELLY: I mean, we're sure that they
10 have hardened vents, that they were used. How they
11 were plumbed is not, you know, understood, so, you
12 know, there is still --

13 MEMBER CORRADINI: Okay.

14 DR. KELLY: But that still needs to be
15 fully verified.

16 MEMBER ARMIJO: John, would -- these vents
17 would normally not discharge into the refueling floor.
18 So they --

19 DR. KELLY: No.

20 MEMBER ARMIJO: So, you know, something --

21 DR. KELLY: Something else went wrong.

22 MEMBER ARMIJO: -- went wrong when they
23 were venting or before they went -- were venting.

24 CHAIRMAN ABDEL-KHALIK: Unless you get
25 connected.

1 DR. KELLY: So there is some
2 interconnection. That may explain the mystery of
3 Unit 4, so -- but basically, what I wanted to talk
4 about was, you know, what kind of happened in those
5 first days. Of course, you know, we know the NRC
6 stood up their Emergency Operations Center. They
7 deployed people to Japan.

8 They formed this reactor safety team that
9 was really there to provide advice to the Ambassador
10 and the government as questions came in. And it was
11 principally on the -- managing the reactors and spent
12 fuel pools. I mean, that's what the NRC team was
13 principally focused on.

14 But they initiated this consortium call
15 that was twice a day, daily, you know, it was very
16 frequent, that it had participation from NRC, INPO,
17 DOE, Naval Reactors, and GE, other industry partners.
18 So there was a call that was discussing basically that
19 the appropriate accident management guidelines, as we
20 are gathering data and looking ahead, as to what was
21 next.

22 Dr. Lyons, my boss, and Chairman Jaczko
23 got together with INPO and discussed, how are we going
24 to deal with all the industry's interest in assisting
25 Japan? And so INPO agreed to be the coordinating

1 point for that, and they sent -- ended up sending
2 people both to -- to Japan as well as coordinating
3 things here in the U.S.

4 And so this really was a great idea,
5 because it helped get our capabilities, which are
6 great in terms of many of these areas, channeled in
7 the right direction, so that they could be deployed
8 more rapidly.

9 MEMBER CORRADINI: So INPO was the point
10 of focus, the point of contact to TEPCO.

11 DR. KELLY: Yes.

12 MEMBER CORRADINI: Okay.

13 DR. KELLY: And for all interesting in
14 assisting, it was -- INPO served as a clearinghouse
15 for that.

16 Department of Energy -- our responsibility
17 was principally on the -- well, we have our own
18 Operations Center, but principally on the airborne
19 monitoring system that the NNSA maintains for various
20 nuclear disasters in the U.S.

21 And, you know, this is vital for not only
22 informing the Embassy in Japan about potential dangers
23 to the U.S. citizens, it was also to the military that
24 has naval bases, air base in Japan in close proximity.
25 There were a number of reasons why this was very

1 important for the benefit of U.S. citizens, and, at
2 the same time, it was benefitting the government of
3 Japan.

4 We also sent representatives from Idaho,
5 PNNL, Sandia, to Japan. We sent additional DOE staff,
6 and then we had the great job of having -- doing shift
7 work, hadn't done that in a while. I got the midnight
8 to 6:00 in the very beginning. Of course, that's when
9 everything was happening, so it was pretty
10 interesting. But even Dr. Lyons was doing shift work
11 when we got the EOC stood up.

12 MEMBER BANERJEE: Who organized the badges
13 with freshwater and things?

14 DR. KELLY: That was the Navy that --

15 MEMBER BANERJEE: Did you guys get
16 involved in that?

17 DR. KELLY: No. See, the military was
18 also involved, so it was -- I didn't have their
19 activities on here, but --

20 MEMBER BANERJEE: Nobody coordinated that
21 activity from DOE or NRC.

22 DR. KELLY: No. There's actually a
23 disaster assistance team -- DART it's called -- and
24 that was the overall coordinating function. But every
25 agency has their roles and responsibilities. We kind

1 of follow down that line.

2 You know, so during the first several
3 weeks, we did a significant number of analyses -- so
4 that's in my office -- basically asking a lot of the
5 "what-if" questions, because we were trying to
6 anticipate what could go wrong next, and we wanted to
7 be ready to inform the Ambassador about, you know, how
8 much time do you have, and these type of questions.

9 If the spent fuel pools are dry, how much
10 time do you have? And what would be the signatures?
11 What would we see? And we could look at the very
12 assets the U.S. Government has to give us early
13 warning on -- if the accident --

14 MEMBER BANERJEE: Were you going directly
15 to the Ambassador or to the Secretary? I mean --

16 DR. KELLY: Our team -- I have a flow
17 diagram that shows the information flow. It's pretty
18 complex, but I'll get there.

19 In terms of DOE offices, NE is mine,
20 Nuclear Energy. Science was involved, NNSA.
21 Environment Management, because it's in EM that we
22 have the expertise at Hanford and Savannah River, and
23 a lot of the work in the future is going to be
24 cleaning up contaminated water. And we have built
25 that equipment in the U.S., and we will probably be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 involved in some role there, had all our labs,
2 universities, consultants.

3 And then, the Secretary, for the VP
4 disaster, had formed this group of science experts
5 that he brought together to consult with. And so he
6 stood that up within the first week to really help us
7 -- the analysis team with giving us advice, questions,
8 and then asking, you know, pertinent questions that we
9 could then communicate to our colleagues in Japan to
10 get information to help understand.

11 So there is kind of the information flow.
12 And this is not a complete wiring diagram, but in the
13 middle we stood up this triad they called this, which
14 Steve Binkley in the Office of Science, Steve Aoki in
15 NNSA, and myself, so we were representing the kind of
16 three major elements of the Department.

17 And then, there was this -- in the U.S.,
18 there was this consortium with INPO, industry, DOE,
19 and NRC, that were having their daily phone calls, and
20 we would have people participating on those phone
21 calls. They, in turn, would have phone calls with the
22 Embassy, and there were probably daily meetings with
23 the Embassy and the government of Japan. And you can
24 see the various organizations in Japan.

25 And, you know, TEPCO and NISA were

1 interacting with the Embassy, and of course Hosono was
2 the overall integrator in Japan. So that was kind of
3 a lot of back and forth.

4 But our main connection to getting
5 information to the Embassy was through the consortium,
6 but we also had two DOE people there all the time that
7 we could, you know, call up and talk to.

8 MEMBER CORRADINI: So, John, I guess I
9 don't recognize what that means. So who is the -- can
10 you explain the integrator's role? I'm sorry. I
11 didn't --

12 DR. KELLY: He is -- the Prime Minister
13 appointed him as the person in charge.

14 MEMBER CORRADINI: All right. Thank you.

15 DR. KELLY: It's all the ministries in
16 Japan that are dealing with this report to him. It's
17 much -- this is just a really small slice of the
18 overall picture.

19 MEMBER CORRADINI: From the standpoint of
20 command and control, then, information advice would go
21 back to TEPCO from that group also.

22 DR. KELLY: Yes. And they were coming up
23 with a list of equipment that they wanted, and
24 analysis. So it was equipment and analysis. They
25 wanted stainless steel tanks for water storage, or

1 they wanted robots, or they wanted pumps. And so this
2 was a way of getting the information put together as
3 quickly as possible.

4 We had the Secretary's -- what we call
5 X1's -- science experts. We were meeting daily with
6 those folks. And then, we had our laboratories where
7 we had -- we brought in some of the -- Harold
8 McFarlane from Idaho fortunately was in Washington at
9 the time, and so we tapped him to kind of be the
10 coordinator of the lab group. So as we got requests
11 for analysis, etcetera, we could give it to Harold,
12 and he would go to the laboratory experts to get the
13 analysis done, and then report it back the next day.
14 So we were pretty busy that first day.

15 As I mentioned, NNSA had the lead on the
16 radiation monitoring, and they deployed the system.
17 They really -- I think our Emergency Response Centers
18 were stood up sometime 11 or -- 11:00 in the morning
19 or so on that Friday, the 11th, which was I believe
20 nine to ten hours after it had happened, because there
21 was already indications that they had lost cooling.

22 I think they deployed in the afternoon.
23 Because of the day difference, they arrived very early
24 on the 13th and were flying their first missions on
25 the 13th, which already was after I think Unit 1 had

1 failed.

2 And then, at the same time, the NARAC
3 group at Lawrence Livermore, they have the plume
4 modeling, and so they were calculating hypothetical
5 source terms, looking at plumes to the U.S., plumes on
6 Japan, and all this was informing EPA in the U.S. and
7 the Embassy in Tokyo.

8 MEMBER CORRADINI: Was that group also
9 informing NRC?

10 DR. KELLY: They were working together, so
11 NRC provided the source term.

12 MEMBER CORRADINI: Oh, NRC provided the
13 source term.

14 DR. KELLY: NRC provided the source term,
15 and then that was put in the NARAC, and there was lots
16 of interactions with Dr. Holderin at the White House
17 on "what-if" scenarios. So that was pretty
18 interesting.

19 Very nice, you know, instruments. They
20 did do these flyovers and would -- maybe you've seen
21 these photos, but they've got lots of data now on
22 radiological. They do have gamma specs, so that they
23 can -- they can pick out the cesium-137 or iodine-131,
24 so we have some isotopic information as well. And
25 then, later they did ground sampling. They set up

1 various monitoring there.

2 And, basically, they are identifying hot
3 zones, and we saw yesterday that there is this kind of
4 plume up to the north and west. And I don't know if
5 it's fortuitous or what, but the plume modeler, if you
6 plug in the weather and sort of a constant release,
7 you get a pattern that kind of looks like this. So
8 that -- it's not exact, but at least it gives you an
9 indication of -- and it's a pretty complicated -- it's
10 probably mostly due to rain, rain at the right time,
11 led to this disposition, rather than in the atmosphere
12 and a lot more dispersion.

13 MEMBER CORRADINI: And so these are --
14 what you are showing here are measurements at a
15 particular point in time.

16 DR. KELLY: Yes. These are dated -- this
17 is April 5th, where they were -- I think the red dot
18 at the bottom is a plant, so then they have a
19 measurement going out. They went over sea, you know,
20 so they did both over the land, over the sea -- a
21 pretty substantial difference. They were running two
22 or three missions a day, so they've run nearly 100
23 missions now I think they told us.

24 MEMBER STETKAR: John, was the Japanese
25 government also doing flyovers, taking their own

1 measurements? And were those --

2 DR. KELLY: Apparently, they didn't have
3 the radiation -- they did not have the radiation
4 monitoring capability.

5 MEMBER STETKAR: Oh, they did not. Okay.

6 DR. KELLY: They did not. They had
7 thermal imaging capability, and so that was one way
8 they were trying to measure the temperature of the
9 spent fuel pools.

10 MEMBER STETKAR: But in terms of -- NNSA
11 was providing --

12 DR. KELLY: Right.

13 MEMBER STETKAR: -- this is the only
14 source of this information.

15 DR. KELLY: And, you know, we -- every
16 time you do this, and especially internationally, it
17 takes a little while to get the protocols all quite
18 right. So initially we were having -- we had the
19 information. We were providing it to our Embassy. We
20 informed the Japanese that we had this data. They had
21 actually asked us to do this. And then, we worked out
22 a way so that we could share it. So it ended up being
23 posted daily on the DOE website.

24 CHAIRMAN ABDEL-KHALIK: You indicated
25 earlier that the NRC provided the source term for

1 Livermore --

2 DR. KELLY: Right.

3 CHAIRMAN ABDEL-KHALIK: -- to do these
4 plume model calculations. Was there any attempt by
5 the labs to sort of develop a source term estimate
6 for it, an independent --

7 DR. KELLY: They went -- so they have a
8 code called RASCAL, which I think has the NUREG-1465
9 source term in it and various modeling. So that was
10 one piece that was used initially. Then, they went to
11 Sandia and asked for, you know, more scenario -- as we
12 learned information, you know, what would this
13 scenario actually give you in terms of fission product
14 release. So we sort of had a best case/worst case --
15 what would they call it -- it was best estimate
16 bounding source term or something.

17 CHAIRMAN ABDEL-KHALIK: So that was
18 developed by Sandia.

19 DR. KELLY: And then, that was put into
20 NARAC. I think we learned -- there was some learning
21 there that NARAC really hadn't been set up for that
22 kind of interface, and so it was kind of cumbersome
23 and took -- and it was difficult to do quick
24 turnaround, because that had not been put together,
25 that interface. With RASCAL, I think it was already

1 in place.

2 So in terms of our office, we formed
3 something called the Nuclear Energy Response Team. We
4 spent a lot of our time assessing and clarifying
5 information for our leadership, because we're seeing
6 I think a lot of erroneous press reports, and there
7 was a lot of concern about what was going on. And so
8 we were, you know, looking at that trying to
9 rationalize it.

10 We took the approach that we needed to
11 keep an open mind, that we needed to be able to
12 explain hopefully all of the data, or the majority of
13 the data observations that we were seeing, before you
14 had a theory, so there were multiple theories for the
15 same data sets.

16 And then, we tried to assign probability
17 such as this is likely, not very likely, you know, to
18 that, and then that helped I think put it in
19 perspective that the data could mean something else.
20 And so we were always trying to envision what could
21 the data actually mean, and the horror stories were
22 kind of coming out.

23 We supplied watch standards to people on
24 the shift work, and then we organized our response to
25 the questions from the White House, Embassy, and our

1 leadership.

2 In terms of the way we organized, it was
3 really around these four or -- sorry, five main areas.
4 First, work associated with how to stabilize the
5 reactors and spent fuel pools. That was important to
6 get the stability. We are also concerned that you had
7 to do things to get the radiation levels down, so that
8 the workers could go in and do things, because if the
9 radiation levels were high, they were still not in a
10 very good state.

11 Because of the high probability of
12 recurring earthquakes, you needed to install some
13 remote operations capability. Over time, they were
14 able to get remote controlled vehicles that could
15 spray water into the spent fuel pools, for instance.

16 And then, you know, even though the
17 containments may be leaking, we still need to be
18 concerned about their long-term integrity. You know,
19 complete failures of the containment could make this
20 accident become even worse, even today.

21 And then, if the situation really becomes
22 very worse, we need to plan for that situation,
23 something like Chernobyl sarcophagus type of thing.
24 If the situation were to worsen, this is how we'd
25 frame the problem in the first couple of weeks.

1 CHAIRMAN ABDEL-KHALIK: So how would you
2 inform that last box?

3 DR. KELLY: I'll get to what we did on
4 each of these.

5 So the way we did it is we identified what
6 the potential threats were and what the -- you know,
7 what the mitigation strategies would be. So I don't
8 want to go through all of these in detail, but, you
9 know, we are worried still today about potential core
10 melting to the vessel and backing the containment.
11 That cannot be ruled out until you can manage the
12 decay heat.

13 Lots of concern about hydrogen explosion
14 and containment, because we didn't know -- we were
15 pretty sure there was still probably hydrogen in the
16 containment, but we didn't know how much oxygen was in
17 the containment. And so if you started various
18 mechanisms that would begin to condense the steam in
19 the containment, and oxygen could come -- the
20 principal source of oxygen was the water we were
21 putting in, we thought.

22 So we put all of this water -- seawater or
23 even the freshwater had a certain ppm. And if you put
24 enough of it in, you're going to get oxygen
25 concentrations that could take you into the flammable

1 regime.

2 Spent fuel pool fires, another earthquake,
3 corrosion of the intact fuel, eventually there is
4 zirconium cladding, which would lead them to another
5 release of -- the gap release for those, so those are
6 all things that could happen.

7 But basically, the idea -- you know, what
8 we wanted -- needed to do was to help inform them
9 about getting more water into it. We eventually -- I
10 think we communicated to them the concern about
11 oxygen, so they ended up treating the water with
12 hydrazine to take the oxygen out before they put it
13 into the system, to try to mitigate that hydrogen
14 threat downstream. But, you know, these were the
15 kinds of things that we thought would be important.

16 In terms of analysis, as I mentioned, we
17 were doing estimates on oxygen. And I'll talk a
18 little bit more about the next one, which is long-term
19 decay heat removal for a couple of slides. We did a
20 lot of talking and thinking about new sensors. I
21 think that was talked about earlier today -- just
22 simple things, water level, radiation, you know, these
23 type of things. You know, whether -- we looked to see
24 if we, you know, have anything available to send over,
25 but that looked impractical.

1 We then also looked at, could you restore
2 failed sensors? And these water levels are based on
3 some pressure differential. We think that if you
4 could blow air through it, you might be able to clear
5 the aerosols that have probably plugged it when the
6 core -- when the water level went down. That's our
7 theory at least. And, you know, you may be able to
8 regain that kind of instrument.

9 Lots of other analysis about mal
10 progression, recriticality, steam explosion potential,
11 boil-down rates, the effect of salt -- and that's
12 still one that we don't fully understand -- mass and
13 energy balance, air ingress, all of these things that
14 were related to potential threats.

15 Now, this kind of shows schematically all
16 of the analysis that we did. It is dozens of
17 different kind of calculations that were done. Some
18 of these have reached the point where they are written
19 up and we can publicly release them. Not all of them
20 will get to that point, but my goal was to, you know,
21 as we move through this, bring these analyses, as many
22 as we can, to some set of closure, so that we will
23 inform people in the future about what could happen,
24 you know, in this kind of accident, and really gain
25 some insights as we move into the lessons learned

1 phase.

2 So I think we need to -- we are paying
3 particular attention to documenting what we did, so we
4 don't lose all this valuable information that --

5 CHAIRMAN ABDEL-KHALIK: And the intent is
6 for all of these documents to be open to the public?

7 DR. KELLY: I think so. I mean, we are
8 trying to resolve any issues of proprietary data with
9 TEPCO. That will get resolved, I believe, as they are
10 moving toward releasing more and more of their data.
11 And there may be some other -- I don't think there
12 will be any other issues, but we will just see. That
13 would be the only one that I would think we would be
14 concerned about.

15 One of the things, though, that Japan is
16 conducting an investigation right now on the accident,
17 and we don't want to do anything to prejudice their
18 decisionmaking. So things that we have done are going
19 to lag -- our release of information will lag anything
20 that they do.

21 CHAIRMAN ABDEL-KHALIK: Okay.

22 DR. KELLY: One thing that we paid
23 particular attention to -- and it's still a subject
24 for discussion -- is, how do you cool the reactor?
25 It's bottled -- you know, the core is bottled up, and

1 there's no pathway outside of the containment to get
2 the heat out. So they are basically stuck with a
3 feed-and-bleed type of cooling system, which isn't
4 good for a number of reasons.

5 One is it's difficult to control it
6 exactly. They don't have a lot of instruments to
7 understand how much water to put in. And at the same
8 time, when they -- when they bleed, they are releasing
9 radioactivity to the environment.

10 MEMBER CORRADINI: And where is the bleed
11 occurring? Is it different for each different unit?

12 DR. KELLY: I think it's coming out from
13 head seals at this point, so --

14 MEMBER CORRADINI: The head --

15 DR. KELLY: Either the -- yes, the drywell
16 seal.

17 MEMBER POWERS: It's a silicon rubber
18 seal. The Japanese have actually done experiments on
19 it and says that it -- it really cannot stand a
20 prolonged exposure to elevated temperatures and
21 radiation loads for --

22 MEMBER CORRADINI: So this is a gaseous
23 leakage through the head seals.

24 DR. KELLY: Yes. Yes, I think the steam
25 will find a way to get out, and so it's not -- I've

1 been informed that it's not deliberate venting, that
2 it's --

3 MEMBER CORRADINI: Okay.

4 DR. KELLY: -- just --

5 MEMBER STETKAR: They're not venting
6 through the drywell head vents or anything like that?

7 DR. KELLY: Not to my knowledge.

8 Now, this is recent data from a few days
9 ago of the radiation levels, which are showing ranges
10 of one and a half to four and a half R per hour, and
11 this is on the -- I think the lowest level of the
12 reactor building. And it turns out that this is the
13 level where the RHR pumps are located.

14 Now, we have information that there was
15 water in this area, so the RHR pumps may be
16 inoperative. There's a high rad level, so it will be
17 difficult to go in there and do things. And the other
18 thing is if you turned them on, you would be pumping
19 contaminated water out of the containment into the --
20 what is left of the reactor building. That is where
21 the heat exchanger is. That's probably not set up.

22 And we are -- we had Oak Ridge look at,
23 how long would the pumps work, and it would be a very
24 short period of time before the salty fission product
25 stuff would fail the seals and the pumps wouldn't work

1 anyway. So the recommendation ended up being don't
2 try to start the pumps, because they are not going to
3 be effective, and it could make the situation worse,
4 but --

5 CHAIRMAN ABDEL-KHALIK: Now, back to the
6 feed-and-bleed situation, are they throttling the
7 feed, so that they -- the bleed is actually just
8 steam?

9 DR. KELLY: Yes.

10 CHAIRMAN ABDEL-KHALIK: And the motivation
11 for that, rather than increasing the feed rate, is
12 just to limit --

13 DR. KELLY: There was some --

14 CHAIRMAN ABDEL-KHALIK: -- the release?

15 DR. KELLY: There has been a discussion
16 about trying to fill the vessel up and these type of
17 things. And they're worried that there's -- the
18 vessel is leaking, and they would not be able to fill
19 it. But without water measure, water level
20 measurements, it is hard to tell really what is going
21 on.

22 So we started looking at -- well, if you
23 have to live with feed-and-bleed, how long is it going
24 to take before you could stop feed-and-bleed? The
25 problem is you have this very thick biological shield

1 outside of the drywell area, and so our -- this work
2 was done at Argonne, started looking at the -- you
3 know, what is the rate-limiting heat transfer step in
4 this process. And it's through that wall, and you
5 don't -- it's something like 250 kilowatts, and they
6 are still in the megawatt range.

7 So you run this out, and for Unit 1, which
8 is the lowest power, it is about a year before you
9 could stop the feed-and-bleed, and it's even longer
10 for the other units. So this is, you know, a very
11 long period of time to have this kind of situation,
12 which in one of the reasons in TEPCO's road map they
13 are looking at adding a heat exchanger or trying to do
14 some other things to begin to get a cooling system in
15 place.

16 CHAIRMAN ABDEL-KHALIK: And this is based
17 on flooding of the drywell? I mean, the --

18 DR. KELLY: The previous one?

19 CHAIRMAN ABDEL-KHALIK: Yes, that says --

20 DR. KELLY: This is a convection
21 conduction.

22 CHAIRMAN ABDEL-KHALIK: This is just
23 convection and --

24 DR. KELLY: Yes, right. And then, what --
25 could you get water in -- onto the drywell, and by

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 cooling the drywell improve the heat transfer. This
2 would -- if you could do it, this would be good. At
3 least in terms of time, it would reduce that time down
4 to nine months. But then, you know, there is a lot of
5 issues with this. One is that the shield plugs are
6 there, and we are pretty sure the cranes are
7 inoperable. So getting the shield plugs at the -- the
8 shield plugs being that --

9 DR. KELLY: These big like multiple
10 concrete structures that would need to be lifted with
11 a crane, which might be difficult to take off.

12 We looked at drilling technology to see if
13 you could use special drilling technology to drill
14 through those rapidly and not drill through the
15 drywell at the same time, and come up with some ideas.
16 So you'd drill two holes, one where you would inject
17 water, and one for the steam to come out.

18 Those options are still being evaluated,
19 but we basically did the analysis, wrote it up, sent
20 it to Japan, and it's under consideration right now.

21 On the spent fuel pool 4, we certainly
22 spent a lot of time looking at this, just because it's
23 outside of containment and a huge source term, if it
24 were to --

25 MEMBER CORRADINI: Let me go back just --

1 I guess you don't have to go back in the slides, but
2 just -- may I go back? So, then, the ultimate
3 objective is to bring it to cold shutdown, and a
4 number of -- what I'm hearing you say is a number of
5 options are still under evaluation. Not one option
6 has been chosen to bring it to -- to get into a closed
7 loop cooling of other -- whether it be outside
8 containment or internal. Just a number of options are
9 still on the table.

10 DR. KELLY: Yes. And I think the
11 engineering challenges are immense. So they have
12 begun, as you saw, to go in and begin to do the
13 radiological survey, because if you're going to do
14 anything else you're going to have to send in people.
15 So I think the plan would be to do those surveys,
16 understand the contamination levels, and then
17 decontaminate, so people could work in there, and
18 then, you know, maybe do the engineering.

19 So I think this is a long-term process,
20 but I think what they wanted to know was, well, how
21 long do we have to wait? It's a long time. So maybe
22 it makes sense to try to go -- you know, have a plan
23 of attack to go in, clean up, and, you know, engineer
24 some systems for the heat removal.

25 So on spent fuel pool 4, so the explosion

1 occurred in the morning about 90 hours after the
2 earthquake. We think it's about that time. They --
3 we had some discussion yesterday about it. It was --
4 I think it was the beginning of the shift, and they --
5 somebody noted in the log that there had been this
6 explosion.

7 Now, we think this -- if it had the
8 explosion that -- and the effects of it, somebody
9 would have heard it, I would have thought.

10 MEMBER ARMIJO: Hard to miss, yes.

11 DR. KELLY: But anyway --

12 MEMBER CORRADINI: But it's not clear that
13 it wasn't coincidence with other things that could
14 have --

15 DR. KELLY: Yes.

16 MEMBER CORRADINI: -- that could have
17 masked that one versus something else.

18 DR. KELLY: Yes. I'll talk about what --
19 you know, what the likely suspects are here. So it
20 was originally attributed to hydrogen, but, you know,
21 it would not be possible to definitely conclude this.
22 And so the original theory was that it was -- water
23 had boiled down, zirconium had overheated, you had
24 hydrogen and, you know, but there was -- you know,
25 that theory didn't fit for a lot of reasons.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 One is they had radiological levels or
2 readings, and, you know, above the pool. And so we
3 had Oak Ridge run shielding calculations, and you
4 could quickly see that, you know, the numbers didn't
5 jive. You must have had water there to get such low
6 levels of radiation at the levels they were at. So if
7 it had boiled down, you would have saw much higher
8 radiation levels.

9 The fission product assays that were being
10 done, you know, the ratios of iodine and cesium
11 weren't right. There was -- there should have been
12 very little iodine, so you would have not -- you can
13 do this forensics work, but basically it didn't look
14 right from the measurements that were coming out. It
15 looked like fission product release from fuel that had
16 been operated recently.

17 MEMBER STETKAR: John, in those -- the
18 radiological measurements, there was reasonably high
19 confidence that they were reliable above the pool?

20 DR. KELLY: Yes, but we -- yes. Well, it
21 was like a -- it would have been two or three orders
22 of magnitude higher had there been no water.

23 MEMBER STETKAR: Okay.

24 DR. KELLY: So, yes, I think we were on
25 good ground there.

1 And zirconium fire, once started, is
2 difficult to put out. So you would have expected to
3 see this linger for days perhaps. At least that's the
4 testing at Sandia -- indicates it just won't go out on
5 its own. So there was a lot of I think conflict on
6 that.

7 And then, furthermore, the calculations we
8 had indicated it would be 10 days to boil down. And
9 so unless you had a major rupture at the gate, or a
10 slosh, big slosh -- again, the slosh was about a meter
11 is what, you know, we think it might have been. It
12 was hard to conclude that.

13 MEMBER CORRADINI: So if I might just ask,
14 so you said the Japanese had thermal measurements,
15 mapping. So did they see any unusual heatup of this
16 pool?

17 DR. KELLY: No. They were reading about
18 80-some degrees Centigrade. So it was -- the pool was
19 warm.

20 MEMBER CORRADINI: But not overheated.

21 DR. KELLY: Not at saturation. Now -- we
22 now know that there's lots of debris, and so they may
23 have been -- their thermal imaging may have been
24 reading debris that could have been colder. So the
25 pool could have been closer to saturation.

1 So the other theory is that there maybe
2 was flammable materials in Unit 4, because they had
3 just begun work to remove the shroud, and so there may
4 have been equipment that had oil for cooling oil, that
5 as the buildings heated up or something the oil leaked
6 and, you know, then it could vaporize and maybe you'd
7 get a pocket of volatile oil, something like that.
8 That was one thought.

9 Maybe they had acetylene there. It turns
10 out we -- they have ruled out acetylene, but it would
11 have taken about two bottles of acetylene going off to
12 explain the damage that we saw. But that has been
13 ruled out, so I'm not -- on that.

14 And third was that perhaps the hydrogen
15 was actually transferred from Unit 3, and this is now
16 believed to be I think the best answer. I think there
17 was -- we discounted radiolysis as a source, and maybe
18 there was some -- a multi-dimensional effect in the
19 pool that led to dryout of a section of it. It's kind
20 of hard to envision that, but because of the channel
21 boxes each -- you know, there is no crossflow between
22 the assemblies in the pool, so you could -- if
23 something was going on in one, others may not be
24 affected by it.

25 But we did have -- you know, we had from

1 TEPCO the full layout of the spent fuel pool, every
2 assembly, its date, its burnup, etcetera, so we were
3 able to put together a very good model. And, you
4 know, using that, we then, you know, did the
5 calculations to -- for various initial pool heights
6 and how long it would take.

7 And it was very difficult to -- unless you
8 were at the bottom of the -- I think the refueling
9 gate there, to start with, that you actually could get
10 to the time when hydrogen production from the spent
11 fuel burning could lead to that explosion. The time
12 would -- the water would have had to have been
13 extremely low at the beginning.

14 So the evaporation blowoff -- as I said,
15 we were calculating about 10 days, and then you
16 wouldn't expect any hydrogen for about 12 to 14 days.
17 And so the explosion at four days, there had to be
18 some leakage -- massive leakage from the pool, and
19 then those -- you know, the numbers, four to five
20 days, pool liner, etcetera.

21 Of course, we now have video that shows
22 there was lots of water in there, so --

23 (Laughter.)

24 -- all this was overcome by events, so --

25 MEMBER ARMIJO: But also, the -- you know,

1 it's not just that there's lots of water in there, but
2 if you look you can see the fuel handles, you can
3 see --

4 DR. KELLY: Yes.

5 MEMBER ARMIJO: -- tops of vent plugs.

6 DR. KELLY: Right.

7 MEMBER ARMIJO: That thing was never on
8 fire.

9 DR. KELLY: So we had speculated about
10 this vent, because we could see from aerial
11 photographs that there is one -- there is fewer stacks
12 than there are plants, and that's because they connect
13 through the stacks. And so we went back and looked,
14 and it -- after the earthquake, these vent lines were
15 still intact. And even after the tsunami they were
16 still intact.

17 So we speculated that the hydrogen buildup
18 in Unit 3 was massive, and, you know, some of it was
19 heading out the stack and went through -- through the
20 stack back into Unit 4. And then, some hours later
21 either -- maybe it was a steam hydrogen mix, steam
22 condensed, and it went -- we don't know what happened
23 next, but at least that's the thinking right now is
24 the likely source.

25 I think this is the more likely. There

1 still could be -- you know, there still could be
2 combustible material as the source, but that's viewed
3 to be less likely now.

4 MEMBER ARMIJO: But, John, why wouldn't
5 that hydrogen just go right up the stack? I mean,
6 that's what it is there for. And then, to go into
7 Unit 4, it would have to go past a whole number of
8 valves.

9 DR. KELLY: Yes. We're going to have to
10 get the details on that and look at that.

11 So the next section had to do with keeping
12 the radiation levels low. Again, I mentioned that if
13 the levels are too high, the workers may be evacuated.
14 That happened a couple of times.

15 This is still a problem area we see that,
16 you know, basically isolating and stopping whatever
17 reactor pressure vessel leak -- that has not been done
18 yet. They have begun the cleanup of contaminated
19 water by first pumping it out into various storage
20 tanks, and then they are envisioning building a
21 cleanup system. And I'll talk a little bit more about
22 what we think is going on there.

23 They definitely need to get more shielding
24 there, because it's still going to be hot for people
25 to work. There is a need to get more data and get the

1 additional sensors and redundant -- you know, pH is
2 important to know in a lot of these chemical
3 processes. And, you know, we have seen -- I don't
4 think we have seen any data on that yet.

5 CHAIRMAN ABDEL-KHALIK: Do we have any
6 idea about extent of salt deposition within the vessel
7 and how that may impact these mitigation activities?

8 DR. KELLY: I think I have a slide on
9 corrosion and salt. Yes, I will deal -- I will talk
10 about that --

11 CHAIRMAN ABDEL-KHALIK: Okay.

12 DR. KELLY: -- because I -- we aren't
13 worried about that.

14 So these are -- here is the set of
15 technical studies that we did related to this about
16 getting the radiation levels down.

17 We had the folks at EM put together a
18 quick report on waste management treatment and
19 storage. And this is where the -- so if you extract
20 the contaminated water, and it has salt in it, and
21 they worry about the efficiency of the cesium
22 extraction, there's the presence of salt. And it's
23 degraded, but they have -- I talked to them yesterday.

24 They thought that their system would still
25 be effective, because they had lots of salt in the

1 Hanford K basin residue. So they are pretty sure that
2 in terms of extracting -- you know, separating out the
3 radioactive -- at least the cesium out of the water,
4 that the systems they have will still be effective for
5 that. And so we basically put together our concepts
6 of this and transmitted that to Japan.

7 MEMBER CORRADINI: So the technique is
8 more what would have occurred in terms of Hanford
9 cleanup than what was done for TMI because of the
10 presence of salt or not -- or just because it is known
11 to be more effective in terms of what was done at
12 Hanford?

13 DR. KELLY: Looking at the situation, I
14 would say it's, you know, similar to Hanford, although
15 I think some of this was done at TMI. I'm not an
16 expert on that.

17 But basically, what you needed to do was
18 to, you know, get to -- you need to get the water to
19 some place safer so that it reduces the radiation
20 levels in the turbine building, etcetera, and then set
21 up a system for treatment and disposal.

22 So they are hopeful that they can clean up
23 the water to the point that they can then use it as
24 cooling water for the reactor, so that they get at
25 least a partially closed system.

1 Let's see, so there are systems that are
2 skid-mountable and are available dealing with all
3 kinds of things. There is oil in the water, so that
4 was one thing that, you know, was another system that
5 needed to be added to this. And there's lots of
6 expertise in the U.S., so this is one where I see a
7 continuing dialogue with TEPCO and the government of
8 Japan on treating and cleaning up the water.

9 In terms of establishing remote
10 capabilities, again, I mention that if workers have to
11 evacuate things could get worse. So they needed to be
12 thinking about installing various remote control
13 capability, robotics, spiralis systems, etcetera.

14 So we did end up sending some robotic
15 equipment with instruments on it. NNSA set up a set
16 of radiation monitors around the plant, in a
17 circumference around it, so that it -- they started to
18 have more release. We'd get more data more quickly.
19 Those were tied into a GPS system and through the
20 internet. Data was being relayed back to Washington.
21 So a number of those things were actually put in place
22 and deployed very quickly.

23 The other area of big interest was
24 maintaining the integrity of the containment, whether
25 it be due to corrosion or another -- a hydrogen

1 explosion, melt-through, overpressure, failure of
2 these silicon rubber head seals.

3 The key here we thought was to -- you are
4 going to have to design a system at this point to
5 extract coolant from the primary -- reactor primary
6 vessel, treat it, either store it, and then recycle it
7 in some kind of concept like that.

8 So, again, we conducted a number of
9 studies looking at oxygen. Again, I mentioned that
10 previously. We did start looking at the corrosion of
11 the reactor pressure vessel and trying to make
12 estimates of how long it would take for the reactor
13 vessel to be corroded through by the saltwater and
14 salt, because we're pretty sure there is significant
15 quantities of salt that have actually precipitated out
16 of the seawater.

17 And then, we developed a different
18 conceptual model for removing reactor pressure vessel
19 water, so the previous system I talked about was for
20 turbine building, things in the sumps of reactor
21 building that had leaked, it has already leaked out.

22 This system was to look at, how could you
23 take one of the existing penetrations into the reactor
24 pressure vessel and use that to develop a system to
25 treat the water?

1 MEMBER STETKAR: John, just before you get
2 too far into the corrosion stuff -- I was just
3 thinking, since several of these systems will need to
4 remain operable for months, if not longer, have the
5 various organizations thought about the possibility of
6 not necessarily a magnitude nine earthquake --

7 DR. KELLY: Right.

8 MEMBER STETKAR: -- but, you know, pick a
9 magnitude six earthquake, for example, occurring near
10 the site.

11 DR. KELLY: Right.

12 MEMBER STETKAR: Are you thinking about
13 pardoning the equipment at all, or have those
14 thoughts --

15 DR. KELLY: We have recommended --

16 MEMBER STETKAR: The good news is you have
17 longer time, because you are much lower --

18 DR. KELLY: We have certainly
19 recommended --

20 MEMBER STETKAR: In terms of releases and
21 things like that, it could be --

22 DR. KELLY: We have recommended that, and
23 we understand that they do have alternate power and
24 heat sink capability now.

25 MEMBER STETKAR: Okay.

1 DR. KELLY: We also have set up some
2 ARCOFF analysis to try to understand how things would
3 progress if you had a fault. So we're trying to mock-
4 up what it is just to -- it's more to find out how
5 much time you have to --

6 MEMBER STETKAR: I mean, that's the key.

7 DR. KELLY: -- time to recovery. It's not
8 predictive in that sense, but it's to get some time
9 estimates for when it can go.

10 MEMBER STETKAR: Okay. Thanks.

11 DR. KELLY: Again, this is for the
12 recovery phase. There is another whole set of
13 calculations that were done, and, you know, we --
14 yesterday we went through some of these, and it took
15 a whole day. So I would suspect, you know, we could
16 easily put together a multi-day briefing on what --
17 you know, all the work that DOE collectively did.
18 It's quite interesting.

19 MEMBER CORRADINI: Can I go back to John's
20 question? Maybe I'm -- so I'm sure there were a bunch
21 of aftershocks. So you know that -- how many
22 aftershocks were there above some magnitude? So to
23 give a feeling -- I would assume a bunch.

24 DR. KELLY: What was the number, a dozen?

25 MEMBER REMPE: There were 500 within the

1 first week. I have seen -- I have a viewgraph that
2 has like maybe 10 of them based on USGS that were
3 above six that were from the day of the event through
4 -- you know, but it -- I can't give you exact numbers
5 here. I haven't counted it.

6 DR. KELLY: All right. So I think that's
7 -- you know, one of the reasons they are -- because of
8 the explosion in Unit 4, they are I think worried
9 about the integrity of the building, and so that is
10 why they are trying to increase its seismic
11 capability.

12 So a little bit about corrosion. Our
13 understanding is that they may use this A533B steel,
14 kind of an industry standard. I'm not an expert in
15 this area, but that's what the folks at Oak Ridge --
16 I believe. They may need to confirm that.

17 Very little data on this class of steels
18 and salts or concentrated salt solution. And it's not
19 a typical choice for that type of application.

20 I probably had not really thought about
21 salt and water into -- in the reactors before,
22 although it had happened at Millstone in '72. They
23 had a condenser failure, and they got some salt in and
24 it destroyed a lot of their power detectors, you know,
25 power monitors, and they saw some stress corrosion

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 cracking, things like that. So they had -- that was
2 '72, I think there was a report on that, and --

3 MEMBER CORRADINI: The Navy has no
4 experience --

5 DR. KELLY: Well --

6 MEMBER CORRADINI: The Navy experience
7 doesn't fit into this mold I guess.

8 DR. KELLY: I think they use cath anode or
9 something. You know, they use systems to --

10 MEMBER ARMIJO: Cathodic protection and
11 all of that.

12 DR. KELLY: Cathodic protection is the
13 word.

14 MEMBER ARMIJO: Are they deaerating the
15 water that is -- the contact?

16 DR. KELLY: They are deaerating the water
17 now.

18 MEMBER ARMIJO: Nitrogen sparging or --

19 DR. KELLY: They are using hydrazine.

20 MEMBER ARMIJO: Hydrazine.

21 MEMBER SHACK: It's much more effective,
22 even if it leaked hydrazine.

23 MEMBER ARMIJO: Well, maybe.

24 DR. KELLY: But here is the information on
25 Millstone. It was September of '72 and --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER BANERJEE: Got a lot of hydrogen
2 anyway.

3 DR. KELLY: So seawater was introduced
4 into full-flow demineralizers, so they got this
5 indication of high conductivity. And, anyway, they
6 started just seeing all of their local power range
7 monitors fail, and so this -- then, they scrambled,
8 and, you know, found out what was happening.

9 Stress corrosion -- they did a full
10 inspection. Stress corrosion cracking was observed in
11 other reactor components and considered to be
12 superficial. And then, GE followed up with additional
13 tests, found it to be more severe than the actual
14 accident.

15 So we expect that the stainless steel
16 components will be cracking in this salt solution.
17 Now, you know, if it's the liner and the vessel head,
18 you still have a lot of material before you would
19 corrode through that, so you may have time. But a lot
20 of -- so many penetrations in the bottom of the BWR
21 that it's hard to say that you would -- we would not
22 get some cracking leading to potential penetration.

23 MEMBER ARMIJO: That's weld overlay. It's
24 duplex microstructure, very resistant to a lot of this
25 cracking. But, you know --

1 MEMBER SHACK: This is chloride cracking,
2 though, Sam. This isn't our old favorite.

3 MEMBER ARMIJO: Okay. So it may have
4 some.

5 DR. KELLY: So we actually don't know for
6 sure, so we -- we are actually putting together a test
7 matrix to try to think about what testing we could do
8 to get our arms -- because we don't know -- we think
9 it's -- I think the data is here, corrosion rates for
10 carbon steel, and there was some limited data on low
11 allow carbon steel. And that was mils per year or a
12 few mils per year, a hundred if there was sulfuric
13 acid present. If it's just eating through the head,
14 that's a long time.

15 MEMBER CORRADINI: It's more the
16 connections, the weldments.

17 DR. KELLY: Yes. It's probably the
18 connections and weldments. So we really don't know
19 how long, and so this is still a concern of getting
20 more massive failure of the lower head, in which case,
21 you know, having the containment flooded up if it's
22 capable would help mitigate that.

23 MEMBER ARMIJO: Is there an assessment of
24 how concentrated the water is in those vessels, what
25 the saltwater concentration -- salt concentration is?

1 MEMBER POWERS: At least .5 molar.

2 (Laughter.)

3 DR. KELLY: We think it's --

4 MEMBER POWERS: Less than six and more
5 than .5.

6 DR. KELLY: So seawater is about three
7 percent salt, and the solubility is about 30 percent.

8 And so when you boil, about 10 -- 10 RPVs
9 full of water out, which they would have had to do,
10 you will get -- the salt will stay and the steam will
11 leave, and so you will easily get up to the
12 precipitation limit. So the estimates were somewhere
13 around 100 to 200 tons of salt, which could
14 significantly fill the lower head.

15 In terms of the area's emergency response,
16 there wasn't that much done here except we did some
17 work on developing bounding source terms, really to
18 inform -- at this point, it's more to inform
19 evacuation procedures rather than thinking about
20 entombing the reactor. So it was, you know, do you
21 shelter, do you evacuate, and that was a function of,
22 you know, what bounding source term would -- could
23 still be evolved as the accident progresses?

24 So we have the initial one, but there is
25 -- now out and largely deposited, but if you had

1 another one, what could happen? So this was the --
2 you know, a second phase of emergency response if
3 something happened again.

4 MEMBER RYAN: Can you describe that in
5 terms of fraction of intact material in the reactors
6 that would be engaged in that --

7 DR. KELLY: Yes. So what we were looking
8 at was, you know, where is the cesium, where is the
9 iodine now? How much has already been release? How
10 much is there? And we're using MELCORE to do that
11 partitioning.

12 You know, the code says most of both the
13 cesium and iodine are still in the water. Less than
14 one percent has actually been released to the
15 atmosphere, and that's -- so they had about 500,000
16 curies, and that number is somewhat consistent with
17 the radiological measurements. And we haven't pulled
18 all of that together to get the coherent picture, but
19 that number, like one percent-ish or so, of cesium and
20 iodine release is not inconsistent with the --

21 MEMBER RYAN: Well, I mean, that's --
22 you've got source term still in the plants and on the
23 ground. They local.

24 DR. KELLY: Right. And then, you know, we
25 didn't see the strontium yet, so we're not -- we don't

1 think the temperatures were hot long, or it's in
2 solution as well I guess.

3 MEMBER BANERJEE: Did you see any
4 ruthenium?

5 DR. KELLY: No. I don't --

6 MEMBER POWERS: You are never going to see
7 any ruthenium in these kinds of plants.

8 DR. KELLY: Now, they did see
9 plutonium-238. They are still -- we are still not
10 sure what --

11 MEMBER POWERS: You will see plutonium --

12 DR. KELLY: Yes, Unit 3 was running on
13 mixed oxide.

14 MEMBER POWERS: John, you will see
15 plutonium in Japan anywhere you go. And you will see
16 plutonium in Colorado anywhere you go.

17 DR. KELLY: Yes. But 238 would be odd to
18 see.

19 MEMBER RYAN: Did they have any gauges
20 or --

21 MEMBER POWERS: No, I don't think
22 that's --

23 MEMBER RYAN: -- because it might have a
24 seal, 238 seal.

25 DR. KELLY: Yes, so that's another one,

1 another piece that we'll have to -- yes, did they have
2 sources or something, yes. Anyway --

3 MEMBER POWERS: But, I mean, the whole
4 thing is quite remarkable, I mean, that you have
5 damage to three units, maybe a couple of spent fuel
6 pools, we've got a megacurie or so of cesium outside
7 the plant.

8 DR. KELLY: Yes.

9 MEMBER POWERS: I mean, that just shows
10 you how much defense-in-depth you have, even when
11 things get very, very heavily compromised here. I
12 mean, there is a tremendous -- had you asked me
13 a priori, before the event, you had this sort of event
14 occur, what kind of source term would you expect, I
15 would have written out a much more severe set of
16 numbers for you.

17 DR. KELLY: So, but you know there's still
18 a lot of work that has to be done. The clean-up as
19 well as stabilization. And so I think we're -- Again
20 another large earthquake could maybe again disable
21 cooling. And our estimates are not that it's on the
22 order of 10 hours. If they lost cooling, it would be
23 10 hours before they would begin to remelt.

24 MEMBER BANERJEE: Does the analysis with
25 what measurements you've been making? The plume

1 analysis?

2 DR. KELLY: Qualitatively. But there is
3 --

4 MEMBER CORRADINI: You're saying in terms
5 of -- I guess I want to understand. Sanjoy --

6 MEMBER BANERJEE: I want to actually work
7 backwards and see if the source term is correct or
8 not.

9 MEMBER REMPE: And that was based on the
10 later melt core source term.

11 DR. KELLY: Right. There were two things.
12 So the plume analysis is with this NARAC code. They
13 were just doing unit source term.

14 MEMBER RYAN: There was no exposure
15 measurements. It's hard to calibrate.

16 DR. KELLY: They weren't doing the detail.
17 But that pattern of having this direction in the
18 northwest, if you put in the weather, the winds and
19 rain, you've got a majority of the deposition along
20 that path. So that's why I say it's qualitative.
21 Qualitatively it was showing that that should have
22 been the highest region and that's what it was.

23 MEMBER BANERJEE: But you couldn't back
24 out whether your source term was --

25 DR. KELLY: We're going to try to take a

1 look at that. But because we had three different
2 source terms kind of overlaid and at different times
3 it's going to be a --

4 MEMBER BANERJEE: Yes, it's a difficult
5 problem.

6 DR. KELLY: But that certainly -- The
7 folks at Livermore are very interested in getting that
8 data to help improve the validation of their modeling.

9 MEMBER RYAN: I'm guessing with the
10 rainfall that occurs fairly routinely in Japan it will
11 be hurt to get enough of that plume measured within a
12 reasonable --

13 DR. KELLY: Yes. We're going to have to
14 rely on a lot of the data we already have because
15 they're heading into the rainy season pretty soon.

16 MEMBER RYAN: Right. So it's going to
17 wash away.

18 DR. KELLY: It's going to wash -- So in
19 terms of -- My last slide and then we can have
20 questions. Next steps. So we're continuing our
21 support for the Government of Japan. We see our role
22 as providing peer review and analysis as requested.
23 So as they move forward with their engineering
24 designs, they've been asking us for our evaluations.
25 We've been giving them feedback. So I think that kind

1 of thing will continue.

2 We have been collecting data. We've been
3 trying to understand, doing the accident forensics and
4 eventually lessons learned. We see that kind of
5 activity continuing.

6 And we're staying vigilant on potential
7 accident consequences. So there are questions about
8 evacuation zones. The Ambassador is visiting us in
9 two weeks. And I'm sure we'll have a good session
10 with him to see what's worrying him today and how we
11 can help do analysis and other things, sort through
12 it.

13 MEMBER RYAN: Has there been any advanced
14 planning on where all the waste material is going to
15 end up?

16 DR. KELLY: The plan we saw was to
17 basically create an onsite low level waste storage
18 area.

19 MEMBER RYAN: That's storage. But what's
20 the ultimate call?

21 DR. KELLY: You know, that may be 30 years
22 or more before they could reuse the site. So maybe
23 almost permanent.

24 MEMBER POWERS: I'm telling you, Ryan,
25 that we've got the merry, honest French there.

1 DR. KELLY: You know, they're trying to
2 figure out how this -- It's going to be complicated.
3 They're going to have to bring in vehicles and they
4 want to have a clean path so they can bring in things
5 that don't get radiologically contaminated. So then
6 they're have a cordoned-off area where they'll deal
7 with that.

8 This was briefed to us -- I don't know if
9 it's a plan. I can't remember who was -- the company
10 that came in. But they had this plan of setting up a
11 region on the site where they would do the storage.
12 And whether then it could be repackaged and
13 transferred later, that was to be determined.

14 MEMBER RYAN: That raises some interesting
15 questions about do you want to continue on-going
16 activities like that on the coast and then under not
17 ideal conditions. So that's a challenge I think
18 ahead.

19 CHAIR ABDEL-KHALIK: John, we heard
20 earlier from industry that one of their goals is to be
21 able to handle any nuclear accident in the U.S. and
22 also be able to provide a response overseas. Have you
23 given much thought to DOE's role in such a response
24 capability?

25 DR. KELLY: Yes. Well, clearly, this lack

1 of instrumentation measurements is really severe. We
2 think that there may be capabilities within our
3 laboratories to invent new instruments that could be
4 deployed. And so that's one area for research.

5 When I think about it, I kind of put it in
6 a research terminology. Because I think if industry
7 has capabilities DOE doesn't need to do things.
8 Industry can do it. But if there's a new technology
9 that's needed, perhaps.

10 You know, we have a very good system for
11 responding to other type of nuclear incidents. And so
12 maybe having more capabilities, stage capabilities,
13 these types of things, might be useful. And I think
14 DOE has some of those capabilities. There may be a
15 way to think about how these could be used in the
16 commercial sector.

17 MEMBER CORRADINI: Maybe just a follow-up
18 then. So are you then discussing it not just within
19 NE but within EM and NNSA?

20 DR. KELLY: Yes. Because there's much
21 more to DOE than just NE in terms of --

22 DR. KELLY: Yes. It's more than just NE.
23 So I'm talking more broadly now.

24 MEMBER CORRADINI: The same triad.

25 DR. KELLY: We're already doing research

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 on zirconium-free cladding which would be a big
2 benefit. Silicon carbide cladding. So that's been a
3 research area. And it was really to get over some of
4 the materials issues with high burn-up with zirconium.
5 But there's also always the hydrogen issue if you use
6 that.

7 CHAIR ABDEL-KHALIK: My question really
8 was aimed at any response activities associated with
9 that "coordinated response" that the industry would
10 provide. Do you foresee a role for DOE?

11 DR. KELLY: Only if there's technology
12 development needs and perhaps some learning from what
13 we have in terms of the response for like nuclear
14 weapon incident. We have a response time. That
15 capability is in place. It's tested.

16 So there is certain learning if we wanted
17 to stand up. I think Jim Ellis at INPO has suggested
18 something like this. And I think they're certainly
19 learning from it, the NNSA folks, that could be had
20 from that. And then there may be some capabilities
21 that need to be developed that aren't in the
22 commercial sector. And again there would be a role
23 for DOE there.

24 CHAIR ABDEL-KHALIK: Okay.

25 MEMBER BANERJEE: Going back to Unit 4,

1 the explosion, have there been any observations
2 planned or have there been observations already of the
3 fuel to see if the cladding may have reacted? Because
4 that's one of the scenarios we discussed. Right?

5 DR. KELLY: Yes. So they have had a
6 camera dangling on this water crane pan over it and
7 you can see things pretty good. You can see the
8 handles. You can see the identification numbers on
9 the assemblies. It certainly doesn't not look like
10 degraded.

11 Now the best pictures are of unburned
12 fuel. So they had a lot of fresh fuel that was going
13 to be loaded in in there. And there's a region that
14 they just didn't pan over. So that's one of the
15 questions we're going to have.

16 MEMBER BANERJEE: That's rather unlikely
17 that scenario then.

18 DR. KELLY: That the zirconium -- Yes.

19 MEMBER BANERJEE: Yes.

20 DR. KELLY: I think that's one of the
21 least likely scenarios --

22 MEMBER BANERJEE: Okay.

23 DR. KELLY: -- when you have a zirconium
24 fire. And as I mentioned there was a number of other
25 data pieces that did not correlate with that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 hypothesis.

2 MEMBER BANERJEE: Thanks.

3 MEMBER SHACK: Did they have water
4 chemistry samples?

5 DR. KELLY: The water chemistry is another
6 one that doesn't -- The cesium that they detected is
7 equivalent of the cesium in one -- is less than the
8 cesium in one fuel pin.

9 MEMBER STETKAR: If there's indications of
10 water, I don't know how their pools are configured,
11 but they typically will have weirs between the
12 different pool sections. If there's indications that
13 water level remained above the sections of those
14 weirs, the entire fuel pool was --

15 DR. KELLY: You know, these are some of
16 the things you learn is that what they worry about is
17 not overfilling. And so they have measurements close
18 to the top because they probably didn't envision
19 wanting to know where it was when it went down. So
20 they've got --

21 MEMBER ARMIJO: It was flooded up for this
22 major maintenance.

23 DR. KELLY: Yes.

24 MEMBER ARMIJO: So there was plenty of
25 water there. The question, did it leak out through

1 the bottom as a result of the earthquake and then
2 caused a fire? And you know those early thoughts seem
3 not to be supported.

4 DR. KELLY: Yes, it's hard. If there is
5 a leak, we think it's small. We found out what kind
6 of sealing mechanism they use for the gates. I think
7 it's a seal that seals with hydrostatic pressure. So
8 maybe there could have been something but it would
9 reseal. We think it's unlikely that that's the
10 scenario. The data just doesn't line up to that.

11 MEMBER BANERJEE: So it's either something
12 was there other than the hydrogen most likely or a
13 hydrogen leak from somewhere.

14 DR. KELLY: It was either other
15 combustible materials that we haven't discovered. And
16 if they could get into the building they should be
17 able to -- the observation tunnel.

18 The explosion they thought started lower,
19 too, which was --

20 MEMBER ARMIJO: You see the building was
21 destroyed at the base.

22 DR. KELLY: Yes. So it was low which then
23 points to the hydrogen coming from --

24 MEMBER BANERJEE: Somewhere else.

25 DR. KELLY: If it was hydrogen from

1 somewhere else, yes.

2 CHAIR ABDEL-KHALIK: Are there any
3 additional questions for John?

4 MEMBER ARMIJO: John, have you
5 communicated directly with the plant designers, the
6 GEs?

7 DR. KELLY: I was at the GE Emergency
8 Center on like the 13th of March. It turned out the
9 PSA conference was held in Wilmington. So I took the
10 opportunity to go over. I know that was really good.
11 So we've established that liaison, too. So that when
12 we need information on the GE plants we've got that
13 network in place.

14 MEMBER ARMIJO: And so you feel they're
15 giving you the information you need.

16 DR. KELLY: Absolutely. Yes. And they've
17 been part of these consortium calls, too. So it's
18 been a real coming together of all the nuclear
19 expertise in the country to help.

20 MEMBER ARMIJO: Because early in the event
21 there was a lot of uncertainty whether the Japanese
22 plants were very similar to the U.S. BWR4s, Mark I
23 containments or not including hardened vents or not
24 hardened vents. All those sorts of questions. Has GE
25 helped you resolve that since they designed and built

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 at least Fukushima 1.

2 DR. KELLY: Well, they had some
3 information. They were the builders of the 1 and 2.
4 And then I think it became Hitachi and Toshiba.

5 MEMBER ARMIJO: Right.

6 DR. KELLY: And of course they're
7 connected to Hitachi now. So there's information
8 going back and forth on that. But you know unless you
9 get the actual as-built you maybe can never know for
10 sure. The hardened vents would have been an Adder,
11 post TMI.

12 MEMBER ARMIJO: Yes.

13 DR. KELLY: I think there are still some
14 questions about getting the details and then really
15 understanding the vent pathways still part of the
16 puzzle on the Unit 4.

17 CHAIR ABDEL-KHALIK: Joy.

18 MEMBER REMPE: I want to pick on you with
19 the same questions that we picked on with Tony towards
20 the end. I think there's a lot of key uncertainties
21 and it could help us with our state of knowledge and
22 how we address severe accidents.

23 And I know it appeared that Tony said,
24 "Yes, we need to go in and see that information." It
25 may be five years or more before we ever do. And

1 industry might be able to throw some support as Dana
2 suggested.

3 But it's my opinion that would happen at
4 TMI. It was an OECD type of effort and NRC and DOE
5 did it together. Have those kind of discussions been
6 ongoing at DOE?

7 DR. KELLY: Yes, I think that's one of the
8 areas that we've identified. And at this point it's
9 to understand where we think we would have validation
10 needs for our severe accident modeling capability.
11 Because what we want to do is take whatever
12 information we can gain from this, understand how well
13 our codes predict because we rely on those codes a lot
14 to inform our risk assessments and accident management
15 and all kinds of things. And so we want to know are
16 they valid.

17 As we go through this we have
18 uncertainties identified in our analysis. Those will
19 point to data needs that could be had when they begin
20 to disassemble the core. So they can -- As they did
21 before, if they take sections so that we can do the
22 metallography, etc. we should be able to go in.

23 MEMBER REMPE: But as Dana pointed out
24 there may be a lot of push.

25 DR. KELLY: There will be a need for

1 expedieny now. So I expect -- I mean we already have
2 very strong bilateral relationships with Japan. And
3 I expect that to continue and strengthen as we move
4 forward.

5 Together we have more of the GE BWRs in
6 the world. So there's a lot of interest in us
7 understanding the implications. I think there will be
8 an even stronger need to collaborate on that. So
9 there may be joint efforts and things like that. If
10 that comes into play, then we will at least encourage
11 data recovery to support code validation.

12 MEMBER STETKAR: Let me put you on the
13 same point I put Tony. He mentioned the current IAEA
14 teams on the ground collecting information, doing for
15 lack of a better term forensic analysis I guess. Are
16 you plugged into that effort? Or you mentioned
17 bilateral agreements between the U.S. and the Japanese
18 government. How is all this playing out?

19 DR. KELLY: I'm plugged into some of the
20 IAEA activities. So I'm not exactly sure -- They were
21 over there before. And my understanding was they had
22 some real problems with their data collection
23 previously.

24 MEMBER STETKAR: Okay.

25 DR. KELLY: And they were just doing

1 measurements on the ground. I don't know what the
2 current team is doing other than that they're going
3 over there.

4 But there's a huge IAEA meeting at the end
5 of June. And we're currently developing an action
6 plan which will be a plan for all the nuclear nations
7 in the world to work through IAEA to do a set of
8 activities. That's currently being developed and will
9 be rolled out in the end of June time frame. And
10 there will be a whole set of meetings over the next
11 year on all of these things.

12 In terms of collecting data, verifying it,
13 documenting it, these types of things, I think that --
14 people may differ -- there's merit to having different
15 sets of eyes look at the same thing. And if you can
16 afford to do that and then come together and do the
17 cross-checking, it will hopefully help the whole
18 international community have a set of reliable data.

19 There were still lots of mysteries with
20 the Three Mile Island data years later. We know a lot
21 more about severe accident phenomenology now. So
22 we're able to more quickly assess things.

23 But to my knowledge I don't know who the
24 experts are with IAEA, who they've picked up to go
25 over there. But the severe accident expertise is in

1 the DOE National Laboratories in this building. So
2 it's data plus analysis that go together to help you
3 understand what the data is saying at the same time.

4 I think we have a lot to bring to bear on
5 this problem. Having a data collection, verification,
6 analysis, cross-checking, we'll be doing that
7 ourselves. But then having international community
8 involved I think will be a good thing long term.

9 MEMBER STETKAR: Thanks.

10 CHAIR ABDEL-KHALIK: Are there any
11 additional questions for John? Well, let me just on
12 behalf of ACRS say --

13 MEMBER POWERS: Can I just ask one
14 question?

15 CHAIR ABDEL-KHALIK: Sure.

16 MEMBER POWERS: Do you want me to come
17 over and stage your garden?

18 (Laughter.)

19 DR. KELLY: Can you stop by once a week?
20 I still have my home in Albuquerque.

21 CHAIR ABDEL-KHALIK: I may make that
22 assignment later. But on behalf of ACRS, let me just
23 thank you for taking the time from your very busy
24 schedule to brief us.

25 DR. KELLY: You're welcome.

1 CHAIR ABDEL-KHALIK: Thank you.

2 DR. KELLY: Thank you.

3 CHAIR ABDEL-KHALIK: At this time we will
4 take a roughly 15 minute break. And we'll come back
5 to hear the public comments and have additional
6 discussions amongst ourselves. So let's reconvene at
7 4:05 p.m. Off the record.

8 (Whereupon, the above-entitled matter went
9 off the record at 3:52 p.m. and resumed at 4:05 p.m.)

10 CHAIR ABDEL-KHALIK: On the record. We're
11 back in session. At this time our schedule calls for
12 us to hear from the public. And as I mentioned in the
13 opening remarks, we received a request from Mr. Arnold
14 Gundersen to make a comment. And he has been allotted
15 five minutes to do so.

16 So I would like to ask the staff to open
17 the bridge line so that Mr. Gundersen (1) can let us
18 know that he's here and (2) make his remarks. Bridge
19 line open.

20 PARTICIPANT: Yes, the bridge is open.

21 CHAIR ABDEL-KHALIK: Okay. Mr. Gundersen,
22 are you on the line? Is there anyone else on the line
23 who can let us know?

24 MEMBER CORRADINI: Now maybe it's open.

25 PARTICIPANT: Please let us know if you're

1 on the line.

2 MR. GUNDERSEN: Hi. This is Arnie
3 Gundersen on the line.

4 CHAIR ABDEL-KHALIK: Yes, Mr. Gundersen
5 you have five minutes.

6 MR. GUNDERSEN: All right. Thank you
7 very much.

8 Good afternoon, Mr. Chairman and Members
9 of the Advisory Committee on Reactor Safeguards, I
10 speak to you today as a (telephonic interference) I
11 have not been retained by any group to make a
12 statement at this meeting.

13 Although there are many issues to resolve
14 as a result of the nuclear accident at Fukushima I
15 want to focus on the single statement of integrity in
16 the brief time you've allotted me.

17 CHAIR ABDEL-KHALIK: Mr. Gundersen. We're
18 having some difficulty hearing you. So if you try to
19 -- If you're sort of speaking into a microphone, try
20 to minimize any physical contact with the microphone.

21 MR. GUNDERSEN: I'm sorry. Is this
22 better?

23 CHAIR ABDEL-KHALIK: Yes.

24 MR. GUNDERSEN: Okay.

25 CHAIR ABDEL-KHALIK: Please proceed.

1 MR. GUNDERSEN: Okay. I first wrote to
2 you, the ACRS, in 2005 to express my concerns on
3 Vermont Yankee and the net positive suction head lever
4 the ACRS had granted to Vermont Yankee.

5 In 2008, (telephonic interference) was
6 retained by SECAM to analyze the containment.

7 PARTICIPANT: Excuse me.

8 MR. GUNDERSEN: I wrote ACRS regarding my
9 belief that the containment volume to power ratio at
10 Millstone was the smallest of any Westinghouse plant.
11 At that meeting the ACRS was told by the NRC that
12 (telephonic interference) analyze the containment
13 system.

14 In 2009 --

15 PARTICIPANT: Excuse me. Can I interrupt?
16 I think people either in the room or on the line that
17 need to mute their lines or just stop making noise
18 next to the phone because I don't think that the
19 static is coming from Mr. Gundersen. Thank you.

20 CHAIR ABDEL-KHALIK: If there are other
21 people on the line if you could please mute your
22 microphones on your end so that we can hear Mr.
23 Gundersen clearly. Thank you very much.

24 Mr. Gundersen, please proceed.

25 MR. GUNDERSEN: Thank you, Mr. Chairman.

1 Did you hear what I had said already or
2 should I start again?

3 CHAIR ABDEL-KHALIK: No, we have heard up
4 to this point. So please proceed.

5 MR. GUNDERSEN: Okay. Thank you, Mr.
6 Chairman.

7 In 2009, Citizens Power retained Fairwinds
8 to analyze a hole found in Beaver Valley containment.
9 My analysis was also provided to the ACRS.

10 In 2010, I met with you as a candidate for
11 an opening on the ACRS and we discussed positive
12 suction head and its relation to containment
13 integrity. I notice that the Browns Ferry unit had
14 not been allowed the NPSH credit. But the ACRS
15 granted that credit to Vermont Yankee five years
16 earlier. It was illogical for the people of Alabama
17 to have more accident protection than the people of
18 Vermont.

19 In 2010, at the AP 1000 Oversight Group
20 Fairwinds was retained and in April Fairwinds provided
21 to you a report detailing a long history of
22 containment failures around the country.

23 In 2010, (telephonic interference) met
24 with you for an hour and half to delineate my concerns
25 reporting doubt of a containment integrity of the AP

1 1000 design.

2 In December I wrote you again, notifying
3 you of a significant amount of additional information
4 about containment failure due to flaws. Each time I
5 have contacted you, containment integrity data had
6 been rebuffed and ignored.

7 The accident at Fukushima has confirmed my
8 belief that the leakage of a nuclear containment
9 cannot be based upon the assumption of a leak rate of
10 zero as used by the NRC. Just this week Tokyo
11 Electric has finally acknowledged that all seals of
12 Mark I containment systems are leaking significant
13 radiation to the environment and at least Units 1 and
14 2 began leaking on the first day of the accident.

15 Unfortunately, the possibility of such
16 containment failures to which I alerted you for the
17 last six years has been proven correct. It was no
18 surprise to me that the containment systems have a
19 long history of leaking and have now failed three
20 times at Fukushima. Yet it apparently comes as a
21 major surprise to the NRC.

22 The ramifications of a nuclear reactor
23 containment leakage and failure of the NRC and its
24 body to consider are: (1) the SAMSA analysis of
25 Westinghouse AP 1000 design (telephonic interference)

1 that there is zero probability of a containment leak
2 of any magnitude. When historical record prior to
3 Fukushima proved this assumption fault and the
4 Fukushima containment failure of the AP 1000 design be
5 analyzed and retrofitted with charcoal filters on top
6 of the shield built.

7 MR. WARREN: Pardon me. Arnie?

8 MR. GUNDERSEN: Yes.

9 MR. WARREN: This is Jim Warren. Can you
10 hear me?

11 MR. GUNDERSEN: Yes, I do.

12 MR. WARREN: I apologize for interrupting.
13 But there is so much noise on the phone bridge it's
14 obvious that some people are not listening. And
15 others that are on the phone cannot hear the
16 presentation.

17 CHAIR ABDEL-KHALIK: Sir, I have asked all
18 others except for Mr. Gundersen to mute their phone so
19 that we can hear him without interruption.

20 MR. WARREN: Thank you. That's all I'm
21 asking is that we can all hear him and that we all
22 listen. Thank you.

23 MR. GUNDERSEN: The ACRS has granted net
24 positive suction heads credits to numerous reactors
25 around the country in violation of Regulatory Guide 1.

1 Today in a simple stroke of the pen the ACRS can
2 acknowledge this erroneous decision by requesting the
3 NRC staff to revise the licenses of reactors so that
4 every reactor is in compliance with Regulatory Guide
5 1. And with this simple one stroke of a pen you can
6 make all the reactors immediately safer than they are
7 today.

8 Everyone sitting at the ACRS today knows
9 that the pressure suppression containments on GE BWRs
10 were inadequate when they were first designed. As a
11 result of that design inadequacy, boiling water
12 reactor containment vents were added in 1989 to
13 prevent containment overpressurization. Currently,
14 there are 23 Mark I containment systems in operation.
15 All Mark I have vents that were added as a bandaid
16 fix.

17 Events at Fukushima show that this fix did
18 not work. I urge the ACRS to evaluate containment
19 venting to determine whether or not any of these
20 reactors --

21 (Simultaneous speaking.)

22 -- a single operation.

23 (4) The ACRS should stop license renewal
24 of any BWR until the Fukushima accidents have been
25 completely analyzed.

1 For the record and finally, Fairwinds
2 finds it disconcerting that both NEI and DOE have been
3 granted an hour to make a presentation to this body
4 when NEI and DOE have responsibility for promotion of
5 nuclear power. I brought these containment integrity
6 issues to your attention for more than six years.

7 In closing, I strongly suggest that each
8 of you as members evaluate the bias you bring to the
9 table when listening to experts with whom the nuclear
10 industry disagrees. Thank you for your time, Mr.
11 Chairman. I'll gladly brief you in detail if you
12 choose.

13 CHAIR ABDEL-KHALIK: Thank you, Mr.
14 Gundersen. We would appreciate it if you provide your
15 comments in a written form just in case we missed.

16 MR. GUNDERSEN: I will send them to Dr.
17 Hackett this afternoon.

18 CHAIR ABDEL-KHALIK: Dr. Hackett. Thank
19 you very much.

20 Okay. At this time, we have sort of
21 concluded all the presentations. Are there any other
22 members of the public who would like to make comments
23 or ask questions?

24 (No response.)

25 Is there anybody else on the line? Is

1 there anybody else here?

2 Yes, sir. Please come to the microphone,
3 identify yourself.

4 MR. LEYSE: Yes, this is Robert Leyse.
5 I've talked to you before.

6 CHAIR ABDEL-KHALIK: Mr. Leyse, please
7 hold off. We have some here in the room who is going
8 to make comments. So I will recognize you later.

9 MR. LEYSE: I will go to *6.

10 CHAIR ABDEL-KHALIK: Sir.

11 MR. KAMPS: Thank you. Hello everyone.
12 My name is Kevin Kamps with Beyond Nuclear. And I'm
13 also on the board of Don't Waste Michigan. We are
14 watchdog groups on the nuclear power industry.

15 And I just wanted to inform the ACRS if it
16 did not know yet that our organization joined with
17 colleague organizations at the grassroots who live
18 near GE-BWR Mark 1s across the country. We have
19 launched a 2.206 petition to the NRC to immediately
20 suspend the operating licenses of the 21 to 23 BWRs in
21 this country that are very similar design to the
22 Fukushima Units 1 through 4. And this is an important
23 safety step until we learn the lessons from Fukushima
24 so that it doesn't happen here.

25 Another part of that petition in addition

1 to the reactor risks are the risks of high level
2 radioactive waste storage pools at these reactors.
3 And this would even include shutdown reactors of this
4 design including the Millstone unit that's been
5 mentioned, the pool of which still contains high level
6 radioactive waste.

7 So I just wanted to inform you of this.
8 We have been granted a petition review board on June
9 8th that will last for two hours. I'm not sure of the
10 exact time of day. But we have a growing number of
11 groups across the country joining this coalition.

12 And in addition to this effort there's
13 also a petition drive by another organization, Nuclear
14 Information and Resource Service which is a grassroots
15 petition drive which already has thousands of
16 signatures calling on the NRC to immediately suspend
17 the operating licenses of these reactors in this
18 country.

19 Thank you very much.

20 CHAIR ABDEL-KHALIK: Thank you, sir.

21 Okay. At this time, Mr. Leyse, if you'd
22 like to offer any comments.

23 MR. LEYSE: Just came back on. Quickly,
24 I want to say DRM 50.93 was around well ahead of
25 Fukushima and a predecessor to that was around since

1 the mid -- around 2002 or 2003. And nothing seems to
2 move.

3 Now today we heard NEI tell us that while
4 we take this Fukushima act on we don't ignore what
5 else is going on. I would advise ACRS to be get into
6 DRM 50.83 as well as the NRC. NRC once had it as a
7 high priority item until a rather otherwise useless
8 meeting back in October of the Thermohydraulic
9 Subcommittee, the only part really bragging, not
10 bragging.

11 But it's a fact that made any sense what
12 Mark Leyse and myself discussed. You went through the
13 whole thing and never got into zirconium or how it
14 would react in a loss of coolant accident. Instead
15 you listened to endless presentations from Penn State
16 and others that really don't bear on what's going on
17 today or was potentially going to go on.

18 CHAIR ABDEL-KHALIK: Mr. Leyse.

19 MR. LEYSE: End of comments. Thank you.

20 CHAIR ABDEL-KHALIK: Thank you very much.

21 Is there anybody else who would like to
22 make comments? Are there any other members of the
23 public who would like to make a comment?

24 MR. WARREN: This is Jim Warren again.
25 And I like to come back and apologize for having to

1 interrupt Mr. Gundersen's presentation a few minutes
2 earlier. But it was very frustrating that obviously
3 some people in the room were not listening to what he
4 was saying. And it make it possible for others of us
5 not to hear either.

6 I am concerned that is a reflection of the
7 lack of respect for members outside the nuclear and
8 academic orbit.

9 CHAIR ABDEL-KHALIK: Sir, excuse me.

10 MR. WARREN: I want to thank you for
11 holding the meeting and allowing us to listen. Please
12 do respect our ability to listen to these and to
13 participate further. Thank you.

14 CHAIR ABDEL-KHALIK: Sir, the interruption
15 was not caused by anything that was going on in this
16 room. It may have been caused by others who were
17 connected to the phone line. But I assure you that
18 this committee provides ample opportunity for members
19 of the public and offers them to make comments and
20 treats those comments seriously and with the upmost
21 respect.

22 MR. WARREN: Okay. Well, I appreciate
23 that. And if I'm mistaken then I do apologize. But
24 when he began his presentation there began an awful
25 lot of conversation. It sounded like it was around

1 the room or near the phone.

2 CHAIR ABDEL-KHALIK: It was not, sir.

3 MR. WARREN: Okay. Thank you. Then it
4 was someone else and I apologize.

5 CHAIR ABDEL-KHALIK: Thank you. All
6 right.

7 Are there any additional comments that
8 anyone else would like to make?

9 (No response.)

10 Hearing none, let me just go around the
11 room and see if members would like to offer any
12 comments or reflections on what we heard today. Let
13 me start with you, Jack.

14 MEMBER SIEBER: I have no additional
15 comments at this time.

16 CHAIR ABDEL-KHALIK: Okay. Sanjoy.

17 MEMBER BANERJEE: None.

18 CHAIR ABDEL-KHALIK: Harold.

19 MEMBER RAY: None other than that what I
20 said to NEI on that one point.

21 CHAIR ABDEL-KHALIK: Dennis.

22 MEMBER BLEY: No. No additional.

23 CHAIR ABDEL-KHALIK: Dana.

24 MEMBER POWERS: What we see is a
25 tremendous amount of interest in the Fukushima

1 accident right now and desperate attempts to try to
2 learn lessons at which is a very premature stage and
3 understanding of this accident. And our experience
4 from previous accidents is it takes quite a while
5 before you can draw conclusions that stand any test of
6 time.

7 In fact, I think if we go back to our own
8 experiences at TMI we saw an awful lot of prompt steps
9 taken that had to subsequently be reversed. And I
10 grow concerned that we'll be preemptive now when we
11 don't need to be. I'm not sure Mark I BWRs located in
12 the midland of the United States are really
13 susceptible to both tsunamis and earthquakes
14 simultaneously. And so maybe we don't need to address
15 those things right now.

16 I think we can and maybe this Committee
17 can help define things that can be done at this stage
18 for a time. And I certainly pointed out that
19 potentially one of them was just how the FSARs are
20 done in Japan versus how they're done here in the
21 United States is something that can be done.

22 Similarly, I think in the area of seismic
23 engineering a lot of plants in Japan were affected by
24 this earthquake and did not sustain damage that shut
25 them down. But they did sustain the earthquake.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And there are opportunities for us to
2 compare our seismic engineering projections against
3 what actually happened at plants other than Fukushima
4 Daiichi. And I think we ought to be encouraging
5 perhaps in our research report for the NRC to take
6 advantage of that. Because at least my looking at
7 things like the IPEEE suggests to me that the rank
8 ordering or vulnerable locations predicted versus
9 those actually observed in Japan may not be entirely
10 coincidental.

11 Now you can draw -- You cannot from the
12 specific incident draw general conclusions always.
13 But it sure is an opportunity to validate or suggest
14 where more work needs to be done.

15 CHAIR ABDEL-KHALIK: Thank you.

16 Sam.

17 MEMBER ARMIJO: Yes. I'd just like to say
18 that an awful lot of good work has been done by DOE
19 and I appreciate the presentation.

20 I think the thing that's bothered me from
21 the beginning of this is the mystery of Unit 4 and the
22 spent fuels. I think we've gotten new information
23 that in fact the spent fuel in Unit 4 was in good
24 shape, relatively good shape, compared to the cores in
25 the other reactors.

1 But we don't know why that plant had an
2 explosion and so much damage. And I think if DOE and
3 others can really study that and find out what
4 happened there because I think that's still a mystery.
5 And I don't think we can really address the U.S. plant
6 safety until we understand what happened in Unit 4.
7 And I think that's a big open issue.

8 CHAIR ABDEL-KHALIK: Okay. Thank you,
9 Sam.

10 John.

11 MEMBER STETKAR: Nothing more. Thanks.

12 CHAIR ABDEL-KHALIK: Mike.

13 MEMBER RYAN: No additional comments.

14 Thank you.

15 CHAIR ABDEL-KHALIK: Bill.

16 MEMBER SHACK: Nothing.

17 MEMBER BROWN: Nothing more than what I
18 said.

19 CHAIR ABDEL-KHALIK: Joy. Mike.

20 MEMBER CORRADINI: Well, I have a lot of
21 questions. But I guess the only thing that I would
22 suggest is that I don't know about Tony's
23 presentation. But in terms of John's -- I guess in
24 Tony's case I really do think you asked him to get the
25 strategic plan. I don't know the right terminology.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 I do think we need that in writing so we understand
2 what are the big pictures things they're looking.
3 Because I know they've allotted a good deal of
4 resources to do this. And I think it's important that
5 we at least understand how they're divvying up
6 relative to the topics.

7 In John's case, I guess I think Tanny --
8 I asked Tanny to send everybody electronically the
9 copies of his talk. I think the one thing that I find
10 interesting is that he's trying to get TEPCO to remove
11 the proprietary nature of some of the information.
12 Because I think the more public information that is
13 available is important so we actually can -- everybody
14 can look at the same set of information and its
15 sources. That to me is probably the most important
16 thing.

17 CHAIR ABDEL-KHALIK: Okay.

18 MEMBER CORRADINI: But other than that I
19 think it was a very good presentation. I hope we can
20 continue and hear from the staff next month.

21 CHAIR ABDEL-KHALIK: Yes. That's the
22 plan. The staff will brief us on June 23rd. We have
23 a subcommittee meeting in the afternoon and that is
24 the plan.

25 Are there any -- Tom.

1 DR KRESS: Thank you. I don't have any
2 additional comments. I just have been jotting down my
3 reactions in terms of lessons learned. I don't want
4 to bore anybody with them, but I've got about 20 right
5 now. And I think the ACRS should get involved in the
6 NRC's efforts of lessons learned.

7 But you can be a little premature. These
8 20 I've got, a lot of them may not prove to be good
9 when we get the real information. That's really my
10 reaction to this.

11 CHAIR ABDEL-KHALIK: Right. Thank you,
12 Tom.

13 Are there any additional comments?

14 PARTICIPANT: If I can.

15 CHAIR ABDEL-KHALIK: Yes, sir.

16 PARTICIPANT: Maybe I'm a little bias
17 because I worked on Station Blackout many years ago as
18 one of the first things I did. And now today I think
19 it's going to be very important that the Committee
20 look at that issue and how it evolves now. And I
21 guess there's going to be reg. guides that are going
22 to be updated and a lot of other things related to
23 Station Blackout.

24 But it might be worthwhile for the
25 Committee to focus on that because that is probably

1 the most important event right now that could occur at
2 a plant. And so whatever the Committee does with
3 respect to Station Blackout I think is going to be
4 very helpful to the Commission.

5 CHAIR ABDEL-KHALIK: Thank you, John.

6 PARTICIPANT: Appreciate that.

7 CHAIR ABDEL-KHALIK: Are there any
8 additional -- Does anybody know what this alarm means?

9 PARTICIPANT: It's a door alarm. It's
10 okay. We're fine.

11 CHAIR ABDEL-KHALIK: Okay. At this time,
12 we're adjourned. We're off the record.

13 (Whereupon, at 4:28 p.m., the above-
14 referenced matter was concluded.)

U.S. DEPARTMENT OF
ENERGY

Nuclear Energy

DOE Response to Fukushima Dai-ichi Accident

John E. Kelly

**Deputy Assistant Secretary for Nuclear Reactor
Technologies**

**Office of Nuclear Energy
U.S. Department of Energy**

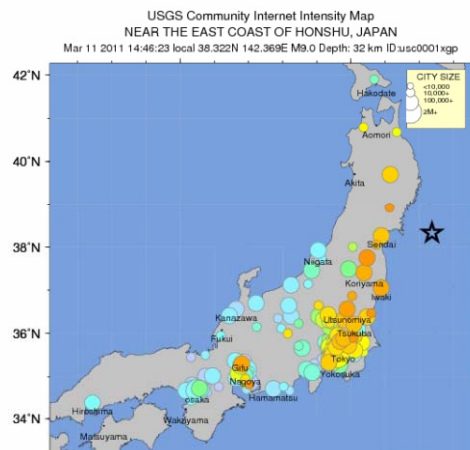

May 26, 2011

Earthquake 3/11

- **14:36 JST Earthquake**
- **15:41 JST Tsunami**
- **Magnitude: 9.0**
- **Generated a 14m Tsunami**
- **Many thousands perished**
- **More that 100 thousand people were homeless without food, water, or heat**

3-2. Major root cause of the damage

Note:

- All operating units when earthquake occurred were automatically shut down.
- Emergency D/Gs have worked properly until the Tsunami attack.

① Loss of offsite power due to the earthquake

Grid Line

Tsunami (estimated more than 10m)

Turbine Building

Reactor Building

D/G

② D/G Inoperable due to Tsunami flood

①+② ⇒ Station Black Out

All Motor Operated pumps (including ECCS pumps) became inoperable

Elevation:
about 10m

Seawater level

Seawater Pump

U.S. DEPARTMENT OF
ENERGY

Nuclear Energy

Accident Sequence for Fukushima Dai-ichi Reactors

- Station blackout due to the earthquake
- Loss of emergency diesels due to the tsunami (nearly 1 hour later)
- Eventual loss of batteries and cooling to control steam driven emergency pumps
- Core overheats, cladding oxidizes and melts producing hydrogen
- Hydrogen escapes from containment and explodes/deflagrates in reactors 1, 2, & 3
- Explosion/deflagration in reactor 4 building

Immediate Response

- ☐ Activated its Emergency Operations Center
- ☐ Immediately deployed personnel to the U.S. Embassy in Japan to support the Reactor Safety Team (RST)
- ☐ Provided expert advice to the U.S. Ambassador and Government of Japan ministers
- ☐ Set up and coordinated consortium call that involved NRC, INPO, DOE, and Naval Reactors

- ☐ Organized nuclear industry technical response to assist TEPCO

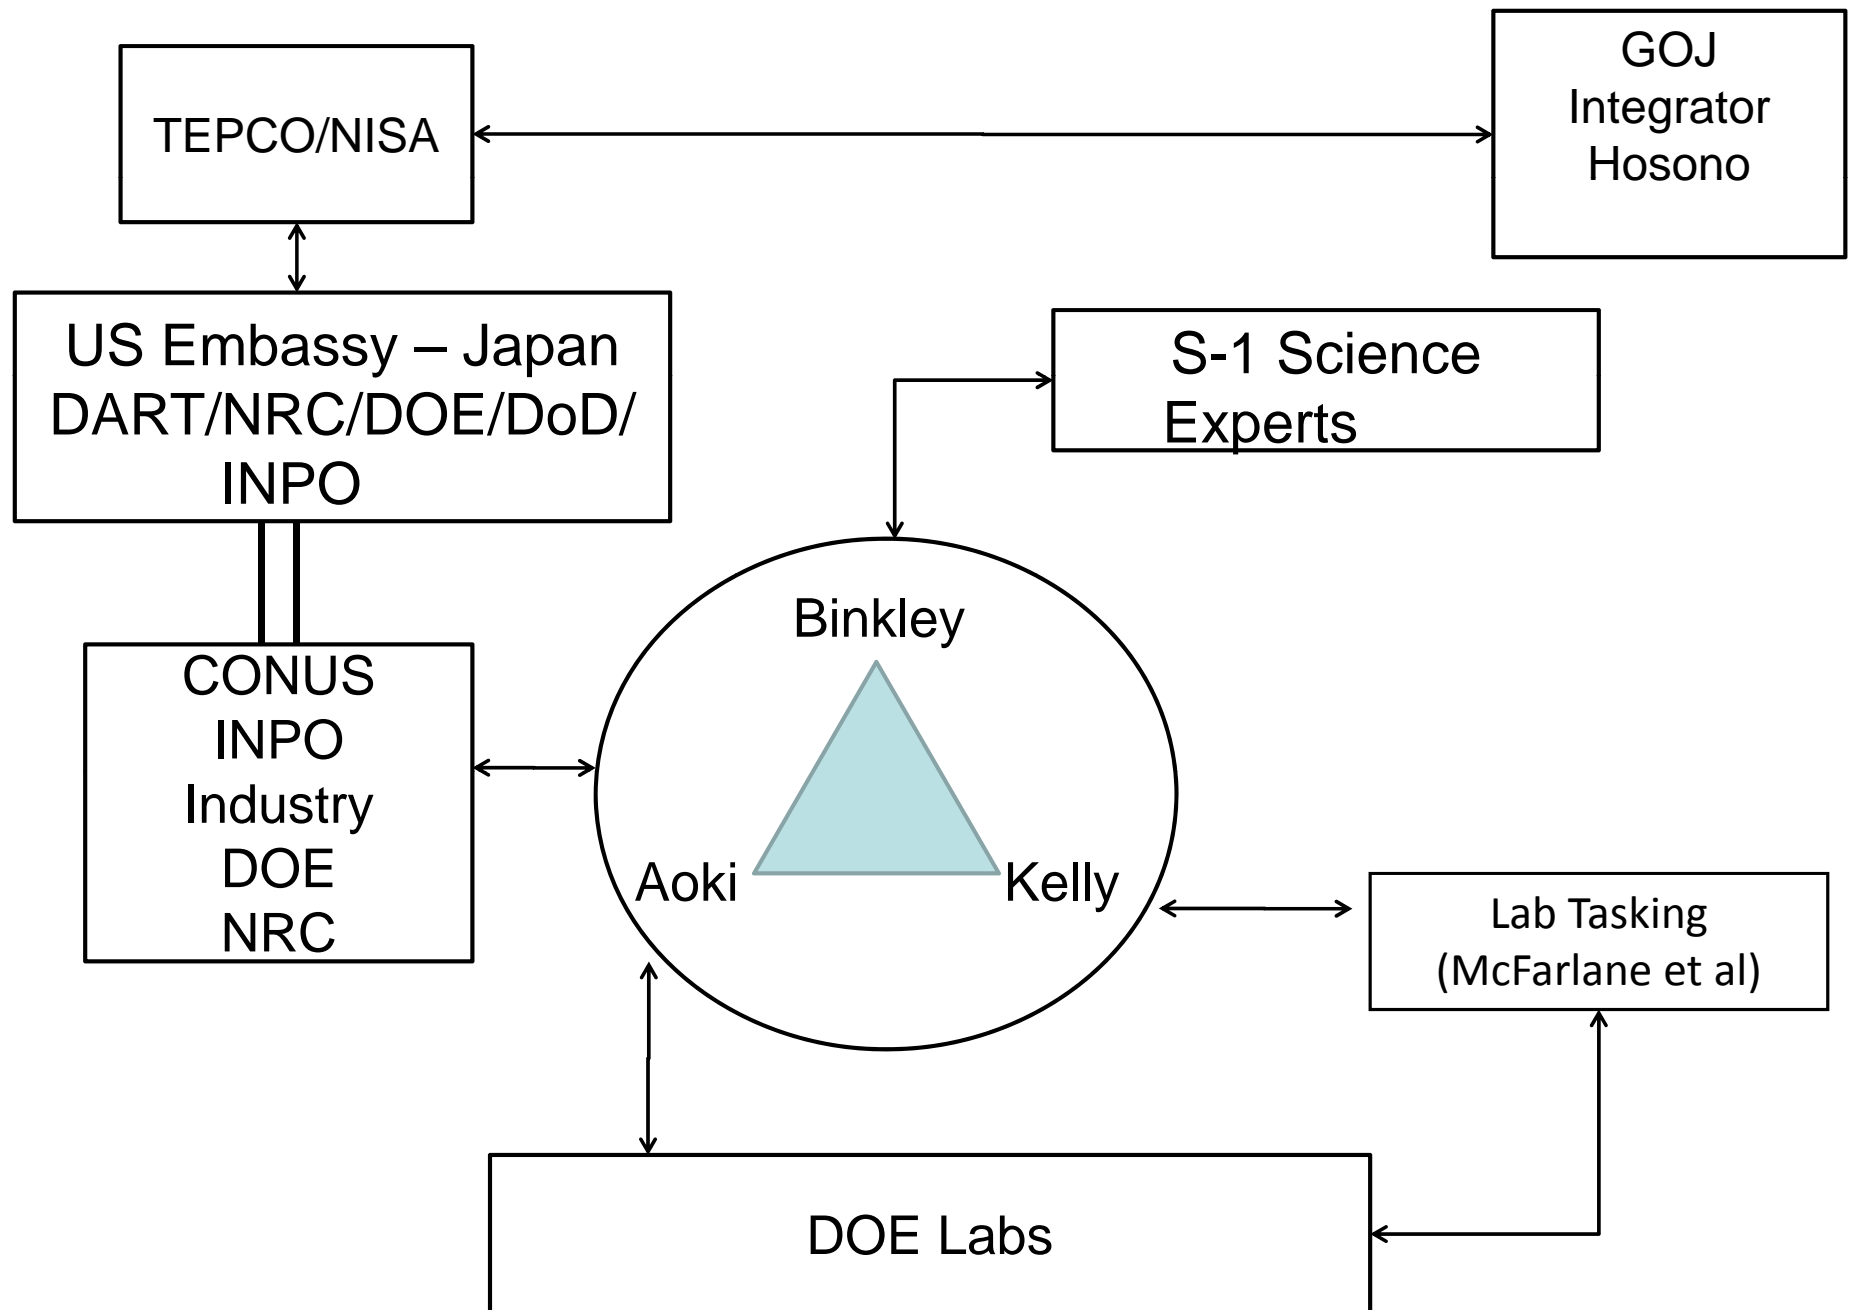

- ☐ Activated its Emergency Operations Center focused on monitoring radiation release and impact on U.S. citizens (both in Japan and the U.S.)
- ☐ Deployed Airborne Monitoring System aircraft and sensors
- ☐ Provided additional DOE Embassy reps to the two already assigned to the U.S. Embassy
- ☐ Deployed national laboratory reps from INL, PNNL and Sandia to provide technical assistance
- ☐ Assigned NE personnel to stand watch in the DOE EOC

DOE has provided a significant response to the events at Fukushima

- **During the first several weeks after the massive earthquake in Japan, DOE provided a significant and diverse set of analysis to support the events at Fukushima-Daiichi**
- **This response involved a broad set of institutions with over 200 people contributing**
 - DOE: Offices of NE, SC, NNSA, EM
 - Laboratories: ANL, BNL, INL, LANL, ORNL, PNNL, and SNL
 - Numerous universities
 - Individual consultants – Secretary's external science experts

Nuclear Energy Response Team

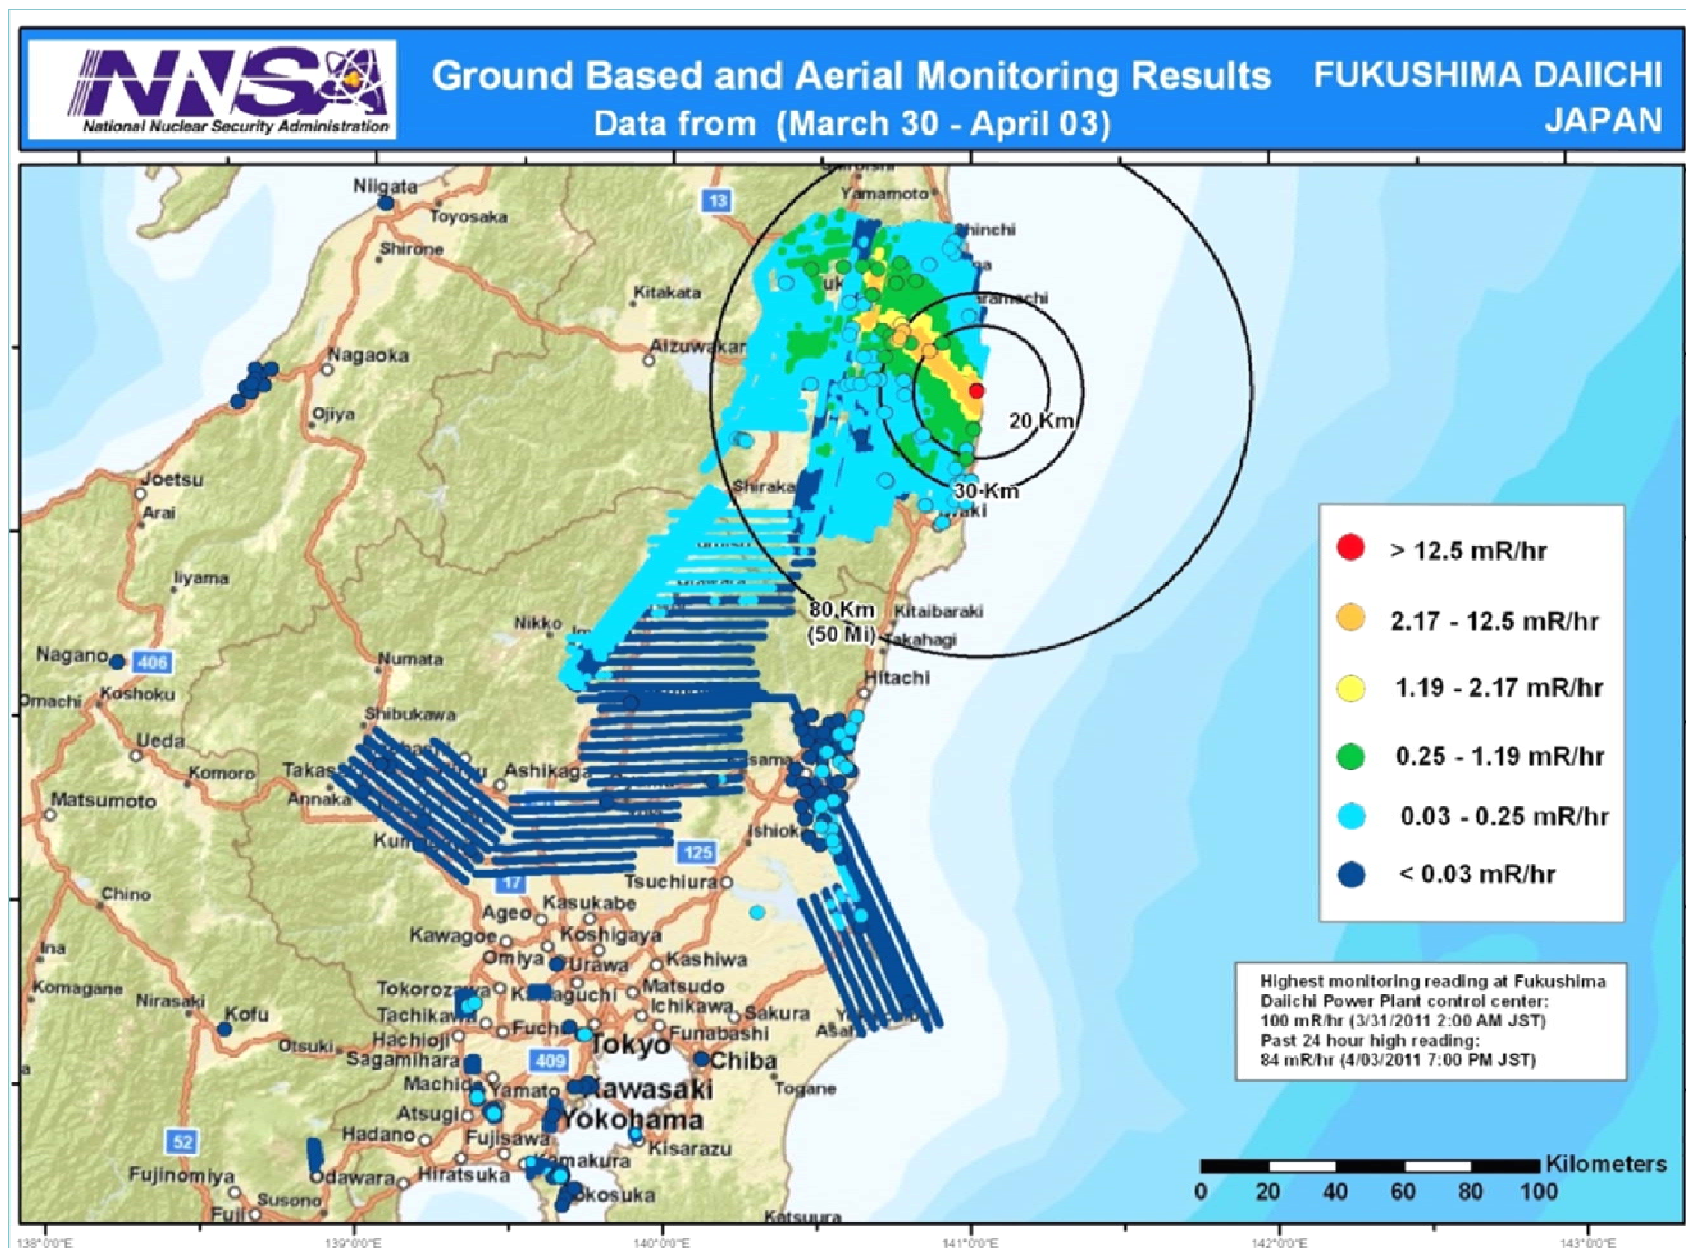

Airborne Radiation Monitoring

- NNSA had primary responsibility to monitor and notify U.S. citizens of radiological fallout, including those in Japan
- Deployed airborne monitoring systems
- Used NARAC code at LLNL to model calculate plume impact on the U.S

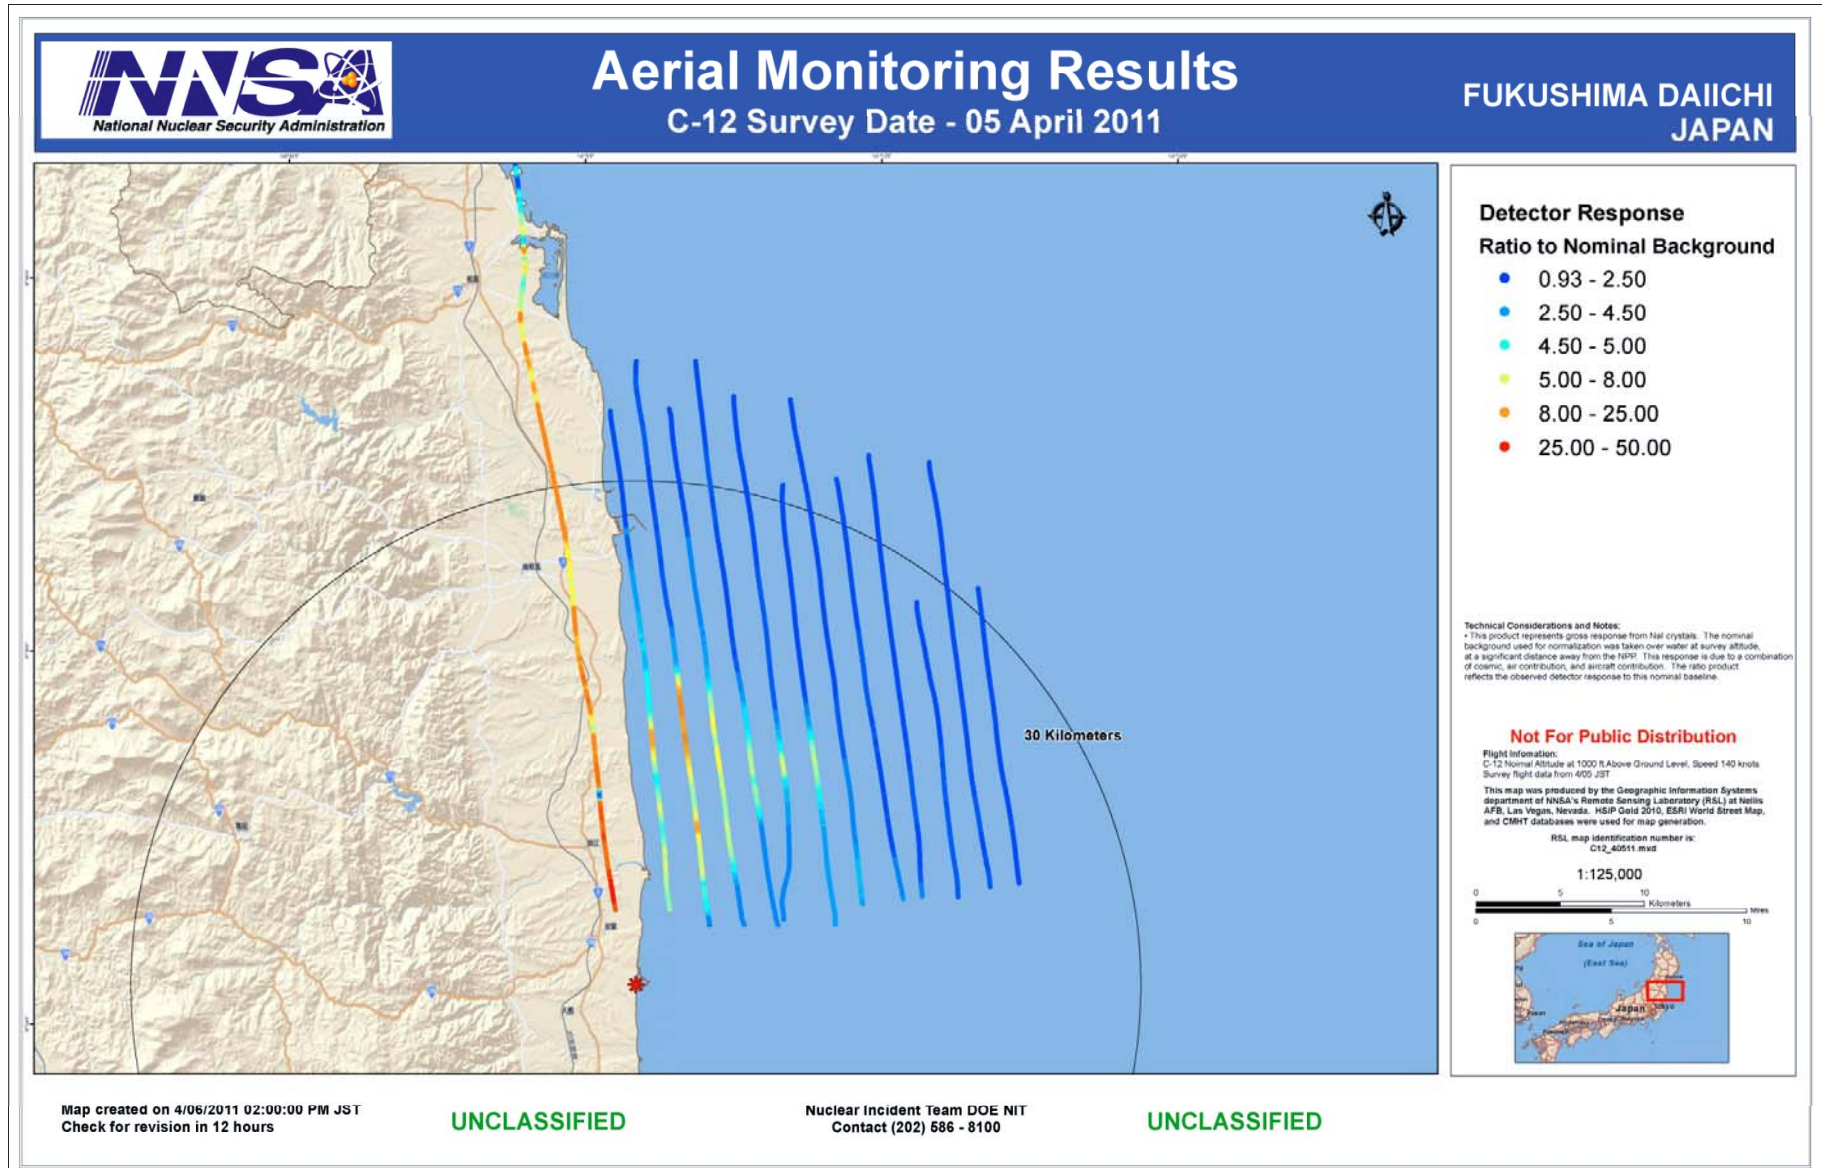

DOE/NNSA Monitoring

This product is an aggregate of data collected from March 30 – April 3, 2011. Monitoring results are derived from aerial measuring platforms and validated where possible by ground survey teams.

DOE/NNSA Monitoring (Over-water)

U.S. DEPARTMENT OF
ENERGY

Nuclear Energy

Office of Nuclear Energy Response Team

■ Primary mission

- Assess and clarify information for DOE and NE leadership concerning the status of the Fukushima Dai-ichi reactor situation
- Provide support to NE EOC watch standers
- Organized national laboratory analysis activities in support of:
 - *White House and USG*
 - *U.S. Embassy Requests*
 - *DOE and NE Leadership*

Accident Management Strategies

Stabilize reactor and
spent fuel pools

Keep radiation levels
low so workers can
continue to work

Establish remote
operations capability

Take measures to
maintain long-term
integrity of
containment

Plan emergency
response if situation
worsens

Stabilize Reactors and Pools

■ Threats

- Reactor core melting thru vessel and attacking containment
- H₂ explosion in containment
- Spent fuel pool fire
- Another earthquake
- Corrosion and gap release of radionuclides episodically from now intact fuel rods

■ Mitigation

- Continue to inject water to remove decay heat
- Inert containment
- Keep adding water to pools
- Restore pool cooling
- Get more data on water level, radiation levels, chemistry
- Remove spent fuel from pools

NERT Technical Studies related to Reactor & Pool Stabilization

- **Estimation of O₂ build up in Containment**
- **Long term decay heat removal**
 - Time to achieve fully passive heat removal
 - Alternative cooling strategies
- **Additional sensors for measuring water level, radiation levels, etc in pools, containment, and RPV**
 - New sensors
 - Restoring failed sensors
- **Melt progression estimates**
- **Potential for recriticality**
- **Potential for steam explosions**
- **Spent fuel pool boil down rate and Zr fire potential**
- **Salt precipitation and effect on cooling**
- **Mass and energy balances**
- **Air ingress analysis**

U.S. DEPARTMENT OF
ENERGY

Nuclear Energy

DOE Analysis for Initial and Stabilization Phase

Collection of daily status data and events

Isotopic analysis of releases

H₂ production and explosions in reactor buildings

N₂ inerting options and processes

Gas inventory calculations

Potential for further H₂ production and explosions

Structural analysis of RPV after pressure spikes

Core damage and fuel condition

Sensor data analysis

Water level calculations

Corrosion in sea water solutions

Drywell filling options and water level tracking

Stabilization criteria

Severe accident analysis and management

Criticality determinations

Decay heat calculations

Isotope and radionuclide calculations and releases

Spent Fuel Pool (SFP) water level analysis

SFP hydrogen production and analysis

SFP modeling

Reactor building and SFP dose assessments

Thermal analysis for SFP fill options

Robotics tools for stabilization

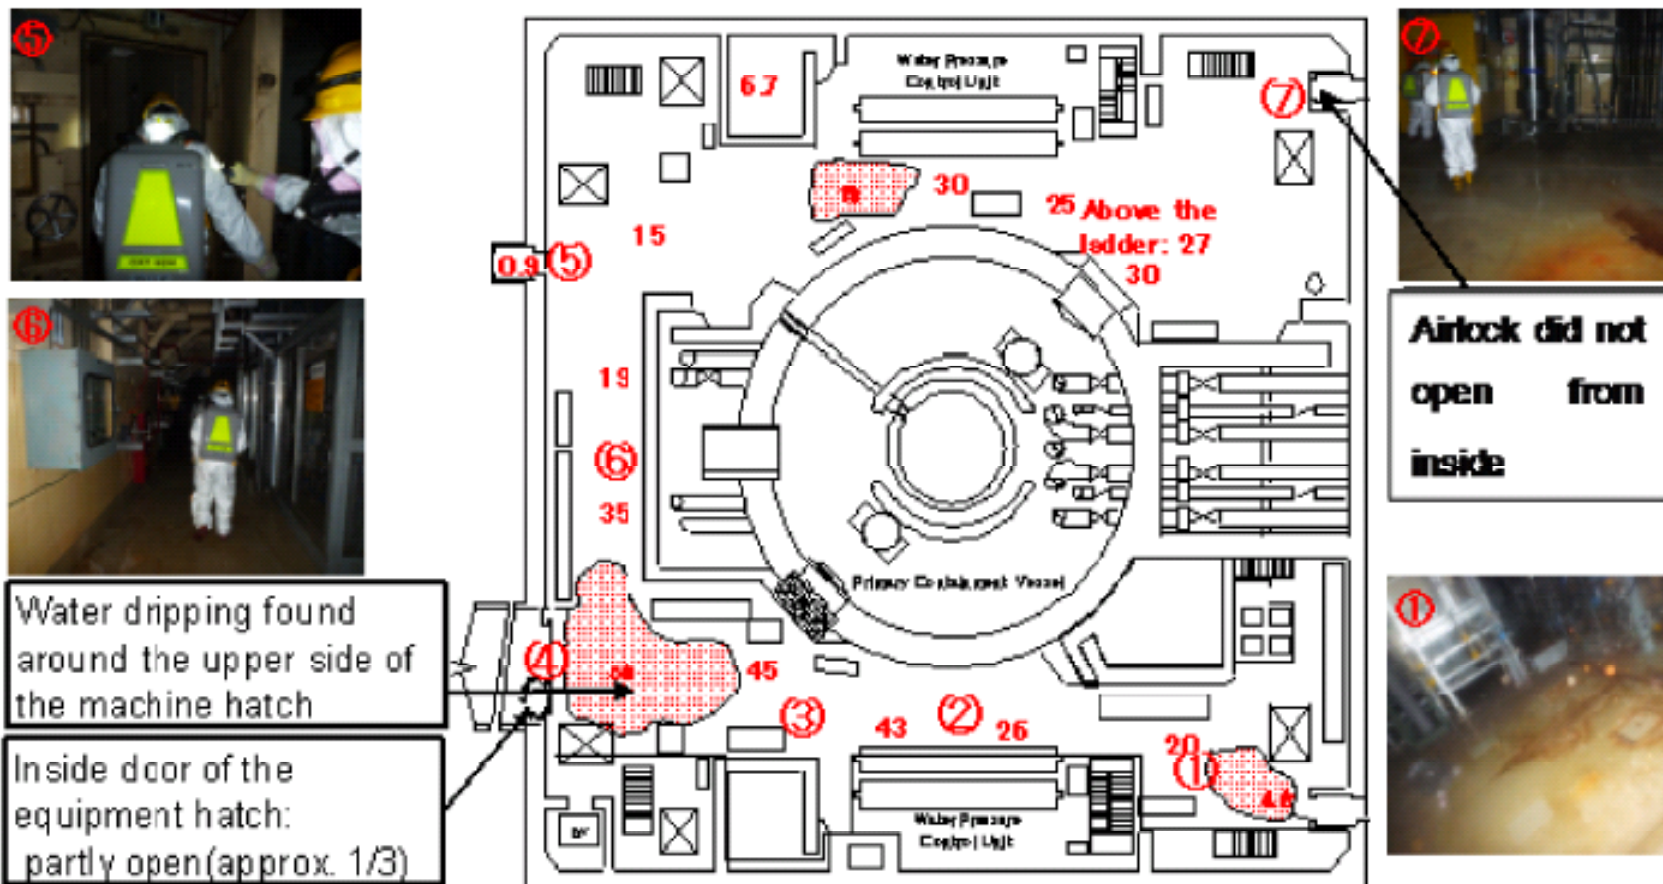

Shielding advice for on-site equipment

Bioaccumulation for water releases

Reactor Building Survey Results for Unit 2

- Recent (19 May) survey results for Unit 2 shown below; dose rates in the range of 15 to 45 mSv/hr (1.5 to 4.5 R/hr)
- Underscores the difficulty in restarting normal RHR equipment.

Passive Cooling Assessment

Calculated containment passive cooling heat removal rates compared with decay heat levels for Units 1-3

Shielding concrete

Reactor building exterior walls

Long-term Decay Heat Removal

- Decay heat cooling would take about 9 months using of passive cooling
- Explored options for accelerated cooling
 - Capture, treatment and reuse of cooling water
 - Alternate cooling approaches

Background on Unit SFP 4 Explosion

- **Unit 4 explosion Occurred March 15, 6:00 am – Approximately 90 hours after earthquake (Full core offloaded into pool, high heat load (~2.3 MW))**
- **The Unit 4 Explosion was originally attributed to hydrogen, but it has not be possible to definitively conclude this.**
- **An assessment of possible causes of the explosion was performed resulting three primary causes:**
 - Hydrogen produced from zirconium oxidation from the fuel cladding (or other fuel assembly and storage rack structures) in the fuel storage pool
 - Ignition of other flammable materials in the unit 4 building that were possibly being used for maintenance work (such as acetylene)
 - Hydrogen that was transferred through the stack vent lines from the hydrogen produced in unit 3
- **There were additional possible causes that have been proposed by others, but not analyzed:**
 - Hydrogen production from radiolysis
 - A proposed scenario based on material blockage preventing convective flow coupled with extreme boiling to provide hydrogen production without a low water level.

Thermal analysis of pool heatup and boil off

- Models of spent fuel pools developed to predict pool boil off time and to understand hydrogen production
- Used to perform analysis of pool leakage scenarios
- Calculations based on several codes and models to provide range in turn-around time and fidelity

UNIT 4 SFP HEAT GENERATION RATE DISTRIBUTION

POOL LEVEL FOR VARIOUS SCENARIOS FOR UNIT 4

Hydrogen Explosion From Fuel Storage Pool

- **Evaporation and boil off of a the full pool would take ~10 days and significant hydrogen production would not be expected until ~12-14 days after earthquake.**
- **For explosion at <4 days, there would have had to been leakage from pool**
- **Four leakage scenarios**
 - Leakage of refueling pool gate or gate seals (hydrogen production in 4-5 days)
 - Damage to refueling pool penetrations (hydrogen production in 8-9 days)
 - Damage to refueling pool liner (depends on damage, could be ~ 1 day)
 - Failure of two refueling pool cooling system anti-siphon check valves coupled with second failure of refueling pool cleanup system piping
 - Sloshing during earthquake (a few feet)
- **Refueling gate leakage or pool liner damage could result time frame for hydrogen production similar to that which actually occurred**

Hydrogen from Unit 3 Transferred Through Stack Vent Lines

- The vent lines for Unit 3 and Unit 4 connect to the same stack
- A possible source of hydrogen in Unit 4 is leakage from Unit 3 to Unit 4 through this common vent line

Keep Radiation Levels Low

■ Threat

- If radiation levels are too high, workers may be evacuated

■ Mitigation

- Isolate and stop RPV leak
- Clean-up contaminated water
 - *Extract, treat, store*
- Deliver more shielding
- Collect more data on chemical composition and radiation levels
- Deploy additional and redundant sensors

NERT Technical Studies related to Reducing Radiation Levels

- **Conceptual design for system to extract, treat, and store contaminated water in turbine building**
- **Assessment of potential RPV and containment leak pathways**
- **Characterization on shielding requirements**
 - Shielding analysis for RHR pipes and water in turbine building
- **Sensors and robotics for radiological surveys**
- **Venting strategies**
- **Evaluate containment head seal failure and how to mitigate**

Waste Water Storage & Treatment

- Significant quantities of water is collecting in the sumps and basements of the reactor and turbine building
- Japan government requested U.S. concepts for
 - Collection
 - Transfer
 - Storage
 - Treatment of waste water

Hanford Spent Fuel K-Basin

Hanford Spent Fuel K-Basin

Design Options for Water Retrieval and Treatment

- **Currently accumulated sea water**
 - Pump water from basement, tunnels and other locations
 - Treat water for storage/disposal
- **Cooling water**
 - Pump water from reactor vessels or spent fuel basins
 - Treat water for recirculation
- **Skid mounted systems**
 - Pumping/retrieval technologies for liquids and sludges
 - Pre-filters and filters to remove debris and solids
 - Ion exchange resin columns and sorption systems for removal of radionuclides
 - Evaporation systems
 - Treatment equipment contained in large shielded fuel transport casks
- **Utilize DOE-EM cleanup contractor base for expertise**

Conceptual design of a water treatment system deployed in a spent fuel basin

Establish Remote Operations

■ Threat

- If workers evacuate, spent fuel and reactor could resume meltdown

■ Mitigation

- Install pumps and systems that can be operated remotely with redundancy
- Install remote data collection with back-up
- Install robotic and wireless monitoring system
- Evaluate fire risks posed by the onsite operations especially electrical fires

NERT Technical Studies related to Remote Operations

- **Sensors and instruments to characterize site**
 - Emphasis on simple or off-the-shelf

- **Evaluating robots, pumps and equipment that can be operated remotely**

Take Measures to Maintain Long-Term Integrity of Containment

■ Threat

- Containment may fail due to corrosion
- H₂ explosion
- Melt thru of core
- Overpressure
- Failure of silicon rubber head seals

■ Mitigation

- Design and install system for extraction, treatment, and storage (or recycle) of corrosive, radioactive liquid waste including heat removal
- Install additional and redundant data collection for water level, radiation levels, water pH, etc

NERT Technical Studies related to Maintaining Long-term Integrity of Containment

- **Oxygen level in containment study**
- **Corrosion of RPV and containment by salt water**
 - Test matrix for testing steels
- **Conceptual design of salt/radioactivity removal system from RPV and/or containment**
- **Additional sensors for measuring water level radiation levels, pH, etc**
- **Evaluating use of Millstone I for staging & check-out of new systems**

DOE Analysis for Recovery Phase

Corrosion rates of RPV steels have been examined in the open literature

- Fukushima-Daiichi plants utilize A533B steel for the pressure vessel (likely based on industry standards, but not confirmed)
- There is little data on this class of steels in salt or concentrated salt solutions as it is not a typical choice for any application
- Some data has been identified (and the search will continue)

Corrosion experience from Millstone unit 1

- **Sept. 1, 1972, the Millstone Unit 1 BWR was undergoing routine startup**
 - sea-water was introduced into full flow demineralizers
 - high conductivity water entered the reactor vessel via the condensate/feedwater system
- **Corrosion effects were observed in a matter of hours**
 - 116/120 of the local power range monitors (with very thin walls) were damaged by cracking
 - Stress corrosion cracking was observed in other reactor components and considered to be “superficial”
 - Subsequent tests at GE found tests produced results more severe than in the actual incident

Implications from Millstone 1 experience to Fukushima

- **Cracking likely occurred in all units very quickly as seawater was introduced**
- **However, rapid cracking early in the event may not be sustained, consistent with the disposition of cracks that were deemed superficial to subsequent operation in Millstone**
- **The observations on carbon steel testing are consistent with other literature results from other industries for this class of alloys**

Corrosion Rate for Carbon Steel

■ Initial data for low-alloy steels (LAS) and carbon steels (C-steel) in salt-solutions

Alloy	Temp. (C)	Solution	Concen.	Other factor	Corrosion rate (mm/y)	Corrosion rate (mils per year)
LAS	25	NaCl	3.5%	--	0.025	1
LAS	25	NaCl	3.5%	--	0.38	15
LAS	25	NaCl	3.5%	H ₂ SO ₄	3.8	150
C-steel	150	MgCl ₂	10%	Irrad.	0.07	27
A533B (Davis Besse)	310	Boric acid	High		64	2500

Davis Besse test data is still most conservative

Plan Emergency Response

■ Threat

- Large release could expose large number of people to radiation

■ Mitigation

- Develop realistic, bounding source terms
- Perform radioactivity plume dispersion analysis
- Develop timeline of precursors and indicators to major event
- Develop guidelines for shelter vs. evacuate
- Develop contingency plans for sarcophagus construction

U.S. DEPARTMENT OF
ENERGY

Nuclear Energy

NERT Technical Studies related to Emergency Response

- **Plume analysis**
- **Develop timeline for precursors and indicators to major release**
- **Scoping study to support permanent stabilization of reactor complex**

Next Steps for DOE-NE

- **Continue our Support for the Government of Japan**
 - Peer reviews and analysis as requested
- **Data collection and accident forensics to support lessons learned**
- **Continued vigilance on potential accident consequences**

May 18, 2011

Dr. Edwin Hackett, Designated Federal Official
Advisory Committee on Reactor Safeguards
U.S. Nuclear Regulatory Commission
Edwin.Hackett@nrc.gov

Dr. Said Abdel-Khalik, Chairman

This letter is in response to the invitation for public comments at the May 26, 2011 meeting of the U.S. Nuclear Regulatory Commission Advisory Committee on Reactor Subcommittee on Fukushima (Federal Register, vol. 76, no. 90, May 10, 2011, Notices, page 27103).

Many U.S. organizations (e.g. U.S. Environmental Protection Agency RadNet, U.S. Department of Energy national laboratories, and various state radiation laboratories) have been making measurements of fission products in environmental media resulting from the Fukushima incident. These measurements are likely being made to understand the resulting dose to the nearby public. I believe that the Nuclear Regulatory Commission in partnership with the U.S. Environmental Protection Agency could play an important role in assisting these many organizations in using their measurement data to convey to the respective publics the resulting exposure risk in a clear and consistent manner. I believe the public is interested in more detail than statements such as “are well below any level of public health concern”.

As with fallout resulting from above ground nuclear testing in the early 1960’s and contamination from the 1986 Chernobyl Unit 4 accident, environmental scientist have made use of the deposited radio-elements to characterize natural processes. The environmental contamination resulting from Fukushima may likewise present such an opportunity even at a much smaller levels. Such applications would likely be assisted with accurate and precise information on the relative isotopic abundances of the fission products, e.g. Cs-134/Cs-137, from each of the several Fukushima units that were compromised.

The International Atomic Energy Agency (IAEA) and the U.S. National Institute of Standards and Technology (NIST) have a number of environmental media standard reference materials, including fish and agricultural products, with low levels of man-made radioactive contaminants such as the following: IAEA-375, “Radionuclides and Trace Elements in Soil”; IAEA-384, “Fangataufa Sediment”; IAEA-414, “Fish”; IAEA-372, “Grass”; NIST 4353A, “Rocky Flats Soil 2”; and NIST 4357, “Ocean Sediment Environmental Radioactivity”. I’m not sure if an equivalent Japanese institution has considered developing similar environmental media standard reference materials with low levels of man-made radioactive contaminants from the Fukushima vicinity. If there is such intent perhaps subject matter experts at the IAEA and/or NIST may wish to assist if so invited.

In closing I would like to extend my thanks to the U.S. Nuclear Regulatory Commission for its timely start to document lessons learned from the Fukushima event. Through such positive actions I believe the U.S. Nuclear Regulatory Commission can assure the safe and productive usage of nuclear energy for the benefit of our nation.

Sincerely yours,

Mr. Donovan R. Porterfield

Fairewinds Associates, Inc
Burlington, VT 05408

Date: May 26, 2011

To: The Advisory Committee on Reactor Safeguards

Good afternoon Mr. Chairman and members of the Advisory Committee on Reactor Safeguards.

I speak to you today as the Chief Engineer of Fairewinds Associates, Inc, and have not been retained by any group to make a statement at this meeting. Although there are many issues that must be resolved as a result of the nuclear accidents at Fukushima, I will focus on the single issue of containment integrity in the brief time you have allotted to me.

I first wrote to you, the ACRS in 2005 to express my concern regarding Vermont Yankee and the net positive suction head (NPSH) waiver that the ACRS granted to Vermont Yankee.

In 2008 Fairewinds was retained by CCAM to analyze the Millstone 3 containment. I spoke twice to the ACRS regarding my belief that the containment volume to power ratio at Millstone 3 is the smallest of any Westinghouse four-loop plant in the world. At that meeting, the ACRS staff acknowledged that it does not have the capability to analyze containment systems.

In 2009 Citizen Power retained Fairewinds to analyze the hole found in the Beaver Valley containment. That analysis was also discussed by the ACRS.

In 2010 when I met with you as a candidate for an opening on the ACRS, we discussed NPSH and its relation to containment integrity. I noted then that the Browns Ferry units had not been allowed the NPSH credit, yet ACRS granted the NPSH credit to Vermont Yankee five years earlier. It is illogical that that the people of Alabama have more accident protection than the people of Vermont.

In 2010 the AP1000 Oversight Group retained Fairewinds, and in April 2010, Fairewinds provided you with a report detailing a long history of containment failures around the country. In June 2010 Attorney Runkle and I met with you for an hour and a half to delineate my concerns regarding doubts about the containment integrity of the AP1000 design. In December of 2010 I wrote to you again notifying you of a significant amount of additional information about containment failures and flaws because at the October 2010 ACRS meeting, the NRC staff informed the ACRS that the NRC's calculations assume that there is zero leakage in the Mark 1 design.

Each time I have contacted you, the containment integrity data has been rebuffed and ignored. The accidents at the Fukushima Mark 1 BWR reactors have confirmed my belief that leakage of a nuclear containment cannot be based upon the assumption of a leakage rate of zero used by the NRC. This week, Tokyo Electric Power Company (TEPCO) has finally acknowledged that all three of the Fukushima Mark 1 containment systems are leaking significant radiation into the environment, and at least Units 1 and 2 began leaking on the first day of the accident. Unfortunately, the possibility of such containment failures, to which I have alerted you for the past six years, have been proven correct.

It is no surprise to me that containment systems have a long history of leaking and have now failed three times at Fukushima, yet it apparently comes as a major surprise to this advisory body and the NRC.

The ramifications of nuclear reactor containment leakage and failure the NRC and this body must consider are:

1. The SAMDA analysis for the Westinghouse AP1000 design is based upon false calculations that there is zero probability of a containment leak of any magnitude. The historical record prior to Fukushima proved this assumption false, and the Fukushima containment failures require that the AP1000 design be reanalyzed and retrofitted with advanced charcoal filters on the top of the shield building.

2. This advisory body has granted NPSH credits to numerous reactors around the country in violation of Regulatory Guide 1. Today, with a simple stroke of a pen, the ACRS can acknowledge its erroneous decision by requesting that the NRC revise the licenses of all reactors so that every reactor is in compliance with Regulatory Guide 1. And, with this one simple pen-stroke you can make all of the reactors applying the NPSH credit immediately safer than they are today.
3. Everyone sitting on the ACRS today knows that the pressure suppression containments on General Electric BWR's were inadequate when they were first designed. As a result of that design inadequacy, boiling water reactor containment vents were added in 1989 to prevent containment over-pressurization. Currently there are 23 Mark 1 containment systems in operation. All 23 Mark 1's have vents that were added as a Band-Aid fix. It is time for the ACRS to evaluate containment venting to determine whether or not any of these reactors be allowed to continue operation.
4. Moreover, ACRS should stop the license renewals of any BWR until the Fukushima accidents have been completely analyzed.

For the record, Fairewinds finds it disconcerting that both NEI (Nuclear Energy Institute) and DOE (Department of Energy) have been granted one hour each to make presentations to this body, when NEI and DOE are responsible for the promotion of nuclear power. I have brought these containment integrity issues to your attention for more than six years. In closing, I strongly suggest that each of you as members evaluate the bias you bring to the table when listening to experts with whom the nuclear industry disagrees.

Thank you for your time. I will gladly brief you in detail if you so choose.

Arnie Gundersen

International Physicians for
the Prevention of Nuclear War

Medicine & Global Survival is published by International Physicians for the Prevention of Nuclear War. A peer-reviewed journal on medical, public health, environmental, and humanitarian aspects of war—particularly nuclear war—and other forms of armed violence, *M&GS* was published continuously from 1990 (as *The PSR Quarterly*) through 2002.

A complete archive of articles is available at www.ippnw.org.

Editor: John Loretz

International Physicians for the Prevention of Nuclear War (IPPNW) is a federation of national medical organizations in 63 countries, representing doctors, medical students, other health workers, and concerned citizens who share the common goal of creating a more peaceful and secure world freed from the threat of nuclear annihilation. IPPNW received the Nobel Peace Prize in 1985.

The Fukushima Nuclear Disaster

About this issue

We decided to publish this special issue of M&GS—the first since 2002—in order to present in one place the perspectives on radiation and health, the dangers posed by nuclear energy, and the links between nuclear power and nuclear weapons technologies that IPPNW, its national affiliates, and its network of physician experts have made available to the press and to the public since the tragic events in Japan in March.

This is by no means a comprehensive collection, and we refer readers to the IPPNW Peace and Health Blog (peaceand-healthblog.com), where many more resources, including links to audio and video reports in several languages, are compiled.

INTRODUCTION

On March 11, 2011, a massive earthquake and tsunami caused extensive and irreparable damage to the nuclear reactors and spent fuel pools at the Fukushima Nuclear Power Plant in Japan, releasing harmful radiation into the environment. Since then, our physician experts have briefed government officials, medical professionals, and journalists in numerous countries about the impact of these radiation releases on public health in Japan and elsewhere.

IPPNW's first concern has been for the people of northeastern Japan, whose health and security have been seriously compromised by a misguided national reliance on nuclear-generated electricity. In the days following the disaster, IPPNW called for an expansion of the evacuation zone around Fukushima to protect the health of children and pregnant women, who are particularly vulnerable to the effects of radiation. That evacuation zone, comparable to the one that has surrounded the Chernobyl reactor since 1986, had been extended to 12 miles by mid April 2011.

IPPNW has been formally opposed to nuclear energy since 1998, when our International Council called for a halt to new plant construction and the phase out of existing nuclear plants because of the insurmountable dangers nuclear energy poses to health, the environment, and security.

First and foremost, we know that there is an inherent link between nuclear power and nuclear weapons. Every commercial reactor produces plutonium and other fissile materials that can be used in weapons programs. The biggest practical obstacle to the abolition of nuclear weapons is the proliferation of nuclear power plants around the world—the so-called nuclear renaissance promoted by the industry and its government proponents.

The nuclear reactors and spent fuel pools at Fukushima and at similar nuclear

Rescue workers monitor children for increased radiation exposure after the Fukushima nuclear disaster. Reuters photo.

power stations in the US and in other countries contain thousands of times the amounts of radioactive isotopes released by the Hiroshima and Nagasaki bombs. Isotopes that have been steadily and increasingly entering the air, soil, and water around the plant include iodine-131, which causes thyroid cancer; cesium-137, which causes cancer in the liver and kidneys; strontium-90, which causes leukemia; and plutonium-239, which has a half-life of 24,000 years and causes lung cancer when ingested in microscopic amounts.

The International Atomic Energy Agency and the World Health Organization have estimated that there were 6,000 to 9,000

new cases of cancer—primarily thyroid cancers and leukemias among children—as a result of the 1986 Chernobyl explosion in Russia, but there is good reason to believe that the true numbers are much, much higher. While it is now impossible to reconstruct an accurate data set of exposures and illnesses related to Chernobyl, independent experts have concluded that the IAEA/WHO data itself supports an estimate as high as 25,000 additional cancer deaths, and that the real number of deaths and illnesses is substantially higher—into the tens or even hundreds of thousands according to an assessment published by IPPNW-Germany in April 2011.

In addition to the immediate and long term health dangers from radioactive contamination, the environmental destruction resulting from each major nuclear power plant disaster to date has been enormous. While one of the two reactors at Three Mile Island continues to produce electricity, the area surrounding the plant, which was the site of the first commercial reactor meltdown in 1979, will have to be monitored for hundreds of years after the facility is finally decommissioned. There is a permanent 20-mile “exclusion zone” around the Chernobyl reactor. It is still too soon to assess the full extent of the long term dangers around Fukushima, but there is no doubt that an extensive area around the doomed reactors will be uninhabitable and unusable for generations to come.

IPPNW has additional concerns about nuclear power plants. They are tempting targets for acts of terrorism. Were someone to deliberately fly an aircraft into the nuclear plant at Indian Point, just north of New York City, for example, and rupture the containment vessel around the reactor, the probable result, planned or spontaneous, would be the evacuation of one of the world's major cities, immeasurable damage to the US economy,

and ripple effects—more like an economic tsunami—to the global economy.

IPPNW rejects the industry's arguments that nuclear energy is needed to mitigate the effects of global warming. Even if the other risks described above were acceptable, which we believe they are not, the world would need to build hundreds of new nuclear power plants, at an average cost of \$8-10 billion each, in order to bring about sufficient carbon reductions to protect the climate. Moreover, it would take decades to bring that number of plants online, by which time it would be too late to prevent a climate catastrophe. As Amory Lovins, Arjun Makhijani, and other energy experts have pointed out, investments in conservation, efficiency, and renewable energy sources such as wind and solar, are dollar-for-dollar more effective in reducing carbon emissions than comparable subsidies to the nuclear industry. As a simple matter of economics, nuclear energy fails every test. That is why IPPNW has joined other NGOs in supporting the International Renewable Energy Agency (IRENA), an intergovernmental body of nearly 150 countries committed to the rapid development and deployment of renewable, non-nuclear energy worldwide.

The attempts to provide security with nuclear weapons and to meet global energy needs with nuclear power share the same flawed premise: that we can prevent the most dangerous technologies ever created by human hands from ever failing. The lesson of Hiroshima and Nagasaki is that nuclear weapons must be abolished before they abolish us. The lesson of Fukushima—and of Chernobyl and Three Mile Island before that—is that we can no longer afford to roll the dice on a technology that cannot be allowed to fail, when failures now appear to be inevitable, with catastrophic consequences.

The Fukushima Nuclear Crisis, Month 1: A Brief Chronology

March 11, 2011—A magnitude 9 earthquake strikes the northeast coast of Japan and is followed 30 minutes later by a tsunami. More than 20,000 people are killed or injured, almost 7,000 more are missing, and hundreds of thousands are forced to evacuate. The Fukushima Daiichi nuclear power plant is automatically shut down, but with no electricity to power the cooling systems, water inside the reactors began to boil off, threatening a meltdown of the uranium fuel in three reactor cores that had been running at the time. The Japanese government declares a state of emergency and advises people living near the plant to leave.

March 12—Tokyo Electric Power Co. (TEPCO) reports rising pressure inside reactor 1, begins to vent radioactive steam containing iodine-131 and cesium-137, and starts to evacuate 20,000 people who live within 10 kilometers of the plant. An explosion tears the roof off the building housing reactor 1; workers begin to pump seawater into the reactor; the government distributes iodine pills to nearby residents.

March 13—The evacuation zone is expanded to 20 kilometers; radiation levels continue to rise; seawater is pumped into reactors 2 and 3, which are also failing.

March 14—A second hydrogen explosion ruptures reactor 3, injuring several workers; evidence begins to appear that the reactor containment may have been breached; cooling fails at reactor 2, exposing the fuel rods to the air.

March 15—An explosion occurs in the building housing reactor 2 and radiation levels increase four-fold; the reactor containment is apparently damaged. A fire in the reactor 4 building, shut down for maintenance at the time of the earthquake, threatens the spent fuel ponds on the building's roof. Prime Minister Naoto Kan goes on television to warn residents within a 30-kilometer radius of the crippled plant to remain indoors. A fourth hydrogen explosion rocks the reactor 4 building. By day's end, radiation levels near reactor 3 reach 400 milliSieverts per hour; TEPCO evacuates all non-essential workers.

March 16—Water continues to boil off spent fuel ponds in reactors 3 and 4 but temperatures and pressures begin to drop at reactor 2, indicating some level of success. Radiation spikes, however, prevent workers from approaching the reactor, and a plan to dump seawater on the reactor by helicopter has to be postponed. Seawater is dropped on the exposed fuel ponds at reactors 3 and 4, but fears of a core meltdown at reactor 3 remain high.

March 17—Military helicopters drop water on reactor 3 building, while fire engines spray water from the ground.

March 18—The Japanese nuclear safety agency declares a Level 5 nuclear emergency on a scale of 7.

March 19—Radioactive materials above "allowable" levels are detected in raw milk in Fukushima Prefecture and spinach in Ibaraki Prefecture; Russian, French, and Finnish experts say Fukushima Daiichi is more likely a Level 6 nuclear emergency.

March 20—Reactors 5 and 6, which had not been operating at the time of the disaster, are stabilized in "cold shutdown."

March 21—Workers are evacuated from reactor 3 after smoke spews out.

March 22—More water is dumped on reactor 4.

March 23—Elevated levels of radioactive iodine are detected in a water treatment plant in Tokyo; the city government warns residents not to give tap water to infants.

March 24—Three workers are exposed to elevated levels of radiation at reactor 3. Water restrictions in Tokyo are lifted.

March 25—The government urges people living within a 20-30 kilometer radius of Fukushima Daiichi to evacuate voluntarily.

March 26—Radioactive iodine at 1,850 times the "allowable" level is found in seawater near the drainage for reactor 1.

March 27—High levels of radioactive water are found in tunnels near turbine buildings for reactors 1 and 3.

March 28—Highly contaminated water is found in the basement of the reactor 2 building. TEPCO announces that during the previous week it had detected plutonium in the plant.

March 30—TEPCO announces that reactors 1-4 have been decommissioned.

April 2—A cracked pit near the seawater intake for reactor 2 is found to be leaking water.

April 4—TEPCO begins dumping radioactive water into the sea, raising serious concerns about contamination of fish and other marine life, and bioaccumulation of radiation up the food chain; 520 tons of radioactive water will leak into the sea before the leaks are plugged.

April 5—Radioactive material is, in fact, found in fish caught off Ibaraki Prefecture.

April 6—TEPCO states that leaks of highly contaminated water into sea have stopped; pumps nitrogen gas into reactor 1 to prevent new hydrogen explosions.

April 7—Major aftershock strikes Miyagi Prefecture.

April 10—Work begins to remove rubble, some of it radioactive, with remote-controlled heavy machines; water in the plant tunnel system is so radioactive—more than 1,000 mSv/h—it must be removed before repair work can continue. Removal of radioactive water will continue throughout April and May.

April 11—The Japanese Nuclear and Industrial Safety Agency (NISA) raises the disaster at Fukushima Daiichi to Level 7 on the INES scale, making the crisis comparable to the Chernobyl disaster 25 years earlier.

April 25 —Japanese government increases the maximum amount of radiation exposure for children to 20 mSv/year, prompting international censure and protests from IPPNW and other NGOs.

Fukushima Radioisotopes Some Key Facts

Cesium-137, iodine-131, strontium-90, and plutonium have been the principal radioisotopes of concern to physicians, public health officials, and epidemiologists during the nuclear reactor crisis at Fukushima Daiichi. The following facts are drawn from radioisotope profiles produced by the US Centers for Disease Control and Prevention (www.cdc.gov).

Cesium-137 (Cs-137)

Half-life: 30.17 years

Mode of decay: Beta and gamma radiation

Cs-137 is produced by nuclear fission for use in medical devices and gauges. Cs-137 also is one of the byproducts of nuclear fission processes in nuclear reactors and nuclear weapons testing. Small quantities of Cs-137 can be found in the environment from nuclear weapons tests that occurred in the 1950s and 1960s and from nuclear reactor accidents, such as the Chernobyl power plant accident in 1986, which distributed Cs-137 to many countries in Europe. External exposure to large amounts of Cs-137 can cause burns, acute radiation sickness, and even death. Exposure to Cs-137 can increase the risk for cancer because of exposure to high-energy gamma radiation. Internal exposure to Cs-137, through ingestion or inhalation, allows the radioactive material to be distributed in the soft tissues, especially muscle tissue, exposing these tissues to the beta particles and gamma radiation and increasing cancer risk.

Iodine-131 (I-131)

Half-life: 8.06 days

Mode of decay: Beta particles and gamma radiation

I-131 is produced commercially for medical and industrial uses through nuclear fission. It also is a byproduct of nuclear fission processes in nuclear reactors and weapons testing. External exposure to large amounts of I-131 can cause burns to the eyes and on the skin. Internal exposure can affect the thyroid gland...which cannot distinguish between radioactive iodine and stable (nonradioactive) iodine. If I-131 were released into the atmosphere, people could ingest it in food products or water, or breathe it in. In addition, if dairy animals consume grass contaminated with I-131, the radioactive iodine will be incorporated into their milk. Consequently, people can receive internal exposure from drinking the milk or eating dairy products made from contaminated milk. Once inside the body, I-131 will be absorbed by the thyroid gland exposing it to radiation and potentially increasing the risk for thyroid cancer or other thyroid problems.

Strontium-90 (Sr-90)

Half-life: 29.1 years

Mode of decay: Beta radiation

Sr-90 is produced commercially through nuclear fission for use in medicine and industry. It also is found in the environment from nuclear testing that occurred in the 1950s and 1960s and in nuclear reactor waste and can contaminate reactor parts and fluids. Sr-90 can be inhaled, but ingestion in food and water is the greatest health concern. Once in the body, Sr-90 acts like calcium and is readily incorporated into bones and teeth, where it can cause cancers of the bone, bone marrow, and soft tissues around the bone.

Plutonium

Half-life: Pu-238—87.7 years; Pu-239—24,110 years;
Pu-240—6,564 years

Mode of decay: Alpha particles

Plutonium is created from uranium in nuclear reactors. It is a by-product of nuclear weapons production and nuclear power operations. Because it emits alpha particles, plutonium is most dangerous when inhaled. When plutonium particles are inhaled, they lodge in the lung tissue. The alpha particles can kill lung cells, which causes scarring of the lungs, leading to further lung disease and cancer. Plutonium can enter the blood stream from the lungs and travel to the kidneys, meaning that the blood and the kidneys will be exposed to alpha particles. Once plutonium circulates through the body, it concentrates in the bones, liver, and spleen, exposing these organs to alpha particles. Plutonium that is ingested from contaminated food or water does not pose a serious threat to humans because the stomach does not absorb plutonium easily and so it passes out of the body in the feces.

EDITORIALS

As the nuclear reactor crisis in Japan unfolded in the days and weeks following the earthquake- and tsunami-induced disaster at the Fukushima Nuclear Power Station, IPPNW doctors, medical students, and policy experts wrote numerous editorials and commentaries that were published in newspapers and magazines, online news sites, and the federation's own Peace and Health Blog (peaceandhealthblog.com). Many of these articles are collected here, with the publication date and source noted.

IPPNW has been a constant voice against nuclear energy

For the past six days, IPPNW doctors in a number of countries have been overwhelmed with requests from journalists hungry for information about the health effects of radiation and the potential health consequences of the crisis at Japan's nuclear reactors.

The leaders of IPPNW-Germany, many of them experts on radiation and on Chernobyl-related illnesses, happened to be meeting in Frankfurt on the weekend the disaster unfolded, and have worked around the clock ever since analyzing what information is available and putting it into a medical and public health context (see Xanthe Hall's excellent piece, "Nuclear power—basta!").

In the US, PSR has mobilized its own physician leadership to help reporters (who are openly frustrated with the quality of "official" briefings) understand what is going on. A PSR press briefing conducted by telephone from Washington, DC yesterday drew questions from the country's leading newspapers not only about the basic science of radiation, but also about how to interpret and evaluate the information coming from official sources.

Physicians in Japan, Switzerland, Australia, India, Greece, France, and other countries are explaining the biological effects of cesium-137, iodine-131, strontium-90, and

plutonium-239 (a component of the MOX fuel in one of the Fukushima reactors) to an apprehensive and confused public.

To take just one example, if you google Ira Helfand, a PSR/IPPNW leader whose skill as an emergency physician is obvious in his clear, calm explanations of complex and terrifying facts, you will find so many print, television, and radio interviews since March 11 that one can only wonder when he has slept let alone treated patients since this started.

What IPPNW is saying in the midst of crisis, sadly, is no different from what we have been warning for many years. A look back through the historical record shows that PSR issued an appeal to halt nuclear energy development in the US in 1979, mere weeks before the Three Mile Island incident.

IPPNW-Germany has made it a special part of their mission to study and document the effects of Chernobyl—an understandable response to the large amounts of radioactive fallout from Chernobyl that landed on German soil. They have held major conferences on Chernobyl over the years, and were planning the next one in Frankfurt when reality intruded.

PSR/IPPNW-Switzerland held its own conference, "Rethinking Nuclear Energy and Democracy After September 11, 2001," in 2003. The conference presentations, some of them calling the whole concept of "nuclear

IPPNW's Peace and Health Blog (peaceandhealthblog.com) contains a special section devoted to the Japan nuclear crisis, including links to online interviews, news articles, and analysis by IPPNW experts.

What IPPNW is saying in the midst of crisis, sadly, is no different from what we have been warning for many years.

safety" into question, were gathered into a publication that is still worth reading almost a decade later.)

IPPNW's organizational position on nuclear energy was adopted at the 13th World Congress in Melbourne, in 1998. The vote was not unanimous (the notes from the International Council meeting reflect opposition from the Finnish and Japanese affiliates), but the rejection of nuclear energy approved by a large majority was unambiguous and the reasons given touched on every major concern: the link with nuclear weapons proliferation; the unsolved (to this day) problem of

nuclear waste; health and environmental dangers, whether from accidents, terrorist attacks, or "normal" operations; economic costs; and the availability of wiser alternatives.

In the aftermath of Fukushima, the Melbourne resolution sounds even more urgent today than it did some 12 years ago.

—John Loretz

IPPNW Peace and Health Blog

March 17, 2011

**Nuclear Energy Resolution
IPPNW International Council
December 9, 1998
Melbourne, Australia**

BEARING IN MIND THAT:

- The acquisition of nuclear-weapons-usable materials is the most difficult step in the making of nuclear weapons and the most important obstacle to proliferation;
- Commercial reprocessing produces plutonium that can be used to make nuclear weapons;
- The creation of a technical infrastructure and of plutonium (and/or uranium-233) is an inevitable accompaniment of the use of nuclear energy, and large surpluses of weapons-usable commercial plutonium have been built up as a result;
- Nuclear power makes proliferation more likely and verification more difficult;
- All existing designs of nuclear reactors are vulnerable to accidents and can become targets of attack, for instance in conventional wars or due to terrorism, thereby creating an intolerable risk for health and environment;
- The commercial nuclear fuel cycle creates health risks for many generations in a manner similar to nuclear weapons production;
- There are far more satisfactory ways from the point of view of economy and health to meet the world's energy needs than nuclear energy;
- Unless the industrialized countries of the West make a firm commitment to phase out nuclear energy other countries are unlikely to give it up.

BE IT RESOLVED THAT IPPNW WILL WORK TOWARDS THE FOLLOWING GOALS:

- Reprocessing, both commercial and military, should be stopped.
- No new nuclear power plants should be built or commissioned in any country and existing nuclear power plants should be phased out at most by the end of their current license periods.
- Separated plutonium, whether from commercial or military sources, should not be used in nuclear reactors to generate energy.
- Immobilization of plutonium should be used as a way to put all military and all separated commercial plutonium stocks into non-weapons-usable form.
- The financial, scientific, and technological resources of society should be used to meet energy needs in far more efficient and less dangerous ways than nuclear power.

THE FIRST STEPS TO BE TAKEN SHOULD INCLUDE:

- Informing all IPPNW affiliates about the links between nuclear power and nuclear weapons.
- At this crucial juncture, creating a project to work in coalition with other groups to stop all military and commercial reprocessing.
- Creating a project to analyze the health implications of use of nuclear energy as a power source.

Nuclear power—“basta”!

It really is enough now. Hiroshima, Nagasaki, Windscale, Harrisburg, Chernobyl and now Fukushima. When will it be enough for governments around the world to understand that there is no playing with nuclear fire? The moment that Oppenheimer saw the first nuclear explosion he understood the magnitude of this new and awful kind of energy. Now the raw power of nature meets our technical arrogance and is destroying Japan in the form of earthquakes, tsunami and the unleashing of terrifying quantities of radiation. It hardly bears thinking about. But we must think about it and act upon it.

As I boarded the train this morning in Frankfurt heading back to Berlin, an exhausting day behind me, the news was still totally unclear. Had there already been a meltdown or was it yet to come? Would there be more than one meltdown? How much radiation had already leaked out of the reactor that had exploded and how much had they deliberately released to reduce pressure in the core?

In one of the television interviews I gave yesterday the interviewer began by saying “With what we know now about the accident at the Fukushima reactor, what will be the consequences for the Japanese people?” and I had to ask back “what do we know now? We know hardly anything at all.” Impossible to answer other than to say, as our outgoing Chairperson Angelika Claussen did: “we need more transparency.” How can physicians even begin to react to a disaster such as this without any real knowledge of the amounts of radiation and measurements of isotopes? It reminded me of Chernobyl where it took days before they even admitted what had really happened.

But here it could be even worse. More than one reactor is affected. Maybe more earthquakes are on their way. Evacuation is hampered by the destruction caused by the earthquake. Presumably medical services are also severely hindered from helping radiation victims and have their hands already full with mechanical injuries caused by the earthquake. It is not over yet, maybe it is just beginning. I fear the dragon has only opened its mouth, but not yet breathed out its horrific fire.

IPPNW-Germany was meeting in Frankfurt this weekend for their annual gen-

eral meeting. By Saturday morning it was clear that we could not continue with our planned agenda. For the first hour or two a small group tried to gather information and draw conclusions from what had happened or might have happened. Most of the media reports were conflicting. We studied the pictures of the reactor and tried to surmise how big the leak might be and whether we were already facing a meltdown. After a two-minute silence, we then separated into groups to decide how to act, how to react. At the same time, our press officer Angelika Wilmen rang the main TV stations and offered them interviews with our experts. The one good thing was that we were all together: Henrik Paulitz, Angelika Claussen, Reinhold Thiel, Winfred Eisenberg—all experts on radiation and health, or on security deficits in nuclear power plants. The media reaction was nothing short of overwhelming. Other doctors were quickly briefed so they

could help in reacting to all the interview requests. All of us, including myself, were called upon to give statements, appear on TV or speak to the radio.

Meanwhile the other doctors were ready to take to the streets. Equipped with banners, balloons, and “nuclear” umbrellas, we organised a flashmob in the centre of Frankfurt. About 100 of us were there, chanting loudly for the nuclear power plants to be shut down. One group shouted “nuclear power” and the other answered “basta!” The TV filmed us and people around showed their approval. It felt good to be shouting our frustration and anger. No doubt there will be more actions in the next few days and weeks. What else

**It really is time
that politicians
admit that the use
of nuclear energy,
both civilian and
military, starting
with uranium min-
ing and ending
with a chain reac-
tion, controlled or
uncontrolled—
contaminates, kills
and causes
immense suffering.**

can we do?

The answer to that question was also brainstormed and ideas emerged. More information on radiation and health in short, easy-to-read flyers that can be handed out on the streets is needed. The call for people to immediately change their electricity supplier to one that only provides renewable energy to the net should be insistent, so that money is cut off from the nuclear industry. Moving money from banks that invest in the nuclear industry, asking “how radioactive is my bank?” Flooding the government with letters demanding that nuclear power plants are shut down, right away. Calling worldwide for an end to nuclear power, starting immediately

with all nuclear power plants in regions where there is any seismic activity. These were just a few of the ideas that were voiced.

It really is time that politicians admit that the use of nuclear energy, both civilian and military, starting with uranium mining and ending with a chain reaction, controlled or uncontrolled—contaminates, kills and causes immense suffering. There have been enormous attempts to cover up the data from Hiroshima and Chernobyl so that people swallow the nuclear lie. It is not safe, it is not clean, it is not the answer to climate change, it does not keep the peace. It is our only enemy and it will kill us. Those who are not killed will helplessly watch the others die and not be able to help them. I do not exaggerate. We are doing exactly that right now, watching the people of Japan—already history's hibakusha—dying, and we cannot do anything. We can only raise our voices loud and clear and say—basta!

Nuclear energy is no alternative

The events around the Japanese quake and nuclear-reactor damage are tragic and will be repeated again in some other iteration as long as we embrace nuclear energy as an alternative to fossil fuels. The damage to the nuclear reactor and release of nuclear waste compound the tragedy of the earthquake because they now likely condemn the people of Japan (especially the children) to higher rates of cancer over the following decades as well as an expensive cleanup of waste that has an extraordinarily long half-life.

The Japanese government put down the most sophisticated system possible to prevent this exact course of events and it still happened. As we mourn this catastrophe, I hope we do not forego the opportunity to learn from it as well. We owe it to ourselves and the Japanese people.

A potential source of radiation

Indian Doctors for Peace and Development (IDPD) has expressed its grief over the devastation caused by the tsunami and earthquake in Japan. The blast at the nuclear power plant vindicates the stand of the International Physicians for the Prevention of Nuclear War (IPPNW) and IDPD that nuclear power plants are a potential source of radiation. We doctors have always maintained that the option of produc-

ing electricity from nuclear power is dangerous and expensive.

The world still remembers the Chernobyl nuclear accident; an estimated 93,000 people are reported to have perished. The health of the "liquidators" (clean-up workers), engaged in the task of clearing the area, is a matter of serious concern even today.

An accident in a nuclear power plant is almost like an atomic explosion with devastating consequences on flora, fauna and ecology. The Government of India should review its nuclear power policy and use other safe renewable options for power generation. These are widely available alternatives in our country. Japan has the best disaster management capacity; in contrast India's track record is extremely dismal. Our policy-makers ought to derive a lesson from the calamity in Japan.

Futility of nuclear energy: Alternatives for Nigeria

The footage of the double sets of tragedy in Northern Japan are a common scene on our television screens and internet pages. One set being natural (earthquake and Tsunami) and the second, technology failure (nuclear plant accidents and potential radioactive leakages).

On Friday 11th March, 2011 at 2.46pm (Japanese time) 8.9 magnitude earthquake hit the port city of Sendai in Northern Japan sending severe shock waves across the country and region. As if this was not enough, a heavy tsunami with waves as high as 8-10 meters raged across Japan and the Pacific sea at the speed of about 1000km/hr. Tsunami alarm was immediately sounded within Japan and 53 countries on the path of this monstrous phenomenon.

My treatise would be limited to the nuclear plant (NP) explosions and the potential radioactive leakages with reflection on the Nigerian planned Nuclear energy acquisition with the evitable risk such investment present for public health and human survival.

The much talked about reform in the energy sector had been raised as political bait tossed around by government since the return to democracy in 1999. Several solutions to "blackouts" had been promised but never delivered. The roadmap to Nigerian's energy sectors should be robustly driven by diversities in clean and modern sources of power production.

Our nuclear energy adventure would be aborted even before take off by monumental bureaucracy and technical challenges; we

have no proven maintenance culture not to think of an uninterrupted electric supply supported by an effective backup to an acquired NP. The NPs at Fukushima Daiichi, Japan had three tiers of electricity supply to the cooling system, all of which failed by forces of nature, the quake and tsunami. Should Nigeria be lucky to have regular electricity supply to power the cooling system, we may run out of water for one phantom reason or another.

The outcome of the failed cooling system at Fukushima-1 NP was a built up of pressure within the reactor and an eventual explosion releasing radioactive substances into the environment- a scary development of an immense historical dimension. However, conflicting reports of the exact amount of radioactivity has deepened the crisis and prompted heightened fears on the Citizens and the Government. The Nuclear watchdog Chief, Ambassador Amano would be travelling to Japan to see things for himself. Fukushima-3 NP exploded on 14 March and Fukushima-2 the following day while fire was reported in Fukushima-4 NP.

Plutonium, a highly radioactive and vital component of nuclear reactors is the element release in the event the core of the reactor is compromised. The risks of exposure of humans include radiation illnesses, future carcinoma and deaths depending of the dose of exposure. However, it is hope that the winds would blow the emissions eastwards to reduce contamination.

Apart from leakages and accidental fall-outs, disposal of nuclear waste have always posed a regrettable environmental and health disasters of unimaginable proportion.

Chernobyl in Ukraine is a case in context where effects of radioactive fallout of 1986 are still felt as far as the Nordic countries. Other NP accidents resulting in release of radioactive materials were Windscale, UK in 1957, Kyshtym, Russia in 1957 and Three mile Island, USA in 1979 just to mention a few. Debate has been re-ignited as to the closure of some of the 104 NPs in USA as the result of the current nuclear disaster in Japan.

In 2006, a near meltdown of the reactor occurred after fire broke out at a NP in Ringhals, Sweden few months after a reactor in Forsmark also in Sweden went up in flames. Health and environments campaigners have not ceased advocating for complete elimination of NP in Sweden, Germany and other European countries.

The International Physicians for the Prevention of Nuclear War (IPPNW) for over 30 years have advocated and educated the public on the dangers of eventual radiation fallout from nuclear weapons. It is universal

knowledge that nuclear reactors are precursors of nuclear weaponry. An accidental meltdown of such weapons and reactors as currently witnessed in Japan poses an enormous danger to the environment, health of humans and living things. IPPNW's effort was recognized by the UNESCO Peace Education Prize in 1984 and by the Nobel Peace Prize in 1985.

In Nigeria, the affiliate of IPPNW is known as Society of Nigerian Doctors for the Welfare of Mankind with membership all over Nigeria.

There are viable alternatives for power generation in this modern age. Hydroelectricity could be relevant and sustainable in some communities for example, NESCO was efficient at electricity supply to Bukuru and part of Jos in Plateau state from Kura falls when I resided there. Shiroro falls had its area of supply. Qua falls in Cross River state should be exploited to generate electricity for her catchment areas.

Hydropower may be complimented with other sources such as wind turbines that could be conveniently mounted offshore across the vast Bight of Benin to supply electricity to the entire South West, South South and South Eastern zones of Nigeria. Communities in the other zones could also benefit from electricity generated from wind depending on their topography.

What of our God given sunlight? This source is an envy of countries in the northern hemisphere especially those with long dark nights.

A European consortium has planned to tap sunrays from the Sahara desert to supply electricity to most of Europe, a project that if completed would begin shut down of NPs in the subscribed nations. A paradox hits hard on our psyche that is comparable to having crude petroleum oil and refineries but we wait in long queues for its by-products. Countries without crude petroleum oil or refinery have petroleum products 24/7. It would be reasonable that we hide our faces in shame if we cannot use technology to harness the benefit of our abundant sunlight.

Biodegradation has been successfully utilized for energy generation in many communities and countries. Why not in Nigeria? If well utilized, our cities would be rid of waste keeping them clean. Waste would become marketable and employment generated from organized waste collections and disposals through sales to biodegradation plants.

The suggestions above are not new; several commentators had made similar and perhaps better proposals in the past. However, one of the reasons for an apparent disregard to these ideas is situated in the misplaced priorities of successive Nigerian

Governments, corruption and huge governments; a push to satisfy political cronies outweighs instituting a legacy for a modern nation.

Unfortunately, in an event of radioactive accidents, there's just no sustainable remedy; iodine tablets have very limited solution. Evacuations to far distances have mere palliative effect. In case of Fukushima, an initial 20 km was advised and later 30 km safe zone was advocated. Many are impressed by the resilience of the Japanese people and the rescue teams who are searching all nooks and crannies despite unfavorable terrain couple with snow and falling temperatures.

One ponders how we would have managed should such a disaster confront us? What relief can we muster when a dam breaks its banks? Nigerians were stranded in Tripoli for weeks before being evacuated home. The risk of radioactive contamination should be weighed against other electricity generating options before taking a dive to disaster.

What could be worse?

Each day the news out of Japan is that much worse than the day before. Desperate attempts to scoop loads of water out of the ocean and dump them from helicopters onto overheating spent fuel pools at the Fukushima Nuclear Power Plant failed today. So did a plan to spray the reactor buildings with water cannons normally used for crowd control. Neither the helicopters nor the cannons could get close enough to their targets because radiation levels were too high. The secondary containment around one reactor is now reportedly destroyed.

Thousands of people have been evacuated from around the plant, adding to the hundreds of thousands already made homeless by the earthquake and tsunami—events that would be dominating the news under any other circumstances but now seem almost like afterthoughts (or pre-shocks?). We keep hearing that Tokyo is not in any danger from radiation right now, but our Japanese friends have told us that people in Tokyo are under enormous stress, unsure of how to balance individual and family anxiety with their deeply ingrained sense of collective responsibility.

In less than a week, the Japanese economy, like the tsunami-ravaged coast, has fallen into shambles. Any natural disaster of this magnitude has vast social, environmental, and economic repercussions, and even without the destruction of the Fukushima reactors Japan would have faced a prolonged period

of recovery and billions of dollars in costs. The nuclear crisis, however, threatens the very foundation of Japan's economy, which has been organized, for better or worse, around nuclear power.

"Worse" has now arrived. We keep hearing from Japanese leaders (who are in an impossible position) and from "nuclear safety" experts (a term that is now the dictionary definition of "oxymoron"), that this is not the worst case scenario, that full core meltdowns at the plants are unlikely, and that even if one were to occur, there would not be Chernobyl-like consequences.

Is anyone actually supposed to take any comfort from that? Are the Japanese people—or any of us, for that matter—supposed to be reassured that the damage from this incident, if it ends here, will be "limited?" Limited to what? The displacement of and trauma to thousands of people whose lives will never be the same? The creation of an uninhabitable sacrifice zone many kilometers out from the hopelessly contaminated reactor site? Tens of billions of dollars of direct and indirect costs? The devastation of an entire national psyche?

And that's not the worst-case scenario?

The case for nuclear energy, if there ever was one, has now collapsed. Far from being a cheap source of electricity, nuclear power has proven itself to be extraordinarily expensive. It is an ineffective answer to global warming because even if all other restrictions were removed we would not be able to build enough nuclear power plants to make a dent in carbon emissions in time to make a difference. Even worse, the proliferation of nuclear weapons is inextricably linked to the global expansion of commercial nuclear power reactors, which are not themselves bomb factories, but which produce the fissionable materials needed in bomb factories.

And now the things that "couldn't happen," or "couldn't happen here," or were such remote possibilities that they were worth the risk, have happened. There's even an identifiable trajectory. Three Mile Island was a catastrophe narrowly averted; Chernobyl was a "unique" catastrophe unlikely to be repeated; Fukushima was the outcome of overwhelming natural events that could not have been anticipated.

Except, of course, that they could have been—and were—anticipated by opponents of nuclear power who have been aggressively demonized by the nuclear industry and its supporters as doomsayers and fearmongers. Even this week, nuclear energy propagandists on Fox have complained that the world is "overreacting" to Fukushima.

What we have to focus on now (after

helping the victims in Japan get through the acute stages of this crisis as best they can), is the real lesson of Fukushima. The industry—and governments invested in the industry—are already promoting the self-serving message that Fukushima can teach us how to make nuclear power operations still safer and less vulnerable to natural disasters.

The lesson we ought to be learning is that we are finished with this whole misguided enterprise and with the people who persist in promoting it. That it's time (long past time, in fact) to halt the construction of any new nuclear power plants, to phase out and close down the ones that exist as soon as possible (and no later than the end of their current operating licenses), and to accelerate the transition to clean, sustainable, renewable systems for producing and consuming energy.

From Hiroshima to Fukushima and back

Settled agriculture began about 12,000 years ago. If human children are still born and play on a hospitable planet in another 12,000 years, it will be because we succeeded in eradicating the terror of nuclear weapons and preventing runaway climate change. Twelve thousand years is not very long really.

Earth has been around for 4.6 billion years. 400 human generations; one half of one half-life of plutonium-239, among the most potent radioactive carcinogens, produced in every nuclear reactor, present in large amounts in the mixed uranium/plutonium fuel in the Fukushima Daiichi No.3 reactor, and one of the two fuels for nuclear weapons.

If people can look back in 12,000 years, they will scratch their heads at the unrivalled folly of the 20th and 21st centuries. Very cleverly packaging the primordial energy that powers the stars into nuclear weapons in their tens of thousands, about 2,000 still ready to be launched in minutes. Weapons by which a self-selected few claim the right to threaten the birthright of all. Weapons able to unleash temperatures hotter than the sun, and radiation which can deliver a lethal dose with little more energy than the heat in a cup of coffee.

The same awesome power dispersed in hundreds of nuclear reactors to boil water for electricity in the most hazardous way possible, amplifying the radioactivity of the starting fuel around one million times. After a few decades the reactors themselves become radioactive waste, needing absolute isolation for hundreds of thousands of years on a small interconnected planet, with 11 earth-

quakes of magnitude 8.5 or greater in the 20th century, and 5 in the first 11 years of the 21st, almost all of them followed by tsunamis. More nuclear reactors raising further the danger of nuclear war have been justified on the pretext of slowing climate change.

Our paramount shared responsibilities are clear: first, negotiate an irreversible, verifiable global treaty to outlaw and eliminate nuclear weapons, urgently. This will require enrichment of uranium to be very tightly restricted, and extraction of plutonium from spent nuclear fuel to cease. Second: prevent rampant global warming by massively and speedily scaling up energy efficiency, demand reduction and benign, renewable energy production.

In our ordinary, fallible, uncontrollable world, there are already enough primordial forces capable of great destruction. We don't need any more. The power of nuclear fission and fusion belong in the stars. And that is where they should stay. The recent catastrophe in Fukushima is a strong vindication of this truth.

The nuclear chain – splitting atoms, hairs and personalities

It is no coincidence that one speaks of the civilian and military use of nuclear energy. There is nuclear energy on the one hand and on the other there is the way it is used. It can create a nuclear explosion or it can be harnessed to make electricity, but intrinsically, it is the same thing.

After the earthquake and tsunami hit Fukushima, many people around the world asked the question: after what the Japanese had suffered from the military use of nuclear energy on Hiroshima and Nagasaki, why did they invest so greatly in the civilian use? Indeed, it is surprising that the original distaste for all things nuclear was lost in the sixties, when Japan began building nuclear power plants to beat the band. More than just about any other country, except perhaps France, the Japanese seemed to think nuclear energy was the best thing since sliced bread. And while just about everyone else (except the Russians) was shifting away from the plutonium economy, saying that it was too dangerous and too expensive, Japan began using MOX and expanding its reprocessing facilities.

Yet this inexplicable splitting of the collective personality into nuclear good and nuclear bad is not just a Japanese phenomena. Attend any Review Conference of the Non-Proliferation Treaty (NPT), you will

hear the same weird belief that nuclear energy is bad in weapon form, but good if you plug it in and run your kettle off of it. A whole institution has been built on this lie that was part of the 50s propaganda "Atoms for Peace", the International Atomic Energy Agency (IAEA).

Nuclear energy is not good or bad, in my view. What I condemn is the human arrogance and ignorance that leads us to think that we can control a force as massive and potentially destructive as this, or that the risks inherent in harnessing it as a source of electricity are calculable. Chernobyl showed us how humans make mistakes. Fukushima has made it abundantly clear that we are not in control, and that we are pitiful in the face of nature's ability to determine our fate. The disaster that hit Japan was bad enough, but did we need to compound it by adding our own stupidity to the equation by building nuclear reactors on fault lines?

It starts at the front end with the mining of uranium. Locked up in rock, uranium was not meant to be taken out of the earth—so we are wisely advised by the indigenous peoples of the world, who have lived on top of uranium-filled rock for centuries. Remove it from its natural habitat and it becomes dangerous, releasing particles that, when breathed in, can cause cancer.

After being processed, the uranium then has to be enriched. Again, the difference is minimal. Once you have the technology to enrich, then you can choose how much you enrich your uranium—roughly, 3-5% for nuclear power, 20% for medical isotopes, 85-90% for weapons. The only thing that stands in your way is the view that there is nuclear good and nuclear bad. And a treaty. But you can choose not to sign the treaty in the first place, or use it to get the nuclear technology and then leave the treaty. So far, so good (or bad).

The chain does split into two different branches when you get to putting your enriched uranium to use—you can put your enriched uranium into a nuclear power plant and make electricity with it, or you can enrich it a bit more and make nuclear weapons. (By the way, you can also use the by-product of the enrichment process, depleted uranium, to make weapons as well.)

When it gets to the question of waste, however, it gets more complicated. What should you do with it all? Rather than just throwing it all away (and where should it go?) you can reprocess it. And because you've successfully made plutonium by burning your uranium in a nuclear reactor, you can separate this out and, bingo, you have the stuff to make MOX. Or nuclear weapons. Japanese politicians have repeatedly remind-

ed the world that they had enough plutonium stockpiled that they could easily make a whole load of nuclear weapons, should they be so inclined. What stopped them? The view of nuclear good and nuclear bad.

When it comes to Iran, there is only nuclear bad in the eyes of the West. It was the conflict with Iran that really started to shake the foundations of Article IV of the NPT that says everyone has a right to use nuclear energy "peacefully." Actually, the discovery in the early 90s that Iraq had hidden a well-developed military nuclear programme successfully behind its "peaceful" programme while remaining an NPT member was the first major wake-up call. Then the lid blew on A.Q. Khan's network and people began to realise that the proliferation of nuclear energy could lead and had led to the proliferation of nuclear weapons. The good, the bad and the ugly.

What we forget is that while the intention may be peaceful, the energy itself is not. The difference between "peaceful" and "military" use is no more than a hair's breadth. From outside, it is hard to see the difference, you have to send in the IAEA to inspect, probe and interrogate. Still, we don't really know whether Iran's nuclear programme is good or bad and the IAEA is still looking for actual (rather than circumstantial) evidence.

Instead of splitting hairs over whether there is a difference between nuclear energy and nuclear energy, we should begin to understand the connection between all the aspects of the nuclear chain. There is an inextricable link that binds uranium mining, enrichment, nuclear power, reprocessing, nuclear weapons, radioactive waste and fall-out together. When we talk about one, we should not forget all the others. They add up to make an ugly picture of death and destruction, of incalculable risk and contamination.

—Xanthe Hall

March 21, 2011*

Just in case you missed it, here's why radiation is a health hazard

The March 11 earthquake and tsunami in Japan and complicating nuclear crisis  throw into sharp focus concerns about exposure to ionising radiation. What is it, how is it harmful, how much is too much?

Inside a nuclear reactor, the radioactivity is increased about a million times as some of the uranium or plutonium is converted to a cocktail of hundreds of different radioactive elements.

There are many different pathways through which people can be exposed to radiation: inhalation of gases or particles in the air, deposits in soil or water, ingestion of

food, water or dust. Some radioisotopes mimic normal chemical elements in living systems and therefore make their way up the food chain and onto our plates.

Ionising radiation

Radiation is called “ionising” when it has sufficient energy to knock the electrons off atoms to produce ions (atoms which have a net positive or negative electrical charge). Ionising radiation damages large complex molecules either directly or by creating highly reactive chemicals inside cells.

The biological potency of ionising radiation is not related to the amount of energy it contains so much as that this energy is packaged in a form which can reach and damage complex molecules—particularly the DNA that is our genetic blueprint, that is passed on to form each new generation.

A lethal dose of radiation may contain as little energy as the heat in a cup of coffee. Our senses cannot warn us about ionising radiation—it cannot be seen or touched or felt or tasted or smelt.

Levels of exposure

Some effects of radiation only occur above certain thresholds. In the short term, high levels of radiation exposure can cause acute radiation sickness. In the longer term there is an increased risk of cataracts, birth defects, sterility and hair loss.

High doses of radiation can kill cells - this is the reason targeted radiation is used in the treatment of some cancers.

Acute radiation exposure at doses over 100 milliSieverts (mSv), and particularly over 1000 mSv, has most impact on our rapidly dividing cells. These are the blood-forming cells of the bone marrow, lining of the gut, and ovaries and testis. The symptoms of acute radiation sickness therefore include vomiting and diarrhea, bleeding, and reduced ability to fight infection.

The major long-term effect of ionising radiation exposure is an increased risk of a wide variety of cancers. There is no “safe” level of radiation below which there is no increase in cancer risk. The earliest to appear, after around three to five years, are leukemia and thyroid cancer. The 1986 Chernobyl disaster, for instance, has resulted in an epidemic of thyroid cancer with 6,500 children affected so far.

Other cancers begin increasing after 10 years—lung, breast, colon, ovary, bladder and many others. Excess rates of cancer in the Hiroshima and Nagasaki survivors continue to rise.

Sources of exposure

All of us are exposed to ionising radia-

tion all the time - from the stars, from the earth and rocks, from common equipment and appliances. The global average estimated human exposure is 2.4 mSv per year.

The biggest natural source is radon gas produced from radium, part of the decay chain of uranium, which is widely distributed in the Earth's crust. After smoking, radon is the second most important cause of lung cancer worldwide.

The bulk of ongoing exposures of human origin are from medical X-rays, and there is considerable concern about the rapidly rising medical radiation exposures, particularly from the growing number of CT scans being performed. CT scans involve radiation doses of between 3 and 11 mSv.

Exposure to ionising radiation from all sources should be kept as low as is feasible. In Australia and most countries, it is recommended that 1 mSv per person per year be the maximum permissible exposure from non-medical sources for the general population; and 20 mSv per year the annual permissible limit for nuclear industry workers. In Japan the maximum permissible dose for the emergency nuclear workers in Fukushima has been increased to 250 mSv.

Health harms

The most authoritative current estimates of the health effects of low dose ionising radiation are contained in the Biological Effects of Ionising Radiation VII report from the US National Academy of Sciences (BEIR VII). This report reflects the substantial weight of scientific evidence that there is no exposure to ionising radiation that is risk-free. The greater the exposure, the greater the risk.

BEIR VII estimates that each 1 mSv of radiation is associated with an increased risk of solid cancer (cancers other than leukemia) of about 1 in 10,000; an increased risk of leukemia of about 1 in 100,000; and a 1 in 17,500 increased risk of cancer death.

But while radiation protection standards are typically based on adult males, it is important to note that not everyone faces the same level of risk. For infants (under 1 year of age) the radiation-related cancer risk is 3 to 4 times higher than for adults; and female infants are twice as susceptible as male infants.

Females face a lower risk of leukemia, but a 50% greater risk of developing a more common solid tumour, so their overall risk of cancer related to radiation exposure is 40% greater than for males. Fetuses in the womb are the most radiation-sensitive of all.

Over time, estimates of the health risks associated with radiation exposure have inexorably risen. Some of these risks are probably still under-estimated, particularly

the impact of internal contamination, such as from plutonium particles lodging in the lung. Internal contamination may not be picked up by external devices designed to detect gamma radiation alone, such as the handheld radiation monitors now being widely used to screen people in Japan.

In Germany, a recent national study showed that normal operation of nuclear power plants in Germany is associated with a more than doubling of the leukemia risk for under five year olds living within 5 km of a nuclear plant, and increased risk was seen to more than 50 km away. This was much higher than expected.

The longevity of some radioactive minerals is almost incomprehensible. Plutonium-239 has a half-life of 24,400 years. It will take almost a quarter of a million years for it to decay to less than one thousandth of the starting level. So the same particle inhaled into someone's lung could go on to increase cancer risk for other individuals over successive generations.

—Tilman Ruff
The Conversation (Australia)
March 24, 2011

There really is no safe level of radiation

As the radioactive contamination of food, water, and soil in Fukushima, Japan worsens, the media is continuously reassuring us that these levels are "safe." But there is no safe level of radiation.

Yes, at lower levels the risk is smaller, but the National Research Council of the National Academies of Science has concluded that any exposure to radiation makes it more likely that an individual will get cancer.

The press is reporting that 100 millisieverts (mSv) is the lowest dose that increases cancer risks. This simply isn't true. According to the NAS, if you are exposed to a dose of 100 mSv, you have a one in 100 chance of getting cancer, but a dose of 10 mSv still gives you a one in 1,000 chance of getting cancer, and a dose of 1 mSv gives you a one in 10,000 risk.

Those odds sound fairly low for one individual, but if you expose 10,000 people to a one in 10,000 risk, one of them will get cancer. If you expose 10 million people to that dose, 1,000 will get cancer. There are more than 30 million people in the Tokyo metropolitan area.

To understand the danger of low levels of radiation exposure, consider several factors.

First, the total dose is the most important factor, not the dose per hour. When you get an X-ray, you're exposed to a one-time

burst of radiation. If you work for 10 hours in a spot where the radiation level is 1 millisievert per hour, your dose is 10 millisieverts, and the dose goes up the longer you stand there.

Second, there's a big difference between external and internal radiation. If you're standing in a spot where you're exposed to external radiation, that exposure ends as soon as you move away. But if you ingest or

inhale a radioactive particle, it continues to irradiate your body as long as it remains radioactive and stays in your body.

Further, if you ingest radioactive particles, the dose isn't spread evenly over your entire body. It concentrates where the particles lodge. The average

total body dose may be relatively low, but the dose at the site may be large enough to damage that tissue and cause cancer.

That's why the radiation being found in Japan in spinach, milk, and other food—as well as water—is so worrisome. If consumed, it will create ongoing radiation exposure and increase the risk of cancer. A large majority of the hundreds of thousands of cancer cases that have occurred in the former Soviet Union because of the Chernobyl catastrophe were caused by people eating radioactively contaminated food.

Finally, it makes a big difference who gets irradiated. Children are much more vulnerable than adults. If a fetus is exposed to only 10 mSv in utero, his or her risk of getting cancer by age 15 doubles. So it's particularly dangerous when children or pregnant women consume radioactive food or water.

Reports indicate that the total radioactive releases in Fukushima have been relatively small so far. If this is the case, then the health effects will be correspondingly small. But it's not "safe" to release this much radiation. Some people will get cancer as a result. Most importantly, we don't know at this point how much more radiation there will be.

That's why the U.S. government has said that people shouldn't be allowed within 50 miles of the plant.

If a comparable accident were to occur at the Indian Point nuclear reactors 24 miles north of New York City, 17 million people would need to evacuate. That's something to think about when we're told everything is OK at our nuclear plants.

—Ira Helfand
CommonDreams.org, widely syndicated
March 28, 2011

Over time, estimates of the health risks associated with radiation exposure have inexorably risen. Some of these risks are probably still underestimated...

Anger is renewable energy

Some weeks ago, I had a 9 year old patient who was suffering from enormous temper tantrums. Whenever he felt overwhelmed and helpless, when it was clear to him that no one would listen to his voice, he didn't know of any better way to deal with his feelings than to hurt himself and everyone around. Kicking, beating, biting and scratching, he tried to gain control of the situation and forced helplessness onto the adults who had been so ignorant before.

When I read about what is going on in Japan now, I somehow feel like this little boy. I feel overwhelmed with anger, but there's no one to address, no one listening to people's questions and concerns. I feel helpless to the point of being paralyzed. Haven't we warned our governments of the hazards of using nuclear power again and again? Aren't there already thousands and thousands of innocent people suffering from the consequences of a man-made disaster, in vast areas around Chernobyl?

Prevention is a medical doctor's most important contribution for securing their patients' well being and survival. In this case, it means putting an end to nuclear technology once and for all. The use of nuclear power, be it civil or military, has brought an intolerable risk upon us. People's health is constantly at stake, so to speak from the cradle to the grave of the radioactive material needed for the nuclear fuel rods.

The tragedy starts with the neglected suffering of the uranium miners in Canada, Australia, Niger, Namibia, India or the United States. Many of them indigenous people who have been tricked into sacrificing their sacred lands for nuclear weapons and the Western world's craving for more and more energy. Those sacred lands have become wastelands, the radioactive tailings making them unsafe for centuries.

It goes on with the children living near one of the many nuclear power plants. Their leukemia risk increases 1.2 fold if their home is located within a range of 5 kilometers around a nuclear power plant. To make myself clear on that point: We speak of the risk emerging under normal operation. Still, politicians and so-called independent scientists do not seem to be concerned. Besides, the World Health Organization, having the mandate to promote and protect the health of all peoples, is subjected to the interests of the International Atomic Energy Agency by a working agreement approved in 1959. Oh, the IAEA's objective is to promote the civil use of nuclear technology throughout the world, right?

In addition, nobody knows how to deal

with the radioactive waste adding up with every second of running a nuclear power plant. Burying it in ancient salt mines or using outer space as a nuclear landfill? One solution is more insufficient than the other. Depleted uranium, a byproduct of uranium enrichment for nuclear power plants or weapons, has been used by the U.S. and other NATO forces for developing weapons with unusual armor-piercing capabilities. Dumped on the battlefields in Iraq or the Balkans, the cheap and abundant material threatens the health of everyone living in the surroundings because of its radioactivity and chemical toxicity.

Nuclear power powers the bomb. Research in the field of nuclear technology, even if for medical purposes, always bears the risk of being used for the development and proliferation of the most cruel weapon of mass destruction humanity has ever invented. We won't escape the nuclear vicious circle if we overlook the link between the civil use of nuclear energy and its even more evil siblings, the nuclear weapons still being stored all over the world.

I don't want to silently swallow all that anger and sadness. I want to tell the world about it even if there's this meanly nagging suspicion that no one's really listening. I'm afraid that the world's leaders interest will abate within short notice, that the media will find another topic of urgent interest in no time. Sometimes it is better to be outraged than to be paralyzed. Maybe we should store some of this anger and use it as a renewable source of energy. We'll have to apply it wisely and persistently in order to make sure that the nuclear lobby won't have the final say.

—Ursula Völker

IPPNW Peace and Health Blog

Children of Fukushima need our protection

I was dismayed to learn that the Ministry of Education, Culture, Sports, Science and Technology earlier this week increased the allowable dose of ionizing radiation for children in Fukushima Prefecture.

The dose they set, 3.8 microsieverts per hour, equates to more than 33 millisieverts (mSv) over a year. This is to apply to children in kindergartens, nursery, primary and junior high schools. Let me try to put this in perspective.

Widely accepted science tells us that the health risk from radiation is proportional to the dose—the bigger the dose the greater the risk, and there is no level without risk.

The International Commission on Radiological Protection recommends that all

radiation exposure be kept as low as achievable, and for the public, on top of background radiation and any medical procedures, should not exceed 1 mSv per year.

For nuclear industry workers, they recommend a maximum permissible annual dose of 20 mSv averaged over five years, with no more than 50 mSv in any one year.

In Japan the maximum allowed annual dose for workers, 100 mSv, was already higher than international standards. This has been increased in response to the Fukushima disaster to 250 mSv.

The U.S. National Academy of Sciences BEIR VII report estimates that each 1 mSv of radiation is associated with an increased risk of solid cancer (cancers other than leukemia) of about 1 in 10,000; an increased risk of leukemia of about 1 in 100,000; and a 1 in 17,500 increased risk of dying from cancer.

But a critical factor is that not everyone faces the same level of risk. For infants (under 1 year of age) the radiation-related cancer risk is 3 to 4 times higher than for adults; and female infants are twice as susceptible as male infants. Females' overall risk of cancer related to radiation exposure is 40 percent greater than for males. Fetuses in the womb are the most radiation-sensitive of all.

The pioneering Oxford Survey of Childhood Cancer found that X-rays of mothers, involving doses to the fetus of 10-20 mSv, resulted in a 40 percent increase in the cancer rate among children up to age 15.

In Germany, a recent study of 25 years of the national childhood cancer register showed that even the normal operation of nuclear power plants is associated with a more than doubling of the risk of leukemia for children under 5 years old living within 5 kilometers of a nuclear plant.

Increased risk was seen to more than 50 km away. This was much higher than expected, and highlights the particular vulnerability to radiation of children in and outside the womb.

In addition to exposure measured by typical external radiation counters, the children of Fukushima will also receive internal radiation from particles inhaled and lodged in their lungs, and taken in through contaminated food and water.

A number of radioactive substances are concentrated up the food chain and in people. As a parent, as a physician, the decision to allow the children of Fukushima to be exposed to such injurious levels of radiation is an unacceptable abrogation of the responsibility of care and custodianship for our children and future generations.

The writers

Subhas Chakraborty is Secretary, Indian Doctors for Peace and Development, Kolkata.

Richard Grady is President, Washington Physicians for Social Responsibility, Seattle.

Xanthe Hall is a nuclear weapons and nuclear energy policy expert and campaigner with IPPNW-Germany.

Ira Helfand is an internist and emergency physician in Springfield, Massachusetts; past president of Physicians for Social Responsibility; and North American regional vice president of International Physicians for the Prevention of Nuclear War.

Ime John is a former co-president of International Physicians for the Prevention of Nuclear War.

John Loretz is program director of International Physicians for the Prevention of Nuclear War.

Tilman Ruff is associate professor, Nossal Institute for Global Health, University of Melbourne; regional vice president of International Physicians for the Prevention of Nuclear War for Southeast Asia and the Pacific; and chair of the International Campaign to Abolish Nuclear Weapons (ICAN).

Ursula Völker, a physician from Tübingen, Germany, specializes in child and adolescent psychiatry, and is on the board of IPPNW-Germany.

COMMENTARIES

In addition to articles written for the press, IPPNW and its affiliates published their own statements about events at Fukushima; recommendations for action by the Japanese government, their own governments, and international agencies; and the need to phase out and end reliance on nuclear energy around the world. A number of those statements are reproduced in this section.

IPPNW-Germany demands the closing of all nuclear power plants worldwide

25 years after Chernobyl, and on the day of the catastrophe in Fukushima that resulted in an uncontrolled release of radioactivity, the German affiliate of the International Physicians for the Prevention of Nuclear War (IPPNW) demands that all nuclear power plants worldwide should be closed down. The risks of nuclear technology are uncontrollable even for allegedly safe nuclear power plants of the western world.

IPPNW points out that the population density in Japan is about 15 times higher than it is in the Chernobyl region. (Japan: 337 inhabitants/square kilometre). Depending on the direction of wind and weather situation the health consequences in Japan may be dramatic.

As physicians we wish to emphasise the global health risk that is a result of this catastrophe.

The radioactive cloud will not halt at Japan's borders. Increased levels of radioactivity were detected after Chernobyl even several thousands of kilometers away in Japan.

The time has come for politicians to prevail against the mighty lobby of the nuclear industry.

It is irresponsible to endanger us citizens for the profit interest of a few companies.

—IPPNW-Germany
12 March 2011

Medical specialists urge full information on Japan health risks

Specialists from the Medical Association for Prevention of War today lamented the lack of accurate information about the continuing

nuclear crisis in Japan. It is deeply concerning that our government has now advised that Australian citizens should evacuate 80 km from Fukushima, having only yesterday reassured Australians that the 30km Japanese evacuation zone was adequate.

"We call on the Australian Government to seek and distribute comprehensive information from Japanese authorities about radiation releases from the ailing Fukushima reactors," said MAPW President Dr. Bill Williams.

"We are gravely concerned for those emergency workers on-site at Fukushima, and the hundreds of thousands of desperate people now sheltering or fleeing from radioactive fallout. Without accurate data, it is impossible to accurately assess risk levels."

MAPW notes that the lack of detailed data has already led to mischievous claims from industry representatives that people are at no risk. Equally disturbing has been the trend in some official statements trivialising the risks associated with lower level exposures.

"The current scientific understanding of the health risks from ionising radiation exposures are based on decades of research," said Dr Williams. "The worldwide expert consensus conforms with the so-called 'Linear No Threshold' model: this means there is no safe dose of ionising radiation."

While it is essential that a calm and rational approach is adopted in advising the public, it is equally important not to give false assurance or to trivialise the dangers. Because of the chromosomal disruption caused by the radioactive matter being released from the damaged reactors and spent fuel ponds, inhalation or ingestion can lead—even at low doses—to cancers. This is

particularly so for children, babies and of course developing embryos. Many of the cancers caused by radioactive fallout from the Chernobyl accident were due to relatively low levels of radiation in the form of ingested I-131 in children drinking milk from cows which ate contaminated grass.

"We hope and pray that the Japanese emergency response averts the danger of larger releases over the coming days," said Dr Williams, "but the environment has already been contaminated, and people will be at risk of exposure to radioactive agents like iodine-131 and caesium-137 for many years to come."

—*Medical Association for Prevention of War, Australia*

India Should Use Renewable Resources for Power Generation; Shun Nuclear Power Plants

While expressing solidarity with the people of Japan at the devastation caused by Tsunami and Earthquake, Indian Doctors for Peace and Development (IDPD) has demanded that India should shun the pursuit for nuclear power plants and instead look forward to utilize renewable energy resources like, wind power, biowaste, micro-hydel and solar which are in plenty in our country.

We demand the government to immediately put moratorium on all ongoing nuclear activity.

Events in Japan are very shocking and vindicate the stand of International Physicians for the Prevention of Nuclear War (IPPNW) and IDPD that nuclear power plants are a potential threat of radiation. The cost of producing electricity from nuclear power is fraught with dangers and is 2-3 times more expensive than from conventional sources like coal and gas. There cannot be any comparison with the renewable resources which are totally non hazardous.

It is pertinent to note that US has not built any nuclear power plant since the 3 Mile Island incident and France which pioneered the nuclear technology and nuclear power plants have not built one in the last 25 years. The nuclear plant can never be dismantled as the half life of Uranium in the reactor is 24000 years that means the danger is reduced to half 24000 years and they have to be kept for an eternity, literally, before the spent fuel (the used Uranium from reactors) for it to become safe completely.

More over the cost of dismantling is much more than the cost of installation. The track record of safety in the nuclear facilities in India is far from satisfactory.

According to reports an estimate 300 incidents of serious nature have occurred causing radiation leaks and physical damage to the workers. But these have remained official secrets so far. During Tsunami water had entered the Kalpakkam Nuclear Plant in Tamil Nadu. The people around Uranium mines in Jadugoda are total unprotected. As per the reports the technology being used by the French company, Areva, which is building the world's largest nuclear power plant in beautiful coastline of Ratnagiri (Jaitapur Town), India has not been completely tested.

The world still remembers the Chernobyl nuclear accident where about 93000 people are reported to have died. Health of liquidators (cleanup workers) engaged in the job of cleaning the area is a matter of serious concern even today. An accident in a nuclear power plant is almost like an atomic explosion with serious consequences on flora & fauna and ecology. We demand that the Indian government should review its nuclear power policy and use other safe renewable options for power generation which are available in abundance in our country. Japan has the best disaster management capacity but in contrast our country's track record in disaster management is extremely dismal.

The explanation by some of our nuclear lobbyists that our country falls in the low seismic zone is unfounded and ignoring the reality as next time the disaster may not be due to earthquake but due to terrorism, climate change, technology failure, proliferation of plutonium or human error.

IDPD is writing a letter to Prime Minister and all MPs in this regard.

PSR Statement on Radiation Exposure in the United States from the Japan Nuclear Accident

The unknown and changing situation in Japan regarding radiation releases is continuing to cause concern and confusion here in the United States. PSR National and our Chapters are receiving many questions regarding radiation effects and requests for medical advice. It is not possible for PSR to provide specific case-by-case medical advice. This should be given by individual health care providers and public health officials.

Currently, the primary public health risk from radiation exposure is to people closest to the plant site in Japan and in particular the workers. At this time, it is not known how much radiation may reach the US. It will depend on the amount of radiation released

and how the wind blows. Given the long distance across the ocean between the US and Japan, much smaller amounts are likely to reach the US and will likely not require any special treatment. However, avoiding radioactively contaminated food and water is strongly recommended.

For those people who are close by and directly affected by the radioactive plume, protective measures include staying indoors, moving to safer areas, and having children, pregnant women and lactating mothers take potassium iodide (KI). Pregnant mothers should do this only in consultation with their physician. Patients with known thyroid disorders should also consult a physician.

At this time, we do NOT recommend that people in the US purchase or take potassium iodide (KI). We do not recommend further preventive measures at the present time. We will continue to monitor the situation as best we can.

Physicians for Social Responsibility Deeply Concerned About Reports of Increased Radioactivity in Food Supply

Physicians for Social Responsibility (PSR) expressed concern over recent reports that radioactivity from the ongoing Fukushima accident is present in the Japanese food supply. While all food contains radionuclides, whether from natural sources, nuclear testing or otherwise, the increased levels found in Japanese spinach and milk pose health risks to the population. PSR also expressed alarm over the level of misinformation circulating in press reports about the degree to which radiation exposure can be considered “safe.”

According to the National Academy of Sciences, there are no safe doses of radiation. Decades of research show clearly that any dose of radiation increases an individual’s risk for the development of cancer.

“There is no safe level of radionuclide exposure, whether from food, water or other sources. Period,” said Jeff Patterson, DO, immediate past president of Physicians for Social Responsibility. “Exposure to radionuclides, such as iodine-131 and cesium-137, increases the incidence of cancer. For this reason, every effort must be taken to minimize the radionuclide content in food and water.”

“Consuming food containing radionuclides is particularly dangerous. If an individual ingests or inhales a radioactive particle, it continues to irradiate the body as long as it remains radioactive and stays in the body,” said Alan H. Lockwood, MD, a member of the Board of Physicians for Social

Responsibility. “The Japanese government should ban the sale of foods that contain radioactivity levels above pre-disaster levels and continue to monitor food and water broadly in the area. In addition, the FDA and EPA must enforce existing regulations and guidelines that address radionuclide content in our food supply here at home.”

As the crisis in Japan goes on, there are an increasing number of sources reporting that 100 milliSieverts (mSv) is the lowest dose at which a person is at risk for cancer. Established research disproves this claim. A dose of 100 mSv creates a one in 100 risk of getting cancer, but a dose of 10 mSv still gives a one in 1,000 chance of getting cancer, and a dose of 1 mSv gives a one in 10,000 risk.

Even if the risk of getting cancer for one individual from a given level of food contamination is low, if thousands or millions of people are exposed, then some of those people will get cancer.

Recent reports indicate the Japanese disaster has released more iodine-131 than cesium-137. Iodine-131 accumulates in the thyroid, especially of children, with a half-life of over 8 days compared to cesium-137, which has a half-life of just over 30 years. Regardless of the shorter half-life, doses of iodine-131 are extremely dangerous, especially to pregnant women and children, and can lead to incidents of cancer, hypothyroidism, mental retardation and thyroid deficiency, among other conditions.

“Children are much more susceptible to the effects of radiation, and stand a much greater chance of developing cancer than adults,” said Dr. Andrew Kanter, president-elect of PSR’s Board. “So it is particularly dangerous when they consume radioactive food or water.”

All food contains some radioactivity as a result of natural sources, but also from prior above-ground nuclear testing, the Chernobyl accident, and releases from nuclear reactors and from weapons facilities. The factors that will affect the radioactivity in food after the Fukushima accident are complicated. These include the radionuclides that the nuclear reactor emits, weather patterns that control the wind direction and where the radionuclides are deposited, characteristics of the soil (e.g., clays bind nuclides, sand does not) and the nature of the food (leafy plants like spinach are more likely to be contaminated than other plants like rice that have husks, etc.). However, radiation can be concentrated many times in the food chain and any consumption adds to the cumulative risk of cancer and other diseases.

“Reports indicate that the total radioactive releases from the Fukushima reactor

have been relatively small so far. If this is the case, then the health effects to the overall population will be correspondingly small," said Ira Helfand, MD, a member of the Board of Physicians for Social Responsibility. "But it is not true to say that it is "safe" to release this much radiation; some people will get cancer and die as a result."

—Physicians for Social Responsibility
March 23, 2011

Nuclear catastrophe in Fukushima: extend the evacuation zone

The physician's organisation IPPNW-Germany and the President of the German Society for Radiation Protection (GfS), Sebastian Pflugbeil, believe that an extension of the evacuation zone around the damaged Fukushima nuclear plant is urgently needed. They call on the Japanese government to evacuate the population promptly from a much wider area, in particular to ensure the protection of children and pregnant women.

The recommendation of the US Nuclear Regulatory Commission (NRC) and the Australian Radiation Protection and Nuclear Safety Agency that the evacuation zone be extended to 80 kilometres could be a helpful first step, say the two organisations. Evacuation zones, however, are only a method of helping to roughly mark out a possible area of contamination and in reality the radioactive exposure depends on wind direction, strength and precipitation. Twenty-five years ago, when the Chernobyl disaster occurred, there was an irregular distribution of contamination and "hot spots" emerged, where the Soviet authorities found contamination of more than 555,000 becquerel per m².

Reinhold Thiel, member of the German Board of IPPNW, is especially worried about the danger posed by unit 3: "This unit is run on MOX fuel which contains plutonium and black smoke is billowing out of it. I am concerned that large amounts of plutonium are

now being released into the air." IPPNW calls on the German government to press for an immediate publication of all existing measurements of plutonium levels. "It could be, however, that Chancellor Merkel already has that information" said Thiel.

Plutonium is a highly toxic emitter of alpha radiation which does approx. 20 times more biological damage than the same dose of gamma emitting radionuclides such as Cesium-137. Breathing in plutonium easily leads to bronchial and lung cancer. If plutonium is taken into the body via food and drink, it concentrates in the liver and bones and has a biological half-life of 40 years in the liver, 100 years in bones.

According to IAEA, high levels of beta-gamma radiation were found at distances between 15 and 58 km away from the nuclear power plant. The measured levels were between 200,000 und 900,000 becquerel per m². This means, according to Prof. Edmund Lengfelder of the Otto Hug Institute on Radiation, that the Fukushima disaster has evidently reached the same dimensions seen in Chernobyl. After the Chernobyl disaster, contamination reached more than 555,000 bq/m² (Cesium-137) in Ukraine, Russia und Belarus.

Japanese authorities have found up to 55,000 bq/kg iodine-131 in spinach from the Ibaraki prefecture. These levels are way above the acceptable levels for Japan for consumption (2,000 bq/kg).

IPPNW and GfS call on foreign minister Guido Westerwelle to actively pursue the publishing of the radiation measurement data that the Comprehensive Test Ban Treaty Organisation (CTBTO) has collated through its global network of monitoring stations. The CTBTO shares this information with the WHO and IAEA but has not yet made this data public.

MAPW President Bill Williams
YouTube video posted on March 29, 2011

Noting that Australia is a major source of the world's uranium for nuclear power plants, Dr. Bill Williams, President of IPPNW's Australian affiliate, MAPW, said "the Tokyo Electric Power Company is buying about a third of their uranium from us. Think about it. That cloud of radioactive gas and other materials that's depositing over Japan right now, some of that actually started here in Australia....On a good day for the nuclear industry, that uranium ends up as radioactive waste and we don't know what to do about that. But on a really bad day for the nuclear industry and for the rest of us, it ends up as radioactive fallout."

—www.youtube.com/watch?v=LziwRNUivPM

IN THE NEWS

Reporters and editors looking for an independent perspective on the health implications of the Fukushima nuclear disaster called upon experts at IPPNW and its affiliates to explain the dangers of rising radiation levels for the people in contaminated areas, and the potential dangers for those in other parts of the world should the radiation spread as it did after the Chernobyl explosion. A representative sample of quotes and citations from the international press are reproduced in this section, in chronological order.

"It is not known how much radiation has been or will ultimately be released from the damaged Daiichi nuclear reactor in Japan, but as found by the National Academy Sciences, any exposure to radiation increases a person's risk of cancer. No one, including the plants operators, can say what is going to happen, and potentially millions of people are in harm's way. The Japanese government should be preparing for the worst-case scenario. After one year of operation, a commercial nuclear reactor contains 1,000 times as much radioactivity as was released by the Hiroshima bomb. From a public health perspective, the most important isotopes are short-lived isotopes of iodine (like Iodine-131), Cesium-137, Strontium-90, and possibly Plutonium-239. Radioactive iodine caused thousands of cases of thyroid cancer in children after the Chernobyl accident. Cesium and strontium cause a number of different kinds of cancer and remain dangerous for hundreds of years; plutonium causes lung cancer as well as other types of cancer and remains deadly for hundreds of thousands of years."

Radiation fears for residents near nuclear plant

The International Atomic Energy Agency says radiation levels around the plant are now 400 millisieverts an hour. That's eight times the amount, every 60 minutes, that nuclear workers are normally sup-

posed to absorb in a year.

Ira Helfand: That means that somebody who is exposed to this for a couple of hours would develop radiation sickness. This is a very, very large increase from the radiation readings that have been recorded just a few hours before the most recent explosion.

Bronwyn Herbert: Ira Helfand is a medical doctor based in Washington, DC who has written extensively on the impacts of radiation.

Ira Helfand: Well there are two different kinds of harm. If you get a high enough dose of total body irradiation you'll develop something called radiation sickness and you, over the course of a period of days to weeks, develop nausea, vomiting, suppression of your bone marrow which allows you to become susceptible to infections which promotes bleeding and you become weak, dehydrated. And if you absorb a large enough dose you die from this over a period of several weeks.

But even if you don't get that kind of large total body dose of radiation, if you inhale or ingest radioactive nuclides like radio-iodine or caesium or strontium or plutonium you can develop cancer subsequently and this is a second distinct danger that people will be facing if there is a very large release of radiation in this disaster.

—Australian Broadcasting Corporation
March 15, 2011

Health Risk Fears Escalate as Japan Nuclear Plant's Radioactive Release Remains Uncertain

Although the most pressing immediate health concern is the powerful direct gamma radiation that threatens workers at the plant, "we need also to focus on the radioactive isotopes that are being dispersed at some distance from the plant," Ira Helfand, a former president of Physicians for Social Responsibility, said at a Wednesday news conference organized by that group, which is opposed to nuclear power. ...

Some nuclear experts are concerned that "even if the total radiation dose is not real high downwind from a plant, the concentration of these isotopes can pose a very serious health problem," Helfand said. ...

The clean "linear relationship between your dose of total body radiation and the effect on your health is really lost when you're talking about low-dose radiation at some distance from the source," Helfand said. "You can have a very small total body radiation dose and end up getting thyroid cancer, or ingest some radioactive strontium and end up getting leukemia."

March 18, 2011

IPPNW-Germany participated in a spontaneous demonstration against nuclear energy in Frankfurt on March 12, 2011—one day after receiving news of the disaster at the Fukushima Nuclear Power Station in Japan. IPPNW-Germany photo.

Radiation might affect Japan's youngest

You can't smell it, you can't taste it and you can't feel radioactive materials in the air. But exposure to it can affect the health seriously.

For normal adults, depending on the amount of radiation, exposure might cause cancer, premature aging, organ diseases or even acute poisoning which usually ends in death, explains Dr. Winfrid Eisenberg from IPPNW, a German working group on nuclear energy.

He also points out that radiation is a particular threat to unborn children. The young embryos, especially in the first three months of pregnancy, are the most susceptible to radiation damage, much more than born children or adults, he says. "An embryo grows very fast and it means that cells are dividing all the time," he explains further. "These cells are more sensitive to the effects of radiation than older cells."

Eisenberg says even a very small elevation of radioactivity or ionizing radiation may be harmful to embryos or fetuses.

—Deutsche Welle
March 18, 2011

"The nuclear lobby, after being silent for about 15-20 years, once again has begun to provoke discussions in favour of nuclear energy, arguing that 'oil prices are rising,' 'this is the only solution to the economic cri-

sis,' and that 'lignite is also dangerous for human health.' These people managed to impose the perception in the European Union that this [nuclear] energy is 'green,' which is a big lie. I'll explain why. Although the nuclear power plant does not contribute to increasing carbon dioxide in the atmosphere during its operation, very large amounts of carbon dioxide are produced during the stages of its construction, the extraction of the nuclear fuel and the destruction of the nuclear reactor. So, it is wrong to say that this is 'green' energy.

"The most negative is that all these nuclear power plants are associated with nuclear and radioactive weapons. Governments of countries that need nuclear weapons always strive to have nuclear power plants. This connection makes the companies and people who build them even more powerful. Of course, since people were afraid in recent years and governments have required very high security specifications, the construction cost of a nuclear power plant, which is half the value of its destruction cost, has become very high. For this reason, renewable energy sources began to compete with nuclear technology on price basis and they should be preferred....

"As I said, I was concerned about the ongoing discussion in Greece on the good side of nuclear energy. Even a political leader argued some time ago: 'when our neighbours build nuclear power plants, why don't we?' This is crazy. We think that we should exert pressure and we should do it again just like we stopped the construction of the Akuyu nuclear power plant in Turkey the first time, and just as we could 'freeze' the construction of Belene NPP we should not allow it to start again. We do not want the countries to lose their energy independence, but to provide the funds they spend now for making safer nuclear power plants for alternative energy development."

—Maria Arvaniti-Sotiropoulou,
IPPNW-Greece
Interviewed in GR Reporter
March 18, 2011

U.S. radiation-safety experts said that, based on radioactivity levels detected in Tokyo's tap water, health risks for most people generally were slight.

Government officials in Tokyo urged special precautions with drinking water after detecting traces of radioactive iodine-131 in the water supply that were twice the acceptable level of exposure for children. The material was below the government's exposure limits for adults.

Radioactive iodine is especially worrisome to pregnant women and children because the body naturally concentrates the isotope in the thyroid gland, where it quickly can affect growth.

"The reason that iodine-131 is so dangerous in children is that their normal growth and development, especially of the brain, depends on the thyroid gland," said University of Buffalo Medical School neurologist Alan Lockwood, who sits on the board of Physicians for Social Responsibility, a non-profit group that advocates against nuclear proliferation. "And if there is exposure as a child, the risk of developing thyroid cancer later in life is higher."

—Wall Street Journal
March 23, 2011

"Plutonium is a very dangerous and harmful substance. Even in small quantities, plutonium, if ingested by the human body, almost certainly leads to the development of cancer. There is no concept for how to monitor and how to store the radioactive fuel, which will radiate for many, many thousands of years. According to the information provided by the IAEA last week, already a significant amount of radioactive substances such as iodine-131 and cesium-137 will be released; it might lead to a situation where we might compare Chernobyl and Fukushima if it comes to the release of the radioactive substances. Plus, at this time there is a danger of a release of plutonium."

—Lars Pohlmeier, IPPNW-Germany
Interviewed by RT (Russia Today) TV,
March 29, 2011

Indian Doctors for Peace and Development (IDPD), IPPNW's Indian affiliate, held a press conference on March 17, 2011 to express "solidarity with the people of Japan" and to demand that India "shun the pursuit for nuclear power plants and instead look forward to utilize renewable energy resources." IDPD photo.

"Monbiot's assumption ignores all that is known about the health effects of previous nuclear accidents, particularly Chernobyl. Leaving aside the deaths of workers killed either by the initial explosion or through exposure to dangerous levels of radiation during the clean-up, the impact on health from nuclear accidents continues—25 years and more than 6,000 cases of thyroid cancer later, the effects of Chernobyl are still being felt in the UK. Today, more than 300 farms remain contaminated and are still under food restriction orders.

"Supporters of nuclear power often fail to address the threat to the health of future generations by the unsolved problem of nuclear waste. Buried in the ground, it remains radioactive for tens of thousands of years, and is vulnerable to climate change and natural disasters. What right do we have to dump this lethal legacy on future generations?

"Monbiot worries about the impact of wind farms, pylons, power lines and reservoirs on the landscape. Can we really balance the altered appearance of the landscape with the impact that drinking water contaminated by radiation would have on children's health? Given the potentially devastating impact on the health of future generations, the cost of nuclear power is just too high."

—Marion Birch, *Medact*
Letter to the Editor, *The Guardian*
March 29, 2011

(in response to an article by George Monbiot arguing that the Fukushima disaster had shown that nuclear energy, even in the worst of circumstances, was less dangerous to public health and the environment than the alternatives)

"The discovery of plutonium in the area around the Fukushima plant is another indication of the seriousness of this accident. The dangers of such a release, to public health and the environment, cannot be overstated. If a minute amount of plutonium is trapped in the lung, it will deliver an intense dose of radiation to a very small volume of tissue for a very long time. This makes it highly carcinogenic."

—Alan H. Lockwood, *Physicians for Social Responsibility*
eNews Park Forest, Illinois
March 30, 2011

"Japan's government and TEPCO must be completely transparent about the facts of this situation....In order to properly protect the public and our precious natural

resources, it's vital that they give us a full accounting of what they've discovered around the plant."

—Jeffrey Patterson, *Physicians for Social Responsibility*
eNews Park Forest, Illinois
March 30, 2011

"[T]here's a current major controversy in Japan because the government has decreed that the maximum permissible limit for children in Fukushima will be not one millisievert, which is the normal standard internationally and in Japan, but 20 millisieverts. Now that involves significant risks. That means that if you say that there are two million people living within 80 kilometres of Fukushima, if you say roughly half a million of them might be under 20 then you're talking about potentially 3,000 or 4,000 additional cancers per year in those from 20 millisieverts. So that's currently under intense controversy, as it should be, in Japan....

"[R]adiation in foodstuffs is long term a

significant hazard from nuclear fallout from either nuclear weapons or from accidents involving nuclear reactors or spent fuel. That's complicated and exacerbated by the fact that a number of important isotopes...mimic important biological constituents that are normally part of our bodies and how they work.

"So, for example, iodine-131—one of the important particularly early radioactive contaminants released in Fukushima and Chernobyl—has a half life of eight days; it's pretty short. Your body can't tell whether that iodine is radioactive or not, it treats it just as iodine which your body uses to make thyroid hormone—the hormone that's basically the accelerator pedal on your metabolism; it sort of revs you up or slows you down. Now the uptake and the risk from iodine, which is a major cause of thyroid cancer, and this major rise—about 7,000 cases of thyroid cases in the vicinity of Chernobyl so far, an increase that's likely to continue for some decades—is directly related to exposure to iodine because there were not appropriate constraints on eating iodine-contaminated green leafy vegetables or dairy products, where the iodine contaminates the soil and the grass, the cows eat, it gets concentrated in the milk and cheese and then people eat...

"Cesium, another important isotope, behaves chemically like potassium, so your body puts it inside cells, treats it like potassium so it's widely dispersed in the body. Strontium-90, another important nuclear fallout contaminant also with a half life of 28 years—so around for a long time—behaves chemically like calcium, so it's concentrated in bones and teeth. Plutonium is also concentrated biologically. So because these sort of

mimic important substances that our bodies use, these can be concentrated in plants and animals and up the food chain...

"...[A] lot of [this information] can be used as a way of helping to minimise people's exposures in ways that make good public health sense and informing people about the risks. Particularly protecting the most vulnerable, who are children and pregnant women, who take up more radiation for example because their thyroids are relatively more active, who are more susceptible to the effects and who may have, in fact, accumulate higher levels in their bodies. So, simply things like avoiding milk in the weeks and months after a release of iodine will avoid the risk of thyroid cancer very substantially.

"So there are significant risks but certainly exposures that would involve small fractions of a millisievert of additional risk are relatively insignificant. But it's also important, I think, to say that what might be an insignificant risk at an individual level—if an individual is exposed to one millisievert extra radiation increases their lifetime risk of cancer by 1:10,000, it doesn't sound like a bit deal. But if you apply a 1:10,000 risk to a million or 10 million or 100 million people then you're talking about thousands or tens of thousands of additional cancer cases. So it's about how that burden is shared as well as the dose itself."

A First-Hand Account of Japan's Nuclear Crisis

Katsumi Furitsu

On March 12, 2011, the day after northeastern Japan was struck by an 8.9 Richter-scale earthquake and tsunami, IPPNW began to receive first-person, detailed updates about the crisis at the Fukushima Nuclear Power Plant from Dr. Katsumi Furitsu, a specialist in radiation biology and medical genetics based in Osaka, and a member of the board of the International Campaign to Ban Uranium Weapons. Katsumi's reports, arriving several times a day, provided information and insights into the worsening situation on the ground—information sometimes in stark contrast with what has been reported in the Japanese and global media. Following are all of Katsumi's messages, from the first on March 11 to the last on March 19, with a final reflection on April 22. Katsumi is the first to advise readers that her posts, which were added as they arrived to the IPPNW Peace and Health Blog, were written in haste and amid the confusion of events on the ground. She frequently corrected and revised the information she provided from one update to the next. The real value of these communications—and the reason we include them here unedited—is not only in the information Katsumi provided to those outside Japan who were desperate for information, but also in the sense of immediacy, urgency, sadness, and empathy for the victims and the rescue workers she conveyed to readers who could only observe each day's events from a distance.

*March 11, 2011 5:54:29 PM EST
Japan News Update*

Dear all,

You might already know the following news.

There is already radioactive leakage from the container of the core.

The TV news has just said radiation level in front of the gate of the plant increased up to the level of 8 times higher than the "normal level" (background? or limit?).

Best,

Katsumi Furitsu in Osaka

[From Reuters/Kyodo—ed] Thousands evacuated amid nuclear leak fears

Japan dispatched around 160 military personnel, sending its chemical corps and an aircraft on a "fact finding mission" to the nuclear plant.

o Related Story: Residents near nuclear plant told to evacuate

o Related Story: DFAT issues Japan travel warning

o Related Story: Japan death toll could top 1,000

o Related Story: Record quake unleashes tsunami on Japan

o Related Story: Millions stranded in Tokyo subway shutdown

The Japanese government has declared an atomic emergency because of the "possibility" of a radioactive leak from a nuclear reactor in the quake disaster zone.

But operators of the Fukushima No. 1

nuclear plant have warned that radiation could already have leaked.

This morning Japanese prime minister Naoto Kan said thousands of people living within 10 kilometres of the nuclear plant must evacuate.

The amount of radiation reached around 1,000 times the normal level in the No. 1 reactor's control room, the Kyodo news agency reported the Nuclear and Industrial Safety Agency as saying.

Trade minister Banri Kaieda earlier said authorities were nearing a decision to release radioactive steam from the troubled nuclear reactor in a bid to ease a pressure build-up after its cooling system was damaged by the massive earthquake.

"Pressure has risen in the container of the reactor and we are trying to deal with it," a spokesman for Tokyo Electric Power, which operates the plant, said.

The government had earlier said no radiation leaks were detected among its reactors after the 8.9-magnitude earthquake struck on Friday, Japan's biggest on record, triggering huge tsunamis.

The plant had shut down after the quake, but a reactor cooling system failure had led to the evacuation instruction, a situation the government said was "under control".

Japan has dispatched around 160 military personnel, sending its chemical corps and an aircraft on a "fact finding mission" to the nuclear plant, Kyodo said.

Prime minister Naoto Kan had earlier said no radiation leaks had been detected from Japan's nuclear power stations after the massive quake struck the country.

The IAEA's Incident and Emergency Centre had said that the four nuclear power plants closest to the quake which occurred near the east coast of Honshu, Japan, had been "safely shut down".

According to the industry ministry, a total of 11 nuclear reactors automatically shut down at the Onagawa plant, the Fukushima No. 1 and No. 2 plants and the Tokai No. 2 plant after the strongest recorded earthquake in the country's history.

A fire that broke out in the turbine building of Onagawa nuclear plant in Miyagi Prefecture had been extinguished, the government said. Operator Tohoku Electric Power said there were no indications of a radioactive leak.

Miyagi prefecture was one of the areas worst hit by the tsunami.

Millions of households were without power in north-eastern Japan, according to Tohoku Electric.

Japan - located on the Pacific Ring of Fire, where continental plates meet and create a string of volcanoes and seismic hot spots - records 20 per cent of the world's major earthquakes.

As an industrial powerhouse nation poor in energy resources, Japan also draws about 30 per cent of its total power from its 53 nuclear plants.

March 12, 2011 1:29:04 AM EST

the core is starting to melt down

Dear all,

The news just says that Cs 134 has just been detected surrounding the plant building.

The official nuclear safety committee has announced that it means the core may be starting to "melt".

The government decided to release the air from the containment this morning to reduce the pressure inside. However, it has become clear that they could not open the valve properly and could not actually reduce the pressure.

Then, the cooling water level is getting lower and the upper part of the fuel rods (about 170cm) has come out from the surface of water.

The temperature of the core is getting higher over 2700 degree centigrade.

The radiation level at the gate of the plant is measured to be 90 times as higher than background.

Not all the people from 10km zone has yet evacuated.

I am afraid that the situation is similar to TMI or worse.....

We cannot access to any further information now....

Katsumi

March 12, 2011 1:49:48 AM EST

the core is starting to melt down

They have just announced that they "successfully" opened the valve to reduce pressure of the containment.

They said that pressure inside is getting lower now.

I really hope that the situation is getting better. They are releasing radioactive materials into the environment, though.

March 12, 2011 3:43:29 AM EST

getting worse...

The news is reporting that the radiation level near the plant (?) is measured 1,015 micro Sv/h.

March 12, 2011 3:21:17 AM EST

getting worse...

The reactor (Fukushima I) exploded!
The walls and ceiling have fallen down.
It is just like Chernobyl.....

March 12, 2011 1:47:22 PM EST
cooling with sea water

Dear all,

The government and the company announced that the plant-building was broken (by phreatic eruption) but the containment and the reactor vessel are intact.

It is said that the hydrogen eruption inside the building (outside of the containment) occurred under the high temperature because of the failure of core-cooling-system.

The fuel rods inside the reactor vessel has actually "melted down" to some extent without proper cooling system (the level of cooling water was getting lower).

They decided to cool the reactor vessel and the containment vessel with sea water with boron. The media has reported that a team of the defense force is pumping the sea water and pour into the container now.

As you know, it is unusual decision (or last choice for them) to use sea water for cooling. They seem to decided not to continue to use the reactor after the settlement of critical situation.

It is also reported that the radiation level around the plant is getting lower now.

However, people have already been exposed to radioactive materials to some extent as Ryoma informed. (It is reported that a person with "positive contamination" was exposed at the point 3.7km from the reactor while he/she was getting out of 10km zone. Evacuation zone is now extended to 20km, though.)

We do not know the actual situation of exposure. We have to follow up the situation carefully.

Peace,
Katsumi

March 12, 2011 6:35:44 PM EST
some update

Dear Jeff [PSR-USA president Jeff Patterson—ed.] and all,

Thank you for the response and advice.

I do not think that people (children) have already taken iodine. (I know it is most ideal to take iodine before being exposed to radioactive iodine.)

Can you imagine the situation over there? People have such a disaster of earthquake already and, in addition to it, they are facing to the serious danger of nuclear power plants. It is not a "simple" nuclear-power-plant-accident. The traffic is cut off in some places. All the life line is actually stopped.

Some people might already got injured.....

We ourselves have some friends who live within 3 km from the plant, but we cannot make contact with them since the earthquake happened. We do not know whether they are safe or not even without the problems of nuclear power plants. We only pray for their safety.

It is said that a team from the National Institute of Radiological Science was sent (or will be sent?) to the area.

I really hope they will make a proper decision to protect people.

(I am personally feeling frustration that I cannot do anything directly right now.)

The news has just reported that they found 160 people are exposed, but another news has reported 15 people are exposed and getting some treatment of decontamination. However, we do not know how they diagnosed the people are exposed.

The chief cabinet secretary, Mr. Makieda, has just announced that 9 people are contaminated. He said, "the 'count' of surface radiation was 1800-40000 cpm." (They seem to use a most simple radiation detector and checked the surface contamination of people's clothes. They do not have any information of internal exposure.) He emphasized again and again that "the contamination level is not harmful to people".

As far as I understand from the media news, they have just pour sea water into the containment vessel, but not circulate it at this moment. However, the situation is not clear to me. If they circulate the sea water, they have to release the contaminated water into the sea....

Yes, the cooling system has not yet recovered, as far as I understand.

The bad news is that the same process has been going on in another reactor (No.3 reactor) at the same "Fukushima-I" reactor site. They have just decided to release the air inside the containment to the environment again.

It is a release of radioactive materials to the environment to avoid the worse scenario.

We have to follow the things carefully.

Peace,
Katsumi

March 12, 2011 11:44:00 PM EST
all the three running reactors are going though the similar process

The media has reported that the Tokyo Electric Power Company has just decided to release the air from the containment of the No. 2 reactor of Fukushima-I site to the environment to reduce the pressure inside.

Therefore, all of the three reactors (No. 1-3) at the Fukushima-I site, which were running at the time of the earthquake, have been going through the same process.

About 210,000 people in total are already ordered to evacuate from the 20 km zone(180,000) from the Fukushima-I site and 10 km zone (30,000) from the Fukushima-II site. (You might remember that about 120,000 people are evacuated from the 30km zone of the Chernobyl power plant.)

However, it is not still clear that how many of them, 210,000 people, could evacuate.

*March 13, 2011 10:30:26 PM EDT
reactor situation*

They are now announcing the news: just about 20 min ago, the hydrogen explosion happened at the reactor No.3; the situation is just as the No. 1 reactor.

The building of the reactor has broken. We can see on TV the walls and the ceiling have fallen.

We do not have any further information at this moment. We only hope the core containment would be intact....

*March 13, 2011 10:47:41 PM EDT
reactor situation*

It is said that there are still 600 people within 20 km, most of them are old people or patients, their families and medical staff. It was not easy for them to evacuate soon.

The Chief Cabinet Secretary is now announcing that the company has reported that the containment is (seems to be) intact.

It is reported that no increased level of radiation is measured at this moment at the boarder of the site.

*March 14, 2011 7:32:50 AM EDT
running on the "edge of cliff"*

Dear all,

Now the No. 2 reactor is getting into a critical situation.

The company and government announced early in the afternoon that all the cooling system is out of order.

After that the cooling water level inside the fuel vessel went lower. Then they tried to cool the core with sea water, but they could not do so from some reason. Now, it is reported that whole body of the collective fuel rods are above the water surface (or no water anymore in the fuel vessel containment?). They

say that the fuel rods might be "melting".

I do not want to believe the situation, though....

They are thinking to cool the containment anyway.

When I have written this message to this point, the announcer of the TV news program has suddenly reported, "The government has just announced that they successfully started to pour the fuel vessel with sea water!"

The situation is still unstable. Hydrogen gas might be accumulating inside the plant building....

We will continue to follow the situation carefully.

*March 14, 2011 12:09:45 PM EDT
reactor No. 2/ "heating an empty bathtub"*

Dear all,

The electric power company has just had a press conference:

They started to pour the sea water into the core vessel and the level of water surface went up to the half of the fuel rods.

However, they came to fail to pour the water about two hours ago because of a high pressure inside the core vessel. They say that a valve to reduce the pressure has closed. Then the water surface level went down to the "down scale" again and the whole fuel rods are left without cooling water now (as "heating an empty bathtub"). They does not deny the fuel rods has meltdown.

They are now trying to open some other valve to reduce the pressure.

The radiation level at the boarder of the plant was once measured as high as 3,130 micro Sv/h.

I am sorry for such a complicated explanation.

The situation is really unstable and complicated....it is critical situation anyway.

*March 14, 2011 7:22:02 PM EDT
a part of containment has broken*

The government has just announced:

There was an explosion at the No.2 reactor.

The "Wetwell" (suppression pool- see the figure in a document which Xanthe sent us yesterday) seems to break. The pressure inside the pool has gone down from 3 to 1 atmospheric air pressure.

The radiation level at somewhere at the plant (probably at the gate again?) increased to 965.5 micro Sv/h (later it went down a little bit, they said).

The company has ordered a part of workers to evacuate out side of the plant.

As you can understand, it means a part of containment itself has broken. This is a quite serious situation. The most important barrier to retain the nuclear materials has broken.

I have no words.... the people in the badly affected area by earthquake and tsunami are facing to the danger of nuclear plant.

The government has announced again that the radiation level is not "an immediate danger for public health".

March 14, 2011 8:05:42 PM EDT

8,217 micro Sv/h is measured after 2 hours from the explosion

The company has just reported: The measurement at the gate of the plant was 8,217 micro Sv/h.

It was about two hours after the explosion at the reactor No.2.

It is also reported that about the half of the fuel rods are now above the cooling water surface.

(It was totally above the water surface for some hours during the night, though.)

March 14, 2011 10:27:16 PM EDT

a fire in the reactor No. 4

The government is now announcing:

There is a fire in the reactor No. 4, which was not running at the time of the earthquake.

It seems to happen by hydrogen explosion. They are now working on extinguishing the fire.

The radiation level measured inside the site:

between reactor No. 2 and 3: 30 mSv/h (note it is not micro Sv/h !!)

near the reactor No. 3: 400 mSv/h

near the reactor No. 4: 100 mSv/h

Now, the government is officially saying that the level at the site of the plant is "actually harmful" for people (workers at the site). The workers, except in charge of cooling the plants, were ordered to evacuate.

The people within 20 km ordered again to evacuate completely.

The people within 20- 30 km ordered to be stay inside building.

Katsumi

P.S. An additional information from the news:

The fuel cooling ponds of both (?) reactor No. 1 and 3 are now left without any over

after the explosion of the building. It is under the open air. The cooling system is already out of order so it is not actually a "cooling pond". Unbelievable situation, but seems reality.

March 15, 2011 4:51:06 PM EDT

some updates

Dear all,

I am sorry, but I could not follow in detail the situation since yesterday afternoon.

We, some grassroots groups, went to visit the main office of the electric power company in our region (Kansai, the area including Osaka) to request them to stop all of their nuclear power plants as soon as possible. There are around 10 nuclear power plants about 100 km from Osaka. We requested them to learn the lessons from the disaster which is now happening in Fukushima. We know there is no place in Japan which is completely free from the possible danger of the earthquake and the problems of nuclear power plants.

Anyway.....as far as I have followed the news and statements from the government and company:

#The problem of spent fuel pond in the reactor No.4 is serious:

-They cannot decide yet what the actual cause and process of the fire at the reactor No. 4. Fortunately, the fire stopped spontaneously after some hours.

- They found that the temperature of the water of the spent fuel cooling pond is increasing from 40 to 84 degree centigrade as the cooling system is now out of order. After that they cannot measure the temperature as the meter was out of order. They think this situation might link to the fire and explosion at the plant.

- The hydrogen explosion might happen at the building (hydrogen was generated from the situation of spent fuel pond?). They found two big "holes" (8m x 8m) at the wall and the ceiling.

- The situation of the spent fuel pond is now focused. They considered an idea to pour water using a helicopter from the "hole" on the ceiling. However, the hole is not just above the cooling pond and they have given up the idea.

- They are still seeking to solve the problem.

- They also reported: the fuel rods complex which was to put into the core vessel in the pond (it is not a spent fuel), as they were just before starting to run the reactor when the earthquake happened.

- They also reported that the radiation level inside the building is too high for workers to work. That is why they are thinking to pour water from outside the building.

#The level of radiation slightly elevated in the morning yesterday, on March 15, in the south area from the plant including Tokyo (around 200km from the Fukushima plant). It seems to come from the explosion at the reactor No.2.

Tokyo (Shinjuku):0.81 (around 200 km)

Tokyo(Utunomiya-shi): 1.318 (around 200 km)

Saitama city:1.22 (around 200km)

Fukushima Iwaki: 23.72 (around 50 km)

The increase depends on the direction of the wind.

#They are now worrying about also the increasing temperature and possible decrease of cooling water of the cooling ponds of reactor No. 5 and 6.

They reported some data about the measurement at the site:

at the gate: 9:00, March 15: 11930 micro Sv/h

15:30 : 596.4 micro Sv/h

inside the site: most recent?, March 16: 200-300micro Sv/h

The government is emphasizing the level is decreasing now.

#The Ministry of Health, Labour and Welfare decided to re-consider the "maximum permissive dose" for nuclear workers at the emergency situation. It is 100mSv at the time of "emergency situation for lifesaving", now in Japan. (In usual situation, it is 100 mSv per 5 years, at the maximum limit of 50mSv per year.) However, they have decided to set up the "maximum permissive dose at emergency situation" 250mSv that is 2.5 times as higher than the present limit. They say that under this level, 250mSv, any acute symptoms would not occur. (I do not agree with their idea, though. They might decide it as they think it impossible to manage this critical situation without letting workers work under such a high level of radiation.)

...

I think you can now read some other detailed media coverage or reports from specialists on these situations even in English, though.

It is really hard for us to see the situation of people who have been suffering from the disaster of earthquake and tsunami, and in addition to it, they have to evacuate again or ordered to keep inside building. They cannot even try to find out their loved ones who are still under such huge wrecks.

Some (or many) people are now trying

to leave from the 30 km zone.

I am sorry for I do not cover all the disaster and suffering of the people in the affected areas, but only focusing the issue of nuclear power plants.

I hope you can follow the whole situation, which I could not write here, from the media coverage.

Best,
Katsumi

*March 15, 2011 5:55:28 PM EDT
another fire/ No.4*

The company has just announced that there was another fire at the reactor No. 4 early in this morning!

We do not have further information now. Hydrogen explosion again??

*March 15, 2011 9:45:10 PM EDT
the fire seems to be continuing*

It is something like a nightmare...

We are now seeing the video of the Fukushima-I plant site, which was taken from the distance of 30 km.

The image is not clear, though.

We can see white smoke from one of the reactor buildings.

It might be reactor No. 4.....the water temperature of the spent fuel pond with non-spent-fuel-rods-complex might be getting higher or it might be already boiling and in a possible worse scenario, some part of fuels are above the water surface and starting to "melt"....

I am not a specialist of this kind of technical things. So, I should not make comment on this, though.

The site, especially close to the building of No. 4 is now in the very high level of radiation.

It is not easy to extinguish fire. They might send a special unit to do the proper work at the site as they did in Chernobyl.....

Please note that it is only my personal "imagination"....

The company have just started to explain the situation:

They are saying that they themselves cannot recognize/confirm the real situation because of the highly contaminated situation inside the site. It seems that the smoke can be seen around No. 3 or No. 4. They are insisting that they do not make any comment as making comments based on speculation might cause more confusion....

We are physicians. When we treat such

serious patients, we usually think about the worst scenario and try to do everything what we could do as soon as possible.....before the situation would get worse. I really would like to believe that they, the company and government, has been working in the same way.

I wonder what we can to protect people...now....

Katsumi

*March 15, 2011 10:07:03 PM EDT
the fire seems to be continuing*

The company also mentioned that 4 fire engines were sent to the site from the local fire station.

The company also said that the plant workers even cannot confirm the situation because of the high radiation level.

I am really surprised that the local fire station is still working.....well it should be working.....but, I really hope that they are well equipped for the task at such dangerous situation. It reminds me the firemen at the Chernobyl site who worked just at the time of the accident. You all might know what happened to them.

I really hope my imagination would be just an imagination and not real....

March 15, 2011 10:29:49 PM EDT

The Chief Cabinet Secretary has announced:

What we saw in the vide image was smoke/steam from the reactor No. 3.

The radiation level at the gate increased rapidly from around 600-800 micro Sv/h to mSv/h level for a while around 10:00 am.

However, it is getting down at 10:54.

They think that the steam might be coming from a possible leak of the containment of the reactor No. 3, as it happened at the reactor No. 2 yesterday.

The government has been making great effort and some staff from the government has been working at the site together with the company.

So, it was not from a fire of reactor No. 4.

*March 16, 2011 8:24:38 AM EDT
The following are some updates:*

#The smoke/seam from reactor No. 3:

The company said that the smoke/steam from the reactor No. 3 came from the spent fuel pond (not from a possible leak from the containment).

The cooling system of the pond is out of order and the temperature of the water is getting higher to make steam. As you know, the building of this reactor already is broken down and there is no cover/ceiling over the spent fuel pond. It is open to the air now.

Then, they are planning to drop sea water from helicopters and fill the pond with water to stop the damage of spent-fuel rods.

A team of "Defense Force" started the training to do the task. They are ready to start now.

However, the radiation level over the pond is still high. It was measured "far more than 50 mSv/h". (They actually measured it by a helicopter.) So, they decided not to pursue this operation today. There is no guarantee that the radiation level would become lower tomorrow, though. (The government has decided yesterday to set up the maximum exposure level at an emergency situation from 100 to 250 mSv, as I wrote you yesterday.)

#The reactor No. 4:

The government has just ordered the "riot police" to go to the site as they have a special car which has a "high pressure injection system". (I do not know the proper words for such a car in English. I suppose a car which might be usually used against "riot"....or sometimes against a demonstration, as some of you might know?) They will try to fill the spent fuel with water using the special car. The defense force will lend protective suits to the "riot police". They will start to work tomorrow morning.

#The result of the radiation level measurement today:

Today, a team from the Ministry of Education and Science, measured around the 20-60 km zone:

about 20km: 0.33 mSv/h

30-60 km: 0.0253 - 0.0125 mSv/h

The government and media emphasized, "the level is not a immediate danger for the people's health, though it might be problem to live in such area continuously for a year."

(I agree that it is not an "immediate danger" but it could contribute to cause "late effect" as cancer, leukemia or other disease. It depends on the duration of exposure.)

They do not provide us, people, any information about the concentration of radioactive noble gas, iodine, cesium and so on.

Peace,
Katsumi

*March 16, 2011 8:56 PM EDT
They start dropping water.....*

We are now watching on TV a helicopter which is measuring the radiation level over

the plants.

The helicopter has just dropped water over the No. 3 reactor.....

The reporter says: The CH 47 helicopter can carry 7.5 ton of water. Another helicopter is now heading to the site. (9:48 am)

The second one (or the same one? again) has just drop water....9:52 am

The third drop is over No. 4.

I will write further later.....

*March 16, 2011 10:19 PM EDT
more information*

Just before starting to drop water from the helicopter the government had a press conference.

The following is the information from the conference and the TV media (NHK) report showing the actual operation.

We saw white steam coming out after dropping water. You may see the video later or already seen? Not all the water could drop in pin-point over the pond unfortunately.

Reactor No. 3:

They will pour the spent fuel pool with water both by helicopters of the defense force and special cars with high pressure injection system of the riot police.

The helicopter, CH 47, can carry 7.5 ton of water. It dips up sea water nearby, flies to the reactor and drop the water over the pond of reactors. Before the operation, they measure radiation level and wind over a reactor and see the feasibility to work.

The defense force (DF) estimated that they have to repeat this procedure more than 100 times to fill a pond.

The reporter said that the maximum radiation limit for DF staff is set up 50 mSv with exception of life saving situation:100 mSV. (So, they seem to keep the present limit anyway.....)

On the other hand, they are collecting 11 cars with special injector from all over Japan. All or some of them are now ready to go....they have already headed to the site from 20km zone. They will start to work after the operation of dropping water from helicopters so that (hopefully) the radiation level at the site would reduce to some extent. A car can carry 4 ton of water for each. They will stay about 50 m from the building (as the maximum injection length is 50m), but they estimated only one min. would be allowed for a staff before reaching the maximum exposure level.

They decided to start from the reactor No. 3 as it is more dangerous compared to

No. 4. (You may remember that No.3 has the not spent fuel complex in the pool.) It is easier to drop water in the case of No. 3, as it has no ceiling anymore.

They have dropped water four times this morning from 9:48 to around 10:00 am. (So, the exposure dose might become up to 50 mSv for around 15 min inside the helicopter. This is only my guess.) They said that they put a lead plate on the floor of the helicopter and a staff on board is measuring radiation level during the operation. They put on protecting clothes.

#As for No. 4, they will not use helicopters, but only use the cars of the riot police, as a hole on the ceiling is far from the pool. Fortunately (?) it already has a large hole (or holes?) (seeing from the picture, it is not a hole, almost whole side wall facing to the sea has completely fallen down) on the wall. So, they think that they can inject water from the side.

#The reactor No. 5 and 6:

The temperature of the water of spent fuel ponds is increasing:

No. 5: 63 degree centigrade (5 degree increased compared to yesterday)

No. 6: 60 degree centigrade (4 degree increased compared to yesterday)

They are preparing to introduce electricity from outside of the plant site and try to recover the cooling system.

The facilities of pumping were destroyed by tsunami.

#The reactor No. 1 and 2 are stable anyway. They continue pouring sea water into the containments and core vessels.

*March 16, 2011 10:46 PM EDT
some additional information*

#The minister of defense ministry is now at the press conference:

some additional information:

The radiation level measured before the operation:

4.13 mSv/h at 1000 feet

87.7 mSv/h at 300 feet

They did not start the operation, but they decided to do this morning as the situation too critical to wait anymore.

The minister does not yet have the data after the droppings.

The US force will also join the operation later.

*March 17, 2011 10:27 AM EDT
30 tons of water was injected into the reactor No.3*

#In addition to dropping water from the helicopters this morning, the defense force has injected 30 tons of water in total to the No.3 reactor.

Five special cars were involved in the operation today. They spend around five min for each (7:35, 7:45, 7:53, 8:00, 8:07 p.m.). A pair of personnel worked staying in a car.

We hope the operation was successfully.....we do not know whether or not radiation level has decreased after the operation.

#Prior to the operation by the defense force, the riot police tried to inject water into the No. 3 reactor, but they failed to reach the target.

#It was reported the radiation dose of personnel involved in the operation by helicopter this morning was within the emergency dose limit 100 mSv (max data was 60mSv).

*March 17, 2011 10:27 AM EDT
30 tons of water was injected into the reactor No.3*

#In addition to dropping water from the helicopters this morning, the defense force has injected 30 tons of water in total to the No.3 reactor.

Five special cars were involved in the operation today. They spend around five min for each (7:35, 7:45, 7:53, 8:00, 8:07 p.m.). A pair of personnel worked staying in a car.

We hope the operation was successful...we do not know whether or not radiation level has decreased after the operation.

#Prior to the operation by the defense force, the riot police tried to inject water into the No. 3 reactor, but they failed to reach the target.

#It was reported the radiation dose of personnel involved in the operation by helicopter this morning was within the emergency dose limit 100 mSv (max data was 60mSv).

*March 17, 2011 8:09:35 PM EDT
some information/ they are ready to go also today.....*

The defense force (DF) personnel who worked for injecting water into reactor No. 3 yesterday:

Dropping water from helicopters:

17 personnel were involved in the operation worked around 90 m above the reactor

The exposure dose was officially reported: all of them are under 1mSv

They used a plate of tungsten (not lead, reporter revised the information) for shielding.

Injecting water from cars:

13 personnel

The chief of the DF reported: exposure dose of personnel was up to 60 mSv (maximum)

#The company made comments on the effectiveness of the operation yesterday, on March 17:

There was not so much change of radiation dose rate by the operation of helicopters: changed from 3782 to 3752 micros Sv/h (somewhere inside the plant site).

However, they think a spout of steam from the building which can be seen just after dropping water might be an evidence that the operation could reduce the temperature at the fuel pond to some extent. (I also want to believe so....)

As for the injection of water from cars on ground 50m from the reactor building:

The radiation level at the gate of the plant site:

3:30 pm (before the operation): 309 micro Sv/h

11:00 pm(after the operation): 289 micro Sv/h

#The data radiation level measured by the Ministry of Education, Culture, Sports, Science and Technology on March 17:

Max: 170 micro Sv/h (14:00, 30 km northwest from the plant)

They measured at 28 places in 20-60 km zone, 9:20-15:00 : 18.3-1.1 micro Sv/h

The data depends on the direction of the wind.

#Today (March 18), the DF is ready to work for the same operation both from sky and ground.

In addition to the DF, a fire brigade with special type of cars (usually used for a fire of airplane) from Tokyo has already headed to Fukushima at the midnight. They will also join the operation.

Four helicopter will work.

More cars of DF will work.

#More sad stories are reported:

More than 20 patients (old people) passed away who were left in a hospital in the 20 km zone or on the way of evacuation from the 20 zone.

I cannot write all of these stories now, but they must be recorded.

...

We should not/cannot estimate the number of people who might be exposed to more radiation in the case of larger amount of radioactive materials from the nuclear fuel, though. I would say, at least "hundreds of thousands" people....

...

We, who know the danger of radiation, are thinking about those personnel, fire fighter and workers of the company & associate companies and their families. I believe the government and the company also know that the task is really dangerous because of the high level of radiation. However, we also know: without their work, at least several hundreds of thousands people including children, pregnant women..... might be exposed to more radiation.....

It is really sad and complicated situation....

Katsumi

*March 17, 2011 9:45:11 PM EDT
30 fire engine has joined the DF*

#The 30 fire engine have just arrived at the place (probably 20km from the plant) and joined the DF.

The cars are:

- rudder truck with folding ladder of 22m
- large special (chemical?) fire engine which can spray water 5 ton/ min, even while driving
- fire engine which can pump water from 2km distance water source
- fire engine for special disaster which have equipments to clean up radioactive contamination

I do not know what actually they are, though.

I would say that they are really to do their best to avoid the worst case.

Of course, they will be measuring the radiation dose rate at the site and within the "exposure limit"....

I only hope that they could work with minimum exposure, as smaller as possible....

March 19, 2011 1:47 AM

one week has passed.....still in a difficult situation

Dear all,

I am sorry but I do not have time to update the things now.

Many things are happening here. I myself have to deal with the things what I can do here, in addition to my own routine work and activities.

You may see some of the updates on the following site, at least the "official" information.

<http://www.ustream.tv/channel/nhk-world-tv>

We are still in a critical situation at the nuclear power plant site. Many people, many young skilled workers, fire fighters, engineers and SD staff, at the site have been making great effort to try to stop the situation getting worse. They themselves are already exposed to radiation.....it is really sad, but we know that we cannot get rid of this crisis without their hard work.....

We, anti-nuclear-power-plants activists are starting to discuss concretely the evacuation of children and pregnant women, from the 20-30 km zone. We are afraid of the possibility of the worse situation. (We really hope it would not happen.) It might be too late if we decide after having such a situation. We never want to make people in panic. However, we have to prepare even for the worst scenario. We know that we should carry on such a measurement with an official initiative. The crisis situation makes the government too busy to work on this. They have to focus on the crisis of the plants to avoid the further disaster. It is reality.

Another important thing for us is to request government and companies to release real time and precise information and data of environmental radiation, including the data of isotopes, and the situation of the plants.

We heard that already some or many of them, who have a chance to do so, have already left the areas. However, it is not easy to do so without gas and before preparing proper place to accept them outside of the zone.

I also know that some people even in Tokyo has already left the city and been in a kind of "panic" situation. I really understand their feeling and we cannot blame none of them.

However, we have to focus on the people right now who have been facing to the most "possible" or "realistic" danger to radia-

tion exposure and also the shortage of food, water, medicine, fuel and everything.

The local governments are already starting to accept more than a thousand people from a town which is within 2km, (they evacuated already from their hometown to 20-30 km zone some days ago). Many people, including local authorities, are now trying to do their best.

I am not sure whether or not you who are living away from Japan could understand my complex feeling, sadness and realistic thinking.

Another additional thing is that NHK in Japan has stopped the continuous live news on the affected areas and the nuclear plants today. They might decide to do so as a week has already passed since the earthquake. (Of course, we can get a live image at the site from time to time, when something new happens.) It makes me strange feeling watching sports game, cultural program and other things which do not have any relation to the present disaster. I myself may be in an "unusual" mental a situation.....

I will stop now.

I wish you all have a nice week end. We have no idea about our weekend, though.

Please also continue to work hard to stop nuclear power plants in your own country....

Peace,
Katsumi

P.S. I saw a video of WHO staff who is commenting on the evacuation. I personally thing it very sorry. They are not in a stance of "preventing" possible health impacts on the people who are staying within 20-30km or just out side of the 30km zone. We are not discussing the immediate danger of the people who are living in Tokyo! I hope he will come to Japan and stay with the people in the 20-30 km zone..... I will not say anything further now. We may discuss after we finish this crisis. Sorry in a hurry....

April 22, 2011

Radiation cut off raised for Japanese school children

I have come back from Fukushima late last night. I spent five days there.

I visited some towns and villages over there including Iitate-village, where they have highly contamination even outside of 30 km zone. They have 6,000 residents before the earthquake and accident. Some of them have

already evacuated voluntarily even before the government set of the "planned evacuation zone". (You may already read the report on the measurement of radiation dose and radioactive materials in soil in the village.)

It is really urgent to let people, especially children, pregnant women and younger people (who may have children in the future), evacuate from such a highly contaminated area. I met the head of the village and some staff members of the village. I also met with some groups of residents. I told them the real situation of the contamination in their village and explained them that it is urgent to decide to evacuate. (Some residents do not want to evacuate as they have their own life in their beautiful homeland. However, they are starting to understand what is happening in their land.) I also listen to their stories individually and gave them concrete advices as a physician. It is really sensitive situation in many ways, politically, socially and psychologically, so I cannot write all the things at this moment here. You, who are living outside of Japan, might not understand our Japanese culture, though.

It is really sad and terrible for me to see and hear that people, including babies (some dozens of babies, infants, their mothers and pregnant women have already evacuated under a official program of the village, but not all of the babies are evacuated) have been living in such an area where we can measure such radiation level (ex. indoor: 2-3 micro Sv/h, outside: 5-8 micro Sv/h at 1m above the ground, more than 10 micro Sv/h on the ground).

Some NGOs and individuals from outside are now helping people in the village by supplying non-contaminated vegetable, fruits and such fresh food. They need to have non-contaminated food anyway before evacuation. The evacuation plan takes at least one month.

As you may know that some "specialists" say openly in public that radiation (chronic) exposure below 100 mSv makes no serious health problem. They, together with the local authority, had lectures in many places in the prefecture. They want to avoid the panic situation of people. I understand their concern, though. However, such comments of them influenced people to take their situation easy. Some families who once evacuated outside of the highly contaminated area came back to the village after having lectures and information from such specialists.

I am thinking to visit the area again early next month after the events of 25th anniversary of Chernobyl here in Osaka. I would like to help them as a physician to let them decide themselves what to do. I want to

be with them, as far as I can, and work in cooperation with them. I really do not want to make people in panic. It is important to talk to the people and listen to the people directly and think with them what to do in such a critical situation.

I would add that even outside of the litate-village, the radiation situation is still serious.

We can measure 1-3 micro Sv/h radiation rate all around in the center of the city of Fukushima, where 290,000 people are living. The problem is not limited at the schools. The "20 mSv" of radiation exposure (it is only from external exposure) is a serious problem for almost all of the residents in the contaminated cities and towns in Fukushima prefecture. Of course, "20 mSv" is the dose limit for nuclear workers in Japan in accordance to the Japanese radiation protection law. The radiation level above 0.6 micro Sv/h (1.3 mSv of radiation exposure) is the definition of the "radiation control area" according to the law. However, they are now applying the standards of "emergency version" for both workers and public following the recommendation of ICRP.

As many people are already exposed to some extent, proper health following-up and compensation will be necessary in the future.

We also have to think about the influence to the industry, agriculture dairy farming and fishing in the area. Many people are living on that.

We really need to stop all the nuclear power plants in Japan (and everywhere in the world). I know that we cannot stop them immediately, though. We, as citizens groups, will visit the Kansai-electric company to request them to listen our voices on April 26. We have 10 nuclear power plants just 100 km from Osaka, the second biggest city in Japan. We know that there are active faults very close to the plants.

I agree with the idea of Alex to make a kind of appeal from IPPNW on this occasion to support the exposed people in Japan. I

Katsumi Furitsu speaks about the Fukushima nuclear reactor crisis at IPPNW-Germany's congress, *Timebomb Nuclear Power—25 Years after Chernobyl*, on April 9, 2011 in Berlin. Photo © Jens Jeske/IPPNW-Germany.

think it important to make a critical comments on ICRP and Japanese government's policy of radiation protection at the emergency situation. (Note that Japanese government are following the recommendation from ICRP and many physicians and specialists in Japan have been supporting ICRP. The special adviser for the Japanese cabinet at the emergency situation is a member of ICRP.)

Sorry, but I do not have time to write more in detail now. (I have to prepare the meeting tomorrow.)

The situation is moving here in Japan. I have to work on it, as a physician, in accordance to my conscience.

Thank you for all the support from our colleagues of IPPNW in the world.

Peace,
Katsumi

Young doctors speak out on the Fukushima disaster

IPPNW's global network of young doctors and medical students used online social networking technologies such as Facebook, Twitter, and YouTube, which offer the potential to reach millions of users with updates, expert analysis, and informed opinion about events in Japan as they occurred. Particularly effective are short, self-made videos that can be posted to YouTube and other video-sharing sites, and then linked to blogs and websites in what is called viral communication. Below are brief excerpts from video messages by young IPPNW doctors from four countries. These and others are gathered on the IPPNW medical student website (www.ippnw-students.org/medicalvoices/voices.html). Links are given to the full versions on YouTube.

Ryoma Kayano—Japan

It is true, nuclear power plants supply us a lot of energy. However, as we see in this situation, catastrophe can occur and we simply cannot control the huge energy....First, we have to recognize that nuclear energy is uncontrollable and dangerous. Second, we have to stop and think. Is it right to use this energy? Are there other ways to solve our energy problems without nuclear energy?

www.youtube.com/watch?v=ktHhBSsGvzs

Alex Rosen—Germany

We're all very worried about the health effects from this catastrophe. ...As we see in Fukushima, nuclear power is never 100% safe; no technology is....We know about the effects of these nuclear particles because we have studied the health effects of the Chernobyl disaster, where we've seen a significant rise of thyroid cancers, a significant rise in childhood leukemia [and other diseases].

www.youtube.com/watch?v=WL_Oew16vlg

Vilena Avaliani—Russia

All stages of the nuclear fuel chain have adverse environmental impacts...If a country has nuclear energy, it increases its capacity to build nuclear weapons....We have good alternatives to nuclear power plants, and they are renewable sources of energy such as sun, wind, biomass and many others....It happened once in Chernobyl; it happened a second time in Fukushima. So what next before we say "no thanks" to nuclear energy?

www.youtube.com/watch?v=RSjFM0mvwRE

Ogebe Onazi—Nigeria

We appeal to policy makers of governments all over the world to deemphasize the need for nuclear energy...Let us put in consideration the generation to come. Let us put in consideration the health of the people of Japan. Let us put in perspective what the unborn babies and their mothers are going through this moment in Japan. We do not have nuclear disasters going on in our country; nevertheless, we feel concern for the people of Japan.

www.youtube.com/watch?v=Hq4EcJXqGel

Japan's Nuclear Nightmare

Ronald McCoy

Former IPPNW co-president Ron McCoy, a Malaysian obstetrician who, by his own count, has delivered more than 50,000 babies, read the following paper at a public forum entitled "Eleven Days After Japan's Nuclear Fallout: Selangor's Perspective," organized by the Selangor state government on March 22, 2011. For reasons of space and general interest, paragraphs concerned solely with Malaysian policy have been cut. The paper can be read in its entirety on the IPPNW Peace and Health Blog (www.peaceandhealthblog.com).

Since 11th March, Japan has been reeling from an unprecedented natural disaster of awesome proportions, followed by a man-made nuclear crisis. First, a record-breaking earthquake, 8.9 on the Richter scale, off the north-eastern coast of the Japanese island of Honshu. Then, a towering ten-metre tsunami which killed tens of thousands of people and destroyed almost everything in its path. Finally, the release of radioactivity into the environment from a nuclear power plant, damaged by overheating and explosions.

The earthquake had automatically shut-down the six nuclear reactors of the Fukushima Dai-Ichi nuclear power plant, owned by the Tokyo Electric Power Company (Tepco). But it also knocked out the power grid, forcing operators to fall back on diesel generators to keep coolant flowing into hot reactor cores of radioactive uranium and plutonium fuel rods. Then the tsunami swept in, knocked out the generators and cut off power to the plant's cooling systems. All at once, four out of its six nuclear reactors were in dire trouble from overheating. Explosions then damaged fuel rods and the integrity of the primary containment structure, and radioactivity was released into the environment.

There are few environmental dangers more lasting or more fearsome than radiation from a nuclear accident. We saw this in the Three Mile Island and Chernobyl disasters, and now in Fukushima. The truth of Murphy's Law is inescapable: "If something can go wrong, sooner or later it will go wrong."

Public health

The public health implications of nuclear power should not be subordinate to the economic considerations of the nuclear industry and government energy policies. There is a need to review the scientific evidence for public health impacts of nuclear power, to assess occupational hazards faced by nuclear industry workers, and to assess evidence that challenges the legitimacy of the underlying assumptions of nuclear safety.

A common thread running through these health concerns is the risk posed by ionising radiation. There is no safe threshold. Over the past fifty years, the claims of the nuclear industry, that nuclear power is both safe and vital for our future, have proven false and contentious.

Ionising radiation can damage DNA, causing cancer and inherited mutations.

However, whether an individual develops cancer following exposure to ionising radiation depends on whether the DNA is damaged, what part of the DNA is damaged, whether the cell line can reproduce, whether the damage is completely repaired, and whether the cell completes transformations that lead to malignancy.

The most important evidence regarding risks from exposure to radiation comes from epidemiologic studies that examine incidence of cancer in exposed populations, such as children exposed to radiation in utero, people exposed to background radiation, nuclear plant workers, patients exposed to diagnostic or therapeutic radiation, and people exposed to radiation from nuclear explosions.

The risk of mutation-related damage, including cancer, is proportional to the radiation dose. There is no threshold below which ionising radiation produces no damage. This means that background radiation from any source causes cancer and genetic mutations among exposed populations.

There is no threshold below which ionising radiation produces no damage.

What happens in a nuclear accident

When a reactor is operating, fuel rods containing uranium and plutonium pellets produce heat through nuclear fission and get very hot. The fuel is immersed in water and the heat produces steam, which is used to drive a turbine to produce electricity. The water also serves to keep the fuel from overheating and is continuously circulated to carry away excess heat. Even if the reactor shuts down, the fuel will remain hot for a long time and so must still be cooled.

If the pumps that circulate the cooling water are not operating, the water will heat up and evaporate, and the fuel can be exposed to the environment. At this point, the zirconium cladding on the fuel rods will start to heat up, blister, and then rupture. If the fuel is not covered by water and is exposed for a few hours, it will start to melt. The molten fuel will collect at the bottom of the steel reactor vessel, and it will be a matter of hours before the fuel melts through the steel and settles on the concrete floor of the primary containment vessel. In an accident, the amount of radioactivity released into the environment will depend on the integrity of the primary and secondary containments. The radioactive isotopes of greatest concern in a nuclear accident are iodine-131 and cesium-137.

Uncertain geological knowledge

Nuclear power requires stability—politi-

cal stability and geological stability. Countries considering the option of nuclear power need to soberly assess their plans, particularly if they are located in active volcanic regions.

But geological knowledge is incomplete and imperfect. And we rely on such knowledge too heavily when making policy decisions about locating hazardous technologies.

Designed and built to withstand what is termed “design basis accidents,” nuclear power plants are usually sited in geologically stable and physically secure environments, determined by geologists. The possibility of a “design basis accident” is based on “credible events,” which are determined by an analysis of probabilities. The Fukushima disaster was a “beyond design basis accident” because the analysis was wrong. It was calculated that

the probable “credible event” expected to occur in Fukushima would be an earthquake no greater than a magnitude of 7.9 and a tsunami no higher than 6.7 metres. It was not in the analysis of probabilities that Fukushima would be struck

by an 8.9 magnitude earthquake or a 10-metre high tsunami. But geologists and the nuclear industry, like all human beings, sometimes get it wrong.

It is noteworthy that there are a number of unknown geological faults and processes which make it more difficult to accurately predict a “credible event.” In other words, it is very much an intelligent guessing game, but guessing it is nevertheless. Incidentally, the recent earthquake in Christchurch occurred on an unknown and unexposed geological fault, and was therefore unpredictable. In fact, damaging earthquakes have been known to originate from unknown faults.

Human error

But earthquakes and tsunamis are not the only causes of a nuclear accident. Human error alone can lead to a nuclear accident. It happened in Windscale (later renamed Sellafield), Three Mile Island and Chernobyl.

I have heard the facetious argument that plane crashes are not sufficient reason to abandon air travel. But the scale of a nuclear accident is incomparable. Radiation could kill and injure thousands, cause cancers, and contaminate and render uninhabitable large tracts of land.

Nightmare at Fukushima

Japan, the only country to have experienced nuclear warfare, now faces another nuclear nightmare. Months may pass before we can fully understand what went wrong

and learn from Fukushima. It is a high price to pay for using potentially dangerous and replaceable technology. It has rekindled fading memories of Chernobyl and shifted the balance in the debate on climate change and the risks and benefits of nuclear energy.

It is forcing many countries to review the safety of their nuclear facilities and their energy policies. Germany has responded to strong public anti-nuclear sentiment by reinstating and accelerating its nuclear phase-out policy, and temporarily shutting down the oldest seven of its seventeen reactors. Both India and China, with their expanding economies and energy needs, are reviewing nuclear safety measures, but have not shelved plans to build more reactors in the next ten years.

A number of studies conclude that nuclear power cannot meet energy needs; that it is excessively expensive; that it is not carbon neutral; that it creates additional environmental and security risks. Most importantly, new evidence indicates that environmentally safe and sustainable energy technologies can be developed to meet growing energy needs.

There is a growing conviction worldwide that nuclear power should be phased out and a serious commitment made to invest in renewable energy, energy efficiency and energy conservation.

Public distrust

The nuclear industry has carried the stamp of secrecy like a birthmark. From its very beginning, the nuclear industry has had a long history of cover-ups and downright deception, with the occasional lapse into silence - the silence of guilt. Public trust in the promoters of nuclear power is almost nonexistent. In Britain, America, Germany, Russia, Japan and other countries, people have not been told the truth about the real economic cost of nuclear energy and the health and environmental consequences of nuclear mishaps and near-misses.

The stricken Japanese population is well aware of the culture of nuclear cover-ups. The Tokyo Electric Power Company (Tepco) owns and operates the Fukushima Dai-Ichi nuclear power plant. In 2002, Tepco's chairman and senior executives had to resign when the Japanese government discovered that they had covered up the existence of structural damage to reactors. In 2006, Tepco admitted that it had been falsifying data about reactor coolant materials.

Vexing questions

Radiation is invisible and cannot be recalled. In a nuclear crisis, there will be

many questions about radiation. As the Japanese people are now discovering, it is a nightmare trying to make sense of the uncertainties.

- How do you know when you are in danger?
- How long will this danger persist?
- How can you reduce the danger to yourself and your family?
- What level of exposure is safe?
- How do you get access to vital information in time to prevent or minimise exposure?
- What are the potential health risks and consequences of exposure?
- Whose information can you rely on or trust?
- How do you rebuild a healthy way of life in the aftermath of a nuclear disaster?

These questions are difficult to answer, and they become even more complicated when governments and the nuclear industry maintain tight control of information, technological operations, scientific research, and the bio-medical lessons that shape public health response.

Transparency and accountability

Transparency and accountability do not sit well with an industry, addicted to filtering and censoring information. It explains why there is no clear consensus on the local and global health consequences of Fukushima.

There is no safe threshold for radiation. The claim that exposure to low-level radiation does not pose a risk to health is a myth, generated by governments and the nuclear industry. During the nuclear arms race of the Cold War, scientific findings on health risks from nuclear fallout that contradicted the official narrative were censored. Scientists with integrity were discredited, punished or blacklisted. In 1994, the US Advisory Commission on Human Radiation Experimentation concluded that the literature on radiation and health during the Cold War was heavily sanitised and scripted to reassure and pacify public protests.

Decades of official censorship have reinforced the false core message: Human beings have evolved in a world where background radiation is present and is natural, and that any adverse health effect of radiation exposure is the occasional and accidental result of high levels of exposure.

There are other sources of conclusive data that allow a very different interpretation of the health hazards posed by a nuclear dis-

aster. These include several declassified records of US and Soviet human radiation experiments, Atomic Bomb Casualty Commission records, long-term research on Chernobyl survivors, and proceedings of the Marshall Islands Nuclear Claims Tribunal.

From these records, some important facts have emerged. For example, nuclear fallout and radioactive contamination of ocean and land ultimately enter the food chain and the human body, and therefore represent significant health risks. Chronic exposure to radiation does more than increase the risk of cancers. It threatens the immune system, exacerbates pre-existing conditions, affects fertility, increases the rate of birth defects, and can retard physical and mental development.

Japan's ongoing nuclear crisis demonstrates the degree to which the state prioritises security interests over the fundamental rights of people and their environment. Japan's response to Fukushima mimics the responses of other governments to catastrophic events, such as Chernobyl and Katrina. It has been to control the content and flow of information to prevent panic and mitigate the inevitable loss of trust in the government, reduce legal liability, and protect nuclear and other industry agendas.

There are many lessons to be learnt from Fukushima, not least of which is to recognise that nuclear energy is exceedingly dangerous and carries unacceptable, unnecessary risks to human health and the environment. In Malaysia, there must be strong public demand for transparency and accountability and an end to all plans to opt for nuclear energy.

Misleading information

Nuclear energy is not cheap, clean or safe. And yet, vested interests in the government and the nuclear industry are attempting to override common sense and reason. They continue to trumpet the imaginary virtues of nuclear power and play down the enormous cost of nuclear power, the problem of nuclear waste, and the risks of an accident. Nuclear reactors, like nuclear weapons, do not forgive mistakes of judgement, simple negligence, human error or mechanical failure. Malaysia's poor record of industrial safety and its bad maintenance culture underlie concerns about public safety in the event of a nuclear accident.

The nuclear industry has a history of making misleading claims about nuclear safety that have often confused and misled the uninformed. Genuine debate and critical examination have been avoided, evidence ignored, opponents silenced or marginalised, and critical issues of public health and welfare

have been answered with standard bland platitudes. Nuclear regulatory bodies have too often acted out of expediency and ignored the health and protection of the public.

Proliferation of nuclear weapons

Nuclear power is directly linked to the proliferation of nuclear weapons. Member states of the Nuclear Non-Proliferation Treaty have the "inalienable right" to peaceful uses of nuclear energy. All civilian nuclear energy programmes provide a convenient cover, as well as the training, technology and plutonium necessary for the proliferation of nuclear weapons. That was the route taken by India, Pakistan, Israel and North Korea to become nuclear weapon states. A typical 1000 megawatt reactor produces enough plutonium each year for 40 nuclear weapons.

Radioactive nuclear waste

Nuclear power plants produce lethal radioactive waste that will remain radioactive for thousands of years. The half-life of plutonium-239 is 24,000 years and that of uranium-235 is 731 million years. We are talking about radiation forever.

No country in the world has been able to safely dispose of its nuclear waste, which is accumulating in pools or casks alongside nuclear reactors in forty-four countries, waiting for a solution. Finding satisfactory underground geologic repositories has proved to be an intractable problem. After twenty years and US \$9 billion of investment, the Obama administration has declared that the proposed repository site in Yucca Mountain is "not an option."

When questioned about nuclear waste, the nuclear industry argues that spent nuclear fuel should be reprocessed or 'recycled' into fresh fuel. Only the French experience with reprocessing has been technically successful, but economically it has been a failure.

If medieval man had ventured into nuclear energy, we today would still be managing his waste, assuming we had survived. Nuclear waste is not a legacy we should bequeath future generations.

Cost of nuclear energy

Cheap nuclear power is a myth. "Too cheap to meter" was the false slogan in 1954. Forbes business magazine has described the failure of the US nuclear industry as "the largest managerial disaster in business history."

After fifty years of substantial government subsidies, nuclear power remains prohibitively expensive. Even among business and financial communities, it is widely

acknowledged that nuclear power would not be economically viable without government subsidies.

In the United States, the most important subsidy comes in the form of loan guarantees, which promise that taxpayers will bail out nuclear utility companies by paying back their loans if and when their projects fail.

The nuclear industry's opaque methods of accounting make it difficult to determine the full economic costs of nuclear energy. Costs are often buried in generous government subsidies or conjured into debt legacies for future generations.

Tenaga Nasional Berhad, in Malaysia, claims that it could build a 1,000 megawatt nuclear reactor for RM1 billion, but there is no mention of other costs. Real costs, such as operating costs, accident insurance, maintenance of reactor security, nuclear waste management and decommissioning costs, are buried in the nuclear industry's creative, opaque methods of accounting.

Capital costs remain a critical problem. Objective data on nuclear economics do not exist. Examination of the limited number of published capital cost estimates shows that the estimated capital cost of a new nuclear power plant has escalated rapidly since 2005 and that estimates are largely derived from manufacturers of reactor systems. It follows that it is extremely risky to accept a manufacturer's estimates and to sign a contract that does not specify a fixed cost, and yet some purchasers do exactly that.

The only relatively reliable data on the costs of nuclear power come from the United States, the United Kingdom, France and Finland. Within this limited data base, we know that cost overruns and construction delays are customary and that no nuclear power plant has been built within budget or a contractual time-frame.

As recent as 29 May 2009, two financial reports in the business section of the New York Times exposed the risky economics of nuclear power by highlighting two fiascos: the virtual collapse of Canada's global flagship, Atomic Energy of Canada Limited and the problems facing the French company, Areva, over the construction of a new third generation pressurised water reactor in Olkiluoto, which is four years behind schedule and more than US\$2 billion over budget. Both companies were overtaken by cost overruns, amounting to billions of dollars, and long delays in completion schedules extending into decades.

A recent study in the United States, which focussed on business risks and the cost of building new nuclear power plants, identified several significant risks. The cost of capital for building new nuclear power plants has been rising much faster than inflation. Major construction delays result in cost overruns of billions of dollars. Long lead times for construction also result in a "premium risk" which increases the cost of capital.

In the end, to keep afloat, new nuclear plants will have to impose high electricity rates which will make consumers very unhappy and the economy less competitive.

After more than fifty years in the business, the nuclear industry cannot attract private funding or liability insurance, cannot demonstrate an ability to build new reactors within a contractual time-frame and budget, and cannot deal with its radioactive waste.

Instead of investing billions in nuclear power, it would be far wiser and more justifiable to commit our limited resources to research and development of renewable sources of energy, energy conservation and energy efficiency.

The nuclear industry's opaque methods of accounting make it difficult to determine the full economic costs of nuclear energy. Costs are often buried in generous government subsidies or conjured into debt legacies for future generations.

“A terribly difficult situation with a lot of uncertainties”: PSR Press Conference

On March 16, 2011, Physicians for Social Responsibility, the US affiliate of IPPNW, briefed reporters on the medical, public health, and scientific dimensions of the unfolding nuclear disaster in Japan. More than 200 American and international journalists participated in a moderated telephone conference call that opened with presentations from three experts on radiation, health, and radioactive waste. The opening remarks were followed by an hour-long question-and-answer period.

Ira Helfand

There's been a lot of media attention over the last several days to the ambient radiation in and immediately around the [Fukushima] plant, which is very appropriate, especially given our concerns about the workers who are remaining in the plant trying to bring this situation under control. But I think we need also to focus on the radioactive isotopes that are being dispersed at some distance from the plant, because this is going to cause a whole different set of health problems. We have been told by a number of nuclear experts who've been appearing in the press over the last several days that we will not see the kind of widespread dispersal of radiation that occurred at Chernobyl because there are not graphite bars to burn here, and the graphite fires played a very important role at Chernobyl in dispersing the radioactive material.

But we have had fires already from burning spent fuel rods, and there have also been steam eruptions, explosions—I'm not sure what one would call them—that can play the same role in dispersing the radioisotopes to great distances. And once these are lofted into the air they get carried by the wind. Depending where the wind is blowing, they're

going to get deposited, and this could be at some significant distance from the plant site.

We have to be concerned about this because even if the total radiation dose is not real high downwind from the plant, the concentration of these radioactive isotopes can pose a very serious health problem. Some of them are quite long lived. Some of them are shorter lived, like iodine-131. But strontium-90 has a half-life of 29 years, and once it's incorporated into bone it essentially stays with you for the rest of your life, irradiating the bone and the bone marrow and causing leukemia and bone cancer. Cesium-137 doesn't last in your body quite so long, but it has a very long half-life as well. And of course plutonium has the longest half-life of all these elements that we're concerned about at more than 24,000 years.

So the issue is that people at some remove from the plant may be exposed to very powerfully carcinogenic radioisotopes that may enter their bodies through inhalation or through ingestion from water or food, and that land at some significant distance may be contaminated so heavily with these materials that it cannot be used by humans for extend periods of time. There are areas, you know, more than 100 miles downwind

from Chernobyl which are still not safe for people to use, and this is I think an aspect of the situation which we really need to be focusing on. If the winds blow, for example, in the direction of Tokyo, it is conceivable that significant portions of the Tokyo metropolitan area could be contaminated in this way if there is a large release as this situation continues to unfold. And so I think this is something we really need to be focusing some attention on.

David Richardson

I would want to start by underscoring some of the points that were just made. On the one hand we have incredibly valiant efforts that are being made by the workers at the facility to deal with a really complex string of problems that continue to arise related to overheating, not only of the reactors but also of the cooling ponds. The workers are in a situation now where from an occupational safety and health perspective it's really serious. It's daunting. There are substantial non-radiological hazards: they're working in a facility where there are explosions going on and fires and extreme heat. And then we add to this some of the work areas have extremely high dose rates now, where workers have to be moved out of the work areas over short periods of time, I would imagine spanning minutes, in order to avoid problems of acute radiation poisoning. And over the period of time that they're working now they're going to accrue exceptionally high occupational doses of radiation, and this would be the external ionizing radiation which is radiation that's moving in the form of waves through the body, like X-rays, but in this case gamma radiation.

There's been a lot of focus on environmental releases related to the reactors and the question of will or will not the containments around the reactors hold and serve to mitigate the environmental releases. What's got less attention, and I would suggest that the press has taken their eye off the ball somewhat on this issue, is the ponds that are holding the spent fuel—these boiling water reactor designs have a relatively thin amount of containment. And for several of the pools—those have been damaged or entirely blown off—there's a large amount of radiation, radioactive material that's stored in those

ponds, and I believe we can—the evidence is that we're having releases from those.

Now that's different than the primary radiological concerns that the workers in the facilities are facing. It's not exposure externally to radiation in the form of radiation waves or a beam of radiation, of gamma rays. It's the concern about the intakes of radioactive particles in the form of gases or dusts, that they may inhale or ingest, or later on if you would get a skin cut you could take it internally through a puncture of the skin. And how much of that's going to be released?

We still don't know in the end, and figuring that out is going to be extremely complicated. I think given that most of offsite monitors are not functioning, it may require that we make an inventory at the end of this about what's still left in the plant, and by that we can make a reckoning of what was lost.

The other question is going to be where will it go, and that's—as people have said before, it's going to depend in part on the winds, whether they're moving out to sea or they're moving over land. And it's unlikely that the radioactive material is going to be distributed evenly in concentric circles; rather it's going to be deposited very likely in narrow bands. So it's going to be quite a while before we have anything more than a crude understanding of the magnitude and the distribution of that contamination, but we're going to need to be able to do that in order to help inform people about how to minimize their exposures. So it's an extremely serious situation.

Marvin Reznikoff

I'm going to try to fill in some of the points that were made previously by the other speakers. Let me start by saying that there are two hazards that have been explained. One is from reactors where there have been steam explosions, and the other is from the fuel pools. The steam explosions have released iodine gas and cesium-137. Cesium-137, because that's a semi-volatile metal, and once the cladding to the fuel is broken that material can be released along with the iodine gas, so when the steam is released then these materials are also released.

I have looked over the NOAA forecasts to see what the wind will be over the next

[I]t's going to be quite a while before we have anything more than a crude understanding of the magnitude and the distribution of that contamination, but we're going to need to be able to do that in order to help inform people about how to minimize their exposures.

three days. They actually have forecasts for the next seven days but three days is more reliable. And I think we're fortunate in that much of the wind will be going out from west to east, that is will be going out over the ocean. As was pointed out earlier, the Chernobyl hazard was about a 1,000 mile hazard, but over the ocean to reach the United States is approximately 2,000 miles. So material will be deposited along the way and rain will also take out some of this material, so I think in that sense we're fortunate. But material will also land in the ocean, and that means that marine life will pick up this material. People eat fish, then they will in turn intake this material. Fortunately the Japanese government has evacuated a larger zone, so the hazard is less to people.

Let me say a word about the fuel pools. You've probably seen that these fuel pools are not located on the ground. They are located up near the top of the reactor, so that generally puts them 70 or 80 feet up in the air. With some of these buildings the roofs have been blown off, so the fuel pools are actually open to the environment directly. Also what hasn't been discussed very much is there is a standalone fuel pool at Fukushima that is on ground level and that contains most of the radioactive spent fuel. A lot of it has been shipped to the reprocessing plant at Rokkasho, but a lot of the fuel is actually sitting in this building, which does have windows. And I am not certain what happened when the tsunami hit, and it would be useful to have Tokyo Electric talk a little about that for the media.

Most fuel in the fuel pools, as I said, has been removed, but for Reactor 4 the fuel was removed from the reactor core and put into the fuel pool so that they could examine the reactor. And that fuel is relatively fresh and hotter thermally, so it's not surprising when the water is no longer circulating that it has been speculated that the water was actually boiled off and a zirconium exothermic reaction - that is the zirconium burned. It burns at 1,800 degrees Fahrenheit and releases hydrogen gas at that point. But the material—any material that got into the air would be directly released into the environment. They cannot resupply this reactor with helicopters because part of the roof still remains and they cannot just dump water into the fuel pool.

James Gland, The New York Times

You gave a nice overview on both topics, the issue of exposure near and far from these reactors. Can you give us any numbers, say, in sort of Rems is, I guess, the favorite unit out there, in terms of what you're hearing or have heard are the levels at the reactor

and far away from it, and how that turns into levels of danger ranging from radiation sickness to cancer risk? Anything? I'm not expecting an entire numerical overview. I know all these numbers aren't available, but we're having a hard time finding them and then also turning them into meaning when it comes to actual risk.

Ira Helfand

In terms of the doses inside the reactor it seems to be varying dramatically from moment to moment. The highest that I've seen was a rate of about 40 Rems or four-tenths of a Sievert per hour at one point, which would have given people in that - who were working in the reactor site a dose that would cause radiation sickness after two and a half hours of exposure. That level was not sustained for a long period of time.

As you get farther away I think the dose—the total dosage that people are getting—is perhaps in some ways less important for the reasons we were talking about, several of us, during our presentations. It is unlikely, hopefully, that people at some remove from the reactor, say in Tokyo, are going to actually be exposed to high enough doses of total body radiation to cause them to have, you know, radiation sickness. But that doesn't mean that they're not inhaling or ingesting radioactive nuclides which might cause them to have cancer, and the correlation between them is not very good. You can have a very small total body radiation dose but inhale plutonium and end up getting lung cancer from it, or ingest some radioiodine and end up getting a thyroid cancer, or ingest some radioactive strontium and end up getting leukemia. And so this—the assurance that we're given that, well, the total dose of radiation that we're measuring is relatively low needs to be taken with that big grain of salt.

James Gland

The one number we've got from Tokyo, .809 microsieverts, you know, as a reassuring number being given by the Tokyo government, is that a justified stance on that number given this cancer issue you mentioned?

Ira Helfand

And what I'm arguing is that it is not. It's certainly better that the dose there is low than that it were high, but the fact that the total body radiation dose is not high does not mean that people there are not being exposed to an increased risk of cancer.

David Richardson

To follow up on that a little bit, it matters right—there are several things that make

you want to qualify or at least ask a question about what value they're reporting. If they're reporting, let's say, a measurement of gamma radiation activity one meter off the ground, that tells you about kind of the gamma field there at that location. The concern is that what's been released is not simply gamma-emitting radionuclides—there would also be beta emitters, for example—and that once they're taken into the body you're not so much interested in the amount of energy—so these units of Sievert or Rem are giving you a sense of what's the energy deposited per, let's say, kilogram or per unit mass. And we're not interested anymore once there's an uptake of a radionuclide which has proclivity to aggregate, for example, in the thyroid or the bone marrow. You want to know the dose delivered to a specific tissue, not the average dose when you're averaging over your total mass of your body. So there are several issues there. One is what's being measured? Is it relevant to the radionuclides of concern? And then not—no longer talking about the average dose to the whole body, but the dose to a specific organ of interest.

Marvin Reznikoff

There is another issue involved which is the total dose to the population; not just to the individual, but the total dose to all the individuals that are receiving this dose. When you get out past the 30-mile or 30-kilometer limit, then there are more people out there, and the total dose to the population will really tell you how many cancers might arise in the future.

I wanted to put this 400 millisievert number in another context, which is to compare that to a chest X-ray. Generally a chest X-ray is a tenth of a millisievert, and we are talking about 400 millisieverts per hour, so that's equivalent to 4,000 chest X-rays per hour.

David Brown, Washington Post

My first question, which was actually partially answered, is do you have any suggestions on where the best source for measurements are? Because I'm also having a hard time finding them. So anyway, that's one, but the other one is can you address the risk, at least from—as seen in the Hiroshima—the atomic bomb survivors is surprisingly low in terms of fatal cancers over a long period of time. Between 1950 and '85 among 76,000 people that were followed in the LSS study—life

span study—there's 300 excess cancers, which is obviously not a lot, and this is pretty heavy exposure. So can you sort of put your worries within the context of what's known from past high exposures?

Ira Helfand

One thing I think to bear in mind is the enormous difference in scale in terms of the amount of radiation involved. [The Fukushima complex] has as much radioactivity as 1,000 Hiroshima-sized bombs...So the potential amount of radiation that could be involved here if there is a large scale release, which there has not been yet, is literally orders of magnitude greater than the amount of radiation that was released at Hiroshima.^a

David Richardson

Your first question concerned where are the best sources of measurements. That information has, to my knowledge, been released relatively sporadically, and there's been occasional press conferences noting dose

rates in certain areas for workers at the plants. There's not been a lot of information provided on environmental doses, and particularly kind of the information that would help you to understand the characteristics of the different radionuclides.

Marvin Reznikoff

And the reason is the monitors are located right at the site. What monitors are available have been put on the site, and the wind blows in various directions. It's generally from west to east, but you don't necessarily have a monitor where the plume is going. It's not clear that they have monitors located all around the circumference of this 30-kilometer area, so it's not surprising that we're not getting the numbers that we want.

David Richardson

One other follow-up regarding the life span study of atomic bomb survivors. It was—there are several aspects to this study that are important. It's an incredibly useful study for understanding what the risks of cancer are for people who have been exposed to radiation. It's worth noting that the study started in 1950 is when they enumerated a census of survivors, so it's not giving you

^a Each of the six reactors in the Fukushima complex has the equivalent of 40 Hiroshimas worth of isotopes, while the spent fuel pools each have three to four times that amount.

information about the risks of mortality following an atomic bombing. It's telling you about the risks of mortality among people who survived five years after an atomic bombing and then were subsequently followed. So it's an unusual study in the sense that follow up began quite a period of time after the exposure happened. So you might imagine that there was—there was; you don't have to imagine—an exceptional loss of life between the point of exposure and when the study begins to follow up people.

Another thing to understand is that the design of the study was intentionally over sampling people based on different exposure categories. So while there's 70,000 or actually more people who are enumerated in the cohort, most of them aren't high dose people. In fact, the majority of them are people who had lower doses so that they could have a comparison to draw between people who had higher and lower levels of exposure. So the net numbers of cancers among the five-year survivors of the atomic bombing is in part a function of understanding the dose distribution among those survivors.

Deborah Zabarenko, Reuters News

I'm going to guess that I'm among those who seem rather overwhelmed with the amount of information that we have and underwhelmed with the amount of specificity that we're having. A popular question to ask these days seems to be what the worst-case scenario would be, so let me narrow that down. First, do we agree that the most troubling reactor is troublesome Reactor 4? And if we do, what's the worst-case scenario for what might happen there?

Marvin Reznikoff

Reactor 4 has—all the fuel was taken out of the reactor, was put in the fuel pool. And I'm just looking at it, and the fuel pool contains approximately 135 tons of nuclear fuel right now. It's likely that that material is—apparently there now have been two fires at that particular location and they cannot resupply the water from the air, so it's not clear how they're going to keep that pool cool. So that pool may actually - this exothermic reaction where zirconium actually heats up the area further, workers cannot get close to it because the direct gamma radiation coming off the pool is very high when the fuel is uncovered. Water in the pool serves as shielding and cooling, and when that water is gone the direct gamma radiation is very high. So it's not clear how they're going to recover, you know, that particular situation.

So I would have to go back and do the calculation as to what would happen if 270-some tons of fuel actually began to burn. I

don't know the answer to that off the top of my head.

Deborah Zabarenko

I guess I want to make sure that I've heard things right and that that's the most troubling area right now.

Ira Helfand

Well, they're all kind of troubling, and one other that is particularly cause of concern of course is Reactor 3, where the government has reported that there's been some breach of containment. And this is particularly disturbing because Reactor 3 is fueled with MOX fuel, not just uranium, and the possibility of a very significant plutonium release and subsequent plutonium contamination of area around the plant, which would really make this a very, very long term problem, is a big issue at Reactor 3.

Deborah Zabarenko

How long is this likely to play out in terms of fires, in terms of nobody being able to get in to resupply water? Is this a weeks-long problem? Is this a days-long problem? Is this a months-long problem? I guess that's one question I'd like to see answered.

Marvin Reznikoff

Well, this is a several months problem. The heat will be that high for months, high enough to cause an exothermic reaction. So this is not—this is going to be a continual problem for months.

Tom Maugh, Los Angeles Times

You say there's 135 tons of fuel in the spent fuel pool. How much is in a reactor itself?

Marvin Reznikoff

I don't really know the answer, but less than 135. I don't have the answer right in front of me.

Tom Maugh

You say there are not many monitors around the plant. Were they destroyed by the tsunami or were they just not installed in the first place?

Marvin Reznikoff

Again, this is an assumption on my part, that they were wiped out—this is a conjecture—and that they have temporary monitors located there right now. I'm not exactly certain on that.

Hiramati Yoshitomi, Maniti Newspapers

I have a question to Dr. Ira Helfand. You were talking about contamination risk in

terms of isotopes, but Japanese...government says it doesn't affect people's health, but you said [there are] serious potential risks. So could you please elaborate more?

Ira Helfand

Two points I think need to be made. One is that the repeated assurances that this dose is too low to affect people's health simply does not square with what we know about radiation, which is that no dose is safe, that there's no threshold dose, that any dose of radiation increases somewhat your chance of developing a cancer.

The second point is that there is a very poor correlation, as Dr. Richardson was explaining before, between the total body dose of radiation that may be measured and the dose that's delivered to a particular susceptible tissue, so that if you are exposed to a relatively low dose of total body radiation but you inhale some particles of plutonium you can still go ahead and get lung cancer. And obviously if the total body dose is high, the chances of your ingesting or inhaling a radioisotope are greater because there's more of the material in the area. But this sort of linear relationship between your dose of total body radiation and the effect on your health is really loose when you're talking about low dose radiation at some distance from the source, because the internal dose may be very significant even if the total body dose of your entire body is not. Did that explain it?

Hiramati Yoshotomi

[What is] the long term effect [of the isotopes] you were talking about?

Ira Helfand

I mean the various particles of the different isotopes that are released. There are nearly 200 different radioactive isotopes released potentially from the reactor. There are a few of them that are particularly important because of their biological activity and their radioactive properties: iodine-131 because it concentrates in thyroid and causes thyroid cancer, strontium-90 because it concentrates in bone and causes bone cancer and leukemia, cesium-137 because it's very prevalent and is widely dispersed throughout your body in all tissues and therefore can irradiate any part of your body, and plutonium-239 because of its extreme carcinogenicity in very low doses and because of its very long half-life. And that causes primarily lung cancer when it's inhaled; if it's ingested it's usually not a problem. But if it's aerosolized and you inhale the plutonium you are at significant risk for lung cancer at a very, very low dose of inhalation, which would give you—if

they were measuring the total body dose from that plutonium might be very low. But the dose delivered to the vulnerable part of the tubes leading to your lungs, the bronchi, would be enough to cause cancer.

Marvin Reznikoff

It's important to point out just so that we're in the same ballpark with units the general background radiation—except for radon—is on the order of 1,000 microsieverts per year. So whatever the Japanese government is telling you, you need to compare it to the microsieverts per year, not the microsieverts per hour.

Jenny Uechi, Vancouver Observer

I've been keeping in contact with Japanese relatives and reading up on the Japanese news as well, but they seem to be quite reassured that it's not going to affect their health at this moment. In your view, would the radiation released at present be affecting the health—you know, is this true, is what I'd like to know. Are they safe in places like Tokyo and in the south of Japan in terms of radiation affecting people's health?

Ira Helfand

The doses of radiation that have been released so far in this accident have been relatively small, and the health effects to people as far away as Tokyo presumably is quite low, but it's not zero. The real concern is that the situation remains completely out of control at this point and that the releases that we might see in the coming days could result in a much higher exposure to populations even as far away as Tokyo.

Jenny Uechi

But the government seems to have been reassuring people that there is no need for leaving Japan or leaving places near that area at this moment, but do you feel that there's been not enough information about the risks in the Japanese media so far?

Ira Helfand

Well, it's very difficult to remove large numbers of people from an area. I think the government has acted prudently in removing people from the evacuation zone out to 20 kilometers and taking additional precautions out to 30 kilometers. Hopefully that will be adequate, and since you don't know which way the wind's going to blow it's hard to know where else you would evacuate beyond the immediate area. The danger, of course, is if there's a major release where the winds are blowing from northeast to southwest. That radiation's going to blow down

onto Tokyo, and we just can't predict that. As Professor Reznikoff was saying, this process, this radiation leak could go on for months. During that time, there may be periods when the wind is blowing in the wrong direction and large amounts of radiation are released. This is a terribly difficult situation with a lot of uncertainties as to how exactly it's going to play out.

Sam Trantum, Nuclear Intelligence Weekly

I noticed that you had a number for the amount of spent fuel in the pool at Unit 4, and I'm just wondering where you got that number. I was hoping to find out how much spent fuel is in the other pools onite.

Marvin Reznikoff

Reactor 1—this is what's in the fuel pool. Reactor 1, 50—this is all in tons—Reactor 2, 82; Reactor 3, 88; Reactor 4, 135; Reactor 5, 142; Reactor 6, 151, and in the separate fuel pool that's sitting at ground level, 1,097 tons. There's also some material in dry storage, I should mention: 70 tons.

Sam Trantum

I also wanted to ask you about the possibility of a zirconium fire. I've heard some people talk about this, but I was reading the NEI fact sheet on the spent fuel pool situation and they said that studies performed by the Department of Energy indicate that it is virtually impossible to ignite zirconium tubing. So where's the disconnect between people talking about how if the pool drains you could have a zirconium fire and the NEI saying that's not possible?

Marvin Reznikoff

It appears possible.

Ira Helfand

The disconnect seems to be reality. It appears that this has happened to some degree already.

Sam Trantum

If there is a zirconium fire, how do you put it out? Does just pouring water on it put it out, if that's possible?

Marvin Reznikoff

Yes, cool it down below the temperature. Yes.

Sandi Doughton, The Seattle Times

You were talking about the kind of lack of monitoring even immediately around the reactors. If there is a large release and radionuclides begin migrating, who's going to be tracking that?

David Richardson

I think that's a very good question. Right now there's - as far as I understand they have malfunctioning monitoring posts, and the Nuclear and Industry Safety Agency doesn't know when they'll be back up in operation. So it would not be monitoring in a sense of having environmental radiation monitors onsite and deriving your exposure estimates from that sort of information. It would be much less ideal than that. As I said, it might require doing an inventory of what was released, trying to figure out the time sequence of releases, and then taking into account the topography and wind and doing kind of local dispersion modeling, which is a long, drawn-out process. It's not something that would be done promptly, which means that you're left with sort of crude estimates of kind of the average - you know, average releases over large kind of circles drawn, concentric circles. And that's not really reflective of the exposure that a particular individual in a particular place may receive. So yes, there's a huge gap right now in the information kind of—as far as I can tell on what can be done to do environmental dose estimation or reconstruction.

Sandi Doughton

Obviously the risk is much less to people in the United States, but in the case of a plume coming across the Pacific Ocean, once again, do you have to wait until it, you know, hits—goes above onshore monitors, or is there likely to be any kind of aerial monitoring at that point?

Marvin Reznikoff

The time for material to get across the ocean is on the order of five to eight days. I don't know whether that's useful to you, but once you begin to see whatever results are coming—whatever material is coming over to the United States in that time period. It looks like from the NOAA maps that Alaska and then Canada will be first, and then - and then as—you'll get down to Seattle. And we should be able to detect what's coming across.

David Richardson

My sense right now is that, I mean, most of our focus of attention and concern is more local than that, and that the exposures and the environmental contamination of greatest concern right now that we're talking about are those that are not distributed globally but those that are distributed locally in Japan.

Ira Helfand

I think it's obviously understandable that people here in the United States are concerned about potential risks here, but I think

the real lesson for us to draw from this is what's happening in Japan, and do we court the same risk here in the United States from a future accident at one of our own plants.

Marilynn Marchione, Associated Press

Dr. Helfand, I find your biography that says you have made a career of writing - you're an internal medicine doctor. You've made a career of writing about the risks of nuclear power, and I just would like all three of you to please state if you have any personal opinions or if Physicians for Social Responsibility has a position for or against nuclear power, nuclear plants—just want to have all this on the table.

Ira Helfand

PSR is very clear in its position. We believe that nuclear power poses an unacceptable risk to public health, both because of the danger of catastrophic accident, which we're witnessing now in Japan, and because of the unsolved problem of what to do with the long-term storage of waste, and perhaps most importantly because of the extraordinary role that nuclear power plays in furthering the proliferation of nuclear weapons. We have been in the United States promoting the dissemination of nuclear power technology around the world, and that technology has been in use in the nuclear weapons programs of a number of countries that we are now very worried about. And for all of these reasons PSR since 1978 has had a clear and explicit position against the further development of nuclear power, which position has been supported by broad segments of the American medical community.

Allison Rose Levy, The Huffington Post

Understanding your point that the most immediate concerns are local and in Japan, but also kind of extending a little bit the question from the reporter from Seattle, if this exposure continues and as we're told over many months, you know, this is going to continue to develop or, you know, if a worst case scenario evolves, would there be - you know, not simply toward the West Coast of the United States, which would be, you know, the most immediate sort of next recipient of plumes or anything coming in via air patterns, but in terms of, you know, the entire globe even, you know, with these kinds of materials and gases circulating, would there be any overall global effect, you know, in terms of water, air, overall radioactivity? I know this is a really big question, but just to ask it, if this process in this location kind of continues unabated or worsens.

David Richardson

I can answer in a sort of historical sense, is that yes, we currently have—some part of what we call our background radiation exposure involves the release of radionuclides from the use of nuclear technologies. So we've had a history of nuclear weapons testing, in a few cases nuclear weapons use in Hiroshima and Nagasaki. We've had unintentional releases of radionuclides at commercial plants and weapons factories, and they've contributed to what you would say are detectable levels, albeit small, of radionuclides in the soil and the air and the water. So yes, presumably we'll make a contribution to that.

I think the primary concern right now is not about kind of the global background level of radiation and an incremental increase in that so much as—from my point of view anyway—the kind of more local concerns in Japan.

Allison Rose Levy

Can I ask a follow up to...the statement that it's not the level but the level of dose that is absorbed by a particular tissue or part of the body? Where would one find some of the scientific research articles that talk about that? Because it seems that part of, you know, the kind of health communication message around all of this is the sense that it has to be a high dose, and—you know, so understanding how a small low dose in the wrong place can lead to a health impact? Where would be the existing body of literature on that?

David Richardson

One place to look would be the National Academies—what's called the BEIR VII report, Health Effects of Exposure to Low Levels of Ionizing Radiation. The most recent one is the BEIR VII, and it would lay out the general principles for understanding that at least the way that we're - most current radiation protection models are developed is with the idea that the carcinogenic risks of ionizing radiation—the probability with the likelihood that you're going to cause a cancer is proportional to the dose of ionizing radiation, so that as you increase exposure to radiation you're going to increase the likelihood that you'll cause damage to a cell, which will be a stepping stone to a subsequent cancer. Now that's sort of the idea that there's not a threshold, that there's a certain level where we say there's no health effect; rather, we say that the risk is proportional to the dose.

The question about whether the proper dose metric to talk about is an estimate of your total dose divided by your total mass as opposed to a dose to a specific organ gets more into a more complicated field, which is

kind of how you describe the radiation doses for internally deposited radionuclides. And there they tend to irradiate locally; that is, they're taking up and they'll reside in a piece of tissue or a target organ and they'll just irradiate locally, or they'll deposit most of the dose to an area that's smaller, and so you want to understand the dose to that organ. And most of the effects will be observed in the organs that have been locally irradiated. Now there are some exceptions to that, things like tritium, which tend to move around like radiated water, and they can, like water in your body, be distributed almost across the whole body. But those are sort of exceptional.

Marvin Reznikoff

Just to add to that, for example, strontium-90 would concentrate in the bone, and then you would be concerned about the leukemia effect. Iodine would concentrate in the thyroid so you'd be concerned about thyroid cancer.

Jesse Emspak, *International Business Times*

You mentioned earlier the spent fuel pools and how much is in them and that there's a risk of zirconium fire. And we had the question regarding the NEI position that you can't ignite zirconium alloy, and I was wondering is this—and you're saying the disconnect is reality. And I just wanted to make sure that—do we know for sure that that's what's burning, and if so what the evidence was that that's the case? And then the sort of next operative question is how many plants in the US are using a similar design and how many of those are located near fault lines? 'Cause it seems to me that if you've got, you know, what amounts to a great big swimming pool full of spent fuel elevated you need pumps to keep it going. So, you know, how many in the plants here might end up being in a similar situation if they get hit with a very large earthquake?

Ira Helfand

Well, there are 23 plants in the United States that are exactly of the same design as the Fukushima Reactor 1, and I'm not sure which of those are located near identified fault lines. I think that one of the more interesting articles that's appeared in the last couple days was sort of an assessment of which reactors are most at risk of earthquake damage, and it turns out it's not the ones in California. It's Indian Point north of New York City, and then a reactor here in Massachusetts were the two that were felt to have the highest risk of earthquake because of the relatively less strenuous design criteria

that they were held to, so—to answer that part of your question.

David Richardson

Regarding the spent fuel pools, I think I would refer you—there's a really useful report called *Safety and Security of Commercial Spent Nuclear Fuel Storage*. It's National Academies, at press in 2006, so it's by the National Research Council of the National Academies. And it's got a chapter—it's the third chapter of that book where they lay out in detail kind of how what they call a cladding fire will evolve, and they describe both the chemistry of it and describe scenarios. So I think it's actually—it's not really contested.

Jesse Emspak

Well, the follow-up I'm going to ask, the situation now then, we've got—you're saying it's going to last for a certain amount - I mean, you have a situation—how long would it ordinarily sort of burn for if you can't put any more water on it? I mean, there's only a limited amount of time I think they can keep the seawater going, and that's pretty corrosive anyway. So the question then becomes what - I guess, again, you're sort of asking worst case. Okay, let the stuff burn. You were saying it's several weeks that that could keep going and releasing stuff into the air?

Marvin Reznikoff

The fuel in the fuel pools in Reactor 4, 5, and 6 is relatively fresh because they shut down those reactors, they removed all the fuel from the reactors and put them into the fuel pool, so that fuel is hotter. If you're asking the question at what point will it not—will the fuel pool not be able to reach a temperature of 1,800 degrees Fahrenheit where this exothermic reaction takes place, I'd have to, you know, do some calculations. I don't know the answer to that off the top of my head. But this fuel is relatively fresh that's in Reactor 4 fuel pool.

Ira Helfand

Part of the problem here is that there might be a sequence of bad events. There could be a fire at one of the reactor pools - one of the storage pools this week, but the need to cool the other pools is ongoing so we could have another problem three or four weeks from now if at that point we lose the ability to adequately cool the pools. And the problems of increasing radiation—radioactive contamination around and within the plant site are going to make it increasingly difficult, not easier, for people to move about in there and do work and continue to control the situation. And I think that's what got everybody

who's working on trying to actually control the situation so disturbed and upset, because there seems to be no way of quickly bringing this to closure, and the longer it persists the more potential problems can develop.

Marvin Reznikoff

The fuel pool is not located at the same level as where they are putting water into the reactor. The fuel pool is located 70 or 80 feet up and not where they're trying to relieve the pressure in the reactors. So it makes a more difficult situation to actually do both.

Nancy Gaarder, Omaha, Nebraska World-Herald

Ira, you said that each reactor has the equivalent of 1,000 Hiroshima bombs, the spent fuel pools several times that, and so the potential release is orders of magnitude. Are you saying that there's a plausible possibility over the next coming months that we could have Hiroshima-type releases of many thousand times? And then if that were to happen, what can we expect in the US and what should we be doing? And how would we know? How would we know that it - you talked about we'd know from Alaska to Canada, but how will we know that?

Ira Helfand

Well, we certainly - we could have releases that are 1,000 times as much as Hiroshima. That's a real possibility. At Chernobyl, I believe it was about 400 Hiroshima equivalents of radiation that were released, and we're dealing here with, you know, four reactors and five storage pools. There is an enormous, enormous inventory of radioactive material here that is potentially at risk. How would we know about it? Well, we will be monitoring—I mean, if there's a major release that's going to be picked up very quickly, as the spikes have been picked up over the last couple of days. And I assume that the United States has the technical means to track a plume of radiation even over the Pacific. We have planes with sensors that are part—and we have the whole system put in place to detect radioactive releases from nuclear tests as part of the regimen that was established to implement the Comprehensive Test Ban Treaty should it ever go into effect. So there are the technical means to monitor and track these releases.

Nancy Gaarder

And then the follow up question would be is there anything Americans should be doing to prepare in any way? I know we hear about people snapping up those pills on the West Coast. And then if you had family in

Tokyo, would you ask them to leave?

Ira Helfand

If I had family in Tokyo I'm not sure what I would tell them to do, and I'm not sure where I would urge them to go to. And I know that's a really bad answer to a very legitimate question, but that's the best I can do on that one.

Marvin Reznikoff

Let me just add to what was said. I just wanted everyone to understand why there are so much more inventory in these reactor than released by the Hiroshima bomb. The Hiroshima bomb had fissions on the order of milliseconds, and that produced the cesium and strontium. But these reactors have fuel that's sitting in the reactor for three years continuing to fission, so there are many more fissions and much more fission products than occurred in the Hiroshima bomb.

David Richardson

If I could follow up on that also, I'd like to just make clear we're not saying that a nuclear explosion is going to occur. We're talking about the mass of material which is there, and it would be distributed in a way that would be different than happened in Hiroshima and Nagasaki, where there was a prompt explosion. More likely what's happening here is that there are fires, a lot of the material may stay in place or may burn and some of it aerosolize; the comparison being made is in terms of volume, not in terms of the type of explosion that's going to occur or something like that. These are fires and not nuclear explosions that we're talking about.

Sandi Doughton, The Seattle Times

Do you know if any of the reactors in the United States use the MOX fuel? And the second part of that, how dangerous is even a slight exposure to plutonium? I mean, can you get lung cancer from a single particle?

Ira Helfand

I can answer that second question. You can get lung cancer from a single particle of plutonium, depending on how large it is. The carcinogenic dose is felt to be measured in micrograms, millionths of a gram.

Sandi Doughton

Do we have any MOX fuel reactors in the United States?

Ira Helfand

My understanding is that we do not have any commercial reactors that use MOX fuel. There may be research reactors, but I do

not believe that we have any commercial reactors using MOX fuel. But I'm not 100 per cent certain of that.

David Brown, The Washington Post

Just getting back to these estimates of the amount of radioactivity that was released in various events, I have in front of me the Human Radiation Experiments report—the final report of the President's advisory committee in 1996. There's a chart, and it mentions that at Chernobyl approximately 20 million curies were released. And it says in the first A-bombs, Hiroshima and Nagasaki, approximately 250 million curies released. But Dr. Helfand or someone said earlier that Chernobyl was, like, 400 times Hiroshima—so anyway, could you clarify that?

Ira Helfand

I'm not sure of those figures, and I believe that the release at Chernobyl was sub-

stantially larger than Hiroshima. Part of the difference is that much of the radiation at Hiroshima was direct radiation emanating from the explosion itself as opposed to the isotopes that were distributed afterwards. There is a direct blast of radiation that comes out when there is a fission explosion, and what we're talking about at Chernobyl is the radioactive isotopes with their longer half-lives that are distributed from an accident of that type. There was not a nuclear explosion at Chernobyl and so there was not that burst of radiation coming out directly from the explosion itself.

Marvin Reznikoff

So the comparison is with the longer lived material, such as cesium, and if you look at that and compare Chernobyl to the Hiroshima blast, then the numbers are greatly different.

What may we learn from Fukushima?

Frank Boulton

Medact's Chair Frank Boulton, the chair of IPPNW's British affiliate, Medact, is a retired consultant physician with the National Blood Service, Southampton University Hospital Trust. The following essay, written in April 2011 while events at Fukushima were still unfolding, considers the implications for the UK's nuclear power industry and revisits the health effects of the Chernobyl disaster 25 years ago.

Our heartfelt sympathies go to all the Japanese people in these most testing of times following the earthquakes and tsunami of March 11th. Indeed, were it not for the impact on their nuclear power industry we would be marvelling at the civilized nature of the way Japanese society has responded to the loss of billions of dollars' investments and thousands of human lives. But the still-unfolding events at Fukushima Daiichi throw a different light, and the global implications from the nuclear disaster are very profound even though the death toll is, as yet, very low. Radioactive materials are still leaking and the calculated amount of released radiation has been revised drastically upwards to about a tenth that estimated from Chernobyl in 1986, the biggest nuclear "accident" yet.

Tokyo Electric Power Company (Tepco), assembled in 1951 to help reconstruct Japan after World War 2, is the largest electric power company in Asia and a major component of Japan's very significant nuclear economy.¹ About a third of Japan's energy supply comes from nuclear power. Tepco does not have a sound reputation and questions have been raised about its democratic and societal accountability.^{2,3} In 2002, safety reports

from three nuclear power stations were apparently faked,^{3,4} and in 2007 Tepco was forced to shut the Kashiwazaki-Kariwa Nuclear Power Plant (the biggest complex in Japan) after the Niigata-Chuetsu-Oki Earthquake on the western side of the country caused initially unreported radiation leaks.⁵ The plant was off-line until 2009 and Tepco posted losses of 150.11 billion yen in 2007/8 and expected a loss of 280 billion yen (\$2.60 billion) for 2008/9.⁶

The video-clips of the blasts in Reactors Nos. 1 to 4 at Fukushima in mid-March this year^a give some indication of the scale of damage at these old-style 1970s-built boiling water reactors. Nevertheless Tepco continued to issue falsely reassuring reports for several days until human error—in all likelihood brought on by exhaustion—caused them on March 28 to overestimate the radionuclide contamination of the water in the turbine halls by a hundred-fold.⁷ The detection of traces of I-131 in the air over the UK reported the same day indicate, however slight these traces were, the degree of atmospheric contamination—enough to spread over 10,000 miles—and that Tepco's control

^a(see <http://video.ft.com/v/825918290001/Fukushima-nuclear-plant-explosion>)

of the train of events was being tested to breaking point.

The leak of radioactive water into the trenches of Reactor No. 2 (and the surrounding sea) was only plugged on April 6—after great difficulties⁸ and as yet uncertain permanence. The “Mark I” container design for these reactors has been criticised as being “weak”:⁹ these containment vessels deteriorate through continuous radiation exposure and careful monitoring is needed. Furthermore, the local authorities apparently ignored expert warning in 2005 about the dangers of allowing too much spent fuel to accumulate in the plants’ cooling ponds.² Plutonium now detected in the soil near Reactor No. 3 indicates a melt-down from its fuel, which from September 2010 had been of the “MOX” type⁹ (see comment on MOX below). All four reactors must be decommissioned and the fuel rods removed (and reprocessed): but they cannot be dismantled for at least 40 years as too much radioactivity would be released. They may well need to be entombed long-term and at great expense. The fuel rods in reactors 5 and 6 were shut down successfully but there are eventual plans to re-activate them.⁸

Yet advocates of civil nuclear power, who include Barack Obama and George Monbiot,^{10,11} persist in promoting greater expansion with new “safer” installations. How much Japanese society will continue to support nuclear energy remains to be seen but it will be very difficult for Japan to disentangle itself from a rampant addiction which its political system and societal structures seem impotent to control.³

In the UK, Sir David King—former governmental chief scientific advisor—advocates still expanding our civil nuclear industry and building a new plant at Sellafield (at £3bn) for re-processing nuclear waste into “MOX” (mixed uranium/plutonium oxide).¹² King proposes that the current but defective plant at Sellafield be replaced, and attributes its notorious failures to “faulty design.” Spent waste is very hot to handle while MOX is relatively safe and, from the viewpoint of nuclear power advocates, has the added virtue that MOX manufacture consumes spent waste from uranium-fuelled power plants thereby reducing hazardous stocks.

King also states—with some, but limited, justification (in that coal mining and drilling for oil at sea are notoriously hazardous)—that nuclear power workers have a much lower accidental death rate than conventional power workers,¹² but he ignores the uniquely silent start and horrifically irreversible nature of radiation poisoning and also the health hazards of uranium mining (which his

reprocessing scheme would, at least in theory, reduce).

However, MOX is inherently more dangerous radio-actively than uranium, is readily converted to weapons-grade materials and accurate quantitative accounting for its production is impossible (Barnaby and Kemp, 2007¹³). Thus, large scale MOX production from and for a global “nuclear renaissance” would encourage nuclear weapons proliferation by making it much harder to control unauthorized access to weapons-grade materials. It doesn't even need to be used in a fission explosion

as it would make an effective “dirty bomb.” Barnaby and Kemp also point out—very tellingly—that MOX-based energy production systems are far from carbon-free.

A MOX-based nuclear renaissance will still produce waste—indeed in vastly increased amounts: to deal with this King advocates disposal through “geological storage.”¹² This would be in vitrified blocks trapping the waste and hopefully making it inaccessible to the general environment. Although theoretically attractive, major technical problems have yet to be solved, and vast amounts of industrial energy would be required for the vitrification—either from carbon-intensive combustion or by high intensity (and power-consuming) electric arc furnaces which have other adverse environmental impacts.¹⁴ So any such approach to waste disposal would add great expense and still leave a poisoned legacy for hundreds of generations.

Observers such as Hamish McRae, less obsessed with scientific and technological fixes and taking a long-term financial outlook, offer a different strategy based on non-nuclear renewables and more efficient conservation.¹⁵

Revisiting Chernobyl

The Chernobyl reactor had no contain-

How much Japanese society will continue to support nuclear energy remains to be seen but it will be very difficult for Japan to disentangle itself from a rampant addiction which its political system and societal structures seem impotent to control.

ment facility¹⁶ so its burning graphite fuel-rods were exposed and ejected more radiation than that so far coming from Fukushima.

In reference 16 there are claims that earlier accounts of the numbers of casualties from Chernobyl following April 1986 were exaggerated. However, two authoritative reports in April 2006 (Fairlie and Sumner;¹⁷ and IPPNW-Germany, updated 8 April, 2011)¹⁸ challenge many of the conclusions of the UN/WHO report on the Health Effects of the Chernobyl Accident¹⁹ which gives a total of 9,000 related cancer deaths compared with 900,000 expected cancer deaths in the affected region over the same period. Fairlie and Sumner predict up to 60,000 excess deaths from cancer, and the IPPNW reports describe many Chernobyl-related deaths and much morbidity not due to cancer. A press release from the International Agency on Research in Cancer (IARC, part of the WHO) of 20 April 2006, stated that “the cancer burden from Chernobyl cannot at present be directly measured” but referred to work on prediction models based on other studies, particularly the survivors of Hiroshima and Nagasaki. The press release went on to predict that by 2065 a mean of about 16,000 cancer deaths—with an “uncertainty interval” of between 6,700 to 38,000—may be expected due to radiation from the Chernobyl accident, and a mean of 16,000 cases of thyroid cancer (most of which would respond to treatment) and of 25,000 for other cancers. It also noted that these figures would represent a very small proportion of the total cancer deaths.²⁰

Fairlie and Sumner state that the UN/WHO report was conducted meticulously by respected experts, but they also point out inadequacies—for example restricting the study area to Russia, Belarus and Ukraine and under-quoting the numbers of the “liquidators” who physically cleaned up the reactor site. “Only” 9,000 excess cancer deaths still represent 9,000 avoidable tragedies even though being just 1% of the deaths expected. Bob Gale, the American transplant specialist sent to graft bone marrow to those receiving supra-lethal radiation, such as the helicopter crews dowsing the openly burning Chernobyl core (none survived), gives a valuably informative medical history.²¹

It should be noted that observations on non-human life currently around Chernobyl

indicate profoundly adverse ecological effects associated with the excessive radiation.²²

All these accounts should be considered afresh when deciding the future of nuclear power. This is even though the reactor at Chernobyl had no “containment” and that

[I]t is a common experience that no regulatory system can completely protect humankind from even well-established health hazards...

lessons may be learnt from the vulnerable “Mark I” container designs at Fukushima. Leaks appear to be continuing which makes it likely that upward revisions of the calculated total radiation exposure from Fukushima will continue. The abysmal reputation of Tepco and the way in which it became a virtually unaccountable independent hegemony to

which Japanese society is so dependent is now very apparent, and a profound lesson to all societies of any political persuasion. However, massive and unaccountable irresponsibility is not confined to the nuclear industries—military or civil, banking and the arms trade also exemplify global fields of human endeavour where good regulatory intent has cracked under the pressure of “progressive” instincts and the drive for “growth.”

Nuclear advocates will argue that their installations can be regulated into safety. Dr Mike Weightman, the highly respected Head of the UK’s independent safety regulator under the Health and Safety Executive, has been charged by the government to issue an interim and then a full report on the implications of Fukushima for the UK and has invited comments.²³ This exercise is not meant to help decide whether the UK has a nuclear future but to define improved control, and as such is very important (see ref 24 for an informative response from a nuclear sceptic organisation). However, although it is perfectly feasible to design much improved systems for nuclear safety—and even putting the costs issue on one side—it is a common experience that no regulatory system can completely protect humankind from even well-established health hazards: oft-quoted analogies in, for example, blood transfusion and the pharmaceutical and airline industries, support this attitude and hence the application of the “precautionary principle.”

Hence, while offering our most heartfelt consolations to the Japanese people and recognising that there are no major geological fault-lines in Britain, we need still to heed the

lessons of human frailty and the unpredictability of major events affecting the integrity of nuclear power plants. The better appreciation of 1) the nature of unexpected life-threatening leaks and accidents at nuclear power stations, reinforced by Fukushima; 2) the costs of dealing with all the sequelae of nuclear power including improved safety, build and waste disposal; and 3) the increased insecurity generated from vastly higher global stocks of MOX, provides the framework for a particularly potent case

against a global nuclear renaissance and

for a healthy non-nuclear world based on entirely different economies and life-styles.

Even though establishing such a world is probably the greatest challenge yet to face humankind and would entail significant suffering, this would be much preferred to nuclear annihilation.

Radiation in medicine and in nuclear power plants: the same but very different

Andreas Nidecker

Dr. Andi Nidecker, a specialist in radiology in Basel, Switzerland and a member of the board of IPPNW, was asked to explain for non-specialists how exposure to ionizing radiation affects human health, and what factors need to be considered when radioisotopes are used in diagnostic and therapeutic medical procedures. Dr. Nidecker produced the following fact sheet, which IPPNW made available to its affiliates for public education and to answer questions from the media.

I have been asked to explain as diagnostic radiologist briefly the difference between radiation used in diagnostic x-ray and nuclear medicine studies and the radiation being emanated from a failing nuclear power plant as is unfortunately now happening in Japan.

Different types of ionizing radiations

Radiation is called “ionizing” because it can harm the cell nuclei in living tissues, cause disease and even death depending on the dose. Radiation occurs naturally in certain rocky areas in the world and is being emitted by certain substances called radioactive isotopes. The most powerful of those ionizing radiations is gamma radiation which is used for diagnostic x-ray and for radiotherapy but also in nuclear power plants for electricity production.

Radiation in medicine

As gamma radiation can penetrate tissues, it has the advantage—if used with caution and in reasonably small dosages—to make the inner organs of the human body visible. This is done in two ways: either by using an x-ray tube to send gamma-rays through

the body or by injecting into the body very small doses of a short lived radioactive radioisotope, usually technetium. The information compiled through the use of computers will be transmitted via x-ray films or CT sensors or gamma cameras to give information about different organs and measure accumulation of technetium or other radioisotopes in the body.

Being short lived, all injected radioactive material will have disintegrated and been eliminated by the patient within minutes or hours. Whether using external radiation in x-ray machines or CT scanners or whether injecting radioactive substances in nuclear medicine studies, radiologist always use minute doses which are known not to harm the patient. Every patient seen by them needs a diagnosis and radiation may be used if medically justified: the risk of missing a patient's serious disease is much higher than the risk potentially induced to him by the burden of ionizing radiation. Occasionally other non-radiological methods, i.e., non ionizing, such as ultrasound or magnetic resonance imaging, can also be used to render a diagnosis.

Radiation in the nuclear power industry

In a nuclear power plant radiation effects occur in so called fuel rods made by uranium. Uranium exists in different forms and breaks down in the fuel rods by emitting Gamma rays just like in medicine. But this radiation is much stronger and is used to heat water which then produces steam in order to propel a steam turbine which in turn produces electricity. As long as the radioactive fuel rods are covered by water this process occurs in a controlled manner and the water keeps on being heated and produces steam.

So far this was considered an elegant although expensive way to produce electricity. However, there are safety issues involved and this makes nuclear power a potentially risky method to produce electricity. If the radioactive fuel rods are not persistently kept cool, they start to heat up and increase the temperature and pressure in the innermost location of the power plant. This so-called core or inner containment may break under pressure if the cooling is not maintained. The fuel rods then disintegrate and a large amount of radioactivity will be blown out into the atmosphere.

Radioactive isotopes in the fuel rods, such as uranium, plutonium and cesium, are much longer lived than the radioisotopes used in medicine. They will continue to send out harmful radiation as long as they are around. These particles can be blown as clouds over oceans and continents, but once they land somewhere, they still will emit radiation and will do this sometimes for many years e.g. the strontium and cesium isotopes for about 50 years, yet plutonium 40,000 years and uranium over 400,000 years.

As these radioisotopes can penetrate the ground, they will accumulate in the water and will be ingested by humans or animals through plants: once inside the body, they will build up in inner body organs, just like

the short lived isotopes used in nuclear medicine studies. However, due to their much longer life, these isotopes may submit the body or a particular organ e.g. the thyroid gland, to continued harmful radiation. Through this process, the cells in the body could experience genetic damage, heart disease and malignant tumours.

Today it is known that even small doses or so called low level radiation, if ingested repeatedly as by the people living in radioactive contaminated regions, can be harmful and lead to disease.

Extremely helpful and extremely harmful

In summary one can say that radiation used in the core of a nuclear power plant is dangerous, obviously more so when set free in an accident: it is produced by highly radioactive corpuscular substances which are long lived. As the radiation comes from particles, these may be blown over large distances and can potentially be ingested,

unnoticed by humans, and lead to chronic radiation diseases including cancer. On the other hand, the radiation produced by an x-ray tube affects the body for milliseconds to minutes and that used in nuclear medicine disappears from the body within minutes to hours.

Radiation used in medicine has the beneficial effect of allowing early detection of a serious disease, whereas radiation from the power plant accident had a high chance to produce serious disease and death, depending on the doses experienced. In conclusion, radiation is of the *same* type in medicine and nuclear power but very *different*: small doses are used in a controlled way in medicine and dangerous long lived radioisotopes are blown into the atmosphere in an uncontrolled way in a nuclear accident.

Radiation used in medicine has the beneficial effect of allowing early detection of a serious disease, whereas radiation from the power plant accident had a high chance to produce serious disease and death...

Children, Teens and the Japan Disaster

Harry Wang

Dr. Wang, a child and adolescent psychiatrist in Sacramento, California, is Clinical Professor of Psychiatry at the University of California Davis School of Medicine. He is also the President of the Sacramento chapter of Physicians for Social Responsibility. Dr. Wang said he compiled the following guidelines for possible use by others, because “during this difficult time.... I am dealing with a lot of anxious children and teens.”

As we all know, Japan is suffering through a horrific disaster caused by the 9.0 earthquake, tsunami, and probable meltdowns at the Fukushima nuclear power plants. Unfortunately, this crisis will not end any time soon. I have already heard a variety of fears that young clients have expressed as they grapple with this tragedy. Children and teens who have, themselves, experienced traumas and/or losses will be more susceptible to what has happened in Japan. The amount of news that is watched on television may also increase the anxiety level of children and teens.

The American Academy of Child and Adolescent Psychiatry has information on children and news of disasters. “Children and the News” can be downloaded at: www.aacap.org. I have copied their guidelines below (in italics).

Guidelines for minimizing the negative effects of watching the news include:

- *monitor the amount of time your child watches news shows*
- *make sure you have adequate time and a quiet place to talk if you anticipate that the news is going to be troubling or*

upsetting to the child

- *watch the news with your child*
- *ask the child what he/she has heard and what questions he/she may have*
- *provide reassurance regarding his/her own safety in simple words emphasizing that you are going to be there to keep him/her safe*
- *look for signs that the news may have triggered fears or anxieties such as sleeplessness, fears, bedwetting, crying, or talking about being afraid*

Parents should remember that it is important to talk to the child or adolescent about what he/she has seen or heard. This allows parents to lessen the potential negative effects of the news and to discuss their own ideas and values. While children cannot be completely protected from outside events, parents can help them feel safe and help them to better understand the world around them.

As adults it is also important that we monitor our own reactions to these events. One’s own history, present sense of safety, and anxieties can effect how we interact with our children and other family members and friends. Here are some helpful guidelines to

consider (in italics) from the American Psychological Association found at: <http://www.apa.org/helpcenter/distress-earthquake.aspx>.

Managing Your Distress About the Earthquake from Afar

For people with friends and family living in regions affected by earthquakes, watching news coverage of the earthquake's devastation can be very distressing, particularly if there is no news on their safety and well-being. Even for those without personal connections to the country, the news coverage can be overwhelming.

APA offers the following tips to manage your distress:

- *Take a news break. Watching endless replays of footage from the disaster can make your stress even greater. Although you will want to keep informed – especially if you have loved ones in earthquake-affected areas – taking a break from watching the news can lessen your distress.*

- *Control what you can. There are routines in your life that you can continue such as going to work or school and making meals. It is helpful to maintain these routines and schedules to give yourself a*

break from constantly thinking about the earthquake.

- *Engage in healthy behaviors. Eat well-balanced meals, engage in regular exercise like going for a long walk, and get plenty of rest. Bolstering your physical well-being is good for your emotional health and can enhance your ability to cope.*

- *Keep things in perspective. While an earthquake can bring tremendous hardship and loss, remember to focus on the things that are good in your life. Persevere and trust in your ability to get through the challenging days ahead.*

- *Find a productive way to help if you can. Many organizations are set up to provide various forms of aid to survivors. Contributing or volunteering is a positive action that can help you to make a difference.*

- *Strive for a positive outlook. Many people who have experienced tragedy find that they grow in some respect as a result of persevering through the hardship. Over time, people can discover personal strengths and develop a greater appreciation for life.*

I hope that these ideas are useful as we interact with children and teens during these difficult times.
