Higher electricity bills will prompt businesses and local governments in the Kansai region to purchase power from other suppliers. Already, more than 10,000 workplaces have switched to new power suppliers offering lower rates.
Power consumption by households has been trending down as a result of efforts to save on energy use.
The planned liberalization of the power retail market in 2016 could accelerate the defection of households from KEPCO.
The utility is at a crossroads. It should map out a long-term strategy for crafting for itself a future without having to reply on nuclear energy.
That would be the best way to win support from its consumers for the rate increases.
Since the 1970s, the Kansai region around Osaka has been heavily dependent on electricity generated at regional nuclear power plants, many of which are located in Fukui Prefecture.
But the Fukushima nuclear disaster has raised serious questions about the way cities in the region have been consuming power generated at nuclear plants located far away.

Certain increases in electricity bills will be inevitable in the process of shifting away from nuclear energy to other power sources.
KEPCO's additional rate hikes should serve at least as an opportunity for the region to ponder the region's energy future.
The Union of Kansai Governments, composed of the governments of seven prefectures and four designated cities in the region, adopted a target earlier this year of tripling the amount of power generated with renewable energy sources by fiscal 2020.
But no workable plan to lower the region's dependence on atomic energy has been offered.
There will be no progress toward a future with less nuclear power generation as long as the region continues to count on the central government to lead the way.
The Kansai region should take the initiative in working with KEPCO and Fukui Prefecture to develop a viable vision for its energy future.

Updating costs of various energy sources

January 2, 2015

Gov't to update estimates of different energy source costs

http://mainichi.jp/english/english/newsselect/news/20150102p2a00m0na008000c.html

The Ministry of Economy, Trade and Industry will begin work in January to update the estimated costs of different types of energy sources, numbers which will factor into the government's planned energy mix for 2030.
The manner in which costs that have accompanied the Fukushima No. 1 Nuclear Power Plant disaster are reflected in the estimates is expected to be a central point of the debate.
The estimates are planned to be put together within this fiscal year by an expert committee set up in an advisory body to the ministry. They will calculate the kilowatt hour cost of different types of energy, based on factors such as plant construction cost, fuel cost and amount of power produced.
The last time these power costs were estimated was in December 2011, under the rule of the Democratic Party of Japan. A committee set up in the Cabinet Secretariat then calculated the costs for 2010, and added in accident response costs for nuclear power after the Fukushima disaster. They concluded that nuclear power costs at least 8.9 yen per kilowatt hour, a jump of around 50 percent from the 5.9 yen estimate of 2004. The new estimate put the cost of nuclear power on par with the costs of coal power -- which was from 9.5 yen to 9.7 yen per kilowatt hour -- and those of liquid natural gas, which was from 10.7 to 11.1 yen per kilowatt hour.
For the 2011 nuclear cost estimate, costs for paying compensation for the Fukushima disaster, removing radiation and decommissioning its reactors were estimated at 5.8 trillion yen, and each jump of a trillion yen in costs was calculated to add 0.1 yen to the kilowatt hour cost. Currently, the actual costs have

ballooned to around 10 trillion yen, which should raise the kilowatt hour cost in the new estimates accordingly.
Major power companies have also invested a total of over 2 trillion yen on construction to meet new safety requirements enacted in July 2013, in an aim to restart their halted nuclear reactors.
The previous estimate put the cost of reprocessing spent nuclear fuel and disposing of high radiation waste from the nation's reactors at around 19 trillion yen. The new estimate for these costs is likely to be a point of contention.
Regarding renewable energy sources, the previous estimate put the cost of land-based wind power at 9.9 to 17.3 yen per kilowatt hour, and the cost of solar panels for houses at 33.4 to 38.3 yen per kilowatt hour. Those estimates do not include the feed-in tariff system for renewable energy introduced in July 2012 and costs for building and strengthening power lines needed for expanding solar and wind power. The new numbers for these power sources are yet another part of the new estimates likely to be the focus of debate.

FIT revision just an excuse for turning nukes back on?

January 2, 2015

Nuclear motive suspected in feed-in tariff reforms

http://www.japantimes.co.jp/news/2015/01/02/national/nuclear-motive-suspected-in-feed-in-tariff-reforms/#.VKbDiXt1Cic

by Eric Johnston
Staff Writer

Recent revisions to the feed-in tariff system have been welcomed by utilities as much-needed government intervention that will ensure safe and stable supply of all forms of electricity by helping to prevent renewable energy from overloading the grid and causing blackouts.
But critics say the move by an agency under the Ministry of Economy, Trade, and Industry does little to solve the basic electricity transmission issues, and hint that the real purpose of the changes is to limit the amount of renewable energy generated so there is enough grid capacity to handle nuclear power once the reactors are turned back on.
The controversy began in September, when Kyushu Electric Power Co. announced it would no longer sign contracts with most companies that were supplying renewable energy. The reason, the utility said, was that its transmission network would be overloaded if it actually purchased electricity from all of the renewable energy suppliers it had signed contracts with.
Since the advent of the July 2012 feed-in tariff system, which obligates Japan's 10 utilities to purchase electricity made from solar, wind, geothermal, mini-hydro and biomass sources from private firms, there had been something of a gold rush mentality. Firms large and small rushed to take advantage of the tariff, which guaranteed a fixed price per kilowatt hour, and the latest figures show the central government had approved nearly 1.5 million different projects.

About half of these were for solar projects generating under 10 kilowatts, and are primarily rooftop solar panels for homes and small businesses. On the other end of the scale, a total of 1,265 projects had been approved for solar projects generating more than 2,000 kilowatts. Many are “megasolar” projects that generate tens of thousands of kilowatts.

But the larger than expected — by officials at least — number of entrants led Kyushu Electric to announce it would suspend applications from renewable energy suppliers. Four others, including Shikoku Electric Power Co., Hokkaido Electric Power Co., Tohoku Electric Power Co., and Okinawa Electric Power Co., quickly followed suit, sending a shock wave through the industry and sparking warnings that Japan’s nascent moves toward renewable energy were in danger.

In response to the panic, METI looked into the issue. In mid-December, the Agency for Natural Resources and Energy, as part of a general review of the feed-in tariff program, issued a new set of rules for both renewable energy suppliers and distributors (the utilities).

Lax standards in terms of project deadlines meant that, as long as approval for a project had been granted under one tariff price over a fixed period, firms could delay construction by waiting for costs to fall, thus widening their profit margin between the guaranteed price per kilowatt hour they would receive (the tariff price) and the actual generation cost per kilowatt hour.

Under the new rules, however, once project approval is granted, firms are given deadlines for completing construction and connecting to the grid. Missing the deadlines could mean losing the right to grid access.

Also, utilities could previously limit output of renewable-generated electricity for up to 30 days annually, under the assumption the time would be calculated on a daily basis. The basic unit has been changed to hours, which means they can now limit the amount of solar project output by 360 hours annually, and wind power output by 720 hours annually.

This is being done to increase the efficient grid use of renewable energy, the government said.

“By controlling output on an hourly basis, the amount of available capacity can be increased,” the agency said in announcing the rule changes.

A METI study found that seven utilities — Hokkaido Electric, Tohoku Electric, Hokuriku Electric, Chugoku Electric, Shikoku Electric, Kyushu Electric and Okinawa Electric — only accept about 58 percent of the total solar power renewable-energy firms can, or plan to, generate due to grid limitations.

However, renewable energy advocates say the latest decision by the energy agency under pro-nuclear METI fails to address a number of concerns and was based on assumptions about the future of nuclear power in Japan that are, to nuclear opponents, optimistic at best.

“In the basic energy plan approved by the government in April, it states that the fundamental goal is to reduce the reliance on nuclear power as much as possible. But (the agency’s) calculations for the new rules are based on the premise that all of Japan’s nuclear reactors, including those that are 40 years old, will be in operation. The result is nuclear power accounting for between 50 and 60 percent of the supply at Hokkaido Electric and Kyushu Electric during minimum load demand times, and the reduction of available renewable energy,” the Japan Renewable Energy Foundation, a think tank set up by billionaire entrepreneur Masayoshi Son, said in a report released just after the agency’s announcement.

Anti-nuclear activists in Kyushu have questioned the timing of Kyushu Electric’s September announcement that it would not purchase most of the renewable energy generated. Only days before, the Nuclear Regulation Authority had given approval for two Kyushu Electric reactors at its Sendai plant in Kagoshima Prefecture to restart.

“Kyushu Electric says they stopped purchasing renewables to maintain a demand and supply balance, but I really wonder if this is the case”, said Yoshitaka Mukohara, a Kagoshima-based anti-nuclear activist.

All of the utilities have agreed to the new rules. Kyushu Electric is expected to resume purchasing renewable energy this month, but under certain conditions.
But given the ardent efforts of pro-nuclear Prime Minister Shinzo Abe and the ruling coalition, as well as a pro-nuclear lobby that consists of most local politicians, utilities and METI, to restart all safe reactors as soon as possible, it's clear that renewable energy faces a bumpy road due not only to technical and financial issues, but also political and bureaucratic hostility that makes overcoming the other issues all the more difficult.

Exporting nukes

January 3, 2015

Toshiba in talks to export nuclear reactors to Kazakhstan

http://ajw.asahi.com/article/business/AJ201501030030

THE ASAHI SHIMBUN
Toshiba Corp. is in negotiations with Kazakhstan's state-run nuclear energy company over the export of nuclear reactors, according to sources.
Westinghouse Electric Co., Toshiba's U.S. subsidiary, will build the reactors for the central Asian nation.
In cooperation with Japan Atomic Power Co. and an affiliate of Marubeni Corp., Toshiba in 2010 started feasibility studies on constructing a nuclear plant in Kazakhstan.
The former Soviet republic is a major producer of uranium and plans to complete the building of a nuclear plant in the 2020s, the sources said.
Although it is now more difficult to build a new nuclear power plant in Japan due to the 2011 Fukushima nuclear disaster, the Japanese government has been promoting the export of nuclear energy technology as part of its economic-growth strategy.
Other than Toshiba, Hitachi Ltd. and Mitsubishi Heavy Industries Ltd. are active players in the nuclear energy sector. Mitsubishi Heavy Industries, which has tied up with Areva SA of France, has reached a basic agreement with Turkey on a contract for four nuclear reactors. Hitachi has been working on a plan to build a nuclear power plant in Lithuania, also in the 2020s.

People's views & decision-making

January 6, 2015

EDITORIAL: Consensus-building process needed for nuclear policy decisions

Nearly four years have passed since the 2011 Great East Japan Earthquake and tsunami triggered the disaster at the Fukushima No. 1 nuclear power plant.
Signs are that 2015 will be remembered as the year when Japan restarted nuclear power generation.

The No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture, which have passed the Nuclear Regulation Authority's safety screenings in line with stricter regulations, are expected to resume operation as early as this spring. The nuclear safety watchdog has also given the green light to a plan to restart the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture.

Applications for the NRA's safety reviews have also been submitted for 17 other reactors at 12 nuclear power stations. These reactors are waiting in the wings for the NRA's approval.

DIVIDED PUBLIC OPINION

To bring an offline reactor on stream again, the operator also needs to win the consent of the prefecture and municipalities where the reactor is located.

In the case of the Sendai plant, the local assemblies of Kagoshima Prefecture and the city of Satsuma-sendai voted last autumn to support the plan to restart the reactors. The Kagoshima governor and the mayor of the city have also decided to approve it. The will of the local communities concerned has been made clear according to formal procedures.

But the will of the nation as a whole concerning the issue is different.

In a survey The Asahi Shimbun conducted in November, 56 percent of the respondents expressed opposition to restarting reactors, against 28 percent who supported the move. We have been asking similar questions since our survey in June 2013, and all the polls showed that a majority of the people were cautious about the idea of bringing reactors back online.

The opinions of the local governments concerned represent the popular will, as do the results of opinion polls.

If the will of the people concerning other reactor restarts is represented in the same way as in the case of the Sendai plant, the desire of many Japanese to see an end to nuclear power generation in this nation could be ignored as the NRA accelerates its safety screenings of the reactors. Is that acceptable?

Since the Fukushima nuclear disaster, public opinion has remained sharply divided over various related issues, such as evacuation plans, damage caused by radiation and hikes in electricity rates.

The situation requires the government to rethink the way it makes nuclear policy decisions.

The nation clearly needs a system to integrate widely different popular views about nuclear power generation into policies.

In many Western nations, systems are designed to allow citizens to take part in policy debate to refine and visualize public opinion.

CITIZENS' PARTICIPATION IS CRUCIAL

Denmark was a pioneer in this area by creating a system to incorporate public opinions into the policymaking process through "consensus conferences."

Since the late 1980s, the system has been actively used to make decisions on key science and technology policy issues, such as the application of genetic engineering.

Under this system, a dozen or so citizens are chosen from among those who have responded to the government's invitations to participate in debate on a certain issue. They spend several days asking experts related questions and studying and discussing the issue as a panel. Then, working on their own, the citizens prepare and publish a written opinion about the issue.

Lawmakers and media are invited to be present when the citizens publish the document.

Similar systems have been used in various ways by countries and areas. They are all designed as "dialogue-oriented" plans to build consensus among the public while respecting different opinions.

In summer 2012, the government led by the Democratic Party of Japan attempted to adopt a similar approach when it initiated "national debate" on nuclear power policy decisions.

In addition to introducing a public comment system and holding public hearings in various parts of the nation, the DPJ-led government conducted what is known as a "deliberative opinion poll" for the first time in Japan.

About 300 citizens, selected randomly from the nearly 7,000 people who had responded to a survey, engaged in a discussion meeting that ran two days with an overnight stay. A total of three surveys, including the ones conducted before and after the meeting, were held to find out changes in their opinions.

The participants were chosen at random to ensure that the sample would represent the entire population demographically and vocationally. It was an attempt to create a more thought-out public opinion regarding nuclear power through in-depth discussions.

As a result of this process, the government concluded that many Japanese wanted to see their society abandon nuclear power generation.

Some problems arose with the survey method and the way the government made its policy decisions accordingly. But it was nevertheless a welcome attempt to accurately grasp the will of the people. Such an approach should be used more for debate on nuclear power policy issues.

MANY ISSUES DEMAND BROAD CONSENSUS

The division of public opinion over nuclear energy is not limited to the one between the will of the nation as a whole versus the will of local governments concerned.

Since the Fukushima disaster, there have been disagreements among local governments over the scope of "local communities" that should be involved in the decision-making process on such issues as whether to approve construction of a nuclear power plant and a restart of an offline reactor.

In April last year, Hakodate, Hokkaido, sued the state and Electric Power Development Co., or J-Power, to halt construction of the Oma nuclear power plant in Oma, Aomori Prefecture, which is located across the Tsugaru Strait.

Hakodate is located within 30 kilometers of the plant, and its citizens would be exposed to serious threats to their health if a severe accident were to occur there.

Hakodate's legal action is based on the notion that its vicinity to the nuclear plant should qualify it for involvement in decisions on whether to approve construction.

A heap of issues related to nuclear power generation should be settled through broad consensus and agreement. They include the program to provide state subsidies to local governments hosting nuclear plants, storage of spent nuclear fuel and disposal of radioactive waste.

Public opinion will be divided in various ways over all these issues. If there is no effective system to build consensus on such contentious issues by overcoming wide disagreements, the government will have to repeat the futile choice of either forcibly executing or postponing its decisions.

The administration of Prime Minister Shinzo Abe is seeking to revive nuclear power generation in this nation.

But the government's new basic energy supply plan, which the Abe Cabinet endorsed in April last year, contains the following passage: "The government will consider attempts to allow diverse parties to engage in discussions on various energy-related challenges and study together to deepen their understanding for the sake of progress in policy efforts."

The government plans to hold policy debate on the future share of nuclear power in Japan's overall power supply with an eye to making the decision by summer.

If the government is concerned that the traditional approach to policymaking may not work with this challenge, it should change the way it makes decisions now.

What is the best way to measure people's views and opinions and integrate them into the decision-making process? The issue of nuclear power generation raises this fundamental question about the way policy decisions are made.

Convention on Supplementary Compensation (for Nuclear Damage)

January 20, 2015

Japan brings life to nuclear accident fund

Six-nation kitty offers financial help for dealing with disasters

http://www.japantimes.co.jp/news/2015/01/20/national/japan-brings-life-to-nuclear-accident-fund/#.VL4GjS51Cos

Bloomberg, Kyodo
VIENNA – An international pact on nuclear disaster compensation will enter into force April 15 after Japan signed on to the treaty last week, and a fund will be created to help victims of accidents like the one at the Fukushima No. 1 power plant in 2011.
The **Convention on Supplementary Compensation for Nuclear Damage**, which will come into force 90 days after Japan's treaty acceptance, obliges each country to cover at least ¥47 billion in compensation in connection with nuclear disasters within their borders. The other member countries are required to contribute to compensation above that amount with funds set aside by business operators related to nuclear power.
Under the treaty, Japan will contribute up to ¥4 billion to an international fund and could receive up to ¥7 billion to cover compensation in the event of another nuclear accident.
The decision taken by Japan, with the world's third-biggest installed nuclear capacity, ended a 17-year wait for the treaty to become legally binding.
"As a country that experienced an accident, Japan has a responsibility to push forward, not only nuclear safety but also the international convention," Mitsuru Kitano, Japan's ambassador to the International Atomic Energy Agency, said Thursday in Vienna, where he deposited the treaty.
Japan will seek to get more Asian countries to adopt the accord, he said.
The convention will allow countries and companies to offset liability in the event of a nuclear accident.
The U.S., with the world's largest installed nuclear-power base, has championed the convention but struggled to get other leading atomic powers on board. Argentina, Morocco, Romania and the United Arab Emirates are the only other signatories.
"The use of nuclear power looks set to continue to grow throughout the world in the coming decades and it is important to have adequate compensation schemes in place," IAEA Director General Yukiya Amano said at the signing ceremony. Japan's accession is a "valuable additional step toward establishing a global nuclear liability regime."

Even as global nuclear power generation sank last year to its lowest level in more than three decades, IAEA forecasters see installed capacity growing at least 8 percent by 2030. Asian countries, with a combined 47 reactors under construction, are propelling the growth.
Countries have struggled to reassure populations about the safety of nuclear power after the 2011 tsunami caused three reactors at Fukushima No. 1 to melt down and forced 160,000 people to evacuate their homes.
The pact is seen as likely to help promote Japan's exports of nuclear power plants at a time when the administration of Prime Minister Shinzo Abe is seeking such exports and is in talks with India to export nuclear power technology there.
The convention is also likely to make it easier for Japanese nuclear plant manufacturers to export products to member countries because it limits their responsibility in the event of a disaster.
The pact may also make it easier for foreign firms to offer technology to help decommission the Fukushima reactors and clean up the fallout.
While the new compensation fund is intended to encourage nuclear trade between companies located in countries adhering to the pact, it will not come without costs for U.S. manufacturers. Nuclear suppliers will be on the hook to pay at least $70 million in compensation in the event of an accident, according to the U.S. Department of Energy, which asked the industry for comments last month.
"Initial great expectations for the CSC have been tempered by the long road to its entry into force," James Glasgow, a partner at Washington-based Pillsbury Winthrop Shaw LLP, wrote last month. There are still "doubts that the CSC will gain sufficient members to constitute a global regime."

20 percent by 2030?

January 26, 2015
METI considers 20% ratio for nuclear power

http://www3.nhk.or.jp/nhkworld/english/news/20150126_17.html

Jan. 26, 2015 - Updated 02:50 UTC+1
Japan's industry ministry wants to have nuclear energy account for 20 percent or more of the country's electricity supply by 2030.

The ministry has asked a panel of experts to start talks this week on the nation's optimal energy mix.

The government's basic energy policy calls for reducing dependence on nuclear power as much as possible, but still calls it an "important base load power source."

Before the Fukushima nuclear accident in 2011, nuclear energy provided 28 percent of Japan's electricity.

All the nation's nuclear reactors are currently offline. The 20-percent figure assumes restarting some, while scrapping other aging reactors by 2030.

The industry ministry also hopes to raise the aggregate share of nuclear and renewable energy to a maximum of 50 percent of total supplies.

The aim is to reduce Japan's emissions of greenhouse gases.

It's unclear what the expert panel will recommend. Some of the members apparently favor keeping the ratio of nuclear power as low as possible.

Nukes & Taiwan

January 26, 2015
Taiwan's Ma won't rule out nuclear energy option

http://www3.nhk.or.jp/nhkworld/english/news/20150126_34.html

Jan. 26, 2015 - Updated 12:12 UTC+1

Taiwan's President Ma Ying-jeou has stressed that the option of using nuclear power should not be ruled out if Taiwan wants to avoid experiencing energy shortages.

Public opposition to atomic energy has been increasing in Taiwan since the 2011 Fukushima Daiichi nuclear power plant accident in Japan. Authorities froze construction of Taiwan's fourth nuclear power plant near Taipei in April last year.

Speaking at a national energy conference on Monday, Ma reiterated his pledge to slowly reduce dependency on nuclear power, with the aim of zero nuclear energy in Taiwan.

But he stressed that renewable energies are not stable and the construction halt on nuclear power plants may force Taiwan to suffer power shortages in several years.

He said Taiwan cannot afford to abandon any energy options.

Following Ma's remarks, some conference participants loudly expressed concerns about the safety of nuclear plants. A civic group also held a rally outside the venue to oppose nuclear power.

Japan Nuclear Power eyes restructuration

January 28, 2015

Japan Atomic Power, reeling from nuke shutdown, eyes major restructuring

http://www.japantimes.co.jp/news/2015/01/28/business/corporate-business/japan-atomic-power-reeling-from-nuke-shutdown-eyes-major-restructuring/#.VMielS51Cos

Kyodo

Japan Atomic Power Co. is considering spinning off its mainstay nuclear power operations into two companies to boost its technical capacity covering two types of reactors, according to sources close to the matter.

The utility, which deals only with nuclear power, is mulling setting up a holding company and reorganize its operations into two companies, one based in east Japan for boiling water reactors (BWRs) and the other in west Japan for pressurized water reactors (PWRs) to obtain human resources separately for each type, the sources said Tuesday.

The move is aimed at **creating an organization suited to supporting major power utilities in decommissioning their reactors in an effort to rebuild the company's struggling business.**

The plan was proposed by Tokyo Electric Power Co., the company's leading shareholder, according to the sources. The plan presumably reflects the government's intention, as it holds a majority stake in Tepco.

Major utilities mainly have BWRs in eastern Japan and PWRs in western Japan.

Established in 1957, Japan Atomic Power is the only Japanese utility with a track record of operating both reactor types. It currently has one reactor in Ibaraki Prefecture and two in Fukui Prefecture.

The suspension of nuclear power plants nationwide following the 2011 Fukushima crisis has reduced the company's revenue source mainly to just fees paid by Tepco and four other utilities for maintaining facilities.

The five utilities, which pay more than ¥100 billion annually, are calling on Japan Atomic Power to reform its management.

"Gimmicks" for an "unrealistic reliance" on nukes

January 31, 2015

COMMENTARY: Utilities running a shell game in relying on nuclear power over renewable energy

http://ajw.asahi.com/article/views/column/AJ201501310022

By TOSHIHIDE UEDA/ Senior Staff Writer

When regional utilities calculated how much electricity generated with renewable energy sources they can purchase from businesses and individuals, they resorted to gimmicks to continue to place an unrealistic reliance on nuclear power.

Seven companies--Hokkaido Electric Power Co., Tohoku Electric Power Co., Hokuriku Electric Power Co., Chugoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co. and Okinawa Electric

Power Co.--announced those “maximum acceptable quotas” at a meeting of an industry ministry working group on Dec. 16.

At six of the utilities, except for Chugoku Electric, the allotments for solar power were smaller than the combined output capacities that the government authorized for businesses and individuals, from which they are required to buy solar power at fixed rates under the feed-in-tariff system.

The maximum acceptable quotas are calculated by assigning part of the power demand to established types of power plants, such as nuclear, thermal, hydro and pumped storage, and the rest to relatively new renewable energy sources, such as solar and wind.

Allocating more to established energy sources removes an equal amount off the quotas for the new energy sources.

Under the feed-in-tariff system, many businesses have acquired the right to sell renewable energy--while the purchase price is high--but have yet to start plant construction.

The practice, known as paper-only slot reservations, is hampering the introduction of more green energy.

The industry ministry working group is tasked with reviewing how much renewable energy the utilities can purchase from businesses and individuals.

When I listened to its discussions on Dec. 16, I thought, “This is nothing but a new twist on slots being reserved on paper only.” This time around, regional utilities are reserving slots for nuclear power.

UNCERTAINTIES ABOUND

How one of their gimmicks works can be seen in the case of the Oma nuclear power plant, being built by Electric Power Development Co. (J-Power) in Oma, Aomori Prefecture. Construction was halted after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster in March 2011, only to be resumed in October 2012.

By coincidence, it was on the day of the working group meeting that J-Power applied to the Nuclear Regulation Authority for safety screenings of the Oma plant based on Japan’s tightened regulation standards, marking a major step toward full-fledged construction work.

Tohoku Electric presupposes, in accepting the supply of renewable energy, that it will receive 280 megawatts of power from the Oma nuclear plant.

But construction of the Oma plant is only 37.6 percent complete. J-Power says it hopes to have the plant operational in fiscal 2021, which means the plant will only begin generating power seven years from now even if everything goes as planned.

And it remains to be seen how long it will take the NRA to complete its screenings.

The Oma plant is designed to use mixed-oxide (MOX) fuel, which contains both uranium and plutonium extracted from reprocessed spent nuclear fuel. The use of MOX fuel in a regular nuclear reactor is called a “pluthermal” program.

While it is customary to use MOX fuel in only about one-third of all fuel, the Oma plant is aimed at full-MOX operations, which involve exclusive use of MOX fuel. Such operations are unprecedented in the world.

Regular pluthermal operations have a track record of more than four decades in Western countries. Japan also implemented pluthermal programs at four nuclear reactors from 2009, so records that are essential for safety screenings are reasonably available.

But full-MOX operations would require screenings to be conducted from scratch.

Kenji Sumita, who served as deputy chairman of the Nuclear Safety Commission of Japan, one of the predecessors of the NRA, is a proponent of nuclear power but is skeptical of a full-MOX pluthermal program.

“Germany attempted to do full-MOX operations in the past, but didn’t do so in the end,” said Sumita, a professor emeritus of nuclear engineering with Osaka University. “The practice involves so many unknown factors, including the status of the reactor core during operation. The plan should be cautiously screened.”

The Oma nuclear plant is also under court proceedings.

The city government of Hakodate, Hokkaido, part of which lies within 30 kilometers of the Oma plant, filed a lawsuit with the Tokyo District Court in April 2014 against J-Power and the central government to demand a halt to the construction. The trial could affect the entry into service of the plant.

Tohoku Electric has nevertheless reserved a slot for the Oma plant. The reservation will remain on paper only until the Oma plant is operational.

“We have taken into account the long-term nature of our purchases of renewable energy,” said Hideto Takahashi, who heads the equipment planning division of Tohoku Electric’s Fukushima branch office.

The Oma plant is not the exception.

Tohoku Electric’s calculations include a prospective power supply from the No. 1 through No. 3 reactors of its Onagawa nuclear plant, the No. 1 reactor of its Higashidori nuclear plant, the No. 1 reactor of Tokyo Electric Power Co.’s Kashiwazaki-Kariwa nuclear plant and Japan Atomic Power Co.’s Tokai No. 2 nuclear plant.

The situation is much the same with five other regional utilities that possess nuclear plants. They have reserved maximum slots for power from nuclear reactors, including two that are so aged that there is talk of decommissioning them--the No. 1 reactor of JAPC’s Tsuruga nuclear plant and the No. 1 reactor of Chugoku Electric’s Shimane nuclear plant.

Of course, no nuclear reactor in Japan is up and running now. And the calculations assume that all nuclear reactors will be restarted.

TRICKERY OF THE MATH

The assumption of constant nuclear reactor utilization rates, used in the calculations, is also very questionable.

The utilization rates were averaged over a 30-year period preceding the Fukushima nuclear disaster.

Tohoku Electric assumes, for example, that nuclear reactors will be generating a constant power supply of 2.35 gigawatts because “that is how the calculations are done in the working group,” in the words of a Tohoku Electric official.

But I doubt that nuclear reactors have actually been utilized to that extent.

Demand in Tohoku Electric’s service area bottoms out at 7.91 gigawatts on May 12. Nuclear power accounts for 30 percent, or 2.35 gigawatts.

Nuclear reactors are obligated to undergo routine inspections at regular intervals. Tohoku Electric’s four reactors underwent a total of 38 regular checks before the Fukushima nuclear disaster. Twenty-one of them were conducted during a period including May 12, the day of the lowest power demand.

It is all too natural for utilities to carry out inspections when the demand for power is low. In the case of Hokkaido Electric, too, 40 percent of its pre-disaster periodic inspections came during a period including May 26, the date of its minimum demand.

The average utilization rate is 69.8 percent for Tohoku Electric and 84.8 percent for Hokkaido Electric. It is unnatural to assume the utilization rates will reach those levels when demand is low.

The central government and regional utilities have nevertheless calculated how much renewable energy can be bought only after setting aside maximum amounts for nuclear power. Their primary concern appears to be about reserving slots for nuclear energy.

We have to be on guard against trickery aimed at putting a priority on nuclear power.

In an emergency recommendation in November, the Fukushima prefectural government called on the central government, Tohoku Electric and other parties to take prompt action to eliminate stalled renewable energy projects. However, there have been no signs of improvement.
“Paper-only slot reservations could be eliminated if only rules were to be set and utilities were to respond properly,” said Shuzo Sasaki, director of the energy division of the Fukushima prefectural government. “But utilities won’t tell you what is taking place. So, if you want to start a renewable energy project, all you can do is make daily visits to the utility office in charge and keep submitting application forms.”

Gov't advisory panel mulls setting nuclear power dependence at 15-25%

http://mainichi.jp/english/english/newsselect/news/20150131p2a00m0na016000c.html

An Economy, Trade and Industry Ministry panel began discussions on the country's future energy mix on Jan. 30, considering establishment of the dependence rate on nuclear power at 15 to 25 percent, and renewable energy at 20-plus percent in 2030.
The long-term energy supply and demand subcommittee to the economy ministry's Advisory Committee for Natural Resources and Energy is looking to finalize a report on Japan's future power mix by this summer, which will be reflected in the greenhouse gas reduction goal for beyond 2020.
In the basic energy plan approved at a Cabinet meeting in April 2014, nuclear power is regarded as the country's important baseload energy, which is able to provide stable electric power around-the-clock at low cost. Following the Fukushima nuclear plant crisis, the government proposed a reduction of dependence on nuclear energy as much as possible from the pre-disaster levels of around 30 percent -- but the concrete figures to which such energy was to be reduced was left unspecified. While the economy ministry and corporations want to keep nuclear power dependence at around 20 percent in order to hold down the price of electricity and ensure a stable supply of power, opinion polls show that the public supports the move to scrap nuclear energy.
The government's basic energy plan sets the goal for the use of renewable energy sources at more than 20 percent. However, the cost of renewable power generation, which is relatively high, has been added to

electricity bills -- leaving issues such as how to balance renewable energy promotion and control financial burdens squarely on consumers' shoulders. The economy ministry plans to calculate the cost of power generation based upon different types of energy sources at another expert panel, and it will take into consideration during its discussions on the forthcoming energy mix.
The country's future power mix will serve as the premise of the greenhouse gas reduction goal, which Japan aims to present at the 21st conference of parties to the United Nations Framework Convention on Climate Change at the end of the year. The Japanese government is seeking to finalize the reduction goal at an early stage, in order to present the figure at a G7 summit meeting in June.

Energy mix: What do Japanese people want?

February 9, 2015

EDITORIAL: Policy debate on energy sources needs viewpoint of consumers

http://ajw.asahi.com/article/views/editorial/AJ201502090028
A working group of the Ministry of Economy, Trade and Industry has started discussing Japan's future energy mix. The group will debate which power sources should provide how much of the energy the nation will consume in 2030, with plans to reach its conclusion by around June this year.
Their debate should focus on two central issues: how to reduce nuclear power generation and how large the share of renewable energy sources like solar, wind and geothermal power should be in the overall energy supply.
The group's work is an attempt to map out the future of this nation, which has suffered severely from the harrowing accident at the Fukushima No. 1 nuclear power plant.
IS 15 PERCENT THE LOWEST POSSIBLE LIMIT?
In the basic energy plan approved by the Cabinet in April last year, Prime Minister Shinzo Abe's administration opted for continued power generation at nuclear plants that have met the new safety standards of the Nuclear Regulation Authority (NRA). But the blueprint also called for lowering the ratio of nuclear power as much as possible.
Before the Fukushima nuclear disaster, atomic energy accounted for 28.6 percent of Japan's total electricity production. Currently, there are 48 nuclear reactors across Japan. The NRA has received applications for its safety screenings for 21 reactors, including some under construction. Four reactors are now almost certain to be restarted.
Assuming that all reactors that have passed the NRA's safety assessments will be brought back on stream and that the government-set limit of 40 years for the operational life of reactors is observed, the share of nuclear power generation in the nation's total power output will become around 15 percent by 2030. If the lifetimes of certain reactors are extended and plans to build new nuclear plants or expand existing facilities are approved, the ratio will be around 20 to 25 percent.
In either case, the share of nuclear energy in Japan's power production will be lower than the figure before the Fukushima accident. That means, the government contends, nuclear power generation in this country will diminish.
No member of the industry ministry's working group is arguing for phasing out nuclear power generation by 2030. It is widely expected that the panel's debate concerning the share of nuclear power will revolve around the range between 15 and 25 percent.

But is 15 percent acceptable as the lowest possible share of nuclear power in Japan's overall energy supply in 2030?

At this moment, Japan is producing no electricity from nuclear energy. After the triple meltdown at the Fukushima plant, two reactors at the Oi nuclear power plant in Fukui Prefecture temporarily resumed operations. But the two reactors were shut down again in September 2013 for regular inspections, and no reactor has since been restarted.

PLAN SHOULD REFLECT REALITY OF NO NUCLEAR POWER

The lack of nuclear power generation, however, did not cause a major power outage last summer thanks to steady electricity saving efforts by consumers, wider use of energy efficient equipment, and arrangements among established utilities for mutual supply of electricity beyond the borders of the regions they serve. No serious problem has occurred this winter, either, at least to date.

Given the large risk that quake-prone Japan takes on by depending on nuclear power, it is vital to phase out nuclear power generation as soon as possible. It is not unreasonable to set a target of terminating nuclear power generation completely by 2030.

Japanese people have a strong will to avoid using nuclear power as much as possible. In various opinion polls, a majority of the respondents expressed opposition to plans to restart idled reactors. A growing number of Japanese are also voicing their desire to see an increase in production of electricity by using renewable energy sources.

It is true that some aged thermal power plants have been dusted off to plug the hole left by the loss of nuclear power generation. The situation has also caused some other serious problems, including hikes in electricity rates made necessary by increased imports of fossil fuels.

Even so, any vision for the future of Japan's energy supply that is based on the assumption that the ratio of nuclear power generation will rise to 15 percent from the current zero would be divorced from public opinion.

CHANGING ROLE OF GOVERNMENT

The electric power market will be deregulated further in the coming years. The government plans to submit to the current Diet session a legal revision to complete the process of power deregulation.

Under the plan, electricity rates will be fully liberalized by 2020. The long-running system of regional monopolies by established electric utilities will be scrapped, and power transmission operations will be separated from the power generation business.

The scheduled market liberalization will allow consumers to freely choose the utilities and power sources they use.

It will even be possible for consumers to buy power from a combination of multiple suppliers using different power sources from the viewpoints of prices and environmental impact. There will be competition among electric utilities.

The deregulation will also prompt consumers to review their choices of power sources and switch suppliers accordingly, thereby making it necessary to reduce electricity production from certain sources while increasing power output from others.

That will be a dramatic change from the era when the energy mix was basically determined only by the supply side.

Despite all these changes, there will still be room for government involvement. It will be impossible to leave market forces to deal with all necessary energy policy decisions.

The government needs to show leadership in responding to international challenges like how to stem global warming. As for the feed-in tariff system, in which utilities are required to buy electricity produced

with renewable energy at fixed rates, it is the government's responsibility to determine the purchase prices.
Considering that electricity is vital for people's lives, we can safely assume that the government will have to continue playing a key role in securing a stable power supply. The government, for instance, needs to provide policy support to ensure that power is also supplied to underpopulated, rural areas and make policy responses to such emergencies as sudden and sharp rises in the prices of resources.
Still, the ratios of the components of the energy mix will assume different implications. They will become more like policy targets and may eventually be replaced by "guideline ranges."
The last time the composition of power sources was determined was in 2010, by the administration of Prime Minister Yukio Hatoyama of the Democratic Party of Japan.
At that time, the government's focus in making the decision was on the fight against global warming. The energy plan called for building at least 14 new nuclear reactors by 2030.
Then, the unprecedented nuclear accident at the Fukushima plant, which was triggered by the 2011 earthquake and tsunami, forced the administration of Hatoyama's successor, Naoto Kan, to scrap the energy supply blueprint. And now, power deregulation is making progress.
Over the past five years, the environment surrounding energy supply has changed drastically. More than anything else, Japanese people's perceptions about power consumption have changed radically.
That makes it all the more important for policymakers to pay sufficient attention to the needs of consumers in pondering the future of the nation.
We want the government to make discussions that can obtain the understanding of the people.

"Politically motivated resistance"

February 10, 2015
10.02.2015_No32 / News

Failure Of Swiss Safety Initiative Blamed on 'Politically Motivated Resistance'

http://www.nucnet.org/all-the-news/2015/02/10/failure-of-swiss-safety-initiative-blamed-on-politically-motivated-resistance

10 Feb (NucNet): A Swiss-led initiative to further strengthen global nuclear safety by amending an international treaty has failed because of "politically motivated resistance" by some nations, Switzerland's chief nuclear regulator has said.
Representatives from 77 countries adopted the **non-binding** 'Vienna Declaration on Nuclear Safety' at a conference in Vienna yesterday, rather than voting on a proposed Swiss amendment aimed at imposing stricter rules under the Convention on Nuclear Safety (CNS).

"Without the readiness of major nuclear energy producing countries to support our initiative, the goal of improving nuclear safety worldwide wasn't achieved," said Hans Wanner of the Swiss Nuclear Safety Inspectorate (ENSI) in an online statement. "The resistance was mainly politically motivated."

The French nuclear safety authority ASN (Autorité de Sûreté Nucléaire) also issued a strongly worded statement, saying the conclusions of the conference were limited to "a non-binding political statement

which does not strengthen the legal obligations of the signatory states".

"The general objectives [approved yesterday] remain below the legally-binding dispositions of the European Directive on Nuclear Safety revised in 2014," ASN said. "This situation might lead to a two-tier nuclear safety system in the world, which would eventually be detrimental to all countries.

"The outcome of the negotiations does not live up to the issues at stake, recalled by the Fukushima-Daiichi accident."

But ENSI also said the adopted principles differ little from Switzerland's original amendment. "The result is a success for Switzerland and for the world," Mr Wanner said. "The international community has committed to continuously improving the safety of nuclear power plants around the world," ENSI said.

ENSI said all participating countries agreed on a statement and the statement has security principles resulting from Switzerland's initial proposal.

ENSI said key principles had been agreed including that new nuclear stations should be designed and constructed according to most recent safety standards and the latest technologies with the aim of avoiding accidents. However, if an accident were to occur, its consequences must be mitigated and significant releases of radioactive material must be prevented at an early stage.

The safety of existing nuclear facilities must be systematically and regularly reassessed. These reassessments should be used as a reference value "for the timely implementation of safety improvements achievable in a reasonable manner".

Yesterday's conference was initially called to consider the proposal by Switzerland to amend Article 18 of the CNS, related to the design and construction of nuclear installations.

The proposal was to add a paragraph that said: "Nuclear power plants shall be designed and constructed with the objectives of preventing accidents and, should an accident occur, mitigating its effects and avoiding releases of radionuclides causing long-term off-site contamination. In order to identify and implement appropriate safety improvements, these objectives shall also be applied to existing plants."

The IAEA said the contracting parties had thoroughly considered the Swiss proposal and concluded it would not be possible to reach consensus on the amendment. Instead, in order to reach the same objective as the proposed amendment, parties unanimously recommended for adoption the Vienna Declaration on Nuclear Safety including principles for the implementation of the convention to prevent accidents and mitigate radiological consequences.

The declaration contains a series of principles to guide countries in the implementation of the objectives of the CNS.

While the declaration says that "reasonably practicable or achievable safety improvements are to be implemented in a timely manner," it falls short of the original Swiss goal of requiring operators to implement back-up systems to contain radioactive contamination in the event of an accident.

The objective of the CNS, which entered into force on 24 October 1996, is to achieve and maintain a high level of nuclear safety worldwide through the improvement of national measures and international cooperation.

The IAEA said obligations for the 77 contracting parties under the CNS include submitting national reports on the implementation of their obligations under the CNS for peer review in meetings held every three years. The last review meeting took place in Vienna from 24 March to 4 April 2014, with more than 800 participants from 69 contracting parties attending.

Kansai Electric still ignoring calls for reducing dependence on nukes

February 10, 2015

EDITORIAL: Kansai Electric out of step with vision of reduced dependence on nuclear power

http://ajw.asahi.com/article/views/editorial/AJ201502100039

Kansai Electric Power Co. has announced its intention to restart nine of the 11 nuclear reactors it owns in southern Fukui Prefecture.
The utility that serves the Kansai region focusing on the Osaka area has made clear that it will depend on nuclear power to generate electricity in spite of the catastrophic accident at the Fukushima No. 1 nuclear power plant in March 2011.
The nine reactors the company plans to reactivate include the No. 1 and No. 2 reactors at the Takahama nuclear power plant and the No. 3 reactor at the Mihama plant, which have been in service for 38 to 40 years.
In the aftermath of the Fukushima disaster, the central government set a basic upper limit of 40 years on the life of nuclear reactors, with a possible extension of up to 20 years in certain circumstances. But only one extension is permitted as an exception, on condition that the reactor passes a special safety assessment by the Nuclear Regulation Authority to check the degree of equipment deterioration.
Kansai Electric, which generated half of its total power output with atomic energy before the Fukushima accident, is under intense pressure to fall in step with the government's policy of lowering Japan's dependence on nuclear power generation as much as possible.
Under these circumstances, the utility's decision to continue operating nine of its 11 reactors is hard to understand.
The Osaka-based company is expected to post losses for the fourth consecutive year, mainly on the back of increased thermal power generation after the accident that has driven up fuel costs.
At the end of last year, the utility applied for government permission to raise its electricity rates again. If the raises are approved, the company's power charges will be the second highest in Japan.
Kansai Electric's decision apparently reflects its desire to lower electricity rates by bringing offline reactors back on stream.

This is precisely the kind of thinking that prevailed in the industry before March 11, 2011.
The triple meltdown at the Fukushima plant created many formidable challenges for nuclear power generation.
Fukui Prefecture is home to 14 nuclear reactors, including those operated by other organizations. An emergency situation involving multiple reactors simultaneously would be extremely difficult to deal with, as dramatically demonstrated by the crisis that unfolded at the Fukushima plant.
The accident highlighted the immense safety risk of a total power outage at a nuclear power plant and showed that utilities need to take more rigorous measures to protect their facilities from terrorist attacks.
To keep operating reactors that have been in service for over 40 years, many special safety measures need to be taken. For example, power cables should be made flame resistant. These measures would cost hundreds of billions of yen, according to one estimate.
It is said that the spent fuel pools of Kansai Electric's nuclear power plants will reach their storage capacity within several years if the utility restarts the reactors.
Fukui prefectural authorities have called for the construction of a facility for interim storage of spent nuclear fuel outside the prefecture. But the prospects of that happening are close to zero.
In the four years since the 2011 nuclear disaster, Kansai Electric has yet to show a convincing solution to any of these tough challenges it will immediately face if it restarts reactors.
When the power retail market is fully liberalized, as planned, the utility, which has been effectively monopolizing the Kansai region's market, will have to compete with other electricity suppliers for customers.
Securing diverse power sources should be part of its management efforts to ensure its long-term viability.
Established electric power companies have been ignoring calls for reduced dependence on nuclear power under the pretext of ensuring a stable power supply.
Kansai Electric, which has the largest number of operative reactors among Japanese utilities, has been leading this trend.
But the Kansai region did without nuclear power last summer and is managing to deal with the situation this winter as well.
We urge Kansai Electric's management team to start making serious efforts to hatch a new business strategy based on the assumption that it will not produce electricity with atomic power.
--The Asahi Shimbun, Feb. 10

China plans to resume construction of nuclear plants

February 12, 2015

Despite safety concerns, China resuming construction of nuclear plants

http://ajw.asahi.com/article/asia/china/AJ201502120074

THE ASAHI SHIMBUN
BEIJING--Facing growing energy demands and struggling against air pollution, China this year plans to resume full-scale construction of nuclear power plants for the first time since the Fukushima nuclear disaster in March 2011.

The country's target is to triple the electricity generation capacity of its nuclear power plants to 58 gigawatts by 2020. That figure would approach the level of France, whose current nuclear generation capacity is second only to that of the United States.

But the variety of reactors that China wants to fire up has raised concerns that workers and engineers will be ill-prepared if a disaster strikes.

One type is a high-temperature, gas-cooled "fourth-generation" reactor. Work is under way to assemble the world's first demonstration reactor of that kind at a nuclear power plant in a coastal area of Shidao Bay at the tip of the Shandong Peninsula.

Practical use of fourth-generation reactors, said to be highly efficient and safe, is expected in the 2030s at the earliest.

In January, many huge cranes were operating at the site of the plant about 600 kilometers southeast of Beijing.

"Construction work, which had been suspended due to the Fukushima accident, has finally begun," a guard said.

China also plans to build several "third-generation" reactors for practical use at the same plant. Third-generation reactors, which were developed in the latter half of the 1990s, are the most advanced reactors currently in operation.

In November 2014, China's National Development and Reform Commission applied to the Standing Committee of the State Council for permission to build six nuclear reactors in the coastal area of Shidao Bay and other regions. The six include China's first domestically produced third-generation reactors and new-type reactors with little actual operating experience.

Some government officials are cautious about approving the application.

However, a senior official of the Nuclear and Radiation Safety Center of the Environmental Protection Ministry said, "The application will be approved sooner or later."

Approval would fall in line with the policy of Chinese President Xi Jinping. His government needs to secure energy sources for the country's growing economy while tackling environmental problems caused mainly by coal-fired plants.

At a Chinese Communist Party meeting held in 2014, Xi declared, "We will promptly start construction of new nuclear power plants in coastal areas by adopting the world's highest safety standards."

After tripling its nuclear electricity generation capacity by 2020, China plans to construct more than 200 reactors, including those in the conception stage.

Some experts estimate that total capacity will increase to a range between 400 gigawatts and 500 gigawatts by 2050.

On March 16, 2011, five days after the Great East Japan Earthquake and tsunami caused the accident at the Fukushima No. 1 nuclear plant, the Chinese government froze work at nuclear power plants whose construction had not yet started and suspended screenings of applications to build new nuclear plants.

Amid growing calls from Chinese officials to review nuclear safety standards, the government conducted stress tests at nuclear plants in various parts of the country. It also reviewed measures to deal with tsunami and secure electricity sources during emergencies.

In October 2012, Beijing worked out its "safety plan of the nuclear power generation," and then began granting permission for the construction of nuclear power plants.

However, the reactors that were given the green light were mainly those where construction work had started before the Fukushima nuclear accident. Very few reactors where ground had not been broken obtained approval.

But the challenges of meeting energy demands while reducing environmental problems became increasingly serious for the Chinese government.
In autumn 2014 in Beijing, President Xi promised in his meeting with U.S. President Barack Obama that China would raise its ratio of non-fossil fuels to about 20 percent by around 2030. But keeping that promise would be difficult without nuclear power generation.
In China, three major state-run operators of nuclear power plants have adopted separate technologies from the United States, France and Russia. The various types of reactors and technologies used in China have sparked concerns about safety at the nuclear plants.
In addition, workers at nuclear plants in China have had little experience in dealing with emergencies. Critics also say that the nurturing of nuclear engineers in the country is not keeping pace with the rapid increase in the number of nuclear reactors.

Australia to go nuclear?

February 13, 2015

Uranium-rich Australia puts its nuclear taboo under review

http://www.bloomberg.com/news/articles/2015-02-12/nuclear-taboo-under-review-in-uranium-rich-australia-energy
by James Paton
Bloomberg
While Australia is home to the world's largest uranium reserves, it has never had a nuclear power plant. Now, amid growing concerns over climate change, the government is weighing whether to reverse its long-held ban.
The state of South Australia, where BHP Billiton Ltd. operates the Olympic Dam mine, is setting up a royal commission to evaluate nuclear power's impact on both the region's economy and its carbon emissions. At the same time, the federal government is set to release within months an extensive report on energy that will explore the issue further.
Those reports will follow Prime Minister Tony Abbott's comments in December that **global warming has made the issue worth revisiting.** It's a significant shift in a nation where grassroots resistance to nuclear energy dates back to the 1960s. Still, any push to introduce nuclear power would face legal and political hurdles from community groups.
"This is going to open the door to a proper informed debate and a comparison of nuclear against other low emissions technologies," said Tony Irwin, director of SMR Nuclear Technology Pty, a Sydney-based company that's developing technology for small reactors.
The Fukushima nuclear disaster in 2011 tilted global public opinion against nuclear power, and Japan and Germany shuttered nuclear facilities.
Four years later, interest in nuclear power has been revived, in part because it has no greenhouse gas emissions. Kyushu Electric Power Co. has received approval to restart two reactors in Japan, while China is renewing its atomic ambitions with five reactors set to start construction this year.

Coal and Gas

While Australia exports uranium to nations including the U.S. and Japan, abundant coal and natural gas have precluded any pressing economic need in the past for nuclear power.

Coal, though, is now under fire because it's the biggest man-made source of greenhouse gases. Abbott said in December that nuclear power should be considered to help reduce carbon emissions, calling it the "one, absolutely proven way of generating emissions-free baseload power." Abbott is a member of the Liberal Party, part of the ruling coalition with the National Party.

Envoys from 190 nations -- including Australia -- will meet at United Nations-sponsored talks in Paris in December to draw up carbon-dioxide emission limits. The current goal calls for policy makers to keep global warming increases to 2 degrees Celsius (3.6 degrees Fahrenheit) by the end of the century.

"The world has a CO2 problem," said Alan Finkel, president of the Australian Academy of Technological Sciences and Engineering, a group with more than 800 scientists and engineers. "We need large-scale solutions. There is some awareness that nuclear, if well managed and well regulated, can significantly contribute at scale to reducing CO2 emissions."

'Open Mind'

South Australia Premier Jay Weatherill also cited climate change when he announced the creation of a commission to study all aspects of the nuclear fuel cycle on Feb. 8.

"I have in the past been opposed to nuclear power -- all elements of it," Weatherill told reporters. "I now have an open mind about these issues." The involvement of Weatherill, a member of the Labor Party, means both sides of Australia's political scene are examining this issue.

A domestic nuclear-energy industry would boost demand for uranium, which has surged 36 percent to $38.20 a pound from a low of $28 in May, according to data compiled by Bloomberg. Australia has 31 percent of the known reserves, according to the World Nuclear Association, and is the third-biggest producer, behind Kazakhstan and Canada.

Uranium traded at $67.50 a pound before the earthquake and tsunami that crippled Tokyo Electric Power Co.'s Fukushima nuclear power plant and triggered the worst atomic disaster since Chernobyl in 1986.

'Probably Valid'

Creating the South Australian commission is "probably valid, given we are a supplier of uranium to the global market," Andrea Sutton, chief executive officer of Energy Resources of Australia Ltd., said by phone. The Darwin, Australia-based company is controlled by Rio Tinto Group, and produces uranium at the Ranger mine in the Northern Territory.

The Australian government believes all energy options, including nuclear, should be part of any discussion about the country's future energy mix, Industry Minister Ian Macfarlane said in an e-mailed response to questions.

There are significant hurdles to introducing nuclear power in Australia, said SMR Nuclear's Irwin, who once operated eight reactors for British Energy Group Plc and also teaches at the Australian National University. Perhaps most significantly, there are **federal prohibitions against the technology.**

Conservation Council

A move toward nuclear energy would also face opposition from environmental and community groups. The Conservation Council of South Australia criticized the South Australia review, saying the state should focus on renewable energy instead.

The nuclear debate in Australia isn't new, and it's easy to look at history and come to the conclusion that there's "very little likelihood that anything is going to happen," according to the Australian Academy's Finkel.
"The confluence of big environmental considerations, economic opportunity and new technology coming down the line might invigorate the debate," he said.

Germany's determination

February 16, 2015

Japan Political Pulse: Germany's rock-hard commitment to nuclear phase-out

http://mainichi.jp/english/english/perspectives/news/20150216p2a00m0na002000c.html
Germany's nuclear power phase-out has reached a point of no return.
On a Japan National Press Club tour of Europe earlier this month, I had the opportunity to speak extensively with energy transition experts in Berlin. There, the head of the economics and environment department at left-leaning daily newspaper Die Tageszeitung asked me how Germany's energy transition was being received in Japan.
I showed him copies of articles from monthly and weekly Japanese magazines declaring Germany's nuclear phase-out a massive failure. He immediately asked me why the effort was being characterized as a mistake. The articles said that electricity prices would rise, preventing significant progress in the energy shift, I told him.
The argument was a boilerplate used by those opposed to energy transition, he asserted, explaining that Germany had, in fact, seen an increase in renewable energy that has helped bring electricity costs down for major corporations. Plus, home electricity costs constitute just a small portion of household expenditures, he said.
But the Japanese articles said the energy transition was a policy that benefitted the wealthy with the means to purchase renewable energy equipment, while placing a great burden on the poor, I continued.
He countered that energy transition was not to blame for poverty. To say so would be like saying that a public transportation system was faulty just because bus fares went up. According to him, **there's an understanding among those involved in the energy transition that no one's ever done it before, but it has to be done.** He explained that Germany is a wealthy country with excellent technology, and has a sense of duty to go a step ahead of other countries to change. We need to understand that the transition is based on this consensus before we bring up electricity prices, he said.
I also interviewed a state secretary of the Federal Ministry for Economic Affairs and Energy, industry associations, and major utility experts, but I got no sense that underneath all the pro-phase-out rhetoric, they actually wanted to revert to nuclear power. I also found no conservative newspapers trying to promote a return to atomic power.
Germany's push to withdraw from nuclear power originated with the 1986 Chernobyl disaster, which helped the anti-nuclear movement gain momentum. A center-left governing coalition decided in 2000 on a

nuclear power phase-out, but in late 2010, the center-right coalition administration of Chancellor Angela Merkel reversed course to prolong Germany's nuclear power use.
The Fukushima nuclear disaster broke out in March 2011, and soon after Germany returned to its phase-out policy under Merkel's leadership. Whether to interpret the move as a wise decision made by a physicist or the instinct of a leader intent on preserving her administration is up to the individual.
With the exception of a few countries, European states accommodate each other's power needs through a network of transmission operators. At the moment, members of the North Atlantic Treaty Organization (NATO) are not particularly concerned about the possibility of a nuclear war.
Meanwhile, however, there is tension between the island nation of Japan and neighboring nuclear states. This means there's a realistic concern in the argument that Japan must protect its nuclear power plants to maintain a latent nuclear weapons capability. It lacks, however, the historical and global outlook to recognize that the Earth will not survive unless we eliminate our reliance on nuclear power and fossil fuels in light of the sudden development of emerging countries.
I asked a German government official whether the country finds itself isolated from the rest of the world, and received the response that half of Europe did not have nuclear reactors, and that France was in the process of reducing its nuclear reactors by half -- and at a faster pace than Germany.
Every country runs into bumps in the road. France's efforts toward halving its nuclear reactors may be stalled if the administration changes. As for Germany, however, its commitment to nuclear phase-out looks unwavering.
Germany has seen a boost in wind and biomass power generation, but **still faces challenges in areas such as the expansion of transmission networks and thermal power generation as a back-up power source**. There's no need to idealize Germany's transition efforts, but there is also no need to buy into the mocking dismissals voiced by Japan's proponents of nuclear power. (By Takao Yamada, Expert Senior Writer)

No dark side to German "Energiewende"

Nuclear future
Source : REneweconomy
http://reneweconomy.com.au/2015/the-myth-of-the-dark-side-of-germanys-energiewende-94542

The myth of the dark side of Germany’s Energiewende

By Conrad Kunze and Paul Lehmann on 18 February 2015
Energy Post
Critics of renewable energy have mocked the Energiewende, claiming that it has led to an increase in coal power and related CO2 emissions in Germany. But Conrad Kunze and Paul Lehmann of the Helmholtz Centre for Environmental Research – UFZ show that this is a myth. German coal generation and CO2 emissions rose not because of but in spite of the Energiewende. They would have been even higher if Germany had not phased out its nuclear power and embarked on its remarkable renewable energy path. “There is no dark side to the Energiewende”.
The *Energiewende* has come in for a good share of mockery in the international media, especially in the Anglo-Saxon and French press. It was widely reported that CO2 emissions in Germany, famous for its anti-

nuclear stance and multibillion-euro renewable energy programme, increased in 2013 (and 2012). True enough, in 2013 German emissions – although still well below the levels of 1990 and 2000 – did rise by 1.5% (see Figure 1). And the reason for this was the growth in Germany's coal-fired power generation (see Figure 2).

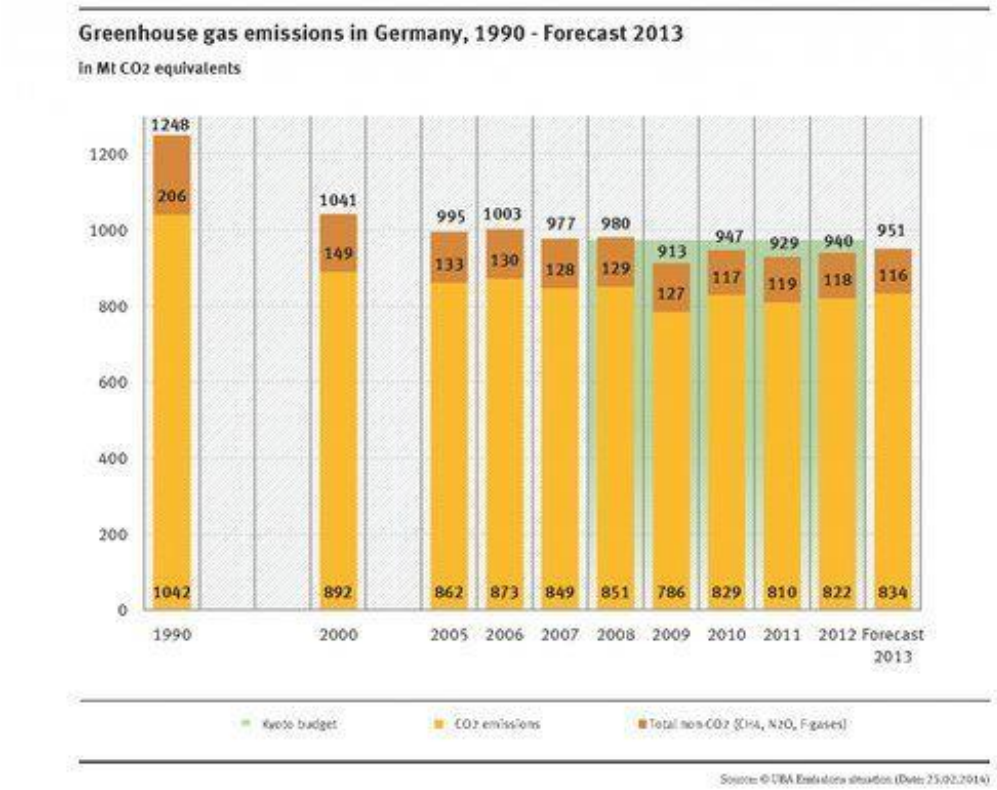

Figure 1: Historic CO2 Emissions in Germany

Source: Umweltbundesamt 2014

Most commentators swiftly linked this trend – increases in CO2emissions and coal-fired power generation – to Germany's energy transition. National Geographic wrote in February 2014: "Some blame the return of coal on the imminent end of Germany's nuclear power industry".[1] In the same month, the New York Times agreed: "But Germany's sudden hunger for coal has emerged as the dirty side of Ms. Merkel's ambitions to shut down the country's nuclear power plants by 2022 and eventually move Germans mostly to renewable energy."[2]And the Guardian repeated the story in August, embellishing the claim by specifically making a nuclear-lignite connection: "Lignite (…) consumption in Europe has remained stable since the late 1990s, but grew slightly over the past few years on the back of high gas prices and the scaling back of nuclear power in Germany."[3]

Is this narrative true? Has the *Energiewende* really caused a coal binge in Germany?

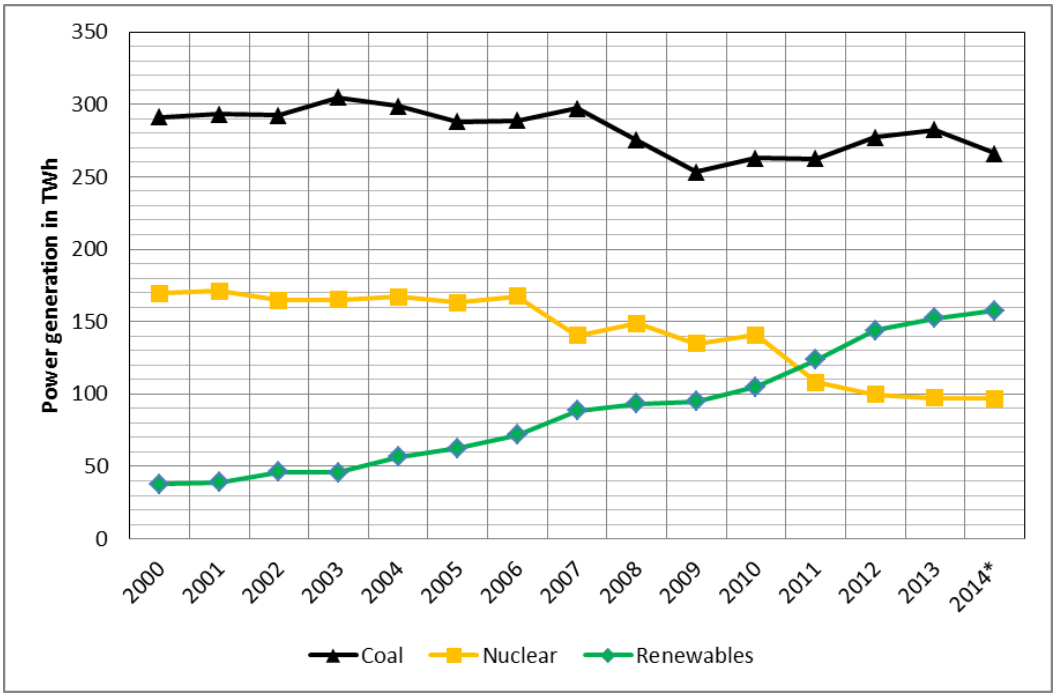

Figure 2: Development of power generation from coal (lignite and hard coal), nuclear and renewable energy sources (in terrawatt-hours, 2014 data partly estimated)
Source: Based on data from AG Energiebilanzen e.V., 2014

Renewables closed the nuclear gap

The narrative of Germany's dirty Energiewende rests on the idea that renewables could not live up to their promise to fill the gap of retiring nuclear reactors. Consequently, that gap needed to be closed by power generation from coal.

But if we look at the figures we get quite a different picture. The yellow line in Figure 2 above depicts how the amount of electricity from nuclear declined from 2000 to 2014. Due to the decommissioning of old plants, nuclear power had been declining steadily. When the German government decided on the phase-out, in 2011, some nuclear power stations were shut down immediately and the output went down more quickly. Afterwards, the steady decline continued once more.

The green line shows the steady rise of renewable energy in the same period. In 2011, more electric energy was provided from renewable sources than from all nuclear facilities. In 2014, renewables achieved a share of approximately 29% in total electricity generation. So renewables have substituted the falling nuclear production in terms of total annual power generation and are very likely to continue doing so until 2022 when the last nuclear plant will be shut down.

Certainly, this observation needs to be interpreted with care. Due to the intermittency of wind and solar energies, power generation from renewables does not always correspond to that of nuclear. Even if renewables can compensate for the reduction in nuclear power generation on an annual basis, there may be shortages throughout the year when the wind is not blowing and the sun is not shining. Such gaps need to be closed by power generation from other sources.

Yet, it is not necessarily coal-fired power plants that fill this breach nor nuclear reactors, which are too inflexible. Natural-gas fired power plants are more suitable since they can be ramped up more quickly than coal-fired power plants – and may therefore be better suited to respond to sudden changes in

renewables supply. So there is no proof that it was coal power which was expanded when renewable energies were not available.

Firing coal for exported electricity

But we know that coal generation did increase in 2012 and 2013. Why was that if not to make up for renewable shortfalls? There is in fact a ready explanation. As renewables and coal increased, and nuclear dropped, overall power generation in Germany increased from 613 to 633 terrawatt-hours (TWh) from 2011 to 2013. Did Germans use that much more energy then? No! In fact, domestic power consumption declined during the same period!

Figure 3, which shows power exports and imports, throws light on the question. The blue line in the graph depicts the amount of imported electricity in TWh. From 2000 to 2007 imports stayed level, despite a brief increase. The red line stands for the amount of exported energy. In 2002 exports started to rise steeply and stayed well above the blue line. In other words, since 2002 Germany has been an electricity exporting country. It also imports, but exports exceed imports.

There is a drop in power exports in 2011, the year in which the decision to phase out nuclear was taken. But even with that reduced production capacity in 2011, Germany still exported more than 50 TWh. The country has never become an electricity importer again, despite the nuclear phase-out.

More importantly, since 2012, exports have been thriving! We may deduce, then, that the German coal binge is related to the increase in overall power generation and exports, not to the *Energiewende* as such.

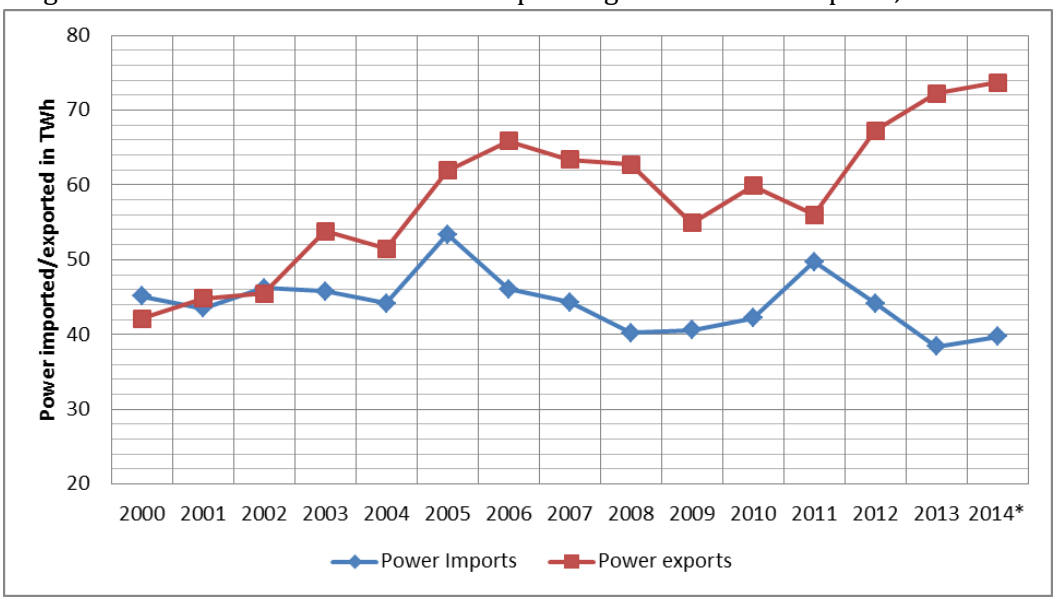

Figure 3: Power imported to and exported from Germany (in terrawatt-hours, 2014 data partly estimated)

Source: Based on data from AG Energiebilanzen e.V., 2014

The coal binge is global, not German

So why has coal generation been thriving? The actual story has got little to do with the German *Energiewende*, and a lot with international markets. In fact, the cost of generating power from coal has declined over the past years. World market coal prices have dropped significantly by more than 30% since 2011 (see Figure 4). As the International Energy Agency points out in its recent Medium-Term Coal Market Report, prices have been driven down by a large oversupply of coal, partly as a result of the shale gas boom in the United States, but also thanks to increasing production capacities in Asia.

What is more, the prices of CO2 allowances, which need to be held by the operators of fossil-fuelled power plants, have collapsed – from 15-17 Euro per tonne of CO2 in 2011 to 5-7 Euro in 2014.
Both effects – the drop in coal and CO2 allowance prices – have made coal an extremely profitable fuel for power generation. Notably, both developments happened in 2011, the year of the nuclear phase-out.
Given Germany's large stock of existing coal-fired power plants, it is no surprise that coal-fired power generation and exports have increased significantly since then. It is thus obvious that the German coal binge has been primarily driven by the developments in international fuel and carbon markets – and hardly, if at all, by Germany's energy transition. Most likely, it would have occurred in the same way if Germany had not phased out nuclear and promoted renewables.

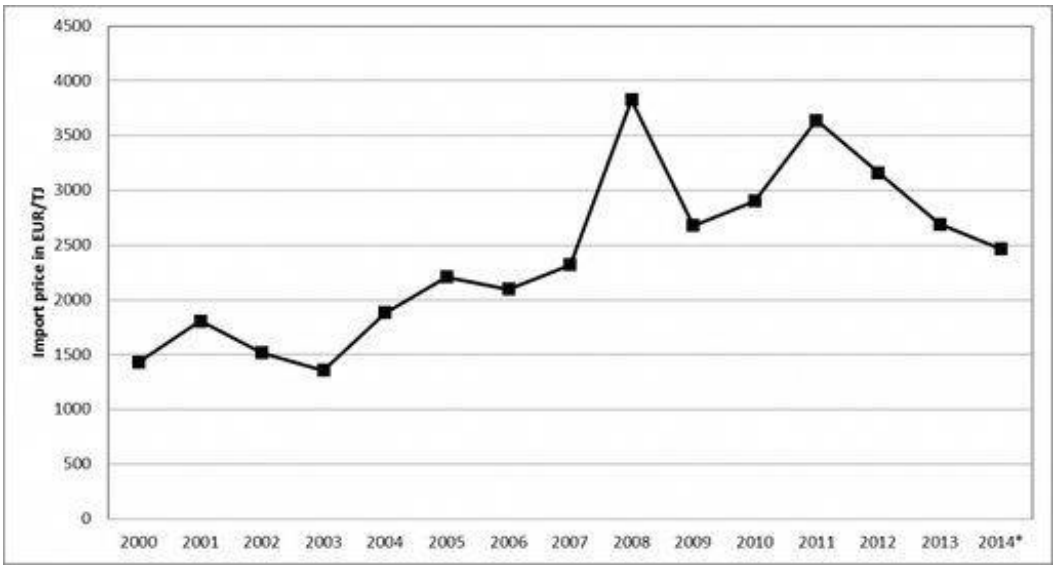

Figure 4: German import price for hard coal (in Euro/terrajoule, 2014 data estimated)
Source: Based on data from BAFA, 2014.

Promoting the *Energiewende* by phasing out coal

Many observers simply don't believe that it's possible for a modern industrial nation to phase out both nuclear and fossil power plants, as the Energiewende is aiming to do. In that sense the Energiewende has become a great test case for the possibility of a post-fossil *and* post-nuclear energy economy. Is it passing that test?
If the German *Energiewende* rests on these two pillars – getting rid of the old nuclear-fossil power plants and setting up new, renewable capacity – the second one is certainly holding up. Renewables rose to an all-time high of 27.7% of electricity production in October 2014 and for the first time beat lignite (26.2%) as the main source for electricity generation.[4]
The other pillar, however, is only half-standing. Nuclear plants are gradually shutting down, but what is missing is a mechanism to retire the coal industry. The most effective and efficient means to do so would be the tightening of the European Emissions Trading Scheme (ETS), e.g. by reducing the overall emissions cap or by implementing a price floor. Admittedly, this option may be limited due to political objections from some Member States, notably Poland. Additional measures, such as a politically mandated phase-out of coal were already considered and rejected in the political discourse.
Economy Minister Sigmar Gabriel, responsible for the *Energiewende,* still emphasises the necessity of coal as a bridging technology, to prevent what he has called a "de-industrialisation of Germany". But the energy industry itself seems to go the other way. In 2014, coal giant RWE was still in financial trouble, the main lignite producer Vattenfall announced its withdrawal from lignite as early as 2015 and Eon has announced

its divestment from all coal and nuclear facilities. It is now up to German (and European) policymakers to fully internalise environmental costs in power prices and advance the phasing out of coal.

A temporary coal binge *despite* the Energiewende

The French-German TV station Arte commented on the expansion of one open cast lignite mine as "the dark side of the *Energiewende*".[5] But this is fundamentally wrong: coal generation and related CO2 emissions have risen despite of, not because of, the *Energiewende* – and presumably would have been even higher without the promotion of renewables.

Recent figures support this argument: Germany's coal-fired power generation and CO2 emissions from power generation have started to decline again in 2014, even if the seasonal effect of the relatively warm winter is excluded (AG Energiebilanzen 2014).

Moreover, it is important to emphasize that the *Energiewende* is not only about climate change mitigation. It also pursues the overall objective of making power generation more sustainable. It is meant to address quite diverse issues next to climate change, such as nuclear hazards, local environmental problems, fuel import dependency and even a democratisation of the energy economy (Kunze/Becker 2014, Gawel et al. 2014). Consequently, an assessment of the *Energiewende*must not be based on CO2 reduction only, but on all relevant societal benefits.

In Germany it took a long time for renewable energy not to be portrayed anymore as a niche activity, unable to provide large-scale power. In international debates this notion still seems commonplace. Mistakenly, as we have tried show.

Concluding that the *Energiewende* has taken the right direction is not to say that it has overcome all major challenges. Important issues still need to be solved, such as safeguarding security of supply with high shares of volatile renewables or mitigating social and ecological conflicts associated with renewables. These are the real challenges that should be spotlighted when discussing the future of the German energy transition, which continues to unfold despite what seems to have been a coal intermezzo.

Iran wants to buy Japanese reactors

March 3, 2015

We want to buy Japanese nuclear reactors': Iran atomic energy official

http://mainichi.jp/english/english/newsselect/news/20150303p2a00m0na013000c.html

TEHRAN -- In multiple interviews with the Mainichi Shimbun, the Deputy Head and Spokesman of the Atomic Energy Organization of Iran (AEOI) Behrouz Kamalvandi said his country would be happy to buy Japanese nuclear reactor technology in the future.

"We look forward to nuclear power plants becoming an area where we cooperate with Japan," he said.

Japan is currently cooperating with economic sanctions imposed on Iran by the U.S. and Europe, and Kamalvandi's comments appear to be envisioning a period after the lifting of such sanctions. Iran and six nations including the United States and European nations are working to reach a framework agreement regarding Iran's nuclear program by the end of this month, with a final agreement to be reached in June.

Currently, the only operating commercial nuclear reactor in Iran is a Russian-made reactor in Bushehr, along the Persian Gulf coast. In November last year, Iran and Russia agreed to the construction of two new reactors. According to Kamalvandi, these three reactors combined will have an output of 3,100 megawatts. Iran has also reached a broad agreement with Russia for the construction of six other nuclear reactors.
Kamalvandi said that assuming new reactors are of the same power output scale as the Bushehr reactor, which outputs 1,000 megawatts, "We will need nine reactors' worth of power, in addition to the three reactors (that will exist after the two new ones are built)."
"In 10 years, Iran's power demand is predicted to be 120,000 megawatts (which is over twice the current power demand.) In every analysis, we end up covering 8 to 12 percent of this with nuclear power. If we assume 10 percent, not counting the three Russian-made reactors, we will need 9,000 megawatts of nuclear power," he said.
He added, "We have been on good terms with Japan for a long time, and if the matter of constructing nuclear power plants here comes up, we will be glad to accept. Japan has technology and knowhow for large-scale nuclear power plants."
Currently, due to its participation in the economic sanctions, Japan is not in a position to conduct nuclear technology exchange with Iran. Kamalvandi expressed understanding of Japan's situation, and said, "If circumstances change, and Japan gets in a position where it can sell us nuclear reactors, we would like to buy."
Kamalvandi is a close aide to the head of the AEOI, Ali Akbar Salehi. When Salehi was foreign minister, Kamalvandi was chosen to act as his deputy foreign minister. Kamalvandi has also served as ambassador to Zimbabwe and Indonesia. He has held his current post since August 2013, when Salehi became head of the AEOI. At the AEOI, in addition to being spokesman, Kamalvandi handles dealings with the Iranian parliament and the AEOI's foreign affairs. He was a participant in nuclear talks held in Geneva in late February this year. (Interviewed by Ryuji Tanaka, Tehran Bureau)

China: Construction of reactors approved

04.03.2015_No47 / News

China ‘Approves Construction’ Of First Reactors Since Fukushima

http://www.nucnet.org/all-the-news/2015/03/04/china-approves-construction-of-first-units-reactors-fukushima

Plans & Construction
4 Mar (NucNet): China has approved construction of its first nuclear power project since the Fukushima-Daiichi accident in Japan almost four years ago brought the programme to a standstill while safety checks were carried out, media reports have said.
China’s State Council gave the go-ahead on 17 February 2015 for two new reactors at China General Nuclear Power Group’s Hongyanhe plant in the country’s northeast, the National Business Daily newspaper reported.

The China Nuclear Energy Association (CNEA) said in August 2014 that the two units, to be named

Hongyanhe-5 and Hongyanhe-6, were expected to be of the CAP-1400 Generation III domestic design, which is based on the Westinghouse AP1000 design.

Hongyanhe already has two commercially operational units and two under construction, all of the domestic Generation II CPR-1000 design.

Hongyanhe-1 and -2 entered commercial operation in June and October 2013. Construction of Hongyanhe-3 began in March 2009 and of Hongyanhe-4 in August 2009.

In June 2014, Chinese authorities said approval for 12 new nuclear reactors would be accelerated, among them the two new units at Hongyanhe.

According to the International Atomic Energy Agency's (IAEA) Power Reactor Information System (Pris) database, China has 16.900 gigawatts of nuclear capacity in commercial operation and 27.756 GW under construction, a total of 44.656 GW (net).

CNEA said a total of 14 GW of nuclear power generation is expected to become operational in 2015 and 2016.

China plans to expand its nuclear capacity to as much as 58 GW by 2020, National Business Daily said.

According to the IAEA, China has 24 operational nuclear units delivering electrical power to the grid, accounting in 2014 for 2.39 percent of China's total electricity production.

There are 25 nuclear reactors under construction in China. The Chinese Nuclear Society said in January 2015 that construction of five more units will begin this year.

Japan nuke exports to Vietnam

Illuminations bathe Ho Chi Minh in light, but nuclear project looms on horizon

http://ajw.asahi.com/article/forum/politics_and_economy/southeast_asia/AJ201503020060

Michiko Yoshii
Professor at the Department of International Communication of Okinawa University
Michiko Yoshii is a professor at the Department of International Communication of Okinawa University. She was a professor at the Center for International Education and Research of Mie University. She did her postgraduate work at Paris VII University and the University of Tokyo and earned her Ph.D. Her areas of expertise are Vietnamese anti-war songs, the plight of street children and civil society.

For Christmas and New Year's, I visited Ho Chi Minh City, Vietnam, where I lived for 12 years until 2005. It was my first time in a decade in the city during the holiday season.

"What the heck is this?!" I thought to myself in astonishment, as I ventured downtown at night. Every street was decked with lights ... lights ... and more lights!

Taking a closer look, I found that the illuminations on the central street leading to Reunification Palace were not for Christmas or New Year's, but rather to commemorate the 40th anniversary of Saigon's liberation in 1975.

Does this mean they will keep the lights on every night until the actual anniversary date on April 30? The sight of rows of brilliantly colored illuminations does not compare to Tokyo, or where I live in Naha, Okinawa. I became worried, thinking, "Maybe they're not using LEDs. In that case, they'll eat up electricity."

On a Sunday morning I went to a neighborhood in the outskirts, where regular people live. In one part where foreigners rarely step foot, there was a narrow market road that seemed to go on forever, where migrants from the countryside reside in tenement houses. They work at a nearby industrial park.

LACK OF AWARENESS OF NUCLEAR PLANT PROJECT

I asked Duc, a 38-year-old worker who handles cargo at a factory, if he was aware of the nuclear crisis at the Fukushima No. 1 nuclear power plant in March 2011.

"I recall hearing the name," he replied. "But I don't know what it is."

When he was younger, Duc migrated from his home in Ninh Thuan province.

I then asked, "Do you know about the nuclear power plant they're going to build soon in the area you are from?" He answered: "I've never heard about that. I just watch soccer on TV."

Duc returns to his family, who live within 20 kilometers of the site for the nuclear reactor Japan will export, each year.

He was not the only person I met who was unfamiliar with the Fukushima incident. Mai, a 30-year-old sewing plant worker, said, "I saw the earthquake and tsunami on TV, but I don't know about Fukushima." When I told her about the planned nuclear facility, she said: "Wow, they're going to build a nuclear power plant in Thai An? That's the first I've heard of it. I only watch dramas on TV." She added: "That village is close to a water supply, so radioactive contamination would be terrible. We have to do something."

Mai was born within 20 kilometers of the plant's planned site and still has parents and siblings living there.

I went with the intention of asking Ninh Thuan natives for their opinions about the nuclear power plant, but my effort came to no avail. I felt like I only ended up publicizing the nuclear power project. I wanted to ask them what they think about the impoverished countryside of Ninh Thuan supplying the electricity used in those glittering illuminations.

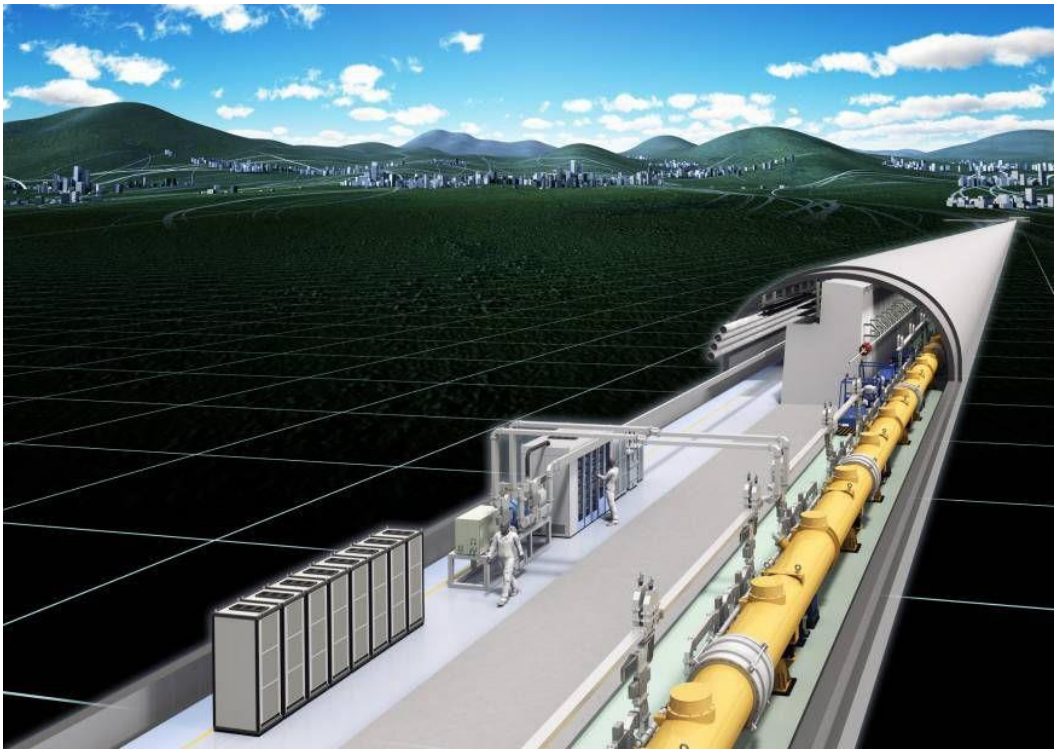
I happened to notice there were numerous mini lights (also used as Christmas lights) suspended just above head level on the narrow tenement-lined road. Then I saw bulbs over the market road as well. When I asked what they were for someone told me, "They're Christmas and New Year's lights."

I asked in response, "Well, who pays for the electricity?" I was told, "The lines run from the homes of relatively wealthy people around here." It seems to be part of a social contribution by people of distinction.

Electricity is consumed like water here, from downtown Ho Chi Minh City to where the masses live. Meanwhile, people migrate from Ninh Thuan because they can't survive there. And the folks from the planned site seem for the most part unaware of the nuclear power plant project.

I felt a great sense of responsibility as a Japanese, the country exporting the nuclear technology. During the big countdown on New Year's Eve, I felt ill at ease and ended up going to bed without watching the fireworks downtown. This year, I decided I must do something to stop Japan from exporting nuclear reactors to Vietnam.

Is this the future?



INTERNATIONAL LINEAR COLLIDER

Tohoku pins rebound hopes to atom smasher

by Tomohiro Osaki
Staff Writer

As the disaster-hit Tohoku region struggles to recover from the deadly tsunami four years ago, many residents have hopes for what is considered a once-in-a-lifetime opportunity to galvanize the area's resurrection.

Chances are the region may host the International Linear Collider, a state-of-the-art research facility physicists worldwide hope will shed light on the secrets of the universe.

We look into the situation both at home and abroad surrounding the ILC and its potential impact on Japanese society.

What is the ILC?

The ILC is an unprecedented particle accelerator that must be built in an underground tunnel 30 to 50 km long. It is the brainchild of the Linear Collider Collaboration, a group of physicists from around the world. The much-anticipated international project calls for the accelerator to catapult two ultra-small particles — electrons and positrons — into each other head-on at close to the speed of light. The process will be repeated numerous times a second, around the clock.

Each successful collision will unleash a significant amount of energy for a split second and re-create the extremely high-energy state of the Big Bang that purportedly spawned the universe.
Construction of the facility is expected to cost about ¥830 billion.

What's the significance of the ILC experiment?

The high-energy reaction is expected to spark an array of particles considered relevant to the birth of the universe, including the recently discovered Higgs boson.
Scientists hope this Big Bang simulation will help explain some of the most profound mysteries in the universe, including its makeup and how it works. An estimated 95 percent of matter existing in the universe remains scientifically unaccounted for.
One chief objective of the ILC project is to delve into the mechanism of the Higgs boson, the "God particle" detected for the first time by scientists in the European Organization for Nuclear Research (CERN) during an experiment conducted at the Large Hadron Collider in 2012.
The Higgs boson is thought to impart mass to other particles, meaning that without it, every single particle, for example those in a human body, would disperse at the speed of light.
The ILC, if built, will be the longest particle accelerator in the world, dethroning the LHC, which lies deep beneath the Franco-Swiss border near Geneva.
While the LHC smashes particles using a 27 km-long circular path — roughly equivalent to Tokyo's Yamanote Line — the ILC will be straight. A linear collision is considered more powerful than a circular one because curves reduce the speed of the particles.

What would be the potential societal impact if Japan hosts the ILC?

If the ILC is built in Japan, it will be the first international research institute Japan has hosted, according to Satoru Yamashita, an associate professor at the International Center for Elementary Particle Physics at the University of Tokyo.
It will be a major breakthrough in a country that has long suffered from a brain drain of local talent and help Japan regain global visibility in science and technology, Yamashita said.
But perhaps more significantly, the ILC would attract a swarm of foreign physicists and their families, creating a global community.
Nomura Research Institute estimates the facility will create 250,000 jobs over a 30-year period covering its construction (10 years) and operation (20 years), with the economic benefits over the same period likely to reach ¥4.3 trillion, according to the Tohoku Conference for the Promotion of the ILC, a regional group seeking to promote Japan's bid.

What are the chances of the ILC coming to Japan?

It seems the chances are quite high.
According to Yamashita, a consensus has been formed among physicists in the United States and Europe that it should be built in Japan.
The Particle Physics Project Prioritization Panel (P5), part of the U.S Department of Energy's high-energy physics advisory group, said in its report last May that Japan's fledgling ILC initiative is an "exciting development," and recommended the U.S. "play a world-leading role in the ILC experimental program" should "this exciting scientific opportunity be realized in Japan."

Is there a nationwide movement to host the ILC?

So far, the domestic interest has largely been municipal, because the central government hasn't officially declared Japan's candidacy.
A panel of outside experts set up by the Education, Culture, Sports, Science and Technology Ministry is scrutinizing Japan's potential to host the facility and is likely to conclude the discussion by the end of the next fiscal year.

Japan will then discuss the panel's assessment with global leaders, and decide on its ILC acceptance and other details, Yamashita said.

Where in Japan would the ILC most likely be built?

A group of scholars and researchers determined in summer 2013 that the Kitakami mountains, which straddle three Tohoku prefectures — Aomori, Iwate and Miyagi — would be the best ILC location in Japan, ruling out the Sefuri mountains in Kyushu.

The Kitakami mountains, a large part of which lie in Iwate Prefecture, were judged ideal because their ground consists of layers of solid granite 50 km wide, long enough to accommodate the ILC.

An investigation by the group into geological conditions also confirmed there is no active fault running underneath that would trigger an earthquake.

What's the local response like?

Iwate Prefecture, for one, has strenuously campaigned for the ILC. It characterizes the project as a "once-in-a-lifetime" opportunity for the future of Tohoku, which is struggling to recover from the devastating quake and tsunami four years ago that killed nearly 19,000 people.

"We believe the ILC will not only enable us to regain what was lost in the disaster but to gain something new and make the Tohoku region something akin to an international hub of scientists," said Masataka Miya, chief of a team set up by the prefectural government for the hosting bid.

Miya said the project will boost science education for local children and provide new business opportunities to local manufacturing industries.

The prefecture set up a task force in 2013 to discuss how to make its communities more amenable to incoming foreign scientists and their families.

Among the topics under discussion are how to address the serious lack of full-time medical interpreters in local hospitals and where to school foreign children who accompany their parents, Miya said.

Any concerns?

Miya acknowledged that some residents are worried about the ILC's link to radiation.

The ILC accelerator releases radiation while it operates and the tunnel as a whole will be designated a radiation-controlled area.

The Advanced Accelerator Association Promoting Science & Technology (AAA), which campaigns for the ILC initiative in Japan, claims on its website the possibility of a radioactive substance leaking outside the facility is nearly zero, citing its watertight safety measures and full-time surveillance system.

However, in 2013, a proton accelerator facility called Japan Proton Accelerator Research Complex (J-PARC) in Ibaraki Prefecture malfunctioned and exposed 34 workers and researchers inside to radiation.

Yamashita from the University of Tokyo said the likelihood is low that a similar accident will befall the ILC, noting that electrons and positrons require only a thousandth of the radiation necessary to collide protons. Still, he added: "Radiation is such a fearful thing for many people that even the tiniest amount of it leaking is enough to frighten them. The fact that the facility needs only a limited amount of radiation does not make unnecessary robust safety precautions."

Renewables goals for 2030 rather low

March 11, 2015

FOUR YEARS AFTER: Ministry forecasts 20% green power by 2030; experts criticize goal as too low

March 11, 2015
http://ajw.asahi.com/article/business/AJ201503110053

By KUNIAKI NISHIO/ Staff Writer

Twenty percent of the electricity produced in Japan 15 years from now will be renewable energy, according to the economy ministry, but some industry experts said the figure needs to be higher.

The ministry announced the estimate on March 10 during a Subcommittee on Long-term Energy Supply-demand Outlook meeting to discuss the nation's future energy plans.

Of an estimated 1 million gigawatt-hours to be produced in fiscal 2030, renewable energy will account for around 200,000 GWh, according to the ministry.

The 20 percent total falls short of the goal the government set in April 2014 in its basic energy plan, in which it anticipated "a standard outpacing the previous goal," which had been set at 20 percent for fiscal 2030.

Some subcommittee members pointed out that the new estimate at just 20 percent doesn't "outpace" this goal.

"We should strive for 30 percent," said Takeo Kikkawa, professor of economics at Hitotsubashi University's Graduate School of Commerce and Management.

Kikkawa proposed such policies as utilizing power lines that would be out of service after the decommissioning of nuclear power plants.

Power generated through renewable energy sources in fiscal 2013 totaled 100,400 GWh, accounting for about 10 percent of all the electricity produced that year.

According to the government's new estimate, solar power produced in fiscal 2030 will total 70,000 GWh.

The figures were estimated by combining the “maximum acceptable quotas” set by the 10 main electric power utilities of Japan.

Maximum acceptable quotas are calculated by assigning part of the power demand to established types of power plants, such as nuclear, thermal and pumped-storage hydroelectric, and the rest to relatively new renewable energy sources, such as solar and wind power.

The estimate does not include the effects of new regulations set by the ministry, such as the requirement to temporarily reduce power generation to introduce more solar energy.

Eyeing the establishment of wind power facilities currently being assessed on their environmental impact, the government estimates that at least 10,000 GWh will be produced through wind power in fiscal 2030.

Costing relatively little to set up, wind power plants have been spreading across the globe, but power lines to bring the electricity made by wind turbines to urban areas often need costly upgrades.

According to the ministry, introducing an additional 10,300 GWh of wind power in Hokkaido and the Tohoku region will require an additional 1.17 trillion yen ($9.65 billion).

Estimates on geothermal energy and hydropower, along with biomass power from such sources as wood chips, were made in consideration of such factors as eased restrictions on these power sources in the future.

At the March 10 meeting, some experts were concerned over possible increases in electricity bills after the spread of renewable energy.

The ministry will continue reviewing such issues as introducing more solar and wind power projects, and the costs of reinforcing power lines.

Don't put renewables on the back burner

March 12, 2015

Editorial: Japan must not miss the renewable energy bandwagon

http://mainichi.jp/english/english/perspectives/news/20150312p2a00m0na009000c.html

The disaster at the Fukushima No. 1 Nuclear Power Plant has shattered the "safety myth" of nuclear power, attesting to the difficulty quake-prone Japan has in coexisting with nuclear plants. It has also sparked within many a desire to create a society that does not rely on nuclear power by boosting renewable energy and promoting energy conservation.

Four years have passed since the outbreak of the Fukushima nuclear crisis. While the public's wish remains unchanged, the government seems to have forgotten about the disaster. In discussion about the country's future energy mix that started in January, it has attached priority to maintaining nuclear power. This will not lead to any energy reforms that satisfy public expectations.

The expansion of renewables is a global trend. Renewable energy is growing not only in Europe but also in China. Alas, Japan is ranked only 19th in the world in the amount of wind power generated. While solar power initially grew rapidly in Japan, momentum has been dampened by revisions to the feed-in tariff system, after utilities suspended purchases of renewable energy.

At this rate, Japan will be left behind and lose sight of business opportunities. It's about time for the country to change its mindset with its eyes set on a new era, and to drastically review its infrastructure and old systems centering on nuclear and thermal power generation.

From a short-term perspective, it is important to ensure that the feed-in tariff system does not lose momentum. Rules have been changed for solar energy purchases under the pretext of preventing oversupply, but the move is based on the unrealistic premise that most of the existing nuclear reactors will go online.

Under the current system, energy interchange among power companies is designed to put renewable energy on the back burner. If the government is to review the policy of prioritizing nuclear power and the current system, there should be sufficient room for accommodating renewable energy.

In the meantime, we must also encourage the growth of wind and geothermal power instead of relying solely upon solar energy, while keeping an eye on potential electricity rate hikes. It is important to review the prices for purchasing renewables in an appropriate manner.

In the medium and long run, we will need to give attention to the effect of liberalization of electricity retailing and the separation of power generation and transmission. Under these reforms, utilities will no longer be able to monopolize power transmission networks. This will help spur renewable energy. Electricity deregulation is believed to have played a role in promoting the introduction of renewables in European countries.

Some point to the potential risk of power outages due to a surplus of solar and wind power destabilizing the power grid. In Europe, renewable energy supplies can be adjusted across different countries as their transmission networks are interconnected, but that's not the case in Japan. However, such problems are

realistic only after the renewable energy sources increase. We must boost renewables first and foremost. If we connect divided transmission networks over a wider area, we may benefit from the same kind of effect as in Europe.
The public might need to shoulder heavier costs as a result of an increased renewable energy supply. In order to come up with solutions to this and other issues, it is imperative to draw a concrete image of energy reform based on the premise of less reliance on nuclear power. In no way have we time to be racking our brains about how to maintain nuclear power.
March 12, 2015(Mainichi Japan)

Abe and Merkel don't see eye to eye on nukes

March 10, 2015

On nuclear energy, Abe and Merkel remain far apart

http://ajw.asahi.com/article/behind_news/politics/AJ201503100068

THE ASAHI SHIMBUN
German Chancellor Angela Merkel agreed on a number of things during her talks with Prime Minister Shinzo Abe, but where the two leaders parted company was on the issue of nuclear energy.
Merkel explained her decision to cancel Germany's dependence on nuclear power plants was a direct result of the Fukushima disaster in Japan four years ago.
Abe, on the other hand, was at pains to state that Japan must continue to rely on nuclear energy as a cheap and stable source of power.
At a joint news conference following their March 9 meeting, Abe was asked by a German reporter why Japan was still thinking about resuming operations at nuclear power plants when Germany had decided to move away from nuclear energy by 2022 following the triple meltdown at the Fukushima No. 1 nuclear power plant in 2011.
"Japan depends on nuclear plants for one-third of its energy source," Abe said. "Suspension of operations at those plants has forced us to depend more on fossil fuels, such as petroleum. We have to fulfill our responsibility of providing an inexpensive and stable supply of energy. We hope to resume operations at nuclear plants that have been judged by the Nuclear Regulation Authority to have passed safety standards."
The Abe administration has made clear its intention to resume operations at nuclear plants. Moves are already under way to resume operations at the No. 3 and No. 4 reactors of the Takahama nuclear plant in Fukui Prefecture operated by Kansai Electric Power Co. and the No. 1 and No. 2 reactors of the Sendai nuclear plant in Kagoshima Prefecture, operated by Kyushu Electric Power Co.
Those reactors could come back online before the end of 2015.
For her part, Merkel staked out an energy policy that is sharply at odds with the direction Japan is taking.
In a video message released shortly before her arrival, Merkel said she Japan should join Germany in promoting renewable energy sources as a way of moving away from a dependence on nuclear energy.

Trained as a physicist, Merkel gave a detailed explanation of her decision to move away from nuclear energy during a lecture she gave prior to her meeting with Abe.
Saying that the Fukushima nuclear accident had played a major role in affecting the change in her thinking, Merkel said: "One reason is because the accident occurred in a nation like Japan, which has a high level of technology. It clearly showed that even in such a nation, there are risks such accidents can happen. I came to realize there are risks for events which we thought would never happen."
She went on to explain that for many years she had supported the peaceful use of nuclear energy, but added: "The era of the peaceful use of nuclear energy in Germany is ending. Now we have to construct our energy structures based on the decision."
With courage and the political will, Merkel suggested that any nation could follow Germany's example in moving away from a dependence on nuclear energy.
Because of their obvious differences on energy policy, Abe and Merkel did not discuss nuclear energy during their talks, according to Japanese government officials who briefed reporters.
Merkel also toned down her rhetoric at the joint news conference. She did not directly mention nuclear energy, but only said that Germany and Japan "are working closely on energy efficiency and the stable supply of energy."

But what is Gov't s energy policy?

March 17, 2015

Suga comments on utilities' decision

http://www3.nhk.or.jp/nhkworld/english/news/20150317_33.html

Mar. 17, 2015 - Updated 11:11 UTC+1
Japan's top government spokesman says power companies may have decided to scrap some reactors due to the government's policy of lowering the country's dependence on nuclear energy.

Chief Cabinet Secretary Yoshihide Suga spoke to reporters on Tuesday, after 2 nuclear plant operators announced they would decommission 3 aging reactors.

Suga said the government aims to realize an energy-efficient society and introduce reusable energy as much as possible.

Regarding the radioactive waste that will be generated from decommissioned reactors, he said plant operators are responsible for the waste, and need to secure disposal sites.

Lessons from Fukushima?

Four Years After Fukushima, India Still None The Wiser

Posted: 12/03/2015 18:27 IST Updated: 12/03/2015 18:27 IST

On March 11, four years ago, the great east Japan earthquake rocked the north-eastern coast of Japan leading to a triple reactor core meltdown in the Fukushima Daiichi nuclear plant. The explosion that followed spewed radiation to as far as Fukushima City, 60 km from the plant site. Around 160,000 citizens were relocated to temporary housing and other places in Japan to avoid contamination. The estimated bill for the damage is believed to be at least USD 250 Billion, all of which will be footed using public money by the operator, Tokyo Electric Power Corporation (TEPCO) and the Japanese government.

Four years hence, the damaged plant continues to eject large quantities of radiation into the surrounding air and water. The operator has not made much progress in stemming the flow of radiation. Most monitoring locations within the 60km radius of the plant continue to report high values of contamination. With no permanent storage location, the mountains of waste generated are being haphazardly stored in various locations, including backyards of houses, parking lots and parks. Untreated contaminated water from the site has also leaked into the Pacific Ocean. The majority of the affected population continues to be displaced, living in cramped one-room apartments. Most of them have given up hope of ever returning to their old lives.

"While the 10m-high tsunami wave was the trigger, what ensued at the plant was clearly the product of human error and gross malpractice on behalf of both the operator and the then nuclear regulator "

A Tsunami And A Man-Made Disaster

While the 10m-high tsunami wave was the trigger, what ensued at the plant was clearly the product of human error and gross malpractice on behalf of both the operator and the then nuclear regulator, the Nuclear and Industrial Safety Agency (NISA).

NISA was a semi-autonomous organisation under the Ministry of Economy Trade and Industry (METI). METI's primary purpose was the promotion of nuclear energy. METI members were also a part of the NISA staff, along with "technically trained experts" from the industry. In practice, NISA was what is known as a captured regulator--a regulator that had been effectively captured and defanged by interested parties such as the industry and the bureaucrats that oversee it. It caters instead to the needs of the industry by formulating and enforcing weak regulations and standards.

This is exactly the kind of clash of interest that led to the regulator accepting falsified reports from TEPCO, hiding critical cracks in the reactor vessel. This reactor vessel was found to be so flawed that its designers from General Electric resigned in protest, certain of an inevitable disaster if the reactor were out to use. Even in the aftermath of the disaster, the regulator continued to fail miserably at its duties by not releasing crucial data on the radiation spread to the public. This in turn led to a completely unplanned and unguided evacuation with residents flying straight into high-radiation areas.

Lessons From Fukushima

Since the disaster, both the regulator and the operator issued multiple apologies. NISA for its lax attitude towards ensuring the safety of the plants and TEPCO for its unpreparedness in crisis management.

NISA was finally replaced by the Nuclear Regulatory Authority (NRA) on 19 September, 2012. The NRA is an Article 3 authority under Japan's National Government Organization Law. This guarantees it "independent exercise of authority, without control and supervision from a senior agency (e.g. the minister of a relevant government ministry)". It also places the safety agency outside the government system, wherein it is not required to practice rotation of personnel from agency to agency within the ministry, as was the case with NISA and the METI.

It is a part of, and not under, the Ministry of Environment (MOE) and its staff consists primarily of civil servants from the MOE. If nothing else, through this action, Japan at least showed that it had learnt its lesson of keeping the regulator separate from the ministries that have an interest to promote nuclear power. This is a valuable lesson which the Indian government has still not picked up.

"The strength of an actual autonomous regulator cannot be replaced by however many bodies affiliated in some way to the government and other parties with vested interest."

Why India Needs To Take Notice

The Indian regulatory system is riddled with conflicting interest. The Indian regulator, the Atomic Energy Regulatory Board (AERB) is located under the government unit of the Department of Atomic Energy (DAE) - just as the NISA was under the METI. The chairman of AERB reports to the Secretary of DAE. The DAE promotes nuclear technology in the country. India's sole nuclear operator, the Nuclear Power Corporation of India Limited, also comes under the administrative control of the DAE and is regulated by the AERB. This set up has effectively stripped the regulator of what freedom it could have had in framing rules and overseeing the working of the operator.

Post Fukushima, the Indian government introduced the NSRA Bill in the Lok Sabha in September 2011. NSRA was to be a truly autonomous body. Unlike AERB which reported to DAE, it would submit is report to the Parliament. And while AERB was created following a government order, the NSRA would be established by an Act of Parliament, making it much stronger.

But on the other hand, the members of the NSRA will be picked by a Council consisting of the Prime Minister and other government minsters, essentially paving way for another government-controlled regulator. Certain "nuclear material, radioactive material, facilities, premises and activities" can be exempted from the jurisdiction of the regulator in the name of national defence by the central government. The Regulator will also be exempted from the purview of the RTI Act, reducing the need for it to be transparent.

The recommendations made by the Parliamentary Standing Committee in 2012 addressed some of these glaring shortfalls. After its lapse with the change in government, the Bill was to be considered again in the Winter Parliament Session of 2014. But the Session has come and gone and the Bill remains unaddressed. But passing the Bill along with the recommendations alone will not grant absolute autonomy to the regulator. The NSRA will still not have complete financial, administrative and institutional independence from the government. No ideal solution can be found until the Indian government acknowledges the fact that the strength of an actual autonomous regulator cannot be replaced by however many bodies affiliated in some way to the government and other parties with vested interest. A disaster like Fukushima is too high a price to pay for overlooking this simple fact.

At least 20% nukes, says business lobby

March 25, 2015

Business leaders says 20% nuclear power needed

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Mar. 25, 2015 - Updated 06:12 UTC+1
A group of business leaders in Japan is proposing that nuclear power supply at least 20 percent of the country's energy needs by 2030.

The nuclear accident at Fukushima four years ago has prompted Japan to reconsider how it produces electricity.

Government officials, politicians and business leaders, as well as academics and civic groups, are working on the problem. They are trying to figure out what mix of energy sources could meet the country's needs.

Officials with the Japan Association of Corporate Executives say nuclear power will be needed as a base-load energy source for some time to come.

They say it's unlikely that renewable resources such as wind and solar power will supply more than 30 percent of energy needs by 2030.

They say Japan will probably have to rely on nuclear power for 20 percent or more of its energy needs.

Before the 2011 accident, nuclear power supplied 28 percent.

All of Japan's nuclear power plants are currently off line.

Business lobby calls for minimum 20% dependence on nuclear energy

http://ajw.asahi.com/article/business/AJ201503250024

By KIYOHIDE INADA/ Staff Writer
An influential business organization called on the central government to maintain at least a 20-percent dependence on nuclear energy, citing expected limits on expanding the use of renewable energy sources.
Keizai Doyukai (Japan Association of Corporate Executives) also proposed extending the operating life of nuclear reactors beyond the 40-year period set by the central government.
The organization’s recommendations on energy policy released on March 24 came as the government is discussing Japan’s “energy mix” for power generation. A key element of that mix is having nuclear energy account for between 15 and 25 percent of the nation’s electricity in 2030.
Keizai Doyukai urged the government “to set a minimum level of about 20 percent” as a “realistic” target for that year.

The proposal foresees continuing to use nuclear reactors beyond 2030 and calls on the central government to consider rebuilding reactors or constructing new ones.
The business group cited the limits of renewable energy sources and the benefits of nuclear energy for consumers and the economy.
Reflecting on the suspension of operations at nuclear power plants following the 2011 accident at the Fukushima No. 1 nuclear power plant, the proposal said, “We should not forget the serious effects on the daily lives of the people and economic activity brought about by increasing electricity rates.”
In 2011, Keizai Doyukai issued a proposal to reduce dependence on nuclear energy in the medium to long term by seeking out alternative renewable energy sources.
Teruo Asada, chairman of trading company Marubeni Corp. who also serves as chairman of Keizai Doyukai’s Committee for Environment and Energy, denied the business organization has switched its policy.
“We never said that the ultimate goal should be zero nuclear plants,” Asada said at a March 24 news conference. “The latest recommendations do not represent any change in our thinking.”

Miyama Govt. establishes power-producing company

March 27, 2015

City challenges Kyushu Electric, sets up company to sell power to households

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201503270005

The city-supported solar power plant in Miyama, Fukuoka Prefecture, has a capacity of 5 megawatts. (Masanobu Higashiyama)

THE ASAHI SHIMBUN

MIYAMA, Fukuoka Prefecture--Miyama has become the first local government in Japan to establish a company that will sell electricity to households--and at rates cheaper than regional monopoly Kyushu Electric Power Co.

City officials said March 25 that the company, Miyama Smart Energy, set up in collaboration with the private sector, will start operations next month. It will initially supply power to public entities such as city government offices, schools and libraries, and begin targeting ordinary households in April 2016.

Miyama Smart Energy was founded in February with capital of 5 million yen ($42,000). The capital is expected to increase to 20 million yen.

The company expects to employ 25 workers and post sales of 1.3 billion yen four years later.

The main goal of the initiative is to bolster the local economy by consuming locally produced power.

"We have set out to achieve self-sufficiency in the energy field by locally generating and consuming power with renewables and create jobs for the local communities," Miyama Mayor Chikashi Nishihara said at a ceremony marking the start of the project on March 25.

In spring next year, Japan will deregulate the power industry by allowing households to buy their electricity from suppliers other than regional utilities.

Miyama Smart Energy envisages purchasing electricity from the 5-megawatt, city-supported solar power plant in Miyama as well as from surplus solar power generated at ordinary households at a price 1 yen higher per kilowatt hour than buying from Fukuoka-based Kyushu Electric.

It plans to sell the electricity to households at rates cheaper than Kyushu Electric's.

Tatsushi Isobe, a director of Epco, a Panasonic Corp.-affiliated energy consultancy in Tokyo that has invested in Miyama Smart Energy, expressed confidence in the initiative.

"Even if the new company buys power at a rate higher than Kyushu Electric and sells it cheaper, it will pay off since its investment and payroll costs are low," he said.

According to the industry ministry, Nakanojo, a town in Gunma Prefecture, and Izumisano, a city in Osaka Prefecture, have already established power-supplying companies.

But their services are geared for public entities and do not include ordinary households. Miyama Smart Energy is the first to plan serving households from the outset.

The company will not follow Kyushu Electric's policy of reining in purchases of solar power from generators on sunny days, when the energy output is higher.

Miyama Smart Energy, which has concluded a deal with another solar power generator in Miyama, should be able to cover all the electricity needs for the city of 40,000 people during daytime on sunny days, according to the municipal government's estimate.

One challenge for the company is luring users away from Kyushu Electric. Currently, the residents are all paying the utility for electricity.

If they switch to Miyama Smart Energy, their fees will be recirculated within the city, helping to bolster Miyama's economy.

To pitch the company, the city since last fall has provided devices to about 2,000 households in the city on a trial basis that enable them to see their electricity consumption levels at any time of the day on their tablet computers.

Consumers say Kyushu Electric's bills do not have such a detailed breakdown.

Obstacles to energy autonomy mainly political

March 28, 2015

Political obstacles stymie energy autonomy

by Philip Brasor
Special To The Japan Times

When German Chancellor Angela Merkel was in Japan earlier this month, local coverage focused on a joint German-Japanese statement about the Ukraine crisis and her comment that Japan should forthrightly address its actions during World War II. She said nothing about how Japan and Germany have diverged on nuclear energy, and reportedly she and Prime Minister Shinzo Abe didn't discuss it with each other.

Germany decided to abandon nuclear power in 2011 as a direct result of the Fukushima No. 1 reactor disaster. The chancellor, a trained physicist, has said that her thinking was affected by the realization that such an accident occurred in Japan, which has a "high level of technology." Asked by a German reporter during a joint news conference why Japan continues down the atomic path, Abe replied that with all of Japan's nuclear plants idle the country has had to rely on imported fossil fuels for its energy needs. There is no way to provide an "inexpensive, stable" supply of energy except nuclear power generation, so once the safety of the nation's reactors has been "assured," they will go back online.

Later, when a Japanese reporter asked him why Japan didn't follow Germany's lead, Abe said that Germany can easily buy electricity from neighbors, whereas Japan cannot. By then, however, Merkel was gone, so her opinion couldn't be solicited. By remarking on European energy interdependence, Abe meant to imply that despite its non-nuclear policy, Germany still gets power from nuclear-dependent France. What neither he nor the Japanese press mentioned is that Germany also has a concerted policy for promoting renewable energy.

There are varying opinions as to whether or not this policy is successful, but in Japan right now the story in the media is that renewables are not viable, if for no other reason than that the government has decided nuclear energy is more efficient for Japan's long-term needs.

That much was made obvious on March 10, when the Ministry of Economy, Trade and Industry revealed that a subcommittee of experts had estimated that renewables such as solar and wind power would supply Japan with 20 percent of its energy needs by 2030. This figure has remained the same since the country's Basic Energy Plan was formulated in 2001 by a group of politicians with close ties to the power industry, although later the government said it would endeavor to increase the portion. Now, METI has decided that renewables are too inconvenient, since facilities for transmitting electricity produced by renewable power structures would have to be built. According to the Asahi Shimbun, some members of the subcommittee "demanded" a greater effort to develop renewables. As one professor said, it wouldn't be difficult to boost the portion to 30 percent, especially since some transmission capability will be freed up by the planned decommission of older reactors.

METI cited the cost to consumers as being another problem with renewables. Because of a law passed by the Democratic Party of Japan before its brief stint as ruling party ended in 2012, power companies are compelled to buy energy from anyone who generates it through renewable resources, and at an artificially high rate that is passed on to users. Starting last fall, power companies cut back on purchases of renewable energy, claiming they don't have the capacity to handle it all, especially in Kyushu, where a number of businesses have built large solar energy farms.

What the government seems to be saying is that the plan to promote renewables was successful, but too much energy is being produced and the public still has to pay for it. Then there was a backlash and METI introduced measures to check power plant output in order to allow more solar energy to enter the grid. In any case, in accordance with sōkatsu genka regulations, large regional power companies are guaranteed a "rate of return" on their investment.

The monolithic nature of power utilities is the subtext of the 2010 German documentary "The Fourth Revolution," which has been screened by civic groups throughout Japan in recent months. The film explains how **"energy autonomy"** is the next step in the evolution of industrial development. It is less concerned with renewables as the savior of the environment than with promoting solar and wind power as rational means of energy provision for everyone in the world.

Because private concerns control the finite resources that produce most electricity at present, energy is a commodity. The goal of the film's subjects is local control of energy generation using renewable resources that aren't owned by anyone. Private companies will do anything they can to prevent such a goal from being realized, but governments, which are supposed to guarantee the welfare of their people, should pursue energy autonomy with a sense of purpose, so the only obstacles are political, even if the gatekeepers of the energy market insist they are economic, that renewable energy is not yet and never will be viable enough to run factories and heat homes. The film shows how technology has advanced in Denmark and Germany to the point where whole towns can address their energy needs with renewables.

The movie's message is especially relevant in light of next year's liberalization of the Japanese energy market, something the power industry has resisted since it was first proposed by METI in the '90s. According to a recent survey conducted by advertising firm Hakuhodo, 80 percent of the public are aware they can choose a provider next April, but aren't sure what that entails. Neither the media nor the government has effectively explained the process, so consumers may end up defaulting to the big regional power companies, especially if they're seen as being cheaper. What's important to remember is that it's not about nuclear versus non-nuclear — it's about breaking free of entities that make those decisions for you.

A larger role for nuclear power?

April 2, 2015

LDP urges base load source ratio raised to 60%

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Apr. 2, 2015 - Updated 03:26 UTC+2

A panel advising Japan's governing Liberal Democratic Party wants nuclear power and other stable energy sources to play a larger role in the country's energy supply to lower electricity costs.

The government plans by June to determine Japan's energy mix as of 2030.

The proposal by the LDP panel on nuclear policy, supply and demand says Japan must overcome energy

restrictions to achieve full-scale economic growth. It said power costs must be lowered as much as possible.

The panel advises raising the ratio of base load power sources, meaning coal, nuclear, hydro and geothermal power, from 40 percent to around 60 percent. That is the level before the 2011 nuclear accident.

Base load sources ensure stable supply throughout the day. Power companies consider these sources to be cost-effective.

The panel also wants Japan's energy self-sufficiency rate raised to around 25 percent. The rate is now 6 percent as all nuclear reactors are offline.

The panel plans to submit its proposal to Prime Minister Shinzo Abe next week.

March 31, 2015

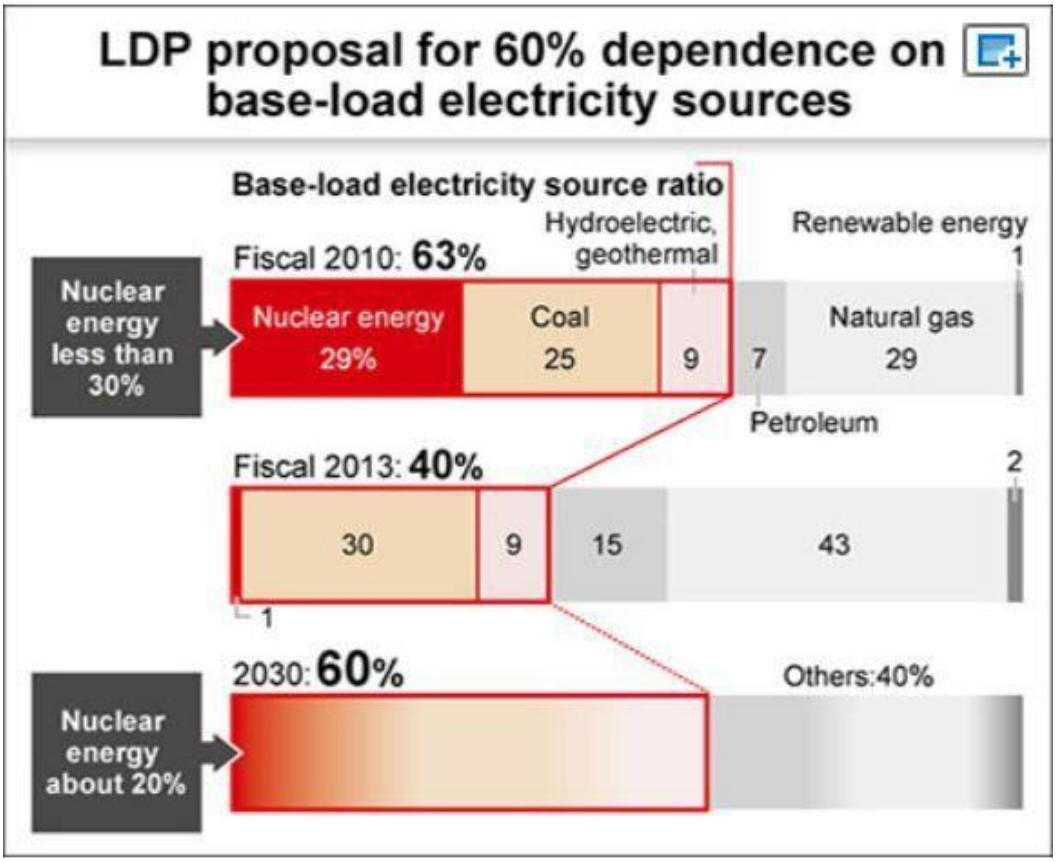
Gov't wants ratio of nuclear power to total output to exceed 20% in 2030

http://mainichi.jp/english/english/newsselect/news/20150331p2a00m0na019000c.html

The Ministry of Economy, Trade and Industry told a panel of experts on March 30 that the ratio of nuclear power generation to the country's total electricity production will exceed 20 percent in 2030.
The government takes the position that the ratio of so-called "base load power sources" such as nuclear, hydraulic, coal-fired and other power plants that can ensure stable supply throughout the day should be secured at around 60 percent. But according to preliminary calculations made by the industry ministry, the ratio of base load power sources other than nuclear power is presumed to fall below 40 percent at the most.
The industry ministry stressed that nuclear power can help reduce greenhouse gas emissions and lower utility bills. But at the March 30 expert panel meeting, there was a flurry of opinion that Japan should not return to nuclear power easily, with some experts saying that the government was discussing the issue based on the same idea as that adopted before the 2011 nuclear disaster.
Base load power sources are power sources that can supply certain levels of electricity consistently throughout the day with low fuel costs. Under the basic energy plan worked out last year, the government positioned nuclear, hydraulic, coal-fired, and geothermal power as base load power sources, stating that it is important to secure energy on a level that is "not inferior" to those of other countries.
The ratio of Japan's base load power sources had hovered at around 60 percent since the latter half of the 1990s, but it fell below 40 percent after the country's nuclear plants went offline in the wake of the Fukushima nuclear disaster. As for base load power sources other than nuclear power, the industry ministry assumed the ratio of the coal-fired power source at 28.6 percent if its power generating capacity remained at the current level. The ministry had already said the ratio of the hydraulic power source would likely be 9.5 percent at the most and the geothermal power source at up to 1 percent. In light of measures to be taken against global warming in the future, it is hard to expect coal-fired power generation to be increased.

Therefore, the ratio of base load power sources other than nuclear power becomes 39 percent at most in 2030, and in order to secure the ratio of overall base load power sources at 60 percent, nuclear power has to account for at least 21 percent.
March 31, 2015(Mainichi Japan)

Increase Japan's dependence on nukes



The Asahi Shimbun

April 3, 2015

LDP stealthily seeking to raise nuclear energy dependence

http://ajw.asahi.com/article/behind_news/politics/AJ201504030042

THE ASAHI SHIMBUN
The ruling Liberal Democratic Party is pushing a policy of heightening Japan's dependence on nuclear energy but has buried this stance under a calculation trick.
An LDP research commission on energy issues on April 2 called on the central government to ensure that base-load electricity sources--nuclear energy, coal-fired thermal plants, hydroelectric and geothermal plants--account for about 60 percent of Japan's energy needs in 2030.

The proposal does not mention any specific ratio for nuclear energy. But considering the difficulties in increasing the supply from the other base-load electricity sources, the dependence on nuclear power would have to rise to about 20 percent.
The proposal is expected to be presented to Prime Minister Shinzo Abe as early as next week as the formal recommendation of the LDP. The central government wants to decide on the energy mix for Japan in 2030 and beyond by June.
The government's designation of the base-load electricity sources means their costs for power generation are comparatively low and electricity can be produced around the clock.
In fiscal 2013, Japan depended on base-load electricity sources for about 40 percent of its power: 1 percent for nuclear energy; 30 percent for coal-fired thermal plants; and a combined 9 percent for hydroelectric and geothermal plants.
However, coal-fired thermal plants emit huge volumes of carbon dioxide that go against measures to deal with global warming, so raising the ratio of energy from such plants would be difficult. Increasing dependence on hydroelectric plants would also be tough because huge dams would have to be planned. Geothermal plant projects are also time-consuming because of the need for environmental assessment studies.
If the government cannot raise the ratio for these three base-load electricity sources, the nation's dependence on nuclear power would have to rise to 20 percent to meet the 60-percent goal in the proposal.
The LDP panel's proposal said, "Energy policy must serve to strengthen Abenomics."
It pointed out that electricity rates increased after nuclear power plants went offline following the Fukushima nuclear crisis triggered by the 2011 Great East Japan Earthquake and tsunami.
But to achieve that level of dependence on nuclear energy, nuclear plants would have to be operated beyond the current 40-year operating life set by the government or the government would have to approve the reconstruction or new construction of nuclear plants.
An experts' panel under the Ministry of Economy, Trade and Industry is discussing the energy mix. At the end of March, the ministry recommended that base-load electricity sources account for about 60 percent of total energy supply, about the same level as found in Western nations.
The LDP panel's proposal also referred to the fact that many Western nations depend for at least 60 percent of their energy needs on base-load electricity sources.
(This article was written by Ryo Aibara and Tomoyoshi Otsu.)

April 3, 2015

Japan looks to generate 20% of electricity by nuclear in 2030

http://mainichi.jp/english/english/newsselect/news/20150403p2g00m0dm026000c.html

TOKYO (Kyodo) -- Japan looks to generate at least 20 percent of its electricity by nuclear power in 2030, government officials and ruling party lawmakers said Thursday.
The government of Prime Minister Shinzo Abe seeks to retain nuclear power as a key energy source despite persistent antinuclear sentiment among the public following the March 2011 Fukushima nuclear disaster.

But some experts in a panel under the industry ministry, which is currently discussing the country's future energy mix, have voiced concerns that Japan is returning to nuclear power too easily after the world's worst nuclear accident since the 1986 Chernobyl disaster.
During a recent panel meeting, the industry ministry proposed a plan to increase the percentage of electricity generated by so-called base-load power sources, which can provide electricity day and night, to 60 percent from the current 40 percent.
The government includes nuclear, coal-fired thermal, hydro and geothermal power in the base-load electricity sources. But it is not willing to drastically boost thermal power that emits greenhouse gases, while it takes a long time to introduce necessary installations for hydro and geothermal power generation.
Before the 2011 nuclear catastrophe triggered by a huge earthquake and tsunami, atomic power accounted for around 30 percent of Japan's total energy production. In fiscal 2013, nuclear power accounted for only 1 percent as reactors were gradually taken offline due to safety concerns.
This year the government is expected to restart several nuclear reactors cleared by the safety regulator.
In its basic energy policy adopted last April, the government of the Liberal Democratic Party pledged to reduce the country's dependence on nuclear power and introduce renewable energy as much as possible. But at the same time, it defined nuclear power as an "important base-load power source."
April 03, 2015(Mainichi Japan)

April 3, 2015

Reliance on atomic power urged to exceed 20% by 2030 http://www.japantimes.co.jp/news/2015/04/03/national/japans-reliance-atomic-power-may-top-20-2030/#.VR6hH-Hwmos

JIJI

There is a growing possibility that Japan will rely on nuclear energy for more than 20 percent of its total power output in 2030, compared with about 30 percent before the Fukushima nuclear disaster started in March 2011, sources said.
Following the triple reactor core meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant, the government initially looked to reduce the nation's dependence on nuclear energy as much as possible, issuing incentives that led to a glut in solar energy.
The Ministry of Economy, Trade and Industry meanwhile plans to secure the nation's base load output from such stable sources as atomic power, coal-fired power plants and hydroelectric power, at the international standard of about 60 percent.
In fiscal 2013, coal-fired and hydroelectric power plants accounted for 30 percent and 9 percent, respectively, of the nation's total power output.
If the base load is to be raised to the envisioned level, Japan's dependence on nuclear energy will have to exceed 20 percent, because of difficulties in substantially boosting the output from thermal and hydroelectric power generation, the sources said Thursday.
All of the nation's nuclear power plants have remained offline since the Fukushima disaster triggered a rethink of nuclear safety throughout the country.
In a related development Thursday, the ruling Liberal Democratic Party adopted a proposal to achieve the 60 percent base load share at a nuclear power policy panel meeting.

An increasing number of LDP members are leaning in favor of reviving the use of nuclear energy to curb climbing electricity bills.
But other members are criticizing the base load expansion plan as a scheme solely designed to sustain the use of nuclear power, which the government has heavily invested in for decades to offset Japan's dependence on energy imports.
An industry ministry panel is expected to come up with a specific proposal on the "best energy source mix" for the country by the end of this month, at the earliest.

Large potential for renewables

April 4, 2015

Renewable energy could account for 35 percent of 2030 power supply: ministry

http://mainichi.jp/english/english/newsselect/news/20150404p2a00m0na013000c.html

Renewable energy sources could be expanded to account for 24 to 35 percent of Japan's power supply in 2030, according to estimates released by the Ministry of the Environment on April 3.
"The potential for the introduction of renewable energy is large. There are also large policy problems to tackle, however, such as handling the cost of reinforcing the power line network," a ministry official commented.
An expert committee for the Ministry of Economy, Trade and Industry is considering how much higher the country can go than the goal of at least 20 percent for renewable energy sources put forth by the nation's basic energy plan, and the new estimates could influence the committee's conclusions.
Out of the national power output of 939.7 billion kilowatt-hours for fiscal 2013, renewable energy sources including hydroelectric power accounted for only 10.7 percent. According to the newly released estimates, if the full extent of possible preparations were made -- such as reinforcing power lines to allow power exchange across wide areas, and setting up batteries to store charge -- as much as 356.6 billion kilowatt-hours of renewable energy generation would be possible by 2030.
Even if these preparations are not made, however, renewable energy is still predicted to rise to 241.4 billion kilowatt-hours. By these calculations, assuming demand of 1 trillion kilowatt-hours, at least 24 percent should be possible to provide with renewable energy.
The estimates predict that the financial burden on the country's citizens caused by the government buying up renewable energy will be between 1.78 to 2.56 trillion yen. It also predicted between 1.1 to 2.3 trillion yen in average annual economic ripple effects, however, from factors such as construction and infrastructure investment, as well as between 93,000 and 187,000 new jobs per year.
Furthermore, due to less import of fossil fuels, the estimates show that between 15 and 29 trillion yen of funds could be kept from leaving the country through 2030. Annual carbon dioxide emissions could drop by between 86.06 million and 172.8 million tons, while a goal of cutting carbon dioxide emissions by around 10 percent compared to 1990 levels would also be possible.
These estimates were put together by the Mitsubishi Research Institute at the request of the environmental ministry. They were originally planned to be released around June, but members of both

the ruling and opposition parties requested that they be released before the expert committee makes its conclusions, which could come as soon as mid-April.

What about a nuclear-free Japan?

April 5, 2015

INSIGHT: Why not talk more about a nuclear-free future for Japan?

http://ajw.asahi.com/article/views/column/AJ201504050005

By NAOHITO MAEDA/ Senior Staff Writer
While German Chancellor Angela Merkel, who is moving to pull the plug on nuclear power in her nation, was visiting Japan on March 9, I met with a former Lower House member.
"In my view, Japan does have energy politics but has no energy policy," Satoshi Shima, 56, emphatically told me.
Shima currently serves as an adviser to Softbank Corp., a telecommunications company led by Chairman and CEO Masayoshi Son, a high-profile entrepreneur. Having served eight years as head of the CEO's office at the company, Shima, a stalwart champion of a nuclear phase-out, has been working behind the scenes to link policy with politics with regard to renewable energy sources.
In Shima's opinion, "politics" is about making arrangements as to who will gain profits, whereas "policy" is about deciding the best choice from an overall perspective.
"Germany has chosen to go nuclear-free after properly studying energy policy," he said. "But Japan, as it stands now, has nothing more than a sum of stakeholders' lobbyism. Nuclear opponents are no match for pro-nuclear lobbies, which are so influential."
The Fukushima nuclear disaster of 2011 prompted Shima and Son to call for pulling the plug on nuclear energy and using more renewable energy sources.
Shima backed Morihiro Hosokawa and Junichiro Koizumi, an alliance of former prime ministers, who campaigned under the banner of "zero nuclear power" during the February 2014 gubernatorial election in Tokyo. But Hosokawa failed to win the governor's seat, and nuclear opponents have barely made any headway since. They have now come to a grinding halt.
Japan is headed, without serious debate, toward a continued reliance on nuclear power. It is a foregone conclusion for the administration of Prime Minister Shinzo Abe that the country's nuclear reactors, all of which are idled now, will eventually be restarted. No in-depth debate is being made in the Diet over what to do with nuclear power.
The adversity notwithstanding, Shima is still pinning his hopes on elections. He showed me a paper that outlined a policy timeline related to renewable energy sources, and pointed to an entry that said 2016.
"This is the year when the electricity retail market will be fully liberalized," he said. "And there will be an Upper House election in the summer of that year. To begin with, we need a political force that will fight those who will move to obstruct new entries into the market at that stage."
The crucial moment, in Shima's view, will be the process of "unbundling," scheduled for 2020, whereby the power transmission and distribution operations within major utilities will be spun off from their

power generation operations and will be turned into separate entities. That policy process is believed to hold the key to spreading the use of renewable energy sources.
"That process could be emasculated if we go on like this," Shima said. "To prevent that from happening, we need to develop politicians who will put up a fight during the Upper House election in the summer of next year. Upper House members have a term of six years, so they can afford to work in a longer perspective. They are not quite like Lower House members, who are intimidated into silence under the overwhelming power of lobbyists."
The Democratic Party of Japan, which Shima belonged to as a Diet member, has set the goal of pulling the plug on nuclear power by the end of the 2030s. But the party is hard-pressed to come up with a clear-cut stance on whether nuclear reactors should be restarted, split as it is between the pros and cons of such a measure. In fact, the DPJ once made a decision to temporarily restart nuclear reactors when the party was at the helm of the government.
When Akira Nagatsuma, then acting DPJ president, ran unsuccessfully for the party's presidency in January, he was the most cautious of all candidates about restarting nuclear reactors. He was visibly exasperated by the current situation, wherein calls for a nuclear phase-out are gaining little traction.
"There are three conceivable crises that can put a state's survival at stake: war, nuclear disaster and financial collapse," Nagatsuma said. "Why not eliminate nuclear disaster, which is the easiest risk to eliminate? The Diet is full of what I cannot figure out, but this one is among the hardest to comprehend."
It would be too early to forget the nightmare of the Fukushima nuclear disaster, which has yet to be brought under control. I believe that from the perspectives of both policy and politics, we need to talk a lot more about a phase-out of nuclear power and about Japan's future.

Japanese-French consortium to build nuclear plant in Turkey

April 4, 2015
Source : Balkans

Turkish Parliament approved the construction of second nuclear plant from Japan

Balkans.com Correspondent - 02.04.2015
Parliament's General Assembly accepted in the early hours of April 1 an international agreement between Turkey and Japan for the construction of Turkey's second planned nuclear plant. With the approval, the legal framework for the construction of the plant has been laid.
Turkey's second planned nuclear plant was awarded to a **Japanese-French consortium** in May 2013, to be constructed in the northern province of Sinop.
Japan's Mitsubishi Heavy Industries Ltd (MHE) and Itochu Corporation, with France's GDF Suez, will build the **4,800 MW plant at an estimated cost of $22 billion**. The plant will be operative with **ATMEA1** reactors developed by MHE and the French company of **Areva**.
Turkey's first nuclear power plant will be built by the Russian Rosatom in the southern province of Mersin. hurriyetdailynews

More than 25% nukes

April 7, 2015

Keidanren says over 25% ratio for nuclear power

http://www3.nhk.or.jp/nhkworld/english/news/20150407_14.html

Apr. 7, 2015 - Updated 03:01 UTC+2
Japan's largest business federation is proposing that nuclear power supply should be more than 25 percent of the country's energy needs in 2030.

Officials at Japan Business Federation, or Keidanren, have compiled the proposal to be presented to the government for its energy mix discussions.

They say the ratio of renewable sources, such as solar power, should be about 15 percent, and thermal power should cover the remaining 60 percent or so.

The officials also say in addition to restarting nuclear reactors at power plants where their safety is confirmed, rebuilding of such facilities should also be considered.

The government has been working to decide on its energy mix plan which would impact greenhouse gas emissions. It must present its target for cutting greenhouse gas emissions at a UN climate change conference COP 21 at the end of this year.

Keidanren Chairman Sadayuki Sakakibara told reporters on Monday keeping a certain level of nuclear power plants is necessary for Japan's energy policy and for global measures to fight the climate change.

April 5, 2015

METI reviewing Japan's energy mix

http://www3.nhk.or.jp/nhkworld/english/news/20150405_15.html

Apr. 5, 2015 - Updated 10:09 UTC+2
The Ministry of Economy, Trade and Industry is reviewing Japan's energy mix. It aims to increase the use of renewable energy sources while reducing the country's dependence on nuclear power.

The ministry has been holding meetings of experts since January to come up with an optimal energy mix for 2030. The Cabinet adopted a basic plan last April.

The ministry plans to lower the target for nuclear power from 28 percent, which was approved before the

2011 Fukushima accident.

However, the ministry intends to keep the ratio in the lower 20-percent range to reduce greenhouse gas emissions and to contain the cost of generating electricity.

The new target assumes the resumption of existing nuclear plants as well as the decommissioning of some reactors, including the 5 whose closure was decided last month.

The target for renewable sources, on the other hand, will be raised from the original 21 percent to exceed the ratio for nuclear power.

The ministry will present a draft energy mix proposal to the ruling parties by the end of this month. It intends to finalize the plan before the G7 summit in June, when measures against global warming will be discussed.

Renewables: METI vs Environment Ministry

April 7, 2015

Miyazawa doubts estimate of renewable energy use

Apr. 7, 2015 - Updated 08:49 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150407_21.html

Japan's Economy, Trade and Industry Minister Yoichi Miyazawa has doubts about the feasibility of the Environment Ministry's plan regarding the nation's energy mix.

The Environment Ministry said earlier this month that energy from renewable sources can supply up to 35 percent of the country's total energy demand in the future. The Industry Ministry also plans on boosting the ratio of renewable energy from the current goal of 21 percent, but has not set a specific target.

Miyazawa told reporters on Tuesday that he has no idea how the Environment Ministry's estimate is viewed by insiders. He said the estimate does not fully take into account a possible increase in costs that would occur as a result of the increase in renewable energy.

Miyazawa said it is difficult to use the estimate to work out Japan's energy mix.

Also on Tuesday, Environment Minister Yoshio Mochizuki said his ministry's estimate is different from those of other ministries because it has yet to calculate the necessary technology.

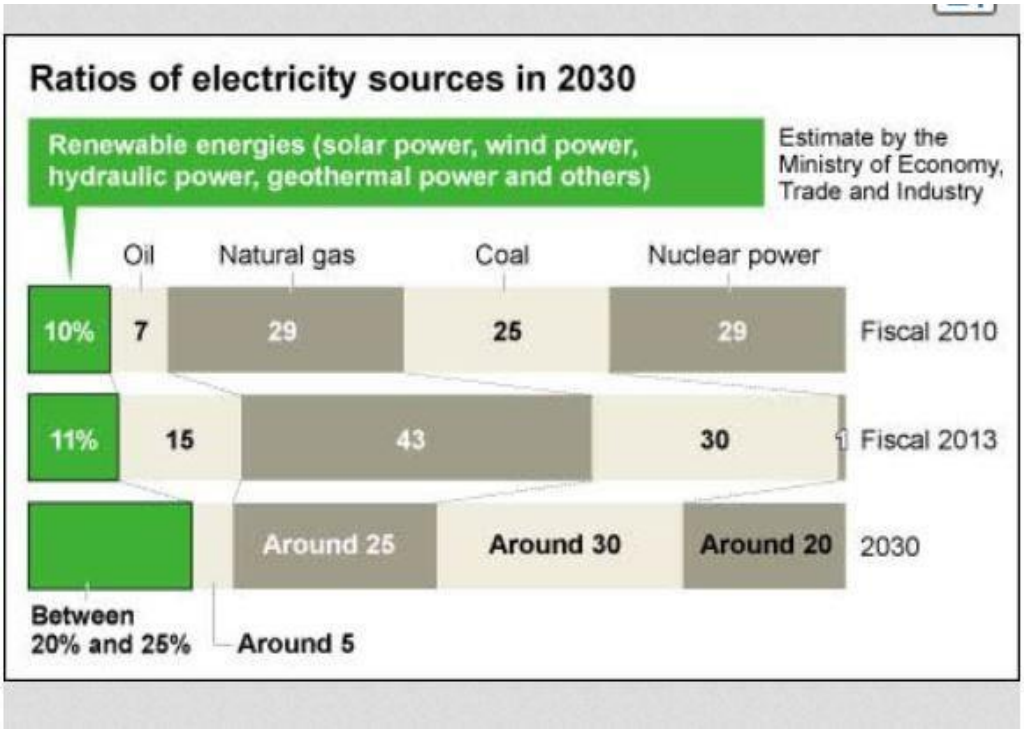
Mochizuki said it is obvious that the figure cannot be achieved through hope alone, but that his ministry would like to increase power from renewable sources as much as possible.

What electricity mix for 2030?

April 8, 2015

Industry ministry seeks renewable energy ratio of 20% to 25% in 2030

http://ajw.asahi.com/article/behind_news/politics/AJ201504080030



By TOMOYOSHI OTSU/ Staff Writer

The industry ministry rejected a proposal by the Environment Ministry and is calling for renewable energy sources to supply "between 20 and 25 percent" of Japan's electricity in 2030, sources said April 7.

The Environment Ministry on April 3 had called for a range between 24 percent and 35 percent.

However, the Ministry of Economy, Trade and Industry said that plan was unrealistic, and it proposed a lower range to avoid increases in electricity charges and to curb the costs for corporate activities.

Prime Minister Shinzo Abe on April 7 received a report from a ruling Liberal Democratic Party task force on the nation's "energy mix" for 2030. The contents are almost identical to the proposals of the industry ministry.

"Based on the ideas described in the report, I want to proceed (with the energy mix plan)," Abe said.

Renewable energies include not only solar power, wind power and geothermal power but also hydraulic power.

In fiscal 2013, renewable energies, centering on hydraulic power, accounted for 11 percent of Japan's electricity supply.

The industry ministry plans to double the ratio by 2030. During the period, the combined ratio of solar power and wind power is expected to increase from 2 percent to 10 percent.
The ratios of hydraulic power and geothermal power will likely remain unchanged because it is difficult to construct large-scale dams and environmental assessments for constructing geothermal power plants requires much time.
The ratio of nuclear power will be around 20 percent in 2030, according to the ministry's plan. The proposal does not mention replacing old nuclear reactors or building new ones. It assumes that current nuclear reactors will continue operating even after they have reached their lifespan of 40 years.
The industry ministry plans to coordinate its opinions with the LDP, junior coalition partner Komeito and the Environment Ministry about the energy mix plan for 2030.
The industry ministry will submit a draft of the plan to its experts' council at the end of this month. The proposal is expected to be completed by the end of May.
The ministry calculated the power generation capacities of renewable energy sources and the costs for 2030 based on several factors, including the amount of electricity that can be accepted on the current power grid and construction plans for wind farms.
It calculated that a ratio of renewable energies much higher than 20 percent would require more than 1 trillion yen (about $8.3 billion) for expansion of the power grid and other measures, resulting in sky-high electricity charges, the sources said.
The Environment Ministry's calculations showed that the ratio of renewable energies could be raised to between 24 percent and 35 percent.
But industry minister Yoichi Miyazawa refused to use that result, saying, "It does not pay sufficient consideration to feasibility."
The industry ministry places importance on nuclear power, coal-fired thermal power, hydraulic power and geothermal power as "base-load electric sources," which indicate their power generation costs are low and their facilities can be operated around the clock.
The ministry wants to raise the combined ratio of those base-load electric sources to more than 60 percent, matching the ratios in the United States and some European countries.
It is difficult for Japan to raise the ratio of coal-fired thermal power because of concerns about the large quantities of greenhouse gas emissions.
But the ministry also does not want to depend on solar power or wind power, citing their high operational costs and unstable power supplies.

Energy choices depend on how you look at safety

April 12, 2015

Reactor closures to test Abe's green energy pledges

http://www.japantimes.co.jp/news/2015/04/12/national/reactor-closures-to-test-abes-green-energy-pledges/#.VSqdTpPwlLM

by Chisaki Watanabe **and** Emi Urabe
Bloomberg

Japan's plan to mothball at least five aging nuclear reactors highlights the challenge Prime Minister Shinzo Abe faces as his administration debates how to replace lost electricity generation with power sources that are cheap, clean and safe.

The decision announced by the reactors' operators last month to decommission the plants, all dating from the 1970s, will eliminate output equivalent to about 65 percent of the power produced by all the solar panels currently installed nationwide. That's even after solar use has surged, making Japan the second-biggest solar market in the world for two years running.

The policies are under a microscope as Abe's ruling Liberal Democratic Party indicated earlier this month it wants to see nuclear energy play a prominent role in generating the nation's electricity, a plan opposed by most voters following the 2011 meltdowns in Fukushima. In the meantime, policymakers are wrestling with how to mix in renewables with traditional forms of energy and determining what scale of greenhouse gas cuts it can promise for a United Nations deal on global warming this year.

"It is possible to partially replace nuclear with clean energy, but we need to turn to coal at the moment," said Keigo Akimoto, chief researcher at Kyoto-based Research Institute of Innovative Technology for the Earth. "I support increasing renewables. We should not be misguided about the scale."

The implications are global, since countries such as the United States and Germany face the question of what to do with their own aging atomic plants. In Germany, Chancellor Angela Merkel has announced that her country would gradually turn off all nuclear. The reactor fleet in the U.S. is one of the oldest in the world, and a wave of retirements is expected beginning in the 2030s, the International Energy Agency estimates.

Environmentalists in Japan, mindful of the Fukushima No. 1 nuclear disaster, say the country has shown it can do without nuclear through efficiency gains and renewables.

Utilities, meanwhile, say they're having difficulty accommodating all the new electricity from clean sources such as solar that is testing their grids.

Japan's biggest business lobbies argue industry can't do without nuclear power and the steady supply of reliable power it produces. The nation's 48 viable reactors are shuttered pending new safety checks by the nation's regulator.

"The most important thing is to optimize different power sources such as nuclear, thermal and renewables," Hajimu Yamana, a professor at Kyoto University Research Reactor Institute, said at a meeting at the Ministry of Economy, Trade and Industry on March 30. The ministry oversees the nuclear sector.

For all the concerns about the safety of nuclear energy, one fact is unassailable: Since the triple meltdown, the nation's utilities are getting the bulk of their electricity from fossil fuels, despite a government-backed push to expand sources of renewable energy such as solar.

The five reactors that the utilities said in March they planned to decommission, among the smallest and oldest in Japan, annually produced about 13 terawatt-hours on average before the 2011 disaster, according to Bloomberg calculations using data supplied by the plant operators. Compare that with contributions from solar, which totaled 19.9 terawatt-hours in the year to March 31, based on estimates by Bloomberg New Energy Finance.

"We are at a crossroads, and yet we are still evaluating power sources in the same way we did before the earthquake," said Yasuko Kono, secretary-general of Shodanren, a union of consumer groups urging policymakers to consider the potential of renewables and energy savings. **"The choices we will make will depend greatly on how we look at safety."**

The Abe government is under increasing pressure to set a long-term plan for how much electricity should come from what sources. Divided views on nuclear's role are preventing the nation's policymakers from making international pledges on greenhouse gas emissions ahead of climate talks in December.
"Our discussions on nuclear power have been focusing too much on negative aspects," Kyoto University's Yamana said. "Four years have passed and we need to look at nuclear calmly," he said, adding that atomic power helps Japan cut greenhouse gas emissions.
Nuclear's share of the electricity mix is at the center of the policy debate. In fiscal 2010, the nation derived nearly 30 percent of its power from nuclear while renewables provided almost 10 percent, with the majority of that coming from hydropower.
Four years after the triple core meltdown at the Fukushima No. 1 plant, the public remains cautious about nuclear.
According to a March poll by the Nikkei newspaper and TV Tokyo, 62 percent of respondents said reactors shouldn't be restarted, while 27 percent supported the resumption of nuclear power.
Meanwhile, power rates have risen 20 percent for homes and 30 percent for industry use since the nuclear crisis began in March 2011, according to date from the Ministry of Economy, Trade and Industry.
Keidanren, the nation's top business lobby, said April 6 that nuclear power should supply more than 25 percent of electricity by 2030, while renewables should be around 15 percent.
The panel of LDP lawmakers that presented their findings to Abe on Tuesday recommended the nation get its electricity from base-load sources on a par with other developed countries, which is currently above 60 percent.
"For utilities, there is no economic incentive to add clean energy," said Ali Izadi-Najafabadi, a Bloomberg energy finance analyst in Tokyo. He said Japan's current approach may benefit utilities in the short term.
"In the long term, it hurts the country including manufacturers," as domestic companies may miss out on opportunities to compete in fully liberalized markets abroad because they lack such experience at home, he said.
If all of the nation's reactors are to be decommissioned after the 40 years considered the operational age limit by Japanese regulators, only 20 will be in working condition by 2030, accounting for about 15 percent of power supply, according to an analysis by Keizai Doyukai. To keep nuclear capacity at 20 percent, utilities would need to seek government approval to extend operations, the group said in a report.
"Renewable energy has to be more stable and cheaper, and energy storage needs to develop further," Teruo Asada, who heads the group and also serves as the chairman of major trading company Marubeni Corp., told reporters in March.

IAEA's unabated support for nukes

April 13, 2015

IAEA chief stresses nuclear power

http://www.japantimes.co.jp/news/2015/04/13/business/iaea-chief-stresses-nuclear-power/#.VSvOKpPwlLM

Kyodo

International Atomic Energy Agency Director-General Yukiya Amano on Monday underscored the importance of nuclear power generation, saying it contributes to stable electricity supply and economic growth.
"Nuclear power supports the economy as it ensures stable energy supply, and bolsters a nation's competitiveness," Amano said in a speech during an annual event in Tokyo organized by the Japan Atomic Industrial Forum, which promotes nuclear power.
The chief of the U.N. nuclear watchdog also said: "It is a misunderstanding that (international society) is pressed to choose either nuclear power or renewable energy" as they are "complementary to each other."
Following the Fukushima No. 1 nuclear disaster triggered by a huge earthquake and tsunami in March 2011, the majority of the public in Japan remain opposed to restarting nuclear reactors amid safety concerns.

Nukes under 20% in 2030

April 14, 2015

Nuclear power to be less than 20% of Japan's energy mix in 2030: sources

http://www.japantimes.co.jp/news/2015/04/14/national/nuclear-power-less-20-japans-energy-mix-2030-sources/#.VS1d3pPwlLN

Kyodo
The Japanese government is planning to set the target for the ratio of nuclear power generation to the country's total electricity production in 2030 a little below 20 percent, compared with 28.6 percent in fiscal 2010, when the Fukushima nuclear crisis occurred, sources said Monday.
The Ministry of Economy, Trade and Industry, which is close to major manufacturers, had been aiming to set a goal of 20 percent or more, viewing promoting renewable energy as costly.
But Prime Minister Shinzo Abe's government has leaned toward the view it would be difficult to win public support in its energy policy if the target ratio of nuclear power is set at the 20 percent level as seen before the crisis. As a result, the sources said, the target could be set at 18 to 19 percent.
Some lawmakers in the ruling bloc led by Abe's Liberal Democratic Party, however, remain cautious about lowering the ratio below 20 percent, so preparations for creating the country's new future energy mix may not go smoothly.
The cautiousness is partly due to the necessity for Japan to cut greenhouse gas emissions to fight global warming, which means the country would burn less fuel for thermal power generation, and instead seek to restart nuclear reactors confirmed safe by regulators.
All of Japan's nuclear reactors have remained offline amid safety concerns following the March 2011 disaster in Fukushima.
The industry ministry is planning to have a panel of experts make a proposal for the 2030 energy mix by the end of this month, while aiming to have the proposal approved by the ruling coalition in May.

The plan will also see Japan present its numerical goal for reducing greenhouse gas emissions based on the energy mix plan before a summit of the Group of Seven industrialized nations is held in June in Germany.

JAIF on the future of nukes

16.04.2015_No74 / News in Brief

Nuclear Can Still Have A Role To Play In Japan, Says Jaif President

http://www.nucnet.org/all-the-news/2015/04/16/nuclear-can-still-have-a-role-to-play-in-japan-says-jaif-president

16 Apr (NucNet): Nuclear can still have a key role to play in Japan's energy policy, but the restart process for the country's offline reactor fleet is strict and time-consuming, Japan Atomic Industrial Forum president Takuya Hattori told NucNet. Mr Hattori said Japan has no indigenous energy resources with the exception of hydropower, which supplies less than 10 percent, and renewables are "very limited". He said: "We need power and nuclear is one of the most reliable sources." Out of the 48 commercial reactors in Japan, none have been in operation since September 2013, Mr Hattori said. "Considering the serious impact on the Japanese economy, especially on industry and local economies, there is a desire to restart reactors as soon as possible." The interview is online for subscribers: http://bit.ly/1b5EeoN

METI: Enough electricity this summer even without nukes

April 17, 2015

Current nonnuclear power capacity should suffice for summer: METI

http://www.japantimes.co.jp/news/2015/04/17/business/current-nonnuclear-power-capacity-suffice-summer-meti/#.VTEjkpPwlLM

Kyodo

Japan is expected to secure the minimum required power supply capacity this summer, the industry ministry said Thursday, meaning electricity supply will be sufficient during the high-demand season even if none of the country's nuclear reactors resumes operation by then.

Although the government is expected to call on companies and the general public to help save power, for the third consecutive year it is unlikely to set numerical power-saving targets to address supply concerns that have emerged since the onset of the 2011 Fukushima No. 1 nuclear power plant crisis.

All of Japan's 48 nuclear reactors have been offline since September 2013, meaning the world's third-largest economy is getting by without a power source that generated almost a third of its electricity at the time the Fukushima disaster struck.

Prime Minister Shinzo Abe's government hopes to revive nuclear power generation in part to cope with the risk of a possible shortage of power supply caused by a malfunction by thermal power plants — currently the main power generators — or other incidents.

The latest power supply outlook could deepen doubts over the government's logic for restarting the nation's idled fleet of reactors, some observers said.
Nine regional utilities calculated their extra power supply capacity this summer on the assumption that Japan will see extremely high temperatures like in 2010, and the Ministry of Economy, Trade and Industry presented the estimates at a meeting with experts mulling electricity issues.
According to the estimates, the nine regional utilities expect their electricity supply capacity to exceed demand by levels ranging from 3 percent to 12.1 percent — all above the minimum required level of 3 percent.
While utilities serving eastern Japan generally reported a solid level of supply capacity, two utilities in western Japan — Kansai Electric Power Co. and Kyushu Electric Power Co., which had been particularly dependent on nuclear power before the Fukushima disaster — met the minimum 3 percent level only by contracting for electricity, if needed, from other utilities.
To facilitate power transmission between eastern and western Japan, the industry ministry announced a plan the same day to raise the nation's East-West transmission capacity from 1.2 million kW now to 3 million kW by the late 2020s.
By installing new transmission lines and frequency converters, the government aims to build enough capacity so that utilities can exchange power to prevent shortages if major disasters occur.

20-22% for nukes

April 23, 2015

Industry ministry eyes 20-22% for nuclear power

http://www3.nhk.or.jp/nhkworld/english/news/20150423_35.html
Apr. 23, 2015 - Updated 12:44 UTC+2
Officials of Japan's industry ministry plan to reduce the nation's reliance on nuclear power in 15 years.

A ministry draft plan says nuclear power should meet 20 to 22 percent of the nation's energy needs in 2030. The figure was around 28 percent before the 2011 Fukushima nuclear crisis.

The target for renewable energy is 22 to 24 percent, up from slightly over 10 percent in fiscal 2013.

That means the ministry expects more energy to come from sources such as solar and wind power than nuclear in 2030.

Officials say they see a need for some nuclear power to curb greenhouse gas emissions and fuel costs.
Japan's reliance on thermal power rose after the Fukushima accident. Increased use of fossil fuel led to more carbon dioxide emissions and fuel imports.

The officials took into consideration utilities' decision in March to scrap 5 aging reactors. They say more reactors could be decommissioned.

The ministry has discussed the 2030 targets at expert panel meetings since January.

Officials plan to present the draft plan to the panel next Tuesday and draw up a final plan before a Group of Seven summit in June. Measures against global warming are expected to be on the meeting agenda.

Industry ministry eyes 20% to 22% of electricity from nuclear by 2030

--
http://www.japantimes.co.jp/news/2015/04/23/business/economy-business/industry-ministry-eyes-20-to-22-of-electricity-from-nuclear-by-2030/#.VTkS3ZPwmos

Kyodo
The industry ministry is looking to set the target for the ratio of nuclear power generation to Japan's total electricity production in 2030 between 20 percent to 22 percent, compared with 28.6 percent in fiscal 2010 before the Fukushima nuclear crisis, sources close to the matter said Thursday.
Miyazawa, head of the ministry overseeing the power sector, presented the plan to other Cabinet ministries during a meeting at the prime minister's office on Thursday. He also suggested that the country generate 22 percent to 24 percent of the total electricity by renewable sources in 2030, according to the sources.
Miyazawa, however, told reporters after the meeting that nothing has been decided on the country's future energy mix.
The ministry is expected to present the targets at next Tuesday's meeting of a panel discussing the country's energy mix, with a view to reaching a conclusion by the end of next month.
In the wake of the triple meltdown at Tepco's Fukushima No. 1 plant, the government of Prime Minister Shinzo Abe has pledged to lower the country's dependence on nuclear power and promote clean energy such as solar and wind. But it is also aiming to restart many of the country's idled nuclear reactors in spite of public opposition.
Many members of the public are opposed to restarting nuclear reactors that have remained offline amid heightened safety concerns since the Fukushima crisis began. In light of persistent anti-nuclear sentiment, the government initially sought to set the target for nuclear power generation at less than 20 percent of the total.
But the industry ministry now says it would like to boost the nuclear power target to cut greenhouse gas emissions. Tokyo is striving to present its numerical goal for reducing greenhouse gas emissions based on the energy mix plan before a summit of the Group of Seven industrialized nations to be held in June in Germany.
In a related move, a panel of the ruling Liberal Democratic Party compiled a proposal Thursday that the country generate more than 30 percent of the nation's electricity supply from renewable sources by 2030.

Japan must stop using Fukushima as an "excuse"

April 21, 2015

Editorial: Japan must set anti-climate change goal without using nuke disaster as excuse

http://mainichi.jp/english/english/perspectives/news/20150421p2a00m0na010000c.html

The government is said to be in the final stages of setting a new target for reducing greenhouse gas emissions at about 25 percent of current levels by 2030. This translates into a reduction rate from 1990 -- the base year set by the Kyoto Protocol -- of about 10 percent, which is much lower than the reduction goals submitted already by other industrialized nations.

At this rate, it is unclear whether Japan will be able to reach its Cabinet-approved, long-term target of an 80-percent reduction in greenhouse gas emissions by 2050.

The next international negotiations on climate change will be at the United Nations Climate Change Conference (COP 21) in Paris at the end of this year, during which participating states hope to establish a new framework on the reduction of greenhouse gas emissions from the year 2020 onward.

The European Union has already submitted its goal for 2030 of at least a 40 percent reduction from 1990 levels; the United States has also submitted its goal for 2025 as a reduction of 26 to 28 percent compared to 2005 levels. Both these targets are aligned with international goals for industrialized countries to reduce emissions by 80 percent by 2050. The International Energy Agency (IEA) has run analyses on possible gas reduction volumes for various countries based on reduction measures that are currently implemented, but the targets set by both the E.U. and the U.S. are more ambitious than those figures.

Meanwhile, the reduction rate being finalized by Japan is about the same level as the figure predicted through IEA's analyses. It will be incredibly difficult to reach Japan's long-term targets at this pace, meaning future generations will be forced to bear a greater burden. Indeed, we cannot ignore the disadvantages we face in our anti-climate change efforts partly as a result of our nuclear reactors being stopped. But Japan is the world's fifth-biggest greenhouse-gas emitter. It is our responsibility to set an ambitious reduction target and contribute to global anti-climate change efforts.

We cannot fulfill that responsibility without stepping up efforts to conserve energy and to expand the use of renewable energy.

Exporting Japanese technology to reduce emissions overseas can help on a global scale, but we must not neglect measures within Japan.

Japan's energy-saving measures are world class, but efforts have plateaued. Today, emissions per GDP are lower in Britain and Italy than in Japan. Last month, the Japan Climate Leaders' Partnership (Japan-CLP) -- comprising corporations passionate about anti-climate change efforts -- recommended the implementation of an emission trading scheme based on the thinking that creating an economic structure that focuses on energy and resource conservation would help improve Japan's competitive edge. It's a mindset that responds to the demands of the times in which we live.

Expanding the use of renewable energy can result in the rise of electricity prices, but it can also reduce the cost of procuring fossil fuels. Locally generating and locally consuming renewable energy can help create jobs in regional communities, contributing to the goal of "vitalizing local economies" emphasized by Prime Minister Shinzo Abe.

According to the Federation of Electric Power Companies of Japan (FEPC), the use of one nuclear reactor reduces carbon dioxide emissions by approximately 3.2 million tons annually. However, since Japan generates a total of 1.4 billion tons of greenhouse gases per year, the proportion that nuclear power contributes toward achieving Japan's long-term goals is not that great.

Japan stands at a point now, where it can no longer hide behind the Fukushima nuclear disaster for its passive stance toward anti-climate change measures.

Chernobyl 29

April 26, 2015

Chernobyl marks 29 years since disaster

http://www3.nhk.or.jp/nhkworld/english/news/20150426_25.html

Apr. 26, 2015 - Updated 14:26 UTC+2
Hundreds of people gathered in a town in Ukraine on Sunday morning to pray for the victims of the Chernobyl nuclear accident 29 years ago.

The gathering took place at a monument for the victims in the town of Slavutych, home to many former plant workers.

One of the reactors at the Chernobyl plant exploded during a test run on April 26th, 1986, sending a huge amount of radioactive substances into the air.

Around 130,000 residents were evacuated from areas within a 30-kilometer radius of the plant.

About 30 plant workers and firefighters died after being exposed to high levels of radiation.

Medical experts say a growing number of former residents and people who worked at the plant after the accident are dying from cancer, including leukemia.

The building of the reactor is now called a sarcophagus after being covered with concrete and metal to prevent further contamination.

Now a giant arch is being built to cover the aging sarcophagus. The structure, which will stand 108 meters tall, is due to be completed in 2 years.

Chernobyl: Missing 265 million dollars

Chernobyl arch faces €265m funding gap ahead of disaster's 29th anniversary

http://www.theguardian.com/environment/2015/apr/24/chernobyl-arch-faces-265m-funding-gap-ahead-of-disasters-29th-anniversary

World must plug funding gap for massive 100-metre steel arch being built to contain remaining radioactive waste at the site

_old and new construction called sarcophagus covering the nuclear reactor no. 4 in Chernobyl Nuclear Power Plant, Ukraine, 2nd October 2014 Photograph: Alamy

Arthur Neslen
Friday 24 April 2015 11.28 BST Last modified on Friday 24 April 2015 12.21 BST

A massive engineering project to make the Chernobyl nuclear power plant safe is facing a €265m (£190m) funding shortfall.

Next week a conference held by Germany in London will call on countries to make up the gap, but the European Bank for Reconstruction and Development (EBRD) has said it may have to ask its shareholders to make up the shortfall if donations dry up.

This Sunday marks the 29th anniversary of the world's worst nuclear disaster, when a power surge blew the roof off a reactor, spewing radioactive clouds across Russia, and eastern Europe.

A makeshift sarcophagus built in the explosion's aftermath was supposed to protect the environment from radiation for at least 30 years. But it has since developed cracks.

The project to build a new radiation container had been due for completion this year but the deadline slipped to November 2017, as costs mushroomed from an initial estimate of €800m (£572m) to more than €2.15bn today.

Over 40 governments and the European commission have committed to help a Chernobyl Shelter Fund tasked with sealing off the 100 tonnes of uranium and one tonne of plutonium that remain within the site.
"If countries recognise the nature of the problem in Chernobyl and its importance for human security in Ukraine and ecological security in Europe, there is a hope that the gap could be closed at the donor conference on April 29," Anton Usov, an EBRD spokesman told the Guardian. "Verbally the donors are committed to contribute more funds."
The bank believes there is a broad understanding among nations of the threat that radioactive dust on the site still poses to Kiev, around 70km away.
But "if there is a shortfall, then we will speak to the bank's management and shareholders and it may be funded by EBRD reserves," Usov added. "Theoretically, that is something we could do."
The 31,000 tonne protective steel arch is an engineering project of staggering dimensions – 100m high, 165m long, with a span of 260m. When finished, it will be slid across teflon pads to entomb the burned out reactor, and is intended to remain effective for a century.
"The are no parallels in the history of world engineering," Usov said. "No-one has even undertaken a project like this before."
Construction of the stainless steel arch has been hampered by factors ranging from optimistic early architectural designs to heavy snows in the winter of 2013/14, which caved in part of a roof near the stricken Unit 4 reactor shelter. Workers were evacuated from nearby sites, as radiation levels surged.
The reactor itself is still too contaminated for workers to approach. Removal of radioactive materials there will only begin once the new confinement structure has been finished.

What future for nuclear reactors?

May 2, 2015

Number of nuclear plants in the world

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

May 2, 2015 - Updated 04:04 UTC+2
Global distribution of nuclear power plants fell in western nations last year, but rose in emerging economies.

Officials at the Japan Atomic Industrial Forum say 5 new nuclear reactors in China and one in India started operating in 2014. One facility in the United States shut down.

The total number of operable nuclear reactors worldwide was 431 in 31 countries and regions. The figure is 5 up from the previous year.

China has 26 reactors under construction and plans to build an additional 30. Eleven reactors are under construction in Russia and 6 in India.

No new reactor has gone online in the US or any EU member country for 7 consecutive years.
The US has closed 5 plants over the last 2 years, reducing its total number of reactors to 99. The figure fell

below 100 for the first time in 28 years.

The closures come at a time when increased production of shale gas is pushing down electricity prices. This is making nuclear power generation unprofitable.

Anti-nuclear sentiment has also contributed, with Germany and Switzerland deciding to withdraw from the nuclear industry due to public pressure.

JAIF officials say eastern European and Middle East countries, as well as other emerging economies, are moving to build more nuclear reactors in an effort to cut their greenhouse gas emissions.

So what's changed since 3/11?

May 3, 2015

The same old energy mix

http://www.japantimes.co.jp/opinion/2015/05/03/editorials/the-same-old-energy-mix/#.VUccpZPwmic

The government's draft for Japan's energy mix in 2030, which was endorsed by a panel of experts at the Economy, Trade and Industry Ministry last week, makes it clearer that the Abe administration is pursuing a return to the nation's energy landscape that existed before the 2011 Fukushima nuclear disaster and contradicts Prime Minister Shinzo Abe's repeated words that the government is seeking to reduce the nation's dependency on nuclear power as much as possible by maximizing introduction of renewable energy and greater energy efficiency.

According to the medium-term targets set in the draft, nuclear power will account for 20-22 percent of the nation's electricity supply as of 2030, while the share of renewable energy such as solar and wind power will rise to 22-24 percent.

True, the target for renewable sources was set just slightly higher than the share of nuclear energy, which is forecast to fall from the levels before the 2011 triple meltdowns at Tokyo Electric Power Co's Fukushima No.1 plant. It is questionable, however, whether all possible measures were explored to increase the future share of renewable energy before such targets were set.

The feasibility of the target for nuclear power is also in doubt. In 2010, nuclear power made up of 28.6 percent of Japan's electricity generation. As power companies shut down their nuclear reactors in the wake of the Tepco plant disaster, the share of nuclear power plunged to 1 percent in fiscal 2013. All of the nation's 48 reactors — including four aging ones that were officially decommissioned last week — are currently offline.

While the Abe administration is seeking to reactivate the idled reactors once they clear the Nuclear Regulation Authority's screening under what the government touts as the world's toughest safety standard, the 20-22 percent share for nuclear energy in 2030 still appears to be a tall order.

Following the Fukushima disaster, the government decided that reactors should be decommissioned after they have been in operation for 40 years in principle — except for a one-time extension of their life to up to 60 years on the condition that they undergo costly safety renovations. If no new nuclear power reactors are built in the coming years— which seems difficult given the continuing popular safety concerns about nuclear power — the power companies would need to extend the operation of about 15 aging reactors by 2030 to secure a 20 percent share for nuclear energy, assuming that all of the reactors approved by the NRA have been put back online.

Meanwhile, the government continued to balk at setting ambitious targets for increasing the share of renewable energy. The trade and industry ministry, which led the discussions at its panel, remained negative toward substantially boosting the share of renewable energy, which in 2013 stood at 10.7 percent, including hydro power. When the Environment Ministry in early April released a simulation commissioned to a private think tank that stated renewable energy can account for up to 35 percent of Japan's power supply in 2030, trade and industry minister Yoichi Miyazawa was quick to dismiss the calculation as impractical, noting that it fails to properly assess the feasibility of the various steps that need to be taken to promote the renewables.

Opponents to boosting the share of renewable energy often cite the high cost of power generation through such sources. Keidanren (the Japan Business Federation) argued against setting the target for renewables higher by citing the damage higher electricity charges would cause to businesses and consumers.

But what's missing from the argument is the issue of how the cost of renewable energy — which indeed remains high in Japan despite the trend of falling costs in other countries — can be lowered. The government should identify the hurdles that make renewable energy expensive in this country, and take steps to remedy the problems, including reform of the power transmission networks.

In setting the draft for the energy mix, the trade and industry ministry also released its estimate of the per-unit cost of each source of electricity in 2030. According to the estimates, the cost of nuclear energy per 1 kilowatt hour will be ¥10.1 — cheaper than ¥12.9 for coal-fired thermal power, ¥13.4 for liquefied petroleum gas-fired thermal power, ¥13.9-¥33.1 for wind power and ¥12.5-¥16.4 for solar power.

The cost of nuclear energy was raised from ¥8.9 in the earlier estimate released in 2011 to reflect the increased cost of measures to bump up plant safety in accordance with the updated NRA regulations and possible expenses of compensation in case of severe accidents, although the calculated frequency of such accidents was lowered in view of the tighter safety standards. The cost of thermal power that depends on imported fuel was raised from earlier estimates in view of the yen's fall against the dollar. While it was estimated that the equipment costs for renewable power would decline, the profits that generators of such power get through the feed-in-tariff system — which would be added on to the utility charges — were newly added to the calculations.

The validity of the formula of these estimates — based on which the government touts the cost advantage of nuclear energy over other sources — should be thoroughly examined.

As nuclear power plants were put offline, the utility firms fired up more thermal power plants, whose share in Japan's electricity generation rose from 61.7 percent in 2010 to 88.3 percent in 2013. Thermal power generation would need to be maintained for the foreseeable future. But unlike many other industrialized economies that promote the use of natural gas-fired thermal plants, which emit relatively small amounts of carbon dioxide, Japan seems to be pushing for coal-fired plants — because coal is less expensive. The draft sets the target share of natural gas-fired thermal power plants at 27 percent and that of coal-fired plants at 26 percent. The government should reconsider whether this is the right direction in view of the fight against climate change.

Practical nukes training difficult in Japan

May 11, 2015
Universities struggle to provide practical nuclear power training
http://mainichi.jp/english/english/newsselect/news/20150511p2a00m0na012000c.html

Universities are struggling to provide practical nuclear power training to students because reactors for education and research remain idle as they cannot meet the new regulatory standards introduced following the outbreak of the Fukushima nuclear crisis.
The new standards, worked out by the government's Nuclear Regulation Authority (NRA), require operators of reactors for education and research with smaller outputs to take as strict safety measures as those for commercial reactors.
However, universities operating these reactors are unable to beef up their safety measures, and there are no prospects that they will pass NRA safety screening.
Concerns have been raised that the suspension of operations at these reactors could adversely affect development of human resources in nuclear technology, but the NRA cannot loosen up screening standards for these reactors as they are directly linked to safety. As such, both universities and the NRA are at a loss about what to do.
Kyoto University's Research Reactor Institute in Osaka Prefecture has two reactors for education and research purposes, with an output of 100 watts and 5,000 kilowatts, respectively. Kinki University's Atomic Energy Research Institute, also in the prefecture, has one with an output of only 1 watt.
Both institutes claim that even if hit by a powerful earthquake, it would not cause a serious accident to the reactors that would require evacuation of local residents. Thousands of students and researchers, including those at other universities, have used these reactors for research and experiments, such as those involving starting up the reactors and adjusting their outputs.
Before the outbreak of the Fukushima nuclear crisis in March 2011, the operation of these reactors had been permitted if conditions that were set at the time of the installations were met.
Under the new standards, however, operators of these research reactors must assume the scales of earthquakes that could hit the reactors and implement multiple safety measures just like those for commercial nuclear reactors. Therefore, the operators are required to calculate how far every device in these research reactors can withstand vibrations estimated to be caused by the maximum possible earthquake.
Kinki University's reactor had been stopped by Feb. 5, 2014, and Kyoto University reactors were halted by May 26 last year for regular inspections.
The two universities applied with the NRA for safety inspections last fall, but the reactors have not yet passed the inspections as the regulator demanded that the universities submit specific figures and other information on the safety of the reactors.
Unlike electric power companies that have numerous employees, teachers at these universities must handle these duties while lecturing at classes and conducting their own research activities.
"Only five teachers can handle the duty. We can't assign more people to the task," laments Tetsuo Ito, head of Kinki University's Atomic Energy Research Institute.
NRA Chairman Shunichi Tanaka expressed understanding of the need for research reactors at universities. "These are important facilities for education," he has pointed out.

Still, Shinzo Kuromura, who oversees inspections on reactors at the NRA, said the authority cannot compromise its safety inspections.
"We can't relax our inspections," he said.
Kuromura added that he "would like to seek other ways" for the research reactors. However, neither the NRA nor the universities has come up with productive ways to ensure both human resource development and safety.
Since students cannot undergo training to operate nuclear reactors in Japan, Kinki University received a subsidy from the education ministry to dispatch students to participate in training at Kyung Hee University in South Korea.
Kyoto University organizes inspection tours of nuclear reactors for students instead of having them undergo training to operate reactors.
Ito of Kinki University underscored the need for students to learn through nuclear reactor operation training so that the decommission projects can be carried out safely at commercial reactors.
"We can't take all students studying nuclear technology overseas for training. It's regrettable that some students will start their career (in nuclear technology) without going through the tense training of operating nuclear reactors," he said.
May 11, 2015(Mainichi Japan)

Nuclear still the cheapest, acording to METI

May 11, 2015

Nuclear remains cheapest power source despite Fukushima meltdowns: government

Kyodo
A panel of nuclear experts on Monday largely approved a government report saying that atomic power remains the cheapest source of electricity despite the rising safety costs triggered by the 2011 Fukushima core meltdowns.
Despite an expected glut in solar power, the government is looking to make nuclear power account for 20 to 22 percent of Japan's electricity supply by 2030, underscoring its policy of sticking with atomic power even though the majority of the public remains opposed to restarting its idled reactors.
According to the latest estimate of power generation costs by the Ministry of Economy, Trade and Industry, atomic power would cost at least ¥10.3 per kilowatt-hour in 2030 — cheaper than power derived from fossil fuels, natural gas, wind and solar energy.
That's higher than the ¥8.9 projected in 2011 and is based on a projection that costs for plant decommissioning and compensation from a severe accident would jump to ¥9.1 trillion from the ¥5.8 trillion estimated in 2011, reflecting the Fukushima nuclear crisis.
METI also said additional safety measures required to run a nuclear reactor would cost an average of ¥60.1 billion.
But the increase in overall generation costs is limited because the probability of a nuclear accident would decrease after utilities complete their safety measures, it said.

In the report, the ministry also estimates that coal-fired power will cost ¥12.9 per kwh and liquefied natural gas ¥13.4 per kwh, compared with earlier projections of ¥10.3 and ¥10.9, respectively.
Wind power would cost up to ¥34.7, solar power up to ¥16.4, geothermal power ¥16.8, and hydropower up to ¥27.1 per kwh, the report said.
In its national energy policy adopted last year, the government of Prime Minister Shinzo Abe pledged to reduce reliance on nuclear power and promote renewable energy as much as possible, while standing by nuclear as a key power source, citing the importance of a stable electricity supply to economic growth.
Japan is expecting a glut in solar power because utilities refuse to upgrade their power grids to purchase all the energy as mandated under the feed-in tariff system. A study has found that seven of the nation's utilities lack the transmission network capacity to accept all of the solar power energy that suppliers plan to generate, METI says.
Combined, they can only accept 58 percent of the total, METI said. METI began looking into their transmission capacities after five utilities decided to cap their clean energy intake, revolting against the government's plan to increase generation of renewable energy in light of the Fukushima disaster.
Under the feed-in tariff system, utilities are obliged to purchase all electricity generated from such sources as solar, wind and geothermal power at fixed rates for a set period.
But the system ran into a roadblock after new suppliers flooded the solar power business, prompting the utilities to suspend signing power-purchasing contracts in September amid fears that overcapacity could cause blackouts.
Currently, all of Japan's commercial nuclear reactors remain offline to pass a beefed-up safety screenings based on new, more stringent regulations drafted after the Fukushima meltdowns. The government is planning to restart reactors that have met the post-Fukushima safety requirements.

Kepco's commitment to reducing costs questioned

May 14, 2015

EDITORIAL: We need to hear Kansai Electric's vision for future power sources

http://ajw.asahi.com/article/views/editorial/AJ201505140039

Kansai Electric Power Co. will raise its electricity rates for households in June. The standard monthly rate of 8,058 yen will go up to 8,220 yen.
The increase comes only two years after the last increase. In May 2013, the utility jacked up its power charges by nearly 10 percent.
Kansai Electric attributed the increase to swelling fuel costs due to the expansion of thermal power generation forced by the continued shutdown of its nuclear power plants.
But how much has the company done to cut costs to avoid a rate hike during this period?
The utility, during the government's review of the rate hike plan and public hearings over the issue, failed to provide persuasive arguments that it was committed to cost reductions.
One aspect of the company's operations that has cast doubt over its seriousness to cut costs concerns executive pay.

At the time of the previous increase, the government asked the utility to lower the average annual remuneration of the board members to 18 million yen. But Kansai Electric kept it at 21 million yen until the end of last year. After being criticized for failing to cut its executive salaries, President Makoto Yagi promised on May 12 to lower the average to 16 million yen.
The utility initially hoped to raise its power charges by more than 10 percent in April. But the government limited the hike to 8.36 percent, saying the company could do more to boost its cost efficiency.
An increase in electricity rates has a direct impact on people's livelihoods. The utility needs to demonstrate that it has made every effort to slash costs. That is a basic premise.
Since the catastrophic accident at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, which led to a shutdown of all nuclear reactors in Japan, it has been impossible to resume nuclear power generation at pre-disaster levels.
Nuclear power accounted for half of Kansai Electric's overall power output before the accident. The utility now should make more serious efforts to wean itself from its dependence on atomic energy.
In spite of this, the company has said it will keep using nine of the 11 reactors it owns.
It appears that Kansai Electric is proverbially waiting for the storm to pass by pinning its hopes for earnings recovery on eventual restarts of its reactors.
Last month, the Fukui District Court issued an injunction to prevent restarts of two reactors at Kansai Electric's Takahama nuclear power plant in Fukui Prefecture. The court cited safety concerns in issuing the injunction in response to a request from local residents.
There is strong opposition to plans to bring offline reactors back on stream, especially in areas around Fukui Prefecture.
The utility should take more seriously the changes in the social environment caused by the Fukushima triple meltdown.
Kansai Electric's latest business plan also calls for greater efforts to build state-of-the-art thermal power plants with higher fuel efficiency and introduce renewable energy sources for power generation.
If it is serious about pursuing these goals, we suggest the company lay out a vision for its future power sources before the government's policy debate on the nation's future energy mix is concluded.
In its long-term growth strategy unveiled in 2010, the company pledged to raise the share of non-fossil fuel power sources, mainly nuclear energy, to a level of 60 to 70 percent in 2030. The target must now be reconsidered as a result of the disaster that unfolded in March 2011.
If the company sets clear numerical targets for lowering its dependence on nuclear power in 10 or 20 years, more constructive debate on its business plans will be possible.
The power retail market is slated to be fully deregulated next spring, which will allow households to freely choose their suppliers of electricity.
As the power market for industrial consumers has already been liberalized, more than 5,000 companies and local governments terminated their contracts with Kansai Electric, which raised the rates, and switched to new power suppliers by the end of March.
Unless it is willing to reform its management policy and structure in response to the changes of the times, Kansai Electric could lose many more customers.
--The Asahi Shimbun, May 14

High costs fo renewables as an excuse for nukes

May 27, 2015

Nuclear power crucial as renewable energy too costly, ministry says

http://ajw.asahi.com/article/behind_news/politics/AJ201505270040

THE ASAHI SHIMBUN

The high cost of renewable energy means Japan has no choice but to rely on nuclear power to provide between 20 and 22 percent of its energy by 2030, according to an industry ministry report.

That would be a small drop in the reliance on nuclear power from the levels before the 2011 Fukushima nuclear disaster.

The shift away from nuclear energy to renewables, including solar power, will generate “pressure for drastic rise in energy cost,” stated the report released May 26. The ministry, a staunch supporter of nuclear energy, concluded it is the least expensive method of power generation.

While nuclear energy should provide between 20 and 22 percent of Japan's electricity, renewable energy should account for 22 to 24 percent in fiscal 2030.

About 27 percent of Japan’s electricity was provided by nuclear power on a yearly average in the decade up to the 2011 Fukushima nuclear disaster.

The proposal also said that nuclear power was required to keep power costs at a manageable level for corporations and households and also to enable Japan to reduce greenhouse gases to levels set by advanced economies in the West.

The draft report was released by an expert committee at the Natural Resources and Energy Agency headed by Masahiro Sakane, a senior adviser at Komatsu Ltd. It will be finalized at a meeting of the committee in early June and adopted as the government’s official energy-mix plan in July at the earliest after going through a public-comment phase.

All the nation’s reactors were shut down after the disaster, and hurdles remain high for the government to restart many of them due to strong public opposition and safety concerns of local governments.

In its Strategic Energy Plan released in April 2014, the government underscored its intention to push for reactor restarts but said “dependency on nuclear power generation will be lowered to the extent possible.”

At a news conference April 26, the industry minister Yoichi Miyazawa said that high energy costs and other concerns "will be all solved by increasing the ratio of nuclear power.”

The minister emphasized that the 20-22 percentage scenario was the minimum possible reliance on nuclear energy.

While the Strategic Energy Plan projected that renewable energy must account for far more than 20 percent of Japan’s future plan, the draft report pointed out that solar and wind power output are particularly unstable.

The proposal states that Japan should rely on just 7 percent of energy from solar power and 1.7 percent from wind power.

During the committee sessions, Yukari Takamura, a professor of international law at Nagoya University, and two other members submitted opinion papers that asserted the discussions at the committee do not fully address the need to reduce nuclear energy and increase dependency on renewable energy.

But the figures in the draft proposal are likely to be approved in the committee's next meeting in early June.
(This article was written by Tomoyoshi Otsu and Kenichiro Shino.)

About Japan's energy mix draft

June 1, 2015

Some experts demanded less use of nuke power

http://www3.nhk.or.jp/nhkworld/english/news/20150601_26.html

Jun. 1, 2015 - Updated 10:58 UTC+2

In a discussion about the final draft plan on Japan's future energy sources, several experts have called for using less nuclear power.

The 14-member panel endorsed on Monday the draft for Japan's energy plan for fiscal 2030. It aims to set the country's nuclear power dependence at 20 to 22 percent of total energy.

Earlier, three of the panel members lodged a written objection against the panel's draft plan. They said it failed to meet Japan's policy to reduce as much as possible its reliance on atomic energy.

Their paper said the ratio is based on the scenario the operational lifespan of Japan's nuclear reactors will be extended beyond their standard of 40 years.

The experts said the use of renewable energy, set at 22 to 24 percent in the draft, should be raised to at least 30 percent by introducing more solar and wind power.

During Monday's meeting, some members proposed that renewable energy be available for use when nuclear plants cannot provide sufficient energy.

Others said the use of nuclear power should be reduced to meet public expectations. They said **priority should be attached to safety**, and existing power plants be replaced by new state-of-the-art nuclear facilities.

Industry ministry officials overseeing the panel said that no plan is in place to build new nuclear reactors or replace old ones with new ones.

They said some of the plants will be put into use beyond the operational lifespan, but with greater safety

levels and higher operating rates.

The plan was ultimately endorsed by the panel members. The final draft proposes that once the plan is officially adopted it be reviewed every 3 years.

Govt. panel endorses energy mix draft plan

http://www3.nhk.or.jp/nhkworld/english/news/20150601_24.html

Jun. 1, 2015 - Updated 09:33 UTC+2
A panel of experts on Monday endorsed the final draft plan submitted by industry ministry officials on Japan's electricity needs in the future.

The key issue is the balance of nuclear power, fossil fuels and renewables.

The plan indicates nuclear power should contribute 20 to 22 percent of total energy by fiscal 2030. The figure was about 28 percent before the Fukushima nuclear accident in 2011.

The plan also calls for Japan to more than double its reliance on renewable energy sources to up to 24 percent.

Renewables accounted for about 10 percent of total supply in fiscal 2013.

Ministry officials say they will collect comments from the public. They will officially decide on the energy plan as early as July.

Cut greenhouse gas emissions by 26%

June 2, 2015

Japan aims to cut greenhouse gas emissions by 26% by 2030

TOKYO (Kyodo) -- The Japanese government on Tuesday decided on its commitment to reducing greenhouse gas emissions by 26 percent by 2030 from 2013 levels, as part of efforts to reach a new international agreement at the end of the year to tackle climate change.
Prime Minister Shinzo Abe plans to explain about the emission goal at a summit of the Group of Seven industrialized nations starting Sunday in Germany, and submit it to the United Nations in July.
The target is "internationally comparable and ambitious," the premier told a government meeting on global warming. It "entails concrete measures and technologies" to reduce greenhouse gas emissions, he said.
The new reduction target, however, only represents an 18 percent cut compared with the Kyoto Protocol base year of 1990 and is seen as insufficient among environmental activists and researchers.

International society is seeking to create a new framework to replace the Kyoto Protocol, the current international framework for fighting global warming, at the 21st session of the Conference of the Parties to the U.N. Framework Convention on Climate Change, or COP21, to be held in Paris in November and December to decide on a post-2020 regime for reducing greenhouse gas emissions.
Japan has lagged behind other countries in setting a post-2020 reduction goal amid uncertainty over its future energy policy in the wake of the 2011 Fukushima meltdowns, which brought all of the country's nuclear reactors offline by the end of September 2013.
Under the new goal, Tokyo plans to cut emissions to the equivalent of some 1.04 billion tons of carbon dioxide in 2030. It represents a 25.4 percent reduction from 2005 levels.
In the long term, industrialized countries have agreed to cut their combined emissions by 80 percent by 2050. Japanese government officials said they believe Tokyo's new reduction goal is consistent with the global target.

June 2, 2015

Japan aims to cut greenhouse gases by 26%

http://www3.nhk.or.jp/nhkworld/english/news/20150602_19.html

Jun. 2, 2015 - Updated 05:13 UTC+2

Japan's government has decided to aim for a 26 percent reduction in greenhouse gas emissions by 2030, compared to 2013 levels.

Prime Minister Shinzo Abe was on hand when a government task force on climate change made the decision on Tuesday. The government consulted experts and the ruling parties about the target.

The latest emissions data available comes from 2013. The target also translates to a 25.4 percent reduction compared to 2005, the previous baseline.

Cuts in carbon dioxide emissions from power plants and corporate activities are expected to make up the bulk of the reduction, or nearly 22 of the planned 26 percent.
The remainder is to be achieved through cuts in other greenhouse gases and by counting CO2 absorptions by forests and farmland.

Countries around the world are being asked to present their emissions reduction goals beyond 2020 before a UN climate change conference is held at the year-end.

The prime minister told the task force that Japan's target is ambitious and on a par with international standards. Abe said he will explain Japan's vision at the upcoming Group of 7 summit.

He also said Japan is determined to lead global debate in the run-up to the climate change conference, to realize a fair and effective framework to be joined by all nations to counter global warming.

The government plans to solicit public opinion for about one month, and present the target to the United Nations, possibly in July.

Reduce by 26 % by 2030

June 8, 2015

Abe outlines greenhouse gas emission goal at G7

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jun. 8, 2015 - Updated 13:46 UTC+2
Prime Minister Shinzo Abe has told leaders from the Group of 7 countries that Japan will aim to cut its greenhouse gas emissions by 26 percent by 2030.

Abe made the announcement on Monday, the second day at the G7 summit in southern Germany.

Abe said Japan has been faced with a huge shift in the energy environment since the March 2011 earthquake and tsunami.

He said Japan's energy consumption has declined since the disaster, but the country will not stop there.

Abe said Japan's government has decided to aim for a 26 percent reduction in greenhouse gas emissions by 2030, compared to 2013 levels.

Japanese officials say other leaders appreciated the target, calling it aggressive.

The leaders agreed to push for the adoption of a framework that includes all countries at the UN climate change conference scheduled for the year-end in Paris.

35 reactors by 2030?

JUne 11, 2015

Japan needs 35 nuclear reactors operating by 2030, says industry minister

http://ajw.asahi.com/article/behind_news/politics/AJ201506110038

THE ASAHI SHIMBUN

Japan needs about 35 working nuclear reactors by 2030 to achieve the government's long-term energy strategy to return the country's dependence on nuclear energy to slightly under the level it was before the 2011 Fukushima disaster.
That many would be required for nuclear energy to provide between 20 and 22 percent of the country's electricity, said industry minister Yoichi Miyazawa at a Lower House committee session on economy and industry.
Currently, there are 43 nuclear reactors in Japan with three more under construction, but none are actually operating.
After the Fukushima nuclear disaster in March 2011, the government limited the operational life of nuclear power reactors to a maximum of 40 years in principle, with an extension of up to 20 years in exceptional cases.
If the 40-year principle was to be strictly applied to all the existing reactors, there will be only 23 operative reactors in 2030, meaning that 10 or so reactors would have to have their lifespans extended in order to reach the power target.
The three new reactors include those at two new nuclear power plants in Aomori Prefecture, Electric Power Development Co.'s Oma plant and Tokyo Electric Power Co.'s Higashidori plant, while the other is the third reactor at Chugoku Electric Power Co.'s Shimane plant in Shimane Prefecture.
IAEA MEETING
Japan has strengthened safety measures against severe nuclear accidents and limited the operational lifespan of reactors through revisions of the nuclear reactor regulatory law, Ambassador Mitsuru Kitano told an executive meeting of the International Atomic Energy Agency (IAEA) in Vienna on June 10.
It was Japan's responsibility to share the experiences and lessons of the Fukushima disaster with other IAEA member nations, added Kitano, who is ambassador of the Permanent Mission of Japan to the International Organizations in Vienna.
At the meeting, the international nuclear watchdog unveiled its report on the Fukushima disaster, which will be officially released at its general meeting in September.
The report pointed out that blind trust in nuclear safety has prevented plant operator TEPCO from taking sufficient preparatory measures against tsunami and other natural disasters, while the government and its nuclear watchdog also failed to demand TEPCO take necessary safety steps prior to the accident.
While Kitano declined to comment on the government's opinion on the safety of nuclear power plants at the time the accident took place, he emphasized that Japan created a new nuclear watchdog, the Nuclear Regulation Authority, in 2012 to ensure its independence from the nuclear industry.

Environment minister against coal plant

June 12, 2015

Mochizuki to oppose coal-fired power plant

Jun. 12, 2015 - Updated 06:35 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150612_21.html

Japanese Environment Minister Yoshio Mochizuki says he will submit a letter of objection over the planned construction of a coal-fired thermal power plant in western Japan. He cites global warming concerns as a reason.

An operator that has secured funding from J-Power and Osaka Gas is planning to build the 1.2 million kilowatt plant in Ube City, Yamaguchi Prefecture. The ministry has conducted an environmental impact study of the project.

Mochizuki told reporters on Friday that he will say in the letter to the economy and industry ministry that the plan cannot be approved at present. The industry ministry is in charge of authorizing the plant's construction.

The environment minister expressed concern that the operation of the thermal power plant could undermine Japan's efforts to achieve its greenhouse gas emissions reduction goal.

Earlier this month, the government decided to aim to cut emissions by 26 percent by 2030 from 2013 levels.

Coal-fueled power generation involves sizeable carbon dioxide emissions.

But a series of projects to build such plants have been unveiled since the Fukushima Daiichi nuclear power plant accident in 2011.

The environment ministry estimates that if all the planned plants are brought into operation, power output by coal-fired plants may grow by more than 30 percent from fiscal 2013, which ended in March 2014.

The ministry is calling on the power industry to introduce a framework to reduce utilities' emissions.

Industrial watchers say the coal-fired plant construction projects may face a review.

All ready to start again

Japan returns to nuclear power

http://blogs.ft.com/nick-butler/2015/06/22/japan-returns-to-nuclear-power/**?**

Nick Butler
| Jun 22 05:30 | 3 comments | Share

Within the next few weeks the Japanese utility Kyushu Electric Power will restart its two nuclear power reactors at Sendai in the Kagoshima prefecture in the far south of the country. Fuel loading is set to begin

July and the plants should be onstream again in August. After four years of crisis and much legal and political debate, the Japanese nuclear industry is finally on the way back. The implications for the rest of the energy sector in Asia and across the world are significant.

The two reactors at Sendai have been closed since 2011. From a nuclear fleet of 50 reactors capable of producing some 47 GW of electricity and supplying over 30 per cent of Japan's daily electricity needs at the beginning of 2011, the sector's output shrank to zero in the months following the Fukushima disaster. At Fukushima itself six reactors have been closed and are being decommissioned. The rest of Japan's nuclear fleet stands cold and unused. Gradually, however, the negative mood of 2011 has abated. Now the operators of 24 different reactors across the country have applied for permission to reopen with the full and very active co-operation of the Japanese state and the powerful industrial lobbies such as the Kaidanren and the Keizai Doyukai.

Public opinion in Japan is divided about nuclear power but the Democratic Party of Japan (DPJ) which campaigned for the phasing out of all nuclear activity, lost power at the 2012 elections and has been unable to recapture the surge of support it enjoyed in the immediate aftermath of Fukushima.

The DPJ's plans to transform Japan's energy mix were dropped when the government of Shinzo Abe came to power. The policy of the current administration focuses on a gradual restoration of nuclear's share in Japan's energy mix . The process is slow and painful. Each plant still faces challenges to demonstrate conformity with new standards. In some cases there is local opposition but the chances are that up to 10 nuclear plants will be operational again within 18 months. There are even plans for the construction of new nuclear stations, most of which are reported to have strong local support. As the industry never fails to point out no one died at Fukushima and the story can be written as one of an industry responding to the challenge of a natural disaster completely beyond its control.

The record of the last four years has demonstrated once again the ability of the Japanese government to command the key players in the national economy when necessary. It is hard to imagine such a process working in the same way in the US or in Europe.

The first step was the imposition of a dramatic programme of energy conservation measures. Electricity demand fell by 12 per cent — and peak demand by 18 per cent. A comparable programme applied across the EU would reduce consumption by as much as 300 terawatt hours a year.

The remaining gap in Japanese energy needs has been filled by expensive gas and by coal. In both fuels Japanese demand has sustained the global market and kept prices up. As nuclear returns the impact will be painful, especially for gas. For the last few years gas prices have included an Asian premium because of increased demand from Japan. In recent months, however, gas prices have begun to fall as the coming shift back to nuclear is factored in. As a paper by Peter Hughes and Daniel Muthmann for the recent Pacific Energy Summit in Beijing demonstrates, the regional premium is disappearing and gas is becoming a single global commodity market with LNG spot prices in Asia and Europe converging.

Worldwide, the demand for traded gas is weak. As the new BP Statistical Review confirmed last week, gas demand in Europe fell by more than 11 per cent in 2014 as it was pushed out of the fuel mix by the combination of subsidised renewables and cheap coal. US demand is fully satisfied by local supplies. Japanese gas demand was 112bn cubic metres last year and could easily fall by 10 per cent a year for the next three years. Once the first nuclear stations such as Sendai are back onstream the pace of recovery could be quite rapid.

The trend will hit the coal market as well. Japanese coal imports grew after Fukushima and the Japanese government was forced to abandon their 2020 emissions reduction target. Now, however, Mr Abe's government is keen to get back to something close to the original targets within the next decade, and that means that coal use will be strictly limited.

The irony is that over time Fukushima may be seen as having done more damage to the nuclear sector outside Japan than to the industry within the country. It is Germany not Japan that has abandoned nuclear. Many other countries have found that the added costs of protecting nuclear stations from the sort of extreme weather conditions that destroyed Fukushima are prohibitive. New safety regulations have certainly contributed to the problems of Areva and EDF as they struggle to build new capacity in Finland, France and the UK.

In Japan, however, faith in civil nuclear power remains strong. The country imported more than 80 per cent of its energy needs in 2014 — an uncomfortably high figure. Nuclear is regarded as an indigenous source of supply that can limit this dependence. The Japanese economy retains a strong industrial sector which sees nuclear as a low-cost source of supply. Most important of all, despite the fact that the local utility Tepco made every possible mistake in handling the Fukushima disaster, the accident has not been blamed on the nuclear sector as such. Nuclear reactor businesses including Toshiba and Hitachi retain a very high reputation and remain attractive suppliers worldwide. In contrast to the panic in Germany, Japan has methodically adjusted to what has happened and has absorbed the costs of ever tighter regulation. By 2020 it would not be surprising to see Japan back as one of the most nuclear dependent economies in the world.

Europe has failed to learn from Fukushima

Source : Greenpeace
http://www.greenpeace.org/eu-unit/en/Publications/2015/Greenpeace-warns-Europe-is-failing-to-learn-lessons-from-Fukushima/

Greenpeace warns Europe is failing to learn lessons from Fukushima

Nuclear regulators and the Commission must strengthen stress tests

Press release - June 29, 2015

Brussels – A new report published today by Greenpeace [1] found that Europe's nuclear regulators have failed to act on vital lessons from the Fukushima catastrophe, exposing Europeans to the risk of a nuclear accident. The release coincides with the bi-annual conference of the European Nuclear Safety Regulator Group (ENSREG) held in Brussels.

Greenpeace nuclear energy expert Jan Haverkamp said: *"Europe has failed to learn some of the vital lessons from Fukushima and remains woefully unprepared for similar accidents. We call on the Commission and regulators to act now to ensure that European nuclear operators address these serious safety concerns."*

The report analyses national action plans that are based on a series of nuclear 'stress tests' [2] set up in the aftermath of the Fukushima nuclear disaster in Japan in March 2011. It found that several countries in Europe have failed to implement crucial protection measures against earthquakes, floods and hydrogen explosions, and the installation of proper pressure safety valves to prevent the release of radioactivity into the environment in case of accident. The lack of such valves at the Fukushima reactor forced operators to face the dilemma of risking over-pressurisation and explosion, or releasing radioactivity and therefore contaminating the environment and population.

In a communication on the Energy Union last February [3], the European Commission said the EU should have the world's safest nuclear generation by using the highest standards of safety, security, waste management and non-proliferation.
ENSREG was mandated by the European Council and the European Commission to carry out the stress tests and is expected to present the results of its own peer-review of national action plans.

Deregulation of power sector

July 5, 2015

Electricity and gas liberalization

http://www.japantimes.co.jp/opinion/2015/07/05/editorials/electricity-and-gas-liberalization/#.VZlBZkbwmic
The Diet last month enacted two bills to finalize the liberalization of the electricity and city gas industries. The government should do its utmost to ensure not only fair treatment of all entrants into the markets but also the stable supply of electricity and city gas to consumers.
Under a revision of the Electricity Business Law, the culmination of the liberalization of the power industry will come in April 2020, when power transmission and distribution sections will be separated from the nation's nine major power firms, which now enjoy regional monopolies. An earlier stage of reform started in April when the Organization for Cross-regional Coordination of Transmission Operations was established to facilitate power transmission between western and eastern Japan in case of an emergency. OCCTO's establishment was prompted by the experience of what happened in the wake of the March 2011 crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Moving power to disaster-hit eastern Japan was made difficult by the difference in the frequency of electricity between the two regions.

In April 2016, retail sale of electricity to households and other small-lot users will be opened to new entrants. Since the gradual liberalization of electricity sales began in 1995, businesses from various other sectors have been selling electricity to large-scale users such as plant operators and have already taken a market share worth 3 million kilowatts of electricity — equivalent to the output capacity of three nuclear power plants combined.

To help push the liberalization of electricity retail sales for small-lot users, OCCTO will work to increase competition among power suppliers beyond traditionally demarcated service areas. It will also make it easier to transmit electricity generated from renewable energy sources such as wind and solar facilities over long distances, for example between eastern and western Japan.

Currently 1.2 million kW electricity can be transmitted between the country's western and eastern regions. OCCTO plans to eventually increase the capacity to 3 million kW by beefing up frequency conversion facilities. Major power firms have already started a project to raise the capacity to 2.1 million kW by the end of fiscal 2020.

Liberalization of the gas industry will follow deregulation of the power sector. A revision of the Gas Business Law will liberalize the gas retail market in 2017 at the earliest and will spin pipe management divisions off the major city gas firms in Tokyo, Nagoya and Osaka in April 2022 so that new entrants to the business can have better access to gas pipes.

These changes will facilitate not only the entry of new businesses into the electricity and gas markets but also help power and gas companies enter each other's markets. It is hoped that increased competition will result in lower electricity and gas bills for consumers and help initiate new services such as price discounts through the package sale of gas and mobile phone services, and coupon points accumulated through electricity purchases. Some new entities may attract eco-minded consumers by selling power from green sources.

Behind the decision by the Ministry of Economy, Trade and Industry to separate power transmission and distribution sections from the major utility firms is the view that new entrants would face difficulty entering the market unless they can use transmission lines now effectively monopolized by the major firms under more equitable conditions.

Still, doubts remain as to whether the competition between the major firms and new entrants will be fair because the spun-off power transmission and distribution businesses will be under the umbrella of holding companies that also control the power-generating firms that will be spun off the major power companies. A new committee that will be established to oversee transactions in the power and gas industries must keep a close eye on them and ensure the competition is fair.

The revised Electricity Business Law contains a supplementary provision that says that the power supply and demand situation will be reviewed when the separation of transmission and distribution sections from the major utilities is carried out and "necessary steps" should be taken in view of the situation. This means that depending on the supply and demand situation, the separation may be delayed. For example, major utilities might cite a delay in the restart of nuclear power plants — mostly idled in the wake of the Fukushima disaster — as an excuse to seek a delay of the separation. **The ministry should not allow the firms to link nuclear power generation to the implementation of the deregulation measure.**

The Abe administration, which is pushing for the reactivation of the idled nuclear power plants, plans to have nuclear power account for 20 to 22 percent of Japan's electricity generation in 2030. But increased competition through deregulation can raise the cost of nuclear power relative to other sources of electricity. **Since liberalization of the power-sector is meant to promote market-based competition under equitable conditions, the government should be aware that any preferential treatment for**

nuclear power plants to keep them competitive would defeat the purpose of the deregulation measure.
The government should also keep watch if liberalization of the power market causes any disadvantages to consumers. It needs to eliminate the possibility of major problems, such as power outages that could result from a lack of proper cooperation and coordination among power companies in the liberalized environment. In addition, electricity charges might rise unreasonably in areas where demand for power is low, such as small communities in mountainous areas. The government needs to take adequate steps when necessary to prevent the deregulation from having adverse effects on consumers.

Iran's Nuclear program: What's in it for Japan?

July 6, 2015

Influence of Iran's nuclear program on Japan

http://www3.nhk.or.jp/nhkworld/english/news/20150707_03.html
Jul. 6, 2015 - Updated 23:27 UTC+2
World powers are working on the issue of Iran's nuclear program. Japan has high hopes for a resolution, as **Iran could be a stable source of crude oil and a large potential market for Japanese companies.**

Iran was once one of the main exporters of crude oil to Japan, and has the world's 4th largest reserves.

But European countries and the United States tightened economic sanctions against Iran, prompting Tokyo to withdraw from a project to develop Iran's Azadegan oil field. The field has one of the largest deposits in the Middle East.

Japan has cut crude oil imports from Iran by over half in the past 5 years.

In response to the sanctions, Iran threatened to close the Strait of Hormuz at the mouth of the Persian Gulf, the world's most important route for crude oil shipments.
This prompted crude oil prices to rise and gasoline prices to jump in Japan.

Resolving the nuclear issue may also pave the way for Japanese firms to enter Iran's market, which has 78 million consumers and rich resources.

Nukes: Between 8 and 88% increase by 2030

July 10, 2015

IAEA Bullish On Long-Term Role For Nuclear, Report Shows

http://www.nucnet.org/all-the-news/2015/07/10/iaea-bullish-on-long-term-role-for-nuclear-report-shows

Plant Operation
10 Jul (NucNet): Global nuclear capacity could grow between eight percent and 88 percent by 2030 because of growth of population and demand for electricity in the developing world, recognition of the role nuclear power plays in reducing greenhouse gas emissions, the importance of security of energy supply, and the volatility of fossil fuel prices, the International Atomic Energy Agency said.
In its 'Nuclear Technology Review 2015', the Vienna-based agency said circumstances point to nuclear energy playing an important role in the energy mix "in the long run".

In 2014 near and long-term growth prospects remained centred in Asia, particularly in China, the IAEA said. Of the 70 reactors under construction, 46 were in Asia, as were 32 of the last 40 reactors that were connected to the grid since 2004.

There were 438 reactors operating at the end of 2014 and nuclear energy had a global generating capacity of 376.2 gigawatts, the IAEA said.

There was only one permanent shutdown in 2014. The single-unit Vermont Yankee in the US ended commercial operations on 29 December 2014 due to "financial considerations".

In 2014, five new reactors were connected to the grid: Atucha-2 in Argentina, Ningde-2, Fuqing-1 and Fangjiashan-1 in China, and Rostov-3 in Russia. Construction of the Atucha-2 reactor unit had originally started in 1981 but was delayed and reactivated only in 2009.

There were three construction starts – at Belarusian-2 in Belarus, Barakah-3 in the United Arab Emirates and Carem-25, a small integral type of pressurised light-water reactor design in Argentina.

Safety improvements continued to be made at nuclear stations, the IAEA said. These have included identifying and applying lessons learned from the Fukushima-Daiichi accident, improving the effectiveness of defence in depth, strengthening emergency preparedness and response capabilities, and protecting people and the environment from ionising radiation.

Although considerable exploration and development expenditure was reported, many new uranium mining projects have been or are expected to be delayed due to low uranium prices, the IAEA said.

The IAEA emphasised the need for "a comprehensive, integrated, cradle-to-grave approach" for radioactive waste management, and highlighted the fact that solutions are available for implementation.

The report is online: http://bit.ly/1CtNOhb

Reducing greenhouse gases by 2030

Juy 17, 2015

METI drafts plan to cut CO2 by 30% in 10 years

http://www3.nhk.or.jp/nhkworld/english/news/20150717_43.html

Jul. 17, 2015 - Updated 13:49 UTC+2
Industry ministry officials in Japan have devised a plan to develop new technologies for coal-fired power generation. They hope to cut carbon dioxide emissions by 30 percent in 10 years.

A panel with the Economy, Trade and Industry Ministry published the roadmap. It calls for building large energy-efficient plants by the early 2020s.

The coal gasification technology is expected to cut emissions by about 20 percent. The plan also calls for developing another more advanced coal-gasification technology by around 2025.

The ministry says it will support utilities in line with the roadmap.

Power industry announces CO2 emission target

http://www3.nhk.or.jp/nhkworld/english/news/20150717_30.html

Jul. 17, 2015 - Updated 10:07 UTC+2
Japan's power companies have come up with their own CO2 reduction target. The energy sector is Japan's largest emitter of greenhouse gases.

An industry group that includes the country's top power companies announced on Friday that it will cut emissions by 35 percent by 2030.

The target refers to the amount of gases emitted from generating one kilowatt-hour of electricity.

The group says the cuts from 2013 levels will bring them back to pre-Fukushima accident levels in 2010. Fifty nuclear power plants were online at that time. Japan has imported massive quantities of fossil fuels since the nuclear disaster in 2011.
To achieve the goal, utilities will have to generate more energy from renewable sources and restart some nuclear plants.

Japan aims to cut greenhouse gas emissions by 26% by 2030

http://mainichi.jp/english/english/newsselect/news/20150717p2g00m0dm061000c.html

TOKYO (Kyodo) -- The Japanese government officially decided Friday on a goal of reducing greenhouse gas emissions by 26 percent in 2030 from 2013 levels, as part of efforts to reach a new international agreement at the end of the year to tackle climate change.
Economy, Trade and Industry Minister Yoichi Miyazawa told a press conference that the government will swiftly submit the plan to the Secretariat of the U.N. Framework Convention on Climate Change.
Prime Minister Shinzo Abe said, "It is urgently needed to bolster efforts by the international community to combat climate change." He urged relevant Cabinet ministers to work together to realize Japan's national interests at U.N. climate talks.
The new reduction target, which is touted by Abe as "ambitious," only represents an 18 percent cut compared with the 1997 Kyoto Protocol's base year of 1990 and is viewed as insufficient among environmental activists.
Specifically, Tokyo will aim to achieve a 21.9 percent heat-trapping gas emissions reduction by promoting energy saving and reviewing its energy mix, or the proportion of electricity to be generated by various sources, and a 4.1 percent cut through forest absorption of carbon dioxide and reduced use of alternatives for chlorofluorocarbon, a major greenhouse gas.
The international community is seeking to create a new framework to replace the Kyoto Protocol, the current international framework for fighting global warming, at the 21st session of the Conference of the Parties to the UNFCCC, or COP21, to be held in Paris in November and December.
As the basis for the reduction target, Japan on Thursday decided on its energy mix for 2030, under which the government plans to make nuclear power, with its near-zero carbon emissions, account for 20 percent to 22 percent of total electricity output.
Nuclear power accounted for around 30 percent of total output in Japan before the March 2011 Fukushima crisis, which put domestic nuclear power generation at a standstill.

Japan sets 26 percent cut in greenhouse gas emissions as 2030 target

http://www.japantimes.co.jp/news/2015/07/17/national/japan-sets-26-percent-cut-in-greenhouse-gas-emissions-as-2030-target/#.VakRgfnwmie
Reuters

The government said Friday that Japan will slash greenhouse gas emissions by 26 percent by 2030 from 2013 levels and will submit the plan to the United Nations as its contribution to a global summit on climate change in Paris in November.
The target is based on the government's power generation plan for 2030 that the Ministry of Economy, Trade and Industry finalized Thursday. The plan calls for relying slightly less on nuclear power than on renewable energy following the 2011 Fukushima disaster.
Using 2013 as a baseline, Japan's 26 percent cut would be higher than an 18 to 21 percent cut by the United States by 2025 and a 24 percent cut by the European Union by 2030.
Japan — the world's fifth-largest emitter of greenhouse gases — saw its emissions rise to 1.41 billion metric tons of carbon dioxide equivalent, the second-highest on record, in the year through March 2014. That was up 10.8 percent from 1990, reflecting the rise in coal-fired power after the indefinite closure of nuclear power plants.

Green activists and some other countries that are calling for even bigger cuts say Japan will be blamed by the global community not only for a low target but also for plans to build more coal-fired power plants.
METI on Thursday said the government will plan to make nuclear energy account for 20 to 22 percent of Japan's electricity mix in 2030, versus 30 percent before Fukushima.
It set the target for renewable energy at 22 to 24 percent of the mix, liquefied natural gas at 27 percent and coal at 26 percent.
The Federation of Electric Power Companies, whose members include the 10 main power monopolies, and 25 other firms said Friday they have voluntarily set a goal to curb carbon dioxide emissions per 1 kilowatt of power by 35 percent from 2013 levels to around 0.37 kg in 2030.
By installing fossil fuel-fired plants using the best available technology, the power companies see a potential to reduce carbon dioxide emissions by as much as 11 million tons a year, they said.
The Paris summit in November aims to finalize an agreement as part of efforts to limit the global average temperature rise to 2 degrees above pre-industrial levels.

20 to 22% nukes by 2030

July 16, 2015

Japan adopts energy mix plan

http://www3.nhk.or.jp/nhkworld/english/news/20150716_46.html
Nuclear & Energy
Jul. 16, 2015 - Updated 14:48 UTC+2
An expert panel in Japan has approved a government plan that sets out how the country should meet its energy needs by the year 2030.

The panel endorsed the energy mix plan at a meeting on Thursday.

By fiscal 2030 Japan will take between 20 and 22 percent of its power from nuclear plants, down from more than 28 percent before the 2011 nuclear accident. Power from renewable sources will make up between 22 and 24 percent, up from just over 10 percent in fiscal 2013.

Some panel members opposed the plan. They said it contradicts a government policy to minimize dependence on nuclear power.
Experts are focusing on what kind of support the government will offer to the renewables industry and nuclear power operators.

2 years without any nukes - And now what?

July 30, 2015

EDITORIAL: Reflections on 2 years without nuclear power ahead of planned restarts

http://ajw.asahi.com/article/views/editorial/AJ201507300035

Japan has survived without atomic energy for almost two years since all of the country's nuclear power reactors were taken offline in the aftermath of the Fukushima nuclear accident triggered by the March 2011 earthquake and tsunami disaster.

The country rode out summers and winters, despite surges in electricity demand for air-conditioning and heating purposes, with no major blackouts.

The triple meltdown at the Fukushima No. 1 nuclear power plant, which threatened the very survival of the Japanese state, has yet to be brought under control.

Opinion polls show that more than half of the general public is opposed to restarting nuclear reactors. The public's desire to keep the reactors offline, even at the cost of inconvenience, is due to the fact that people have learned how dreadful atomic energy can be.

However, the Abe administration is seeking a return to nuclear power. It is preparing to restart Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture in August, and aims eventually to have atomic energy account for 20 percent or more of Japan's electricity mix in the future.

We oppose any return to nuclear power that comes without serious debate. Japan should make utmost efforts to avoid restarts, while at the same time taking care that doing so will not place an onerous burden on people's living standards. Our energy needs should be centered on renewable energy sources rather than nuclear power as the primary source of electricity.

POWER DEMAND ALREADY COVERED

The Asahi Shimbun published a series of editorials in 2011 calling for a society free of nuclear power.

We stated that all of Japan's nuclear reactors should be decommissioned, hopefully in 20 to 30 years, with priority given to aged reactors and high-risk reactors. The reactors to be kept alive should be selected on a "safety first" basis and limited to those necessary from the viewpoint of supply and demand.

We also stated that Japan should do its best to develop and spread the use of renewable energy sources while simultaneously pursuing measures for power saving and energy conservation. Thermal power generation could be strengthened as a stopgap measure, although steps should be sought in the long term so that a departure from nuclear energy does not contribute to global warming.

We also said Japan should push forward with power industry reform to encourage new entrants into the market while moving toward a decentralized energy society where wisdom and consumer choice play a greater role.

Our basic ideas remain the same. But the situation has changed over the last four years.

The most dramatic development is that the amount of electricity generated by nuclear reactors is now zero.

Nuclear reactors were up and running across Japan four years ago. They were subsequently taken offline one after another for regular inspections. Kansai Electric Power Co.'s Oi nuclear power plant in Fukui

Prefecture was reactivated temporarily, but no single nuclear reactor has been brought back online since September 2013.

Despite concerns that were raised, no serious power shortages occurred. Emergency power sources were raked up to stave off a crisis on some occasions, but there has always been sufficient supply to cover demand, partly because the practice of saving power has taken root in the public mind, and partly also because capacities were enhanced at thermal power plants and regional utilities cooperated in supplying power to each other.

But it is too early to say that we have a solid foundation for keeping the number of active nuclear reactors at zero.

The clustered siting of power plants, whereby electricity is sent from large-scale power stations to faraway areas with heavy power consumption areas, has remained unchanged after the nuclear disaster. Systemic vulnerability is still an issue. And there is always the danger of unforeseen circumstances unfolding if a key thermal power plant were to malfunction during peak power demand.

SYSTEMIC VULNERABILITY PERSISTS

The current situation, where thermal power accounts for 90 percent of Japan's electricity, could hardly be called sustainable. As long as Japan relies on imports for its energy sources, the country will remain permanently exposed to the risk of variations in foreign exchange rates and prices.

We are also left to reflect on the extent to which the general public and the Japanese economy could tolerate additional increases in electricity rates. We have to avoid letting rate hikes, without detailed studies, have a serious impact on people's living standards and general economic activity.

The risk of a serious impact on people's lives has yet to be reduced to zero. Given the situation, it is difficult to totally rule out the option of restarting nuclear reactors as a last resort.

However, decisions on restarting individual nuclear reactors must be made with extreme care.

What kind of disadvantage could be averted by activating a particular nuclear reactor? Will a nuclear restart still be necessary after power demand has been covered by a mutual supply of electricity over broad areas? Persuasive explanations should be available from viewpoints such as these.

The nuclear reactor in question must be safe enough from the viewpoint of its geographical location. Means must also be available to allow residents of adjacent areas to evacuate in an emergency. These are obvious preconditions for a nuclear restart.

The fact that we have got along without nuclear power has correspondingly heightened the hurdles for a restart.

Japan, under these circumstances, must develop renewable energy sources as quickly as possible and pursue a shift to a distributed system of electric power. Indispensable to that end are policy initiatives for guiding a switch to the new direction.

The central government should set a pathway for reform and focus its resources on upgrades on the power grid, disposal of nuclear waste and other efforts. There should also be organizational arrangement for pursuing the decommissioning of nuclear reactors, assistance to local governments that will lose revenue from the nuclear plants they host, and transitional measures for business operators associated with nuclear power generation.

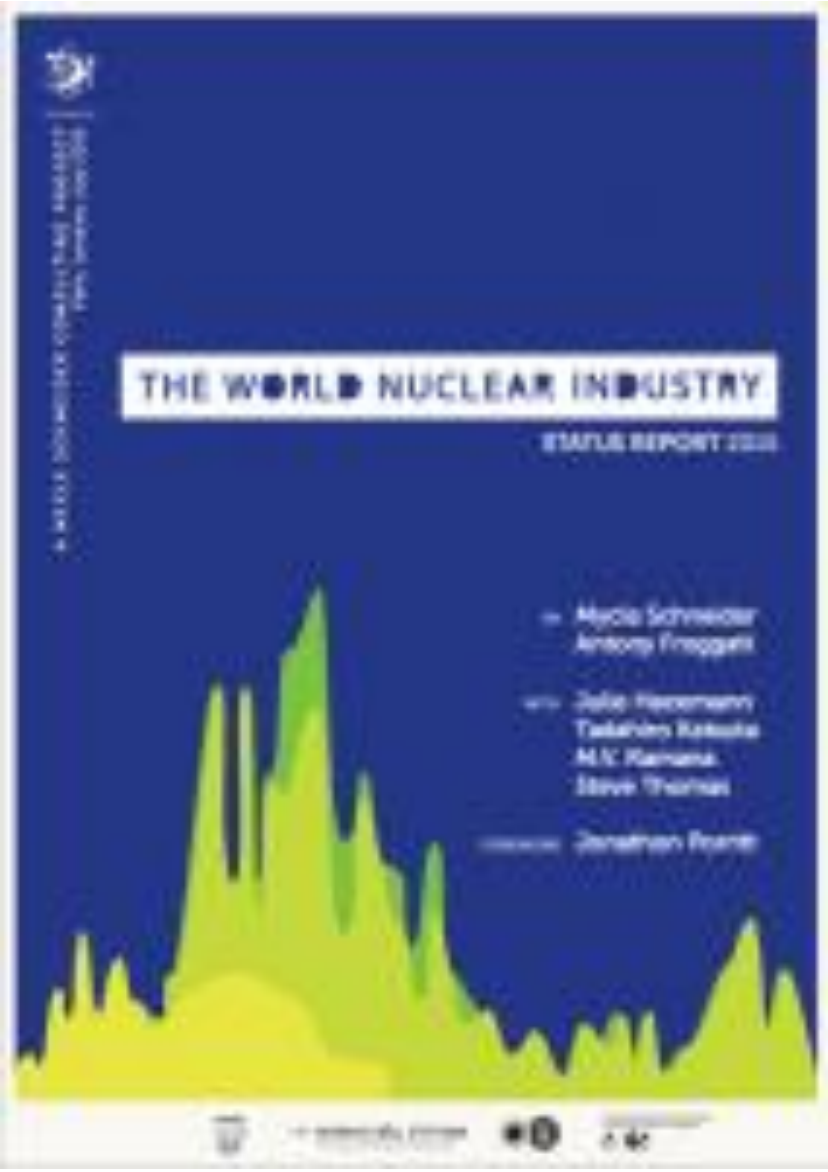
FUKUSHIMA DISASTER THE STARTING POINT

The Abe administration, however, is heading in the opposite direction.

It initially said it would reduce Japan's dependence on nuclear energy as much as possible, but then changed course to maintaining nuclear plants, and left it all up to the Nuclear Regulation Authority to make all decisions on the safety of nuclear reactors ahead of any go-aheads for restarts.

The NRA is tasked only with screening procedures to ensure the safe operation of nuclear power plants. It is not in any way responsible for the entire policy.
The administration told local governments hosting nuclear plants that the central government will be responsible, but what precisely this entails remains to be seen. A mountain of unanswered questions remain about the Sendai nuclear plant, such as measures to ensure the safety of local residents and measures against potential volcanic eruptions.
The Fukushima nuclear disaster should be the starting point for reflecting on the issue of nuclear power generation.
We should think about ways to make the most of the fact that no nuclear reactor is active now.
--The Asahi Shimbun, July 30

World Nuclear Report 2015



http://www.worldnuclearreport.org/-2015-.html

The World Nuclear Industry Status Report 2015

The challenge to select and assess the outstanding events of the year for the release of the July 2015 edition of the *World Nuclear Industry Status Report* turned out to be particularly tough: For the first time in 45 years, Japan was without nuclear electricity (and no lights went out) and, indeed, without any operating industrial nuclear facility or even research reactor; AREVA, the self-proclaimed "global leader in nuclear energy", went technically bankrupt; China, the global leader in new-build, launched a construction site after a 15-month break; in the U.K., concerning the French sponsored new-build project, there are "growing suspicions" that the Treasury "would not be disappointed if Hinkley [Point C] never happened"; the French draft Energy Bill passed the second reading at the French National Assembly stipulating the reduction of the nuclear share from three quarters to about half by 2025; and so on. While this report attempts to provide an overview of essential events of the past year its main aim is to identify and highlight the trends.

Released on July 15, the World Nuclear Industry Status Report 2015 *(WNISR 2015)* is the latest independent assessment of nuclear energy trends in a series first published in 1992. This year's report comes at a time when most energy and environmental experts shy away from the words "nuclear renaissance" but some view nuclear power as an indispensable substitute for fossil fuels in global efforts to combat climate change. Current trends, however, suggest that a rapid ramp-up of nuclear power is unlikely, and that renewable energy is surging past nuclear power in many countries. Here are a few of the report's key findings:

Nuclear electricity generation. By mid-2015, 30 countries were generating electricity from nuclear power. Nuclear plants generated 2,410 net terawatt-hours of electricity last year, a 2.2 percent increase over the previous year but close to 10 percent below the 2006 historic peak—by comparison, solar power surged by 38 percent and wind by 10 percent. A surprising eight countries (China, Hungary, India, Russia, Slovenia, South Africa, South Korea, and Taiwan) achieved their greatest nuclear production in 2014, but of these countries only China and Russia started up new reactors during the year. The gains in other countries were essentially a result of uprating or better management at existing power plants.

Although nuclear electricity generation increased last year, nuclear energy's share of global commercial electricity generation has changed little over the past three years. In 2014, nuclear power was 10.8 percent of the global mix. As in previous years, the "big five" countries—the United States, France, Russia, South Korea, and China—generated more than two-thirds of all nuclear electricity in the world. The United States and France accounted for half of all global nuclear production, and France alone generated half of the European Union's nuclear power.

Construction starts and delays. *WNISR 2015* goes further and deeper than previous reports in analyzing the pace of nuclear power plant construction: the length of the process, the reasons for delays, the number of projects that have been cancelled or suspended, and how construction trends vary from country to country. These are limiting factors in any plan for a global scale-up of nuclear power.

The average construction time of the 40 units that started up in nine countries since 2005—all but one (in Argentina) in Asia or Eastern Europe—was 9.4 years, with a large range from 4 to 36 years. Construction starts plunged from 15 in 2010 to three in 2014. There are currently 62 reactors under construction, five fewer than a year ago, and at least three-quarters of these projects are facing delays. In 10 of 14 countries that are building new reactors, *all* projects are delayed, many by years. Five reactors that are "under construction" are projects that began more than 30 years ago.

For the first time, this year's report devotes a full chapter to Generation III+ reactors such as the Westinghouse AP1000, Rosatom AES-2006, and Areva EPR—advanced reactors designed to improve the safety and economics of nuclear power. These reactors are not proving easy to build: By May 2015, 18 next-generation reactors were under construction, but only two projects were still on schedule; the rest were running behind by two to nine years. This includes the AP1000s being built at the Summer and

Vogtle nuclear plants in the United States, which after only two years of construction are late by at least two years.

Generation III+ reactors were originally seen as a transition to even more advanced Generation IV reactors, but if Generation III+ reactors fail, the future for the nuclear industry looks bleak. Small Modular Reactors (SMRs) or radically new reactor designs, known as Generation IV and optimistically touted by some nuclear lobbyists as the key to de-carbonizing the global economy, are still decades away from commercial deployment. Meantime, existing nuclear plants around the world are edging toward retirement, with an average age that has been increasing steadily and now stands at 28.8 years.

Nuclear heavyweights. In both France and Japan, two of the three countries with the largest installed nuclear capacity (the United States is number one), the nuclear industry is in deep trouble. Although Japan still has 40 reactors that are counted as installed capacity, none of them operated in 2014. It was the first time in 50 years that Japan was without nuclear electricity for an entire calendar year. And no lights went out. As of today, it appears likely that two reactors, at most, will restart in Japan this year.

In France, long the world's role model for how to successfully develop nuclear energy, the National Assembly passed an energy bill that defines a target to reduce nuclear's share of the electricity mix from three-quarters to half by 2025. The French state-controlled energy group Areva—the self-proclaimed global leader in nuclear energy—went technically bankrupt after reporting massive losses for four years in a row. Credit-rating agencies have downgraded Areva's long-term debt to "junk," and the company's share price plunged to a record low earlier this month, a level 90 percent below its record high in 2007. Areva is the designated builder for the Hinkley Point C project, which was to be the United Kingdom's first new reactor in decades, and had planned to contribute 10 percent of the investment. That project is now in shambles. In addition to Areva's financial woes, the pressure vessels for the Flamanville (France) and Taishan (China) EPRs—the same European Pressurized Water Reactor design planned for Hinkley Point C—have "very serious" material defects, the French Nuclear Safety Authority told a parliamentary hearing in April 2015.

The rise of renewables. In the United Kingdom, electricity output from renewables (including hydropower) has overtaken the output from nuclear. Meanwhile, China, Germany, Japan, Brazil, India, Mexico, the Netherlands, and Spain generated more power from non-hydro renewables than from nuclear in 2014. Compared with 1997, when the Kyoto Protocol on climate change was signed, in 2014 there was an additional 694 terawatt-hours of wind power and 185 terawatt-hours of solar photovoltaics—each outpacing nuclear's additional 165 terawatt-hours.

What is spectacular is the extent to which the nuclear industry and many decision-makers are appearing to ignore the financial and technical realities of 2015, and the generalized move toward decentralized electricity generation and storage. The industry's track record of delays and cost overruns, coupled with the urgency of replacing fossil fuels with efficiency improvements and low-carbon sources of energy, do not bode well for the long-term future of the industry.

Victory for nuclear lobby

August 11, 2015

In major victory for nuclear industry, first reactor goes online under post-Fukushima regime
by Eric Johnston

Staff Writer

SATSUMASENDAI, Kagoshima Pref. – Four years and five months to the day after the crisis began at the Fukushima No. 1 power station, Japan formally returned to nuclear power Tuesday with the restart of Kyushu Electric Power Co.'s Sendai No. 1 reactor in Kagoshima Prefecture.

Despite nationwide public opposition, questions about plant safety, the practicality of disaster response plans and who will be responsible for them, the strongly pro-nuclear Prime Minister Shinzo Abe and the Ministry of Economy, Trade and Industry, as well as the politically powerful utilities, local Liberal Democratic Party politicians, and major corporations involved in the nuclear industry have pushed hard to bring as many reactors back online as possible.

The nuclear lobby strongly argues that atomic power is cheaper than importing oil or coal and will help curb greenhouse gas emissions.

With the restart of the Sendai No. 1 reactor, the first under the new safety inspection regime that went into effect two years ago, attention has now turned to whether there will be a rush to restart other reactors.

In addition to reactor No. 2 at the Sendai plant, which is expected to be brought back online in early or mid-October, another 23 reactors at 14 plants are under consideration to restart.

Three of these, including the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama facility in Fukui Prefecture and reactor 3 at Chugoku Electric Power Co.'s Ikata plant in Ehime Prefecture, have been given the green light for restart by the Nuclear Regulatory Authority (NRA).

However, the two Takahama reactors have a provisional injunction against their restart slapped on them by the Fukui District Court in April, thereby making their fate uncertain.

On Tuesday morning, workers at the two-reactor Sendai plant in the city of Satsumasendai pulled out the control rods that have been suppressing nuclear fission in reactor 1 for the first time since May 2011, when it was taken offline for mandatory regular checks.

The reactor was expected to reach criticality within half a day, and the utility plans to start generating and delivering electricity in three days.

The reactor will have a test run for about a month, and if no problems are encountered, Kyushu Electric Power will begin selling the nuclear-generated electricity in mid-September.

At about the same time, final preparations will begin for a restart at the plant's No. 2 reactor, which is expected to occur in early or mid-October, with electricity from that reactor being sold by mid-November.

"The Abe administration, under its basic energy plan, has already decided it will activate reactors that have cleared new nuclear safety standards by the NRA, which are the toughest in the world. It's under this policy that the Sendai reactor was restarted," Chief Cabinet Secretary Yoshihide Suga said Tuesday morning.

Local communities like Satsumasendai, and the pro-nuclear local chapters of the Liberal Democratic Party, also rely heavily on central government subsidies and utility donations that come with hosting a plant.

The restart of the Sendai reactor thus marks a major victory for nuclear proponents at not only the national level but in other localities looking to restart another two dozen reactors.

At a news conference in the afternoon, Satsumasendai Mayor Hideo Iwakiri welcomed the restart, saying he believes the plant's reactors are safe and that he hopes they will provide a much-needed financial and economic boost.

"Between 5 and 6 percent of the town budget comes from central government funding for hosting a nuclear power plant or from Kyushu Electric," Iwakiri said.
Tuesday's restart came despite local concerns about what will happen if an accident occurs and, most importantly, who bears responsibility for the orderly and timely evacuation within 30 km of the plant.
"The premise of evacuation plans drawn up by Kagoshima assumes that the main access road in the area will not be damaged and will be available to get people out of the contaminated area before they are exposed to radiation. If that's the case, what happens?" asks Shoji Takagi, a manga artist and anti-nuclear activist.
The question of where final responsibility lies for the overall safety of the plant's operation, including proper safety measures, has emerged as the key issue in the debate over not only Sendai but all possible restarts.
Local officials say they grant permission for restarts based on the "central government's" seal of approval but admit they also need direction from Tokyo to draw up more detailed and effective accident contingency plans.
The NRA, however, says it is only responsible for the technical aspects of the safety of each plant.
Yukio Edano, secretary-general of the Democratic Party of Japan, the nation's largest opposition force, said that while the local governments have been tasked with drawing up and carrying out emergency evacuation programs, the roles of the central government have not been spelled out.
"(The Fukushima crisis) has made it clear that it is impossible for local governments alone to (evacuate residents). The central government should play responsible roles to evacuate them," Edano said.
"But the state is trying to evade that responsibility," he added.
In an attempt to quell lingering concerns, industry minister Yoichi Miyazawa said Tuesday that in the event of an accident, the central government will take the lead in responding to any emergency.
However, with nearly two dozen reactors elsewhere up for restart, both the central government and local authorities who want the money that comes with restarts are likely to find that demands to address these concerns in more detail are not going away.
Staff writer Reiji Yoshida contributed to this story.

Kepco anticipates improved supply

August 11, 2015

Utility says restart will improve supply

http://www3.nhk.or.jp/nhkworld/english/news/20150811_25.html

Aug. 11, 2015 - Updated 07:01 UTC+2
The operator of the Sendai nuclear power plant expects the restart of its reactor to greatly improve energy supply.

Nearly 40 percent of Kyushu Electric Power Company's output came from nuclear power before the 2011 accident in Fukushima. The ratio is higher than those of other utilities.

Company officials say they are meeting this summer's power demand by operating thermal plants at full capacity and procuring power from other firms. But they say the thermal plants are old and often stop running.

The officials say that with the full operation of the Sendai plant's No.1 reactor, the company can secure power reserves of 5 percent or more. The reactor has a generation capacity of 890-thousand kilowatts.

Sendai restart leaves too many questions unanswered

August 12, 2015

EDITORIAL: Sendai No. 1 reactor must not become a model case for future restarts

http://ajw.asahi.com/article/views/editorial/AJ201508120023

The No. 1 reactor at the Sendai nuclear power plant in Kagoshima Prefecture, operated by Kyushu Electric Power Co., was brought back online Aug. 11. It is the first facility to be reactivated in Japan after nearly two years of suspended operation of all reactors.

The Sendai reactor is also the first to clear new safety standards set by the Nuclear Regulation Authority after the 2011 disaster at the Fukushima No. 1 power plant. Now that the Sendai reactor is back in operation, the government intends to reactivate all nuclear reactors that meet the NRA's safety requirements.

But the process by which the reactivation of the Sendai reactor was given the green light leaves numerous questions unanswered. For instance, serious doubts still remain about the NRA's risk assessment with regard to major volcanic eruptions. Deficiencies have been pointed out in the evacuation plans drawn up for a possible severe accident, and more than half of the residents of Kagoshima Prefecture are opposed to the reactor's reactivation. It is unclear which parties are ultimately responsible for the decision to put it back in operation.

We cannot accept this decision that not only leaves all these unresolved questions and doubts, but also goes against the will of the people. And we are adamantly opposed to the government's use of the Sendai No. 1 reactor as a model case of decision-making in favor of reactivation and piecemeal revival of the nation's reliance on nuclear power generation.

BASELOAD AN OUTDATED CONCEPT

Prior to reactivating the Sendai reactor, the government established the nation's power source composition target for 2030 and set the proportion of nuclear power generation at 20 to 22 percent of the total. This level cannot be attained without building new nuclear reactors or extending the serviceable years of a good number of already old reactors.

Makoto Yagi, president of Kansai Electric Power Co. and chairman of the Federation of Electric Power Companies of Japan, told a news conference in late July: "I understand that those numbers (set by the

government) require the operation of many of the current 46 reactors (including three under construction)."

Quite clearly, the government and utility companies alike are set on returning to nuclear power generation.

Nuclear power generation is positioned as a "baseload power source," which is described as "a low-cost source of stable supply of electricity, which renders 24/7 operation viable."

But in advanced nations, the baseload concept itself is being phased out. The current trend is to maximize reliance on wind, solar and other sources of renewable energy, and position nuclear and thermal power generation as "regulating valves" for when power from renewable sources is insufficient.

Such a switch is made possible by power industry reforms.

In Europe, power transmission business is separated and kept independent from power generation business, but both are managed and operated in an integrated manner. As for satisfying demand for power generated by renewable energy sources that are prone to be affected by weather conditions, operations cover extensive areas and are kept flexible according to accurate weather forecasts.

In the days ahead, the key to success in the power industry is said to lie in technology for flexible supply control in keeping with fluctuations in demand.

Though belatedly, Japan has embarked on power industry reforms, and the last package of related laws have been enacted in the current session of the Diet. The reforms will proceed in three stages until 2020. It is hoped that Japan will be transformed into an energy society where various power source and service options, including power from renewable energy, will be available to consumers with utilities competing under fair conditions.

NUCLEAR POWER GENERATION NOT COST-EFFECTIVE

In such an energy society, there will no longer be regional monopolies that have supported nuclear power generation, nor the present billing system that enables utilities to slap their operating costs directly on consumers.

Nuclear power generation was said to be "inexpensive." But in recent years, the costs of operation and construction of facilities have been rising steadily worldwide.

Areva, a French multinational group and one of the largest nuclear plant makers in the world, had to be bailed out by the government when the bloating construction costs of new facilities drove it into dire financial trouble. And Japan's Toshiba Corp., which has been embroiled in an accounting scandal, is now paying dearly for having reinforced its nuclear department.

Japanese utilities are projecting 2.4 trillion yen ($19.18 billion) for the implementation of additional safety measures. In the days ahead, they will be forced to make further investments every time new measures become necessary.

When expenditures are added up--such as for subsidizing communities chosen for the disposal of nuclear waste and construction of a new facility, and for damages that will have to be paid in the event of an accident--it becomes clear that nuclear power generation is hardly cost-effective, and that this business is not viable in the new power generation and supply system. And more than anything, a majority of the Japanese people now want a "society that does not have to rely on nuclear power generation."

BRACING FOR 'SACRIFICES'

What the government needs to be doing now is definitely not to reactivate offline reactors one by one and bring nuclear power generation back as the mainstay of the power industry. The government's task should be to decommission older reactors and those with safety concerns although it may have to temporarily turn to nuclear power generation, while nurturing the renewable energy industry at the same time.

In terms of natural environment, Kyushu is one of the ideal regions.
In the meantime, the feed-in tariff system has been established for fixed-price purchase of power generated by renewable energy sources, and "local utilities" that play up regional features are debuting nationwide. While the current trend poses some problems, such as the tendency to rely too heavily on solar power and the need to review the purchase prices, momentum is definitely building up for greater reliance on self-supply energy sources that can also help curb global warming.
New projects require financial support for the time being, but once the infrastructure for ready access to the grid is firmly in place, there is every likelihood that renewable energy will become a cheaper and more stable source of electricity.
Of course, it takes time for society to diversify its energy sources and switch to relying mainly on renewable energy. Various problems are also bound to arise along the way. The public will have to be prepared to make some sacrifices, such as paying bigger electricity bills at times.
Still, the Fukushima disaster has taught us to fear nuclear power generation. And that is where we start in seeking a new energy society.
--The Asahi Shimbun, Aug. 12

Nuclear power poses fundamental problems

August 12, 2015

Editorial: Japan should not depend on nuclear power

Kyushu Electric Power Co. restarted the No. 1 reactor at its Sendai Nuclear Power Plant in Satsumasendai, Kagoshima Prefecture, on Aug. 11. The move comes four years and five months after the outbreak of the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant that severely affected local residents' livelihoods.
It was the first reactivation of a nuclear reactor under the new regulatory standards enforced following the nuclear accident triggered by the March 11, 2011 Great East Japan Earthquake and tsunami. The central government and power companies apparently intend to use the resumption of operations at the Sendai plant as a springboard to restart idled nuclear reactors one after another across the country.
However, the government's basic stance toward nuclear power has remained unchanged since the outbreak of the disaster, and lessons learned from the catastrophic accident have not been sufficiently put to good use. The restart of the Sendai plant's reactor must not be a step toward reviving the pre-disaster myth of nuclear plants' infallible safety.
Lessons learned from the disaster include: Nuclear accidents can happen even if countermeasures are taken and that damage caused by nuclear accidents to people, the environment and society differ markedly from that triggered by other accidents in terms of quality and scale. Moreover, Japan is a volcanic country prone to earthquakes. Such being the case, it is highly risky to continue operating atomic power stations in this country. Nuclear energy is far from being a sustainable energy source when

considering how to dispose of radioactive waste. Therefore, the Mainichi Shimbun has insisted that Japan should stop using nuclear plants as early as possible.
At the same time, the Mainichi Shimbun has said there could be occasions where Japan must approve of the minimum necessary operation of atomic power plants under certain conditions, taking into account economic and social risks that would be caused by an immediate halt to all nuclear plants.
However, the latest reactivation of the Sendai plant's No. 1 reactor does not meet such conditions and should not have been approved.
In the first place, the government has not clearly characterized the restart as part of the process of phasing out nuclear power. The basic energy plan approved by the Cabinet of Prime Minister Shinzo Abe last year states that Japan's reliance on atomic power will be reduced to the minimum possible level. As such, it is the national government's duty to draw up a road map toward steadily phasing out nuclear power in line with this policy.
However, the Economy, Trade and Industry Ministry has set the ratio of nuclear power to total electric power to be generated in Japan in 2030 at 20-to-22 percent. To achieve this, it would be necessary to rebuild or extend the use of aging nuclear reactors beyond the 40-year limit, and construct new reactors. This indicates the government intends to return to a society dependent on atomic power.
The essential condition of minimizing damage that would be caused by a nuclear accident to local residents has not been met. It is true that the new regulatory standards require nuclear plant operators to implement stricter safety measures, assuming serious accidents that had not been assumed under the previous standards. The Nuclear Regulation Authority (NRA) that examines whether nuclear reactors meet the regulatory standards has become more independent of the government. However, these measures to beef up safety measures are necessary conditions but are not sufficient.
In the Fukushima nuclear crisis, confusion in the chain of command worsened the situation. Information on the spread of radioactive substances was not provided to local residents, causing some of them to flee to areas where radiation levels were higher. The evacuation of hospitalized patients and residents of nursing care facilities was greatly confused and many people died while evacuating or at evacuation shelters. Following the accident, the zone where local bodies are required to work out evacuation plans for local residents was expanded from 8-10 kilometers from nuclear plants to 30 kilometers.
Evacuation plans have been worked out for residents near the Sendai plant, but evacuation drills have not been conducted to secure the effectiveness of the plan. The national government has tolerated the local body's failure. The attitude to hastily restart the Sendai nuclear reactor without taking sufficient safety measures for local residents is apparently based on the myth of nuclear plants' infallible safety. To ensure the safety of local residents, the local government should conduct evacuation drills, clarify problems involving the evacuation plan and even suspend operations at the plant depending on the results of the drills.
A lack of clarity for responsibility over reactivating nuclear plants has not changed since before the March 2011 outbreak of the nuclear plant crisis. Since nuclear plants are operated by private companies as business activities, power companies are primarily responsible for restarting atomic power stations and ensuring safety at the plants. However, nuclear plants are operated as part of the government's policy. The government intends to approve reactivation of nuclear reactors as long as the reactors meet the regulatory standards, while the NRA is of the view that meeting the standards does not necessarily mean the plants are absolutely safe. This has raised concerns that nobody would be held responsible if another nuclear accident were to take place, just as was the case with the Fukushima crisis.
There are more fundamental problems. The government has failed to show its determination to promote a nuclear and energy policy while gaining public understanding.

In most opinion polls conducted by various news organizations, those who are opposed to restarting nuclear plants have outnumbered those in favor since the March 2011 accident. In an Aug. 8-9 survey conducted by the Mainichi Shimbun, 57 percent of the respondents expressed opposition to resuming operations at the No. 1 reactor at the Sendai power station.
Still, no means have been secured to reflect public opinion in the country's energy policy even following the nuclear accident that has had such a huge impact on local residents. The process of using an advisory panel to the Economy, Trade and Industry Ministry to determine the direction of the nation's energy policy has remained unchanged since before the crisis. The previous government led by the Democratic Party of Japan, which is now the largest opposition party, at least attempted to conduct a deliberative poll and took other measures to reflect public opinion in the energy policy. However, the current administration has not even shown such a stance.
The fact that radioactive waste will only accumulate as long as atomic power plants are operated poses a serious challenge. It is necessary to consider final disposal of radioactive waste on the assumption that it will take 100,000 years before such waste becomes harmless, but Japan has no prospects for working out any feasible disposal plan. Even if a nuclear accident were not to occur again, atomic power stations can not be maintained over a long period as long as no solution is found to problems involving the final disposal of radioactive waste.
First and foremost, the government should draw up a specific road map toward scrapping nuclear power. It is also necessary to create a system under which the NRA would evaluate local governments' evacuation plans and drills in advance. The restart of the Sendai Nuclear Power Plant should not be used as a springboard to revive Japan's dependence on atomic power.

Post 3/11 (energy) reality

August 15, 2015

Post-3/11 power-conservation goals change the energy game

by Philip Brasor
Special To The Japan Times
The heat wave rolling over Tokyo is a godsend for Olympics bashers like former newscaster Hiroshi Kume. On his TBS radio show last week, he said that five years from now when the games are held here, they will “violate the Olympic charter,” which requires an environment where all athletes can demonstrate their abilities to the fullest.
The last time Tokyo was the host, the games were held in October, when it’s cooler, but American broadcasters, who call the shots, would never approve such a move nowadays because then the Olympics would overlap with the World Series as well as the American football and basketball seasons. Actually, Tokyo’s heat is no worse than Beijing’s or Athens’, but many athletes fainted at the Beijing Opening Ceremony and a substantial portion of the field for the women’s marathon in Athens dropped out during the race.

Olympics Minister Toshiaki Endo is reportedly working on countermeasures, such as pavement that reflects infrared rays, mist curtains for long-distance running sports and scheduling that slots outdoor events in the early morning or after dusk.

All this concern focuses on the well-being of foreign athletes. Locals don't need these countermeasures, apparently, because suffering is an integral part of Japanese sports. The National High School Baseball Championship is always held during the hottest weeks of the year. Nobody has ever suggested it be played in a different month or at night in order to safeguard the health of adolescent boys, because showing what they can do under hellish conditions is part of the contest's appeal.

The tournament is sponsored by the Asahi Shimbun, and last year the Global Energy Policy Research website, a propaganda organ for nuclear power interests, blasted Asahi for being hypocritical since the nominally left-wing newspaper supports the antinuclear cause and yet won't change the dates. The writer of the piece claimed that electricity usage goes up significantly during the competition because people are watching at home, and TVs and air conditioners consume electricity in large amounts — this during the riskiest time of the year for power companies since, at the time, all nuclear reactors were offline.

He dug deeper, comparing the Osaka headquarters of the Asahi with the offices of Kansai Electric Power Co., which happen to be across the street from each other. While Asahi's employees plot the ruination of Japan in climate-controlled comfort, Kepco workers sweat because the company won't use air conditioning so as to set an example for responsible energy use. The writer admires Kepco's forebearance, but these efforts can also be seen as a form of corporate passive-aggression — martyrdom in the name of nuclear revival.

Such a view is supported by the fact that for the past several summers there has been no danger of overtaxing the power grid. After the Great East Japan Earthquake took out the Fukushima No. 1 nuclear plant and led to the shutdown of all reactors until safety measures were improved, power companies feared they might not have the capacity to supply enough electricity during the peak summer months and called on everyone to cut back for the good of the country.

They were all too successful. Normally, utilities are worried when usage tops 95 percent of capacity, but according to Asahi, during the current hot spell the sole utility that exceeded the limit was Chubu Electric Power in central Japan, and that was only momentarily on Aug. 1. Tokyo Electric Power Co. recorded only a few days over 90 percent, and that's because consumers have reduced electricity usage by 10 percent since before the 2011 disaster, so all the thermal plants that replaced the idle nuclear reactors have no problem producing enough power. In fact, the only reason Chubu Electric demand breached 95 percent is that the utility underestimated usage for that day.

Of course, if they're burning fossil fuels that's a problem for the environment and one that needs to be addressed regardless of how many reactors go back online, but another reason capacity is abundant is the spread of solar panels, a matter the regional power companies, not to mention the mainstream media, neglects to mention. **The amount of electricity generated by solar systems in Japan has increased tenfold since 2010.** Solar energy remains relatively inefficient, but since it's renewable, it's not as if producers and users are wasting finite resources. **As it stands, the amount of power being produced by solar is equivalent to the output of a dozen nuclear reactors.**

Naysayers point out that solar is not stable enough for power generation because it only works when the sun is out, but it is exactly while the sun is shining in the summertime — when temperatures soar and people reach for the remote control — that supplemental solar power makes sense. The advantage of solar energy is that it can take care of the extra demand as that demand increases.

With the reboot of Kyushu Electric Power Co.'s Sendai nuclear reactor last week, the solar solution takes on less urgency, but as the Tokyo Shimbun points out, the area serviced by the reactor has nine times the

solar capacity it had when the reactor was turned off. Asahi quotes the chief of the 21st Century Political Policy Research Center as saying that nuclear power is needed to bring down electricity costs, but Kyushu Electric hasn't said it will lower prices, only that it won't raise them again. Its first responsibility is to stockholders, and last year all the regional utilities recorded hefty profits thanks to the drop in oil prices. One reason for the high price of electricity is the lack of competition in the energy-supply field. The nuclear industry emphasizes the cost of other forms of energy in order to get reactors back online before next spring's market liberalization, when consumers will be able to choose their suppliers and the Asahi Shimbun can blast its air conditioners without anyone complaining.

IAEA and Kazakhstan agreement

August 28, 2015

IAEA, Kazakhstan agree on uranium bank

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 28, 2015 - Updated 01:00 UTC+2
The International Atomic Energy Agency and Kazakhstan have signed an agreement to set up what they call a Low Enriched Uranium Bank in the country.

IAEA Director General Yukiya Amano and Kazakhstan's Foreign Minister Erlan Idrissov signed the deal on Thursday in the Central Asian country's capital, Astana.

The facility to be built in Oskemen, eastern Kazakhstan, is aimed at promoting nuclear non-proliferation. It will help to ensure the stable supply of low enriched uranium to countries. It will also work to curb enrichment of uranium that could lead to nuclear weapons production.

The Low Enriched Uranium Bank will store 90 tons of the element. That amount can power a large city for 3 years. It will open in 2 years under IAEA safeguard.

Idrissov said his country will contribute to the development of nuclear energy as well as global security at the same time.

Kazakhstan is the world's largest producer of uranium. More than 450 nuclear tests were conducted during 40 years in the Soviet era at the Semipalatinsk test site, in the northeast region of the country. That left about one-million people exposed to radioactivity. Kazakhstan is well known for its activity in promoting nuclear non-proliferation.

A matter of opinion

September 3, 2015

IEA chief calls Japan's 22% nuclear energy policy 'realistic'

http://www.japantimes.co.jp/news/2015/09/03/national/iea-chief-calls-japans-22-nuclear-energy-policy-realistic/#.VegPrZfwmif

by Sohei Ide
Kyodo

Fatih Birol, newly installed executive director of the Paris-based International Energy Agency, has said the nation's energy policy following the Fukushima meltdowns provides a "realistic and balanced outlook," underscoring the importance of continued use of nuclear power in the country.

In its future energy mix, decided in July, the government plans to have nuclear energy account for 20 percent to 22 percent of the country's total electricity supply in 2030. This compares with 28.6 percent in the fiscal year that ended in March 2011, the year of the disaster.

"I believe Japan without nuclear energy will face major challenges," such as higher energy prices, greater energy security problems and greenhouse gas emissions, Birol, who took office Tuesday, told Kyodo News by phone last week.

"This plan provides a good prospect for nuclear power, and I believe nuclear power has an important role to play in Japan for the prosperity, cleanness and also the security of the country," he said.

Turning to the lifting of sanctions related to Iran's nuclear program and its possible impact on the global energy market, Birol foresees a boost in oil production in Iran. He said output from existing oil fields may increase by half a million barrels to 3.4 million barrels per day "within a year's time" once sanctions are lifted.

There is a "substantial potential for new production, new investment and new capacity building," said Birol.

"How much Iran can make out of this will be in line with what kind of investment framework the Iranian government will offer to attract new investment and technology."

Regarding the Group of Seven energy ministers' meeting scheduled next May in Japan, Birol noted that it will take place "at a very crucial time" as it follows an international gathering this year aimed at reaching a new global agreement to tackle climate change.

"It will be the very first occasion that G-7 energy ministers will meet together to look at the result" of the 21st session of the Conference of the Parties to the UNFCCC, or COP21, to be held in Paris in November and December.

Founded in 1974, the IEA has 29 member countries and makes policy proposals on energy issues, among other things. Birol was chief economist and director of global energy economics at the Paris-based organization before becoming executive director.

IAEA keen to share lessons of Fukushima

September 14, 2015

IAEA discussing nuclear issues in Iran and Japan

http://www3.nhk.or.jp/nhkworld/english/news/20150915_03.html
Sep. 14, 2015 - Updated 18:20 UTC+2
Members of the International Atomic Energy Agency have begun discussing an international nuclear deal with Iran, among other issues.

The nuclear watchdog agency opened its 5-day annual General Conference in Vienna on Monday.

In his opening speech, Director General Yukiya Amano said the nuclear deal made between Iran and 6 world powers in July contributes to the IAEA's verification procedures.

US Energy Secretary Ernest Moniz praised the agreement for making clear that Iran would not possess nuclear weapons under any circumstances.

The head of Iran's atomic energy agency Ali Akbar Salehi called for an impartial and objective conclusion of the ongoing process by the IAEA and the 6 powers. He said unjust sanctions should be removed.

The IAEA has submitted to the conference its final report on the 2011 nuclear accident at the Fukushima Daiichi nuclear power plant. The agency hopes to share lessons from Fukushima and improve the safety of nuclear plants.

Chairman of Japan's Atomic Energy Commission Yoshiaki Oka briefed the conference about the restart of a nuclear power plant in August under new regulations introduced after the Fukushima accident. All nuclear plants in Japan had been off line for nearly 2 years.

TEPCO's agreement with French CEA

September 23, 2015

TEPCO to sign cooperation pact with France's CEA

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Sep. 23, 2015 - Updated 01:41 UTC+2
NHK has learned that the operator of the crippled nuclear plant in Fukushima plans to sign an agreement with a French organization to obtain the necessary technology to decommission the facilities.

Tokyo Electric Power Company, or TEPCO, will initially focus on decontaminating the areas around the reactor containment vessels.

The removal of molten nuclear fuel will be the toughest challenge in the decontamination process because of the extremely high radiation levels.

TEPCO plans to obtain technical knowhow from the Alternative Energies and Atomic Energy Commission, or CEA, which is funded by the French government. The French organization has expertise in dismantling aged nuclear reactors and fuel-reprocessing facilities.
Sources say that under the agreement, the CEA will help TEPCO to develop remote-controlled robots that can withstand high radiation levels.

The CEA will also help with training workers and TEPCO will provide data for the decommissioning process.

This will be TEPCO's second agreement with a foreign organization. Last year, it signed a pact with a British company to address the buildup of contaminated water.

Mitsubishi to nuy into Areva?

September 24, 2015

Mitsubishi Heavy in talks on investment in Areva reactor unit

http://www.japantimes.co.jp/news/2015/09/24/business/corporate-business/mitsubishi-heavy-talks-investment-areva-reactor-unit/#.VgQIyZfkNME
JIJI, Kyodo
Mitsubishi Heavy Industries Ltd. said Thursday it is in talks about taking an equity stake in Areva NP, a reactor unit of French nuclear giant Areva SA.
The heavy machinery maker is discussing the deal with Areva SA and Electricite de France, a French power utility known as EDF, which is deciding whether to support financially struggling Areva NP.
Mitsubishi Heavy said in a statement it is in talks over the possibility of investing in the Areva subsidiary. "No decision has been made so far," it said.
Areva SA has been reeling from a slump in the nuclear power industry since the Fukushima disaster began in 2011. For the business year ended in December 2014, the company logged a net loss of around €4.8 billion (¥645 billion).
EDF has agreed to buy between 51 percent and 75 percent of Areva NP.
Mitsubishi Heavy and Areva SA are in an alliance to develop and sell a new pressurized water reactor called Atmea. Areva SA apparently sought investment from Mitsubishi Heavy as a measure to help rebuild its slumping business.
EDF has already agreed on a framework to give support to Areva SA by acquiring an equity stake of up to 75 percent in Areva NP. The remainder will be held by Areva SA.

As the stake to be taken by EDF is supposed to be at least 51 percent, the utility is expected to seek additional investment from other companies, including Mitsubishi Heavy and a Chinese firm, to lower its holdings.

French PM will discuss nuclear energy policy

September 24, 2015

French prime minister to visit Japan early October, seek cooperation on climate conference

http://www.japantimes.co.jp/news/2015/09/24/national/politics-diplomacy/french-prime-minister-visit-early-october-seek-cooperation-climate-confab/#.VgRJpZfkNME

Kyodo
PARIS – French Prime Minister Manuel Valls will visit Japan early next month to seek Tokyo's cooperation toward a Paris conference on climate change later in the year, the French Foreign Ministry said Wednesday.
During his four-day trip from Oct. 2, Valls hopes to hold talks with Prime Minister Shinzo Abe to discuss the prospects for the 21st session of the Conference of the Parties to the U.N. Framework Convention on Climate Change, or COP21, to be held from late November.
Valls also plans to hold talks on bilateral security and defense cooperation as well as **nuclear energy policy**, according to the ministry.
It will be Valls' first visit to Japan since he assumed office in March last year.

Ever optimistic IAEA

18.09.2015_No37 / World Nuclear Review

Post-Fukushima Action Plan Has Delivered Concrete Results, Says IAEA

http://www.nucnet.org/all-the-news/2015/09/18/post-fukushima-action-plan-has-delivered-concrete-results-says-iaea

Security & Safety
18 Sep (NucNet): The International Atomic Energy Agency's Action Plan on Nuclear Safety, drawn up following the 2011 accident at the Fukushima-Daiichi nuclear station in Japan, has delivered concrete results and nuclear facilities have already become safer because of it, the agency said.
In a final report on the implementation of the action plan the IAEA said the main purpose of the plan was to set a framework for the further strengthening of nuclear safety worldwide. The plan focused on 12 key areas including safety assessments, IAEA peer reviews, emergency preparedness and response, national regulatory bodies, and the international legal framework.

Since the adoption of the plan in 2011, the IAEA secretariat, member states and relevant stakeholders have undertaken a number of activities and have introduced concrete measures which have effectively strengthened nuclear safety worldwide, the IAEA said. It said the secretariat has initiated 68 projects with extra-budgetary funding across all 12 areas of the plan.

Results include better collaboration between member states and all stakeholders. The IAEA peer review mechanism has been strengthened and member states have been encouraged to regularly host peer reviews at their nuclear facilities.

The report is online: http://bit.ly/1QL3Q9g

Franco-Japanese cooperation in nuclear (and defense)

October 6, 2015

Japan, France pledge tight cooperation in nuclear and defense

http://ajw.asahi.com/article/behind_news/politics/AJ201510060049

THE ASAHI SHIMBUN
Japan and France agreed to bolster their cooperation in the fields of nuclear and defense technology at a meeting in Tokyo on Oct. 5.
Prime Minister Shinzo Abe and his French counterpart Manuel Valls agreed to help ensure Japan maintains its longtime policy to recycle spent nuclear fuel and develop technology to decommission reactors.
In addition, they pledged to collaborate on joint development of defense equipment and assistance to Africa to enable developing countries there achieve sustainable growth.
Abe briefed Valls on security legislation enacted last month to drastically widen the overseas role of Japan's Self-Defense Forces.
Valls expressed his hope that Japan will cooperate for success of a meeting of the United Nations Climate Change Conference, which gets under way in Paris from late November.

Enough power for winter

October 10, 2015

Enough power to go around this winter

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201510100034

By TOSHIO KAWADA/ Staff Writer
The government is confident there is a sufficient electricity supply to heat homes and offices this winter and will not call on households and businesses to conserve energy.
It said forecasts show that there will be enough supply even on the coldest of days when demand will peak.
Forecasts on supply and demand of electricity this winter were compiled by nine electric utility companies and released by the industry ministry's Electricity Supply-Demand Verification Subcommittee on Oct. 9.
The nine companies include all Japanese regional electric utility monopolies, except Okinawa Electric Power Co.
According to the report, all nine firms have secured sufficient power to maintain electricity within a 3-percent margin.
Because of this, the government decided there is no need to set a specific goal on energy conservation by homes and offices.
Kyushu Electric Power Co. said it will be generating more electricity this winter with the restart in August of the No. 1 reactor of its Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture.
It was the first nuclear power plant to come back online after all nuclear power plants were shut down in the aftermath of the 2011 nuclear disaster in Fukushima Prefecture.
The utility had expected to take advantage of a power pool from another utility last winter, but was able to maintain a 3-percent capability margin without having to do so. The figure is estimated to improve to 4.7 percent this winter.
Hokkaido Electric Power Co.'s supply capabilities are also expected to improve this winter and, like the last one, will not be imposing restrictions on electricity consumption to households and businesses.
Whether or not nuclear power plants under Kansai Electric Power Co. will be restarting anytime soon remains unclear, but nevertheless, the utility said it will be able to maintain a 3.3-percent capability margin this winter.
The nine utilities had projected that demand this past summer would total 162.6 million kilowatts. However, actual demand fell short by 8.06 million kilowatts.
This was most likely due to conservation practices becoming more commonplace than the utilities had initially thought, along with a shift toward alternative energy sources, including household power generation and the utilization of surplus power from factories. Low temperatures experienced by western and central Japan also played a role in falling demand for power over the hottest months of the year.

Positive impact of Fukushima?

08.10.2015_No190 / News

Prospects For Nuclear In Southeast Asia Have Diminished Since Fukushima, Says IEA

http://www.nucnet.org/all-the-news/2015/10/08/prospects-for-nuclear-in-southeast-asia-have-diminished-since-fukushima-says-iea

Comment & People

8 Oct (NucNet): Rising electricity demand, growing dependence on imported fossil fuels and environmental concerns have prompted several Southeast Asian countries to consider the role that nuclear power could play in their energy mix, but since the Fukushima-Daiichi accident in Japan the near- to medium-term prospects for nuclear in the region have diminished, a report by the Paris-based International Energy Agency says.

All countries in Southeast Asia that are interested in deploying nuclear power face “significant challenges”, the report says. These challenges include sourcing the necessary capital on favourable terms, creation of legal and regulatory frameworks, compliance with international norms and regulations, sourcing and training of skilled technical staff and regulators, and ensuring public support.

There are no commercial nuclear power plants in operation in Southeast Asia, but there has been interest in developing nuclear power technology including in Indonesia, Malaysia, Philippines, Thailand and Vietnam.

The report says Vietnam has made the most progress, albeit with major delays, and aims to start construction of a Russian-supplied plant in 2019.

A master plan calling for nuclear power to provide about 10 percent of electricity production by 2030 was passed by the government in 2011, the report says.

In 2010, Vietnam signed reactor construction agreements with Japan and Russia under which each country agreed to supply two 1,000-megawatt reactors. Russia was to build the first one, Ninh Thuan-1, with construction slated to begin in 2014 for operation by 2020 and the second plant for operation by 2021.

Construction on the Japanese reactors was scheduled to begin in 2015. But in January 2014, Vietnam announced that the projects had been postponed by four years. Another delay was announced in January 2015, pushing the expected construction start to 2019.

Negotiations regarding financing and technology as well as safety and legal concerns have delayed construction of all these reactors, the report says.

Malaysia has undertaken feasibility studies for the possible introduction of nuclear power, but the government has yet to make a formal decision on whether it will pursue it.

Thailand‘s National Energy Policy Council requested a feasibility study for nuclear power and approved the construction of nuclear capacity in its Power Development Plan (PDP) for 2007-2021, the report says. In each subsequent PDP the capacity target and timeframe for nuclear power have been revised and extended. The 2015 PDP includes two 1,000-MW nuclear power plants to begin operation by 2036.

Japan pledges to help Iran on nuclear matters

October 13, 2015

Japan to provide expertise on nuclear energy to Iran

http://ajw.asahi.com/article/asia/around_asia/AJ201510130043

By DAISUKE KANDA/ Correspondent

TEHRAN--Japan pledged Oct. 12 to provide personnel and expertise to Tehran to help it develop nuclear energy for peaceful purposes.

Agreement was reached here during talks between Foreign Minister Fumio Kishida and his Iranian counterpart Mohammad Javad Zarif.

Kishida and Zarif agreed that Japan will provide its know-how on earthquake-preparedness at nuclear facilities based on its experience of the Fukushima nuclear disaster in 2011.

Tokyo will also share its experience of emergency measures it took after the triple meltdown at the Fukushima No. 1 nuclear power plant and other steps to improve safety at nuclear facilities.

"Japan will continue efforts to foster cooperation between the two countries by providing its expertise to Iran in fields with which it has advanced know-how," Kishida said during a news conference.

The two ministers also signed a bilateral investment pact to entice Japanese companies to make inroads into the Iranian market.

Under a historic accord Iran signed with a group of six nations led by the United States, Tehran can continue nuclear development to supply energy and for medical purposes. The United States had imposed sanctions against Iran over its uranium enrichment program.

In exchange, the pact requires Tehran to establish a "nuclear safety center" to obtain technological expertise on nuclear energy with support from the six nations and other countries.

According to a joint statement released after the ministerial meeting, Japan will dispatch nuclear experts to the center to help it map out strategies to cope with a nuclear accident.

Japanese experts will also provide training to their Iranian counterparts to explain the importance of building nuclear facilities capable of withstanding earthquakes and provide know-how on calculating and managing nuclear materials.

The experts are likely to arrive at the center next year or later when Iran is ready to implement the accord with the six countries.

The investment pact, which aims to assist Japanese firms as they tap into the Iranian market, was signed after only one month of negotiation. Teheran has signed similar investment accords with 52 countries, including Germany, France, China and South Korea.

Kishida also agreed to set up a Japan-Iran cooperation council to promote bilateral cooperation in economic, environmental and other fields.

During the news conference, Zarif expressed confidence in expanding bilateral cooperation, saying a very bright future lies ahead for the two countries' diplomatic relations.

Promotion of nuclear fuel recycling will continue

October 22, 2015

Govt.: Nuclear fuel recycling policy unchanged

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Oct. 22, 2015 - Updated 19:01 UTC+2
Japan's newly-appointed industry minister says the central government will continue to promote nuclear fuel recycling.

Motoo Hayashi made the remark on Thursday in a meeting with Aomori Prefecture Governor Shingo Mimura.

The northeastern prefecture hosts the country's first fuel reprocessing plant. But its completion has been postponed many times due to repeated problems during test runs.

Governor Mimura asked Hayashi for the government to promote the fuel recycling policy in a responsible and stable manner.

Mimura also asked the minister not to make his prefecture the final disposal site for the high-level radioactive waste from reactors in the country.

The prefecture has only allowed the reprocessing of spent nuclear fuel.

Hayashi said the government will keep its promise not to build the final disposal site in Aomori. He said the site will be determined by consensus from the Japanese populace at large and the local community involved.

The governor said he values Hayashi's words clarifying the government's fundamental stance. Mimura added that he will continue to closely watch the actions of the government and the plant's operator, so that he can ensure the safety and security of people in the prefecture.

Alaskan LNG: Kyoto nuclear-free by 2040?

October 25, 2015

Kyoto advances nuclear-free agenda with Alaska LNG pact

http://www.japantimes.co.jp/news/2015/10/25/national/kyoto-advances-nuclear-free-agenda-alaska-lng-pact/#.Vi053Ct1Cot

by Eric Johnston
Staff Writer

KYOTO – The Kyoto Prefectural Government signed an agreement with Alaska last month to explore the possibility of importing liquid natural gas from the state to Maizuru, a port city on the Sea of Japan.

While daunting financial and bureaucratic challenges mean it will still be a while before Alaskan LNG flows to Kyoto, the agreement represents a step forward for Kyoto to achieve a larger goal: ending prefectural dependence on nuclear power by 2040.
The strategy, as outlined by Kyoto Gov. Keiji Yamada, calls for building up LNG facilities at Maizuru and installing new LNG pipelines in the Kansai region. The prefecture envisions Maizuru supplying not only Kyoto, but other prefectures in the region with gas to replace Fukui Prefecture's nuclear power plants as a major source of electricity.
Kyoto is not alone in seeking to replace atomic power with a combination of LNG imports and renewable energy. As of the end of 2014, more than 600 local governments nationwide had declared their intent to be nuclear-free, although not all of have set specific dates like Kyoto, and many lack a strategic plan for achieving that goal.
Yamada listed several reasons why the prefecture needs to end its usage of nuclear power, which comes mostly from 11 Kansai Electric Power Co. reactors in neighboring Fukui.
"We're grateful to Fukui for hosting nuclear power plants. But given issues like what to do with spent nuclear fuel and the need to decommission older reactors, we in Kyoto have to think about our energy future," Yamada said in 2013, when he first announced the plan.
Just prior to the memorandum of understanding with Alaska, the governor also said that, in addition to helping the prefecture get out of nuclear power, increasing natural gas usage via the port of Maizuru would have regional benefits.
"In the event of a national disaster off the Pacific coast of Kansai, it's possible that LNG facilities in the Osaka Bay area will be destroyed. Maizuru could then serve as a major natural gas hub," he said.
At present, Niigata is the only prefecture on the Sea of Japan coast that has the facilities needed to serve as an LNG base. In Kansai, the ports of Sakai, Osaka Prefecture, and Himeji, Hyogo Prefecture, have LNG facilities.
Kyoto and Hyogo, along with Osaka Gas, Kepco, and the Ministry of Economy, Trade and Industry, agreed in early September to formally research the cost of building an LNG pipeline from Maizuru to Sanda, Hyogo Prefecture, that could then supply other parts of Kansai and likely lead to other localities needing less nuclear power.

What energy future for Japan?

October 29, 2015

Japan's nuclear energy choices

http://www.japantimes.co.jp/opinion/2015/10/29/commentary/japan-commentary/japans-nuclear-energy-choices/#.VjHWyyt1Cov

by Kathleen Araujo

STONY BROOK NEW YORK – As Japan recovers from recent flooding, concerns about nuclear safety are never far from people's minds. During the flooding, bags of contaminated debris were swept away from cleanup sites associated with the 2011 Fukushima No. 1 nuclear power plant accident. Japan also restarted commercial operation of domestic nuclear generation last month under more rigorous, post-accident rules. Amid these developments, questions linger over whether the country should (or even is ready to) expand its nuclear operations. For this, answers may lie in fuller public engagement.

In August, news broadcasts showed the control room of the Sendai No. 1 reactor in Kagoshima Prefecture renewing initial operations. Among those protesting the restart was former Prime Minister Naoto Kan, who held office during the Fukushima crisis. Shortly after the reactor's restart, five cracked tubes were discovered in the cooling system, requiring new mitigation measures.

To put the experience into broader context, Japan is highly seismic and volcanic in nature. It is home to 110 active volcanoes and has 1,500 earthquakes of varying magnitudes each year. In August, the Meteorological Agency warned of larger-than-usual risks (prompting evacuation) in conjunction with volcanic eruptions at Mount Sakurajima. Based roughly 50 km from the restarted Sendai plant, the volcano is one of the most active in Japan, with volcanic sediment from previous flow found about 5 km from the plant.

Critics of the nuclear restart point out that new safety rules and evacuation planning are not adequate. Sufficient numbers of buses, for example, are not available in some areas should the need for evacuation arise. It is also not clear whether design adaptations to Japan's nuclear fleet adequately account for international best practices and the country's natural conditions. Moreover, polls indicate strong misgivings by a majority of the public, which favors a slow phase-out of nuclear technology.

By contrast, supporters see promise in the return to nuclear generation. As an island nation with few natural resources, nuclear energy offers a form of low-carbon power generation that can run nearly continuously.

This past summer, Japan experienced one of its hottest seasons in recent history with utility usage rates running at 80 to 95 percent, as 43 operable reactors remained idle. Kyushu Electric Power Co., the utility that manages the Sendai plant, reportedly paid more than double its costs following the accident for alternative generation. With the restart at the Sendai plant, economic benefits are projected to equal $25 million per year for the local economy. (This compares with estimates of accident-related damages valuing the abandoned region, homes, businesses, and agricultural land alone at $250 billion to $500 billion in a national economy of $4.7 trillion.)

Looking ahead, Japan's current, national energy plan outlines a goal of meeting 20 percent of domestic energy supply with nuclear generation by 2030. The new nuclear regulator and safety infrastructure will also undergo a review this January with the International Atomic Energy Agency. Yet, some say economic recovery has dominated political decision-making at the expense of more difficult discussions about risk in the country's energy choices.

At this juncture, Japan has the chance to create a more durable national energy strategy. To begin, public discussions should present trade-offs and risks in technically viable energy options. Meetings should openly convey information about the assumptions and challenges in reasonably understandable form, and include top policymakers, safety regulators, members of industry and citizens.

Discussions should also allow for consideration of alternative options, like renewable energy and changes in practices, with rationale for costs and benefits. These exchanges could provide greater visibility to what may be a new safety culture, while also enabling better cross-sectoral channels for widespread learning. A national referendum could then follow, asking which national energy path citizens will support and on what terms (for instance, higher taxes or costs passed to consumers). This approach would require more time and broad-based commitment, but prioritizing safety and fuller societal buy-in may prove to be more sustaining for Japan over the longer term.

For a country that has witnessed some of the darkest moments in nuclear history and also shown unmistakable evidence of resilience and innovation, Japan now has a unique opportunity to chart a more enduring path with policy and safety implications that can resonate globally. If nuclear energy is to have a chance at being sustainable in Japan, public officials, the nuclear industry and the country's citizens will need to openly engage about what is known and assumed in their complex set of energy choices.

Kathleen Araujo is an assistant professor at Stony Brook University, specializing in national decision-making on energy-environmental systems, and science and technology policy.

MHS closer to investing in Areva

Mitsubishi Heavy Steps Closer to Investment in France's Areva

Masumi Suga
November 6, 2015 — 10:21 AM CET

- Couches proposal in terms of wider Franco-Japan collaboration
- Two nuclear companies have relationship going back to 2006

Mitsubishi Heavy Industries Ltd. moved closer to investing in Areva SA's reactor unit after it said it has begun examining a "concrete proposal" to take a minority stake, a step that would deepen ties between Japan and France in the generation of nuclear energy.

Japan's sole producer of pressurized water reactors said Friday that in coming weeks it will consider the conditions for making an offer for Areva NP, including "ownership ratios," and will also "work up a proposal of Japan-France collaborative measures" around the safety and reliability of nuclear power plants.

The Tokyo-based company's statement comes a month after French Prime Minister Manuel Valls sought Japanese investment in the Areva unit as part of wider collaboration between the two governments over nuclear energy. Any deal would help state-owned Areva shore up its finances after losses caused in part by the retreat from atomic energy in countries including Japan and Germany.

Mitsubishi's investment would deepen a partnership with Areva that began in 2006. The two companies signed a $22 billion agreement in May 2013 to build a nuclear power plant in Turkey, the first major order for a Japanese firm since Fukushima. It would also signal the importance to Mitsubishi of seeking overseas contracts to replace domestic sales lost by the shuttering of Japan's atomic reactors in the wake of the 2011 disaster.

Nuclear Cooperation

Mitsubishi would join Electricite de France SA in owning Areva NP. EDF, the world's biggest operator of nuclear plants, said in July it plans to take a majority stake in the reactor unit as part of a rescue plan for the unprofitable Areva. The two state-controlled companies also agreed to set up a venture to manage new projects, including exports, that would be led by EDF.

Mitsubishi first said it was interested in investing in Areva NP June. This week, Areva SA said China National Nuclear Corp. may buy a minority stake in the parent company as part of wider ranging nuclear cooperation.

Mitsubishi is a maker of ships, planes and rockets. Its recent success has been in power systems that now account for 40 percent of revenues. Its thermal business is conducted in partnership with another Japanese conglomerate, Hitachi Ltd.

Japan restarted the first of its 43 operable atomic reactors in August despite public opposition. The government anticipates that nuclear will account for as much as 22 percent of electricity generation by 2030.

Mitsubishi built about half of the nuclear reactors in Japan. For its project, the Turkish government chose a 1,100-megawatt unit, called Atmea, which was jointly designed by Mitsubishi and Areva.

Remember your humanity but forget about nuke-free world for now

Pugwash 2015: Remember your humanity, but forget about a nuclear free world for now

Pugwash 2015: Remember your humanity, but forget about a nuclear free world for now

"The person who prays for peace must not hide even a needle, for a person who possesses weapons is not qualified to pray for peace."
-Takashi Nagai, *Towers of Peace* [1]

Remember your humanity, but forget about a nuclear free world for now. That may not be the official line, but it was the take-away message from the Pugwash Conference sessions in Nagasaki on November 1, 2015. Diplomatic niceties and patience were emphasized at this time when "mutual trust and confidence" have declined amid alarming new regional conflicts and refugee crises. The imbalances of economic and military power make nuclear deterrence, with only slow, incremental disarmament, the only safe way to proceed.

Maiden of Peace, Nagasaki Peace Park

One might think that because the Pugwash Conference espouses such high ideals that it has always called for the immediate abolition of nuclear weapons, but it never actually made such a radical demand. The website of the *Pugwash Conferences on Science and World Affairs* includes the following description of the founding of the organization:

During the darkest days of the Cold War, the founders of Pugwash understood the dangers of nuclear weapons. In their efforts to change dangerous policies they became pioneers of a new kind of transnational, "track 2" dialogue. [2]

The conference was founded two years after Albert Einstein and Bertrand Russell had released their famous 1955 manifesto, signed by nine other distinguished scientists [3]. It is notable that the manifesto did not stress the abolition of nuclear weapons but rather the abolition of war. It stated, "Although an agreement to renounce nuclear weapons as part of a general reduction of armaments would not afford an ultimate solution, it would serve certain important purposes." A footnote called for this to be a "concomitant balanced reduction of all armaments." The manifesto seemed to assume that nuclear weapons were here to stay and would inevitably be used in war, so the more urgent issue was for nations to accept "distasteful limitations of national sovereignty" and "find peaceful means for the settlement of all matters of dispute between them." Thus one shouldn't expect the Pugwash Conference to be a militant organization that cannot tolerate the existence of nuclear arsenals. Pugwash and its co-founder were awarded the Nobel Peace Prize in 1995 in recognition of their mission to "diminish the part played by nuclear arms in international politics and, *in the longer run*, to eliminate such arms." [emphasis added] [4]

1955年7月、哲学者のバートランド・ラッセルと物理学者のアルバート・アインシュタイン[原書]を発表し、核兵器廃絶を訴えた。

In July 1955, philosopher Bertrand Russell and physicist Albert Einstein issued a "declaration" calling for the abolition of nuclear weapons.

Other organizations have emerged over the years that have much less patience for elimination "in the long run," so the Pugwash Conferences seem complacent by comparison. At the Pugwash Conference public session in Nagasaki on November 1, 2015, most of the speakers, aware that they were facing an audience of divided opinions, chose to stick to factual reports and to refrain from expressing their personal conclusions. Government officials preached pragmatism and patience.

There was no opportunity for the audience to challenge the ideas presented or have a dialogue with the speakers. The Q and A sessions were too short, and only the Pugwash members in the front rows were offered chances to ask questions, and most of them were inarticulate and long-winded commentaries. Some of them showed by their questions that they hadn't even been following current events like Fukushima and didn't know some of the basic science and history of the nuclear era, but they have been deliberately asking naïve questions just to make a point.

Meanwhile, the general public and media representatives in the back rows were supposed to only listen and learn. It was ironic to hear the speakers saying repeatedly that the public is woefully ignorant about the issues and needs to be educated, while here members of the public had made the effort to attend yet their questions and comments were not wanted. Why should the public get educated if they are not going to have any influence even at a small conference such as this?

This structure revealed what seems like a serious problem with the Pugwash organization. Perhaps back in 1957 when the US and USSR were playing with hydrogen bombs like they were firecrackers, there really was an urgent need for scientists from both countries to get together in a remote place for private meetings so that they could go back and hopefully influence leadership in their respective countries, but this hardly seems necessary now. This sage-on-the stage approach seems unnecessary now when scientists are even more sidelined from power than they were then. The mass media would flock to a press release concerning the latest iPhone release, but here is no equal to Russell or Einstein today who could assemble the media to take note of an "important announcement."

What is needed now are truly participatory events that are connected with critical voices, citizen groups and contrarians who can break through the polite diplomatic niceties and stale frameworks in order to truly debate the issues—at the risk of offending the dignitaries present. These problems can't be solved if leaders are not going to really make the effort to educate themselves while they educate others, get out of their elite bubbles, then listen and do the hard work of leading by obeying.

Statue of Mother and Child at the Hypocenter, Nagasaki

What follows is a discussion of the session that was held on the afternoon of November 1, 2015. For anyone who has been following the anti-nuclear movement on the street or in the free-for-all of alternative media, blogs, twitter and facebook groups, the stilted and constrained parameters of discussion will come as a shock. All discussions were limited by the realities that have been laid down by the United Nations and the signatories of the Non-Proliferation, Strategic Arms Limitation and Nuclear Test Ban Treaties. The experts who know the history of these treaties can extemporaneously list all the dates, treaty numbers, signatories, conditions and exceptions, with the effect that the listener is left in a state of utter confusion and intimidation. Once one becomes an expert in this subject, one is in that world and can no longer think about lofty ideals and principles. The possible is restricted to only what the treaty history has carved out. So this process is very slow at nuclear disarmament, but it is very effective at disarming anti-nuclear activists who would like to see rapid change.

From the start the anti-nuclear activist is already out of the picture because the basis of all the Non-Proliferation Treaties is that all states which agree to forego the development of nuclear weapons are guaranteed the freedom to develop nuclear energy. This idea became entrenched before the first nuclear catastrophes, and it is always presumed the IAEA will be eternally omnipotent and capable of spotting any attempt to convert plutonium from a civilian waste product to a product that is militarily useful.

Thus the entire framework of global disarmament has no problem with the legacy of Chernobyl and Fukushima Daiichi, and the risk of other future catastrophes is not a concern. The treaties have nothing to say about unsecured uranium mine tailing ponds, depleted uranium weapons, and the seventy-year-old unresolved question of what to do with nuclear waste. Ecological, social and human health impacts are of no concern.

Spent nuclear fuel facilities could be considered as a radiological weapons which nations stupidly build as if they wanted to do a favor for any future aggressors they might have. They spare enemies the need to have a nuclear weapon because all they require is a conventional missile to launch at a nuclear facility. Or it could be that nuclear facilities are supposed to be a kind of a deterrent. Who would want to pillage or occupy a country after it has been turned into a nuclear wasteland? Unfortunately, disarmament treaties pay no attention to this hazard.

One of the first people on the stage was Hitoshi Kikawada, Parliamentary Secretary, Ministry of Foreign Affairs, Japan, who repeated the usual government platitudes: the only country ever attacked by nuclear weapons, deeply committed to a world free of nuclear weapons, and so on…

If the Japanese government were serious and it really wanted to change the behavior of the nuclear states, it would break off ties, impose sanctions, and employ any means available to alter the behavior it wanted changed. This is where Japan's hypocrisy becomes obvious. It is hardly "deeply committed" to a nuclear free world at all. It may *want*a nuclear free world, but it is not a high priority. If Japan were serious, it would come out from the US nuclear umbrella, and, as long as the US insisted on having nuclear weapons, it would not host US military bases on its soil. In interpersonal relations, we call this having the courage of one's convictions. Or it's just the use of simple strategies, like those of a housewife who has various ways of withdrawing affection and cooperation to deal with a wayward husband. But governments seem to have trouble resorting to strategies that are just common sense within personal relations.

States like Japan which live under a nuclear umbrella have been called the "weasel states" [5] of global disarmament talks, and along with the truly non-nuclear states they have always overlooked their power to shun, exclude and sanction the nuclear powers as a strategy for forcing them to change their ways. Perhaps the time has come for them to employ this strategy, but so far they have been divided and ruled, or other considerations force them to stay in their alliances.

At this time of "heightened tension" and "degraded trust" (no one at the conference had the courage to say "Syria" or "Ukraine" explicitly), it was interesting to see two officials from the US and Russia sitting side by side, sticking to their talking points while diplomatically only alluding to the mutual grievances that were on full display at the UN just weeks earlier. [6] But at least they showed up in this forum to respond to an organization that has for 61 years urged the superpowers to seek peaceful solutions and pursue disarmament. In the roster of speakers, the absence of representation from North Korea, Pakistan, Israel and France was notable, and no one from Germany was there to discuss the recent exit from nuclear energy or its diplomacy on the front lines between East and West.

Anita Friedt, Principal Deputy Assistant Secretary, Bureau of Arms Control, Verification and Compliance, Department of State (USA), claimed that arms reductions are continuing, and went over the progress of the 1990s. She said the expensive upgrades to the arsenal consist of no expansion of capability. Knowing that President Obama has been ridiculed for his Nobel Peace Prize, she insisted that his commitment to a world without nuclear weapons hasn't diminished. She just blamed Russia for not picking up the offer to begin talking about reductions.

She said all this apparently oblivious to Russia's reasons for not being ready for such a step. She would be a rather incompetent official if she didn't know that Russia is displeased with eastward expansion of NATO, overseas "democracy promotion" propaganda in Eastern Europe and even within Russia, [7] the recent decade of illegal wars and drone targeting against sovereign nations (Afghanistan, Iraq, Libya, drone in Yemen and Pakistan), and America's enormous expenditures on conventional weapons—including advanced weapons projects that aim to eliminate strategic parity. [8] It's hard to know if she is incompetent or if she was deliberately trying to portray this false image of American innocence. Vladimir

Putin has spoken very clearly on these points at recent press conferences, so the Russian point of view is hardly a state secret. [9]

Mikhail Ulyanov, Director of the Department for Non-Proliferation and Arms Control, Ministry of Foreign Affairs, Russia, hinted at these grievances but didn't state them explicitly. This was a shame because the audience may not have grasped exactly what he was referring to, and in any case, a good raging argument would have made things interesting. It was mid-afternoon by this time and everyone was getting drowsy. I had to wonder if this is the reason we now have this lamentable state of "degraded trust" over "situations" that couldn't be described. If speakers at such gatherings didn't use such passive-aggressive and evasive language, perhaps they could really talk and work out their differences right there. Every couple knows bad things happen later if one goes to bed angry.

Mr. Ulyanov stressed the important point that one cannot talk of nuclear disarmament without talking about imbalances in conventional weapons. He could have expanded this point by adding that conflicts are ultimately driven by financial interests and financial crises. Russia knows well that the conflicts in Ukraine and Syria involve struggles over energy resources and efforts to bring those countries, and surrounding regions, into Western economic spheres.

Mr. Ulyanov, like his counterpart, also tried to pass off some nonsense as pearls of wisdom. He claimed that we just have to accept that disarmament will proceed slowly because the rapid loss of deterrence could be extremely destabilizing. As evidence he said that deterrence with conventional weapons failed in WWII, and the USSR lost 27 million lives in that war. He said Russia cannot accept ever risking that situation again. However, he left out some crucial details such as the fact that Stalin had purged his military of effective leadership by the time the Nazis invaded. They had no effective conventional deterrence at the time. Also, the harsh conditions imposed on Germany after WWI created the resentment which in turn led to Nazism and militarization. All nations in Europe ignored the build-up and made no attempt to create conventional forces that would deter Germany. The "deterrence failed" argument is very weak. War can be avoided in numerous ways without a nuclear arsenal, and in fact, the existence of a nuclear arsenal can make nations extremely complacent about building the foundations of lasting peace. Furthermore, if we assume that nuclear deterrence succeeded after WWII, that is only the selfish viewpoint of the superpowers counting the lives of their own citizens. The Third World countries that were devastated by Cold War conflicts might have a different view. We also have to take account of the opportunity costs, and the ecological and human toll of uranium mining and the manufacturing and testing of nuclear weapons, both inside and outside the territories of the US and the USSR. The nuclearization of nations also transformed them into paranoid security states, and the harm to the political and social fabric was carried over to the "war on terror." Finally, while one is busy nuclear deterring, one is running the constant risk of unleashing all the consequences that would follow from the accidental detonation of a nuclear weapon. The logic of deterrence doesn't hold up, but if Russia still wants to insist they need deterrence, then logically it makes sense for all nations—and so the weaker ones need it all the more.

Mr. Kim Won-soo, UN Under Secretary-General and Acting High Representative of Disarmament Affairs (Republic of Korea) was next and spoke of being "deeply disappointed" by the recent failure of NPT Conference (May 2015). [10] For this author it was "deeply disappointing" that he couldn't specifically talk about some of the reasons for the failure. The hesitation to name names and describe specific disagreements amounts to a shrug in which global leadership just seems to wistfully say "stuff happens."

Professor Hiromichi Umebayashi, of the University of Nagasaki, discussed his group's proposal for working toward a nuclear free Northeast Asia. This plan seemed fatally flawed. It is hard to understand how they could seriously believe that North Korea would ever consider this plan. It depends on the

building of mutual trust among North Korea, South Korea and Japan, with China, Russia and the US promising (scouts honor) to never resort to the use of nuclear weapons in a dispute in this region. One flaw in the plan is the fact that the US is called a "neighboring nation" when its territory is nowhere near Northeast Asia. More importantly, North Korea would never consider this proposal while Japan stays under the US nuclear umbrella and hosts US military bases. Even if the US promised not to use nuclear weapons, its nuclear-armed submarines would still be patrolling the ocean in the region, and the US would be capable of hitting North Korea from afar by other means even if the subs were removed.

Furthermore, North Korea distrusts Japan for all the same reasons as China and South Korea. There is no common agreement about what happened in the region in the early 20th century, and this problem provides a rather weak foundation for building the trust needed for a nuclear weapons-free zone. A nuclear free Northeast Asia seems to require a nuclear free world, so the first step would be for South Korea and Japan to each unilaterally break with the American alliance. This would be the only change that North Korea could believe in. But even then there would be that little problem of Japan's plutonium stockpile in Rokkasho. What, exactly, are their intentions?

The final speaker was Ambassador Akylbek Kamaldinov, Ambassador Extraordinary and Plenipotentiary of the Republic of Kazakhstan to Japan, who was honored by Pugwash for his nation's bold decision to give up the nuclear weapons it had on its territory at the breakup of the USSR. Kazakhstan has recently announced that it wants to lead a movement that will see the world free of nuclear weapons by 2045. They stole my idea, but that's OK. They only seem to have the half of it that pertains to nuclear weapons. They take the high ground in speaking about nuclear weapons, but speak little of the widespread contamination throughout the country caused by seven decades of uranium mining. Kazakhstan is a leading producer of uranium, and Japanese Prime Minister Shinzo Abe was recently there concluding deals for the future development of nuclear energy. [11]

Progress in nuclear disarmament is impossible if two aspects of the accepted reality continue to go unchallenged. Firstly, nuclear energy is incompatible with a world free of nuclear weapons. Secondly, few countries will want to give up their nuclear deterrence as long as one superpower maintains a global network of military bases and outspends all others combined on conventional military forces. [12] I got the impression that the resolution statement of this year's Pugwash Conference will have little to say about these two obstacles.

It may seem unrealistic to call for such drastic "unrealistic" changes, but history shows that the unchangeable reality can unravel very fast. No one in 1980 predicted the collapse of the Soviet Union by the end of the decade. It is entirely foreseeable that nuclear energy and the American empire will soon have a confrontation with reality. The evident costs and dangers of both are catching up with them.

Safety and costs: Keep Monju?

November 12, 2015

Fate of troubled Monju reactor hangs in balance

http://www.japantimes.co.jp/news/2015/11/12/national/fate-troubled-monju-reactor-hangs-balance/#.VkRV7L8R-os

by Reiji Yoshida

Staff Writer

The fate of the nation's troubled prototype fast-breeder reactor is in the air amid continued questions over its safety and cost. Political challenges to the country's nuclear policy are also taking a toll.

Taro Kono, the anti-nuclear Cabinet minister in charge of administrative reforms, has himself started attacking the Monju project, openly questioning the feasibility of the plant after a high-profile budget review by a team of experts Wednesday in Tokyo.

In a separate move, the Nuclear Regulation Authority was set to lodge a formal request for a change in the plant's ownership. It was to ask the education and science ministry Friday to find a new operator after decades of serious problems that have shaken confidence.

The NRA's recommendation could lead to Monju's closure because it will be hard to find a replacement for the government-backed Japan Atomic Energy Agency (JAEA), observers say.

"This will be (Monju's) last chance to win the trust of the nation," Chief Cabinet Secretary Yoshihide Suga told a news conference Thursday.

Kono, who was appointed as administrative reform minister in the Oct. 7 Cabinet reshuffle, has long been critical of the policy to develop a nuclear fuel cycle.

During the budget review session Wednesday, he criticized JAEA for wasting vast sums of money on maintaining the nuclear-fuel transport ship Kaiei Maru.

The ship, built in 2006, costs about ¥1.2 billion every year to maintain and has been used only four times.

"After all, you can't tell if Monju will actually work or not," Kono said following the session Wednesday.

"We need to examine whether budgets for certain related projects are really effective, such as those for nuclear fuel recycling," he said, according to media reports.

Monju was designed to produce more plutonium fuel than it consumes. Fast-breeder reactors are a central component in the nuclear fuel recycling system the government still is trying to build, despite Monju's lousy record of accidents and decades of idleness. One of the potential threats stems from the massive amount of dangerous sodium it contains as coolant.

In November 2012, it emerged that JAEA had failed to check as many as 10,000 of Monju's components, as required by safety rules.

In May 2013, the NRA ordered JAEA to halt operations pending improvements to the plant's management.

During a Nov. 4 news conference, NRA Chairman Shunichi Tanaka said the agency had yet to see significant improvement in JAEA's management of the plant, and as a result it wanted the agency fired.

The education ministry will have six months to show how it will respond to the NRA's request.

"Exactly 20 years ago, Monju had an accident involving a sodium leak. Ever since then, numerous measures have been taken to fix problems, but they haven't been corrected yet," Tanaka said.

Tanaka said the NRA had the legal power to retract its "construction permission" for Monju, which would force the government to close the prototype reactor immediately.

But the NRA was not thinking of the option "at this stage," Tanaka quickly added.

He said the NRA was questioning only Monju's safety, not the government's nuclear recycling policy as a whole.

On Thursday, a high-ranking government official admitted the Monju project had drawn much public attention, saying the government should "provide an explanation that can be understood by every party."

The official said JAEA had enjoyed such unqualified support from the government's nuclear policy that it had been indulged a stretch too far.

"JAEA has become spoiled," the official said.

Fukui asks for full govt. commitment to Monju

Nov. 12, 2015 - Updated 09:59 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The governor of Fukui Prefecture has urged the government to take the initiative in addressing safety management issues at the trouble-prone prototype fast-breeder reactor Monju. The prefecture, in central Japan, hosts the reactor.

Monju was developed for the recycling of spent nuclear fuels building up at other reactors in Japan, but due to various safety problems its operator has been banned from conducting a test-run.

Fukui Governor Issei Nishikawa met industry minister Motoo Hayashi on Thursday.

The meeting came after the country's regulator last week judged the operator of Monju, the Japan Atomic Energy Agency, unfit to run the facility, citing its lax safety management.

The regulator plans to recommend the education minister, who oversees the project, to pick a new operator.

The governor said Monju is a pillar of Japan's nuclear fuel recycling plan and the government must be responsible for solving the issue.

He told Hayashi Cabinet members related to Japan's fuel recycling project should set up a system to take responsibility for the plant or otherwise safety problems would recur.

The industry minister replied the education minister will lead discussions on how to address the Monju issue. But he stressed the government will stick to the fuel recycling plan with the understanding of local authorities concerned, as well as from the international community.

NRA's recommendation on Monju: What impact?

November 14, 2015

NRA's Monju reactor recommendation could deal serious blow to nuclear fuel cycle

http://mainichi.jp/english/english/newsselect/news/20151114p2a00m0na007000c.html

The Nuclear Regulation Authority (NRA) officially recommended on Nov. 13 that the troubled Monju fast breeder test reactor be taken out of the hands of the Japan Atomic Energy Agency (JAEA) -- a move that could deal a serious blow to Japan's decades-long "nuclear fuel cycle" policy.

The Ministry of Science, Culture, Sports, Science and Technology -- the JAEA's regulator -- will consider a new organization to operate the Monju facility possibly with the cooperation of utilities and foreign nuclear power companies. However, the range of candidates the science ministry could call on is severely limited in terms of technological prowess and overall capabilities. If the ministry cannot designate a new operator by the May 2016 deadline for responding to the NRA recommendations, it will be forced to consider more radical options, including decommissioning the Monju reactor.

The Monju reactor in Fukui Prefecture was built to run on MOX fuel -- a mix of plutonium and uranium processed from spent conventional nuclear fuel -- and produce yet more plutonium that could be made into yet more fuel. MOX fuel can also be put into conventional reactors, but the Monju project held the promise of creating a fuel loop and help resource-poor Japan become energy self-sufficient. The Monju plant, however, has spent the vast majority of its life shut down due to a string of accidents including a fire -- mishaps that played a major role in the NRA's recommendation to find a new operator for the facility.

After receiving the recommendation from NRA Chairman Shunichi Tanaka, science minister Hiroshi Hase said, "I want to get (Tanaka's) advice and guidance on how to proceed from here on" regarding putting together a new organization to operate the Monju plant. Tanaka, however, later commented at a news conference, "I've presented our recommendation, so I cannot also provide the answer," indicating he has no intention of participating in discussions on finding a new operator.

The JAEA has survived serious scandals and mishaps twice before by changing its name, but Tanaka explained that such a tactic wouldn't work this time around, saying, "It clearly states in the recommendation that a different organization" should take over the Monju project.

Of essential importance to the science ministry's search for a new operator is whether the candidate organization has the technology to handle liquid sodium. The substance is used in the Monju reactor as a coolant, but is also explosive if it comes into contact with air or water. The only domestic body that has any experience handling liquid sodium is the JAEA, so the science ministry plans to consider cooperating with foreign nuclear power companies on the Monju project.

Overseas candidates, however, are also hard to come by, as the United States, Britain and Germany have all given up on fast breeder reactors. Research advances into the technology were made in the 1950s and '60s in Europe and North America, but the volatility of liquid sodium proved a very serious roadblock, and many fast breeder projects had been suspended or cancelled by the 1990s.

Currently, only three countries are pursuing fast breeder reactor research seriously: Russia, China and India. Due to defense and nuclear security concerns, however, it looks very unlikely that Japan will be able to partner with any of these nations. Even the NRA's Tanaka said at the Nov. 13 news conference, "I can't determine that no organization (would take over the reactor). Very little research (on fast breeder reactors) is being done anywhere in the world and, personally, I will forgo a personal evaluation of the matter."

Toshiba still hopeful for nuclear future

November 20, 2015

Toshiba's U.S. nuclear arm poised for Indian reactor contracts

http://ajw.asahi.com/article/business/AJ201511200024

By KEIKO NANNICHI/ Staff Writer
PITTSBURGH, Pennsylvania--The U.S. nuclear power subsidiary of troubled electronics company Toshiba Corp. is set to receive orders to construct nuclear reactors for the first time since the 2011 Fukushima nuclear disaster.
Daniel Roderick, president and CEO of Westinghouse Electric Co., said in a recent interview with The Asahi Shimbun that the company is negotiating orders to build six to 12 reactors in India.
He said the company is expecting to sign the deal in January to March next year. He added that it is also hopeful to win contracts for 30 to 50 reactors in China and eventually to build next-generation nuclear reactors in Japan.
Roderick also said the company hopes to receive orders from the United States, Eastern Europe and Australia.
The subsidiary of Toshiba, which has been embroiled in an accounting scandal since May, has received no reactor construction orders since the ongoing crisis at the Fukushima No. 1 nuclear power plant began in March 2011.
Roderick said Westinghouse sank deep into the red in fiscal 2012 and 2013. The Fukushima nuclear disaster forced the company to scrap its long-term business plan mapped out a decade ago to earn 80 percent of its revenue from construction of new reactors.
Westinghouse's revenue from reactor construction is flagging at around 20 percent of net earnings, but Roderick said the company earned its largest profit in fiscal 2014 since becoming a Toshiba subsidiary thanks to brisk earnings from reactor maintenance services and fuel-related businesses.
The business sectors earned 40 percent and 30 percent, respectively, of the company's net earnings last fiscal year, he added.

Gas a clean fuel?

November 25, 2015

Exporters to promote natural gas consumption

http://www3.nhk.or.jp/nhkworld/english/news/20151124_17.html

Nov. 24, 2015 - Updated 04:21 UTC+1
Members of the Gas Exporting Countries Forum, or GECF, met in Tehran on Monday. They agreed to promote natural gas as a clean fossil fuel, saying it's an abundant and sustainable energy source.

At the start of the meeting, Iran's President Hassan Rouhani proposed that member nations enhance coordination in production and trade. He said that common strategies will help them achieve their goals.

Officials at the International Energy Agency say natural gas consumption will grow at an average rate of two percent a year through 2020. This figure represents a downward revision by the officials, who cited the increasing use of renewable energy.

The leaders of the GECF member nations agreed in a joint declaration to redouble their efforts to expand consumption. They are planning constructive talks with gas importing countries.

There has been a rumor that the GECF might begin fixing prices. But Iran's oil minister Bijan Zanganeh indicated that the organization is not ready to do so.

IAEA still believes in the future of nuclear power

December 8, 2015

IAEA chief: Interest in nuclear power up despite Fukushima

http://mainichi.jp/english/articles/20151208/p2g/00m/0in/009000c

MANILA, Philippines (AP) - Despite the Fukushima nuclear disaster that devastated northeastern Japan in 2011, interest in nuclear power has increased significantly, mainly in Asia, the U.N. nuclear watchdog chief said Monday.

International Atomic Energy Agency chief Yukiya Amano said the appetite for nuclear power has grown in Asia because of the need to fuel the region's bustling economies and demand for relatively clean energy amid concerns about climate change.

Globally, at least 30 developing countries are seriously considering the use of nuclear power, Amano said, adding that more than 440 nuclear power plants are currently operated worldwide.

"After the Fukushima Dai-chi accident, some believed that is the end of nuclear power. It was not the case," Amano told a news conference in Manila, where he attended a conference and discussed with Philippine officials how to harness nuclear technology for economic progress.

"Nuclear power plants or use of nuclear power is increasing significantly," he said.

The meltdowns at the Fukushima Dai-ichi nuclear power plant in northeastern Japan following an earthquake and tsunami displaced more than 100,000 people due to radioactive contamination and spurred a national debate over resource-scarce Japan's reliance on nuclear power.

The plant "was not well prepared for the severe natural hazard," Amano said. Following the disaster, Amano said he visited nuclear plants in several countries and saw that considerable safeguards had been introduced.

"After Fukushima, lots of improvements have been made," he said.

Each government, he said, ultimately has to decide whether to embrace nuclear energy for power generation based on many factors, including the availability of other options like hydropower.

Japan remains committed to nuclear power despite the meltdowns at Fukushima. Only two of the country's 43 workable reactors are currently online, with the others shut down pending safety checks, but the government wants to restart as many as possible.
To offset the shortfall in power output, Japan ramped up imports of oil and gas and fired up more thermal power plants, slowing progress toward reducing its emissions of greenhouse gases.
Countries, meanwhile, need to ensure the security of nuclear power plants and materials amid terrorism threats, Amano said, adding that the IAEA has provided training and other assistance to help governments deal with such concerns.
"If nuclear materials fall into the hands of terrorists, that can be used for dirty bombs," he said. "If it happens in a big city, that can cause a panic."
"Terrorists always target the weakest link, so we need to be well prepared for that to address nuclear security," he said.

Nukes and COP21

IAEA Calls For Nuclear To Be Part Of COP21 Energy Options

http://www.nucnet.org/all-the-news/2015/12/08/iaea-calls-for-nuclear-to-be-part-of-cop21-energy-options

8 Dec (NucNet): Nuclear energy is a “clean, reliable, affordable and modern energy source” that should be considered among low carbon options and as an important contributor to a sustainable energy future, International Atomic Energy Agency deputy director-general Mikhail Chudakov told the Paris climate conference yesterday.
Mr Chudakov told an audience at a United Nations side event at COP21 that nuclear energy has low life-cycle greenhouse gas emissions and has the potential, with innovative technologies, to serve humanity effectively for a very long time.

He also said that in developing economies more effective use should be made of technologies such as small and medium reactors.

“When considered in the broader context of sustainable development, nuclear power enhances energy security and reduces damage to ecosystems and impact on human health,” he said.

At the event, senior representatives from several UN and civil society organisations discussed how to ensure access to affordable and modern energy for sustainable development. Panellists highlighted the issues and priorities and how their organisations plan to contribute to sustainable energy.

Speakers agreed that there was an urgency to make the transformation in business models, technologies and consumer habits that are necessary to move to a low-carbon future. They said drastic energy efficiency improvements and fast upscaling of all low-carbon technologies, including nuclear, carbon capture and sequestration and renewables were necessary in order to limit the increase of average global

temperatures to below two degrees Celsius compared to pre-industrial levels.

In response to a question regarding energy innovations in Africa, Mr Chudakov said that in order to support developing economies, such as in Africa, “we need to make more effective use of technologies, such as small and medium reactors that are safe, secure and sustainable”.

Taking place from 30 November to 11 December, the 21st Conference of Parties (COP21) to the UN Framework Convention on Climate Change (UNFCCC) provides countries the opportunity to present their climate change strategies and negotiate an international agreement.

The IAEA said developing an effective international response to “the threat of climate change” and identifying appropriate mitigation strategies will require a joint framework.

Japan and India ready to sign nuclear agreement

December 9, 2015

Japan, India poised to forge nuclear power agreement

http://mainichi.jp/english/articles/20151209/p2a/00m/0na/007000c

December 9, 2015 (Mainichi Japan)
The Japanese and Indian governments are set to reach a broad agreement on nuclear power that would make it possible for Japan to export its nuclear technology to India, government sources disclosed on Dec. 8.
The two governments are making arrangements ahead of a summit to be held between Japanese Prime Minister Shinzo Abe and his Indian counterpart Narendra Modi in India on Dec. 12. If an agreement is reached, it would be the first pact between Japan and a country that has not signed the Nuclear Non-Proliferation Treaty (NPT).
India and Japan have continued working-level talks on exporting nuclear technology to India as the country looks to increase the number of its nuclear power plants to help solve its energy problems.
India conducted nuclear tests in 1974 and 1998 while remaining outside the NPT. Officials have therefore focused on how to respond should India conduct another nuclear test. Officials have also been wary of the reprocessing of spent nuclear fuel that could be converted for military use.
Japan, the only country to have suffered atomic-bomb attacks, has placed emphasis on nuclear nonproliferation under the NPT, and has sought regulations clearly stating that any agreement would be halted should India conduct a nuclear test. After its test in 1998, India declared a moratorium on nuclear testing.
When the United States formed an agreement with India in 2008, there were no stipulations on nuclear testing, but the U.S. established a domestic law under which exports of nuclear fuel to India would be suspended if India were to conduct a nuclear test.
India was reportedly reluctant to commit to a clear statement, but a Japanese Foreign Ministry official commented, "Regulations stricter than those of the United States are needed."

It appears that officials are searching for a compromise, such as a substantial mechanism to halt technical cooperation following any nuclear test.
India is asking that Japan consent to reprocessing of nuclear fuel at designated facilities, such as reprocessing facilities placed under the watch of the International Atomic Energy Agency. The United States has agreed to reprocessing at facilities that are under surveillance, and the Japanese government is expected to adopt a similar approach.

Japan, India in talks to seal nuclear pact

http://www3.nhk.or.jp/nhkworld/english/news/20151209_15.html

Dec. 9, 2015 - Updated 02:23 UTC+1
Officials from Japan and India are holding talks to lay the groundwork for an agreement on nuclear cooperation in time for a summit meeting this week.

Prime Minister Shinzo Abe will meet his counterpart Narendra Modi during a 3-day visit to India that starts on Friday.

The Japanese government hopes they will agree to sign a pact that would allow Japan to export nuclear power plant technology to India. The two countries have been discussing the deal for 5 years.

India is interested in Japanese nuclear technology to cope with a serious shortage of electricity.

But Japan has insisted that India promise not to convert the technology to military use. India is not a signatory to the Treaty on the Non-Proliferation of Nuclear Weapons.

Michael Mariotte on the future of energy

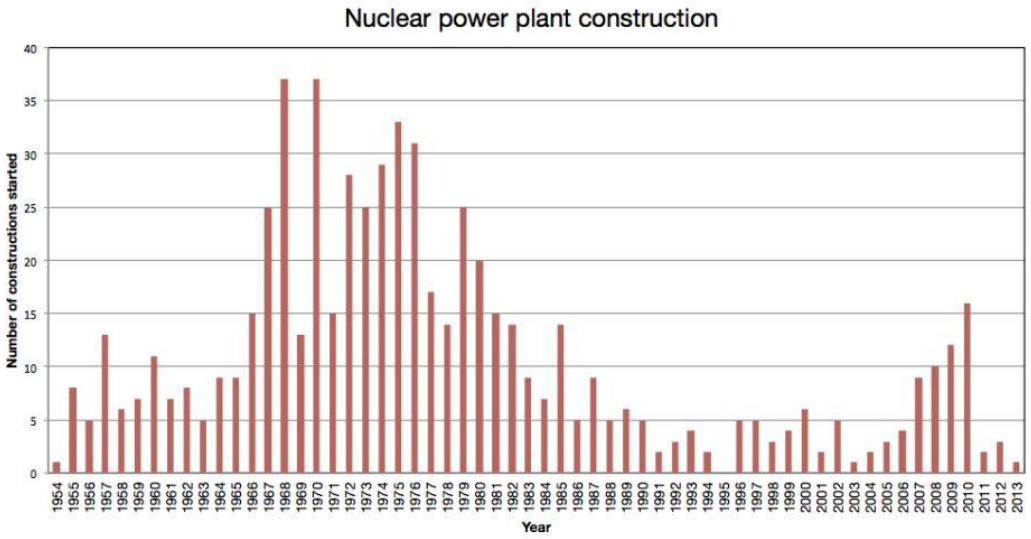
News, Views & Musings for our nuclear-free, carbon-free energy future

The nuclear industry's COP 21 dilemma: 100% renewables is attainable

http://safeenergy.org/2015/12/07/the-nuclear-industrys-cop-21-dilemma/



"Nuclear power plant construction" by James Douch – Own work. Licensed under CC BY-SA 3.0 via Commons –

If you think you've been seeing a lot more pro-nuclear propaganda in the media than usual in the past couple of weeks, well, it's not your imagination. The nuclear industry and its champions are out in force, publishing articles and appearing in the media wherever and whenever they can in what may be a last-ditch effort to convince the world–or at least its leaders–that nuclear power is the answer, or one answer, to our climate crisis. As one writer put it yesterday, "At the Paris Climate Summit (COP21), the global nuclear lobby is in overdrive."

If it all smacks a bit of desperation–and a lot of the pro-nuke pieces out there right now verge on the hysterical, with blatant attacks on those of us who envision a clean energy future–well, that's not your imagination either. That's because there is no global consensus on nuclear power. Some nations are against it entirely while a relatively few others are ardently pro-nuclear, with most–including the U.S.–somewhere in-between. And that means, by the very nature of the COP 21 talks, that nuclear isn't getting what the industry needs; indeed, so far at least, nuclear is simply a non-factor.

Still, it's important to examine and if possible refute the pro-nuclear assertions. It's important to prevent them from taking hold at COP 21, or afterwards, because making large-scale investments in nuclear power as a climate solution would make real carbon reductions more difficult to attain. Nuclear would set the world on the wrong path, and that would prove disastrous. Fortunately, refuting nuclear advocates' arguments becomes easier and easier with the passage of time. Not only are most of the industry's positions fantastical, but the concept of a world powered 100% by clean renewable energy is no longer seen as a hippie pipedream but as a necessary and, more importantly, achievable goal at every level–from individuals to large corporations to cities large and small to entire nations.

Leading the nuclear pack of course, by virtue of respect for his work on climate, is Dr. James Hansen and a small band of cohorts in the climate science community. At his press conference in Paris late last week (background here) and a companion piece published in The Guardian Thursday, Hansen et al made their familiar argument that nuclear must be considered a climate solution and that the world must rapidly develop "…next-generation nuclear power with a closed fuel cycle (where spent fuel is reprocessed)…"

A big part of that argument is their belief, which seems to be based mostly on International Energy Agency (IEA) reports and projections, that renewable energy currently provides only a tiny part of global electricity supply and that renewables cannot scale up rapidly enough to replace fossil fuels. Nuclear, they

claim on the other hand, can do so. According to Hansen, et al, "For example, a build rate of 61 new reactors per year could entirely replace current fossil fuel electricity generation by 2050. Accounting for increased global electricity demand driven by population growth and development in poorer countries, which would add another 54 reactors per year, this makes a total requirement of 115 reactors per year to 2050 to entirely decarbonise the global electricity system in this illustrative scenario. We know that this is technically achievable because France and Sweden were able to ramp up nuclear power to high levels in just 15-20 years."

If Hansen and his friends were correct, perhaps the argument would have merit. But they're not. First, the world has never built 115 reactors per year, much less come close to sustaining such a level for 35 years. The chart at the top of this page shows that, in fact, worldwide we've never even hit 40 per year, and in only four years–all during the nuclear go-go years of the 1970s– did we even top 30 new reactors. Note that the chart shows reactor construction starts, not completions–a lot of those starts, especially in the U.S., were never even finished.

While in theory the world could build more reactors than we presently are (and since Fukushima new starts have dropped to nearly nothing), 61 new reactors per year, over 35 years, is not even remotely achievable; 115 new reactors per years is pure fantasy. The world does not have the infrastructure to build that many, nor the infrastructure to operate that many (nor does the infrastructure, in terms of trained operators and other personnel, plus regulatory systems exist to handle even a fraction of that many reactors in any kind of safety-first environment).

And note that Hansen et al don't take into account the reality that by 2050, most of the existing reactors will have reached the end of their licensed lifetimes and will be closed, so there are another 400+ that would need to be built under their scenario.

The costs of attempting such a program would be astronomical. Not only are the reactors themselves the priciest means of electricity generation available today, but the costs of attempting to build an infrastructure capable of even a fraction of that many reactors would be prohibitive. Sure, there are costs involved with clean energy too; no one ever said addressing the climate crisis will be cheap (but we do, in fact, say a clean energy system will be economically beneficial), but at least it doesn't need the kind of infrastructure (giant complexes capable of forging reactor pressure vessels, huge expansion of nuclear regulatory agencies, etc) that nuclear does.

To look at this another way, consider: in the 60 years since the dawn of the commercial atomic age, the world has built and operated fewer than 600 nuclear reactors (there are 437 currently operable). Hansen, et al. argue this track record proves the world can successfully build and operate 4,025 more reactors in the next 35 years. **The history proves exactly the opposite.**

Clearly, however, the world could build more than we are doing now. Not enough to close a lot of coal plants or make a significant dent in carbon emissions, but we could build more. Do we need to? Can renewables really not scale up in time?

If one relies on IEA reports and projections, it's easy to see why you would think renewables can't handle the job. The IEA's World Energy Outlook shows that for 2013, renewables including large-scale hydro supplied only 4% of the world's primary energy (not just electricity, analyzing this way gives nuclear only 5% of primary energy). By 2040, the World Energy Outlook doesn't see much change: renewables are projected to supply 8% and nuclear 7%.

There are two problems here. First, we need to report and project electricity, not primary energy: nuclear reactors provide only electricity and so do most renewables. The second problem, as we've pointed out before, is that the IEA has proven invariably wrong when it comes to projecting the growth of renewables.

Renewables now provide 22.8% of the world's electricity–which even the IEA has been forced to admit places renewables as the second largest "fuel" source, behind only coal. So it's not renewables that are the small fish in the pond, it's nuclear. **In other words, nuclear power would have to scale up more rapidly than renewables to make a difference, not the other way around.**

And, again, the opposite is happening. Investment is going into renewables, not nuclear. Half of all new generation this year will be renewables (for the U.S. in October, *all* new generation was renewables) , and that number is likely to increase next year and every year from now on.

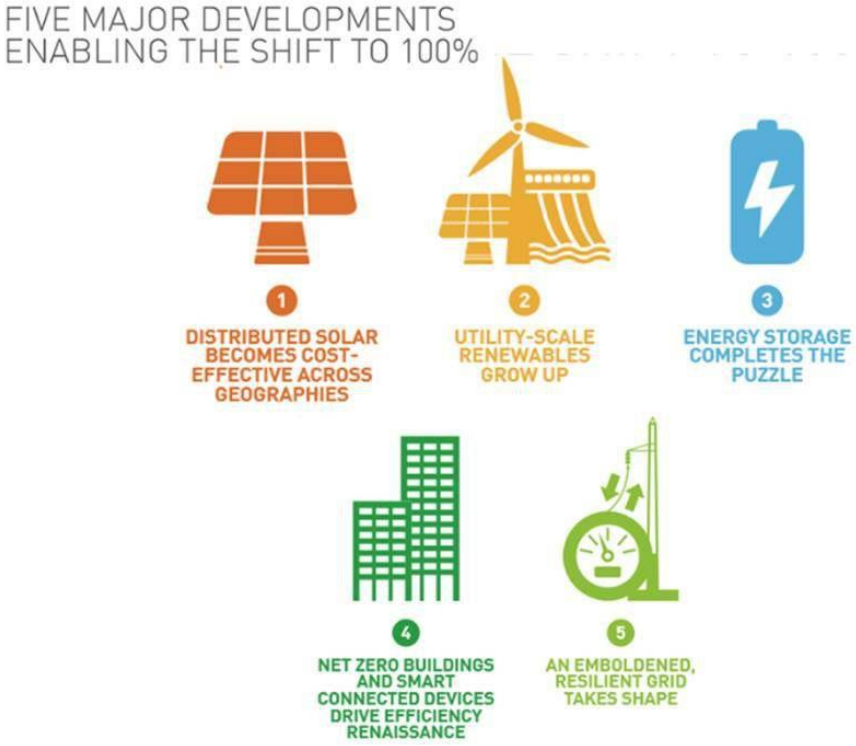
We've reported numerous times on investment bank studies showing that renewables are where they want to put their money. Here are two more from Goldman Sachs: one projects wind and solar power will provide more energy over the next five years than the shale gas (read: fracking) revolution has over the past five years. The other says the most effective investments to reduce carbon emissions are four existing technologies: solar, onshore wind, LED lighting and electric cars.

That these are existing technologies is important. Hansen et. al.'s nuclear-first approach requires use of "Generation IV" technologies that don't exist. The reality is that we have the tools to effectively address the climate crisis, we just need to use them. Bill Gates made a lot of headlines last week with his "Breakthrough Energy Coalition" fund to come up with new energy solutions, including "advanced" nuclear. It's not that innovation isn't welcome (and there remains plenty of innovation in clean energy technologies), but what's needed most right now is large-scale deployment of the innovations of the past few years. These, such as the technologies identified by Goldman Sachs, are already cost-effective and climate-effective. So why not use them?

But if we were to embark on a major new nuclear development and construction program, the economic resources to deploy the clean energy technologies would be dangerously depleted. "All of the above" always sounds reasonable to the public–why not do everything we can?–but it's not only unrealistic, it's irrational: since resources are not unlimited, choices are required and we need to focus resources on what works the best and the most cost-effectively. And that is renewables and efficiency, backed up with electricity storage (which we would argue Goldman Sachs should have included as a fifth effective investment).

Fortunately, the message is beginning to get through.

A growing number of large corporations–Google, Apple, Ikea and the like–are committed to 100% renewable energy for their operations, and are making the investments necessary to attain that goal. So are a growing number of cities: 1,000 mayors have descended on Paris this week with a call for a 100% renewable energy system. Entire nations are relatively quietly moving to 100% renewables; Uruguay, for example, is now at 95%. Even in the U.S. House of Representatives, one of the last bastions of outright climate denial, a resolution for a 100% renewable energy system has been introduced (H. Res. 540) with more than 20 co-sponsors.



Graphic from CleanEdge

All of this is being driven by the five factors in the graphic to the right (click to enlarge). Electricity storage was the missing link. While large-scale (30-40%) use of variable renewables is possible even without storage, 100% renewables was not. But the rapid growth of storage technology coupled with its equally-rapid decline in cost makes that goal both achievable and affordable.

There are more signs. Coal use is already dropping faster than anticipated. The U.S. Energy Information Administration (EIA), not quite as bad at projecting renewables as the IEA, but almost, suddenly added 30% more solar capacity in the U.S. because they've finally started counting rooftop solar. Contributing to the nuclear industry's hysteria in Paris this week is their knowledge that the announced early shutdowns of the Pilgrim and FitzPatrick reactors (on top of five closed reactors in 2013-14) and reactors in Sweden won't be the last such announcements.

A 100% renewable energy system is no longer far-fetched. It's being held back not by inadequate technology, not by an inability to scale up rapidly, but by the still-powerful–but decreasingly so–fossil fuel and nuclear interests. As their fortunes begin to fade, the political and economic power of those interests is weakening, but it must be weakened further.

The danger for the nuclear industry and its apologists is not that a massive clean energy campaign won't work, that renewables can't scale up quickly enough, that they can't reduce carbon and methane emissions fast enough, but that such a campaign *will* work. Because that will mean that nuclear, and its myriad of other environmental and economic deficiencies, simply aren't needed. And all the evidence shows that is, in fact, the case. Nuclear power is not needed to reduce emissions. And so why would anyone want to generate more lethal radioactive waste and subject the world to more permanently uninhabitable zones from the occasional and inevitable nuclear meltdowns? Obviously, the nuclear industry wants to protect its own economic interests. But for the rest of us–and that's nearly everyone–a nuclear-free, carbon-free system makes perfect sense.

Nuclear pact with India

December 11, 2015

Abe off to India for talks with Modi on nuclear technology pact

http://www.japantimes.co.jp/news/2015/12/11/national/abe-off-india-talks-modi-nuclear-technology-pact/#.VmrpTr8R-os
JIJI, Reuters
Prime Minister Shinzo Abe left Friday for a three-day visit to India, where he will meet with his Indian counterpart, Narendra Modi, to discuss a proposed bilateral nuclear cooperation treaty.
Speaking to reporters at his office before departure from Tokyo International Airport at Haneda, Abe expressed his intention to make efforts to reach an agreement on measures to prevent Japanese nuclear technologies sold to India from being diverted to military use.
"Japan is the only country in the world that has ever suffered an atomic bombing," Abe said. "We're holding negotiations based on this fact."
India is not a signatory to the Nuclear Nonproliferation Treaty. The nuclear cooperation agreement with India would be Japan's first with a country outside the NPT regime.
Japan and India started negotiations on a bilateral nuclear cooperation treaty in 2010. They are in the final stages of discussions on whether to stipulate in the treaty that bilateral nuclear cooperation would be suspended if India conducts a nuclear test again. India has not carried out a nuclear test since 1998.
At their meeting slated for Saturday in New Delhi, Abe and Modi are also expected to reaffirm that their countries will strengthen cooperation with the United States at a time when China is accelerating its maritime expansion.
"I'm aiming for results (from the meeting) that will add strong momentum to the further development of the relationship between Japan and India," Abe said.
The two leaders are also seen agreeing on the use of Japan's shinkansen system for a planned high-speed railway between Mumbai and Ahmedabad in western India. Japan is planning to support the project with a large amount of low-interest yen loans.
On Thursday, an Indian government minister and official said India's Cabinet has cleared a $14.7 billion Japanese proposal to build its first bullet train line, one of India's biggest foreign investments in its infrastructure sector.
The decision ahead of Abe's visit gives Japan an early lead over China, which is also bidding to build high-speed rail lines across large parts of India's congested and largely British-era system.
Japan had offered to finance 80 percent of the cost of the train, which would link the financial capital Mumbai with Ahmedabad, the commercial center of Indian Prime Minister Narendra Modi's home state of Gujarat, at an interest rate of less than 1 percent.
"It's been done," said a government minister who attended the Cabinet meeting headed by Modi late on Wednesday.

An official in Modi's office confirmed the decision, saying there were some issues relating to the bullet train that had since been sorted out in time for Abe's visit.
"We expect to make an announcement during the visit," the official said. Both the minister and the official declined to be identified.
Broad agreements are also likely to be reached on two bilateral treaties that would enhance defense cooperation between Japan and India.
One is designed to prevent the transfer of defense technologies to a third country, while the other will specify rules for information protection.
This is Abe's third trip to India, including during his first tenure between 2006 and 2007. It will be the fifth time for him to have bilateral talks with Modi.
Abe and Modi will together visit the sacred Hindu city of Varanasi on Saturday in a gesture to further deepen their personal relationship of trust.

India-Japan nuclear ties

December 12, 2015

India to get Japan's bullet train, deepens defense and nuclear ties

http://ajw.asahi.com/article/behind_news/politics/AJ201512120053
REUTERS
NEW DELHI--Japan will provide $12 billion of soft funding to build India's first bullet train, the two countries announced on Dec. 12 during a visit by Prime Minister Shinzo Abe, which also yielded deeper defense ties and a plan for civil nuclear cooperation.
Relations have strengthened between Asia's second and third largest economies as Abe and his Indian counterpart, Narendra Modi, seek to balance China's rise as Asia's dominant power.
The deal to build a high-speed train line between the financial hub of Mumbai and Ahmedabad city gives Japan an early lead over China, which is conducting feasibility studies for high speed trains on other parts of the Indian rail network.
"This enterprise will launch a revolution in Indian railways and speed up India's journey into the future. It will become an engine of economic transformation in India," Modi said in a speech.
Under the defense deals announced on Dec. 12, the two sides will share technology, equipment and military information, but the long-awaited sale of Japanese aircraft in a deal worth about $1.1 billion was not concluded.
Similarly, while they agreed to work toward cooperation in civil-nuclear technology, they stopped short of signing an agreement, citing outstanding technical differences.
Japan, the only country to have experienced nuclear attacks, has been demanding additional nonproliferation guarantees from India before it exports nuclear reactors.
India and Japan have been negotiating a nuclear energy deal since Japan's ally, the United States, opened the way for nuclear commerce with India despite its weapons program.

"The memorandum we signed on civil nuclear energy cooperation is more than just an agreement for commerce and clean energy, it is a shining symbol of a new level of mutual confidence and strategic partnership in the cause of peaceful and secure world," Modi said.
"I know the significance of this decision for Japan and I assure you that India deeply respects that decision and will honor our shared commitment," Modi added.
India and Japan have been holding talks for two years on the purchase by India of US-2 amphibious aircraft made by ShinMaywa Industries, which would be one of Japan's first arms sales since Abe lifted a 50-year ban on weapon exports.

Japanese agreement with India raises protests

December 12, 2015

Civic groups, A-bomb survivors blast Japan-India nuclear power deal

http://www.japantimes.co.jp/news/2015/12/12/national/civic-groups-a-bomb-survivors-blast-japan-india-nuclear-power-deal/#.Vm1_nr8R-ov

Kyodo

Civic groups and atomic bomb survivors on Saturday criticized the Japanese government for agreeing with India to work toward sealing a civil nuclear cooperation pact, fearing the move might lead India to divert the technology to weapons production.

Some 150 civic group members and others gathered in front of the prime minister's office in Tokyo, holding banners such as "We cannot create peace with nuclear" and protesting, "We oppose the Japan-India nuclear deal."

A deal, which involves the export of Japanese nuclear power plant technology, is controversial because India, a nuclear-weapon nation that conducted its first nuclear test in 1974, has not joined the Nuclear Non-Proliferation Treaty. The NPT only recognizes Britain, China, France, Russia and the United States as nuclear powers.

Kanna Mitsuta, a member of an environmental group called Friends of the Earth Japan, said the agreement "tramples" on nonproliferation efforts made by Japan, which had the bitter experience of suffering the devastation of U.S. atomic bombings during World War II.

S.P. Udayakumar, a leading figure in India's anti-nuclear movement, also joined the event via Skype, condemning Japan for trying to sell nuclear power even though its own people are struggling due to the 2011 Fukushima nuclear power plant disaster.

While admitting that the fast-growing Asian country needs electricity, he said people do not want it in the form of nuclear power.

People in Hiroshima and Nagasaki, the two Japanese cities reduced to ruins by U.S. atomic bombs in 1945, also expressed anger.

Hiroshi Shimizu, secretary general of the Hiroshima Prefectural Confederation of A-Bomb Sufferers Organizations said, "We are not sure when India, for some reason, will seek to divert the technology to nuclear weapons."

"This move is intolerable for atomic bomb survivors because it goes against the government's position to seek the abolition of nuclear weapons," the 73-year-old Shimizu said.

Nagasaki Mayor Tomihisa Taue called the latest development "extremely regrettable," noting that atomic bomb survivors' groups and many others were against the civil nuclear cooperation pact.

"I strongly urge (the Japanese government) to fulfill its responsibility as a country subjected to nuclear weapons," he said.

In India on Saturday, Japanese Prime Minister Shinzo Abe agreed with his Indian counterpart Narendra Modi in principle on concluding a civil nuclear cooperation pact, saying the deal will be signed after technical details are finalized.

Reduce thermal to cut emissions

December 17, 2015

Panel: Japan needs to reduce thermal power plants

http://www3.nhk.or.jp/nhkworld/english/news/20151218_02.html

Dec. 17, 2015 - Updated 17:42 UTC+1

An expert panel of Japan's environment ministry has compiled the outline of a proposal calling for fewer coal-fired and other thermal power plants to meet pledges in the new global climate framework agreed in Paris.

The Paris accord obligates countries to submit emissions-cut goals every 5 years. It also seeks to cut net global greenhouse gas emissions to zero in the second half of this century by reducing emissions to levels that forests, oceans, and other matter can fully absorb.

The expert panel discussed how Japan should set a long-term emissions reduction plan within the new framework.

They agreed to advise the ministry to go ahead with a significant cut in the number of thermal power plants. They say such a cut is needed to achieve a Cabinet-decided long-term goal of cutting emissions by 80 percent by 2050.

They say if the country wants to stick to thermal plants, it must use expensive technology to bury carbon dioxide deep underground. They add because of the high cost, Japan must be careful in approving the construction of coal-fired thermal plants.

Plans to build coal-fired plants are gaining momentum in Japan amid the stall of nuclear power generation after the 2011 Fukushima Daiichi accident. In addition, scheduled deregulation of electricity retailing in April is leading newcomers to tend to pick coal-fired thermal plants based on cheaper coal costs.

The panel will submit the final proposal around January of next year.

Nuclear pact with India should not be rushed

January 7, 2015

Govt. to carefully handle nuclear pact with India

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Jan. 7, 2016 - Updated 22:08 UTC+1
The Japanese government will not seek the approval of a nuclear power pact with India at the current Diet session. It cites the need for careful bilateral coordination.

Japan's Vice Foreign Minister Akitaka Saiki and India's Foreign Secretary S. Jaishankar met in Tokyo on Thursday. They discussed procedures to conclude a nuclear pact.

Last month, Japanese Prime Minister Shinzo Abe and his Indian counterpart, Narendra Modi, agreed in principle to conclude a pact that would allow Japan to export its nuclear power-related technology to India.

The mayors of Hiroshima and Nagasaki have expressed regret over the deal. They say **India held nuclear tests in the past and is not a signatory to the Nuclear Non-Proliferation Treaty.**
A senior Foreign Ministry official says the content of a pact must be firm enough to get through expected rigorous debate at the Diet. Parliamentary approval is needed for concluding the deal.

Other government officials have expressed the desire not to proceed hastily with the deal ahead of an Upper House election this summer.

Japan needs to hold in-depth debate on nukes

January 12, 2016

Nuclear Watch: When will Japan awake from the 'dream' of nuclear energy? (Pt. 63)

http://mainichi.jp/english/articles/20160112/p2a/00m/0na/005000c

People form human letters saying the equivalent of, "Congratulations, initial firing ceremony," on the premises of JRR-1, Japan's first nuclear reactor, on Sept. 18, 1957. (Mainichi)

"Japan still has a dream that the country had when it started using atomic energy," said Nobuyasu Abe, a member of the Japan Atomic Energy Commission (AEC), when he talked in a recent interview about challenges that Japan's nuclear energy policy faces.
Abe, 70, has raised questions about Japan sticking to all nuclear-related projects, including fast-breeder reactors and nuclear fuel reprocessing facilities, based on the idea in the 1950s that uranium is an important resource and must be effectively utilized. **Abe calls it "a law of inertia," and dismisses it as Japan's bad habit. He points to the need to hold in-depth debate on the issue depending on changes of the times.**

Japan has repeated that it will never have surplus plutonium. Still, Japan has found no way to spend 47.8 tons of plutonium that the country has accumulated. With revisions to the Japan-U.S. nuclear energy agreement coming in three years, bilateral negotiations on the matter will face rough going unless Tokyo paves the way for solving this problem.

"Holding Japan-U.S. talks (on the issue) is equal to considering the future direction of Japan's atomic energy," says Toichi Sakata, 67, former vice minister of education, culture, sports, science and technology, who was involved in bilateral talks in the 1980s.

Sakata suggests that **unless all those involved in the use of nuclear energy begin discussions to work out long-term policy measures, Japan's utilization of atomic energy will come to a deadlock.**

There is a reference case in Britain, which has accumulated 114 tons of plutonium for civilian use, more than twice the amount Japan possesses. Britain held discussions for nearly two years from 2010 on whether plutonium is a resource or waste because the country needed to spend 2 billion pounds a year, or some 240 billion yen at the exchange rate at the time, on storing plutonium and had difficulties managing it. People from various circles participated in the discussions. The process of the discussions was fully released to the public for national debate. They concluded that plutonium should be used to make mixed-oxide fuel and plutonium that could not be processed to produce such fuel should be dumped.

Tatsujiro Suzuki, 64, professor at Nagasaki University who had served as acting chairman of the AEC, points out that Britain has expressed its readiness to take over plutonium Japan has accumulated if Tokyo pays a certain amount of money. Suzuki says this is an option.

One cannot help but wonder when Japan will awake from its "dream." **Japan should hold in-depth debate from a long-term perspective instead of adopting an all-or-nothing approach of simply debating whether to promote or discontinue the use of atomic energy.** (By Haruyuki Aikawa, Senior Writer)

What nuclear "renaissance"?

Nuclear renaissance? Failing industry is running flat out to stand still

http://www.theecologist.org/News/news_analysis/2987010/nuclear_renaissance_failing_industry_is_running_flat_out_to_stand_still.html

Dr Jim Green

30th January 2016

Despite the endless rhetoric about a 'nuclear renaissance', there are fewer power reactors today than there were a decade ago, writes Jim Green. The one country with a really big nuclear build program is China, but no one expects it to meet its targets. And with over 200 reactor shut-downs due by 2040, the industry will have to run very hard indeed just to stay put.

Over the next 10-20 years, global nuclear capacity may increase marginally, with strong growth in China more than masking patterns of stagnation and decline elsewhere. Beyond that, the aging of the global fleet of power reactors will be sharply felt.

Ten new power reactors began supplying electricity last year (eight of them in China), and eight reactors were permanently shut down.

Nuclear power's 20-year pattern of stagnation continues. In 1995 there were 434 'operable' reactors - operating plus temporarily shut down reactors. In 2005 there were 441, and now there are 439.

Thus there are fewer reactors today than there were a decade ago. Moreover the 439 figure includes 41 reactors in Japan that have been shut down for several years, and not all of them will be restarted.

The nuclear power industry's malaise was all too evident at the COP21 UN climate change conference in Paris in December. Former World Nuclear Association executive Steve Kidd noted:

"It was entirely predictable that the nuclear industry achieved precisely nothing at the recent Paris COP21 talks and in the subsequent international agreement. ...

"Analysis of the submissions of the 196 governments that signed up to the Paris agreement, demonstrating their own individual schemes on how to reduce national carbon emissions, show that nearly all of them exclude nuclear power.

"The future is likely to repeat the experience of 2015 when 10 new reactors came into operation worldwide but 8 shut down. So as things stand, the industry is essentially running to stand still."

According to the International Atomic Energy Agency, only seven out of 196 countries mentioned nuclear power in their climate change mitigation plans prepared for the COP21 conference: China, India, Japan, Argentina, Turkey, Jordan and Niger.

Now it's getting nasty

A striking feature of the debates around the COP21 conference was the vitriol directed at the anti-nuclear and environmental movements. Tim Judson from the Nuclear Information and Resource Service noted:

"The industry's rhetoric is getting increasingly desperate and personal. The industry rolled out a new front group called 'Nuclear for Climate', which handed out thousands of copies of a book attacking anti-nuclear activists and blaming us for the climate crisis.

"Needless to say, their efforts to intimidate activists are backfiring. In fact, they have given us a clear sign of how close we are to winning.

"Greenpeace International's Kumi Naidoo reminded activists in a speech in December - in which he broadened the call for divestment to include nuclear, as well as fossil fuels - of the famous adage attributed to Gandhi about the path to victory: 'First they ignore you. Then they laugh at you. Then they fight you. And then you win.'"

Perhaps the five stages of grief are relevant as nuclear lobbyists confront the reality that the nuclear renaissance didn't eventuate and isn't likely to. Denial and anger are very much in evidence, along with some bargaining ('we need all low carbon power sources'), depression and, in time, acceptance.

China's great leap forward

With 30 operable reactors, 24 under construction, and many more in the pipeline, China remains the only country with significant nuclear expansion plans. China is unlikely to meet any of its targets - 58 GW by 2020, 110 GW by 2030 and up to 250 GW by 2050 - but growth will be significant nonetheless.

Growth could however be derailed by a serious accident, which is all the more likely because of China's inadequate nuclear safety standards, inadequate regulation, lack of transparency, repression of whistleblowers, world's worst insurance and liability arrangements, security risks, and widespread corruption.

There are fears, for example, that China may press ahead with its twin-EPR project at Taishan despite fears over the metallurgy of its reactor vessels and heads. Similar components supplied to the EPR at Flamanville in France have been found to have areas of excessive carbon leading to brittleness and possible failure in use. The French project is now on hold and may never be completed.

Over the next 10-20 years, global nuclear capacity may increase marginally, with strong growth in China more than masking patterns of stagnation and decline elsewhere. Beyond that, the aging of the global fleet of power reactors will be sharply felt: the International Energy Agency anticipates almost 200 permanent shut-downs by 2040.

Steve Kidd notes that the industry is running to stand still, and it will have to run faster to stand still as the annual number of shut-downs increases.

Growth elsewhere?

India is the only other country where there is a possibility of significant nuclear growth in the nearish-future. But nuclear growth in India has been modest - six reactor start-ups over the past decade - and may remain so.

In early 2015, India claimed to have resolved one of the major obstacles to foreign investment by announcing measures to circumvent a liability law which does not completely absolve suppliers of responsibility for accidents.

But those claims were met with scepticism and a capital strike by most foreign suppliers is still in effect. Strong public opposition - and the Indian state's brutal response to that opposition - will also continue to slow nuclear expansion.

India has just signed an 'preliminary agreement' with EDF to build a massive six-reactor EPR project at Jaitapur, 360km south of Mumbai. But given the still-unresolved liability issues and the EPR's disastrous construction record to date, it's hard imagine any but the most cautious of progress taking place.

Meanwhile renewables are surging ahead. One part of the Jaitapur deal that is likely to move ahead fast is 142MW of wind power in Gujarat that EDF is to develop with its Indian partner, SITAC.

And in mid-January 2016, the latest auction of solar energy capacity in India achieved a new record low price of 4.34 rupees / kWh (US$0.064; €0.059). Energy minister Piyush Goyal said: *"Through transparent auctions with a ready provision of land, transmission and the like, solar tariffs have come down below thermal power cost."*

Russia has 35 operating reactors and eight under construction (including two very low power floating reactors). Only six reactors have started up over the past 20 years, and only four over the past decade. The pattern of slow growth will continue.

As for Russia's ambitious nuclear export program, Steve Kidd noted in October 2014 that it *"is reasonable to suggest that it is highly unlikely that Russia will succeed in carrying out even half of the projects in which it claims to be closely involved".*

South Korea has 25 operable reactors and three under construction. Six reactors have started up over the past decade. Along with China, India and Russia, South Korea is supposedly one of the four countries driving the 'nuclear renaissance'. But the best the industry can hope for in South Korea is slow growth.

South Africa plans 9.6 GW of new nuclear capacity to add to the two Koeberg reactors. But the nuclear program is more theatre than reality. Pro-nuclear commentator Dan Yurman states:

"South Africa's plans to build 9.6 GW of nuclear power will continue to be embroiled in political controversy and be hobbled by a lack of realistic financial plans to pay for the reactors.

"Claims by both Rosatom and Chinese state nuclear firms that they have won the business are not credible. Even if written down on paper, these claims of contracts cannot be guaranteed in the long term due to the political twists and turns by South African President Jacob Zuma.

"Most recently, he burned through three finance ministers over differences about whether the country could afford the cost of the reactors said to be at as much as US$100 billion including upgrades to the electrical grid. Additionally, Zuma is distracted by political and personal scandals."

Brazil's nuclear industry provided some theatre in 2015 with the arrest of Othon Luiz Pinheiro da Silva, the former CEO of Brazil's nuclear power utility Eletronuclear, for allegedly accepting bribes to fix the bidding process for the Angra 3 reactor under construction 100 km from Rio de Janeiro. Fourteen other people were also charged as a result of the federal police's 'Operation Radioactivity'.
"The arrest is a tragedy for the industry," said former Eletrobras' chief executive Luiz Pinguelli Rosa. *"The industry was already in crisis, but now the corruption concerns are bound to delay Angra 3 further and cause costs to rise even more."*
Newcomer countries: The World Nuclear Association claims that *"over 45 countries are actively considering embarking upon nuclear power programmes."* Balderdash. Only two 'newcomer' countries are actually building reactors - Belarus and the United Arab Emirates. Other countries might join the nuclear club but newcomers will be few and far between.
Moreover, some countries are phasing out nuclear power. Countries with nuclear phase-out policies include Germany, Belgium, Taiwan, and Switzerland. Other countries - e.g. Sweden - may phase out nuclear power partly as a result of deliberate government policy and partly because of natural attrition: aging reactors are being shut down without replacement.
Stagnation and decline
Patterns of stagnation or slow decline in North America and western Europe can safely be predicted. In 2014, the European Commission forecast that EU nuclear generating capacity of 131 GW in 2010 will decline to 97 GW in 2025.
The European Commission forecasts that nuclear's share of EU electricity generation will decline from 27% in 2010 to 21% in 2050, while the share from renewables will increase from 21% to 51.6%, and fossil fuels' share will decline from 52% to 27%.
The most important nuclear power story of 2015 was legislation enacted in the French Parliament in July that will reduce nuclear's share of electricity generation from 75% to 50% by 'around' 2025, and caps nuclear capacity at the current level of 63.2 GW.
The legislation also establishes a target of 32% of electricity generation from renewables by 2030, a 40% reduction in greenhouse gas emissions and a 20% reduction in overall energy consumption by 2030.
In April 2015, a report by ADEME, a French government agency under the Ministries of Ecology and Research, shows that 100% renewable electricity supply by 2050 in France is feasible and affordable.
French EPR reactor projects in **France and Finland** are three times over budget and many years behind schedule. As already noted, in April 2015 it was revealed that EDF's Flamanville EPR under construction in France has a weak pressure vessel and head, and that the same problem may afflict China's twin-EPR project with EDF at Taishan.
A January 2016 update to the World Nuclear Industry Status Report discusses the miserable state of the French nuclear industry:
"The French state-controlled AREVA, having announced an outlook of a further 'heavy loss' in 2015, was downgraded by credit-rating agency Standard & Poor's to B+ ("highly speculative"). On 29 December 2015, the company plunged to a new historic low on the stock market (€5.30 compared to €72.50 eight years ago).
"On 7 December 2015, Euronext ejected the French heavy weight Électricité de France (EDF), largest nuclear utility in the world and "pillar of the Paris Stock Exchange", from France's key stock market index, known as CAC40. One day later, EDF shares lost another four percent of their value, which led to a new low, a drop of over 85 percent from its 2007 level. ...
"The French nuclear industry's international competitors are not doing much better. AREVA's Russian counterpart Atomenergoprom as well as the Japanese controlled Toshiba-Westinghouse were both downgraded to 'junk' ('speculative') by credit-rating agencies during the year."

Next door in **Belgium**, ageing reactors at Doel and Tihange - shut down a year ago because of serious safety concerns over numerous leaks and, at Tihange, 16,000 reactor vessel cracks - are scheduled to start up shortly, triggering serious concern across Europe. An Avaaz petition to be delivered to Belgium by German Environment Minister Barbara Hendricks on Monday has already attracted almost 500,000 signatures.

In the **United States**, utilities announced two more reactor shut-downs in 2015: the FitzPatrick reactor in New York will be shut down in 2016, and the Pilgrim reactor in Massachusetts will be closed between 2017 and 2019.

Five reactors are under construction but a greater number have been shut down recently or will be shut down in the next few years. The last reactor start-up was in 1996. In August 2015 the Environmental Protection Agency released its final Clean Power Plan, which failed to give the nuclear industry the subsidies and handouts it was seeking.

A decade ago, the US Nuclear Regulatory Commission was flooded with applications for US$127 billion (€117b) worth of reactor projects. Now, obituaries for the US nuclear power renaissance are increasingly common.

The situation is broadly similar in the **United Kingdom** - the nuclear power industry there is scrambling just to stand still. It should be clear by the end of this year whether the extraordinarily expensive Hinkley C EPR project will go ahead. But the signs are not good for the project's backers: EDF was due to make its 'final investment decision' this week, but flunked out owing to its inability to raise the necessary £18 billion.

According to the World Nuclear Association, most of the UK's reactors are to be retired by 2023. If other projects prove to be as expensive and difficult as Hinkley C, it's unlikely that new nuclear capacity will match retirements.

In **Japan**, only two of the country's 43 operable reactors are actually operating. Perhaps half to two-thirds of the reactors will eventually restart. Five reactors were permanently shut down in 2015, and the six reactors at Fukushima Daiichi have been written off.

Before the Fukushima disaster, Tokyo planned to add another 15-20 reactors to the fleet of 55, giving a total of 70-75 reactors. Thus, Japan's nuclear power industry will be at most half the size it might have been if not for the Fukushima disaster.

Generation IV reactors to the rescue?

Rhetoric about 'super safe', 'best thing since sliced bread' Generation IV reactors will likely continue unabated. That said, critical reports released by the US and French governments last year may signal a slow shift away from Generation IV reactor rhetoric.

The report by the French Institute for Radiological Protection and Nuclear Safety (IRSN) - a government authority under the Ministries of Defense, the Environment, Industry, Research, and Health - states:

"There is still much R&D to be done to develop the Generation IV nuclear reactors, as well as for the fuel cycle and the associated waste management which depends on the system chosen."

IRSN is also sceptical about safety claims: *"At the present stage of development, IRSN does not notice evidence that leads to conclude that the systems under review are likely to offer a significantly improved level of safety compared with Generation III reactors ... "*

The US Government Accountability Office released a report in July 2015 on the status of small modular reactors (SMRs) and other 'advanced' reactor concepts in the US. The report concluded:

"While light water SMRs and advanced reactors may provide some benefits, their development and deployment face a number of challenges ... Depending on how they are resolved, these technical challenges

may result in higher-cost reactors than anticipated, making them less competitive with large LWRs [light water reactors] or power plants using other fuels ...
"Both light water SMRs and advanced reactors face additional challenges related to the time, cost, and uncertainty associated with developing, certifying or licensing, and deploying new reactor technology, with advanced reactor designs generally facing greater challenges than light water SMR designs.
"It is a multi-decade process, with costs up to $1 billion to $2 billion, to design and certify or license the reactor design, and there is an additional construction cost of several billion dollars more per power plant."
Even SMR boosters are struggling to put a positive spin on the situation. Launching a Nuclear Energy Insider report on SMRs, lead author Kerr Jeferies said: *"From the outside it will seem that SMR development has hit a brick wall, but to lump the sector's difficulties together with the death of the so-called nuclear renaissance would be missing the point."*
According to a US think tank, 48 companies in north America, backed by more than US$1.6 billion (€1.5b) in private capital, are developing plans for advanced nuclear reactors. But even if all that capital was invested in a single R&D project, it would not suffice to commercialise a new reactor type.
The UK government also sees a big future for SMRs and has even promised to spend £250 million on *"nuclear innovation and Small Modular Reactors"*. But it will face two big problems. First, the money won't go far. And second, nuclear power is already being outcompeted by wind and solar, which are getting cheaper all the time.
Dan Yurman notes in his review of nuclear developments in 2015: *"Efforts by start-up type firms to build advanced reactors will continue to generate a lot of media hype, but questions are abundant as to whether this activity will result in prototypes.*
"For venture capital firms that have invested in advanced designs, cashing out may mean licensing a design to an established reactor vendor rather than building a first-of-a-kind unit."
***Dr Jim Green** is the national nuclear campaigner with Friends of the Earth Australia and editor of the* Nuclear Monitor *newsletter, where this article was originally published. Nuclear Monitor is published 20 times a year. It has been publishing deeply researched, often strongly critical articles on all aspects of the nuclear cycle since 1978. A must-read for all those who work on this issue!*

Three reactors to be scrapped

February 11, 2016

c

http://www.japantimes.co.jp/news/2016/02/11/national/kansai-electric-japan-atomic-power-move-plans-scrap-three-reactors/#.VrxnNlKDmot

JIJI
Kansai Electric Power Co. and Japan Atomic Power Co. will submit applications to the Nuclear Regulation Authority as early as Friday seeking approval for plans to scrap aging nuclear reactors in western Japan, it was learned Thursday.

The timetables for the **No. 1 and No. 2 reactors of Kansai Electric's Mihama plant** and for the **No. 1 reactor of Japan Atomic Power's Tsuruga plant** will outline the facilities and equipment to be dismantled and the length of time it will take to complete the work.
The dismantling operations are expected to take around 30 years for the Mihama No. 1 and No. 2 reactors and about 25 years for the Tsuruga No. 1 reactor, informed sources said. The three reactors, **all in Fukui Prefecture**, were decommissioned in April last year.
On Wednesday, **Kansai Electric and Japan Atomic Power concluded agreements with the Fukui Prefectural Government and the governments of the host municipalities** — the town of Mihama and city of Tsuruga. The agreements, which include regional revitalization measures, are the first of their kind in Japan.
Along with the three reactors, the No. 1 reactor at Kyushu Electric Power Co.'s Genkai plant in Saga Prefecture and the No. 1 reactor at Chugoku Electric Power Co.'s Shimane plant in Shimane Prefecture were decommissioned in April last year.
Kyushu Electric filed an application in December for NRA approval of its schedule to scrap the Genkai No. 1 reactor.

Worldwide more wind than nukes

February 20, 2016

Global wind power capacity tops nuclear energy for first time

http://www.japantimes.co.jp/news/2016/02/20/national/global-wind-power-capacity-tops-nuclear-energy-for-first-time/#.VshjTeaDmot

Kyodo
The capacity of wind power generation worldwide reached 432.42 gigawatts (GW) at the end of 2015, up 17 percent from a year earlier and surpassing nuclear energy for the first time, according to data released by global industry bodies.
The generation capacity of wind farms newly built in 2015 was a record 63.01 GW, corresponding to about 60 nuclear reactors, according to the Global Wind Energy Council based in Brussels. The global nuclear power generation capacity was 382.55 GW as of Jan. 1, 2016, the London-based World Nuclear Association said.
Both wind power and nuclear energy are being touted as alternatives to fossil fuel power as they produce fewer greenhouse gases.
Wind energy has captured renewed attention as technological innovation has considerably lowered its generation costs while nuclear power continues to suffer a backlash following the 2011 Fukushima meltdowns.
Wind power is the leading energy source in the transition from fossil fuels to renewables, the wind energy council said as it released the data last week.
China led all other countries in wind energy generation capacity with 145.10 GW. Beijing is promoting wind power to shift from coal and other fossil fuels to combat air pollution and global warming.

Coming in second behind China is the United States with 74.47 GW, followed by Germany with 44.95 GW, then India with 25.09 GW and then Spain with 23.03 GW. Japan produced 3.04 GW.

Greenpeace: 5 years and far from over

Source : Greenpeace
http://www.greenpeace.org/international/en/news/Blogs/nuclear-reaction/fukushima-nuclear-crisis-japan-radiation-research/blog/55623/

Five years on and the Fukushima crisis is far from over

Blogpost by **Shaun Burnie** - 24 February, 2016 at 20:00 1 comment

Five years ago the Rainbow Warrior sailed along the Fukushima coast conducting radiation sampling. Now it's back, and has Japan's ex-Prime Minister on board.

Scotland is over 9,000 km from Japan, but there's something the two countries have in common. Along the Scottish coastline, buried in riverbeds, and mixed into the Irish Sea, you can find significant radioactive contamination coming from the other side of the world. Yes, radioactive contamination. All the way from Japan.

Since the 1970s, Sellafield, a nuclear-reprocessing plant in northwest England has been contracted to process high level nuclear waste spent fuel from Japanese reactors. More than 4000 tonnes of spent nuclear fuel was shipped from Japan to Sellafield, including waste from Tokyo Electric Power Company (TEPCO), the owner of the Fukushima Daiichi nuclear plant. As result of reprocessing at Sellafield, more than 8 million litres of low level nuclear waste is discharged into the ocean every day. It's been labelled the "most hazardous place in Europe" - with levels of contamination in the fields, soils and estuaries at a level that can only be described as a nuclear disaster zone. In fact, the Irish Sea is arguably the most radioactively contaminated sea in the world

We're about to approach the five-year anniversary of the Fukushima Daiichi nuclear disaster, and this is a stark reminder that no matter where you are or how far away, nuclear power has a local and global impact.

I remember waking up to the news on March 11, 2011. Though I was at home in Scotland, I've never felt so connected to the people of Japan. Having spent decades with Greenpeace actively campaigning against nuclear power in Japan, I knew deep down that a catastrophic accident was only a matter of time. With media requests coming in thick and fast, I recall appearing on BBC World News live. In mid-interview, as I was talking about the specific threat at Fukushima, I was interrupted as the news crossed to Japan where Reactor 3 exploded.

Greenpeace Japan sent a team to the Fukushima evacuation zone to conduct independent radiation testing; and researchers on the Rainbow Warrior, kitted up in full body chemical suits, pulled floating seaweed from the surrounding area to use as samples. Our results were unfortunately as you would expect – high levels of contamination. Subsequently, we've also found radiation is still so widespread that it's unsafe for people to return across large parts of Fukushima.

Nearly five years later and I'm in Japan on-board the Rainbow Warrior - this time with the famously anti-nuclear former Prime Minister of Japan, Mr. Naoto Kan. It's truly an honour and privilege to hear him describe the first hours and days of the accident in March 2011, as well as show him the research that we are carrying out. As we sailed within 2km of the nuclear plant the feelings are both profound and surreal.

From the deck we've seen steel tanks holding hundreds of thousands of tons of contaminated water; the four reactors now shielded behind temporary structures in an effort to contain some of the radioactive material from being released into the atmosphere; and inside the reactors themselves lie hundreds of tons of molten reactor fuel for which there are no credible plans to deal with.

But there's another reason the Rainbow Warrior is here. A Greenpeace Japan research vessel is conducting underwater marine radiation surveys within a 20km radius of the Fukushima Daiichi plant, with the Rainbow Warrior acting as campaign ship. As with the radioactive contamination near my home in Scotland, Greenpeace is aiming to further the understanding of the impacts and future threats from nuclear power and in particular the Fukushima Daiichi nuclear accident.

For Mr Naoto Kan, who was Japan's leader when the disaster hit, this voyage is as much personal as it is political. In the years since 2011 he has spoken out publicly against the nuclear industry, standing alongside millions of Japanese people opposed to nuclear power – a far cry from the current "tone-deaf" Abe administration, which is desperately trying to save a nuclear industry in crisis. Opposed by the majority of citizens, and beset by enormous technical, financial and legal obstacles, it's an effort that I believe is doomed to failure.

But there's hope.

Like the many communities across the country that are switching to innovative renewable power projects, Mr Kan knows that nuclear should be buried in the past. Renewables in Japan are rising. In the 2015 fiscal year, solar power capable of generating an estimated 13 TWh was newly installed - more than the two Sendai reactors in southern Japan that were restarted that year can produce.

For Japan to go 100% renewable it must urgently formulate more ambitious targets; stop all planned investments in new coal power plants and finally abandon plans to restart its ageing reactors and remove the institutional and financial obstacles to renewable energy growth.

A nuclear free future is not only possible it is essential. Renewable energy is the only safe and secure energy for the people of Japan and the world. .

Shaun Burnie is a senior nuclear specialist with Greenpeace Germany.

Akio Matsumura: Our lessons from Fukushima

Our Lessons from Fukushima: New Concerns for the Future

March 6, 2016Environment, Japan, Nuclear

français

Akio Matsumura

This week people across the world are commemorating the fifth anniversary of the worst nuclear power accident in history, which occurred at the Fukushima Daiichi Power Plant in Japan on March 11, 2011.

A woman is seen at a temporary housing complex covered in snow that accommodates nuclear evacuees from Okuma, a town inside the exclusion zone next to Tokyo Electric Power Co's (TEPCO) tsunami-crippled Fukushima Daiichi nuclear power plant, in Aizuwakamatsu, Fukushima prefecture, February 17, 2015. REUTERS/Toru Hanai

Many aspects of the crisis continue to affect human and environmental safety. There are still 178,000 evacuees in total (99,750 at Fukushima) who do not know when they can return home. 400 tons of contaminated water run into the sea every day. Frequent torrential rains wash away radioactive materials remaining at the site into the sea. 814,782 tons of contaminated water are stored at about 1,000 tanks, with more tanks built every month. The 7,000 workers at the site undertake dangerous tasks every day. The dedicated workers have solved many problems so far, but many continue to perplex managers and cleanup crews. No one approaches reactors 1, 2, and 3 due to strong radiation, and no scientific solution is expected for at least forty years. Unfortunately, future disruption cannot be discounted – the possibility of another strong earthquake in forty years is non-zero.

Since the Fukushima accident, we were fortunate to quickly receive opinions and recommendations across many fields. Nuclear scientists, medical doctors, military personnel, seismologists, biologists, oceanographers, volcanologists, journalists, spiritual leaders, parliamentarians, students and grass-root organizations, and public opinion leaders all weighed in. The horizontal perspective that emerged offered a different view than was possible from any single discipline, no matter how expert the practitioner. The Japanese benefited from these messages that cut through the confusion that pervaded the media at the time.

On the occasion of the 5th anniversary of the Fukushima nuclear accident, I would like to recall the early stages of the event, and share my own appraisal and recommendations from the lessons I have learned from this painful event.

In the first two weeks, experts and the public alike sought technical solutions. Panic grew when few were available. Did the cores meltdown? What was the appropriate distance to evacuate? How could we maintain the cooling systems for the reactors through multiple system failures? Are the ventilation systems working? Was this worse than Chernobyl? Can Self-Defense Force helicopters drop water on the spent-fuel pools of units 3 and 4?

It might be impossible to accurately describe the panic shooting through Japan's leaders and the public at the time. Government agencies and the utility in charge, the Tokyo Electric Power Company, were unprepared for the catastrophic nuclear disaster. The public blamed both parties, and they blamed each other, for poor communication and delays.

The confusion and panic were not limited to Japan, but extended to the US government as well. There was a huge gap between the two governments' assessments of the damages of the six reactors, in particular of the fourth reactor, which because of coincidental maintenance was in a unique position. Mixed messages on safety and damage caused more panic: Japan's government decided 12.5 miles (20 km) was an appropriate evacuation zone while the US government settled on 50 miles (80km) for its citizens. The United Kingdom, France, Germany, and other countries told their citizens to consider leaving Tokyo, 125 miles away (200 km).

From the start, a few experts knew the crisis went beyond current technical solutions, but that any step forward would require more information. Early in the confusion, my good friend, the late Dr. Hans-Peter Durr, former Director of Astrophysics at the Max Planck Institute in Germany, called me to suggest I inform the Prime Minister of Japan that the Fukushima accident was much worse than Japan's government had let on. Although Japan had not admitted the core meltdown then, Hans-Peter knew that Fukushima had brought us to the edge of our scientific knowledge. He recommended Japan invite an independent assessment team of top nuclear scientists and structural engineers to develop a solution. I passed his urgent message on to the Prime Minister office and party leaders.

What was the scope of the problem? A year after the crisis and we still had little quantitative sense. One way to begin to get a sense was to know the number of spent fuel assemblies on site. TEPCO did not share this information, so I asked Ambassador Mitsuhei Murata to check discretely with inside sources. He informed us that the total number of spent fuel assemblies at the Fukushima Daiichi site, excluding the assemblies in the pressure vessels, was 11,421. Then I asked Robert Alvarez, former Senior Policy Adviser to the Secretary and Deputy Assistant Secretary for National Security and the Environment at the U.S. Department of Energy, an explanation of the potential impact of the 11,421 assemblies.

On April 3, 2012, Bob interpreted this number for us. The results were astounding. The Cesium-137 at the site was 85 times greater than at the Chernobyl accident.

While it would not necessarily go "boom" like a nuclear bomb, this amount of radiation had enormous destructive potential. People were shocked to find this out. The article quickly gained over one million readers and was shared virally through the Internet. There is no doubt that without the warnings by international scientists about the potential global catastrophe of the fourth reactor, Japan's government would not have made it a priority to remove the 1,535 fuel assemblies, which contained 14,000 times the radiation of the Hiroshima bomb.

Without experts from multiple fields, important information would have been remained with the government and nuclear utility, rather than with the public.

But even with this information, large aspects of the crisis and its cause are hidden if the focus remains technical. Mr. Kiyoshi Kurokawa, chairman of the National Diet of Japan Fukushima Accident Independent Investigation Commission, has a different, but definitive, perspective.

The earthquake and tsunami of March 11, 2011 were natural disasters of a magnitude that shocked the entire world. Although triggered by these cataclysmic events, the subsequent accident at the Fukushima Daiichi Nuclear Power Plant cannot be regarded as a natural disaster. It was a profoundly manmade disaster – that could and should have been foreseen and prevented. And its effects could have been mitigated by a more effective human response.

How could such an accident occur in Japan, a nation that takes such great pride in its global reputation for excellence in engineering and technology? This Commission believes theJapanese people – and the global community – deserve a full, honest and transparent answer to this question. What must be admitted – very painfully – is that this was a disaster "Made in Japan."
Its fundamental causes are to be found in the ingrained conventions of Japanese culture: our reflexive obedience; our reluctance to question authority; our devotion to 'sticking with the program'; our groupism; and our insularity.

For me, Fukushima taught that we live with new threats, and have been living with them for decades. I learned that a nuclear power plant accident can have an unimaginable impact over human life for centuries. The accident has caused untold harm to those whose lives were disrupted by the plant. If things had gone worse, what about the effect of 24,000 years of environmental harm on future generations?

It is one thing if the public had been aware of and accepted these risks when the plant was constructed. Unfortunately, this was not the case in Japan. Those in charge did not even accept these risks, not at the time of construction, nor at the time of the accident. Not even now.

TEPCO has admitted only last month, five years later, that it delayed two months in using the term "meltdown" at the site. Arnie Gundersen of Fairewinds and Mycle Schneider, author of the World Nuclear Industry Status Report, have indicated that it was obvious from the moment there were massive releases of fission gases that a meltdown was underway. But TEPCO's denial had an impact on how they handled the panic. As Dr. Helen Caldicott suggested, it was obvious that Japan's government should have evacuated women and children sooner and much farther away. Helen wrote for our blog: The Nuclear Sacrifice of Our Children : 14 recommendations to help radiation contaminated Japan. TEPCO and government authorities refused to hear the wake-up call, brushing off the warnings of many experts.

After five years of reflection, Fukushima has pointed me to new concerns with nuclear power plants. It is my important discovery from the Fukushima nuclear power accident that we failed to understand the radiation from the nuclear bombs and the radiation from the nuclear accident are little different in terms of the risk for human life. We have long accepted the dangers of attacks by state actors with nuclear weapons, and now we understand the threat of human error and natural disasters like earthquakes, tsunamis, and volcanoes, on nuclear power plants. What about attacks on nuclear power plants? Above all, I am concerned with terrorist attacks on nuclear power plants in volatile countries, especially Pakistan.

Prime Minister Nawaz Sharif and President Xi Jinping shake hands as China agrees to build more nuclear power plants in Pakistan.

The odds are high and increasing that a terrorist group will target one or more of the many nuclear power plants around the world. These as well as many other such plants remain insecure from various threats – and intelligence of some threats remains hard to share between governments. The United States could not warn Japan, a close ally, of some specific threats if they wanted to! Other nuclear threats, like a small suitcase-sized nuclear device exploding in Times Square, continue to give experts and presidents nightmares. Given the probability of these risks in the year ahead, regardless of whether we live in a democratic or authoritarian society it is surprising that the public has no information on the matter. As we saw in Fukushima, so much pain is caused by the sudden realization that we have been asked to live with risks that were hidden from us until it was too late.

Experts will and should do much of the work in defining, examining, and making recommendations for solutions on these risks. This responsibility increases as more nuclear power plants are built and planned – especially in China, India, the United Arab Emirates, Vietnam, and Indonesia. But an open conversation with the public brings many benefits for preventing attacks and accidents and reacting appropriately once they have occurred. Social media presents itself as a potential bridge between society and experts from many fields when a nuclear accident or attack occurs. Indeed, this could be a powerful tool to complement efforts of other organizations working hard to prevent nuclear disasters. Loss of control of information is difficult for any authority, but Fukushima and other scenarios like Ebola have shown the limits of top-down communication channels.

Politicians face many competing challenges and interests in their jobs as they lead society forward. Nuclear energy looks like a good fit for the challenges of climate change, for example. But no assessment can be considered correct or honest if the risks of any solution are not presented openly to all interested

parties, including the public. Fukushima has offered us an opportunity to have a wide-ranging debate on the challenges we face at the intersection of many human needs – carbon-free energy, safety, environmental health, human security, and preservation for future generations. These are issues that will define our human society for centuries to come – we should not miss the chance to discuss them with all the facts on the table.

A parting note: Sir Brian Flowers, a prominent British nuclear physicist, pointed out that if nuclear power plants had been built and deployed in Europe before WWII, then large parts of Europe would be uninhabitable today because of conventional warfare and conventional sabotage directed against those nuclear plants.

Minamisoma mayor (of the first non-nuclear city)

March 9, 2016

Minamisoma mayor sees future for Fukushima 'nonnuclear' city in energy independence

http://www.japantimes.co.jp/community/2016/03/09/voices/minamisoma-mayor-sees-future-fukushima-nonnuclear-city-energy-independence/#.VuEhtOaDmot

by Sarai Flores

The massive earthquake and tsunami of March 11, 2011, exacted a huge toll on Minamisoma, leaving hundreds dead or missing and much of the city of 70,000 people destroyed. However, the tragedy for the coastal city was just beginning.

Minamisoma's location 25 km north of Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant put it in the direct path of a sinister invisible danger after three of the plant's tsunami-hit reactors experienced nuclear meltdowns. More than 60,000 of the town's residents evacuated as fears grew over radiation that was released into the air from the crippled nuclear plant. Speaking to an audience five years later at a news conference in Tokyo, Katsunobu Sakurai, the mayor of Minamisoma, said his city has still not fully recovered from the nuclear disaster.

Amid calls to toughen safety measures in Japan's nuclear industry following the accident, all reactors across the country were subsequently halted. Last year saw the restart of three idled nuclear reactors in Fukui and Kagoshima prefectures after those facilities passed new tougher safety tests instituted in the wake of the disaster. Later this year, Tepco is hoping to reactivate two reactors at its mammoth Kashiwazaki-kariwa plant in Niigata Prefecture, which would be the company's first restarts since the Fukushima meltdowns.

"As a citizen and as a resident of an area affected by the nuclear power plant disaster, I must express great anger at this act," said Sakurai. "When we are looking at how all the affected areas of Japan, including Minamisoma, can rebuild following the disaster, it is necessary for all of Japan to change its way of

thinking, and its way of life too — to move to become a society like Germany, which is no longer reliant on nuclear power."

Sakurai briefly became one of the most famous faces of the 3/11 triple disaster after posting an 11-minute video on YouTube on March 24, 2011, begging for supplies and support for his town to prevent its people from starving to death.

Five years on, the city's population has rebounded to 57,000, 80 percent of its pre-3/11 size, but many younger people of working and child-bearing age who fled have not come back. Families are afraid to return because of lingering worries about high radiation levels or fear that compensation from the government will be cut or withdrawn completely, Sakurai said. This is having social as well as economic implications, as the town is short of workers able or willing to work in kindergartens and day care facilities, for example.

"Our hope is for as many people as possible to be able to return to Minamisoma and also join or become involved in the ongoing recovery process," Sakurai explained. "However, we are also faced with the reality that, now that five years have passed since the disaster, particularly those from younger generations who have moved away from the area have built new homes and new lives in their places of evacuation, or in the places they have moved to."

In March of last year, Minamisoma declared itself to be a "nonnuclear city," something Sakurai says his city within the 30 km evacuation zone is the first in Japan to do. Turning to the use of solar and wind power in agricultural projects, in tandem with energy-saving measures, Sakurai is aiming for the city to be completely self-reliant in terms of energy by 2030.

"Within a situation where there is so much suffering around the world, what people around the globe are really hoping for are safe communities and safe societies in which they can live," said Sakurai. "Of course, this is the same for Minamisoma, and so having experienced this disaster, which we take very seriously, I would like to pledge to everybody that the city and I personally need to work to create an environment which is safe for people to live in," said Sakurai.

Japan to help Iran

May 20, 2016

Iran hopes quake-experienced Japan can help build nuclear plant

http://www.japantimes.co.jp/news/2016/05/20/national/politics-diplomacy/iran-hopes-quake-experienced-japan-can-help-build-nuclear-plant/#.Vz7LPeRdeot

JIJi

Iran expects Japan's cooperation in its nuclear power plant construction, Iranian Deputy Foreign Minister Seyed Abbas Araghchi said in Tokyo on Thursday.

Iran, a country with as many earthquakes as Japan, needs Japan's advanced nuclear plant construction technologies, Araghchi, a former ambassador to Japan, said at a news conference at the Japan National Press Club.
Araghchi said economic relations with Western countries have yet to return to presanctions levels.
Companies all around the world are paying attention to the Iranian market, Araghchi said, referring to high-speed railway and nuclear plant construction projects in the Middle Eastern country.
Countries reluctant to forge better economic ties with Iran could lose business opportunities, he said.
On Saudi Arabia, which broke off diplomatic ties with Iran in January, Araghchi said Tehran is calling for talks on a resolution, but Riyadh has yet to respond.
Asked about the forthcoming visit by U.S. President Barack Obama to Hiroshima, one of the two Japanese cities hit by U.S. atomic bombs in 1945, Araghchi said leaders of countries that used weapons of mass destruction in the past should apologize to the world in addition to Japan and Iran.
Both Japan and Iran are victims of weapons of mass destruction, Araghchi said, referring to the Iran-Iraq war in the 1980s.

Westinghouse to build 6 nuclear plants in India

U.S., India agree on Toshiba subsidiary's nuclear plant construction

http://mainichi.jp/english/articles/20160608/p2g/00m/0in/057000c

June 8, 2016 (Mainichi Japan)
WASHINGTON (Kyodo) -- The United States and India agreed Tuesday on a plan for a U.S. subsidiary of Toshiba Corp. to build six nuclear power plants in India under a bilateral nuclear pact.

- 【Related】Obama meets Indian PM, seeks implementation of climate pact

The agreement, reached by U.S. President Barack Obama and Indian Prime Minister Narendra Modi in Washington, was the first contract under a bilateral civil nuclear pact which took effect in 2008.
The agreement involving Westinghouse Electric Co., **Toshiba's U.S. nuclear power unit,** demonstrated "a shared commitment to meet India's growing energy needs while reducing reliance on fossil fuels," said a joint statement issued after the meeting of the two leaders.
The two countries will work toward finalizing the contractual arrangements by June 2017, it said.
Obama supported India's bid to join the Nuclear Suppliers Group, which supervises international trade in nuclear technology and related materials, according to the statement.

Parties very vague on energy future of Japan

July 3, 2016

Parties vague on atomic power pledges in run-up to Upper House election

http://www.japantimes.co.jp/news/2016/07/03/national/politics-diplomacy/parties-vague-atomic-power-pledges-run-upper-house-election/#.V3lba6Jdeot

JIJI

The election pledges issued by the top political parties show they are **divided and uninformed about how fast Japan should reduce its dependence on atomic power and what its energy goals for 2030 should be.**

As the pivotal July 10 Upper House election approaches, the parties clearly differ over the government's fiscal 2030 energy mix, which states that Japan will be procuring 20 to 22 percent of its electricity from nuclear reactors by that time.

Five years after the Fukushima disaster shattered Japan's nuclear safety myth, the ruling Liberal Democratic Party is promoting nuclear power as a stable, low-cost energy source, and says it intends to slowly reduce Japan's atomic dependency.

Komeito, its coalition ally, pledges to create a society that does not rely on nuclear power. Although it is opposed to building new reactors, it won't oppose the restarting of those idled in the wake of the triple core meltdown in Fukushima. Komeito also advocates a very gradual move away from nuclear energy.

The ruling coalition parties' positions reflect the government's goal: to lower Japan's dependency on atomic power around 6 points from 28.6 percent — the level it was at before the Fukushima disaster hobbled the industry in March 2011.

Both aim to bring new and old reactors online if they pass the Nuclear Regulation Authority's safety screenings, because more than 30 will be needed to achieve the government's targeted energy mix.

In the opposition camp, the Democratic Party has vowed to rid Japan of nuclear reactors by the 2030s. While the top opposition party will accept reactor restarts, its policy is to strictly maintain the 40-year basic operating limit on reactors. The DP believes its goal will be achievable if no new reactors are built.

The Japanese Communist Party and the Social Democratic Party flatly oppose restarting any nuclear reactors.

Another, Osaka Ishin no Kai, says reactors should not be restarted unless local agreements are enshrined in law as a precondition.

All of the major parties, however, refuse to elaborate on how they will ensure the expansion of alternative energy sources, which are being choked off by Japan's old and divided power grid.

In line with the government's target, the LDP and Komeito have promised to almost double the proportion of renewable energy to 22 to 24 percent by fiscal 2030. The DP's goal is 30 percent and the JCP's goal is 40 percent.

Since no party has provided hard details on how to further the use of renewable energy and what that will cost, voters need to watch whether the parties will offer any convincing explanations about their pledges during the campaign for the Upper House election.

Japan Atomic Power, Hitachi in Britain

Japan Atomic Power to join nuclear power business in Britain

http://mainichi.jp/english/articles/20160708/p2g/00m/0bu/003000c

July 8, 2016 (Mainichi Japan)
TOKYO (Kyodo) -- Japan Atomic Power Co., a constructor and operator of nuclear plants, said Thursday it has decided to enter the nuclear power business in Britain through an alliance with Hitachi Ltd.
Japan Atomic Power, Hitachi and its unit Horizon Nuclear Power Ltd. sealed an agreement the same day in Britain to cooperate in such areas as assessing construction costs and crafting plans toward the test operation of nuclear power reactors planned to be built in Britain.
Japan Atomic Power also said it will participate with the two other companies in the process of obtaining approval from the British government for the construction of nuclear power plants.
According to a statement released by Japan Atomic Power, it will join a project for the construction of two advanced boiling water reactors, scheduled to be built at the proposed Wylfa Newydd Power Station in North Wales.
"Taking advantage of the many years of operating experience (related to nuclear power reactors), and the know-how gained from that experience...we will help to ensure that Wylfa Newydd is built successfully," Japan Atomic Power President Mamoru Matsumura said.
After the plants are completed, Japan Atomic Power is expected to operate the nuclear power plants that Horizon Nuclear Power aims to start running from the early 2020s. Horizon Nuclear Power plans to construct four to six reactors in Britain in total.
Hitachi will be in charge of building the reactors and is eager to partner with Japan Atomic Power, as Hitachi does not have the know-how to operate nuclear power plants, sources familiar with the matter said.
Japan Atomic Power would become the first Japanese electric utility to engage in operating nuclear power reactors overseas, at a time when that business is sluggish in Japan following the 2011 Fukushima Daiichi nuclear disaster.
Amid lingering public concern over the restart of nuclear power plants at home, Japan Atomic Power is apparently trying to boost its revenue by expanding abroad.
The company, controlled chiefly by regional electric power companies in Japan, owns nuclear reactors in the country but all of them are currently offline.
The move is also in line with Prime Minister Shinzo Abe's policy goal of exporting nuclear power plant technology to other nations.
In 2012, Hitachi acquired Horizon Nuclear Power from a major German electric utility to expand its nuclear power business overseas.

July 7, 2016

Japan Atomic Power to join Hitachi's nuclear plant business in Britain

http://www.japantimes.co.jp/news/2016/07/07/business/corporate-business/japan-atomic-power-join-hitachis-nuclear-plant-business-britain/#.V39K3aJdeot

JIJI

Japan Atomic Power Co. will join Hitachi Ltd.'s nuclear power plant business in Britain, informed sources said Thursday.

The two companies will soon sign a cooperation agreement to make Japan Atomic Power the first Japanese power supplier to take part in an overseas nuclear power plant business in full scale.
Japan Atomic Power will become part of a project to build nuclear reactors in Britain, which is undertaken by Horizon Nuclear Power Ltd., a Hitachi unit in Britain, possibly engaging in licensing procedures for reactor construction.
Japan Atomic Power hopes that overseas operations will become a new source of revenue at a time when its nuclear reactors in Japan have been suspended following the 2011 core meltdowns at Tokyo Electric Power Company Holdings Inc.'s Fukushima No. 1 nuclear plant.
Hitachi, which has no experience as a nuclear plant operator, asked for Japan Atomic Power's cooperation over the British project.

Mainichi poll on future nukes

July 8, 2016

50% want nuclear power abolished in future: Mainichi poll

http://mainichi.jp/english/articles/20160708/p2a/00m/0na/018000c

Fifty percent of respondents in an online questionnaire released by the Mainichi Shimbun ahead of the July 10 House of Councillors election say that they are in favor of abolishing nuclear power plants in the future.
As of July 6, a total of 432,635 people had answered the questionnaire, which also lets people see how closely they are aligned with political candidates and parties.
When asked whether Japan needs nuclear power, 50 percent selected the answer, "It's necessary for the time being but should be abolished in the future." Another 31 percent picked "It's not necessary" while 16 percent said "it's necessary."
At the end of the survey, respondents are asked to select three issues that interest them the most. Twenty-one percent selected "nuclear power." The topics "constitutional revision," "revision of Article 9 (of the Constitution)," and "increasing the consumption tax" were also of high interest among users. Among those who picked nuclear power as a topic of interest, 58 percent said that nuclear power was not necessary, 30 percent said it should be abolished in the future, and 11 percent said it was necessary.
In a survey of candidates conducted by the Mainichi Shimbun, 52 percent of those standing for the Liberal Democratic Party answered that nuclear power was necessary, 62 percent standing for the Democratic Party and all those standing for Komeito said it should be abolished in the future, and all candidates for the Japanese Communist Party and Social Democratic Party said it was not necessary.
As those who say it should be abolished in the future permit the reactivation of reactors for the time being, it is therefore hard to say that nuclear power is becoming a major point of contention in the election.

Separately, 67 percent of respondents said Japan should never arm itself with nuclear weapons, while 21 percent said the issue should be considered in light of the international situation and 6 percent said Japan should start to consider the issue. Another 3 percent said Japan should possess nuclear weapons.
The questionnaire (in Japanese) can be found online at http://vote.mainichi.jp

"Look... 20 years down the road"

July 6, 2016

EDITORIAL: The power of a vote can affect Japan's nuclear energy policy

http://www.asahi.com/ajw/articles/AJ201607060033.html

July 6, 2016 at 13:40 JST
With brutal heat forecast for this summer, the government is not calling for power-saving efforts this year. This is a break from tradition that started in summer 2011 after the disastrous accident at the Fukushima No. 1 nuclear power plant, operated by Tokyo Electric Power Co., in March that year.
Only two nuclear reactors are currently running in Japan, both at the Sendai nuclear plant operated by Kyushu Electric Co. But the government determined that the nation's power supply will not fall short this summer, largely because energy-saving practices have become well-established in private homes and businesses over the last five years, including the widespread use of energy-efficient LED lighting.
Japan appears to have become less dependent on nuclear power generation since the Fukushima disaster. Nowadays, the subject is debated less frequently, and anti-nuclear demonstrators have shrunk in number. In the campaign for the July 10 Upper House election, too, the nation's nuclear policy is hardly a hot topic of debate for the ruling and opposition parties.
But we need to re-examine whether the government is moving toward maintaining or abolishing its current nuclear policy.
Looking 20 to 30 years ahead, The Asahi Shimbun has consistently advocated a "zero nuclear power generation society" in its editorials. Our basic thinking is to approve the restart of offline reactors for the time being when urgent power needs exist. But at the same time, high-risk and antiquated reactors should be decommissioned, starting with the oldest and the most dangerous.
Abe administration's piecemeal restart of reactors
Since the current Abe administration was inaugurated in December 2012, its track record has made the direction of its nuclear policy quite clear.
The administration initially stressed a "decrease in reliance on nuclear power generation." But within less than six months, it put the Nuclear Regulation Authority (NRA) in the forefront to justify a switch to the policy of "restarting nuclear reactors once their safety has been confirmed."
In the Basic Energy Plan of 2014, nuclear power is positioned as "an important base load power source." One year later, the administration announced its decision to formulate a policy that would make nuclear energy account for 20 to 22 percent of the nation's power supply in fiscal 2030. This target cannot be attained unless more than 30 nuclear reactors, out of the 54 that existed before the Fukushima disaster, are brought into operation.

In fact, starting with the Sendai reactors last summer, the government has been proceeding, bit by bit, with the restart of idle reactors. So far, four units have gone back on line. This month, the No. 3 reactor at the Ikata nuclear plant operated by Shikoku Electric Power Co. is scheduled to resume operations. Twenty reactors are currently under inspection.

Furthermore, the NRA has approved the extension of operations of the 40-plus-year-old No. 1 and No. 2 reactors at the Takahama nuclear plant, operated by Kansai Electric Power Co. Put plainly, even the "40-year rule," set for averting disasters by decommissioning old reactors, is about to lose teeth.

Abe stresses nuclear power as "a low-cost and stable energy source." But as deregulation in the power industry eliminates regional monopolies while electricity charges become less subject to rigid rate structures, nuclear power generation could actually become a burden to operators for the huge costs needed to maintain safety and dismantle old reactors.

For this reason, the government is coming up with what may be called new initiatives to protect the nuclear power industry.

The Ministry of Economy, Trade and Industry is working on a policy under which the government will buy electricity generated at nuclear power stations at a set price to encourage sustained investment in nuclear power generation.

Another plan under consideration is to decrease the financial responsibility of nuclear power plant operators for accident compensation and increase the government's responsibility instead. This goes in the opposite direction from industry deregulation.

Parties need to clarify positions on nuclear power

Many Upper House election candidates running on the ruling coalition ticket are keeping their opinions on nuclear power generation to themselves, leaving all policy decisions to the government. But some of the same candidates are also starting to call for the construction of new, safer reactors to counter the argument of people opposed to extended operations of old reactors.

Should the ruling coalition win the Upper House election, there is no doubt that it will add momentum to the Abe administration's move to return to nuclear power generation.

The opposition camp, with some minor exceptions, is united in opposing nuclear power generation. The Democratic Party and three other parties share the policy of "realizing a society that does not depend on nuclear power generation."

However, the parties differ in the method and speed with which they propose to reduce the nation's dependence on nuclear energy. While the parties are sharply focused on issues related to Abenomics, the national security legislation and constitutional revision, nuclear power generation tends to remain less discussed.

Will Japan keep relying on nuclear power? Or does it aim to eventually end this reliance by switching aggressively to sustainable energy development?

Because the answer spells a fundamental difference in the future of the nation's energy policy, every party owes it to the voting public to explain its position clearly and engage in serious debate.

In disaster-affected areas of Fukushima Prefecture, the government's evacuation orders are being lifted one by one, but there is a long way to go before the affected citizens can rebuild their lives. For them, the March 2011 disaster is still a dire reality they must face very day.

Looking at the future

For voters not directly affected by the nuclear disaster, five years may be enough time for their interest to wane.

But electricity is indispensable to everyone's daily life and work. An immediate and crucial political issue is how to secure the necessary infrastructure, and at what cost.

Since April, it has become possible for private households to choose their electricity supplier, giving people a greater chance to exercise their free will. Still, every ballot cast carries weight. The outcome of the Upper House election can either accelerate or put the brakes on the Abe administration's nuclear energy policy.

We need to look at 10 years and 20 years down the road, not just today and tomorrow, when we think about the nation's energy policy, especially regarding nuclear power.

--The Asahi Shimbun, July 6

Slowdown of solar boom

July 14, 2016

Sun no longer shines on Japan's solar boom as subsidies wane

http://www.japantimes.co.jp/news/2016/07/14/national/sun-no-longer-shines-japans-solar-boom-subsidies-wane/#.V4fRIqJdeov

by Chisaki Watanabe and Stephen Stapczynski
Bloomberg

Japan's solar boom is beginning to falter.

Until recently, the resource-poor nation has been one of the leading markets for photovoltaic (PV) units, helping to prop up an industry hurt by falling prices for the technology and policy changes. But four years after the introduction of generous incentives to promote clean energy in the wake of the March 2011 Fukushima nuclear disaster, data show the boom is losing steam.

The slowdown — after several years of rapid growth — threatens to undermine the government's push to find a clean alternative to nuclear power and dims what has been a bright spot for the global photovoltaic industry.

"As the declining volume of PV module shipments shows, the market is shrinking," said Takehiro Kawahara, an analyst for Bloomberg New Energy Finance.

Repeated tariff cuts and difficulty securing land and grid connections are among some of the reasons that have led to a drop in new applications to develop solar, Kawahara said.

For Japanese panel makers such as Sharp Corp. and Kyocera Corp., "the shrinking domestic market forces them to lower costs to remain in competition with international players or consider exiting the segment," he said.

Solar power-related bankruptcies are increasing, according to Teikoku Databank Ltd. The number of companies that went bust rose to 36 in 2015, from 17 in 2013 and 21 in 2014. Bankruptcies continue to accelerate, with 17 seen in just the first five months of 2016, Teikoku said.

Some question what Japan has got for all the money spent on promoting clean energy. While more solar energy is being produced, it still comprises a fraction of the nation's power generation mix.

The data, drawn from government and industry sources on solar's contribution to the power mix as measured by what is purchased and produced by the nation's 10 regional utilities, show the percentage has gone from about 0.4 percent in 2012 to about 3.4 percent in 2015.
Solar has grabbed the lion's share of what is known as feed-in tariffs — above-market rates awarded to producers of clean energy. With available land for solar in short supply and some utilities saying they cannot accept more intermittent solar power, that is a worry for some. Also, only about a third of the solar projects awarded the preferred rates have actually begun producing power.
The bulk of the clean energy capacity approved by the government under the FIT program since 2012 has been in solar, raising concern that the tariffs do not seem to have stimulated much in the way of other clean energy sources.
"Feed-in tariffs have proved there's potential for 80 gigawatts of solar in Japan," said Masaaki Kameda, secretary-general at the Japan Photovoltaic Energy Association, the country's solar lobby. "But to bring online this potential, various policies need to be applied continuously," he said.
The government has tightened rules for projects that have been delayed and plans to introduce an auction system for large-scale solar next year.
"Now that we know that solar power generation systems can certainly supply energy, it is important to find out how we can make the most of the generated power," Kameda said.
Prime Minister Shinzo Abe has tried to play it both ways — saying he's a supporter of clean energy, while also backing a continued role for nuclear and a big role for coal. Despite clouds over the nuclear industry and repeated failed attempts to get reactors back online, Japan's latest policy pronouncements see nuclear accounting for as much as 22 percent of Japan's power mix by 2030. Similarly, the government sees a bright future for coal at 26 percent.
Japan's solar market is expected to shift to rooftops. Between 2016 and 2040, Japan will add 94 gigawatts of new solar, including 65 gigawatts of rooftop PV, BNEF said in a report last month.
If Japan wants to achieve a much higher penetration of renewables, "an independent system operator would be necessary to ensure the grid connection approval process is neutral," said Kawahara.

Will Mitazono remain firm?

July 18, 2016

EDITORIAL: New Kagoshima governor must clarify stance on nuclear reactors

http://www.asahi.com/ajw/articles/AJ201607180019.html

Satoshi Mitazono, governor-elect of Kagoshima Prefecture, said during the election campaign, "Operations at the nuclear plant should be suspended temporarily for another (safety) check." The southern prefecture hosts the Sendai nuclear power plant, the only one currently operating in Japan.
The 58-year-old former TV Asahi Corp. commentator, who ran for office as a first-time, independent candidate, defeated incumbent Governor Yuichiro Ito, 68, who had approved the reactor restarts at the nuclear plant operated by Kyushu Electric Power Co.

Ito was seeking a fourth term. Many believe Mitazono won the election because of his criticism of how Ito had held the same office for so many consecutive terms.
But Mitazono's election pledge to temporarily halt the Sendai nuclear plant, in response to the recent series of strong earthquakes in neighboring Kumamoto Prefecture, was probably no less relevant, given the spreading anxiety among the public.
During the first week following the onset of the quakes, Kyushu Electric received 5,000 e-mails and phone calls asking for a halt to the Sendai reactor operations.
Immediately after he was elected, Mitazono reiterated that he will request a temporary suspension with Kyushu Electric, but he has yet to provide more details on the matter.
A temporary shutdown was certainly one of his election pledges, but he did not bring that to the fore during the campaign. Suspicion seems to be arising in the minds of Kagoshima Prefecture's public, including both proponents and opponents of nuclear energy.
The governor has no legal authority to shut down an active nuclear reactor. But the No. 1 and No. 2 reactors of the Sendai nuclear plant, which went back online in summer and autumn last year, are expected to go offline for routine inspections in autumn and winter.
Kyushu Electric does not need to obtain the governor's approval to reactivate the reactors once the checkups are over, but the utility cannot totally ignore the governor's intentions, which, therefore, will set higher hurdles for the reactor restarts.
Mitazono should continue to firmly talk about his own beliefs.
Some speculate he is probably working out strategies to deal with Kyushu Electric and the prefectural assembly, which upheld the nuclear restarts. But the first and most basic thing he must do is provide an explanation to the prefecture's public.
During the gubernatorial election campaign, Mitazono promised to shut down operations of the Sendai nuclear plant, conduct a check on its facilities and review the emergency evacuation plans. He also pledged to set up a panel of experts to discuss nuclear power issues.
The Kumamoto quakes, which caused many roads and bridges to collapse, were followed by aftershocks that gradually approached the Sendai nuclear plant. People in Kagoshima Prefecture were worried that an earthquake striking near the nuclear plant could tear up emergency evacuation routes.
Mitazono's pledge indicated a readiness to address those anxieties.
Niigata and Shizuoka prefectures are among the local governments that have already set up panels similar to the expert panel on nuclear power issues being floated by Mitazono.
Although the central government's Nuclear Regulation Authority is in charge of safety screenings of nuclear reactors being planned for restarts, **it is essential for local governments to play an active role in defending their own residents without leaving the matter up to experts.**
Given that Mitazono was elected after pledging to temporarily halt the nuclear plant, the incoming governor should explain his thoughts carefully and continue his efforts to ease the anxieties of Kagoshima Prefecture's residents.

Kaminoseki?

August 3, 2016

License renewed for new nuclear plant project in western Japan

http://mainichi.jp/english/articles/20160803/p2g/00m/0dm/058000c

YAMAGUCHI, Japan (Kyodo) -- The Yamaguchi prefectural government on Wednesday renewed a license for Chugoku Electric Power Co. to reclaim land for a new nuclear power plant in the western Japan prefecture, surprising and angering local residents opposed to the project.

Whether to extend the expired license for landfill work in the coastal town of Kaminoseki to build the Kaminoseki Nuclear Power Station had been a pending issue after the 2011 Fukushima nuclear crisis led to the suspension of the work. But the local government decided to grant permission, saying that the plant is positioned "within the country's energy policy."

The utility is unlikely to quickly restart the work due to local opposition, however. The local government's license renewal is also conditional: It said landfill work should not start until prospects of building plant facilities become clear.

But the latest development could open up substantial discussions on whether new reactors should be built in Japan, which the central government has largely avoided so far in consideration of antinuclear sentiment that has prevailed after the Fukushima nuclear power plant disaster.

Meanwhile, the government has already been pushing for the resumption of existing reactors that have met post-Fukushima safety requirements. On Wednesday, the No. 3 reactor at Kansai Electric Power Co.'s Mihama plant in Fukui Prefecture became the latest unit to have effectively cleared the state safety assessment.

Chugoku Electric was initially granted the landfill license in October 2008 for the two-reactor Kaminoseki nuclear complex on an island in the Seto Inland Sea.

The company began landfill work a year later, but progress was slow amid local protests and was suspended after the Fukushima crisis was triggered by a huge earthquake and tsunami that hit northeastern Japan in March 2011.

Just before the license was set to expire in October 2012, the utility applied for a three-year extension to the prefectural government. "We have not changed our idea that we need the Kaminoseki plant. We want to keep the license," a utility official said at the time.

Then Yamaguchi Gov. Shigetaro Yamamoto said the local government will "examine the issue appropriately" but did not make a decision, citing "special circumstances after the nuclear accident."

But on Wednesday, the prefectural government reversed course and permitted the extension of the license, though saying that landfill work should not begin until the utility has clear prospects of building plant facilities.

Chugoku Electric Vice President Akira Sakotani said the same day that there is currently no specific date set for building the facilities.

"We will seriously take to heart the request (by the prefectural government) and carefully consider (our response)," he said.

The license will be effective until July 6, 2019.

The decision of the prefectural government drew mixed responses from local residents.

"I can't believe the permission was given," said Toshiyasu Shimizu, 61, who heads a group of residents on an island several kilometers from the construction site.

But Naonori Koizumi, a 58-year-old member of a group supporting the construction project, said, "I don't think work will immediately resume, but the town is depopulating and graying. I hope nuclear power will make this town richer."

Philippines nukes conference

September 2, 2016

Philippines conference discusses nuclear power in Asia-Pacific region

http://www.japantimes.co.jp/news/2016/09/02/business/philippines-conference-discusses-nuclear-power-asia-pacific-region/#.V8lekaJddLM

Kyodo

-

MANILA – A three-day international conference on the prospects of nuclear power in the Asia-Pacific region has wrapped up in Manila, finding the stigma-laden source of energy to be increasingly relevant in the region because of its continuing development and rising population, and the growing campaign for lowering carbon emissions amid threats of climate change.

"The prospects for nuclear power in the Asia-Pacific region are not only promising. Moreover, it is relevant and will continue to remain so in the coming years," Maria Zeneida Collinson of the Philippines' Foreign Affairs Department, who chaired the conference, said in her summary statement late Thursday.

"Nuclear energy could contribute to sustainable development by meeting rising energy demands and, at the same time, mitigating climate change," she added.

The conference, which was organized mainly by the International Atomic Energy Agency, gathered more than 60 participants from 15 countries.

Among the topics discussed was the role of nuclear energy in a low carbon future, how to develop a nuclear energy policy and the legal framework for nuclear power, the prospects of small modular reactors in the region, developing a policy and strategy for spent fuel and radioactive waste management, and developing the environmental impact assessment process.

"A high nuclear scenario in the Asia-Pacific takes into account more potential newcomer states such as Indonesia, Malaysia and Thailand, in addition to Vietnam," Collinson said.

Of the 30 countries in the world that currently operate nuclear power plants, six are in the Asia-Pacific region: China, India, Iran, Japan, Pakistan and South Korea.

"This Asia-Pacific region has one of the fastest economic and growth rates in the world. Hence, it follows that the demand for affordable and sustainable energy sources is expected to rise. Thus, as IAEA Deputy Director-General Mikhail Chudakov pointed out, our region is expected to be the driver of nuclear energy in the future," Collinson said.

In an interview at the opening of the conference on Tuesday, Chudakov said the prospects of nuclear power remain high despite the nuclear accidents of Three Mile Island, Chernobyl and Fukushima, with 10 plants put into operation last year, and the same number expected to run also this year.

Collinson said the conference touched on these accidents by learning lessons from them.

"No one country can just start creating nuclear power because, especially after the accidents of Three Mile Island, Chernobyl and Fukushima, (it showed) that the whole world is connected," Chudakov said in his closing remarks Thursday.

Collinson said the conference revealed that the key challenges to the development of a high nuclear scenario in the region are public acceptance and safety concerns, nuclear waste issues, large up-front investment, and uncertainty in government support.

Citing as one example the revived interest of the Philippine government under the new administration of President Rodrigo Duterte in nuclear power, having built one plant in the 1970s only to be mothballed when it was ready for licensing a decade later due to politics and fears caused by the Chernobyl nuclear disaster in Ukraine, Collinson said Energy Secretary Alfonso Cusi is now actively holding public discussions about the matter.
"For me, the most important is that understanding by our people about what nuclear energy, nuclear power is all about. Having understood that, we can form our own opinion as to whether we really want this, will this be good for the Philippine nation. So, that's No. 1: public acceptance," Collinson said.
Chudakov said some of the advantages of nuclear power are the reliability of supply, and predictability of price over a long period, something that former Philippine Energy Secretary Zenaida Monsada acknowledged.
"If we pursue the nuclear power plant project, we would have increased investments in the country, that will generate jobs and government revenue. If we have more sufficient, reliable power, we can have more investments in manufacturing that will help improve the economy," Monsada said at the closing session of the conference.
Chudakov said that while the decision to put up nuclear power plants is a sovereign one, the IAEA stands ready to assist in the undertaking.

Izumida will not run in gubernatorial election

August 31, 2016

Niigata Pref. nuclear power opponent governor won't stand for re-election

http://mainichi.jp/english/articles/20160831/p2a/00m/0na/008000c

NIIGATA -- Gov. Hirohiko Izumida has retracted his announcement that he will run in the upcoming gubernatorial election to seek a fourth term.

- 【Related】Nuclear watchdog finds 3 nuclear plants guilty of 'malicious' safety violations

Since Izumida has adopted a cautious stance toward the restarting of the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture, his decision not to run in the election will likely have a huge impact on the issue. All seven reactors at the power station, owned by Tokyo Electric Power Co., have been idle since March 2012 in the wake of the 2011 Great East Japan Earthquake, tsunami and the ensuing crisis at the Fukushima No. 1 nuclear plant.
The campaign for the Oct. 16 Niigata gubernatorial election is to kick off on Sept. 29.
Izumida's decision not to run in the election is linked to his criticism of a report in the Niigata Nippo regional daily over a dispute involving a subsidiary of a shipping company funded by the prefectural government.

In an interview with news organizations, Izumida said, "It's important to have prefectural residents know the facts, but I feel my appeal never reached the residents. Even if I requested the newspaper to correct its report, the daily would never do so, which prompted me to abandon running in the race."
At a prefectural assembly session in February this year, Izumida announced that he would run in the gubernatorial election to seek a fourth four-year term. However, his retraction of his candidacy leaves Nagaoka Mayor Tamio Mori, 67, who heads the Japan Association of City Mayors, as the only person who has announced his candidacy.
It came to light this past July that Japan Shipping Exchange Inc., an arbitration organization, had ordered a shipping company's subsidiary funded by the prefectural government to pay 160 million yen to a South Korean company following a dispute over the purchase of a ferry.
The Niigata Nippo published a series of articles holding the Niigata Prefectural Government responsible for the case.
In response, the prefectural government has dismissed the accusations saying, "The daily's coverage is incorrect," and repeatedly urged the newspaper to correct its reports.
The Niigata Nippo is set to release a statement to express its views on the case.

Nuke collaboration with Iran

September 13, 2016

Iran welcomes Japanese reactors if 'lucrative commercial support' is included: Tehran nuke chief

http://www.japantimes.co.jp/news/2016/09/13/business/iran-welcomes-japanese-reactors-lucrative-commercial-support-included-tehran-nuke-chief/#.V9ea5DVdeov

Kyodo
TEHRAN – Iran is ready to buy nuclear reactors from Japan if any proposed sales are accompanied by "lucrative commercial support," according to the head of the Atomic Energy Organization of Iran.
"Of course if we receive any suggestion or any proposal from Japan that would sound very interesting to us, we would certainly be ready to enter negotiation in that domain, Ali Akbar Salehi said in an exclusive interview with Kyodo News on Sunday.
But Salehi said Iran has not raised the matter with the Japanese side yet.
"Japan is a very cautious country so we have to wait until things evolve. So we are not in a hurry. Whenever the Japanese are ready, we are ready," he said.
Russia and China have already stabilized their positions as suppliers of nuclear equipment to Iran, which has a long-term plan to produce 20,000 megawatts of nuclear electricity by setting up 20 more nuclear power plants.
Last weekend saw Iran and Russia break ground to construct two new nuclear power plants valued at $10 billion, while Chinese companies are also keen to construct nuclear power plants in Iran, offering financial support, according to Salehi.
Some European countries "initially have started talks with Iran" in this domain, but no agreements have been reached yet, he said.

After operating a Russian-built and supported 1,000-megawatt power plant in southern Iran since 2012, and starting construction of two new ones with Russian help, Iran is going to construct new small power plants on its southeastern coast.

“Iran’s fourth power plant that we are going to build will be located in the Makran region of southern Iran. Chinese have already visited that region for site selection, but we have not come yet to a final agreement,” he said.

According to Salehi, about seven years ago, Japanese officials had shown interest in cooperating with Iran to construct new power plants.

However, international concerns over Iran’s nuclear development program led them to adopt a more conservative position of preferring to restart talks after the problems are resolved.

That transpired in July 2015 when Iran finalized a landmark deal with six major powers — France, Germany, Russia, China, Britain and the United States — with the aim of limiting its nuclear program in return for an end to crippling economic and banking sanctions.

“Now we have the nuclear deal behind us, but we have not seen any indication as to whether Japan’s government or industry (will) enter negotiation with us,” Salehi said.

In the meantime, he said, there is still scope for Iran and Japan to expand their cooperation on nuclear safety, specifically the training of Iranian experts in the so-called “3S’s” — namely safeguards, safety and security — a topic that the European Union is also interested in.

Salehi said “everything is going well in this domain.”

Since a memorandum of understanding was signed between Foreign Minister Fumio Kishida and his Iranian counterpart, Javad Zarif, in Tehran last October, Iran and Japan have been exchanging experts to increase the level of security and safety at Iran’s nuclear facilities.

To that end, Salehi said, “Japan has expressed interest in setting up a ‘center of excellence’ in Iran on safety issues and so did the EU … so there may be a trilateral cooperation between Iran, the EU and Japan in this matter.”

“We anticipate that we will be learning more than the Japanese learning from us. There is lot we can learn from Japan because they have a lot of experience in running a nuclear plant for so many decades and the very valuable (experiences) that they have accumulated during the unfortunate Fukushima incident,” he added.

One of the major advantages Iran gained with last year’s nuclear deal was joining the international nuclear market.

Just several months after the deal was inked, Iran was able to sell 32 tons of heavy water to the United States. Negotiations on selling the same to Germany, France and Russia are ongoing, with a deal expected to be clinched with the latter.

The Iranian nuclear chief also showed interest in selling heavy water stockpiles to Japan.

Japan's nuclear fuel project: What future?

September 21, 2016

Decommissioning of Monju reactor would affect nuclear fuel cycle project

http://mainichi.jp/english/articles/20160921/p2a/00m/0na/013000c

The government's decision to consider decommissioning the trouble-plagued Monju prototype fast-breeder reactor, because the state can no longer shoulder the heavy financial burden, will inevitably affect the nuclear fuel cycle project, in which spent nuclear fuel is reprocessed and reused.

- 【Related】Gov't to discuss fate of Monju reactor, option of scrapping eyed
- 【Related】Monju fast-breeder reactor operator insiders say project is a failure: survey
- 【Related】Editorial: Time to permanently shut down Monju nuclear reactor

A source close to the government lamented that the government's efforts to coordinate views over whether to continue the Monju project hit a snag as the Education, Culture, Sports, Science and Technology Ministry stuck to the continuation of the Monju project.

"Officials at the Education, Culture, Sports, Science and Technology Ministry only said, 'It'd be a problem if Monju were to be scrapped,' but failed to do anything. What has the ministry done so far?" the source said.

The dispute started when the Nuclear Regulation Authority (NRA) advised the ministry in November 2015 to replace the government-backed Japan Atomic Energy Agency (JAEA) with a new entity as the operator of the fast-breeder reactor.

The technology ministry considered a new organization to operate Monju on the assumption that the reactor would be maintained. The ministry set up a study panel comprised of experts and compiled a report on the issue before the May 2016 deadline set by the NRA.

However, the report stopped short of specifying a new operator but only mentioned the requirements that a new operator must meet.

Based on the report, the ministry explored the possibility of splitting the division that operates and manages Monju from the JAEA and setting up a new corporation to take over the role with cooperation from the private sector, including power companies.

However, businesses have expressed a reluctance to cooperate with such a plan.

A high-ranking official of the Economy, Trade and Industry Ministry, which is responsible for energy policy, coolly reacted to the proposal shown by the technology ministry, which had failed to show an outlook for replacing the Monju operator even after the deadline set by the NRA. "Such a plan would never have been accepted," the official said.

After the technology ministry's study panel issued the report, calls within the industry ministry urging that Monju be decommissioned began to gain momentum.

The senior industry ministry official explained, "If Monju were to be retained, it could spark criticism of the entire nuclear fuel cycle project, which would adversely affect our duty to develop fast breeders and restart idled nuclear power plants."

Monju, which is the core of the government's nuclear fuel cycle project, is a prototype reactor to conduct tests aimed at putting fast-breeder reactors into practical use, and comes under the jurisdiction of the technology ministry. However, the industry ministry is responsible for establishing fast reactor technology aimed at commercializing such a reactor.

Those calling for decommissioning Monju mainly cite the massive amount of costs to maintain the reactor.

According to government sources, Monju needs to meet the new regulatory standards established by the NRA following the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant before the prototype fast-breeder reactor can be restarted. Specifically, drastic refurbishment work on the reactor, including reinforcement of the facility to make it quake resistant, must be conducted. Furthermore, a factory in the

Ibaraki Prefecture village of Tokai, which produces fuel for Monju, also needs to be drastically refurbished. Experts say it would take at least 10 years and cost taxpayers an additional amount of some 580 billion yen to restart the reactor.

As for the reason for aiming to maintain Monju at such huge costs, the technology ministry claimed, "Data gained from operating Monju can be used to build a next demonstration reactor, and is necessary to seamlessly continue the nuclear fuel cycle project."

However, the industry ministry dismissed the claim. "The costs of maintaining Monju would be almost equal to the costs of building a new demonstration reactor. Since the design of Monju is old, there is no need to spend such a huge amount of taxpayers' money to maintain the reactor," an industry ministry official said.

The Cabinet Secretariat played a key role in efforts to coordinate between the two ministries, but the ministries remained at odds over the matter.

However, the convening of an extraordinary Diet session on Sept. 26 was drawing near while the technology ministry failed to show a breakthrough.

A top official in the administration of Prime Minister Shinzo Abe insisted that the executive branch should clarify its position on Monju before the extraordinary Diet session to avoid being grilled by opposition parties over the issue during deliberations.

The Cabinet Office, which is dominated by bureaucrats loaned from the industry ministry, overwhelmed the technology ministry and began considering decommissioning the reactor.

Even if the government decides to decommission Monju, it intends to continue the nuclear fuel cycle project, in which uranium and plutonium extracted from spent nuclear fuel is reused.

Officials are aiming to build a next demonstration reactor and eventually commercialize the nuclear fuel cycle project by using the Joyo demonstration reactor in the Ibaraki Prefecture town of Oarai, which is older than Monju, or conducting joint research with France at ASTRID, a new fast breeder that France is planning to build. However, there are no prospects of breaking the deadlock in the fuel cycle project.

Under the basic energy plan, which the Cabinet approved in June 2010, a new demonstration reactor would be activated by 2025 and the first reactor for commercial use be put into operation by 2050. However, the schedule was effectively scrapped following the outbreak of the Fukushima nuclear crisis. The industry ministry and other government bodies will reschedule the plan, but the project will inevitably be greatly delayed.

Regarding the use of ASTRID, critics within the government say it is difficult to establish Japan's own nuclear fuel cycle technology by relying heavily on overseas technology.

If fast-breeder reactor technology can not be put into practical use in the foreseeable future, the core of the nuclear fuel cycle project would turn to the use of mixed-oxide (MOX) fuel consisting of reprocessed plutonium and uranium. However, it remains to be seen if the project will progress steadily.

The Federation of Electric Power Companies of Japan had planned to use MOX fuel in 16 to 18 commercial nuclear reactors across the country, but the plan is being delayed in the aftermath of the nuclear disaster. The No. 3 unit at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture is the only nuclear reactor that uses such fuel.

Operations at Oma Nuclear Power Plant in Aomori Prefecture, which can run solely on MOX fuel, are expected to begin in fiscal 2024, two years later than initially planned. As a result, how Japan should consume surplus plutonium will pose a challenge to the international community.

Nevertheless, the government is sticking to the nuclear fuel cycle project partly because of the Japan-U.S. agreement on peaceful uses of nuclear energy, which allows Japan to reprocess spent nuclear fuel. The accord is expected to be automatically renewed when it expires in July 2018. However, if Monju, which is

supposed to consume a great deal of MOX fuel, is to be decommissioned and little progress is made on the consumption of MOX fuel in atomic power stations in Japan, Washington could voice opposition to automatically renewing the bilateral agreement.
Japan has so far stockpiled 47.9 metric tons of surplus plutonium both in the country and overseas. It remains to be seen how the next U.S. administration, which will be formed following the November presidential election, will respond to the matter.
"The decommissioning of Monju is separate from the nuclear fuel cycle project," stressed a senior official of the Economy, Trade and Industry Ministry as he insisted that Monju be split from the fuel cycle project.

Ikata new mayor steamroll anti-nuclear rival

October 3, 2016

Nuclear-power advocate elected Ikata mayor in landslide

http://www.japantimes.co.jp/news/2016/10/03/national/nuclear-power-advocate-elected-ikata-mayor-landslide/#.V_IKaMldeos

Kyodo, Staff Report
An advocate of atomic power plants has steamrolled his anti-nuclear rival in the Ikata, Ehime Prefecture, mayoral election, garnering more than seven times as many votes as his opponent.
Sunday's election followed the resignation of the former mayor, who had backed the recent restart of the Ikata nuclear power plant's No. 3 reactor.
The previous mayor resigned in August after being hospitalized.
New Mayor Kiyohiko Takakado, a 58-year-old former member of the prefectural assembly, had the backing of the former mayor and all 16 members of the town's assembly. During the campaign he vowed to continue the policies of his predecessor, Kazuhiko Yamashika.
His rival, 59-year-old Naohito Nishii of the Japanese Communist Party, had urged the town not remain dependent on nuclear power. He was backed by the JCP's local chapter as well as anti-nuclear citizens' groups.
Nishii was trounced in the election, garnering just 765 votes to Takakado's 5,451 in a race with 71.45 percent voter turnout.
"I will completely carry out safety measures for the nuclear power plant," Takakado said after his victory was assured. "I will also tackle the issues of the town's aging population and depopulation."
Shikoku Electric Power Co. reactivated the Ikata plant's No. 3 reactor in August. It was the first time in more than five years that the reactor was switched on since it was suspended for a routine safety inspection in April 2011.
It is the only reactor in Japan currently burning mixed uranium-plutonium oxide (MOX) fuel. It was the nation's fifth reactor that was rebooted under the stricter safety regulations introduced in July 2013 based on the 2011 catastrophe at the Fukushima No. 1 plant operated by Tokyo Electric Power Co. Holdings Inc.
Besides Ikata, the only nuclear plant currently in operation in Japan is Kyushu Electric Power Co.'s Sendai facility in Kagoshima Prefecture.

Yamashita, the former mayor, resigned Aug. 29 after being hospitalized in April.
The Ehime Shimbun reported at the time that he had suffered a stroke that resulted in him having problems speaking.

"They can eliminate nuclear power, so why don't they?"

October 19, 2016

Ex-PM Koizumi: 'Why doesn't gov't eliminate nuclear power?'

http://mainichi.jp/english/articles/20161019/p2a/00m/0na/019000c

MATSUMOTO, Nagano -- Former Prime Minister Junichiro Koizumi on Oct. 18 commented on the victory of an anti-nuclear newcomer in the Oct. 16 Niigata gubernatorial election, asking why the government isn't giving up nuclear power when it can.
The newly elected governor, Ryuichi Yoneyama, has expressed a cautious view on the restart of the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.
"He beat a candidate backed by the Liberal Democratic Party (LDP), Komeito and the Japanese Trade Union Confederation, and it was an unexpected upset. I guess that the public has come to understand that nuclear power plants are dangerous, not safe," Koizumi said during an address in the Nagano Prefecture city of Matsumoto.
He underscored the impact of the election, saying that if the opposition parties jointly field candidates in the next House of Representatives election and make the elimination of nuclear power plants the main focal point, "There's no telling how the LDP will end up."
Koizumi said that while he was in power, he believed the opinions of experts and thought that nuclear power plants were necessary. But his view on nuclear power changed in the wake of the Fukushima nuclear disaster.
"With the Fukushima nuclear disaster, I realized that the descriptions of (atomic power) as safe, clean and low-cost were all lies."
The former prime minister said he started efforts to eliminate all nuclear power plants in Japan after realizing the mistake and wanting to correct it and make amends. At times during his address, Koizumi raised his voice in earnest like he did when he was prime minister.
"They (the government) can eliminate nuclear power, so why don't they?" he asked. "It's time to turn a predicament into a chance."

Taiwan: No more nukes by 2025

October 23, 2016

Taiwan to end nuclear power generation in 2025

By SATOSHI UKAI/ Correspondent

Taiwan's fourth nuclear power plant in New Taipei City in the northern part of the island. Its construction has been suspended due to an anti-nuclear movement that has intensified since the Fukushima nuclear disaster. (Asahi Shimbun file photo)

TAIPEI--In a rare move for power-hungry Asia, the Taiwanese government has decided to abolish nuclear power generation by 2025 to meet the public's demand for a nuclear-free society following the Fukushima nuclear disaster.

Taiwan's Executive Yuan, equivalent to the Cabinet in Japan, approved revisions to the electricity business law, which aim to promote the private-sector's participation in renewable energy projects, on Oct. 20.

"Revising the law shows our determination to promote the move toward the abolition of nuclear power generation and change the ratios of electricity sources," said President Tsai Ing-wen.

The government plans to start deliberations on the revised bill in the Legislative Yuan, or the parliament, in the near future, with the goal of passing it within this year.

Movements toward a nuclear-free society are active in Europe. For example, Germany has decided to abolish nuclear power generation by 2022.

On the other hand, China and India are increasing nuclear power generation to meet the growing demand for electricity. In Taiwan, nuclear power accounted for 14.1 percent of all the electricity generated in 2015. At present, three nuclear power plants are operating.

However, the March 2011 accident at the Fukushima No. 1 nuclear power plant heightened public opinion against nuclear power generation. In response to the sentiment, Tsai, who assumed the presidency in May with a vow of establishing a nuclear-free society, led the government's effort to abolish nuclear power.

Like Japan, Taiwan is hit by many earthquakes. The three nuclear power plants currently in operation will reach their service lives of 40 years by 2025. The revised bill will clearly stipulate that operations of all the nuclear plants will be suspended by that year. The stipulation will close the possible extension of their operations.

The government is looking to solar power and wind power as the pillars of renewable energies. It aims to increase their total ratio among all electricity sources from the current 4 percent to 20 percent in 2025. However, meeting the goal assumes that electricity generated by solar power will increase 24-fold in 10 years. Because of that, some people harbor doubts on the viability of the plan.

“A hurdle to overcome to achieve the goal is very high,” said an electric power industry source.

World Nuclear Industry Status Report 2016

http://www.worldnuclearreport.org/The-World-Nuclear-Industry-Status-Report-2016-HTML.html

In addition to the usual, global overview of status and trends in reactor building and operating, as well as the traditional comparison between deployment trend in the nuclear power and renewable energy sectors, the 2016 edition of the *World Nuclear Industry Status Report (WNISR)* provides an assessment of the trends of the economic health of some of the major players in the industry. Special chapters are devoted to the aftermath of the Chernobyl and Fukushima disasters.

Nuclear pact with India

November 1, 2016
Japan to sign nuclear pact with India
http://www3.nhk.or.jp/nhkworld/en/news/20161101_03/

Japan will sign an agreement on nuclear energy technology with India during a visit by Prime Minister Narendra Modi scheduled to start on November 10th.

The agreement will be Japan's first such deal with a non-signatory of the Nuclear Nonproliferation Treaty. It will allow Japan to export nuclear power technology to India.

Japanese Prime Minister Shinzo Abe met with Modi in India last December and they came to a basic agreement regarding the deal.

The two governments have been negotiating the details of the agreement and the date of the signing.

There is concern in Japan about forming a deal with India, which has conducted nuclear tests.

The pact is expected to include a provision that prohibits the technology from being used for military purposes. If India conducts further nuclear tests, the deal would likely be suspended.

Japan has similar deals with 14 countries and territories.

Japan, India to sign energy pact on condition of no nuclear tests

THE ASAHI SHIMBUN
http://www.asahi.com/ajw/articles/AJ201611010047.html
Japan and India will sign a nuclear energy pact in mid-November that allows Tokyo to opt out if the South Asian nation tests its nuclear weapons, sources said.
The agreement, the first by Japan with a nation that has not ratified the Nuclear Nonproliferation Treaty, will be signed when Indian Prime Minister Narendra Modi visits Japan later this month, a high-ranking Foreign Ministry official said.
The agreement will enable Japan to export its nuclear energy technology for private-sector use in India. But the sources said wording in the pact will give Japan, which has long pushed for nuclear disarmament and nonproliferation, the option of ending cooperation if India conducts a nuclear test.
At a meeting in New Delhi in December 2015, Prime Minister Shinzo Abe and Modi agreed in principle to sign a nuclear energy agreement. However, Abe told his Indian counterpart, “We will discontinue cooperation should India conduct a nuclear test.”
Diplomats of the two nations have since held discussions on the agreement.

Japanese diplomats asked for wording that could be interpreted to mean Japan can cease cooperation in the event of an Indian nuclear test after the bilateral agreement takes effect.
Although Indian officials were hesitant about such wording because of concerns it could constrain India's national security policy, they also showed an understanding toward the Japanese position.
The two nations are currently hammering out the final wording of the agreement. There is a possibility that the terminology will be vague enough to allow both nations to interpret the agreement in a way that is closer to their own national interests.

Japan-India Pact

Nuclear Deal, Infrastructure Projects and Handling China: What to Expect From Modi's Japan Visit

By Pallavi Aiyar on 08/11/2016 • Leave a comment

There are several points still up for discussion before the India-Japan nuclear accord becomes a reality, including Japanese apprehensions on India misusing nuclear technology.

Tokyo: Indian Prime Minister Narendra Modi's upcoming two-day visit to Japan takes place at a time when Asia's second largest and third largest economies are increasingly finding common strategic ground. The November 11-12 meeting will be the third annual summit between Modi and Shinzo Abe, his Japanese counterpart. A long-anticipated nuclear civilian energy deal is the likely headline to emerge. But a raft of other issues are also on the agenda, including measures to give bilateral economic ties a fillip, defence cooperation, infrastructure projects both in India and third countries like Iran, as well as the sensitive, but crucial, issue of dealing with China's expanding presence in the region.

Nuclear negotiations

The nuclear treaty will not only pave the way for Japan to export nuclear technology to India's vast market, it is also a necessity for enabling India's nuclear deals with the US, France and other countries. Key elements of nuclear reactors, including safety components and the domes of nuclear power plants, are a near-Japanese monopoly. Any deal would be significant for firms like GE-Hitachi, Toshiba's Westinghouse Electric Company and Mitsubishi-Areva.

Negotiations over the nuclear accord have been ongoing since 2008, following US-led efforts to facilitate India's access to civilian nuclear energy technologies, despite India not being a signatory to the nuclear non-proliferation treaty. The 2011 Fukushima nuclear disaster in Japan temporarily halted discussions. These have since restarted, but there remain strong concerns in Japan over the possible misuse by India of nuclear technology transfers.

There will, therefore, almost certainly be key provisions in any deal aimed at allaying Japanese apprehensions, most likely a provision to cancel or suspend the accord in the event of India breaking its self-imposed moratorium on nuclear testing. This has been a Japanese demand since the two sides began their negotiations seven years ago. India, which successfully kept such an explicit condition out of its

nuclear cooperation agreement with the US in 2007 (and with every other nuclear partner since then), has so far been reluctant to tie termination of the agreement to a nuclear test by the country.

According to Hisanori Nei, professor and nuclear energy expert at Tokyo's National Graduate Institute for Policy Studies**, Japan will permit Indian power producers to reprocess spent fuel at designated facilities** on condition that the country accepts comprehensive inspections by the International Atomic Energy Agency. But this is something that will be difficult for India to agree to.

A final sticking point is the question of **liability in the event of a nuclear accident**. "It is difficult to imagine that the nuclear sector is a total outlier to the general chaos of the business operating environment in India," explained Jeff Kingston, the director of the Asian studies programme at Tokyo's Temple University. Modi has been seeking to address the concerns of nuclear vendors on the matter of liability. It's not clear yet that he's done enough.

Kingston believes that Abe should be able to push a nuclear accord with India through the parliament by early 2017. He doubts there will be much political opposition, despite the fact that there are many, even within the prime minister's own Liberal Democratic Party, who are against nuclear energy. (Polls indicate that up to 70% of the Japanese population is opposed to developing nuclear power.)

Like Kingston, most experts in Japan are optimistic that despite the challenges, the deal will be struck. **Abe will sell it to a nuclear-sceptic Japanese parliament and public by embedding it in the larger context of Japanese-India ties.** Geo-strategic benefits, India's large export market and investment opportunities will be the sweeteners.

"I don't think public opinion will be an obstacle," said Nei, explaining that the accord did not loom large in public discourse in Japan. "The media might cover it for a week or so, and then it will be easily forgotten."

Economic ties

Economic ties will be the other main focus of the summit. Modi wants to boost India's economic growth by upgrading infrastructure, strengthening manufacturing and developing a network of "smart" cities – all of which would benefit from Japanese investments and technology. For his part, Abe is trying to fire up a Japanese economy that has been stuck in a holding pattern for two decades. India with its large market and growing middle-class can provide new sources of exports and investment opportunities for Japan.

Yet, despite this natural fit, economic ties are not as robust as might be expected. India-Japan trade in 2015-2016 was only $14.51 billion, a decrease of 6.47% over the previous year. In contrast, India-China trade was worth over $70 billion, while Japan-China trade is at about $350 billion. Trade with India is just 1% of Japan's total foreign trade. And although Japan is the largest bilateral donor for India, over the past three years Japanese firms have invested more in countries like Vietnam and Indonesia rather than India.

Abe's government has outpaced China in investment pledges to India, promising to funnel about 3.5 trillion yen ($29 billion) in infrastructure loans, financing and public and private investment. New Delhi has also has set up a special office to promote investments from Japan. At their first summit meeting in 2014, the two leaders vowed to double direct investment within five years.

Against this backdrop, there will likely be announcements of some new investments at this week's meeting, in addition to the mega-infrastructure projects in India that Japan is already an investor in, such as the Ahmedabad-Mumbai High Speed Rail, the Western Dedicated Freight Corridor and the Delhi-Mumbai Industrial Corridor.

However, as Hiroshi Hirabayashi, president of the Japan-India Association and former ambassador to India, put it, "there are too many negative stories from Japanese investors in their experience in India." He cited a litany of cases from the unhappy merger of pharma heavyweights Ranbaxy and Daiichi Sanyko, to NTT Docomo's sour experience with Tata Teleservices and Mitsubishi Chemical's decision to pull out of a massive proposed investment in West Bengal.

According to Hirabayashi, while Modi's visit cannot be expected to solve bilateral problems between companies, he can help to address issues of legality and broad-business policy. The main outcome of the summit, according to the former ambassador, will not be concrete economic problem solving, as much as positive atmospherics.

The symbolism of the visit acquires special significance against the evolving geo-strategic cartography of the region, in particular, Beijing's rising clout and territorial claims. China is expanding its deep-water naval presence and asserts sovereignty over disputed areas of the East and South China Sea and Indian Ocean region, parts of which Japan also claims. India has its own territorial dispute with Beijing along the 4,000-km land boundary they share.

Closer ties between Japan and India are viewed with apprehension in Beijing. According to Japanese news reports, the visit will see India purchasing 12 US-2i amphibious aircraft from manufacturer ShinMaywa Industries at a price tag of between $1.5 and $1.6 billion. The aircraft sale will be one of Tokyo's first arms deals since Japan lifted its 50-year ban on weapons exports in 2014. It will be a first for Japan, which has traditionally been reticent to supply Japanese-made military hardware to other countries. The purchase is certain to rile Beijing, which sees any military closeness between Japan and India as a potential threat. Tokyo and New Delhi already participate in annual joint military exercises along with the US.

Kingston points out that while India continues its policy of hedging, keeping up bilateral ties with both Japan and China, New Delhi is "tilting" closer to Japan than was previously the case. However, although Japan would like to see India make a strong statement of support on its claims against China in the East China Sea, it is unlikely that Modi will do so, beyond a possible reference to upholding the rule of law in settling disputes.

A final area for discussion at the summit might be the furthering of cooperation in infrastructure projects with incidental implications for China. One example is potential Japanese investment in India's development of the Chabahar Port project in Iran, something Tokyo has expressed interest in. This would work towards counteracting the Chinese dominance of infrastructure projects in India's neighbourhood and would help elevate New Delhi's political and economic profile in the region.

Modi and Abe have had a long courtship. Much has been written about the affinity between the two leaders. When the Japanese prime minister signed up for Twitter, Modi was famously the first world leader he followed. If the nuclear deal, in particular, is finally inked this week, it will go some way in demonstrating that their courting is heading towards a firm commitment.

November 7, 2016

Significant headway' on final text before PM Narendra Modi's Japan visit

http://indianexpress.com/article/business/business-others/civil-nuclear-cooperation-agreement-significant-headway-on-final-text-before-pm-narendra-modis-japan-visit-3740653/

During the last meeting between the two prime ministers in New Delhi last December, it was announced that the two sides have agreed "in principle" on inking the civil nuclear agreement.

Negotiations on a final text of the proposed Civil Nuclear Cooperation Agreement between India and Japan have made "significant headway", with both sides learnt to be working overtime on the technical details ahead of Prime Minister Narendra Modi's visit to Japan on November 11-12.
During the last meeting between the two prime ministers in New Delhi last December, it was announced that the two sides have agreed "in principle" on inking the civil nuclear agreement. The details that the two sides are trying to forge a consensus on include **the contentious issue of reprocessing of spent fuel**. Officials involved in the exercise indicated that **Japan is open to somewhat softening its stance on allowing the reprocessing of spent nuclear fuel from Japan-made reactors, something that could have a significant bearing on the progress of the two atomic projects under discussion involving American nuclear vendors — GE-**Hitachi **and** Toshiba**-Westinghouse**.
If Japan were to go ahead and ink a nuclear deal with India, it could be a crucial determining factor as the two US reactor vendors, as well as a range of other global nuclear reactor manufacturers, source the most critical equipment in a reactor — the calandria or reactor vessel — from Japanese heavy forging major Japan Steel Works (JSW). **Experts point to the fact that the transfer of Japanese technology to India for civilian use requires a nuclear pact, but Tokyo has so far desisted from initiating one as India has not signed the Nuclear Non-Proliferation Treaty (NPT).**
Globally, apart from Japan's JSW, there are just three major heavy forging capacities in operation worldwide that can fabricate large single-piece pressure vessels for nuclear reactors — Creusot Forge (a subsidiary of France's Areva group), Russia's OMZ Izhora and Chinese state-owned firm China First Heavy Industries. But **JSW dominates the nuclear forgings business, accounting for an estimated 80 per cent of the world market for large forged components for nuclear plants and owns the world's only plant capable of producing the central part of a large-size reactor's containment vessel in a single piece from a 600-tonne ingot, which reduces radiation risk.**
All the global suppliers are booked with orders for at least the next five years as the most critical issue for accelerating nuclear power plant construction is the availability of heavy engineering plants to make the reactor components, especially for units of over 1,000 MWe (mega watt electric).
While Toshiba-Westinghouse's AP1000 pressure vessel closure head and three complex steam generator parts can only be made by JSW, the Japanese firm has advance orders from GE-Hitachi for fabricating components for its ABWR and ESBWR range of boiling water reactors.
JSW also has the distinction of supplying the pressure vessels for Areva's first two 1650 MWe EPR projects in Finland and France. Reactor vendors prefer large forgings to be integral, as single products, but it is possible to use split forgings that are welded together. These welds then need checking through the life of the plant.
An NPCIL official said the process of bridging the difference over the substantive issues on the proposed India-Japan nuclear agreement in on and that both countries had made significant progress in the negotiations on civil nuclear cooperation. JSW had set up a marketing office in India in 2009 through a subsidiary — JSW India Pvt Ltd.

Japan to sign nuclear pact with India
http://www3.nhk.or.jp/nhkworld/en/news/20161101_03/

Japan will sign an agreement on nuclear energy technology with India during a visit by Prime Minister Narendra Modi scheduled to start on November 10th.

The agreement will be Japan's first such deal with a non-signatory of the Nuclear Nonproliferation Treaty. It will allow Japan to export nuclear power technology to India.

Japanese Prime Minister Shinzo Abe met with Modi in India last December and they came to a basic agreement regarding the deal.

The two governments have been negotiating the details of the agreement and the date of the signing.

There is concern in Japan about forming a deal with India, which has conducted nuclear tests.

The pact is expected to include a provision that prohibits the technology from being used for military purposes. If India conducts further nuclear tests, the deal would likely be suspended.

Japan has similar deals with 14 countries and territories.

Japan, India to sign energy pact on condition of no nuclear tests

THE ASAHI SHIMBUN
http://www.asahi.com/ajw/articles/AJ201611010047.html
Japan and India will sign a nuclear energy pact in mid-November that allows Tokyo to opt out if the South Asian nation tests its nuclear weapons, sources said.
The agreement, the first by Japan with a nation that has not ratified the Nuclear Nonproliferation Treaty, will be signed when Indian Prime Minister Narendra Modi visits Japan later this month, a high-ranking Foreign Ministry official said.
The agreement will enable Japan to export its nuclear energy technology for private-sector use in India. But the sources said wording in the pact will give Japan, which has long pushed for nuclear disarmament and nonproliferation, the option of ending cooperation if India conducts a nuclear test.
At a meeting in New Delhi in December 2015, Prime Minister Shinzo Abe and Modi agreed in principle to sign a nuclear energy agreement. However, Abe told his Indian counterpart, “We will discontinue cooperation should India conduct a nuclear test.”
Diplomats of the two nations have since held discussions on the agreement.
Japanese diplomats asked for wording that could be interpreted to mean Japan can cease cooperation in the event of an Indian nuclear test after the bilateral agreement takes effect.
Although Indian officials were hesitant about such wording because of concerns it could constrain India’s national security policy, they also showed an understanding toward the Japanese position.
The two nations are currently hammering out the final wording of the agreement. There is a possibility that the terminology will be vague enough to allow both nations to interpret the agreement in a way that is closer to their own national interests.

IAEA approves of Kazakhstan (experience in nukes)

IAEA Praises Kazakhstan's Preparations For Nuclear Programme
http://www.nucnet.org/all-the-news/2016/11/08/iaea-praises-kazakhstan-s-preparations-for-nuclear-programme

Policies & Politics
8 Nov (NucNet): Kazakhstan has developed a considerable base of knowledge and experience in nuclear activities, but should develop "a comprehensive report" that summarises the assessment of all nuclear infrastructure issues, an International Atomic Energy Agency (IAEA) Integrated Nuclear Infrastructure Review (INIR) mission concluded. The eight-day mission reviewed the country's infrastructure development for a nuclear power programme and highlighted a number of areas of potential improvement. Kazakhstan should ensure that key responsibilities and options with respect to spent fuel and radioactive waste management are developed, the INIR mission said. Kazakhstan needs to develop a plan for establishing a competent owner/operator and continue the assessment of its legal and regulatory framework for any nuclear power programme. The IAEA said that due to a desire to reduce reliance on fossil fuels, diversify primary energy sources and curtail greenhouse gas emissions, Kazakhstan is considering the potential role for nuclear power in its energy mix. The INIS team identified three good practices that would benefit other countries considering the introduction of nuclear power: early assignment of responsibilities for the development of the future owner/operator; use of a non-governmental organisation to carry out stakeholder involvement activities; use of a government commission and an expert working group to review the initial site survey and to take into account lessons learned from the March 2011 Fukushima-Daiichi accident in Japan. "Kazakhstan has undertaken several studies over a number of years and has developed a good understanding of all the infrastructure issues described in IAEA guides to the development of national infrastructure for nuclear power," said team leader Milko Kovachev, head of the IAEA's nuclear infrastructure development section. The IAEA said Kazakhstan, the world's largest uranium producer, is developing capabilities to implement all stages of the front end of the nuclear fuel cycle. It has a well-developed scientific research base, including three research reactors in operation and several other nuclear installations. It also has 25 years of experience operating the Aktau BN-350 fast breeder reactor, which is currently under decommissioning. More than 80% of electricity in Kazakhstan is currently produced from fossil fuels.

Abe, Modi sign nuclear deal

November 12, 2016

Japan, India sign agreement on civil nuclear power

THE ASSOCIATED PRESS
Japan signed a pact Friday in which it agreed to sell India civil nuclear power equipment and technology, as the Japanese nuclear industry seeks markets overseas because of shrinking business at home since the 2011 Fukushima disaster.

Japanese Prime Minister Shinzo Abe and his Indian counterpart, Narendra Modi, also agreed during talks to advance business and security cooperation.
The nuclear pact, though limited to peaceful commercial use, is controversial because India has not signed the Nuclear Non-Proliferation Treaty. It has raised concerns in Japan about a risk of the country's technology being diverted to India's nuclear weapons program.
The pact allows India to reprocess fuel and enrich uranium, though highly enriched uranium that can be used to make nuclear weapons is not permitted without written agreement by Japan.
The two leaders insisted the agreement will contribute to peaceful use of clean energy, and Japanese officials said Tokyo will scrap the deal if India conducts a nuclear test.
"This agreement sets a legal framework to assure that India acts responsibly for the peaceful uses of nuclear energy," Abe said, adding that it gets India to effectively participate in the non-proliferation treaty framework. "It is also in line with Japan's position to promote non-proliferation to create a world without nuclear weapons."
Modi praised the signing as "a historic step in our engagement to build a clean energy partnership" that will help India "combat the challenge of climate change."
Anti-nuclear groups denounced the agreement, citing threats to safety and regional peace and increased risk of proliferation.
Energy-hungry India wants to increase nuclear power generation to support its strong economic growth. The country has signed similar nuclear agreements with France, Russia, Britain and the United States.
Abe's pro-business government seeks to export nuclear power plants to counter shrinking sales at home since the Fukushima nuclear disaster, and has discussed similar deals with Vietnam and Turkey.
Vietnam was a strong candidate for Japanese nuclear technology exports, but it announced this week that it is scrapping plans for two nuclear power plants because of slowing demand for electricity and the declining price of other sources of energy.
Exports of infrastructure, including high-speed railway systems, are part of Abe's growth strategy.
Japan is set to participate in an upcoming Indian rapid railway system, but the scope of its role is still being negotiated. Design work for the railway system, to link Mumbai and Ahmedabad in western India, is to start in December and construction is set to begin in 2018. Abe expressed hope that Japan wins extensive portion of the project.
On Saturday, Abe will escort Modi on a Japanese shinkansen "bullet" train to visit a railway factory in Kobe in western Japan.
Japan and India also agreed to step up defense cooperation amid increased assertiveness by China in the region. Tokyo is seeking to export defense equipment and technology to India. But an agreement on a long-hoped-for sale of US-2 rescue aircraft, produced by Japan's ShinMaywa Industries, was not finalized because of differences over pricing and other conditions.

November 11, 2016
Abe, Modi sign nuclear power deal

http://www3.nhk.or.jp/nhkworld/en/news/20161111_36/

The prime ministers of Japan and India have signed an agreement that will allow Japan to export nuclear power technology to India.

Japanese Prime Minister Shinzo Abe and his Indian counterpart, Narendra Modi, signed the deal in Tokyo

on Friday.

Under the agreement, nuclear-related technology from Japan will only be used for peaceful purposes. It also calls for exchanging information on nuclear materials and equipment for nuclear power plants.

The agreement includes a provision for halting cooperation to prohibit the technology from being used for military purposes.

The Japanese government says separate documents also confirm that the cooperation will be stopped if India's activities run counter to its 2008 announcement of a suspension of nuclear tests.

This is Japan's first such deal with a non-signatory of the Nuclear Non-Proliferation Treaty.

In international affairs, the prime ministers agreed that attempts to unilaterally change the status quo are unacceptable, and they confirmed the importance of the rule of law. This appears to be a reference to China, which has been increasing its maritime activities.

They also agreed that India aims to open a high-speed railway in the western part of the country by 2023. The country has decided to use Japan's Shinkansen bullet train technology for the project.

The agreement also states that 30,000 Indian engineers will be trained over the next 10 years with the help of Japanese firms. These engineers will then train workers at Indian factories.

Abe told a joint news conference the nuclear agreement is a legal framework that will ensure India uses nuclear power responsibly. He noted that the accord will lead to the country effectively joining the international non-proliferation regime.

Modi said the agreement is a historic step in building a clean energy partnership between the 2 countries, and it is focused on using nuclear power for peaceful purposes.

Modi and Abe will inspect a plant that manufactures Shinkansen bullet trains in western Japan on Saturday, the final day of the Indian prime minister's visit.

Tochigi governor relected

November 21, 2016

Tochigi governor lands fourth term, beats JCP-backed foe of nuke waste plan

http://www.japantimes.co.jp/news/2016/11/21/national/politics-diplomacy/incumbent-lands-fourth-term-tochigi-governor-beats-jcp-backed-foe-nuke-waste-plan/#.WDLFYH2Dmos

Kyodo
UTSUNOMIYA, TOCHIGI PREF. – Tomikazu Fukuda has been re-elected to a fourth term as governor of Tochigi Prefecture, defeating a newcomer supported by the Japanese Communist Party.
Fukuda, 63, backed by Komeito and the local chapter of the Liberal Democratic Party, won Sunday's race with support from commerce and agricultural organizations.
He pledged to promote local businesses and enhance child-rearing support.
The 64-year-old challenger, Toshiharu Kobayashi, stressed he would demand the central government exclude a town in Tochigi from a list of candidate sites for nuclear waste disposal.

Japanese companies to invest in Areva

December 8, 2016

Mitsubishi Heavy, Japan Nuclear Fuel to invest in France's Areva

http://www.japantimes.co.jp/news/2016/12/08/business/corporate-business/mitsubishi-heavy-japan-nuclear-fuel-invest-frances-areva/#.WEqhm32Dmos

Kyodo
Mitsubishi Heavy Industries Ltd. and Japan Nuclear Fuel Ltd. are making final arrangements to invest tens of billions of yen in atomic energy company Areva, which is being bailed out by the French government, sources close to the matter said Thursday.
Through the investment, the heavy machinery manufacturer and the spent-fuel reprocessing firm hope to improve technical cooperation with Areva on decommissioning reactors and reprocessing nuclear fuel.
Areva has been reeling from weak global demand since the 2011 Fukushima disaster triggered a slump in the nuclear power industry.
Areva is being bailed out by the French government, which has been asking Mitsubishi Heavy to invest since last year.
MHI President Shunichi Miyanaga had said that investing in Areva, which has expertise in decommissioning procedures and fuel reprocessing, would benefit Japan as it faces the prospect of decommissioning more aging nuclear reactors amid high public concern over nuclear safety.
A major Chinese nuclear power company is also considering investing in the state-owned group.
Mitsubishi Heavy is also planning to invest in Areva's plant-building arm in hopes of winning orders to build nuclear power plants in emerging economies where demand is growing.
The heavy machinery maker and Areva are already involved in a joint venture to develop nuclear plants with advanced reactors.

Nukes not an answer to global warming

Why nuclear energy is not an answer to global warming

Talk from Dr. Alex Rosen, Medact-Conference
On December 9th, Dr. Alex Rosen, Vice-President of IPPNW Germany, was invited to talk on the subject of nuclear energy and climate change at the MedAct Conference "Healthy Planet - Better World". The subject of his talk was "Why nuclear power ist not an answer to global warming". In it, he argued that nuclear power was not a good investment and that the true and long-term costs and effects of nuclear power far outweigh its potential short-term benefits. He named the detrimental effects of uranium mining and nuclear waste on the environment an on public health and listed the most relevant studies on the effects of uranium mining and civil nuclear energy on childhood leukemia, lung cancer and other radiation-related diseases. He explained the underestimated risks of nuclear catastrophes and talked about the nuclear legacy that we are leaving to future generations. He also cited studies showing that nuclear energy is in fact irrelevant when it comes to the reduction of greenhouse gas emissions or alleviating climate change. The inextricable links between nuclear power and nuclear weapons, brought to light in the common interests between the civil nuclear industry and the British Trident nuclear submarine program recently was also discussed, as were the attempts of the nuclear lobby to create fake citizen groups and NGO's in order to greenwash its business model. His presentation ended with an outlook to what could be described as a real energy revolution: modern energy conservation and efficiency methods, combined with 100% renewable energy generation, feeding flexible, distributed, community-based smart grid systems that would offer energy autonomy and independence of fossil and nuclear fuel imports. The main arguments of his talk can be found in the attached document.

"Why nuclear energy is not an answer to global warming"by Dr. Alex Rosen

Govt to continue nuclear fuel cycle project despite everything

December 22, 2016

Gov't set to continue nuclear fuel cycle project despite Monju closure

http://mainichi.jp/english/articles/20161222/p2a/00m/0na/014000c

The government formally decided at a meeting of Cabinet ministers concerned with nuclear energy on Dec. 21 to decommission the trouble-plagued Monju prototype fast-breeder nuclear reactor in Tsuruga, Fukui Prefecture.

- 【Related】Japan decides to scrap trouble-plagued Monju prototype reactor
- 【Related】Plan to decommission troubled Monju reactor meets local criticism

Over 1 trillion yen in taxpayers' money has so far been invested in the reactor -- the core facility in the government's nuclear fuel cycle project in which spent nuclear fuel is reprocessed and reused in nuclear reactors.

Nevertheless, Monju, operated by the government-affiliated Japan Atomic Energy Agency (JAEA), will be shut down after being in operation for a total of only 250 days since the reactor reached criticality for the first time in 1994.

Still, the government, which is poised to continue the nuclear fuel cycle project, also agreed at the Dec. 21 meeting to draw up a road map by 2018 toward developing a fast reactor for the project.

In other words, the government is moving toward its "next dream" even without clarifying the cause of the failure of what they called "dream nuclear reactor" Monju and who is responsible for the fiasco.

"It's extremely important to maintain the nuclear fuel cycle project and promote the development of a fast reactor," Chief Cabinet Secretary Yoshihide Suga told a news conference following the decision.

However, continuation of the project will likely pose a challenge. The government's nuclear fuel cycle project involves two cycles -- one centered on a fast-breeder reactor and the other in which mixed-oxide (MOX) fuel, nuclear fuel made from reprocessed plutonium and uranium, is used in nuclear plants.

With the decision to decommission Monju, the cycle involving a fast-breeder reactor has failed. At the same time, the government has failed to smoothly press forward with the cycle involving the use of MOX fuel since most nuclear power plants have been idled since the outbreak of the Fukushima nuclear crisis in March 2011. The No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant is the only nuclear reactor using MOX fuel, which is currently in operation.

A spent nuclear fuel reprocessing plant in Aomori Prefecture is undergoing safety screening by the Nuclear Regulation Authority (NRA), and pools holding spent nuclear fuel at atomic power stations across the country are filled to 70 percent of their capacities on average. Japan's stockpile of plutonium, which can be converted to use in nuclear weapons, has kept growing. By the end of 2015, the plutonium Japan possessed domestically and overseas had amounted to 47.9 metric tons.

The development of a fast reactor poses technological challenges. While a breeder reactor is designed to increase the amount of plutonium, the government emphasizes that a fast reactor that it is aiming to develop will play the role of an "incinerator" for nuclear waste such as by reducing the volume of high-level radioactive waste.

However, no experiment has been conducted on a fast reactor using actual radioactive waste. Hirofumi Nakamura, head of JAEA's planning and coordination division, acknowledged that the technology has not even reached the stage prior to putting it into practical use.

Serious questions persist about the feasibility of a fast reactor for economic reasons, and such a reactor is often dubbed as "modern alchemy."

The basic structure of a fast reactor and that of a breeder reactor are basically the same with the only differences being fuel types and arrangements. Therefore, a fast reactor, which is supposed to play the role of an incinerator for spent nuclear fuel, could be converted into a breeder reactor that produces plutonium.

A senior official of JAEA admits that "there is room for converting a fast reactor into one that breeds (plutonium)."

A fast reactor can be put into practical use after the development and production of experimental, prototype and then demonstration reactors. The government participates in the joint development of ASTRID, a French demonstration fast reactor. However, it remains unclear whether data and knowledge gained from the project in France, which is rarely hit by earthquakes, can be utilized in quake-prone Japan.

France is aiming to begin to operate the fast reactor in the 2030s, but the necessary funds for the project have only been allocated up to 2019. Questions remain as to whether Japan, which has aborted its project

involving Monju, a prototype reactor, can be involved in a project to develop an upper-tier demonstration reactor.
Even those within the governing coalition are calling for caution in Japan's involvement in the joint development project in France. "Japan shouldn't ride on someone's (France's) back," said Hiroshi Hase, former education, culture, sports, science and technology minister.
NRA Chairman Shunichi Tanaka dismissed the feasibility of a demonstration reactor. "I understand that a demonstration reactor isn't realistic," Tanaka told a news conference on Dec. 21.

UK and Japan's nuke agreement

23.12.2016_No254 / News in Brief
UK And Japan Sign Nuclear Cooperation Agreement
http://www.nucnet.org/all-the-news/2016/12/23/uk-and-japan-sign-nuclear-cooperation-agreement

Plans & Construction
23 Dec (NucNet): The UK and Japan have signed an agreement that significantly expands cooperation in the nuclear energy sector and paves the way for Japanese companies to build nuclear plants in the UK, the Department for Business, Energy & Industrial Strategy said in a statement. The agreement also covers cooperation in the areas of decommissioning and decontamination and it is anticipated that the deal will give UK companies with advanced technologies greater access to projects at the Fukushima-Daiichi nuclear station, where three of the six reactors suffered meltdowns after the March 2011 earthquake and tsunami. The agreement was signed in Tokyo on 22 December 2016 by Hiroshige Seko, the Japanese trade and industry minister, and Greg Clark, the UK business and energy secretary. The agreement is the first of its kind for Japan, while Mr Clark described it as “vital” to the UK's industrial strategy and the development of clean energy sources. One of the key components of the agreement is the proposals to build new reactors in the UK. Two Japan-led consortia, Horizon and NuGen, are developing plans to build new nuclear projects in the UK. Horizon, bought by Hitachi from a German company in 2012, has delivered the outline of a project at Wylfa Newydd in Wales, and has plans to build as many as six reactors in the UK. Toshiba joint venture NuGen is planning the Moorside nuclear station in Cumbria, northwest England, and is considering additional projects. The first of the three Westinghouse AP1000 reactors at Moorside is targeted to come online in the mid-2020s.

Can Fukushima No.2 plant continue to exist?

January 3, 2017
Fate of Fukushima No. 2 nuclear plant remains unknown

http://www.japantimes.co.jp/news/2017/01/03/national/fate-fukushima-no-2-nuclear-plant-remains-unknown/#.WGvMV32Dmos

JIJI

The government is struggling to decide the future of Tepco's Fukushima No. 2 nuclear power plant, which has been suspended since the March 2011 disaster.

There have been increasing calls for decommissioning the power plant located just a few kilometers south of the wrecked Fukushima No. 1 installation.

The government has been finding it difficult to reach a clear conclusion on Fukushima No. 2's fate, as it and Tokyo Electric Power Company Holdings have been busy dealing with its older counterpart that suffered three reactor meltdowns following the March 2011 earthquake and tsunami.

On Dec. 21, the Fukushima Prefectural Assembly voted unanimously to adopt a resolution calling on the central government to decommission the No. 2 plant "at an early date," arguing that the facility is an obstacle to the prefecture's recovery from the 3/11 disasters.

A temporary halt to the cooling system for a spent fuel pool at the No. 2 plant caused by an earthquake in November rekindled fears of another meltdown crisis.

In 2011, the prefectural assembly adopted a petition calling for decommissioning all reactors in Fukushima.

The assembly has also adopted a series of written opinions demanding the decommissioning of the No. 2 plant, which is located in the towns of Naraha and Tomioka.

Demands from local communities "have been ignored by the central government," one person said.

The central government's official position is that whether to decommission the plant is up to Tepco.

As the government has already lifted the state of emergency for the No. 2 plant, it has no authority to decide the decommissioning under current regulations.

If an exception were made, the central government could receive a barrage of requests for decommissioning reactors all over the country, sources familiar with the situation said.

"Such a situation would destroy Japan's whole nuclear policy," a senior official at the Ministry of Economy, Trade and Industry said.

Some people have called for creating a special law on decommissioning Fukushima No. 2, but others have raised concerns that such a step could infringe on Tepco's property rights, the sources said.

Some officials in the central government have said that no one believes the No. 2 plant can continue to exist.

Prime Minister Shinzo Abe and his Cabinet have left room for making a political decision on dismantling the facility, saying that the plant can't be treated in the same way as other nuclear plants due to fear among Fukushima residents of another nuclear accident.

Since the government effectively holds a stake of more than 50 percent in Tepco, it can influence the company's policy as a major shareholder.

But Tepco now needs to focus on dealing with the No. 1 plant. A senior company official said that it "cannot afford to decide on decommissioning, which would require a huge workforce."

The main opposition Democratic Party plans to pursue a suprapartisan law that would urge Tepco to decide to decommission the plant at an early date.

"While understanding calls for early decommissioning, we have no choice but to wait for the No. 2 plant's four reactors to reach the end of their 40-year lifetimes," a lawmaker of the ruling Liberal Democratic Party said.

The four reactors launched operations between April 1982 and August 1987.

Govt wants roundtable discussions on reorganising the power industry

January 3, 2017

Gov't mulls 'roundtable' meetings to spur power industry reorganization

http://mainichi.jp/english/articles/20170103/p2a/00m/0na/012000c

The Economy, Trade and Industry Ministry is considering holding "roundtable" discussions with top executives of major power companies on measures to restructure their business ties with beleaguered Tokyo Electric Power Co. (TEPCO) and set up operations overseas, it has been learned.

The industry ministry wants to help pave the way for the power industry to restructure and consolidate by setting up a forum in which major utilities can exchange views on the realities of domestic and overseas markets as well as management reforms. The move will effectively have the government play mediator in the reorganization of the power industry.

The move comes after a ministry expert committee on reforming TEPCO and issues related to the tsunami-hit Fukushima No. 1 nuclear plant proposed on Dec. 20 that the government play a "catalytic" role in the realignment of the power industry. In response, TEPCO plans to hash out a new management restructuring plan this month or later. The roundtable is expected to be set up around the time that TEPCO comes up with its new restructuring scheme.

One of the expert panel's proposals is for TEPCO to establish a "consortium" with other utilities on its power transmission and nuclear power projects at an early date. The proposal is intended to facilitate the realignment and consolidation of the power industry as part of moves to rationalize TEPCO's measures to cover the costs of dealing with the Fukushima nuclear accident. The expert panel projected that these costs would swell to 21.5 trillion yen from an earlier estimate of 11 trillion yen. The proposal also draws on TEPCO's plan to move its thermal power business to JERA Co., a joint venture with Chubu Electric Power Co.

The industry ministry is considering plans including publicly soliciting prospective partners for TEPCO. However, major power companies remain cautious, with a senior official at one major utility saying, "Our own company's profits will be used to deal with the nuclear accident." The utility roundtable meeting is the industry ministry's attempt to help resolve this and other issue. The roundtable idea is also in line with the TEPCO's opinion that "as long as TEPCO is aiming to reorganize at a national level, we want to have an opportunity for all companies to meet and discuss things," as a TEPCO executive said.

While domestic power demand has stagnated due to energy-saving efforts and the declining birthrate, the industry is faced with a shifting market overseas, where demand continues to rise. According to an International Energy Agency (IEA) forecast, while Japan's domestic electricity consumption will rise only slightly from 950 billion kilowatt-hours in 2014 to 980 billion kilowatt-hours in 2030, overall global consumption will rise from 19.8 trillion kilowatt-hours to 27.9 trillion kilowatt-hours.

Through the roundtable, the industry ministry is keen to help boost utilities' entry into overseas markets by facilitating industry rationalization to strengthen their businesses at home. However, as the power industry may not respond well to having reorganization foisted on it by the government, the ministry

plans to flesh out the scheme carefully. As a senior utility official said, "It is essential to set up a contact point for private entities first and leave the matter to them thereafter."

Nuclear revival?

January 4, 2017

Long-promised nuclear revival has run out of steam

http://www.theecologist.org/blogs_and_comments/commentators/2988485/longpromised_nuclear_revival_has_run_out_of_steam.html
Paul Brown

A legacy of lies and covered-up accidents has left nuclear energy with a serious credibility gap, writes Paul Brown. But poor safety is only the beginning of the industry's problems. With 'new improved' reactor designs all running late and way over budget, any nuclear revival can only be sustained at massive, unaffordable taxpayer cost.

For the last 35 years not a single nuclear power station in the west has been built to time or on budget, undermining the claim that nuclear power can compete with other fuels on price: without government subsidy, nuclear power cannot survive.

There have been three well-documented major nuclear accidents in the last 60 years, each one accompanied by official lies and cover-ups.

There have been other less well-known serious accidents that have been so effectively hushed up that decades later there are only the sketchiest details available.

The legacy of these disasters is a deep distrust of the industry by many voters. In some leading industrial countries this has led to governments being forced to abandon nuclear power altogether, while others face such strong opposition to new stations being built that they have abandoned the idea, although they still keep the old ones operating, at least for now.

This chequered history of the industry matters. It has caused a global split. While many scientists and politicians concerned about climate change believe that nuclear power is vital if governments are to meet their commitments to curb dangerous global warming, just as many do not.

The opposition is based on the belief that the industry has lost all integrity and credibility and that renewables are a cheaper, safer and all-round better bet. This view is reinforced by the inability of the industry to deal with its waste. Renewables can easily be recycled, but nuclear waste remains dangerous for thousands of years, leaving future generations to pay for it.

But it is the three major disasters that are at the root of this fierce debate. They happened over a span of 60 years, and all had different causes. But all followed a familiar pattern.

From Windscale to Fukushima

The first was at Windscale in north-west England in 1957, when a plutonium-producing reactor caught fire. The second was Chernobyl on the border of Ukraine and Belarus in 1986: the top blew off one of the

reactors and there was a serious fire. The third was at Fukushima in Japan in 2011, when an earthquake and a tsunami caused meltdowns at three reactors.

All three accidents had startling similarities in the official reaction. In each case the governments involved, the nuclear regulators and plant owners tried to hide the scale of the disaster from the public who were most in danger. In each case this resulted in unnecessary exposure of the population to harmful radiation.

Second, the possible long-term health effects to the people involved were hotly disputed. In each case this took the form, both at the time and ever since, of governments and the industry playing down the health risks.

There is still an argument about whether the Windscale fire caused a leukaemia cluster in children in the neighbourhood. After Fukushima, governments and the industry claim, very few or no deaths at all resulted. Expect the argument to continue for decades.

Third has been the underplaying of the enormous cost and intractable nature of trying to clean up the mess. For example, people who are evacuated are told the move is only temporary, when it could last for decades, possibly generations.

Again, the official estimate for' compensation' for the Fukushima accident rose from ¥5.4 trillion (£40bn) to ¥8 trillion (£70bn), a fact only slipped out at the end of November 2016, nearly five years after the accident.

Technically insurmountable

In each case, even after the Windscale accident 60 years ago, the clean-up of the actual nuclear pile that caught fire has several times started and then been abandoned as too difficult. They are not expected to be completed for decades.

There is no hope of cleaning up Chernobyl or Fukushima this century. A new concrete shell over Chernobyl to replace the existing crumbling structure should be in place by 2017 at a cost of €2.1 billion - but this is designed only as a temporary structure, to last 100 years.

Governments tried hard to cover up what happened. At Windscale, the British government subsequently admitted it had deliberately covered up the seriousness of the accidents to keep its nuclear weapons programme on track.

In Chernobyl's case it was the sky-high radiation readings from as far away as Scandinavia and Germany that led the Soviets to admit what had happened. Thirty years later the real health effects of the accident are hotly disputed.

Thousands of children have had their thyroids removed and there have been many birth defects and cancers. Belarus, worst hit by the disaster, is anxious to play down the long-term effects to avoid frightening potential foreign investors in the country.

The nuclear industry has been trying hard to put all this in the past. In response to public concerns it has come up with a whole series of 'safer' designs for nuclear power stations. As a result, some countries like Finland and Britain are encouraging the building of a new generation of French, Japanese, Chinese and American designs.

Nuclear power can only survive on taxpayer handouts

This time, however, it is not just safety that is at issue. For the last 35 years not a single nuclear power station in the west has been built to time or on budget. It undermines the claim that nuclear power will be able to compete with other fuels on price. It has repeatedly been shown that, without government subsidy, nuclear power cannot survive.

The latest evidence for this is the two new power stations being built in Finland and France, at Olkiluoto and Flamanville. Both are nearly 10 years behind schedule and have more than doubled in cost.

The original claims that the price of the electricity the stations would produce would be competitive cannot be true. Wholesale prices must already have more than doubled before a single watt of power has been produced.
Financial markets have also just witnessed the astonishing financial meltdown that has hot Toshiba, which has seen its market capitalisation fall by over $6 billion as a result of massive losses and growing liabilities in its CB&I Stone & Webster and Westinghouse nuclear construction subsidiaries. From 14th December to today, Toshiba's share price has fallen from ¥468 to ¥277 as news of problems with its flagship AP1000 nuclear reactor, and huge time and cost over-runs at construction sites in the US and China, has emerged.
Yet, despite this track record, the nuclear industry hopes to keep on growing and claims it is expecting to do so - and many governments continue to pour money into research and development. They do so in the hope that one day nuclear power will provide a safe and economically viable method of producing electricity.
So far, however, there is no sign of the long-predicted nuclear renaissance. The costs of a safe design continue to increase as the industry and governments attempt to live down the legacy of misleading the public for the last 60 years.
It seems that if the climate is to be saved from overheating, we shall have to do this without the aid of new nuclear power.

Japan unfit for nuclear projects

January 25, 2017

After years of setbacks, Japanese unfit for nuclear energy projects

http://mainichi.jp/english/articles/20170125/p2a/00m/0na/006000c

According to a well-known joke about the national traits of Europeans, it is heaven if the chefs are French, the engineers are German and the bankers are Swiss and it is hell if the chefs are British, the engineers are French and the bankers are Italian."

- 【Related】Editorial: Toshiba must clarify how it suffered staggering losses
- 【Related】Toshiba could incur 700 bil. yen loss, asks state-owned bank for aid
- 【Related】Embattled Toshiba needs to revamp nuclear plant business due to huge loss

As for the Japanese? They appear not suited to a particular field -- nuclear energy. And that is no joke. The development of nuclear technology as part of national policy and by private nuclear businesses has repeatedly experienced failure, causing problems to numerous people and wasting a massive amount of money.
Mutsu, Japan's first and only nuclear-powered ship which was launched in the early 1970s, suffered a radiation leakage and was decommissioned in 1992 after having only four experimental runs.

The government decided late last year to decommission the prototype fast-breeder reactor Monju in Fukui Prefecture, which has hardly been in operation for more than 20 years following a fire triggered by a sodium leak broke out at the facility in 1995.
Construction work on a spent nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture, got underway in 1993, but its completion was postponed 23 times and there are no prospects that it will be put in operation in the foreseeable future.
Roughly 5 trillion yen has so far been spent on nuclear projects in Japan.
In March 2011, a serious accident occurred at Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant after the complex was hit by a massive tsunami triggered by the Great East Japan Earthquake. Over 80,000 residents from areas near the atomic power station are still living outside the affected areas as evacuees. The costs of dealing with the nuclear crisis have already surpassed 20 trillion yen.
Meanwhile, Toshiba Corp. has added a new page to the negative history of Japan's nuclear development.
In 2006, Toshiba acquired Westinghouse Electric Co., a U.S. nuclear plant company, for over 600 billion yen. The deal was criticized as too costly, but Toshiba wanted to control the world nuclear power market. Toshiba's president at the time was upbeat about the takeover saying, "We'll conduct business aggressively."
Nevertheless, Toshiba will likely suffer nearly 1 trillion yen in losses from the deal because the electronics giant failed to find hidden problems involving its U.S. nuclear power unit. The world nuclear power market has shrunk since the outbreak of the Fukushima nuclear crisis. Following revelations that it had padded its profits through accounting irregularities, Toshiba downsized its workforce by more than 10,000 people, but its rehabilitation efforts are still insufficient. Its financial difficulties have even put the company's survival in jeopardy.
Physicist and technology commentator Kiyoshi Sakurai, who is well versed in technical problems and accidents involving nuclear plants, warned in a past Mainichi Shimbun interview, "Only a handful of those concerned with a certain project loudly underscore the significance of the project. These people could self-righteously go too far without understanding the project's objectivity or necessity."
His remarks remind the public of a past silly war (World War II).
More sadly, it is feared that Japanese people traumatized by the atomic bombing tend to stick to the peaceful use of atomic energy and have lost the capacity for calm and rational judgment.
After reviewing the above, one can see that Japanese people are unfit for nuclear energy development projects. (By Hideaki Nakamura, Editorial Writer)

90% "low carbon" but with nukes

February 1, 2017
Japan may aim for 90% low-carbon energy sourcing
https://www3.nhk.or.jp/nhkworld/en/news/20170201_13/

Japan's environment ministry is to call for an ambitious new low-carbon energy target.
Officials will recommend that Japan produce more than 90 percent of its energy from low-carbon sources, **including nuclear power,** by 2050.

Japan will present a plan to the United Nations by 2020 as required by the 2016 Paris Agreement on climate change. Experts including a panel appointed by Japan's environment ministry are drawing up the plan.

The ministry says the draft plan will include a call for Japan to source the vast majority of its electricity from renewable sources such as solar and wind. Nuclear power, a low-carbon energy source, will also be included in the 90 percent target.

The plan would be far more ambitious than a previous government target set 2 years ago. That called for about 40 percent low-carbon sourcing by 2030.

The new plan will also recommend research into emissions trading systems and carbon taxes on fossil fuels.

This is likely to be opposed by bulk consumers of fossil fuels, such as the steel and electric power industries.

Nukes enormously risky...financially

February 4, 2017

Dream of cheap, clean nuclear power is over

http://www.japantimes.co.jp/opinion/2017/02/04/commentary/world-commentary/dream-cheap-clean-nuclear-power/

by Noah Smith
Bloomberg
NEW YORK – For much of my life, I loved the idea of nuclear power. The science was so cool, futuristic and complicated, the power plants so vast and majestic. I devoured science fiction novels like “Lucifer’s Hammer,” where a plucky nuclear entrepreneur restarts civilization after a comet almost wipes us out. I thought of accidents like Three Mile Island and even Chernobyl as stumbling blocks to a nuclear future.
Then, in 2011, two things happened. First, a tsunami knocked out the Fukushima No. 1 nuclear plant, forcing a mass evacuation and costing Japan vast sums of money. Second, I learned that progress in solar power had been a lot faster and steadier than I had realized. I started taking a closer look at whether nuclear was really the future of energy. Now I’m pretty convinced that my youthful fantasies of a nuclear world won’t come true anytime soon.
Safety is part of the problem — but a much smaller part than most people realize. The Fukushima nuclear crisis caused an enormous area to be evacuated. But recent research shows that the reaction might have been overdone — radiation levels for people exposed to the leak was substantially less than many had thought.

Meanwhile, countries are getting better at burying their nuclear waste. Finland is excavating a storage area deep underground that will hold radioactive waste safely for 100,000 years. France, which gets a lot of its energy from nuclear plants, also stores waste deep underground.

So nuclear hazards, while significant, are probably less than many believe. And compared with fossil fuels — which turn whole cities into toxic deathtraps, foul the atmosphere with gigatons of carbon and can lead to huge oil spills — nuclear looks downright clean.

The biggest problem with nuclear isn't safety — it's cost. The economics of nuclear are almost certain to keep it a marginal part of the energy mix, especially in the United States.

Many energy sources involve relatively small upfront costs. To increase solar power, just build more panels. Fracking also has lower fixed costs than traditional oil drilling. But nuclear's fixed costs are enormous. A new nuclear plant in the U.S. costs about $9 billion to build — more than 1,000 times as much as a new fracking well, and more than 3,000 times as much as the world's biggest solar plant.

Raising $9 billion is a daunting obstacle. It's more money than Apple Inc., America's most valuable company, borrowed in 2016. The plucky young entrepreneur raising enough money to build his own nuclear plant in "Lucifer's Hammer" was pure fantasy; in reality, nuclear plants get build by giant corporations such as General Electric Co. and Toshiba Corp., with huge assistance from the government in the form of loan guarantees.

It's hard to raise money for projects with giant fixed costs and long horizons for repayment, because they're inherently risky. If something goes badly wrong with the project, all of that upfront money is lost. If competition makes a project uneconomical in five or 10 years in the future, the financiers will take a big loss. It's very hard to make predictions of more than a few years, especially about competing technologies.

For nuclear power, that's the main risk — rapid advances in competing technologies. Solar power is already cheap and is plunging in price, while energy storage is also becoming much more affordable. If these trends continue, a nuclear power plant that's economical today will be out-competed in a few years. In other words, there will be no way the owner could recover the fixed costs.

What's worse, nuclear doesn't look like it's getting any cheaper. A recent paper by the Breakthrough Institute shows that in most countries, nuclear costs haven't changed much in recent decades:

Constant or rising nuclear construction costs, matched with dramatically falling solar and storage costs, mean that anyone who ponies up the $9 billion to build a nuclear plant today is taking a gargantuan risk.

Another source of risk is safety — not the well-known threats of accidents and storage leaks, but the unknown unknowns. If terrorists figure out how to bomb nuclear plants, or hackers find ways to invade their software and cause them to melt down, the destruction could be catastrophic. But no one really knows how likely or remote those threats will be a decade from now. And even if those risks can be prevented, doing so will probably cause large unanticipated costs.

So nuclear power hasn't become the futuristic dream technology the old science fiction novels envisioned. Instead, it's a huge, risky government-subsidized corporate boondoggle. Someday we may have fusion power or small, cheap fission reactors, and the old dream of nuclear will be realized. But unless one of those breakthrough technologies comes to fruition, nuclear isn't the power of tomorrow.

Noah Smith is an assistant professor of finance at Stony Brook University.

Areva reaches agreement with MHI and JNFL

February 3, 2017
03.02.2017_No25 / News in Brief

http://www.nucnet.org/all-the-news/2017/02/03/mhi-jnfl-to-buy-10-stake-in-areva-s-newco-nuclear-fuel-group

MHI, JNFL To Buy 10% Stake in Areva's NewCo Nuclear Fuel Group

Uranium & Fuel

3 Feb (NucNet): French nuclear group Areva said today it had reached an agreement with Japan Nuclear Fuel Limited (JNFL) and Mitsubishi Heavy Industries (MHI) to buy a combined 10% stake in nuclear fuel group NewCo for €500m ($538m).

The state-owned company also said that the capital of NewCo – which is being split off from Areva in a government-led rescue – remains open to other strategic investors.

Shareholders of parent company Areva SA and NewCo were expected vote on two capital increases for the companies today.

Last month EU anti-trust regulators cleared the French government's restructuring of Areva.

The European Commission said French plans to grant a capital injection of €4.5bn to Areva were in line with EU state aid rules.

In April 2016, France notified the Commission of a restructuring plan to restore its competitiveness.

The plan provides for various divestments, in particular the group's nuclear reactor business.

Areva, which is 86.5% owned by the French state, will instead focus its activities on the nuclear fuel cycle.

France plans to help Areva bear the cost of restructuring by injecting public capital of €4.5bn.

In September 2016, Areva began the transfer of its nuclear fuel cycle activities to NewCo.

Toshiba's woes an opportunity for Japan to change energy policy?

February 15, 2017

Toshiba's woes weigh heavily on government's ambition to sell Japan's nuclear technology

http://www.japantimes.co.jp/news/2017/02/15/national/toshibas-woes-weigh-heavily-governments-ambition-sell-japans-nuclear-technology/#.WKQrfvKDmos

by Eric Johnston
Staff Writer

OSAKA – Toshiba's announcement that it will write down nearly ¥712.5 billion in losses involving its U.S. nuclear unit, Westinghouse, is seen as a major setback for the government's strategy of selling Japanese nuclear power technology abroad.

Over the past four years, Prime Minister Shinzo Abe, the Ministry of Economy, Trade, and Industry, and nuclear power players, such as Toshiba/Westinghouse, General Electric-Hitachi and Mitsubishi Heavy Industries, have promoted Japanese nuclear reactor technology worldwide.

Attempts to increase exports came even as concern within Japan grew over nuclear safety following a triple meltdown at the Fukushima No. 1 plant in the wake of the March 11, 2011 earthquake and tsunami. The efforts also came as questions were being raised about the total cost of nuclear power compared with other energy sources.

Japanese firms have attempted, with little success, to sell their technologies in countries as diverse as France, Vietnam, India, Turkey, Hungary, Poland, Slovakia, the Czech Republic and the United Arab Emirates. In June 2016, Toshiba said its goal was to win orders for 45 or more nuclear reactors overseas by 2030.

But Tuesday's announcement by Toshiba came a few weeks after the company announced it would not take any new construction orders for nuclear reactors, and that it would focus instead on maintenance and decommissioning operations.

That decision effectively ended a decade-long effort by Toshiba, which began when it acquired a majority stake in Westinghouse in 2006, to make nuclear reactors a viable export business.

It follows greater than projected construction costs for four Westinghouse AP1000 next-generation nuclear reactors in the U.S. that have run billions of dollars over budget and are three years behind schedule. Original plans called for their startup around 2019 but that could be delayed.

Yoshimitsu Kobayashi, chairman of the Japan Association of Corporate Executives, told reporters at a regular news conference on Tuesday that promoting nuclear reactor exports was a necessary strategy, but one that needed to be reviewed.

"The nuclear power industry requires huge amounts of money for safety," Kobayashi said.

"Given such high costs, we have to think about whether just one company can succeed. We have to keep strong technology in Japan, but we need to rethink how to create a union of private firms" in the nuclear business, he said.

But with Toshiba's problems and the growing use worldwide of other, cheaper energy sources, including some renewables, anti-nuclear groups see an opportunity for Japan to change its basic policy.

"The Japanese government's nuclear export policy was built on a combination of a poor understanding of the global energy market and self-delusion, said Shaun Burnie, a senior nuclear specialist at Greenpeace Germany who is currently based in Japan.

"The sooner the government and industry realize there is no future for nuclear power either domestically or in exports, the sooner they can concentrate on the energy technology of the future — renewables."

Will Democratic Party distinguish itself from LDP on nukes?

February 17, 2017

Democratic Party delays decision on changing target date for abolishing nuclear power

http://www.japantimes.co.jp/news/2017/02/17/national/politics-diplomacy/democratic-party-delays-deciding-2030-target-make-japan-nuclear-power-free/
JIJI, Kyodo
The Democratic Party is split on whether to move up its target for ending the nation's reliance on nuclear energy by a few years to 2030.
The opposition party's leadership is facing resistance from its members and a key supporter, the Japanese Trade Union Confederation (Rengo), which includes an electric power industry union.
The DP on Thursday began deliberations on the matter at a meeting of its energy and environment panel that brought together some 70 members.
More than 20 people made remarks, with about half expressing opposition to the idea, including former education minister Yoshiaki Takaki.
Until now, the DP had been aiming to end Japan's reliance on nuclear energy within the decade after 2030. It had also accepted that some nuclear plants could be restarted under certain conditions.
The party is now leaning toward moving up the target date as it hopes to underscore its differences with Prime Minister Shinzo Abe's Liberal Democratic Party and strengthen cooperation with the Japanese Communist Party, the Social Democratic Party and the Liberal Party.
A source close to DP President Renho said it has become difficult to highlight positions different from the LDP because the Abe administration has copied some of its policies, such as "equal pay for equal work" and a state-backed scholarship program.
Thus, to distinguish itself from the LDP, the leadership has judged it necessary to change its position on when to abolish nuclear energy. Abe said nuclear is an "important base-load power source" even after the 2011 triple core meltdown at the Fukushima No. 1 power plant.
The Abe administration, however, also claims it would like to reduce the nation's dependence on nuclear as much as possible.
But in the face of resistance, the DP is expected to delay the decision until it sets its platform for the next House of Representatives election. At a news conference Thursday, Renho acknowledged there would be a delay.
"We maintain the belief that we want to show our view at the party convention" on March 12, she said.
Also on Thursday, Renho met with Rengo President Rikio Kozu to discuss the key nuclear policy target, where she failed to win his support.
Rengo also postponed a planned regular meeting with DP executives that was slated for Friday.
On Friday, she met with officials of the Federation of Electric Power Related Industry Worker's Unions of Japan, also a Rengo member, where she sought its cooperation but declined to comment on whether she succeeded.

Democratic Party faces rift over advancing target to rid Japan of nuclear power

http://mainichi.jp/english/articles/20170217/p2a/00m/0na/010000c

The largest opposition Democratic Party (DP) held a meeting of its energy and environment research committee on Feb. 16 to accelerate debate on advancing its target of making Japan a nuclear power-free nation in 2030 instead of sometime in the 2030s.

The DP leadership under President Renho plans to unveil the objective as a centerpiece of a party convention on March 12, but proponents of nuclear energy within the party balked. The Japanese Trade Union Confederation (Rengo), the party's major backer, directly conveyed its complaint about the nuclear power-free target to Renho on Feb. 16.

During the research panel meeting, one lawmaker after another expressed dissatisfaction over moving up the nuclear power-free target year, saying, ''Is it OK for the party's executives by themselves to make a decision on such an important issue? The party could break up.'' Renho and more than 60 DP lawmakers attended the meeting.

Koichiro Gemba, head of the panel, said after the meeting, ''There were many opinions about discussing the issue more fully.'' He added that he was not sure what the party leadership can say about the controversial nuclear policy at the party convention.

The internal rift came to the fore earlier this month when Gemba, acting on the intentions of Renho and other party executives, told a meeting of the energy and environment research committee that the party will spell out the 2030 target year in a draft nuclear power-free bill in light of ongoing energy and electricity-saving efforts. The DP leadership is particular about the target because it wants to re-emphasize its nuclear power-free campaign by advancing an end to nuclear power from its earlier target of sometime in the 2030s, as championed in the party's plank for the 2012 House of Representatives election.

But Gemba's remarks about advancing the target to the year 2030 surprised proponents of nuclear energy and those skeptical about ending Japan's dependence on nuclear power within the party. House of Councillors member Masao Kobayashi, a former member of the Federation of Electric Power Related Industry Workers Union of Japan, and others told DP Secretary-General Yoshihiko Noda on Feb. 9, ''If we review (the target) based on a foregone conclusion, it would cause confusion within the party.''

Repercussions have also reverberated through supporting labor unions. Rengo President Rikio Kozu met with DP chief Renho on Feb. 16 and expressed concern, saying, ''DP must not waver over its policy. Simply moving up the goal even without a road map for ending reliance on nuclear power sometime in the 2030s would be a big blow to the DP.'' Rengo postponed Feb. 17's scheduled regular meeting with the party.

But Renho has been in contact with various labor unions to win their understanding of the 2030 target. She told a news conference on Feb. 16 that she still hopes to declare an end to Japan's nuclear power in 2030 at the party convention on March 12, a day after the sixth anniversary of the 2011 Great East Japan Earthquake, tsunami and subsequent Fukushima nuclear disaster.

End of new build for largest nuclear builder

February 2, 2017

Toshiba-Westinghouse: The End of New-build for the Largest Historic Nuclear Builder

https://www.worldnuclearreport.org/Toshiba-Westinghouse-The-End-of-New-build-for-the-Largest-Historic-Nuclear.html

On 28 January 2017, Japanese media reported that Toshiba will not take any new nuclear reactor orders, "a move that would effectively mark its withdrawal from the nuclear plant construction business". Toshiba, owner of Westinghouse—no other company built more nuclear plants in the world— "will focus on maintenance and decommissioning operations".

Three days later, on 31 January 2017, the Wall Street Journal confirmed that "Toshiba Corp. plans to stop building nuclear power plants", a decision that "could have widespread ramifications for the future of the nuclear-power industry", and reported that Toshiba's chairman, Shigenori Shiga, and Danny Roderick, a Toshiba executive and head of Westinghouse, are expected to step down by mid-February 2017.

The decision to withdraw from the business of constructing nuclear reactors is mainly due to liabilities arising from multi-billion dollar cost overruns on two U.S. reactor construction projects in Georgia and South Carolina. First indications from Toshiba on losses were disclosed in December 2016. The crisis has in part been been triggered by an accounting and legal dispute between the nuclear division Westinghouse Electric Company LLC and Chicago, Bridge and Iron (CB&I) over the valuation of the nuclear construction company CB&I Stone and Webster. Westinghouse purchased Stone and Webster from CB&I in 2015.

On 24 January 2017, Standard & Poor's Global Ratings cut Toshiba's credit rating deeper into junk status, downgrading it to CCC+ ("substantial risks"), down one notch from the previous B- ("highly speculative"). Both ratings are considered non-investment or "junk" level. Japan's securities watchdog recommended that Toshiba be fined a record 7.37 billion yen US$60.5 million for overstating profits, while it is already being sued by shareholders over damages brought about by stock losses.

In future, Toshiba's nuclear division is planning to concentrate on designing nuclear reactors due to the difficulties in forecasting construction costs. The decision followed an emergency board meeting in Tokyo to discuss the survival of one of Japan's major companies, with the President of Toshiba explaining that the decision "will eliminate the risk from the construction business". In June 2016, the incoming President of Toshiba had recommitted to the company's aim to win orders for 45 or more nuclear reactors overseas by 2030, however, it now appears to abandon that goal.

U.S. Nuclear Plants At Centre of Crisis

The Vogtle and Summer plants are at least three years behind schedule and billions of dollars over budget. The AP1000 reactor projects are managed by CB&I Stone and Webster, a subsidiary of Westinghouse Electric Company LLC, which was purchased by Toshiba in 2006. In mid-February 2017, Toshiba is expected to declare a deficit of about 700 billion yen ($6.1 billion).

As of September 2016, the total cost of the Vogtle project was reported **as US$21 billion, more than US$7 billion above initial estimates. With regards to VC Summer, in October 2016, after a review of the project, Westinghouse and the reactor owners South Carolina Electric and Gas Company (SC&G) agreed on a new contract with a higher projected cost of US$14 billion, about 43 percent higher than the US$9.8 billion price tag announced in 2008.**

The latest start dates of June 2019 and June 2020 for Plant Vogtle, are unlikely to be attained, raising the prospects of further costs.

The 2017 losses greatly exceed Toshiba's projections announced in 2016. In April 2016, Toshiba announced that it expected to have US$2.3 billion in impairment losses, in recognition that it had overpaid for Westinghouse and its falling revenues. Toshiba's fiscal year estimate for sales revenue from the nuclear firm is US$3.1 billion in 2015/6 — US$540 million below what it was in November 2015 and US$180 million below what the company projected in March 2016.

Toshiba bought the Westinghouse nuclear group from British Nuclear Fuels Limited (BNFL) in 2006 for US$4.1 billion. At the time the acquisition was hailed as bringing together the "powerful combination of Toshiba and Westinghouse's respective strengths, complementary technologies and businesses, [which] will position Toshiba as the world's leading nuclear power group, with an unrivaled business range extending to both BWR [Boiling Water Reactor] and PWR [Pressurized Water Reactor] systems."

Accounting and Valuation Dispute – Write Down of Goodwill

In October 2015, Westinghouse signed a purchase agreement to acquire CB&I Stone & Webster Inc., the nuclear construction and integrated services businesses then owned by CB&I. Westinghouse President and CEO Danny Roderick said the agreement "supports our company's strategic global growth framework, and expands our capabilities". Westinghouse and its affiliates became the sole contractor for construction of Vogtle-3 and -4, owned by Georgia Power, and V.C. Summer-2 and -3 reactors owned by SC&G.

CB&I have charged that Westinghouse reneged on promises to wipe out all the construction company's liabilities tied to the Vogtle and VC Summer projects. The dispute relates to the value of the net working capital of the CB&I Stone and Webster nuclear construction business. As explained in an analysis from Reuters, Toshiba had claimed that it was owed US$2.15 billion by CB&I. Net working capital is a measure of the financial strength of a business, defined as its current assets minus its current liabilities. When Westinghouse bought Stone and Webster, the sale agreement included a target figure for net working capital to ensure that the financial position of the business would not change materially from the time the deal is signed to when it closes. The two companies agreed that CB&I would not be paid any money, when the deal closed, and instead would receive earning going forward. An independent auditor was brought in to calculate the net working capital of CB&I Stone & Webster. Prior to Westinghouse's purchase of Stone and Webster, CB&I channeled US$1 billion to Stone & Webster between June 2015 and December 2015, when the sale agreement with Westinghouse entered into force. CB&I sees the net working capital mechanism as a way to be compensated for continuing to support the unit after the deal signed. But Westinghouse changed the calculations on Stone and Webster's net working capital and argued that "CB&I's methodology did not adhere sufficiently to Generally Accepted Accounting Principles (GAAP)", while "CB&I maintained that it has stuck to the accounting methodology it used before and Westinghouse previously accepted".

The nuclear power plant construction unit's liabilities affect not just the net working capital calculations, but also the valuation of the unit. Toshiba initially estimated the 'goodwill' resulting from the purchase of CB&I Stone and Webster at around US$87 million, which has now morphed into several billions of dollars. Clearly, as an intangible asset, the goodwill estimated by Toshiba was massively overvalued failing to take into account the rising cost of materials and goodwill to complete Vogtle and VC Summer, leading to the

company's assets worth being less than expected. In April 2016, Toshiba reported the write down of goodwill as likely to be US$2.3 billion, now revised downward further by several billion.

On 5 December 2016, the Delaware Chancery Court found in favor of Westinghouse and dismissed the filing of CB&I, and found that the parties' purchase agreement required an independent auditor to resolve the dispute. CB&I filed an appeal on 7 December 2016.

"We focused on the nuclear business
among all of our energy businesses,
but this will change…
This will entail a review of our overseas
(nuclear) business."

Satoshi Tsunakawa
President, Toshiba Corp.
27 January 2017

Implications for Toshiba-Westinghouse's Worldwide Nuclear Ambitions

The Toshiba crisis raises significant implications for planned projects worldwide, as well as undermining a central tenet of Japanese government economic policy of promoting nuclear reactor exports. Over the decades, Toshiba, alone or in joint ventures, has built 20 reactors in Japan, none of which are operating (nine are closed and 11 in long-term outage) and Westinghouse has built 91 reactors globally, of which 67 are still operating, 12 are closed and four are in long-term outage. (See the Global Nuclear Power Database for details and locations).

Currently, in addition to the four AP1000 reactors under construction in the U.S., four are under construction at Sanmen and Haiyang in China. **As in the U.S., the Chinese projects have** suffered construction delays **and cost overruns, design changes and equipment failure.** The Sanmen cost overruns were the probable cause of the resignations at Toshiba in 2015. They are however, currently scheduled for grid connection of Sanmen-1 in 2017, three years behind schedule, with Haiyang-1 scheduled shortly thereafter.

Toshiba-Westinghouse has been actively seeking contracts for the construction of AP1000's worldwide, including in the U.K. and India.

The U.K. NuGen consortium, with a 60 percent share owned by Toshiba, and the balance with French company Engie, has plans to build three AP1000 reactors near the UK Sellafield site, with Generic Design Assessment for the AP1000 not yet concluded. As with nuclear projects worldwide, financing for the UK project is critical and so far not secured. The financial crisis at Toshiba is impacting the ability of the company to secure the financing it requires for the project. It has already made requests to Japanese insurers as well as some banks including Norinchukin Bank and has hired HSBC as advisor. In 2015, Toshiba had estimated a total cost of 1.5 trillion yen US$12.4 billion for the NuGen project. But industry analysts now believe the cost could be roughly double that due to higher-than-expected labor costs and revised safety standards. The current schedule of 2018 for finalizing financial plans for the 3.4 GW project appear unattainable at this stage.

Toshiba-Westinghouse has long touted the Indian market for exports, with ambitions to build twelve AP1000 in Andhra Pradesh and Gujarat. Despite Toshiba-Westinghouse and the Nuclear Power Company of India Limited (NPCIL) having signed a works agreement in 2013 no construction has begun at either sites and financing has still to be secured. Both, Toshiba-Westinghouse and GE-Hitachi have been reluctant to rush into the Indian market because there is a possibility that they could be facing compensation of billions of dollars in a case of an accident.

However, trade journal *Nucleonics Week* reported in January 2017 that Toshiba-Westinghouse were ready to sign a commercial contract to supply reactors to India without a final settlement of the nuclear liability issue. Analysis carried out by the Institute for Energy Economics and Financial Analysis (IEEFA) concluded that the Mithivirdi project, at Bhavnagar, in Gujurat in northwest India was not financially viable. Toshiba-Westinghouse has been desperately trying to secure financing for the reactor project, with the U.S. Exim Bank being a particular target. Toshiba-Westinghouse was seeking US$8-9 billion from Exim towards the cost of the project. However, U.S. Exim is not able to issue loan guarantees over US10$ million presently, due to a political dispute that has meant that only two of the five board members are currently in place. There is no clarity as to when or if this obstacle will be resolved, given that leading House Republicans are seeking to terminate the bank's very existence, with critical comments on the Bank made by President Trump prior to the election. Financing from the Japan Bank for International Cooperation—the international arm of the Japan Finance Corporation, and under the administration of the Ministry of Finance—while theoretically possible, will be further complicated by the latest crisis at Toshiba.
However, there is no point in continuing the difficult search for financing if the decision to exit nuclear construction altogether is officially confirmed. Toshiba-Westinghouse management is expected to provide the answer by mid-February 2017.

Nuke integration project delayed

February 23, 2017

Hitachi, Mitsubishi Heavy, Toshiba to delay nuclear integration project

http://mainichi.jp/english/articles/20170223/p2a/00m/0na/011000c

Hitachi Ltd., Mitsubishi Heavy Industries Ltd. and Toshiba Corp. have decided to delay the integration of their nuclear fuel businesses that was planned for spring due to reasons such as manufacturing hub-related problems and prolongation of a Japan Fair Trade Commission review.

- 【Related】Industry ministry's push behind move to integrate nuclear fuel businesses

Specifically, the three Hitachi, Mitsubishi and Toshiba affiliates that are involved in these integration talks are as follows: Global Nuclear Fuel-Japan Co., Mitsubishi Nuclear Fuel Co., and Nuclear Fuel Industries Ltd. -- of which U.S. company Westinghouse Electric Company LLC is a major shareholder.
Since the nuclear disaster in Fukushima in 2011, Hitachi, Mitsubishi and Toshiba have all struggled with their nuclear businesses, and each company is aiming to reduce costs in this area by integrating with one another in the hope that this will lead to increased efficiency. Also, it is planned that the three companies will invest equally into a holding company, which will oversee the fuel companies under their control.

According to a source close to the integration project, the three companies are in agreement that they will need to "scrap and build" some of the manufacturing bases that are currently held by the companies' fuel divisions. However, this will not be an easy process because the decision as to which base should be scrapped will inevitably result in job cutbacks.
In addition, earlier this month, Toshiba announced huge losses in excess of 700 billion yen in its nuclear unit in the U.S. Therefore, as the company tries to deal with its massive financial loss, it will inevitably face difficulty as it attempts to proceed with this integration project.
Furthermore, there have also been problems regarding the companies' failure to request a review by the Japan Fair Trade Commission that will be necessary in this case under Japan's Anti-Monopoly Act. There are other issues at hand, such as a possible requirement to support the export of nuclear fuel from overseas to Japan, and it is expected that the review will take several months.
The three companies have all been involved in the manufacturing of nuclear reactors, but the nuclear business environment has worsened, and Toshiba is currently in the midst of a financial crisis. A delay in this integration project could further increase the pressure on these companies' businesses.
In response to an interview with the Mainichi Shimbun, a PR representative from Mitsubishi Heavy Industries stated, "We are looking into various possibilities, including discussions with other companies. However, at this point in time, we do not have a fixed schedule regarding the integration."

What future for US (new) nukes?

Background:
There has always been a lot of speculation and "hype" when it comes to the so-called nuclear renaissance. There are good reasons to be somewhat skeptical of the claim that there is a nuclear power renaissance under way in South Korea, Russia, India, and China, although there is no doubt that extravagant nuclear ambitions exist in those countries.
South Korea did have plans for stupendous expansion, to increase nuclear's share of generation to 60% by 2035. Eleven more reactors were scheduled to come on stream in the period 2012 to 2021. However, in 2013 the government submitted a reduced draft plan to parliament for nuclear output of up to 29% of generation capacity by 2035 — less than half of the original projection — following several scandals **related to falsification of safety documentation. Further cutbacks could well ensue.**

In India, there have been mass protests against the French-backed 9900 MW Jaitapur Nuclear Power Project **in Maharashtra and the Russian-backed 2000 MW** Kudankulam

Nuclear Power Plant **in Tamil Nadu. The state government of West Bengal state has also refused permission to a proposed 6000 MW facility near the town of Haripur that intended to host six Russian reactors. A** Public Interest Litigation **(PIL) has been filed against the government's civil nuclear programme at the Supreme Court. Whether the Government of India can realize its ambitious nuclear expansion plans is unclear.**

China froze new nuclear plant approvals following the 2011 Fukushima Daiichi nuclear disaster **in Japan. Subsequently there was a slow down in the Chinese nuclear program. No new approvals were made during 2014. In 2015 the EPR and AP1000 builds were reported to be running over two years late, mainly due to key component delays and project management issues. Again, while China has adopted ambitious plans for new reactors, it must be born in mind that nuclear power is just 3 percent of China's supply of electricity, and even the most ambitious plans will only raise that share to 6 percent.**

Meltdown of Toshiba's Nuclear Business Dooms New Construction in the U.S.

The collapse of the Tokyo company's nuclear development arm puts a likely end to new U.S. plants.

By James Temple, MIT Technology Review, February 17, 2017

Toshiba's dramatic exit from the business of building nuclear power plants lands another blow to a beleaguered sector, undermining new development and research on advanced reactor designs.
After acquiring a majority stake in Pittsburgh-based Westinghouse Electric in 2006 for $5.4 billion, the Tokyo technology conglomerate had high hopes for rolling out a new generation of safer, smaller, cheaper power plants, as well as a series of streamlined full-scale reactors. Four of the latter are under construction in the United States, representing the only new reactors currently being built in the country. But the company was bedeviled by cost overruns, technical problems, conflicts with contractors, and regulatory challenges that set those projects back by years.
On Tuesday, Toshiba projected a $6.3 billion write-down for its nuclear unit and said it was looking to unload its stake. "It looked like a big deal at the time, but it's turned into a mess," says Michael Golay, a professor of nuclear science and engineering at MIT. "And it's likely to have a very chilling effect."
Toshiba's four massive nuclear plants now under construction in the southern United States are AP1000 pressurized-water reactors, which use a simplified design that was supposed to accelerate construction.

But the Vogtle project in Georgia and the V.C. Summer project in South Carolina are both around three years behind schedule and, together, billions of dollars over budget.

The company said those projects will continue, but many energy experts believe Toshiba's decision to cease building new reactors spells the end of any nuclear construction in the United States for the foreseeable future. Analysts doubt Toshiba will find a buyer for its Westinghouse stake, or any willing construction partners to move ahead with dozens of additional plants it had once planned.

Toshiba's struggles reflect the slow demise of nuclear power in much of the world (see "Giant Holes in the Ground"). The industry has been plagued by the rising cost of construction, the low price of natural gas, the Fukushima disaster in 2011, and the stricter regulations and souring public perceptions that followed. Germany is scaling down its nuclear program, engineering powerhouses like GE and Siemens have pulled back from the market, and France recently engineered the takeover of the nuclear giant Areva to rescue it after a series of stumbles.

Many fear the slowdown will prevent nations from building enough capacity to avoid the growing risks of climate change. The International Energy Agency estimates that nuclear energy capacity needs to double by 2050 to keep worldwide temperatures from rising more than 2 °C. Absent a carbon-capture breakthrough or a miracle battery, there's no realistic plan for cutting greenhouse-gas emissions fast enough without far more use of nuclear, says Steven Chu, the former secretary of energy and a professor of physics at Stanford.

There is, however, something of a nuclear power renaissance under way in some parts of the world, including South Korea, Russia, India, and China. Worldwide, about 60 reactors are under construction and 160 are planned—enough to add almost half again today's capacity, accordingto the World Nuclear Association. China alone is building dozens of conventional nuclear plants and forging ahead with advanced reactor designs in hopes of becoming the world's leader in nuclear power.

Westinghouse's 1,100-megawatt AP1000 pressurized-water reactors were specifically designed to be safer and easier to build than traditional nuclear plants, in part by utilizing standardized components. But plant construction has been plagued by engineering setbacks as well as design revisions required by the Nuclear Regulatory Commission.

Some issues probably stemmed from mismanagement. But MIT's Golay says Westinghouse's problems underscore intrinsic challenges for any company attempting to develop nuclear power in the United States, including a lack of institutional expertise after decades of little construction, rigid regulatory oversight, and shrinking appetites among investors.

Getting nuclear projects moving forward again in the United States is likely to require some combination of supportive government policies and improved construction and deployment methods, says Mike Ford, a researcher at Carnegie Mellon who focuses on nuclear energy development.

Time for Japan to abandon nuclear power

March 8, 2017

Editorial: Reasons for Japan to dump nuclear power more obvious now than ever

http://mainichi.jp/english/articles/20170308/p2a/00m/0na/014000c

It has been nearly six years since the triple-meltdown at the Fukushima No. 1 nuclear plant. Two things seem symbolic of this time: the simultaneous lifting of evacuation orders for the Fukushima Prefecture village of Iitate and other nearby communities, and the recent glimpse of what appears to be melted nuclear fuel in the plant's No. 2 reactor.

One is significant for all those residents who had no idea when they would be able to return to their hometowns, and the other for how much we understand of what is going on inside the stricken Fukushima No. 1 plant reactors, which until recently had been very nearly nothing. Considering how things were going before, these developments can be considered a step in the right direction.

However, if we take a cold, hard look at the situation, there are facts that must be seen as equally representative of the current reality: that the disaster has stolen so much from so many, and that real recovery will be a decades-long struggle with reconstruction and plant decommissioning.

Any visitor to the Fukushima plant will get a keen sense of how demanding the work is to dismantle its ruined reactors. The area where full face masks are required has been significantly reduced, and working conditions have certainly been improved. However, there is still no target for removing the melted nuclear fuel from the reactors -- the greatest challenge to decommissioning -- and no prospect for setting one.

Last month, plant operator Tokyo Electric Power Co. (TEPCO) inserted a "scorpion" robot into the No. 2 reactor containment vessel, and tried to steer it to a spot right under the core. However, its path was blocked by piles of dark material, and in the end the robot was unable to determine the state of the reactor's nuclear fuel.

There are more than 800 workers at the Fukushima plant. Some have been exposed to excessive radiation due to unexpected tasks. They are barred from working inside the reactor buildings, where radiation is extremely high, and absorb higher doses just by getting near them.

Nevertheless, the state of the nuclear fuel in each reactor must be ascertained, and a plan must be devised to remove it.

The No. 1 and 3 reactors are thought to be in worse shape than the No. 2 reactor. The government and TEPCO are aiming to extract the fuel from all the reactors starting in 2021, but that is wildly optimistic. A drastic rethink of the entire decommissioning strategy and schedule -- including the development of the robots that will take on much of the work -- is likely needed.

The burdens placed on Japanese society by the nuclear disaster include the swelling financial cost of dealing with its aftermath.

The Ministry of Economy, Trade and Industry says that reactor decommissioning, victim compensation, decontamination and other nuclear disaster-related costs will hit 21.5 trillion yen -- twice the initial estimate. However, even this figure does not include the cost of disposing of the melted nuclear fuel among other expenses, and is thus certain to rise.

We also cannot overlook the creation of a new system to charge third-party power suppliers to cover part of the compensation costs -- a charge the power supply companies will pass on to their customers, thus effectively making a wide swath of Japanese society pay for TEPCO's compensation liabilities. There are also apparently plans to implement a similar system to cover the decommissioning costs for Japan's aged reactors.

It has been less than a year since the power supply market was opened to competition. Making not just the big utilities but also the new third-party electricity suppliers with no connection whatsoever to the nuclear power business pay for reactor decommissioning is a blow to the very heart of electricity market liberalization. The government's insistence that "nuclear power is comparatively cheap even including accident countermeasure costs" no longer holds water.

If the government is to demand the Japanese people take on this financial burden, it must admit that the "cheap nuclear power" line doesn't match the facts, and reroute Japan's power generation plan to a nuclear-free future.

Looking at the harsh realities of dealing with the Fukushima nuclear disaster, we cannot consent to the ongoing string of reactor restarts. Utilities have applied to the Nuclear Regulation Authority (NRA) to restart 26 reactors at 16 plants under standards drawn up in the wake of the March 2011 Fukushima meltdowns. Just three reactors have been put back on line so far, but 12 more at six plants have or are expected to pass NRA inspections. Among them are three reactors that have been in operation for 40-plus years.

A majority of Japanese citizens are opposed to the restarts, conflicting with the government's evident enthusiasm for getting reactors back on line despite its stated goal of reducing dependence on nuclear power.

Over the past six years, we have learned that Japan would not run short of electricity if it abandoned nuclear power. A more deeply rooted argument in favour of nuclear generation is that it is needed to combat global warming.

Certainly, replacing nuclear plants with fossil fuel-driven power generation would increase carbon dioxide emissions. It is impossible to ignore the negative effect this would have on global warming.

However, Japan's greenhouse gas emissions have in fact begun to dip slightly even as reactor restarts remain stalled. According to the Environment Ministry, fiscal 2015 greenhouse gas emissions were down 5.2 percent from fiscal 2005 levels, and 6 percent down from 2013 levels.

Japan is obliged by international treaty to reduce its greenhouse gas emissions by 3.8 percent from 2005 levels by fiscal 2020. The country has already met that commitment even without nuclear power.

Nevertheless, for Japan to strive for even greater reductions that it promised under the Paris Agreement, it must yet expand energy saving measures and renewable power generation.

Global investment in energy is shifting in force to renewables. According to the International Energy Agency (IAE), of the $420 billion U.S. invested in power generation in 2015, some $290 billion was put into renewables.

The prices of solar panels and wind turbines are falling fast, and offer a cheaper alternative to traditional thermal generation in an increasing number of cases.

The nuclear business is in decline in the developed world, as is evidenced by the deep troubles of Japan's Toshiba Corp. and France's Areva SA. At the same time, the renewable energy industry is growing by leaps and bounds.

If Japan shuts its eyes to this reality and continues to pour more of its resources into keeping nuclear power going than into renewable energy, it will likely be left behind by the rest of the world.

We have no choice but to carry the burden of the Fukushima nuclear disaster for decades to come. We will overcome this crisis, but we will need support.

To make sure we never have another nuclear disaster like the one in Fukushima, Japan should take the decision to abandon dependence on nuclear power. That would be the best support of all.

Time for Japan to abandon nuclear power (2)

March 9, 2017

EDITORIAL: 3/11 anniversary should compel reassessment of nuclear policy

http://www.asahi.com/ajw/articles/AJ201703090038.html

Six years after the 2011 Great East Japan Earthquake, which spawned a massive tsunami causing the reactor meltdowns at the Fukushima No. 1 nuclear power plant, the reconstruction of affected areas is still far from complete.

In particular, some 80,000 people are still living as evacuees from Fukushima Prefecture, where the crippled nuclear plant is located. There are no signs of regeneration in the devastated local communities around the plant.

Meanwhile, the damages from the nuclear disaster and the costs of cleaning up the mess keep ballooning. The harrowing situation notwithstanding, Prime Minister Shinzo Abe's government remains firmly determined to promote nuclear power generation as a vital "core power source" for the nation's energy future.

Is there any reasonable case for keeping Japan reliant on atomic energy despite the catastrophic accident the nation has suffered? Is nuclear power generation really a cheap source of power as the government and the electric power industry claim?

Swelling costs

Evacuees from Namie, a town in Fukushima Prefecture, voiced their anger and anxiety during a meeting held in February at a hall in Tokyo. The entire town had to be evacuated in the wake of the disaster.

"Although we have been told that the decontamination work is over, radiation levels have not fallen enough for us to return home," one evacuee complained at the meeting, organized by the municipal government to hold informal talks with local residents. Another demanded continued financial support from Tokyo Electric Power Co., the operator of the Fukushima plant. "We have been driven out of the town by the nuclear accident. TEPCO should continue paying the housing rents of residents who cannot return."

The evacuation order for central parts of Namie is set to be lifted at the end of March, allowing residents to return to their homes. But it is unlikely that many of the residents will actually do so. In Naraha and other areas where the evacuation orders have already been lifted, only around 10 percent of the residents have decided to live in their former homes again.

The horrible conditions inside the melted reactors are only beginning to become visible. When TEPCO recently deployed an inspection robot to look inside the No. 2 reactor at the plant, it found iron bars twisted by high temperatures and a sticky black lump. But the utility was forced to abort the inspection halfway by high levels of radiation, which would have killed a human in minutes, and sediment. No plausible idea has emerged about how to remove the melted nuclear fuel.

At the end of last year, the Ministry of Economy, Trade and Industry said the total costs of related compensation, decontamination and the decommissioning of the reactors will reach a staggering 21.5 trillion yen ($187.92 billion).

The enormous financial burden, twice as large as the previous estimate, will have to be shouldered by the public through hikes in electricity bills and taxes.
The accident has also caused certain non-economic damages that cannot be expressed by numbers, such as shattered lives and ruined communities. There is no way to measure the true scale of damage caused by the disaster.

Government sticking to pro-nuclear power policy

The government has begun to step up its policy efforts to prevent TEPCO from going under. It has announced a plan to force new electricity suppliers that have entered the retail power market following its liberalization to bear part of the burden of paying compensation for the next four decades. The costs of compensation have so far been covered by TEPCO and the other utilities operating nuclear power plants.
This new compensation-financing plan clearly reflects a policy of putting higher priority on the protection of nuclear power generation than on ensuring the benefits of the deregulation for consumers. It is designed to ease the burden on established utilities by passing part of the costs involved in nuclear power generation onto newcomers, which don't operate nuclear plants.
This outrageous plan underscores the grim reality that nuclear power generation is no longer sustainable without strong policy support from the government.
Still, the industry ministry insists that nuclear power maintains its cost advantage over other power sources even if the money needed to deal with the consequences of the Fukushima disaster is factored in. In making this case, the ministry refers to cost estimates announced in 2015. According to the estimates, the costs of producing electricity by building a new nuclear plant were lower than those of power generation at a thermal plant or a facility using renewable energy sources.
These estimates are used to promote the ministry's vision for the nation's energy supply in fiscal 2030, under which some 20 percent of total power consumption will be covered by nuclear power generation.
But a raft of questions have been raised about these estimates. Experts critical of nuclear power generation say the cost estimates are based on the assumption that nuclear plants can long be operated without any serious trouble. Estimates based on the records of past operations and actual costs required show nuclear power generation is more expensive, they say. The costs of constructing nuclear power plants have also increased globally after the Fukushima accident, they point out.
The ministry's cost estimates are also based on many other questionable assumptions. There is no established technology for the envisioned nuclear fuel recycling system, for instance. There are many variables concerning the process of establishing the system that could radically change the math.
Progress in the efforts to select the final disposal site for high-level radioactive waste has been glacial, leaving the crucial issue unsolved for many years.
These are issues that are also related to the existing nuclear power plants.
While upholding the policy of promoting atomic energy, the successive governments have been putting off tackling these and other sticky issues or taking stopgap measures at best.
This approach has reached its limitations.

Plan to phase out nuclear power needed

This happens to be a year in which the government is scheduled to make its regular, fundamental review of the nation's energy policy.
The government should take this opportunity to make rigorous fresh assessments of the costs, risks and advantages of various power sources including nuclear energy and incorporate them into the new policy.
It is vital to invite opponents of the government's nuclear power policy as well as proponents to take part in the work to ensure that the issues will be discussed from diverse perspectives.

Outside Japan, Germany and Taiwan have decided to phase out nuclear power generation. Some other industrial nations are shutting down nuclear plants ahead of schedule and pursuing goals to reduce their dependence on atomic energy.
For a society that places a premium on safety, nuclear power generation is becoming a hot potato because of many unsolved problems concerning accidents and nuclear waste.
The trend was set by the Fukushima disaster. The introduction of stricter safety standards and resultant cost increases have led to the current financial crisis at Toshiba Corp.
What the Abe administration should do is face up to the grim realities of nuclear power generation and pay serious attention to public concerns about plans to restart offline reactors. It then needs to make serious efforts to work out a specific plan to steadily lower Japan's dependence on nuclear power.
The prevailing logic of the closed community of people and organizations with vested interests in promoting nuclear power generation and the safety myth they successfully peddled set the stage for what transpired in Fukushima.
The government needs to look back on the six painful years following the nuclear disaster and embark on remaking its energy policy into a more reasonable and sustainable one.
--The Asahi Shimbun, March 9

"A much better country with zero nuclear plants" (Koizumi)

March 12, 2017

Ex-PM Koizumi repeats call for 'zero nuclear power plants'

http://mainichi.jp/english/articles/20170312/p2g/00m/0dm/056000c

SAPPORO (Kyodo) -- Former Prime Minister Junichiro Koizumi on Saturday repeated his call for Japan's complete departure from nuclear energy as the country marked the sixth anniversary of the Fukushima nuclear disaster.
"Nuclear power plants will become a negative legacy for future generations," Koizumi said at an event organized by a civic group in Sapporo.
The group is seeking the decommissioning of nuclear reactors at Hokkaido Electric Power Co.'s Tomari power station on Japan's northernmost main island.
"(Japan) can become a much better country with zero nuclear power plants, harnessing natural energy," Koizumi said, adding it will not be so difficult to replace nuclear energy with renewable energy if technological innovation advances.
After his speech, Koizumi criticized Prime Minister Shinzo Abe's policy which promotes restarting nuclear plants most of which remain offline and exporting nuclear reactors.
"If the prime minister said 'zero (nuclear power),' the situation will greatly change. I don't know why he can't understand this," Koizumi said.

DP nuclear phasing-out lacks ambition

March 12, 2017

At party convention, DP shies away from plan to phase out atomic power by 2030

http://www.japantimes.co.jp/news/2017/03/12/national/politics-diplomacy/party-convention-dp-shies-away-plan-phase-atomic-power-2030/#.WMUttvKlSot

by Tomohiro Osaki
Staff Writer

The Democratic Party on Sunday postponed adopting a bold target of slashing the nation's reliance on nuclear power to zero by 2030, shying away from what would have been a decisive declaration against Prime Minister Shinzo Abe's pro-nuclear stance.

At its annual convention, held in Tokyo, Renho, president of the struggling main opposition party, stopped short of upgrading its current goal of pursuing a nuclear-free Japan by the end of the 2030s.

Prior to the convention, media speculation was rife that she would advance the deadline by up to nine years to 2030 in a bid to demonstrate the DP's stronger commitment to eliminating the nation's reliance on nuclear power.

Such an ambitious target would have helped the DP, which grapples with a perennially low support rate of around 8 percent, position itself as a clearer alternative to Abe's Liberal Democratic Party, which is pushing for reactivation of nuclear reactors that have been offline following the March 2011 tsunami-triggered meltdowns at the Fukushima No. 1 power plant.

Her decision not to set the 2030 deadline for a nuclear-free society apparently reflects resistance from labor union Rengo, the DP's main support base, which counts among its participating unions the Federation of Electric Power Related Industry Worker's Union of Japan.

Nonetheless, Renho emphasized that the DP will not backtrack from its current anti-nuclear position, unveiling a plan to draft what she described as a bill promoting a "zero-nuclear" policy.

The DP leader, however, stopped short of clarifying a timeline for the submission of such legislation or elaborating on its content.

"As we brace for a Lower House snap election, we will draft the zero-nuclear bill to realize a departure from our current reliance on nuclear power as soon as possible," Renho told party members at the convention.

"We will envision a different future than that upheld by the current administration, which is promoting a return into nuclear reliance by blindly marching toward the reactivation of reactors."

During a news conference after the convention, Renho said an energy policy council headed by DP lawmaker Koichiro Genba will swiftly go about discussing details of the bill and hold meetings as frequently as possible.

High-ranking DP lawmakers also hewed to Renho's assertion that the DP remains as committed as ever to seeking the phaseout of nuclear power.

For one, former Prime Minister Naoto Kan, who was in office when the nuclear crisis struck the nation in 2011, offered staunch backing for the zero-nuclear bill.
Noting that nuclear industries worldwide are increasingly on the decline, Kan said such legislation "is in line with the global trend."
"A shift to renewable energy is the unavoidable choice for Japan," he said.
At the convention, Renho also renewed her party's vow to offer free education to children and boost female representation in the world of politics.

Nukes in crisis

Terminal Decline? Fukushima and the Deepening Crisis of Nuclear Energy

http://www.counterpunch.org/2017/03/14/terminal-decline-fukushima-and-the-deepening-crisis-of-nuclear-energy/
by Jim Green

Saturday March 11 marks the sixth anniversary of the triple-disaster in north-east Japan – the earthquake, tsunami and the Fukushima nuclear disaster.
And the news is not good. Scientists are wondering how on earth to stabilise and decontaminate the failed reactors awash with molten nuclear fuel, which are fast turning into graveyards for the radiation-hardened robots sent in to investigate them.
The Japanese government's estimate of Fukushima compensation and clean-up costs has doubled and doubled again and now stands at ¥21.5 trillion (US$187bn; €177bn).
Indirect costs – such as fuel import costs, and losses to agricultural, fishing and tourism industries – will likely exceed that figure.
Kendra Ulrich from Greenpeace Japan notes in a new report that *"for those who were impacted by the worst nuclear disaster in a generation, the crisis is far from over. And it is women and children that have borne the brunt of human rights violations resulting from it, both in the immediate aftermath and as a result of the Japan government's nuclear resettlement policy."*
Radiation biologist Ian Fairlie summarises the health impacts from the Fukushima disaster: *"In sum, the health toll from the Fukushima nuclear disaster is horrendous. At the minimum:*
+ Over 160,000 people were evacuated most of them permanently.
+ Many cases of post-trauma stress disorder (PTSD), depression, and anxiety disorders arising from the evacuations.
+ About 12,000 workers exposed to high levels of radiation, some up to 250 mSv
+ An estimated 5,000 fatal cancers from radiation exposures in future.
+ Plus similar (unquantified) numbers of radiogenic strokes, CVS diseases and hereditary diseases.
+ Between 2011 and 2015, about 2,000 deaths from radiation-related evacuations due to ill-health and suicides.
+ An, as yet, unquantified number of thyroid cancers.

+ An increased infant mortality rate in 2012 and a decreased number of live births in December 2011."
Dr Fairlie's report was written in August 2015 but it remains accurate. More than half of the 164,000 evacuees from the nuclear disaster remain dislocated. Efforts to restore community life in numerous towns are failing. Local authorities said in January that only 13% of the evacuees in five municipalities in Fukushima Prefecture have returned home after evacuation orders were lifted.
As for Japan's long-hyped 'nuclear restart': just three power reactors are operating in Japan; before the Fukushima disaster, the number topped 50.

A nuclear power 'crisis'?

Nuclear advocates and lobbyists elsewhere are increasingly talking about the 'crisis' facing nuclear power – but they don't have the myriad impacts of the Fukushima disaster in mind: they're more concerned about catastrophic cost overruns with reactor projects in Europe and the US.
Michael Shellenberger from the Breakthrough Institute, a US-based pro-nuclear lobby group, has recently written articles about nuclear power's *"*rapidly accelerating crisis*"* and the *"*crisis that threatens the death of nuclear energy in the West*".*
A recent article from the Breakthrough Institute and the like-minded Third Way lobby group discusses *"*the crisis that the nuclear industry is presently facing in developed countries*".*
'Environmental Progress', another US pro-nuclear lobby group connected to Shellenberger, has a webpage dedicated to the nuclear power crisis. Among other things, it states that 151 gigawatts (GW) of worldwide nuclear power capacity (38% of the total) could be lost by 2030 (compared to 33 GW of retirements over the past decade), and over half of the ageing US reactor fleet is at risk of closure by 2030.
As a worldwide generalisation, nuclear power can't be said to be in crisis. To take the extreme example, China's nuclear power program isn't in crisis – it is moving ahead at pace. Russia's nuclear power program, to give one more example, is moving ahead at snail's pace, but isn't in crisis.
Nonetheless, large parts of the worldwide nuclear industry are in deep trouble. The July 2016 *World Nuclear Industry Status Report* provides an overview of the troubled status of nuclear power:
+ nuclear power's share of the worldwide electricity generation is 10.7%, well down from historic peak of 17.6% in 1996;
+ nuclear power generation in 2015 was 8.2% below the historic peak in 2006; and
+ from 2000 to 2015, 646 gigawatts (GW) of wind and solar capacity (combined) were added worldwide while nuclear capacity (not including idle reactors in Japan) fell by 8 GW.

US nuclear industry in crisis

The US nuclear industry is in crisis, with a very old reactor fleet – 44 of its 99 reactors have been operating for 40 years or more – and no likelihood of new reactors for the foreseeable future other than four already under construction.
Last September*, Associated Press* described one of the industry's many humiliations: *"After spending more than 40 years and $5 billion on an unfinished nuclear power plant in northeastern Alabama, the nation's largest federal utility is preparing to sell the property at a fraction of its cost.*
"The Tennessee Valley Authority has set a minimum bid of $36.4 million for its Bellefonte Nuclear Plant and the 1,600 surrounding acres of waterfront property on the Tennessee River. The buyer gets two unfinished nuclear reactors, transmission lines, office and warehouse buildings, eight miles of roads, a 1,000-space parking lot and more."
Japanese conglomerate Toshiba and its US-based nuclear subsidiary Westinghouse are in crisis because of massive cost overruns building four AP1000 reactors in the US – the combined cost overruns amount to about US$11.2bn (€10.7bn) and counting.

Toshiba said in February 2017 that it expects to book a US$6.3bn (€5.9bn) writedown on Westinghouse, on top of a US$2.3bn (€2.1bn) writedown in April 2016. The losses exceed the US$5.4bn (€5.1bn) Toshiba paid when it bought a majority stake in Westinghouse in 2006.

Toshiba says it would likely sell Westinghouse if that was an option – but there is no prospect of a buyer. Westinghouse is, as *Bloomberg* noted, "too much of a mess" to sell. And since that isn't an option, Toshiba must sell profitable businesses instead to stave off bankruptcy.

Toshiba is seeking legal advice as to whether Westinghouse should file for Chapter 11 bankruptcy. But even under a Chapter 11 filing, *Reuters* reported, *"Toshiba could still be on the hook for up to $7 billion in contingent liabilities as it has guaranteed Westinghouse's contractual commitments"* for the US AP1000 reactors.

The Toshiba/Westinghouse crisis is creating a ripple effect. A few examples:

+ the NuGen (Toshiba/Engie) consortium has acknowledged that the plan for three AP1000 reactors at Moorside in the UK faces a "significant funding gap" and both partners reportedly want out of the project;
+ Georgia Power, 45.7% owner of the troubled Vogtle AP1000 project, recently suspended plans for another nuclear plant in Georgia; and
+ Toshiba recently announced its intention to pull out of the plan for two Advanced Boiling Water Reactors at the South Texas Plant, having booked writedowns totaling US$638m (€605m) on the project in previous years.

The French nuclear industry is in crisis

The French nuclear industry is in its "worst situation ever", former EDF director Gérard Magnin said in November 2016. The French government is selling assets so it can prop up its heavily indebted nuclear utilities Areva and EDF.

The current taxpayer-funded rescue of the nuclear power industry may cost the French state as much as €10bn (US$10.5bn), *Reuters* reported in January, and in addition to its *"dire financial state, Areva is beset by technical, regulatory and legal problems."*

France has 58 operable reactors and just one under construction. French EPR reactors under construction in France and Finland are three times over budget – the combined cost overruns for the two reactors amount to about €12.7bn (US$13.4bn).

Bloomberg noted in April 2015 that Areva's EPR export ambitions are "in tatters". Now Areva itself is in tatters and is in the process of a government-led restructure and another taxpayer-funded bailout.

On March 1, Areva posted a €665m (US$700m) net loss for 2016. Losses in the preceding five years exceeded €10bn (US$10.5 bn). A large majority of a €5bn (US$5.3bn) recapitalisation of Areva scheduled for June 2017 will come from French taxpayers.

On February 14, EDF released its financial figures for 2016: earnings fell 6.7%, revenue declined 5.1%, net income excluding non-recurring items fell 15%, and EDF's debt remained steady at €37.4bn (US$39.4bn). All that EDF chief executive Jean-Bernard Levy could offer was the hope that EDF would "hit the bottom of the cycle" in 2017 and rebound next year.

EDF plans to sell €10bn (US$10.5 bn) of assets by 2020 to rein in its debt, and to sack up to 7,000 staff. The French government provided EDF with €3bn (US$3.2bn) in extra capital in 2016 and will contribute €3bn towards a €4bn (US$4.2bn) capital raising this year.

On March 8, shares in EDF hit an all-time low a day after the €4bn capital raising was launched; the stock price fell to €7.78, less than one-tenth of the €86.45 high a decade ago.

Costs of between €50bn and €100bn (US$53-106bn) will need to be spent by 2030 to meet new safety requirements for reactors in France and to extend their operating lives beyond 40 years.

EDF has set aside €23bn (US$24.3bn) to cover reactor decommissioning and waste management costs in France – less than half of the €54bn (US$57bn) that EDF estimates will be required. A recent report by the French National Assembly's Commission for Sustainable Development and Regional Development concluded that there is *"obvious under-provisioning"* and that decommissioning and waste management will likely take longer, be more challenging and cost much more than EDF anticipates.

EDF is being forced to take over parts of its struggling sibling Areva's operations – a fate you wouldn't wish on your worst enemy. And just when it seemed that things couldn't get any worse for EDF, a fire took hold in the turbine room of one of the Flamanville reactors on February 9 and the reactor will likely be offline until late March at an estimated cost of roughly €1.2m (US$1.27m) per day.

Half of the world's nuclear industry is in crisis and/or shutting down

Combined, the crisis-ridden US, French and Japanese nuclear industries account for 45% of the world's 'operable' nuclear reactors according to the World Nuclear Association's database, and they accounted for 50% of nuclear power generation in 2015 (and 57% in 2010).

Countries with crisis-ridden nuclear programs or phase-out policies (e.g. Germany, Belgium, and Taiwan) account for about half of the world's operable reactors and more than half of worldwide nuclear power generation.

The Era of Nuclear Decommissioning (END)

The ageing of the global reactor fleet isn't yet a crisis for the industry, but it is heading that way.

The assessment by the 'Environmental Progress' lobby group that 151 GW of worldwide nuclear power capacity could be shut down by 2030 is consistent with figures from the World Nuclear Association (132 reactor shut-downs by 2035), the International Energy Agency (almost 200 shut-downs between 2014 and 2040) and *Nuclear Energy Insider* (up to 200 shut-downs in the next two decades). It looks increasingly unlikely that new reactors will match shut-downs.

Perhaps the best characterisation of the global nuclear industry is that a new era is approaching – the Era of Nuclear Decommissioning (END). Nuclear power's END will entail:

+ a slow decline in the number of operating reactors (unless growth in China can match the decline elsewhere);
+ an increasingly unreliable and accident-prone reactor fleet as ageing sets in;
+ countless battles over lifespan extensions for ageing reactors;
+ an internationalisation of anti-nuclear opposition as neighbouring countries object to the continued operation of ageing reactors (international opposition to Belgium's reactors is a case in point);
+ a broadening of anti-nuclear opposition as citizens are increasingly supported by local, regional and national governments opposed to reactors in neighbouring countries (again Belgium is a case in point, as is Lithuanian opposition to reactors under construction in Belarus);
+ many battles over the nature and timing of decommissioning operations;
+ many battles over taxpayer bailouts for companies and utilities that haven't set aside adequate funding for decommissioning;
+ more battles over proposals to impose nuclear waste repositories on unwilling or divided communities; and
+ battles over taxpayer bailouts for companies and utilities that haven't set aside adequate funding for nuclear waste disposal.

As discussed in a previous article in *The Ecologist*, nuclear power is likely to enjoy a small, short-lived upswing in the next couple of years as reactors ordered in the few years before the Fukushima disaster come online. Beyond that, the Era of Nuclear Decommissioning sets in, characterised by escalating battles

– and escalating sticker-shock – over lifespan extensions, decommissioning and nuclear waste management.

In those circumstances, it will become even more difficult than it currently is for the industry to pursue new reactor projects. A positive feedback loop could take hold and then the industry will be well and truly in crisis.

Nuclear lobbyists debate possible solutions to the nuclear power crisis

Michael Shellenberger from the Breakthrough Institute argues that a lack of standardisation and scaling partly explains the *"crisis that threatens the death of nuclear energy in the West".* The constant switching of designs deprives the people who build, operate and regulate nuclear plants of the experience they need to become more efficient.

Shellenberger further argues that there is too much focus on machines, too little on human factors:

"Areva, Toshiba-Westinghouse and others claimed their new designs would be safer and thus, at least eventually, cheaper, but there were always strong reasons to doubt such claims. First, what is proven to make nuclear plants safer is experience, not new designs. …

"In fact, new designs risk depriving managers and workers the experience they need to operate plants more safely, just as it deprives construction companies the experience they need to build plants more rapidly."

Shellenberger has a three-point rescue plan:

1/ 'Consolidate or Die': *"If nuclear is going to survive in the West, it needs a single, large firm – the equivalent of a Boeing or Airbus – to compete against the Koreans, Chinese and Russians."*

2/ 'Standardize or Die': He draws attention to the *"astonishing"* heterogeneity of planned reactors in the UK and says the UK *"should scrap all existing plans and start from a blank piece of paper"*, that all new plants should be of the same design and *"the criteria for choosing the design should emphasize experience in construction and operation, since that is the key factor for lowering costs."*

3/ 'Scale or Die': Nations *"must work together to develop a long-term plan for new nuclear plant construction to achieve economies of scale"*, and governments *"should invest directly or provide low-cost loans."*

Wrong lessons

Josh Freed and Todd Allen from pro-nuclear lobby group Third Way, and Ted Nordhaus and Jessica Lovering from the Breakthrough Institute, argue that Shellenberger draws the wrong lessons from Toshiba's recent losses and from nuclear power's *"longer-term struggles"* in developed economies.

They argue that *"too little innovation, not too much, is the reason that the industry is on life support in the United States and other developed economies"*. They state that:

+ The Westinghouse AP1000 represents a fairly straightforward evolution in light-water reactor design, not a radical departure as Shellenberger claims.
+ Standardisation is important but it is not a panacea. Standardisation and building multiple reactors on the same site has limited cost escalation, not brought costs down.
+ Most of the causes of rising cost and construction delays associated with new nuclear builds in the US are attributable to the 30-year hiatus in nuclear construction, not the novelty of the AP1000 design.
+ Reasonable regulatory reform will not dramatically reduce the cost of new light-water reactors, as Shellenberger suggests.

They write this obituary for large light-water reactors: *"If there is one central lesson to be learned from the delays and cost overruns that have plagued recent builds in the US and Europe, it is that the era of building large fleets of light-water reactors is over in much of the developed world.*

"From a climate and clean energy perspective, it is essential that we keep existing reactors online as long as possible. But slow demand growth in developed world markets makes ten billion dollar, sixty-year investments in future electricity demand a poor bet for utilities, investors, and ratepayers."

A radical break

The four Third Way / Breakthrough Institute authors conclude that *"a radical break from the present light-water regime … will be necessary to revive the nuclear industry"*. Exactly what that means, the authors said, would be the subject of a follow-up article.

So readers were left hanging – will nuclear power be saved by failed fast-reactor technology, or failed high-temperature gas-cooled reactors including failed pebble-bed reactors, or by thorium pipe-dreams or fusion pipe-dreams or molten salt reactor pipe-dreams or small modular reactor pipe-dreams? Perhaps we've been too quick to write off cold fusion?

The answers came in a follow-up article on February 28. The four authors want a thousand flowers to bloom, a bottom-up R&D-led nuclear recovery as opposed to top-down, state-led innovation.

They don't just want a new reactor type (or types), they have much greater ambitions for innovation in *"nuclear technology, business models, and the underlying structure of the sector"* and they note that *"a radical break from the light water regime that would enable this sort of innovation is not a small undertaking and will require a major reorganization of the nuclear sector."*

To the extent that the four authors want to tear down the existing nuclear industry and replace it with a new one, they share some common ground with nuclear critics who want to tear down the existing nuclear industry and not replace it with a new one.

Shellenberger also shares some common ground with nuclear critics: he thinks the UK should scrap all existing plans for new reactors and "start from a blank piece of paper". But nuclear critics think the UK should scrap all existing plans for new reactors and not start from a blank piece of paper.

Small is beautiful?

The four Third Way / Breakthrough Institute authors argue that nuclear power must become substantially cheaper – thus ruling out large conventional reactors *"operated at high atmospheric pressures, requiring enormous containment structures, multiply redundant back-up cooling systems, and water cooling towers and ponds, which account for much of the cost associated with building light-water reactors."*

Substantial cost reductions will not be possible *"so long as nuclear reactors must be constructed on site one gigawatt at a time. … At 10 MW or 100 MW, by contrast, there is ample opportunity for learning by doing and economies of multiples for several reactor classes and designs, even in the absence of rapid demand growth or geopolitical imperatives."*

Other than their promotion of small reactors and their rejection of large ones, the four authors are non-specific about their preferred reactor types. Any number of small-reactor concepts have been proposed. Small modular reactors (SMRs) have been the subject of much discussion and even more hype. The bottom line is that there isn't the slightest chance that they will fulfil the ambition of making nuclear power *"substantially cheaper"* unless and until a manufacturing supply chain is established at vast expense.

And even then, it's doubtful whether the power would be cheaper and highly unlikely that it would be substantially cheaper. After all, economics has driven the long-term drift towards larger reactors.

As things stand, no country, company or utility has any intention of betting billions on building an SMR supply chain. The prevailing scepticism is evident in a February 2017 Lloyd's Register report based on *"insights and opinions of leaders across the sector"* and the views of almost 600 professionals and experts from utilities, distributors, operators and equipment manufacturers.

The Lloyd's Register report states that the potential contribution of SMRs "is unclear at this stage, although its impact will most likely apply to smaller grids and isolated markets." Respondents predicted that SMRs have a "low likelihood of eventual take-up, and will have a minimal impact when they do arrive".

The Third Way / Breakthrough Institute authors are promoting small reactors because of the spectacular failure of a number of large reactor projects, but that's hardly a recipe for success. An analysis of SMRs in the *Bulletin of the Atomic Scientists* sums up the problems:

"Without a clear-cut case for their advantages, it seems that small nuclear modular reactors are a solution looking for a problem. Of course in the world of digital innovation, this kind of upside-down relationship between solution and problem is pretty normal. Smart phones, Twitter, and high-definition television all began as solutions looking for problems.

"In the realm of nuclear technology, however, the enormous expense required to launch a new model as well as the built-in dangers of nuclear fission require a more straightforward relationship between problem and solution. Small modular nuclear reactors may be attractive, but they will not, in themselves, offer satisfactory solutions to the most pressing problems of nuclear energy: high cost, safety, and weapons proliferation."

Small or large reactors, consolidation or innovation, Generation 2/3/4 reactors … it's not clear that the nuclear industry will be able to recover – however it responds to its current crisis.

Japan Atomic Power and Exelon

April 14, 2017

Japan Atomic Power, Exelon set up joint venture

https://www3.nhk.or.jp/nhkworld/en/news/20170414_26/

Japan Atomic Power has set up a joint venture with a US utility, Exelon, to strengthen its overseas operations. The move comes at a time when the nuclear business is facing difficulties as a result of the accident at the Fukushima Daiichi power plant in 2011.

The new company will advise operators on maintenance and efficient methods of power generation for nuclear plants that will be built overseas.

It will start off by assisting Japanese electronics firm Hitachi with its plan to build a nuclear facility in Britain.

The Managing Director of Japan Atomic Power, Takahiko Hida, will head the joint venture. He says the company plans to help with staffing and providing advice on the UK market.

Japan Atomic Power is currently not selling electricity.
It has 3 nuclear power plants in Japan, but their operations have been halted. One of the plants is ready to be decommissioned.

Towards nuke extinction?

April 14, 2017
Nuclear Giants Limp Towards Extinction
http://www.ecowatch.com/nuclear-energy-collapse-2360633461.html

By Paul Brown
14 April 2017 - Any lingering hope that a worldwide nuclear power renaissance would contribute to combating climate change appears to have been dashed by U.S. company Westinghouse, the largest provider of nuclear technology in the world, filing for bankruptcy, and the severe financial difficulties of its Japanese parent company, Toshiba.
After months of waiting, Toshiba still could not get its auditors to agree to its accounts this week. But it went ahead anyway and reported losses of nearly $5 billion for the eight months from April to December, in order to avoid being delisted from the Japanese stock exchange.
The company admitted it too could face bankruptcy, and is attempting to raise capital by selling viable parts of its business.
In a statement, it said: "There are material events and conditions that raise substantial doubt about the company's ability to continue as a going concern."
Nuclear Reactors
The knock-on effects of the financial disasters the two companies face will be felt across the nuclear world, but nowhere more than in the UK, which was hoping Westinghouse was about to start building three of its largest nuclear reactors, the AP 1000, at Moorside in Cumbria, northwest England.
The UK's Conservative government will be particularly embarrassed because, in late February, it won a critical parliamentary by-election in the seat that would be home to the Moorside plant, on the guarantee that the three reactors would be built—a pledge that now seems impossible to keep.
"I think the day of the large-scale nuclear power station is over," said Martin Forwood, campaign co-ordinator for Cumbrians Opposed to a Radioactive Environment. "There is no one left to invest anymore because renewables are just cheaper, and these prices are still going down while nuclear is always up."
Toshiba and Westinghouse are in deep trouble because the reactors they are currently building—the same design as the ones planned for Cumbria—are years late and billions of dollars over budget. Even if the companies can be refinanced, it seems extremely unlikely they would risk taking on new reactor projects.
Both the UK and Toshiba have looked to the South Korean nuclear giant KEPCO to take over the Moorside project, but the company is unlikely to want to build the Westinghouse design and would want to put forward its own reactor, the APR 1400.
This would delay the project for years, since the whole safety case for a new type of reactor would have to be examined from scratch.

But the company is already under pressure from within South Korea, where Members of Parliament have urged KEPCO not to take on a risky project in the UK. Twenty-eight members of the Republic of Korea's "Caucus on Post-Nuclear Energy" have called on KEPCO not to invest in Moorside.
The other nuclear giant present in Britain, the French-owned Électricité de France (EDF), is in serious difficulties of its own. It is already deep in debt and its flagship project to build a prototype 1,600 megawatt reactor at Flamanville in northern France is six years behind schedule and three times over budget at €10.5 billion.
Originally due to open in 2012, its start date is now officially the end of 2018, but even that is in doubt because an investigation into poor quality steel in the reactor's pressure vessel is yet to be completed.
Despite this, the company and the UK government are committed to building two more of these giant reactors in Somerset in southwest England, and have started pouring concrete for the bases to put them on. These reactors are due to be completed in 2025, but nobody outside the company and the UK government believes this is likely.
So, with troubles of its own, EDF is in no position to help Toshiba out of its financial difficulties. In the nuclear world, this leaves only the Chinese and the Russians who might be capable of taking on such a project.
The Russians will be ruled out on political grounds, and the Chinese are already helping out EDF with a large financial stake in the Somerset project. They also want to build a nuclear station of their own design at Bradwell in Essex, southeast England—another project that looks likely to take more than a decade to complete.

Vast Capital Costs

The problem for all these projects, apart from the vast capital cost and the timescales involved, is that the energy industry is changing dramatically. Solar and wind power are now a cheaper form of producing electricity across the world, and are less capital-intensive and quicker to build.
Despite the fact that there are more than 430 nuclear reactors in operation worldwide and the industry still has great economic and political clout, it is beginning to look like a dinosaur—too big and cumbersome to adapt to new conditions.
Nuclear power now produces about 10 percent of the world's electricity, while 40 percent is from coal and 23 percent from renewables. The rest is mainly from natural gas.
"Nuclear lobbyists are abandoning the tiresome rhetoric about a nuclear power renaissance," said Jim Green, national nuclear campaigner with Friends of the Earth Australia. "They are now acknowledging that the industry is in crisis."
"The crisis-ridden U.S., French and Japanese nuclear industries account for half of worldwide nuclear power generation," he continued. "Renewable energy generation doubled over the past decade, and strong growth, driven by sharp cost decreases, will continue for the foreseeable future."

10 new reactors in India?

May 18, 2017

Indian Cabinet approves plans to build 10 reactors in bid to fast-track nuclear power quest

http://www.japantimes.co.jp/news/2017/05/18/business/indian-cabinet-approves-plans-build-10-reactors-bid-fast-track-nuke-power-quest/#.WR1VkdykKic

Reuters
NEW DELHI – India's Cabinet approved plans on Wednesday to build 10 nuclear reactors with a combined capacity of 7,000 megawatts, more than the country's entire current capacity, to fast-track its domestic nuclear power program.
The decision by Prime Minister Narendra Modi's government marks the first strategic response to the near collapse of Westinghouse, the U.S. reactor-maker that had been in talks to build six of its AP1000 reactors in India.
Westinghouse, owned by Japan's Toshiba Corp., filed for Chapter 11 bankruptcy in March after revealing billions of dollars in cost overruns at its U.S. projects, raising doubts about whether it can complete the India deal.
India has installed nuclear capacity of 6,780 MW from 22 plants and plans to add another 6,700 MW by 2021-22 through projects currently under construction. The 10 additional reactors would be the latest design of India's pressurized heavy water reactor.
"This project will bring about substantial economies of scale and maximize cost and time efficiencies by adopting fleet mode for execution," the government said in a statement.
"It is expected to generate more than 33,400 jobs in direct and indirect employment. With manufacturing orders to domestic industry, it will be a major step towards strengthening India's credentials as a major nuclear manufacturing powerhouse."
Westinghouse has said it plans to continue construction of its AP1000 plants in China and expects to bid for new plants in India and elsewhere, without elaborating on how it plans to do so.
Indian companies, such as Larsen and Toubro, Kirloskar Brother Limited and Godrej & Boyce welcomed the government's move.
Sanjay Kirloskar, chairman of Kirloskar Brother Limited, said, "Nuclear power plants will go a long way in reducing the perennial energy deficit," while Larsen and Toubro Director S.N. Roy called the move "bold and historic."

Swiss vote against nukes

May 22, 2017

Switzerland votes to phase out nuclear energy and switch to renewables

About a third of the country's electricity comes from nuclear reactors

By Chloe Farand, The Independent, May 22, 2017
http://tinyurl.com/lokqk88

Swiss voters have backed government plans to replace the power from ageing nuclear reactors with renewable energy.

A total of 58.2 per cent of voters supported the phaseout of nuclear energy in a binding referendum on Sunday. Under the Swiss system of direct democracy, voters have the final say on major policy issues.
The plan will provide billions of pounds in subsidies for renewable energy, ban the construction of nuclear plants and decommission the country's five existing ones, which produce about a third of the country's electricity.
The first nuclear power plant is earmarked for closure in 2019.
"This is a historic day for the country," Green Party parliamentarian Adele Thorens Goumaz told public broadcaster RTS.
"Switzerland will finally enter into the 21st century when it comes to energy."
The move echoes efforts across Europe to reduce dependence on nuclear energy and has been in the making following Japan's Fukushima disaster in 2011. Germany has announced it will close all nuclear plants by 2022 and Austria banned it decades ago.
The Swiss government wants to boost hydraulic power as well as solar, wind, geothermal and biomass.
Energy Minister Doris Leuthard, from the centre-right Christian Democratic Party, told reporters at a press conference: "The results shows the population wants a new energy policy and does not want any new nuclear plants. The law leads our country into a modern energy future."
The new law is expected to come into effect at the start of 2018 and Ms Leuthard said the plan would cost the average family about 40 francs (£31.64) more a year because a higher grid surcharge would help to fund renewable subsidies. *[40 Swiss francs = $41 US]*
But critics to the plan claimed the initiative would significantly increase electricity bills. The country's largest party, the populist Swiss People's Party, campaigned against the plan and claimed energy bills could ramp up by an additional 3,200 Swiss francs (£2,532) per four-person household a year. *[3200 Swiss francs = $3289 US]*
It said the energy transition will be too expensive, would trigger greater reliance on imported electricity and could disfigure the landscape with more wind turbines and solar panels.
Last November, Swiss voters rejected a plan to speed up the phaseout of coal power plants by limiting their operational lifespan to 45 years, which would have meant three of the five nuclear reactors would have had to close this year.
But most other parties and environmental groups hailed the result of the vote a success.
The new plan does not include a clear timetable for the phaseout of nuclear energy but it aims to cut average energy consumption per person per year by 16 per cent by 2020 and 43 per cent by 2035 compared to 2000 levels.
According to the ATS news agency, only 42.3 per cent of eligible voters cast a ballot in the referendum, a low turnout which yet falls within the average over the past two years.

Declassified papers reveal U.S. held debate on Japan's nuclear ambitions in 1970s

http://www.japantimes.co.jp/news/2017/06/09/national/history/declassified-papers-reveal-u-s-held-debate-japans-nuclear-ambitions-1970s/#.WTv7mdykJLM

by Eric Johnston
Staff Writer

OSAKA – Japan's push to establish a nuclear fuel recycling program and use the plutonium created in the process was the center of an intense debate in the U.S. government four decades ago, pitting those who wanted smooth relations with Tokyo against those who worried the plan might lead to the proliferation of sensitive nuclear technology and plutonium stockpiles.

Formerly classified U.S. State Department and National Security Council memos and cables posted Thursday show that Tokyo began pressing Washington in the late 1970s to let it reprocess spent nuclear fuel from U.S. reactors so the extracted plutonium could be used in the so-called fast breeder reactors Japan wanted to build.

The documents were made available by the nongovernmental Washington-based National Security Archive at George Washington University and the Nuclear Nonproliferation International History project at the Woodrow Wilson International Center for Scholars.

In a cable marked "Secret" and dated May 29, 1980, Jerry Oplinger, a staff member at the National Security Council, warned his colleagues that if Japan as well as Britain and France went through with plans to build fuel reprocessing plants, it would create new proliferation risks.

"Any one of these three projected projects would more than swamp the projected plutonium needs of all the breeder R&D programs in the world. Three of them will produce a vast surplus of pure, weapons-grade plutonium amounting to several hundred tons by the year 2000. Not only would that stockpile of separated plutonium constitute a danger in itself, it would eventually drive these nations, and those watching their example, into the recycle of plutonium in today's reactors for economic reasons," Oplinger wrote.

Others in the U.S. government at the time supported Japan's desire to experiment with plutonium. In an Aug. 29, 1979, U.S. State Department confidential memo, it was noted that Japan's then-minister of science technology Iwazo Kaneko had pressed Washington on the issue.

"He stressed that it was essential for Japan to make maximum use of plutonium, particularly fast-breeder reactors," the memo says.

Other officials, including Assistant Secretary of State Richard Holbrooke, argued in a memorandum dated June 4, 1980, that U.S. reluctance on Japan's reprocessing program would hurt bilateral trust. Ultimately, the U.S. would drop its opposition to the plans, but with some apprehension.

The debates occurred in the final stage of preparations for Japan's first reprocessing plant in the village of Tokai, Ibaraki Prefecture, which become operational in 1981, and reprocessed over 1,000 tons of used fuel for research purposes until 2006, when it no longer had any contracts for reprocessing.

In 2014, the Japan Atomic Energy Agency decided to shut down the plant. Last month, the agency said scrapping the facility over a 70-year period will cost an estimated ¥800 billion. The nation still has about 48 tons of plutonium stockpiled with about 11 tons held domestically and the remainder in Britain and France. Next year, the U.S. and Japan are expected to renegotiate an agreement, originally signed in 1988, to cooperate on nuclear power.

To wrest control of the nuclear market

June 18, 2017

With eye to grabbing slice of market, China focuses on developing small nuclear reactors
http://www.japantimes.co.jp/news/2017/06/18/business/eye-grabbing-slice-market-china-focuses-developing-small-nuclear-reactors/#.WUZimFFpyos

Reuters

SHANGHAI – China is betting on new, small-scale nuclear reactor designs that could be used in isolated regions, on ships and even aircraft as part of an ambitious plan to wrest control of the global nuclear market.

Within weeks, state-owned China National Nuclear Corp. (CNNC) is set to launch a small modular reactor (SMR) dubbed the "Nimble Dragon" with a pilot plant on the island province of Hainan, according to company officials.

Unlike new large scale reactors that cost upward of $10 billion per unit and need large safety zones, SMRs create less toxic waste and can be built in a single factory.

A little bigger than a bus and able to be transported by truck, SMRs could eventually cost less than one-tenth the price of conventional reactors, developers predict.

The global nuclear industry will require around $80 billion in annual investment over the coming decade as countries strive to meet climate and clean energy goals, the International Atomic Energy Agency (IAEA) forecasts, and China is keen to get its hands on a substantial chunk of any new business.

"Small-scale reactors are a new trend in the international development of nuclear power — they are safer and they can be used more flexibly," said Chen Hua, vice president of the China Nuclear New Energy Corp., a subsidiary of CNNC.

Beijing is now racing the likes of Russia, Argentina and the United States to commercialize SMRs, which include passive cooling features to improve safety.

Fukushima fallout

Following the triple meltdown at the Fukushima No. 1 reactor complex in 2011, the beleaguered nuclear industry has been focused on rolling out safer, large-scale reactors in China and elsewhere.

But these "third-generation" reactors have been mired in financing problems and building delays, deterring all but the most enthusiastically pronuclear nations.

The challenges of financing and building large, expensive reactors contributed to the bankruptcy of Toshiba Inc.'s nuclear unit, Westinghouse, and to the financial problems that forced France's Areva to restructure.

SMRs have a capacity of less than 300 megawatts (MW) — enough to power around 200,000 homes — compared to at least 1 gigawatt (GW) for standard reactors.

China is aiming to lift domestic nuclear capacity to 200 GW by 2030, up from 35 GW at the end of March, but its ambitions are global.

CNNC designed the Linglong, or "Nimble Dragon" to complement its larger Hualong or "China Dragon" reactor and has been in discussions with Pakistan, Iran, Britain, Indonesia, Mongolia, Brazil, Egypt and Canada as potential partners.

"The big reactor is the Hualong One, the small reactor is the Linglong One — many countries intend to cooperate with CNNC's 'two dragons going out to sea,' " Yu Peigen, vice president of CNNC, told a briefing in May.

Crowded field

Others are also pursuing the technology, with around 50 different SMR designs worldwide according to the IAEA. Russia leads the way on floating plants suitable for its remote Arctic regions, and construction underway on the world's biggest icebreaker.

U.S. firms including Westinghouse and Babcock & Wilcox have been developing their own SMRs, along with smaller startups like the Bill Gates-backed Terrapower.

CNNC is now working on offshore floating nuclear plants it plans to use on islands in the South China Sea, as well as mini-reactors capable of replacing coal-fired heating systems in northern China. Company scientists are even looking at designs that could be installed on aircraft.

Elsewhere in China, Tsinghua University is building a version using a "pebble bed" of ceramic-coated fuel units that form the reactor core, improving efficiency. Shanghai scientists are also planning to build a pilot "molten salt" reactor, a potentially cheaper and safer technology in which waste comes out in salt form.

The success of new small-scale reactors hinges on investors seeing new large-scale plants coming online and building on those successes, said Christopher Levesque, Terrapower's president.

"We're not competing with those folks, we're rooting for them," he told an industry forum in Shanghai last month.

China has had some overseas success already with its Hualong reactor, with Pakistan currently building a plant using the technology. The Hualong is also expected to gain regulatory approval in Britain after China helped finance the $24 billion Hinkley Point nuclear project there.

Keeping costs down

Officials acknowledge nuclear still struggles to compete with cheaper coal- or gas-fired power.

The OECD Nuclear Energy Agency estimates developers will need to build at least five SMRs at a time to keep costs down.

Taking into account much lower safety, environmental and processing costs, however, the agency said SMRs could be competitive with new, large-scale reactors — particularly in remote regions where the alternative is a costly extension of power grids.

"Given the delays and cost overruns associated with large-scale nuclear reactors around the world currently, the smaller size, reduced capital costs and shorter construction times associated with SMRs make them an attractive alternative," said Georgina Hayden, head of power and renewables at BMI Research.

Some developers believe basic SMR construction costs could eventually be cut to $2,000 to $3,000 per kilowatt, making it competitive with large third-generation plants and new, low-emission, coal-fired power.

"The cost of small reactors is a little higher than big reactors right now," CNNEC's Chen said on the sidelines of an industry expo in Beijing. "But we believe that alongside the further development and bulk production of this technology, costs will decline further."

South Korea vows to end nukes

June 19, 2017

Source : Financial Times
https://www.ft.com/content/40871236-45da-11e7-8519-9f94ee97d996

South Korea steps back from nuclear power

Pledge to scrap plans for new reactors marks overhaul for country's energy policy

by: Song Jung-a in Seoul

South Korea's president Moon Jae-in has vowed to scrap all existing plans for new nuclear power plants and cancel lifetime extensions for aged reactors, heralding a major overhaul for the country's energy policy.

It marked Mr Moon's second major announcement to change the country's power mix after ordering a temporary halt on eight of the country's older coal power plants soon after taking office last month, amid growing health concerns in one of the world's most polluted countries.

"We will abolish our nuclear-centred energy policy and move towards a nuclear-free era," Mr Moon said on Monday in the coastal city Busan, marking the closure of the country's first nuclear reactor built in 1977. "So far, the country's energy policy focused on low prices and efficiency. But this should change now with our top priority on public safety and the environment."

He added that the country would soon shut down another aged nuclear plant following a previous extension of its lifecycle, while hinting at halting the construction of two new nuclear reactors conditional upon a public consensus.

South Korea has the sixth-largest fleet of nuclear reactors in the world, generating about one-third of its energy needs from 25 reactors. But concerns over nuclear safety have intensified after Japan's Fukushima nuclear disaster in 2011 and a major earthquake in the country's southeastern city last year.
The new policy represents a break from the past administrations, which favoured cheaper but dirty coal power and riskier nuclear energy over more costly natural gas and clean renewables.
Worsening air pollution emerged as one of the main campaign issues in South Korea's recent election, with air pollution soaring to record highs in the first few months of 2017. Coal-fired power plants were blamed as one of the main culprits for worsening pollution.
South Korea operates 59 coal-fired power plants that supply nearly 40 per cent of the country's total electricity, but Mr Moon has promised to close those older than 30 years within his five-year presidential term and to not build new coal plants.
But experts caution that the shift could result in energy supply shortages and higher costs for the country that imports much of its energy from overseas. South Korea has the highest per capita electricity demand in Asia, although the country ranks among the top importers of coal, oil and gas in the world.
Former refugee, special forces soldier and human rights lawyer sets out on reform mission
"It is a step in the right direction but there is a question mark over how to address the potential supply shortfall and rising costs," says Kim Kyung-nam, professor at the Graduate School of Energy and Environment at Korea University.
Mr Moon has vowed to increase the portion of renewable energy to 20 per cent by 2030 and increase LNG-fired power production, even raising the possibility of reviving a deal to import natural gas from Russia through North Korean territory.
Renewable sources account for 6.6 per cent of the country's energy supply, the lowest among OECD countries, as their production has been damped by technological constraints, heavy regulations and weak demand.
The government plans to invest Won13.8tn ($12.2bn) this year in developing alternative energy sources in order to cut greenhouse gas emissions by 37 per cent by 2030 under the Paris climate agreement. It also plans to ease regulations and offer more incentives to spur clean energy production.
But experts worry that it could be challenging to increase clean energy production, given the lack of natural resources for the populous and mountainous country. This would mean higher energy costs for South Korean industries, which have enjoyed low electricity prices.
"If you get rid of nuclear energy, which is relatively low cost once built, and replace coal with more expensive LNG, that's going to translate into higher electricity prices, which could hurt domestic industries [and] it is not going to be popular," says Kerry-Anne Shanks at energy consultant Wood Mackenzie.
Experts also caution the government's anti-nuclear stance bodes ill for the country's ambition to export more reactors abroad. On the back of the thriving domestic industry, state-run utility Kepco has emerged as one of the few international players capable of successfully building nuclear reactors, unlike overseas rivals mired in cost overruns and construction delays.
"One of Kepco's biggest strengths is its track record in development of domestic nuclear capacity. Mr Moon's plans to suspend or scrap nuclear developments within South Korea could hurt this record." says Ms Shanks.
"A withdrawal of government support for nuclear development in South Korea would send a negative signal to foreign countries looking to purchase reactors."

New South Korean president
vows to end use of nuclear power

Moon Jae-in said he would lead country
towards a 'nuclear-free era' following
fears of a Fukushima-style meltdown

Justin McCurry ***in Tokyo, The Guardian,*** *Monday 19 June 2017*
https://www.theguardian.com/world/2017/jun/19/new-south-korean-president-vows-to-end-use-of-nuclear-power

South Korea's new president, Moon Jae-in, has vowed to phase out the country's dependence on nuclear power, warning of "unimaginable consequences" from a Fukushima-style meltdown.

Moon, a left-leaning liberal who won last month's presidential election by a landslide following the impeachment and arrest of Park Geun-hye, said he would increase the role of renewable energy and lead South Korea towards a "nuclear-free era".

Speaking at an event to mark the closure of the country's oldest nuclear plant, Kori-1, he said: "So far, South Korea's energy policy pursued cheap prices and efficiency. "Cheap production prices were considered the priority while the public's life and safety took a back seat. But it's time for a change.

"We will abolish our nuclear-centred energy policy and move towards a nuclear-free era. We will completely scrap construction plans for new nuclear reactors that are currently under way."

Moon added that he would not extend the operation of ageing reactors, many of which will come to the end of their lifespans between 2020 and 2030.

Weaning South Korea off nuclear power, however, could take decades, and there is expected to be opposition from construction companies, which have increased technology exports under Moon's nuclear-friendly predecessors.

The country was the fifth-largest producer of nuclear energy last year, according to the World Nuclear Association, with its 25 reactors generating about a third of its electricity.

The former president Lee Myung-bak saw nuclear as an important source of clean energy, while Park wanted to increase the number of reactors to 36 by 2029.

Moon recognised the role of nuclear power in South Korea's rapid economic development, but added that Japan's Fukushima disaster – which prompted the evacuation of tens of thousands of people – had convinced him that his country must look to new sources of energy.

"The country's economic status has changed, our awareness on the importance of the environment has changed. The notion that the safety and lives of people are more important than anything else has become a firm social consensus," he said.

Anti-nuclear campaigners have long warned of the potentially disastrous consequences of a meltdown at a nuclear plant in South Korea, where many reactors are close to densely populated areas.

The public's support for nuclear power has weakened since the 2011 Fukushima meltdown and a 2013 corruption scandal over fake safety certificates for reactor parts.

"The Fukushima nuclear accident has clearly proved that nuclear reactors are neither safe, economical nor environmentally friendly," Yonhap news agency quoted Moon as saying.

"South Korea is not safe from the risk of earthquakes, and a nuclear accident caused by a quake can have such a devastating impact."

He also plans to close at least 10 ageing coal-fired power plants before his term ends in 2022 and to boost renewables' share of the energy mix to 20% by 2030.

Korea's denuclearisation

June 24, 2017

China, U.S. agree aim of "complete, irreversible" Korean denuclearization
REUTERS
http://www.asahi.com/ajw/articles/AJ201706240089.html

BEIJING--China and the United States agreed that efforts to denuclearize the Korean Peninsula should be "complete, verifiable and irreversible", Chinese state media said on Saturday, reporting the results of high level talks in Washington this week.
"Both sides reaffirm that they will strive for the complete, verifiable and irreversible denuclearization of the Korean Peninsula," a consensus document released by the official Xinhua news agency said.
U.S. Secretary of State Rex Tillerson had said on Thursday that the United States pressed China to ramp up economic and political pressure on North Korea, during his meeting with top Chinese diplomats and defense chiefs.
China's top diplomat Yang Jiechi and General Fang Fenghui met Tillerson and Defense Secretary Jim Mattis during the talks. Yang later met with U.S. President Donald Trump in the White House, where they also discussed North Korea, Xinhua reported.
The consensus document also highlighted the need to fully and strictly hold to U.N. Security Council resolutions and push for dialogue and negotiation, which has long been China's position on the issue.
Military-to-military exchanges should also be upgraded and mechanisms of notification established in order to cut the risks of "judgment errors" between the Chinese and U.S. militaries, the statement also said.
Chinese state media described the talks, the first of their kind with the Trump administration, as an upgrade in dialogue mechanisms between China and the United States, following on from President Xi Jiping's meeting with Trump in Florida in April.
Xi and Trump are next expected to meet again in Hamburg during the G20 Summit next month.
A day last week's talks, President Donald Trump said China's efforts to use its leverage with North Korea had failed, raising fresh doubts about his administration’s strategy for countering the threat from North Korea.
The death of American university student Otto Warmbier earlier this week, after his release from 17 months of imprisonment in Pyongyang, further complicated Trump’s approach to North Korea.
China, North Korea’s main trading partner, has been accused of not fully enforcing existing U.N. sanctions on its neighbor, and has resisted some tougher measures.
Washington has considered further "secondary sanctions" against Chinese banks and other firms doing business with North Korea, which China opposes.

S. Korea to hold debate on whether to halt construction project

June 28, 2017

S.Korea to halt reactor project for public debate
https://www3.nhk.or.jp/nhkworld/en/news/20170628_02/
The South Korean government says it will suspend the construction of 2 nuclear reactors while the country holds a national debate on whether the work should go ahead.

The minister for the Office for Government Policy Coordination, Hong Nam-ki, announced this on Tuesday.

Hong said the office will set up a panel of experts from outside the energy sector to solicit the views of the public from an independent standpoint.

He also said the construction of the Shin Kori Number 5 and Number 6 reactors in Busan will stop while the panel conducts opinion polls and hold televised debates over the course of 3 months.

He added that a jury selected from members of the public will make the final decision on the issue.

The 2 reactors were nearly 30 percent complete as of last month. If the project is scrapped, compensation for construction companies and other costs would reach an estimated 2.3 billion dollars.

But Hong said it's desirable to create a social consensus and follow a public decision.

The move came after President Moon Jae-in vowed last week to move away from nuclear power.

South Korea suspends work on 2 reactors

July 14, 2017

S.Korea nuclear operator suspends work on reactors
https://www3.nhk.or.jp/nhkworld/en/news/20170714_29/
The operator of nuclear power plants in South Korea has decided to suspend work on 2 reactors.

The government earlier announced plans to start the process of deciding whether to continue with their construction.

The decision came on Friday at a meeting of the board of directors at Korea Hydro and Nuclear Power Company. It operates the Shin Kori nuclear power plant in Ulsan, where the Number 5 and Number 6 reactors are under construction.

The company estimates that the suspension will cost it about 87 million dollars, mainly in compensation for firms involved in the project.

The government says the 2 reactors were nearly 30 percent complete as of May. It estimates that if the project is scrapped, it will cost 2.3 billion dollars.

The government announced last month that the country will hold a national debate on whether the work should continue.

A panel of experts will be set up to discuss the matter for 3 months before a jury selected from members of the public will make a final decision.

President Moon Jae-in pledged last month to conduct a fundamental review of energy policy and move away from nuclear power. But unionized workers of the operating company and local residents say they want the project completed. Critics say it is unrealistic to cancel the project as it would significantly affect the steady supply of electricity and the national economy.

KEPKO: What future for exports?

July 13, 2o17

South Korea's Anti-Nuclear Push Casts Cloud Over KEPCO's Reactor Exports
https://www.nytimes.com/reuters/2017/07/12/business/12reuters-southkorea-nuclear-exports.html
By REUTERS
SEOUL — A decision by South Korea's new president to scrap plans for more domestic nuclear power plants will make it harder for the country to sell reactors to buyers overseas, experts warn.
State-run Korea Electric Power Corp (KEPCO) is building the first of four nuclear plants in the United Arab Emirates in an $18.6 billion deal, and is scouting for more business in Britain and other countries.
But many nuclear experts doubt South Korea's ability to export a technology it is ditching at home after President Moon Jae-in, who took office in May, said he would scrap plans to build new domestic reactors.
South Korea is the world's fifth-biggest user of nuclear energy and KEPCO, which has built more than 20 reactors at home, vies with the likes of France's EDF and Toshiba's Westinghouse unit in the niche but fiercely competitive nuclear export market.
"Exporting nuclear is an international competition, and Korea will look like a child fighting alone to win a game while others have support from a whole family," said Chung Bum-jin, a nuclear engineering professor at South Korea's Kyung Hee University.
The complexity of nuclear installations meant companies could not rely on past experience for building reactors, said Roh Dongseok, a senior nuclear power policy research fellow at the Korea Energy Economics Institute
"You also need a proven record to revise and upgrade nuclear design. Even if there's a slight change in nuclear design, it is considered as new technology and skills," he said.
Suppliers in Korea, who often produced only small quantities of components, could also face difficulties without the support of a domestic industry, added Chung.
KEPCO's international nuclear project team is working to keep its export business alive.

"We are focussing on the UK market, but also on Saudi Arabia, South Africa and Iran," said Jong-hyuck Park, chief nuclear officer at KEPCO at a recent industry event in London.
KEPCO is also in talks with Japan's Toshiba to buy a stake in Britain's NuGen nuclear project, aiming to use its own reactor design.
"The company (KEPCO) aims to finish the due diligence process by August or September.... and it will take more time to look into South Africa," said a source with direct knowledge of the matter who declined to be identified as he was not authorised to speak to media.
NuGen, planned for Moorside in northwest England, was thrown into doubt after Westinghouse declared bankruptcy and its partner in the project, France's Engie, pulled out.
A KEPCO spokesman said the company is awaiting government guidelines on nuclear exports.
The government's nominee as energy minister has yet to take up the post and it is not yet clear when the government will specify plans for the industry.
"If the South Korean government and industry show a commitment to its exports, it can have a viable and successful nuclear export programme to build on its UAE success," said George Borovas, global head of nuclear at law firm Shearman & Sterling.

Are nukes compatible with the Constitution?

June 24, 2017

EDITORIAL: Is nuclear power compatible with human rights in Constitution?
http://www.asahi.com/ajw/articles/AJ201707240022.html
One year has passed since an evacuation order was lifted on July 12, 2016, for most parts of the Odaka district of Minami-Soma, Fukushima Prefecture, which lies within a 20-kilometer radius of the crippled Fukushima No. 1 nuclear power plant.
Stores and schools in the district are gradually being reopened. Voices of high school students are heard echoing through the streets at times of the day when they go to school and return home. At the same time, though, many stores remain shuttered and grass is running wild in the yards of many houses.
City government figures show that Odaka was home to only 2,046 residents as of July 12, less than one-sixth of the corresponding figure at the time of the 2011 disaster at the nuclear plant, which is operated by Tokyo Electric Power Co. (TEPCO).
The nuclear disaster, triggered by the Great East Japan Earthquake and tsunami, deprived many people of their “lives as usual,” which should have been guaranteed under the Constitution of Japan.
DISASTER HIGHLIGHTED ESSENTIALS OF CONSTITUTION
Katsuaki Shiga, a 68-year-old fisherman, has given up hope of returning to Odaka.
His home, which he had just built near the coastline, was inundated by the tsunami. The home went dilapidated while he was banned entry to the premises in the wake of the nuclear disaster, and Shiga had no choice but to have it dismantled.

"(The disaster) changed not just my life but also the lives of all people in our community," Shiga said. "That made me think about the essentials of the Constitution, such as the right to life and fundamental human rights."

The government of Minami-Soma in May last year distributed a brochure containing the entire text of the Constitution to all households in the city.

Yasuzo Suzuki (1904-1983), a scholar of constitutional law who hailed from Odaka, included an explicit mention of the right to life in a draft outline of Japan's Constitution, which he worked out immediately after World War II ended in 1945.

"**The people shall have the right to maintain wholesome and cultured living standards**," the draft said, in a prelude to Article 25 of the current Constitution.

Katsunobu Sakurai, mayor of Minami-Soma, wanted the city's residents to cast their minds back to a starting point at a time when life had taken a sudden turn for the worse for many of them.

Several tens of thousands of inhabitants of Fukushima Prefecture remain evacuated either within or outside the prefecture's borders. Countless people have lost their longtime livelihoods or dwellings, which means their freedom to choose and change their residences and to choose their occupations (Article 22), along with their right to own or hold property (Article 29), were severely violated.

Many children were no longer able to attend schools in their hometowns, which means their right to an education (Article 26) was also compromised.

And most importantly, the tragedy drove many people into "disaster-related deaths."

"The nuclear disaster has made it impossible to maintain the sort of life that is described in the Constitution," Sakurai said emphatically. "That is unconstitutional, isn't it?"

CONSTITUTION AS PILLAR AND POST

The Fukui District Court in May 2014 issued an injunction against the planned restart of reactors at Kansai Electric Power Co.'s Oi nuclear plant in a lawsuit filed by residents living near the power-generating facility in Fukui Prefecture.

"The use of nuclear energy is meant to fulfill the socially important functions of generating electric power, but that is inferior in standing to the core part of personal rights in light of the Constitution," the court said in its decision.

Akiko Morimatsu said she was given hope by that court decision, which based itself on the Constitution.

The 43-year-old heads a group of plaintiffs from the Kansai region in a group lawsuit filed by evacuees from the nuclear disaster, who are demanding compensation from the central government and TEPCO.

Worried about her two young children's exposure to radiation, Morimatsu fled to Osaka from Koriyama, Fukushima Prefecture, although the area she was from was not under an evacuation order.

Voluntary evacuees like her, who constitute a minority, have had to face unfriendly eyes both in and outside of Fukushima Prefecture, and have received little help from administrative organs and scanty damage payments from TEPCO.

She said she wondered if she had made the right choice, and she took a fresh look at the Constitution, which she had studied in her student years. She thereupon found such statements as "all peoples of the world have the right to live in peace, free from fear and want" (preamble) and "all of the people shall be respected as individuals" (Article 13).

"This should be the pillar and post for me," Morimatsu said she thought.

She argued that it is up to individual freedom to choose between evacuating and staying, and that all individuals, no matter which option they have chosen, should be granted assistance that allows them to realize the sort of life that is guaranteed under the Constitution.

Seventy years after the Constitution came into force, people are still turning to the supreme law of Japan as a weapon in their fight to win back their "lives as usual." That reality should not be forgotten and should be taken seriously.

CHOICE IS UP TO THE PEOPLE

The use of atomic energy was seldom called into question in light of the Constitution before the Fukushima nuclear disaster occurred.

The development of nuclear power in Japan has been advanced in line with the Atomic Energy Basic Law, which was enacted in 1955, eight years after the Constitution took effect.

The law has the stated goal of the "improvement of the welfare of human society and of the national living standard" and says explicitly that the use of nuclear energy should be limited to "peaceful purposes."

"It used to be taken for granted that the use of nuclear power does not violate the Constitution," said Yoshikazu Sawano, a professor of Constitution studies with the Osaka University of Economics and Law. "The issue was seldom ever discussed within academic circles."

There is probably no doubt that nuclear energy, which can supply large amounts of electric power, has contributed to the economic development of Japan, a country poor in natural resources.

Once there is a nuclear accident, however, that puts the human rights of countless individuals at immediate risk. That danger used to be shrouded under a "safety myth" and was not fully understood by the public.

Even after the Fukushima nuclear disaster affected many people, the central government and electric utilities continue to adhere to their policy of promoting the use of atomic energy.

More than 4 million people are living within a 30-km radius of nuclear power plants across Japan where residents may face evacuation orders in the event of an accident.

The future path of Japan should be reviewed from the perspective of whether the continued use of nuclear power would allow the country to maintain society in a state envisaged by the Constitution.

A national referendum in Austria voted against activating a nuclear power plant, which led the Central European nation to pass a law against building nuclear plants in 1978. Public calls for a phase-out of nuclear power intensified following the 1986 disaster at the Chernobyl nuclear power plant in the former Soviet Union, and a ban on the use of atomic power was included explicitly in Austria's Constitution in 1999.

The right to choose the future path of Japan lies with every single member of the country's public, with whom sovereign power resides. There should be broader discussions that take into account of what has taken place during the latest period of a little more than six years.

--The Asahi Shimbun, July 23

No reference to new reactors in energy plan

August 2, 2017

Updated basic energy plan will not refer to new reactors

http://www.asahi.com/ajw/articles/AJ201708020026.html

THE ASAHI SHIMBUN

The government will avoid any reference to building new reactors or replacing aging facilities in its basic long-term energy policy, in light of persistent, public opposition to reliance on nuclear energy.

“There has been no development in circumstances that calls for a change of the outline" of the nation's basic energy policy, industry minister Hiroshige Seko said Aug. 1, indicating that the key parts of the existing plan will remain unchanged.
Whether to mention the construction of new reactors had been the focus of attention as the government prepares to undertake its latest review of the plan, which is conducted roughly every three years.
Although the current plan, crafted in 2014, defines nuclear energy as an “important base load power source,” it does not refer to the government’s position with regard to the construction of new reactors.
The nuclear power industry, along with related business circles, have been pushing for the construction of new reactors.
But the Ministry of Economy, Trade and Industry, which oversees the electricity industry, is hesistant to commit to new construction projects in the new energy plan, given the general outcry over nuclear energy following the 2011 Fukushima nuclear disaster.
Seko said the government’s decision in 2015 to ensure measures are taken so that nuclear energy accounts for 20 to 22 percent of the nation’s overall power output by fiscal 2030 will be achievable without adding new reactors.
“We can attain the objective without building new reactors if existing ones are brought back online,” he said.
Seko added that an advisory panel will meet Aug. 9 to discuss the review of the basic energy plan.
The ministry also plans to hold an inaugural meeting of experts late this month to discuss energy policy through 2050 and whether Japan will need nuclear power plants in the long term.
Five reactors are now operating in Japan after they were certified as meeting more stringent new regulations put in place after the Fukushima disaster.
According to a ministry estimate, the goal of nuclear power accounting for 20 to 22 percent of the nation's energy needs in fiscal 2030 would be achieved if 30 or so existing reactors were in service.
Asahi Shimbun opinion polls since the Fukushima disaster have consistently shown that opposition to nuclear power is almost double that of those who are in favor.

Japan reviews energy plan

August 9, 2017

Energy plan review begins
https://www3.nhk.or.jp/nhkworld/en/news/20170809_40/
A Japanese government panel has begun reviewing the country's medium-to long-term energy policy. The group of experts is focusing on what to do about nuclear power generation and on ways to promote renewables.

The energy policy is reviewed every 3 years or so.

Officials from the industry ministry told the panel that, last fiscal year, nuclear power accounted for about 2-percent of the country's power supply.
Renewables stood at about 15-percent.

The current energy plan calls for nuclear power to account for 20 to 22-percent, and renewables 22 to 24-percent, in fiscal 2030.

Some panel members have requested that the plan be reviewed. Others say more discussions are necessary on whether nuclear power plants should be rebuilt or their numbers increased.

The ministry aims to complete the review by next March.

New reactors?

August 10, 2017

Panel members favor new reactors; others ask, 'Why now?'
http://www.asahi.com/ajw/articles/AJ201708100042.html
THE ASAHI SHIMBUN
Nuclear energy proponents suggested building additional reactors during an industry ministry committee meeting on Japan's energy policy, but others said now is not the time to discuss such a proposal.
Leaders of energy institutions, consulting agencies and others in the field attended the Aug. 9 meeting of the Strategic Policy Committee of the Advisory Committee for Natural Resources and Energy.
The Ministry of Economy, Trade and Industry convened the meeting to obtain opinions concerning the first update of the basic energy plan in three years.
Takeo Kitsukawa, professor of energy and environment policies at the Tokyo University of Science, Professional Graduate School, suggested debate on whether the country should decommission old nuclear reactors and build new ones in their place.
Nobuko Mizumoto, managing executive officer of IHI Corp., a leading heavy industries company, added: "We would like (the ministry) to consider keeping the option of replacing existing nuclear reactors and establishing new reactors."
Although many at the meeting backed the idea of building new reactors, industry minister Hiroshige Seko showed a cautious stance.
"We do not need to change the basic framework," he said.
A number of committee members favor nuclear power generation, including executives of companies that develop nuclear power facilities and a governor of a prefectural government that has accepted hosting such plants.
But given the ongoing battle at the crippled Fukushima No. 1 nuclear power plant, the dominant view in the industry ministry is that it would be too early to include establishment of new nuclear reactors in the basic energy plan. Instead, voices are calling for the government to focus on resuming operations of idle nuclear reactors for the time being.
Kikuko Tatsumi, executive adviser of the Nippon Association of Consumer Specialists, was one of the few participants to clearly propose abandoning nuclear power generation.
"(We should) directly look at the Fukushima accident," Tatsumi said. "(Please shape) policies that are based on sustainable energies."
Hiroya Masuda, adviser of Nomura Research Institute Ltd., said: "Debate on whether we should newly establish reactors means very little now."

Masahiro Sakane, councilor of Komatsu Ltd. and head of the strategic policy committee, echoed that view, saying discussions on building new reactors should come only after resuming operations of existing reactors.
“I totally cannot understand why we are debating whether we should establish new nuclear reactors even though some reactors could be in operation from tomorrow,” he said. “We should look at the realities before discussing the issue.”

South Korea & nukes

August 12, 2017
Lights Out for South Korea's Nuclear Export Ambitions
http://thediplomat.com/2017/08/lights-out-for-south-koreas-nuclear-export-ambitions/
President Moon’s decision to phase out nuclear energy will undercut South Korea’s role in the global industry.
By Viet Phuong Nguyen
Until recently, the success story of nuclear energy was considered a national pride of South Korea, as the country was not only able to establish a strong domestic nuclear market but also compete with other countries on the export front. However, the decision by the newly-elected president of South Korea, Moon Jae-in, to gradually phase out nuclear energy in South Korea has affected both the domestic and export prospects of the Korean nuclear industry. Such a policy, once implemented, will decimate South Korea’s hope for exporting nuclear technology by undermining credibility, capability, and opportunity.
For the past two decades, the nuclear power program of South Korea has become a rare bright spot in the global nuclear industry. The country’s fleet of nuclear power plants has expanded threefold, from eight units in 1989 to 24 units by 2017 with on-time, within-budget constructions of advanced technologies like the APR1400 (Advanced Power Reactor with 1400 MW electricity capacity).
South Korean companies have also searched for opportunities abroad. In 2009, South Korea won its first nuclear contract abroad when the United Arab Emirates selected the consortium led by the Korea Electric Power Corporation (KEPCO) over more experienced bidders from France, the United States, and Japan to build four APR1400 units at Barakah. In the same year, the Korean Atomic Energy Research Institute (KAERI) and Daewoo scored another win for South Korea in the nuclear export market when they secured a contract to supply the first research reactor for Jordan.
Then came the Fukushima nuclear accident in Japan in March 2011, and **the revelation in 2012 of several safety-related scandals of the Korean nuclear industry, like the** cover-up of a station black-out incident **at the Kori nuclear power plant, or the** falsification of safety documents of plant components. In the aftermath, the Lee Myung-bak (2008-2013) and Park Geun-hye (2013-2017) administrations reaffirmed the importance of nuclear energy by continuing the construction of three new APR1400 nuclear units, while reaching out to potential customers of South Korean nuclear technology by signing multiple nuclear cooperation agreements with countries like Vietnam, Saudi Arabia, or Czech Republic. The nuclear export ambitions of South Korea during this booming period were reflected through the the Ministry of Knowledge Economy’s optimistic 2010 plan to export 80 reactors by 2030. More modestly, in 2015, KEPCO projected six new contracts through 2020.
The good fortune of the South Korean nuclear industry has seemingly come to an end, however, under the new government of Moon Jae-in. In a move that stunned many domestic and foreign observers, Moon,

citing safety reasons, announced his decision to phase out nuclear energy by suspending the ongoing construction of two APR1400 units, cancelling any domestic plans for new reactors, and gradually replacing all existing nuclear capacity with natural gas and renewable energy.

On the other hand, it appears that the Moon administration will continue its predecessors' policy of promoting Korean nuclear technology abroad given the recent statement of South Korea's new energy minister: "The problem we're facing is having multiple units in a small country, and if other countries do not have such problems, I have no intention to stop exports at all and am planning to support such moves." Despite such reassuring messages and other good news on the export front, like the smooth implementation of the Barakah project, Moon's nuclear reversal will negatively affect South Korea's nuclear export ambition in three aspects: credibility, capability, and opportunity.

In term of credibility, it is reasonable to argue that when the Korean president has openly stated that nuclear energy needs to be phased out for the sake of public safety, it will be very difficult to convince other countries to import the exact same kind of technology from South Korea. For comparison, when faced with public and foreign partner concerns about the safety of Korean nuclear technology following the Fukushima accident and domestic safety scandals, the Lee Myung-bak government implemented both internal reforms of safety regulation and external communications with the UAE on the nature of the scandals and the safety advantages of the APR1400 technology. These effective measures did help reassure the UAE, as the construction schedule of the four nuclear units at the Barakah site has been maintained without any major dispute.

In another example, the Japanese government, while admitting a faulty regulatory system for nuclear safety was one of the reasons that led to the disastrous events at Fukushima, still insists that the reactors that they offer to other countries are much more advanced, safety-wise, in comparison with the outdated ones installed at the Fukushima Dai-ichi plant. In both cases, nuclear export opportunities were created and maintained, by emphasizing the safety features of the technology through continuous communication with foreign partners, and not by denouncing the same technology in front of the public.

In term of capability, experiences from the United States show that the lack of a robust domestic market will negatively affect the competitiveness of the country on the export front. Two decades without domestic orders for new reactors following the nuclear accident at Three Mile Island in 1979 had a serious impact on the manufacturing and financial capabilities of American suppliers in their competition with vendors from other countries in new projects abroad. The latest sign of such struggles is the bankruptcy of Westinghouse, which was one of the two remaining reactor suppliers from the United States, in early 2017, and the decision by American utilities to stop the construction of two new reactors that were supposed to be the springboard for the revival of the American nuclear industry –both of which Westinghouse was primary contractor for.

In contrast, starting from an importer of nuclear technology, South Korea has recently been praised for a strong domestic industry that can independently design, manufacture, and build nuclear reactors with its own advanced technology. Currently, South Korea is also one of the few countries that can avoid significant delays in new reactor construction, largely thanks to accumulated experiences from continuously building new plants since the late 1980s. Korean companies will hardly be able to keep such a track record and reputation once Moon's domestic phase-out policy is carried out, especially when new demands from other countries are few and far between and thus cannot help sustain the existing domestic manufacturing capacities of Korean suppliers like KEPCO and Doosan Heavy Industries.

Finally, the conflicting messages about phasing out the domestic nuclear fleet while promoting the same technology abroad will lower the chances for South Korea to win new contracts in nuclear newcomers like Egypt or Saudi Arabia. As previously mentioned, it was a big surprise in the international nuclear market

when novice exporter KEPCO won the UAE project over experienced suppliers like Areva and EDF of France. One of the main reasons for such success is the strong coordination between the Korean government, KEPCO, and their partners in preparing for the UAE bid, whereas the French team consisting of Areva and EDF was actually stuck in an internal dispute during the same bidding period.
Lessons learned from this episode, and the strong performance of ROSATOM as the sole representative of Russian efforts in promoting nuclear technology abroad, have led to the creation of other national consortia in Japan (the International Nuclear Energy Development of Japan) and China (Hualong Company) to improve the chance of these countries in the international market. The nuclear reversal policy will likely create confusion between the South Korean government and nuclear companies; an early controversy has already been observed regarding the suspension of construction of two domestic reactors at the Shin Kori site. Under these circumstances, it's an open question whether "team Korea" can keep its previously exemplary coordination in the race to win new exports faced with other strong contenders like Russia and China.
From the above discussion, a conclusion can be made that the nuclear export ambitions of South Korea will be severely affected once the nuclear phase out is official implemented by the Moon administration. Even if this policy is reversed by Moon's successor, as the president of South Korea is limited to one five-year term, the damages in terms of credibility, capability, and opportunity to South Korea's nuclear exports will be significant, especially when taking into account the declining interest in nuclear energy in once-potential customers in Southeast Asia. A policy that may have long-lasting repercussions domestically and abroad, like Moon's nuclear reversal initiative, should be discussed thoroughly and democratically between all national stakeholders that may be affected in order to reflect a balance of interest for the common benefit of South Korea.
From a global perspective, the future of South Korea's nuclear export capability is also of great interest. After the disintegration of the French nuclear giant Areva and the aforementioned downfall of Westinghouse, prospective customers will likely prefer a more competitive export market, with the strong presence of South Korea, to a rising duopoly between Russia and China.
Viet Phuong Nguyen is a Ph.D. candidate in nuclear engineering at the Korea Advanced Institute of Science and Technology (KAIST). He holds a B.Sc. in nuclear physics from the Vietnam National University and a M.Sc. in nuclear engineering from KAIST.

New energy plan : Phase-out nukes and fight global warming

August 14, 2017

EDITORIAL: Phasing out nuclear power a must for Japan's new energy plan
http://www.asahi.com/ajw/articles/AJ201708140020.html
The industry ministry has opened discussions for reviewing Japan's Strategic Energy Plan, which defines a grand framework for how the country will consume, and cover the demand for, electric power, heat and other forms of energy.
Industry minister Hiroshige Seko has said the core part of the plan will remain basically unchanged. Minor adjustments alone, however, would simply not suffice under current circumstances.

The ongoing edition of the plan is questionable in many respects, including in the way it defines nuclear energy as a mainstay power source despite broad public opposition to restarts of nuclear reactors.

A big wave of change is occurring on a global scale. For example, there are moves, mostly in advanced industrialized nations, for pulling the plug on nuclear power. There is also a trend for moving from coal-fired thermal power generation, given that the Paris Agreement has now taken effect for fighting global warming. Renewable energy options, such as wind and solar power, are spreading rapidly.

Japan should also redraw the image of its future self. First and foremost, a phase-out of nuclear power should define the foundation of the country's new future perspective.

While combining a nuclear phase-out with a fight against global warming won't be an easy task, advances in energy-saving technologies and in renewable energy options have lowered the hurdles for pursuing both. There is a need to seek pathways for doing so, with due consideration given to cost performance and the stability of the energy supply.

FALSE PLEDGE TO LOWER DEPENDENCY ON NUCLEAR POWER

The current Strategic Energy Plan, which was approved by the Cabinet in 2014, contains one deceptive aspect.

In response to the Fukushima nuclear disaster of 2011, the plan included a passage saying that, "Japan will minimize its dependency on nuclear power," but it also defined atomic energy as an "important base-load power source."

The plan also explicitly stated that the government would "proceed with the restart of the nuclear power plants" in accordance with the country's revised regulatory standards. And nuclear reactors across Japan are actually being brought back online.

The Long-Term Energy Supply and Demand Outlook, a document worked out by the industry ministry in 2015 on the basis of the energy plan, favors a return to nuclear power more openly. The document assumes that atomic energy will account for about 20 percent of Japan's total power supply in fiscal 2030. That figure translates to 30 or so active nuclear reactors. Restarting reactors that are currently available for restarts would not be enough to achieve that number, so there would also be a need to either extend the service lives of, or replace, many of the aging nuclear reactors.

But even experts with a neutral stance on nuclear power policy have criticized that assumption for being too unrealistic, because nuclear energy is falling out of favor with the times both in Japan and abroad following the Fukushima disaster. For example, the public has grown more skeptical about the use of nuclear power, and the costs of implementing required safety measures have soared.

The question of how to dispose of radioactive waste from nuclear power reactors remains unlikely to be solved any time soon in most of the countries that have such reactors, including Japan. Efforts are spreading, mostly in advanced nations, for seeking to scrap all, or a considerable part, of a national fleet of nuclear reactors.

The forthcoming edition of Japan's Strategic Energy Plan should no longer define atomic energy as a mainstay source of power. Minimizing dependency on nuclear power should be designated a priority issue instead of being left as a hollow promise. Discussions should be made on what efforts are necessary for achieving that goal, and a road map should be presented in a concrete manner.

PHASE OUT NUCLEAR, FIGHT GLOBAL WARMING

Intensive power-saving efforts, combined with a substantial growth in renewable energy options, will represent a solution to the question of how to phase out nuclear power and fight global warming at the same time. It has been pointed out that such measures are costly and have other disadvantages, but possibilities have been opening up for them in recent years.

On the power-saving front, the mainstream approach in advanced nations lies in suppressing energy consumption while pursing economic growth at the same time. Technological innovation is taking place, including in the use of information technology for efficient control of devices and for adjustment of the power demand.

The government should use policy incentives and regulations to apply strong pressure on the private sector to take action, just like it did when Japan was getting over the oil crisis in the past.

On the front of renewable energy options, the current Strategic Energy Plan says that the government "has accelerated the introduction of renewable energy as far as possible."

Solar power has indeed risen sharply in output over the past several years, but the growth of wind power has remained stalled. Renewable energy sources account for around 15 percent of Japan's total power supply, far behind the corresponding figures for European nations.

There is an urgent need to remove obstacles to realize a more substantial spread of the use of renewable energy sources. For example, operation of facilities should be improved so that more electricity generated from renewable energy sources can be supplied to areas where power transmission lines are currently near capacity. Rules should also be set on how to divide burdens of payable expenses so it will become easier for concerned parties to make additional investments that are deemed necessary.

Wind and solar power have become drastically cheaper to generate in the rest of the world. They can now compete on an equal footing with thermal power and nuclear power in more and more corners of the globe.

Those forms of energy remain relatively expensive in Japan, so we should rack our brains to improve the efficiency of wind and solar power plants, across all stages from their installation to their operation.

The spread of renewable energy options has been helped by a system that allows the cost of power generation to be added on top of electricity charges. In future years, however, it will also become essential to design an institutional setup that helps suppress the burdens passed on to the public.

In the meantime, thermal power has risen sharply in supply to fill a hole left by nuclear power reactors, which went offline and have remained idle in the wake of the Fukushima disaster.

The output of thermal power should be reduced steadily in step with the expanding use of renewable energy.

The current Strategic Energy Plan defines coal-fired thermal power, which is cheap to generate, as another mainstay power source on par with nuclear energy. The private sector has an army of plans for building new coal-fired thermal plants.

But moves are taking place quickly overseas for lowering dependency on coal-fired thermal power, which is generated at the cost of particularly large carbon dioxide emissions. Natural gas, which is friendlier to the environment, should be given priority when it comes to thermal power generation.

EYES SHOULD BE SET ON GLOBAL TREND

The proceeding of discussions for the ongoing review of the energy plan is also problematic.

Apart from having the matter discussed by an existing council, the industry ministry is also setting up a separate panel of experts for discussing long-term strategies. Scholars and senior corporate executives sit on the two bodies who are supportive of the current energy policy, whereas advocates of a departure from nuclear power and of intensive development of renewable energy options account for a mere handful of their members.

One could only doubt that such a lineup of members will enable substantial discussions. It would be indispensable to also include experts who are well-versed in overseas trends, matters of technology and issues of cost performance and approach the question from a broad array of angles.

Japan, a country with scanty natural resources, has placed emphasis on the stability of the energy supply. That was indeed a necessary viewpoint, but it also led Japan, in a sense, to fall into a state of sclerosis whereby the use of nuclear power became the central axis of the nation's energy policy.
Renewable energy sources have already replaced thermal energy and nuclear energy as the leading destinations of global investments into the electric power sector.
Japan should quickly switch its energy policy instead of turning its back on the international trend.
--The Asahi Shimbun, Aug. 13

Will East Asia go greener?

August 18, 2017

Greener grid for East Asia
https://www.japantimes.co.jp/opinion/2017/08/18/commentary/world-commentary/greener-grid-east-asia/#.WZb7TcZpyos
South Korea and Taiwan have announced plans to phase out or reduce their use of nuclear power and fossil fuels
by Sung-Young Kim **and** John A. Mathews
SYDNEY – Not long ago, the future of nuclear power was in Asia. In 2015, nine of the 10 reactors that opened globally were on the continent. But recent declarations by South Korea and Taiwan that they will "go green" have called into question nuclear power's long-term viability, at least in East Asia. Indeed, 2017 may mark the end of the region's nuclear love affair — and the start of a new one with renewables.
South Korean President Moon Jae-in and Taiwan's President Tsai Ing-wen have both set ambitious national agendas to boost renewable energy generation while calling for a phase-out of nuclear. For years, overreliance on traditional fuels discouraged investment in clean technologies for power generation, despite the fact that both countries are innovators in green industries, like energy storage and smart grids. Whereas 22 percent of South Korea's energy needs, and 14 percent of Taiwan's, are met by nuclear, those ratios are now set to drop dramatically.
Blueprints are still being formulated, but taken together the two countries' commitments mark a major shift in regional energy planning toward greener, cleaner technologies. Moreover, they will pave the way for increased investment in renewable power installations, placing their countries on a new competitive footing in the regional market.
South Korea's strategy calls for a phased withdrawal from the nuclear industry, through non-renewal of existing licenses and bans on future plants. Last month, Moon, who was elected in May and campaigned on a nuclear-free agenda, called for an increase in the use of renewables, to 20 percent of the country's total power generation, by 2030, up from the current 5 percent. He has also pledged to close 10 coal-fired power plants by the end of his term in 2022. Currently, coal accounts for about a quarter of the country's energy consumption. Natural gas would be used as a "bridging fuel" during the transition to greener power.
Given that South Korea currently operates 25 nuclear reactors and had plans to build six more, the shelving of nuclear power is a significant shift in the country's energy strategy. Indeed, some have expressed doubts about the feasibility of Moon's plans. There are also questions about how the energy-

policy overhaul will affect the country's lucrative export market for nuclear technology. But Moon remains resolute.

In Taiwan, Tsai is equally committed. Last year, responding to public opposition to nuclear energy in the wake of Japan's 2011 Fukushima meltdown, Tsai vowed to make Taiwan nuclear-free by 2025. Today, coal and natural gas provide more than two thirds of the country's electricity needs, with renewables accounting for 5 percent. Tsai has called for the share of renewables to increase to 20 percent over the next eight years, with the capacity coming primarily from solar and offshore wind. This new load would easily replace the electricity generated by the country's six nuclear reactors.

Critics contend that green technologies are not mature enough to replace traditional fuels for industrial-scale energy use. But these claims are a few years too late. Significant declines in startup costs and energy-storage prices, as well as improved battery performance, have made renewables more competitive than ever. As Francesco Starace, chief executive of Enel, Europe's largest energy company by market capitalization, told the Financial Times in June, renewables are becoming the "cheapest and most convenient way of producing electricity."

South Korea and Taiwan are not the first East Asian powers to go greener. China has been moving in that direction for years, and now leads the world in installed renewable-energy capacity. But by joining the renewables revolution, Taiwan and South Korea will make it easier for other regional players to enter the market, because expanded investment opportunities will increase competitiveness and further drive down already declining costs.

In fact, if there is one valid criticism of Moon's and Tsai's visionary goals, it is that they could be realized even faster. For example, if both leaders were to allow the purchase of renewable power from the planned Global Energy Interconnection or the Asian Super Grid, they could increase the share of green energy more rapidly. South Korea and Taiwan have few natural resources of their own, and are heavily reliant on imported fuel to generate electricity. The introduction of competition to the national monopolies in both countries would also speed the shift to renewables.

But for now, what is most important is the precedent that South Korea and Taiwan are setting. The renewables market in East Asia is about to blossom. When it does, the region's decades-old dependence on nuclear power will finally be broken.

What energy plan for the future?

August 27, 2017

National energy plan needs a major review
https://www.japantimes.co.jp/opinion/2017/08/27/editorials/national-energy-plan-needs-major-review/#.WaLgqMZpxLP

The Ministry of Economy, Trade and Industry has begun a review of the government's Basic Energy Plan — three years after its last update in 2014 by the administration of Prime Minister Shinzo Abe. The current plan, the first adopted in the wake of the March 2011 catastrophe at the Fukushima No. 1 nuclear plant, lacks clear direction and features apparent inconsistencies, such as its call for reducing "as much as

possible" the nation's dependence on nuclear power as a source of electricity while at the same time characterizing nuclear energy as an "important baseload power source" that contributes to a stable energy supply. Under this policy, the Abe administration and the power companies have pushed for restarting nuclear reactors taken offline after the 2011 crisis once they have cleared screening by the Nuclear Regulation Authority (NRA).

In the review to be completed by the end of the current fiscal year, METI reportedly intends to keep the basic outline of the current plan intact — because of the political sensitivities surrounding nuclear power six years after the 2011 disaster. However, the government should overhaul the plan with a more pragmatic assessment of the prospect of nuclear power in this country, which could also affect Japan's commitment to reducing its greenhouse gas emissions, and a greater emphasis on renewable energy.

Based on the 2014 plan, the government envisages an energy mix in 2030 where nuclear power will account for 20 to 22 percent of the nation's electricity output — compared with nearly 29 percent in 2010, the last year before the Fukushima crisis. Since power companies have decommissioned several aging reactors under the tightened safety regulations, that target would likely not be achieved unless almost all of the remaining reactors — including the four at Tokyo Electric Power Company Holdings Inc.'s Fukushima No. 2 plant — are restarted and the operations of many of them are extended beyond the 40-year rule to the maximum 60 years allowed as "exceptions.

That hardly sounds like shedding the reliance on nuclear power. But the feasibility of that target is another question. Restarting the idled reactors has so far not progressed as much as hoped by the power industry, which faces a heavy financial burden from having to import fuel to run thermal power plants instead. Of the 26 reactors whose restart have been sought by 11 power firms, only five have been brought back online after clearing the NRA's screening under the post-Fukushima disaster safety regulations and getting the nod of host local governments. In fiscal 2016, the share of nuclear power in the electricity supply stood at a mere 2 percent.

Popular concern over the safety of nuclear power remains strong. as shown in media surveys that point to steep opposition to restarting of the idled reactors. Lawsuits have been filed to prevent power companies from reactivating their reactors — with some court orders issued, though later reversed, to halt their operations. Behind METI's intention to avoid a major overhaul of the Basic Energy Plan, including discussion on the question over construction of new reactors, is said to be the political sensitivities to the public opinion still wary of nuclear power, particularly as popular approval ratings of the Abe administration have come down sharply in recent months.

A recent estimate by Bloomberg New Energy Finance, a private research institute, forecast that nuclear power will account for about 10 percent of Japan's electricity output in 2030 — less than half the government's energy mix target — and that power companies will instead turn more to coal-fired thermal power plants, pushing up the share of coal to as much as 38 percent of the total supply in 2030, far above the government's target of 26 percent and even higher than the 30 percent last year.

The government has long relied on nuclear energy as a key pillar of the nation's measures against climate change, given that nuclear reactors do not generate carbon dioxide in power generation. However, the cloudy prospects of nuclear power cast doubt on reaching the government's targets for reducing the nation's emissions of global warming gases, including the goal of cutting emissions in 2030 by 26 percent from 2013 levels. Furthermore, Japan's continued emphasis on coal-fired plants — which are popular in the power industry because of their low fuel cost but which emit far more carbon dioxide than other forms of power generation — goes against the global trend of other countries shedding coal to combat

climate change. Power companies in Japan have plans to build roughly 40 new coal-fired thermal power plants.

As it is, the Basic Energy Plan does not appear to reflect the broad changes that have taken place in the energy landscape both in Japan and overseas. The once-touted cost advantages of nuclear power now appears to be in doubt with the added safety requirements following the 2011 disaster, with a number of counties rethinking their nuclear power plans. Introduction of renewable energy such as solar and wind power had expanded in recent years, significantly pushing down their costs. While the plan calls for expanding “as much as possible” the share of renewable energy in Japan, their target in the 2030 energy mix is set at a modest 22 to 24 percent — just slightly above the target for nuclear power, and even lower than the one for coal-fired plants. The plan merits a major review in view of these developments.

Japan should stick to its 3 non-nuclear principles

September 9, 2017
Editorial: Japan must stick to non-nuclear principles
https://mainichi.jp/english/articles/20170909/p2a/00m/0na/009000c
Shigeru Ishiba, former secretary-general of the ruling Liberal Democratic Party (LDP), called for discussions on a review of Japan's three non-nuclear principles of not possessing, not producing and not bringing in nuclear weapons.

- 【Related】Japan should discuss deployment of US nukes inside country: Ishiba
- 【Related】Komeito chief insists Japan stick to 3 non-nuclear principles, rejects nuke deployment

Specifically, Ishiba suggested that the third principle of not bringing in such weapons be re-evaluated to open the way for the deployment of U.S. nuclear weapons in Japan.
Debate on the deployment of U.S. nuclear arms could send the wrong message to China and other countries and adversely affect international cooperation in pressuring North Korea to abandon its nuclear weapons program.
Ishiba said, "Is it right to refuse the deployment of nuclear weapons inside the country while relying on U.S. nuclear arms for protection?"
Behind his remark is the idea that the deployment of nuclear arms in Japan, which would be exposed to a direct threat if North Korea possesses nuclear missiles, would enhance deterrence.
Ishiba pointed out that NATO has countered threats from the former Soviet Union and Russia by deploying U.S. nuclear weapons in its member countries, and said, "Such discussions are necessary to increase the usefulness of the nuclear umbrella." However, the security environment in East Asia is significantly different from that in Europe.
After China successfully conducted a nuclear test in 1964, there were discussions on the pros and cons of Japan arming itself with nuclear weapons. Nevertheless, then Prime Minister Eisaku Sato announced Japan's three non-nuclear principles in 1967, and the principles took root in Japan as an important part of its national policy in the process of the Ogasawara Islands south of Tokyo and Okinawa being returned to Japan's sovereignty from U.S. occupation in 1968 and 1972, respectively.
In adopting the principles, the government didn't just consider the Japanese public's sentiments as the only atomic-bombed country. Japan's calls for nuclear arms reduction and nuclear disarmament have

been a pillar of Japan's diplomatic policy, and the denuclearization of East Asia, including the Korean Peninsula, is an important goal for Japan.
While falling under the protection of the U.S. nuclear umbrella, Japan has managed to maintain its goal of nuclear disarmament by adhering to its three non-nuclear principles.
It is necessary to re-examine Japan's diplomatic and security policies in the face of the growing threat posed by North Korea. That does not mean, however, that Japan can disregard the accumulation of historical and multifaceted discussions that led to the adoption of the non-nuclear principles as its national policy.
Fears persist in the international community that if North Korea were to possess nuclear missiles, Japan and South Korea would also arm themselves with nuclear weapons to deter the threat from Pyongyang.
It was appropriate that Chief Cabinet Secretary Yoshihide Suga promptly ruled out the possibility of Japan debating a review of the three non-nuclear principles, saying, "The government isn't considering deliberating the matter."
We fear Ishiba's remarks could undermine Japan's ultimate goal of realizing a world without nuclear arms.
September 8, 2017

EDITORIAL: Even in face of N. Korean threat, anti-nuke policy should remain
http://www.asahi.com/ajw/articles/AJ201709080020.html
With Japan facing the challenge of responding to North Korea's continuing nuclear arms program, former Defense Minister Shigeru Ishiba of the ruling Liberal Democratic Party has suggested a review of the nation's long-standing three non-nuclear principles.
Appearing in a TV Asahi program, Ishiba asked, "Is it a viable argument that we will not accept (nuclear weapons) in Japan while saying that the nation will be protected under the U.S. nuclear umbrella?"
The simple answer to his question is, "Yes, it is a viable argument."
The three principles of not producing or possessing nuclear weapons and not allowing their entry into Japan were first announced in 1967, during the Cold War, by then Prime Minister Eisaku Sato. Since then, the principles have been followed by Japan's successive Cabinets.
This is a key national creed of postwar Japan and a product of its desperate attempt to come to terms with the reality that it relies on the U.S. nuclear deterrence for its security despite its strong desire to help eliminate nuclear arms from the world, driven by its experiences as the only country that has ever suffered nuclear attacks.
The United States doesn't disclose, in principle, where it deploys its nuclear weapons. It is therefore difficult to confirm that the U.S. forces have not brought nuclear arms into Japan.
Even so, Japan's commitment to the three non-nuclear principles has been a pillar of the nation's foreign policy even after the end of the Cold War.
Japan's move to reconsider the principles could prompt South Korea and Taiwan to seek their own nuclear arsenals, triggering a nuclear domino effect.
In South Korea, there are already calls for the redeployment of U.S. tactical nuclear weapons to the country and even for its own nuclear armament.
The moves of South Korea and Taiwan to arm themselves with nuclear arsenals would seriously undermine the Nuclear Nonproliferation Treaty regime, giving North Korea a rationale for developing nuclear arms.

What is more important than anything else for the efforts to deal with North Korea's nuclear program is solidarity among Japan, the United States and South Korea. The three countries should act on their united front to seek cooperation from China and Russia, which have significant influence over Pyongyang.
Japan should contribute to this strategy by sending out a strong message about its resolve to seek the denuclearization of Northeast Asia including the Korean Peninsula.
Japan's solid commitment to the three non-nuclear principles will underpin its diplomatic efforts for this goal.
Made under these circumstances, Ishiba's remarks could cause diplomatic repercussions that can chip away at the foundation of Japan's diplomacy based on its non-nuclear principles. We cannot help but question his view on the issue.
As possible examples of allowing U.S. nuclear arms into Japan, Ishiba cited port calls made by U.S. strategic missile submarines carrying nuclear warheads at the U.S. Navy's Yokosuka base in Kanagawa Prefecture or the Sasebo base in Nagasaki Prefecture.
The port calls at bases in Japan, which are close to North Korea, however, would not make much strategic sense.
In addition, such actions by the U.S. forces could provoke backlashes from some neighboring countries and make Japan a target should war break out.
Ishiba's remarks came as part of a recent series of arguments made by LDP lawmakers for enhancing Japan's military power in response to North Korea's nuclear and missile provocations.
Katsuyuki Kawai, an LDP Lower House lawmaker who now serves as a special adviser to the LDP president, Prime Minister Shinzo Abe, on foreign affairs, recently said, "I personally believe that the time has already arrived to seriously consider the possibility of the Self-Defense Forces possessing intermediate-range ballistic missiles and cruise missiles."
This kind of proposal, apparently designed to promote a hard-line security policy agenda by taking advantage of the current crisis, can never contribute to regional stability.
What is really needed is cool-headed debate that is firmly in line with Japan's basic foreign policy tenets, including the three non-nuclear principles and the strictly defensive security policy.

Human Rights, Future Generations and Crimes in the Nuclear Age (Basel, Sept. 2017)

Basel Declaration on human rights and trans-generational crimes resulting from nuclear weapons and nuclear energy

The participants in the international conference *Human Rights, Future Generations and Crimes in the Nuclear Age*, held in Basel from September 14-17, 2017, affirm that the risks and impacts of nuclear weapons, depleted uranium weapons and nuclear energy, which are both transnational and trans-generational, constitute a violation of human rights, a transgression of international humanitarian and environmental law, and a crime against future generations.

We are convinced that the energy needs of all countries can be met by safe, sustainable, renewable energies, and that the security of all countries can be met without reliance on nuclear weapons. Our conclusions are based on the following;

On Uranium mining

- Uranium mining and enrichment, which provide the fuel for nuclear energy, release long-lasting and highly toxic radionuclides into the environment causing severe impact on the health of current and future generations exposed to the radiation;
- The nuclear fuel chain, especially uranium enrichment and plutonium reprocessing, provide possibilities for countries with these technologies to also produce nuclear weapons, creating additional threats to current and future generations.
- Finally, the financial prospects of uranium mining in the intermediate and long term future seem questionable at best, considering the existing downtrend in utilization of nuclear energy. Subsequently Governments may seriously consider ceasing the exploration of uranium.

On nuclear energy

- Along the chain of production, regular use and waste management of nuclear fuel for energy generation as well as after nuclear power plant accidents huge amounts of radioactive isotopes are released into the biosphere. Severe health effects as cancer and non-cancer diseases have been demonstrated in populations exposed. In particular resulting genetic changes impact on the health of current and future generations. Modern studies on low dose ionizing radiation (LDIR) corroborate the Linear No Threshold [LNT] concept. Scientifically based understanding calls for acceptance of risk estimations at doses as low as 1 mSv. ICRP-recommendations must be revised as they are outdated one decade after their effective date.
- Many nuclear power plants, particularly in Europe, are located in regions of high population density;
- Any nuclear disaster has cross border effects affecting population of several countries, and would be an infringement of international law requiring states to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states.
- The 2015 Sendai United Nations declaration recognized that accountability for disaster risk creation is needed at all levels. Furthermore, all human rights need to be promoted and protected in any disaster situation, including man made hazards and technological risks;
- The exorbitantly high costs of nuclear energy production and management (including waste storage) make it an inappropriate investment as compared to renewable energies;
- Nuclear disasters like those at Mayak, Three Mile Island, Sellafield, Chernobyl and Fukushima, release massive quantities of radionuclides into the environment impacting on the health of current and future generations;
- Nuclear power plants, in operation and after their dismantlement, generate huge amounts of radioactive waste, which is dangerous for thousands of years, even longer than any known civilization has lasted. The question of safe long-term storage of radioactive waste over centuries has not been answered so far.

On nuclear weapons

- The use and testing of nuclear weapons has generated severe, trans-generational damage to health and the environment of those in the vicinity of the detonations and also to humanity as a whole;
- Recent research, highlighted by the series of international conferences on the humanitarian impact of nuclear weapons, indicates that any use of nuclear weapons on a populated area would cause disastrous humanitarian and environmental consequences, and any multiple use of nuclear weapons would cause catastrophic and irreversible damage to the climate in addition to the radiation and blast impacts;
- We affirm that nuclear deterrence is immoral, illegal and of doubtful value for security. The high risks of nuclear weapons being used in current confliicts such as in North East Asia, in other times of tension, and until nuclear weapons are eliminated provides an imperative for nuclear abolition.
- The financial and human investments in the nuclear arms race are deviating required resources from human, social and environmental needs. This includes promoting education, providing basic universal health care, protecting the climate and implementing the sustainable development goals.

On depleted uranium (DU) weapons

- Epidemiological reports indicate that exposure to depleted uranium has health impacts on those exposed and their offspring;
- Use of uranium for armor plating and piercing projectiles release depleted uranium into the environment, where it will be deposited for thousands of years, causing risks to combatants and non-combatants alike.

On international law applicable to nuclear weapons and energy

In addition to general international law, the following branches, *inter alia*, are applicable to nuclear weapons and nuclear energy:

- *International human rights law* protects, in particular, the right to life, the right not to be subject to inhuman or degrading treatment, the right to the highest standard of health and to a healthy environment, the right to an adequate standard of living, including the right to food and water, as well as the freedom of expression and the right to seek and receive information. Moreover, special instruments for particularly vulnerable groups, such as women, children, indigenous peoples or persons with disabilities, have been adopted and concluded.
- *International humanitarian law:* This body of law prohibits the use of weapons or methods of warfare that would indiscriminately impact on civilians, cause unnecessary suffering to combatants, violate neutral territories, be dis-proportionate to the provocation or cause severe, long-term or irreversible damage to the environment.
- *The law of peace and security*: This body of law, expressed primarily through the UN Charter, prohibits the threat or use of force except in legitimate self defence.
- *Law protecting the environment and future generations*: This body of law, expressed in a number of international treaties, provides a responsibility to ensure a sustainable environment for current and future generations, and to prohibit activities which are known to seriously threaten this. There is also a legal responsibility to prevent and protect the public from exposure to harm, when scientific investigation has found a plausible risk.

The production of nuclear energy violates human rights law and international law protecting the environment and future generations due to the impacts of nuclear energy on human health and the environment as outlined above.

The production, threat and use of nuclear weapons violate all four bodies of law outlined above. As such, we agree with the conclusion of the International Court of Justice that '*the destructive impact of nuclear weapons cannot be contained in time or space'* and with the affirmation of the Treaty on the Prohibition of Nuclear Weapons that '*any use of nuclear weapons would be contrary to the rules of international law applicable in armed conflict, and in particular the principles and rules of international humanitarian law*.' More-over, it would constitute an ecocide.

On rights and responsibilities under the law

- We call for full redress for all people whose health, well-being or livelihoods have been negatively impacted by uranium mining, nuclear energy and nuclear weapons;
- We welcome the provision in the *Treaty on the Prohibition of Nuclear Weapons* on victim assistance and environmental remediation and call for its full implementation;
- We appeal to all those in the nuclear weapons and energy industries and administrating government departments to recognize the illegality of the production of nuclear weapons and energy, and to cease such activities;
- We welcome the conclusions of the *International Peoples' Tribunal on Nuclear Weapons and the Destruction of Human Civilisation.* held on July 7-9, 2016, that convicted (in absentia) the leaders of the nuclear-armed States (and one of the allied States as a test case) for war crimes, crimes against humanity, crimes against peace, crimes against future generations and crimes of threatening, planning and preparing acts which would constitute ecocide, which is understood as causing serious damage to, or destruction, of an ecosystem or ecosystems, or of causing serious, long-term or irreversible damage to the global commons.
- We welcome the fact that the majority of countries neither produce nuclear energy nor possess nuclear weapons, and we call on all other countries to join them.
- We welcome the establishment of the International Renewable Energy Agency, which provides assistance to countries to develop renewable energies, and we highlight it's 2016 Report *REthinking Energy: Renewable Energy and Climate Change which demonstrates the possibilities to completely replace fossil fuels by safe renewable energies, without relying on nuclear energy, by 2030.*
- We commend the 184 countries who have joined the *Non-Proliferation Treaty* as non-nuclear States and the 122 countries who voted in favour of the *Treaty on the Prohibition of Nuclear Weapons* which also prohibits the threat or use of nuclear weapons. We call on all countries to agree to the prohibition and elimination of nuclear weapons and to adopt, at the 2018 UN High Level Conference on Disarmament, a framework to implement this.
- We call on all countries utilizing nuclear energy to announce a program for phasing out their use of nuclear energy and replacing it with renewable energy sources.
- Finally, as doctors, lawyers, scientists and nuclear experts from 27 countries we consider it as our moral duty to highlight the facts regarding nuclear energy and weapons, and promote a safe, sustainable and peaceful future for humanity and our planet consistent with human rights and the rights of future generations.

As such we make the following proposals:

We support the initiatives that Switzerland has taken to phase out nuclear energy domestically and to prohibit nuclear weapons globally, and we encourage Switzerland to take further efforts at the United Nations to prohibit all aspects of the nuclear energy and weapons industries.

2. The Linear No Threshold [LNT] concept and collective dose-calculations allow extrapolations of health risks in large populations exposed to low doses of ionizing radiation. Current scientifically based understanding calls for acceptance of risk estimations at doses as low as 1 mSv and therefore asks for a revision of the ICRP-recommendations, which are outdated one decade after their effective date.

3. Violations of human rights by ionizing radiation sources must be documented epidemiologically. In this regard medical standards for compensation of victims have to be established. Companies / people found to violate the rights of the concerned workers must be held responsible by national and international courts. Everyone has the right to seek and receive information. Victims must be compensated.

4. The employment of nuclear weapons, as well as indiscriminate damage to health and to the environment resulting from other nuclear activities, should be included as a crime against humanity under the Rome Statute of the International Criminal Court. We also call for amendment of the Rome Statute to include the crime of ecocide.

5. Young people and students need to be alerted to the relation between « Nuclear energy / nuclear weapons – Violations of human rights – Rights of future generations. Their human rights are endangered and therefore they need to become active and encouraged to have their current and future interests respected. Law and medical faculties are encouraged to consider teaching on human rights in their corresponding curricula, in general but also in the mentioned context of the 'Nuclear fuel chain', and this also in view of the rights of future generations.

6. The 28 May 1959 agreement between the World Health organization and the IAEA, which leads to conflict of interest and limits the free information on health consequences of nuclear civil use, must be abolished

7. The participants of the Symposium 'Human Rights, Future Generations and Crimes in the Nuclear Age' are ready to share these demands and communicate them to decision makers in other countries.

Govt sees nukes as key power source

October 4, 2017

Seko: Zero nuclear plants unrealistic
https://www3.nhk.or.jp/nhkworld/en/news/20171003_25/
Japan's minister of economy, trade and industry says a proposal by Tokyo Governor Yuriko Koike's new party that the country have no nuclear plants is unrealistic.

At a news conference on Tuesday, Hiroshige Seko said the world faces the challenge of cutting carbon dioxide emissions, and electricity bills are rising.

But he said the government is trying to reduce the number of nuclear plants in Japan as much as possible.

The government sees nuclear plants as a key power source.

It says it will restart only reactors certified by the country's regulating body as meeting requirements introduced after the 2011 Fukushima disaster.
Seko stressed the government's stance of implementing balanced, realistic and responsible energy policies with safety as the top priority.

What will happen to Japan's nuclear industry?

October 5, 2017
Nuclear power clash shaping up between ruling, opposition parties
https://mainichi.jp/english/articles/20171005/p2a/00m/0na/018000c#cxrecs_s
A three-way battle appears set to unfold during the general election campaign over the fate of Japan's nuclear power industry, with the ruling parties pushing reactor restarts, conservative opposition forces favoring a planned phase-out, and centrist and left-wing parties pulling for elimination as soon as possible.

- 【Related】TEPCO reactors clear safety review for 1st time after Fukushima
- 【Related】After much shuffling, election now a race between 3 political forces
- 【Japan Election 2017】

While most opposition parties -- the conservative Party of Hope, and the Constitutional Democratic Party of Japan (CDP), the Social Democratic Party (SDP) and the Japanese Communist Party (JCP) in the center and on the left -- want an end to nuclear power, none have so far presented a concrete plan to eliminate it. This lack of specificity makes it hard to foresee debate on the issue reaching any depth during the campaign.
The new Party of Hope, led by Tokyo Gov. Yuriko Koike, has vowed to shut down all Japan's reactors by 2030, putting it one step ahead of the disintegrating Democratic Party (DP)'s promise to do so "in the

2030s." Speaking on Oct. 4, Koike revealed her intention to make the zero nuclear power pledge a major pillar of her party's platform, stating, "If we don't do what the (ruling) Liberal Democratic Party (LDP) has failed to do, then we cannot return Japan to its previous vigor."

Koike was obviously attempting to play up a clear difference between the Party of Hope and the LDP to woo voters. However, Koike's nuclear power promise is essentially the same as the DP's, in that it has not come with a clear schedule to make it a reality. Meanwhile, the party's election ally Nippon Ishin has not taken a clear anti-nuclear power position.

The newly minted CDP is also following in the nuclear power policy footsteps of the DP, and has promised to rid Japan of reactors as soon as possible. In an emailed newsletter sent on Oct. 4, CDP leader Yukio Edano stated, "We will put our greatest efforts into eliminating nuclear power even a day earlier," and also pledged to "release concrete details of the process and a work schedule" towards that end.

When the LDP released its election manifesto on Oct. 2, party policy chief Fumio Kishida stated, "If the debate on nuclear power is boiled down to a choice between saying 'yes' or 'no' to eliminating it, then no proper explanation is possible. As the political party responsible, we will present our thinking based on the full context of the issue including background aspects." However, despite Kishida's comments, nuclear power is not among the LDP's six main platform points.

The party's more detailed "policy bank" campaign pledge document declares that nuclear power "will be used to provide for (Japan's) base load power needs, on the precondition that safety is guaranteed." Junior coalition partner Komeito's platform, meanwhile, says the party will "aim for zero nuclear power." The administration of Prime Minister Shinzo Abe has long lived with this conflicting policy position within the ruling coalition, while at the same time pushing for the restart of reactors that meet post-Fukushima meltdown safety standards.

Furthermore, only the JCP and SDP have declared their clear opposition to these restarts, with the NRA giving the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture a passing safety grade on Oct. 4. All the other parties would allow reactor restarts under certain conditions, and are competing with each other over how strongly they can impress the public with their goal of eliminating nuclear power.

How is Govt going to revise its energy plan?

Status of nuclear power plants built before 1985

	Power company	Nuclear power plant	Output (10,000 kW)	Start date
Decommissioning decided	Japan Atomic Power Co.	Tsuruga No. 1 reactor	35.7	Mar. 1970
	Kansai Electric Power Co.	Mihama No. 1 reactor	34	Nov. 1970
		Mihama No. 2 reactor	50	July 1972
	Chugoku Electric Power Co.	Shimane No. 1 reactor	46	Mar. 1974
	Kyushu Electric Power Co.	Genkai No. 1 reactor	55.9	Oct. 1975
	Shikoku Electric Power Co.	Ikata No. 1 reactor	56.6	Sept. 1977
Being coordinated	Kansai Electric Power Co.	Oi No. 1 reactor	117.5	Mar. 1979
		Oi No. 2 reactor	117.5	Dec. 1979
Long-term operating plants	Japan Atomic Power Co.	Tokai No. 2 plant	110	Nov. 1978
	Kyushu Electric Power Co.	Genkai No. 2 reactor	55.9	Mar. 1981
	Shikoku Electric Power Co.	Ikata No. 2 reactor	56.6	Mar. 1982
	Tohoku Electric Power Co.	Onagawa No. 1 reactor	52.4	June 1984
	Kyushu Electric Power Co.	Sendai No. 1 reactor	89	July 1984

October 18, 2017

Planned decommissioning of KEPCO reactors puts pressure on gov't energy goals
https://mainichi.jp/english/articles/20171018/p2a/00m/0na/006000c
Following Kansai Electric Power Co. (KEPCO)'s decision to work toward decommissioning the No. 1 and No. 2 reactors at its Oi Nuclear Power Plant in Fukui Prefecture, it is now more likely that other aging nuclear plants across Japan will also be decommissioned, regardless of size.

- 【Related】Gov't reluctant to review energy plan as nuclear power policy could further hurt Cabinet

As a result, the government will now be watched closely regarding its next move. Specifically, the key issue will be whether it will approve the construction of new or replacement nuclear power plants so as to achieve its goal of supplying 20 to 22 percent of the nation's electric power from nuclear power plants by fiscal 2030.
The aim of providing 20 to 22 percent of electric power in this way falls under the government's "Basic Energy Plan." In order to provide 20 percent of power from nuclear energy sources, it would be necessary to restart about 30 nuclear reactors. However, of the existing 45 reactors across the country, only 14 reactors at seven plants have met the safety standards set down by the Nuclear Regulation Authority (NRA), and only five of these reactors have been restarted.
With regard to 19 nuclear reactors including those at Tokyo Electric Power Co. Holdings, Inc.'s Fukushima No. 2 Power Plant, no applications to restart operations have been made.
As a result of the Fukushima nuclear disaster in 2011, regulatory standards regarding nuclear power plants have been made stricter, and therefore safety measure costs have increased considerably. Consequently, electric power companies are hesitant about applying to restart reactors as they are trying to determine the costs involved in restarting aging power plants.

Commenting on the plan to decommission the No. 1 and No. 2 reactors at the Oi Nuclear Power Plant, a senior official at the Ministry of Economy, Trade and Industry said, "The decommissioning of aging nuclear plants is within our range of expectation."
However, if there are additional cases of plants that have exceeded the 40-year operation limit being decommissioned instead of extended, it will be difficult for the government to achieve its power supply framework target set out for fiscal 2030.
Currently, the economy ministry is working on amendments to its basic energy plan.
However, if we assume that the decommissioning of dilapidated plants will be accelerated, then the government's response will be undoubtedly watched carefully.
Will the government lower its nuclear power targets for fiscal 2030, or will it approve the construction of new and replacement power plants instead?

South Korea: Reactor construction to be resumed

20.10.2017_No210 / News in Brief
Construction Set To Resume As South Korea Commission Votes In Favour Of Nuclear
http://www.nucnet.org/all-the-news/2017/10/20/construction-set-to-resume-as-south-korea-commission-votes-in-favour-of-nuclear
Plans & Construction
20 Oct (NucNet): South Korea is expected to resume the stalled construction of two nuclear reactors after a state commission recommended doing so despite president Moon Jae-in's campaign promise to scrap the projects. The commission, composed of 471 citizens, said 59.5% of its members supported resuming building the Shin Kori-5 and Shin Kori-6 reactors, near the southeastern city of Ulsan and under construction since last year. **However, 53.2% of the members were in favour of the government policy to reduce nuclear power generation.**
The commission was established to look into plans announced by president Moon to suspend construction of the two reactors for three months as part of a government policy to phase out nuclear power in South Korea, whose 24 commercial reactor units are responsible for about 30% of electricity supply. Following Mr Moon's phaseout announcement, a board meeting of Korea Hydro and Nuclear Power Corporation (KHNP), which operates the country's nuclear plants, endorsed the government's plan to suspend construction of Shin-Kori-5 and -6, although in comments reported in the media company officials said they would fight the shutdown plans. Reports said KHNP has already spent about $1.4bn (€1.2bn) on construction of the two pressurised water reactors and there might be legal and compensation issues if construction was completely halted. Other media reports said "nearly 30% of construction of the two reactors that was estimated to cost $7.5bn has been completed so far". South Korean media reported on 20 October 2017 that construction is expected to resume next week because the government is likely to endorse the recommendation in a cabinet meeting on Tuesday.

What energy plan for Japan?

November 29, 2017

Energy policy body to think long term on global warming as nuke power casts long shadow
https://mainichi.jp/english/articles/20171129/p2a/00m/0na/010000c
A Ministry of Economy, Trade and Industry expert body convened on Nov. 28 to discuss Japan's next basic energy plan will look ahead all the way to 2050, focusing on long-term energy policies and anti-global warming measures, it has been confirmed.

- 【Related】Gov't reluctant to review energy plan as nuclear power policy could further hurt Cabinet
- 【Related】Spotlight on party pledges in upper house election: Energy policy
- 【Related】Researchers in Japan look to ocean for new, stable energy supply

The committee also looks likely to delve into whether Japan should build new nuclear reactors, as the present units inevitably reach the end of their service lives and are decommissioned.
The expert body is a subcommittee of the Advisory Committee for Natural Resources and Energy, an advisory panel to industry minister Hiroshige Seko. Meanwhile, Seko has also made his own private "Energy josei kondankai" advisory group on energy issues an official player in the formulation of Japan's next basic energy policy, and the group has already been discussing plans looking forward to 2050.
The expert subcommittee confirmed on Nov. 28 that, beginning in spring 2018, it would begin discussions on policy goals up to 2050 based on a report set to be put together by Seko's private advisory group by the end of the current fiscal year.
The current basic energy plan includes an energy mix goal for 2030, of which 20 to 22 percent is projected to be nuclear power. If the government and power companies uphold the principle of decommissioning reactors after 40 years in service, then atomic power will only be able to cover 15 percent of Japan's energy needs by that year. However, the 20 to 22 percent goal is considered attainable if older units pass Nuclear Regulation Authority inspections for extending the life span of reactors by up to 20 years.
By 2050, however, even reactors granted two extra decades online will have hit the absolute limit of their operational lives, and decommissionings will be well under way. That being the case, if nuclear power is to retain its one-fifth share of Japan's energy mix, then new reactors will have to be built. While there is currently strong local resistance to restarting existing reactors, the industry ministry maintains that keeping nuclear power in the country's energy mix as a "stable energy source" is indispensable.
Expert subcommittee Chairman Masahiro Sakane stated at the Nov. 28 meeting, "As we will be debating (policy for) 2050, we need to seriously discuss the global warming problem." Government plans call for an 80 percent reduction in greenhouse gas emissions by that year, and as nuclear power is a carbon-free energy source, it is thought the subcommittee will discuss building new reactors.
However, public distrust of nuclear power remains strong in the wake of the March 2011 Fukushima triple meltdown, and the subcommittee is likely to be called on to tread carefully when discussing possible new reactors.

Uncertain future for nuclear policy after high court ruling
http://www.asahi.com/ajw/articles/AJ201712140031.html

The landmark Hiroshima High Court ruling ordering a suspension of operations at the Ikata nuclear power plant will likely have far-reaching ramifications for Japan's nuclear energy policy.
It zeroed in on an aspect that has long been an issue with the anti-nuclear lobby, the Ehime Prefecture plant's proximity to an active volcano and the prospect of the facility being inundated in a pyroclastic flow if Kyushu's Mount Aso, 130 or so kilometers away, blows its top.
Instead of considering the frequency of major eruptions in the area, the Dec. 13 ruling focused on a massive one 90,000 years ago and the possibility of a nuclear calamity occurring if a similar event occurred today.
The ruling, the first by a high court ordering a suspension of nuclear plant operations, is especially relevant because Japan has 111 active volcanoes that have erupted in the past 10,000 years.
While massive eruptions are rare, occurring in general once every 10,000 years, all it takes is one to trigger destruction on an unimaginable scale.
Aso has had four massive eruptions in the last 300,000 years, the most recent occurring 90,000 years ago that triggered a pyroclastic flow that tossed magma and volcanic rocks over the Kanmon Straits separating Kyushu and Honshu into Yamaguchi Prefecture.
The last major volcanic eruption in Japan occurred roughly 7,300 years ago on the seabed south of Kyushu, devastating the southernmost main island where Jomon Pottery Culture (c. 8,000 B.C.-300 B.C.) was thriving.
The government, which was caught off-guard by the Hiroshima ruling, no doubt will pay close attention to future court rulings at that level because other nuclear power plants are situated at distances similar to that between the Ikata plant and Aso.
For example, the No. 1 and No. 2 reactors of the Sendai nuclear plant in Kagoshima Prefecture that are currently operating are located within a 160-kilometer radius of the Aso caldera, as are the No. 3 and No. 4 reactors of the Genkai nuclear plant in Saga Prefecture that Kyushu Electric Power Co. hopes to bring back online next spring.
Kyushu Electric said it maintains close monitoring of seismic movements in the area caused by the rumblings of five volcanoes and is confident it will detect any signs of a possible huge eruption.
However, experts scoff at the notion on grounds that it is almost impossible to accurately predict the timing and scale of such an event. They also note that Japan has no practical experience in dealing with a massive eruption.
That said, the Japan Meteorological Agency monitors 50 active volcanoes around the clock.
Yoshiyuki Tatsumi, a professor of planetology at Kobe University, said, "Under the current setup of observing (volcanic) quakes and crustal movement, it is impossible to predict the scale of any eruption."
The groundbreaking Hiroshima court ruling took the government by surprise.
Hiroshige Seko, the economy minister and a champion of nuclear power generation, asserts that the safety standards implemented by the Nuclear Regulation Agency in the aftermath of the 2011 nuclear disaster are "the highest in the world."
Five reactors that passed the NRA's more stringent screening have resumed operations since the Fukushima accident.

But the Hiroshima High Court said the NRA's decision to allow the Ikata plant to resume operations was "not rational" in light of the facility's location and the danger of a catastrophe occurring if Mount Aso erupts like it did 90,000 years ago.
Although Chief Cabinet Secretary Yoshihide Suga made clear at a Dec. 13 news conference that the government would closely abide by future decisions by the NRA, he was painfully rattled by the thought that the court ruling could sow further doubts among the public about the safety of nuclear plants, especially those located near volcanoes.
The government has set a goal of raising the ratio of electricity generated by nuclear power to between 20 and 22 percent of the nation's overall needs by fiscal 2030. That would mean resuming operations at about 30 nuclear power plants.
However, utilities are already facing mind-boggling expenses just to meet the tougher safety standards. If they now have to brace for the possibility of being ordered by courts to halt their nuclear plant operations, the burden on private companies could become too much.
"Nuclear power generation is now impossible for a private-sector company because the risks are just too great," said an executive of an electric power company.
(This article was compiled from reports by Shigeko Segawa, a senior staff writer, Chikako Kawahara and Tsuneo Sasai.)

What place for nuclear power?

December 19, 2017

Nuclear power should be 'baseload power source': Hitachi president
https://mainichi.jp/english/articles/20171219/p2a/00m/0na/010000c#cxrecs_s
Hitachi Ltd. President Toshiaki Higashihara underscored the significance of nuclear power as Japan's baseload power source despite the sector's sluggish business performance in the wake of the Fukushima No. 1 Nuclear Power Plant disaster.
During an interview with the Mainichi Shimbun and other media outlets on Dec. 18, Higashihara said, "We need to consider issues such as the environment, stable energy supply and securing manpower for reactor decommissioning all in a comprehensive manner. Nuclear power should be the country's baseload power source."
Hitachi acquired Britain's Horizon Nuclear Power in 2012 and is promoting a plan to build two nuclear reactors in the country for possible operation in the early 2020s. The Japanese electronics giant is set to make a final decision on the plan in fiscal 2019, though the manner of raising necessary funds for the project has yet to be decided.
"We will create an environment to make the project profitable while receiving support from the governments (of Japan and Britain)," Higashihara said.
At a press conference in October 2016, Higashihara had suggested potential realignment in the nuclear power business in the future alongside Toshiba Corp. and Mitsubishi Heavy Industries Ltd. However, he expressed reservations about the move during the Dec. 18 interview, saying, "It's not something that one single manufacturer should think about. It requires discussion as the issue concerns global energy policy."
With regard to the move to integrate domestic nuclear fuel businesses among the three companies, the Hitachi president said the talks "have not progressed well."

Higashihara unveiled his company's goal of raising the ratio of operating profit to sales to 10 percent or more under the next medium-term management plan for the three-year period up to fiscal 2021.
The company had earlier set out a goal of raising its operating profit ratio to 8 percent by fiscal 2018 from the 6.9 percent posted in the midterm consolidated settlement for the business term ended September 2017.
"(Achieving that goal) is a pass point. We should further compare ourselves with global companies," he said. As part of efforts to bolster its marketing efforts overseas, Hitachi is aiming for mergers and acquisitions and business alignment with other companies, according to Higashihara. "There are a great deal of negotiations that are under way behind the scenes," the president said about his firm's acquisition strategy.
In reference to the recent data falsification scandals involving Kobe Steel Ltd. and Mitsubishi Materials Corp., Higashihara pointed out, "Various problems arise when companies attach weight to cost-cutting measures. The heads of companies must keep telling their staff that it is more important to discern right and wrong than pursuing profits."
He testified that Hitachi is free of any quality data falsifications, revealing that an in-house survey found no violation of ethics.

Koizumi to announce zero nuclear power policy (Genjiren)

December 22, 2017

Koizumi to introduce 'bill' to abandon nuclear energy
http://www.asahi.com/ajw/articles/AJ201712220043.html
Former prime minister and anti-nuclear exponent Junichiro Koizumi is expected to announce a "bill" abandoning nuclear power plants and promoting natural energy next month.
Genjiren (an acronym for the confederation of zero nuclear power plants and the promotion of natural energy), a private organization headed by Tsuyoshi Yoshiwara, former president of Johnan Shinkin Bank, drafted the proposal for the zero nuclear power policy.
Koizumi, an adviser to Genjiren, will request both ruling and opposition parties to provide assistance.
The policy states that nuclear power plants should not be restarted and renewable energy resources should be increased.
Koizumi, who has been calling for abandoning nuclear power at public lectures across the country, is scheduled to make an announcement together with Morihiro Hosokawa, also a former prime minister, on Jan. 10.
“It might be difficult (to reach the goal) under the Abe administration, but we are determined to fulfill the project of zero nuclear power plants in the near future. Public sentiment that opposes the restart of nuclear power plants is much larger (than that of pro-nuclear power),” Koizumi has reportedly told his confidantes.
He also often says, "Japan can get along with zero nuclear power plants."
The main opposition in the Lower House Constitutional Democratic Party of Japan (CDP) aims to submit a bill calling for no nuclear power plants to the Diet.
“We are in the phase where specific processes (toward zero nuclear power) are questioned," said CDP leader Yukio Edano.

The CDP is expected to compile measures that can be taken for local governments hosting nuclear facilities to prepare them for transition to a phaseout of nuclear energy and the schedule of disposal of spent nuclear fuel.

CDP clarifies position on nukes

December 25, 2017

CDP clarifies goal of eliminating nuclear power in policy draft
https://mainichi.jp/english/articles/20171225/p2a/00m/0na/019000c
The Constitutional Democratic Party of Japan (CDP), the largest opposition party in the powerful House of Representatives, specified its goal of eliminating nuclear power by 2040 in a draft of its basic policy that was revealed on Dec. 24.

- 【Related】CDP, JCP leaders join rally against revising Constitution's war-renouncing Article 9
- 【Related】Editorial: Weakened, fractured opposition needs to band together at faction level
- 【Related】Election Review: United opposition could have won 84 single-seat constituencies

The draft states that the CDP seeks to stop the installation of new nuclear reactors as the necessity for such facilities "cannot be recognized," and will not agree on reactivation of idled nuclear reactors unless the national government works out effective evacuation plans, for which the state can be responsible.
It then pledges to stick to its goal of decommissioning all nuclear reactors by 2040 in principle, reinforcing its goal of achieving a society without atomic power as early as possible, which the party declared in its campaign pledge for the lower house election in October.
With regard to constitutional amendment, the draft says the party will consider clauses that actually require revisions from the standpoint of putting the brakes on the authorities and protecting the rights of the people.
Under the policy draft, the party regards the Japan-U.S. alliance as the linchpin of Japan's diplomatic and security policy and pursues the sound development of the pact, while proposing revisions to the Status of Forces Agreement between the two countries to reduce the burden of hosting U.S. military bases.
On the economic front, the draft states that the party will seek to set mid- and long-term targets of achieving fiscal health and strengthen the system of redistribution of wealth through a review of the entire tax system, including the consumption tax. The policy draft also includes the goal of raising the minimum wage to at least 1,000 yen an hour, enacting legislation to ban corporate political donations while promoting individual political donations. The party also aims to lower the minimum age at which people can run for public office by 5 years.
The CDP is also poised to incorporate its goal of phasing out nuclear power in a draft of its platform to be compiled by the end of this year. The party aims to demonstrate originality in its draft platform using phrases such as "bottom-up politics" and "grass-root democracy," which CDP leader Yukio Edano pledged to carry out when the party was launched.

Private equity group buys Westinghouse

January 5, 2018

Brookfield Private Equity Group To Buy Westinghouse For $4.6 Billion
https://www.nucnet.org/all-the-news/2018/01/05/brookfield-private-equity-group-to-buy-westinghouse-for-4-6-billion
5 Jan (NucNet): Westinghouse Electric Company, the US nuclear engineering group that went into chapter 11 bankruptcy last year, has been sold by its owner Toshiba to Brookfield Business Partners, the private equity group, for $4.6bn (€3.8bn).
According to Brookfield, the deal is conditional on approval from the bankruptcy court and regulators around the world.

Brookfield is funding the acquisition with about $1bn in equity and $3bn in long-term debt, with the remainder coming from pension and environmental liabilities that it is taking on.

Cyrus Madon, Brookfield's chief executive, said the group looked forward to "bringing our significant expertise and reputation as a long-term owner and operator of critical infrastructure in the US and globally, as well as our deep facilities management capabilities, to enhance the company's position as a leading global infrastructure services provider to the power generation industry".

Westinghouse was forced into bankruptcy after long delays and rising costs at the Vogtle and Summer AP1000 nuclear projects in the US, for which it was supplying the AP1000 reactor technology.

The company leading the Summer project, Scana of South Carolina, abandoned the development last year and on Wednesday announced that it had accepted a $14.6bn takeover bid from Dominion Energy.

The other project, Vogtle in Georgia, is still going ahead after state regulators gave their approval last month.

Brookfield said in a statement that Westinghouse had a strong market position as the largest service provider to nuclear power plants worldwide, earning the majority of its profits from long-term contracts.

It added: "An iconic American company, Westinghouse offers a full suite of specialised parts and components, many of which are licensed or patented, as well as industry-leading engineering and other services that enhance the safety, efficiency and reliability of its customers' facilities."

Human Rights, Future Generations and Crimes in the Nuclear Age

January 5, 2018
Paracelsus, the Nuclear Age, and Future Generations
http://akiomatsumura.com/2018/01/paracelsus-the-nuclear-age-and-future-generations.html
Emilie Gaillard and Andreas Nidecker

The famous physician Andreas Paracelsus, who taught at the University of Basel in the early 16th century, wrote: “What sense would it make or what would it benefit a physician, if he discovered the origin of the diseases but could not cure or alleviate them?”

We are a lawyer and a radiologist, reporting from a recent three-day interdisciplinary symposium at the U of Basel. It was attended by physicians, lawyers, nuclear experts and scientists, entitled “**Human Rights, Future Generations and Crimes in the Nuclear Age**” and was sponsored by the Swiss branch of the International Physicians for the Prevention of Nuclear War (IPPNW) and the International Association of Lawyers Against Nuclear Arms (IALANA).

At our symposium we examined what effects policies relating to nuclear weapons have on the health and the environment. In that regard we considered the human rights situation of victims of nuclear tests and nuclear disasters. The recent success of 122 nations, which on July 7th accepted the UN “treaty on the prohibition of nuclear weapons” obliges in Article 6 nations to environmental remediation and to assistance for the victims, at least those of the use and testing of nuclear weapons.

Most of the discussions, however, focused on the implications of the nuclear weapons and civil use of nuclear energy for the future generations. It is they – our children, grandchildren and their descendants – who will continue to bear the risks of nuclear war and the potential health effects of the ongoing, progressive global nuclear contamination. This started with the first atmospheric nuclear weapons test “Trinity” in July 1945, followed by some 2000 test explosions by nine nuclear states, hundreds of which were above ground thereby contaminating the biosphere. The Chernobyl nuclear reactor explosion lead to a regional but also widespread contamination of Europe and today there is the ongoing leakage into the pacific of high volumes of radioactively contaminated water from the damaged reactors in Fukushima. Financing the legacy of civil use of nuclear power, including the construction of safe waste storage repositories will be a further challenge we mainly leave to our children and grand-children.

Discussions finally questioned possible liabilities of Governments i.e. decision makers in nuclear weapon states, when intended or accidental launch of nuclear arms might eventually have global repercussions and could lead to the extinction of mankind. The very idea of recognizing crimes against future generations becomes now a new reality: any nuclear war should lead to a major response of international law as it closes the horizon of the future for ever.

Indeed, the entry into the nuclear age marks the unprecedented acquisition of power of humankind over the earth and all forms of life; geologists name this new era the Anthropocene. Many believe that in this era a new code of medical and legal ethics is necessary, as the specific challenges of facing nuclear risks and disasters require a paradigm shift in both disciplines. We must now seriously consider the trans-generational impacts of ionizing radiation on all forms of life and take effective measures to prevent serious health effects in today’s populations, in particular young women and children. Yet we also must protect our descendants, as ionizing radiation may cause not only cancer and non-cancerous diseases but also may have genetic impacts in humans exposed today. These effects may even occur with long-term chronic exposure to very low doses of ionizing radiation. They will not become manifest in today’s victims, but might present as disease in their offspring only decades later.

Thus we must also adapt the current legal framework of basic principles to this new reality and create new laws, designed specifically to protect and take into consideration the human rights of future generations. The Universal Declaration of Human Rights, although not legally binding, comprises some thirty individual rights. Some of them are pertinent to victims of nuclear accidents. Displaced people in the Fukushima prefecture e.g. should have the right to adequate living standards as well as the rights to express their opinion and the right to receive information. In fact, the Japanese constitution does recognize these rights and defends the trans-generational principle of human rights of future generations

in Articles 11 and 97. Yet these rights presently are not respected, for in Japan the press is forbidden to report on current events in Fukushima and medical research on the effects of the reactor meltdown is restricted. Most radiation scientists in Japan, with some exceptions, minimize the risks of radiation and the official widely-observed policy is that small amounts of radiation are harmless: scientifically speaking this is untenable. Furthermore, the Japanese Government is trying to increase the public limit for radiation from 1 mSv to 20 mSv per year, a value generally allowed for radiation workers only. Its scientists are trying to force the International Commission of Radiation Protection ICRP to accept this large increase, yet many consider this not only unscientific but also unconscionable. This handling of the aftermath of the nuclear catastrophe of Fukushima therefore could be considered a violation of human rights and even a crime against future generations.

To voice concerns for the human rights of future generations today is not enough. New legal provisions to insure these rights must be created. Additionally concrete steps towards abolishing nuclear weapons in the coming years are urgently needed. Furthermore, due to the high costs for dismantlement of nuclear reactors and the enormous investments for safe nuclear waste storage, our generation should take responsibility and at least shoulder some of these costs and not burden them on our offspring only.

2018 World Nuclear Industry Status

https://www.worldnuclearreport.org/World-Nuclear-Industry-Status-as-of-1-January-2018.html

World Nuclear Industry Status as of 1 January 2018

Tuesday 9 January 2018, by Mycle Schneider

The Year 2017 for Global Nuclear Power in a nutshell: 4 reactor startups (12 less than scheduled), 3 shutdowns, 4 construction starts, 2 abandoned constructions, bankruptcy of Westinghouse, bailout and breakup of AREVA, significant financial and economic pressure on nuclear operators. Five new reactors entered long-term outage, and 3 were restarted.

Globally, 405 reactors operating (1 less than a year ago), 52 under construction (3 less).

After ten reactor startups in both 2016 and 2015, only four new units—three in China, one in Pakistan (built by Chinese companies)—were connected to electricity grids in 2017.

Tianwan-3, designed and built by Russian Rosatom, was connected to the Chinese grid on 30 December 2017. Since construction of this unit started only in December 2012, that is a remarkably low construction

time. *The World Nuclear Industry Status Report 2017 (*WNISR2017*)* had listed Tianwan-3 as delayed with a planned startup in February 2018.

As of the beginning of 2017, 16 reactors were scheduled to be connected to the grid during the year (not including Tianwan-3). One year ago, WNISR wrote: "Of these 16 reactors, 11 are already behind schedule. The year 2017 will therefore be an interesting test case for the industry." The test did not go well. Only three of these units plus Tianwan-3 with a combined capacity of 3.3 GW generated their first power, all 13 others, including eight units in China, were delayed or further delayed. This compares with China's "eye watering installation rates" (PV Magazine) of solar capacity, as it added over 50 GW to its grid. Even taking into account lower productivity per installed GW, [1] this means that new solar plants in China alone in 2017 will generate significantly more power than all nuclear reactors started up in the same year in the entire world.

Globally, three reactors were permanently closed in 2017. In Germany, Gundremmingen-B was shut down as scheduled on 31 December 2017, as part of the country's nuclear phase-out policy. South Korea and Sweden both shut down their respectively oldest units, Kori-1 and Oskashamn-1. In addition, two more Japanese reactors, Ohi-1 and -2 were officially closed, after the operator abandoned plans for restart and lifetime extension. However, as the two units have not generated any power since 2011, the WNISR had listed them as in Long-Term Outage (LTO) [2], and now moved them to the shutdown category accounting for their closure in the respective years of last electricity generation. This increases the number of units shut down worldwide in Fukushima-year 2011 to 25. Some of the 31 units, currently still in LTO in Japan, are likely to follow over the coming years. In addition to the Japanese stranded reactors, there are five units in LTO around the world, one each in Argentina, France, India, Switzerland and Taiwan. The Japanese government decided already in December 2016 to officially close the Monju fast breeder reactor, which did not generate any power since 1995. The International Atomic Energy Agency (IAEA) noted that decision in its online Power Reactor Information System (PRIS) only after a full year's delay. The IAEA also lists Santa Maria de Garona as closed in 2017. However, the Spanish reactor did not generate any power since 2012, and WNISR has considered it permanently shut down ever since.

As of 1 January 2018, there are 52 reactors under construction, three less than a year ago. Construction started on four reactors in 2017, one each in Bangladesh, China, India and South Korea. The Chinese project is a pilot fast reactor, launched on 25 December at the Xiapu site in Fujian province, and not a single new construction start for a commercial nuclear power plant was announced in the country. This raises the question, is this the sign of a major shift or slowdown in Chinese nuclear policy, which dominated world nuclear construction for the past 10 years, contributing over 60 percent of all new building sites since 2008?

The construction of Shin-Kori-5 in South Korea, launched in April 2017 (but only officialized months later), had been suspended in June following President Moon Jae-in's election in May, but resumed after a citizens' committee voted in favor of its completion. The South Korean nuclear ambitions remain in question after the Moon administration confirmed its long-term nuclear phase-out goal.

In March 2017, Toshiba-Westinghouse, historically the largest nuclear builder in the world, filed for bankruptcy protection in the U.S., and was bought for US$4.6 billion (subject to regulatory and court approval) by a subsidiary of Brookfield Asset Management, a Canadian holding company with no experience in the nuclear sector, specializing in the takeover of companies in difficulties. In July 2017, the owners of V.C. Summer in South Carolina pulled the plug on the construction of two AP1000 units designed by Westinghouse after spending an estimated US$9 billion. In the last days of the year, the only two other reactors under construction in the U.S., at the Vogtle site in Georgia, received the State Public Services Commission's permission to continue construction—for the time being.

The French state-owned nuclear builder and service company AREVA was bailed out by the government with a US$5.3 billion cash injection and subsequently broken up. AREVA's reactor building and servicing branch AREVA NP was taken over by state utility EDF, effective from the end of 2017, and relaunched in a "back to the future" (Reuters) initiative as *Framatome* (EDF 75.5%, Mitsubishi Heavy Industry 19.5%, Assystem 5%). After a loss of over 90 percent of its stock value since 2007, AREVA was delisted in August 2017. The year has also seen the French Nuclear Safety Authority ASN granting exceptional permission to EDF to use a sub-standard reactor pressure vessel at the Flamanville EPR, which is still under construction. The pressure vessel has been found with a level of carbon significantly exceeding technical specifications and is part of an ongoing quality-control scandal pointing to decades of irregularities and forged documents, impacting tens of thousands of pieces in dozens of nuclear plants around the world. On top of the economic fallout of scandals and challenging ageing issues, nuclear operators struggled with low electricity prices and constantly dropping costs of their main competitors, wind and solar in particular. In countries like the United States, many nuclear power plants have continued to operate only because of massive government subsidies.

The WNISR2017 *has been presented around the world since September, with events (in chronological order) in Salzburg (Austria), Astana (Kazakhstan), Ottawa (Canada), Washington D.C. (U.S.), Berlin (Germany), Macao and Beijing (China). For the first time, the entire 267-page report has been translated into Chinese. The report has received broad acclaim and* media coverage *has been comprehensive. The Chinese version of the Summary & Conclusions will be made available on* www.WorldNuclearReport.org *shortly.*

Download this page in PDF format**.**

Footnotes

[1] An operating nuclear plant can provide about eight to nine times more electricity per installed kilowatt than a photovoltaic plant.

[2] WNISR considers that a unit is in Long-Term Outage (LTO) if it produced zero power in the previous calendar year and in the first half of the current calendar year. This classification is applied retroactively starting on the day the unit is disconnected from the grid. WNISR counts the startup of a reactor from its day of grid connection, and its shutdown from the day of grid disconnection.

Koizumi supports bill aiming at zero nukes

It seems that the anti-nuke movement in Japan has taken a major step forward with former PM Koizumi's backing for a Diet bill to quickly bring Japan to "zero nukes".

January 10, 2017

Junichiro Koizumi-led group pitches bill calling for 'immediate halt' to Japan's reliance on nuclear power

https://www.japantimes.co.jp/news/2018/01/10/national/politics-diplomacy/junichiro-koizumi-led-group-pitches-bill-calling-immediate-halt-japans-reliance-nuclear-power/#.Wlo1mHkiGot

by Tomohiro Osaki
Staff Writer

A group advised by former Prime Minister Junichiro Koizumi on Wednesday unveiled details about a bill calling for an "immediate halt" to Japan's reliance on nuclear power to prevent a recurrence of the 2011 Fukushima disaster. The group is seeking to submit the bill to an upcoming Diet session in cooperation with opposition parties.

Sporting his signature leonine hairdo, Koizumi, one of Japan's most popular prime ministers in recent memory, made a rare appearance before reporters with his unabated frankness, lashing out at Prime Minister Shinzo Abe over his persistent pro-nuclear stance.

"You may think the goal of zero nuclear power is hard to achieve, but it's not," Koizumi said, adding that he believes many lawmakers of the ruling Liberal Democratic Party support nuclear power passively out of respect for Abe, but that they could be persuaded to embrace a zero-nuclear policy under a different leader.

"Judging from his past remarks, I don't think we can realize zero nuclear power as long as Abe remains in power. But I do think we can make it happen if he is replaced by a prime minister willing to listen to the public," Koizumi told a packed news conference organized by Genjiren, an anti-nuclear association for which he serves as an adviser along with Morihiro Hosokawa, another former prime minister.

Claiming that the March 2011 triple meltdown at the Fukushima No. 1 nuclear power plant exposed the "extremely dangerous" and "costly" nature of atomic power — with a means of disposing of spent fuel still not in sight — the bill drafted by Genjiren calls for Japan's "complete switch" to renewable energy.

Specifically, it demands that all active nuclear reactors be switched offline immediately and that those currently idle never be reactivated. It also defines the government's responsibility to initiate steps toward a mass decommissioning and to map out "foolproof and safe" plans to dispose of spent fuel rods.

The bill sets forth specific numerical targets, too, saying various sources of natural energy, including solar, wind, water and geothermal heat, should occupy more than 50 percent of the nation's total power supply by 2030 and 100 percent by 2050.

That Japan has experienced no mass power shortage following the shutdown of all 48 reactors in the wake of the 2011 crisis, except for a handful since reactivated, is in itself a testament to the fact that "we can get by without nuclear power," Koizumi said.

A 2017 white paper by the Ministry of Economy, Trade and Industry shows Japan's reliance on nuclear power has plunged to a mere 1 percent after the Fukushima meltdowns. The vast majority of Japan's power is supplied by sources such as liquefied natural gas, coal and oil.

Although the controversy over nuclear power has rarely emerged as a priority in recent parliamentary debates, the creation of the main opposition Constitutional Democratic Party of Japan may herald a breakthrough.

Later Wednesday, Genjiren pitched the bill to the CDP in a meeting with some of its members, including former Prime Minister Naoto Kan, who was in power when the Fukushima crisis erupted.

The CDP seeks to submit its own "zero nuclear power" bill to a regular Diet session slated to kick off later this month, positioning itself as a clearer anti-nuclear alternative to Abe's ruling party than its predecessor, the Democratic Party.

The DP, which until recently held the most seats among opposition parties in both houses of the Diet, had failed to go all-out in crusading against nuclear power under the previous leadership of Renho, who goes by only one name.

At a party convention last March, Renho balked at adopting an ambitious target of slashing Japan's reliance on nuclear power to zero by 2030 after reportedly facing resistance from party members beholden to the support of electricity industry unions.

In a preliminary draft unveiled Wednesday, the CDP's bill-in-the-making called for ridding Japan of nuclear power "as soon as possible."
For memory:

Koizumi's nuclear power questions

- Nov 11, 2013

https://www.japantimes.co.jp/opinion/2013/11/11/editorials/koizumis-nuclear-power-questions/#.Wlo2dnkiGot

While political repercussions continue over former Prime Minister Junichiro Koizumi's surprise calls for ending nuclear power generation in Japan, what the once popular leader points out are all sensible and legitimate questions about Japan's energy policy that remain unanswered by members of the Abe administration. Any energy policy that fails to squarely answer the questions posed by Koizumi will not have any credibility.

Koizumi, who kept largely out of the media spotlight after retiring as lawmaker in 2009, has been speaking out in recent months that Japan should end its reliance on nuclear power. He says the Fukushima nuclear disaster changed his perception of nuclear power as a low-cost and safe source of energy and now says, "There is nothing more costly than nuclear power." He urges the government to divert the massive energy and money needed to maintain nuclear power in Japan into more investments in the development and promotion of renewable energy sources.

Many of his former Liberal Democratic Party colleagues initially tried to dismiss Koizumi as a retired politician who has nothing to do with the party today. Prime Minister Shinzo Abe, who served in key Cabinet and LDP positions during Koizumi's 2001-2006 rule, said it is "irresponsible" to commit to ending nuclear energy at this point. Meanwhile, hopes have emerged within the opposition camp that an alliance with Koizumi — who drew strong popular support while in office — on the zero nuclear agenda could provide them with ammunition against the LDP's dominance in the Diet.

The political ripple effects — and some criticism over his flip-flop after promoting nuclear power while in office — aside, what seems missing in the controversy are discussions on the very real and pressing issues highlighted by Koizumi. He points to poor prospects for finding a permanent storage site for highly radioactive waste after spent fuel is reprocessed. This problem — for which Japan's nuclear power industry has long been likened to a "condominium without a toilet" — has been set aside since well before the Fukushima crisis.

Abe has told the Diet that a technology has been established to store such waste in geological layers deep underground. Koizumi says the problem is that despite the existence of this technology, the government has been unable for more than a decade to find a candidate site anywhere in Japan. And this technology, Koizumi says, might be problematic in this quake-prone country — a point that Abe conveniently neglects to mention. Given the safety concerns over nuclear power following the triple meltdowns at the Fukushima plant, it is even more doubtful that a candidate site will ever be found, Koizumi says. Thus radioactive waste will continue to pile up as long as nuclear power plants are operated.

Japan's nuclear fuel cycle program is at a standstill. Completion of a fuel reprocessing plant in Rokkasho, Aomori Prefecture, has been delayed for years, and the Monju fast-breeder reactor in Tsuruga, Fukui Prefecture, has been idled for much of the time since a sodium leak and fire in 1995. Meanwhile, storage space for spent nuclear fuel from reactors around the country, and in the Rokkasho complex, is nearly 70 percent full.

As Koizumi points out, the myth that nuclear power is cheaper than other sources of energy is thrown in doubt when the expenses for siting nuclear plants, their future decommissioning and waste disposal are included. And on top of this there is the massive cost of dealing with the aftermath of the Fukushima No. 1 meltdowns, including compensation, which far exceeds the financial capacity of its operator, Tokyo Electric Power Co. This is necessitating the injection of a huge amount of taxpayer money.

Abe's rebuttal is that increased fossil fuel imports for thermal power generation to make up for the nuclear plant shutdowns is costing the nation trillions of yen a year. But his rhetoric does not answer the question whether nuclear power is really the affordable source of energy — as it has long been touted to be by the government — especially after the costs of compensation and decontamination in the wake of the Fukushima nuclear crisis are taken into account.

Abe has vowed to scrap the nuclear phaseout policy of the Democratic Party of Japan-led administration that his LDP ousted from power last year. But the prime minister has yet to present a new vision for the nation's energy policy — except to say that he would reduce as much as possible Japan's reliance on nuclear power while maximizing energy-saving efforts and development of alternative energy.

While the future of Japan's energy policy remains elusive and the Fukushima nuclear crisis is continuing, Abe has been pushing for the sale of Japanese nuclear power plant technology overseas as part of his bid to boost infrastructure exports. When Mitsubishi Heavy Industries and France's Areva clinched a joint-venture deal in October to build a nuclear power plant with four advanced reactors in Turkey, Abe said Japan "is responsible for helping improve the safety of atomic power in the world by sharing the experience and lessons" from the disaster at the Fukushima plant — whose situation he has described as "under control."

At home the Abe administration and the LDP are pushing for the restart of some idled nuclear reactors once they have cleared a new set of safety criteria, even though radiation-contaminated water continues to leak from the Fukushima compound nearly 2½ years after the meltdowns.

Abe should lay out a new energy vision that will fully address the doubts about nuclear power raised by Koizumi. His legitimate concerns are likely shared by a large part of the public — a majority of whom, according to media surveys, oppose restart of the idled nuclear reactors. As Koizumi says, only Japan's political leaders can set the direction for the nation's energy policy. The Abe administration has an obligation to choose a path that ensures Japan will not have to contend with another nuclear power plant disaster in the future.

Two ex-prime ministers team up on 'bill' to end nuclear power

http://www.asahi.com/ajw/articles/AJ201801110038.html
By AKIRA MINAMI/ Staff Writer
Former Prime Ministers Junichiro Koizumi and Morihiro Hosokawa on Jan. 10 announced the drafting of a "bill" to immediately halt all nuclear power plants in Japan and require electricity needs to be met with renewable sources by 2050.
In a news conference, Koizumi said while it would be difficult phasing out nuclear energy under the Abe administration, the proposal would pave the way for a major shift in the country's energy policy.
"We will definitely abolish all nuclear plants in the near future with support from a majority of the public," said Koizumi, who has been campaigning to reduce Japan's nuclear dependency to zero.
"Once the bill begins to be discussed in the Diet, citizens will be awakened (to face the nuclear issue)."
The bill was drafted by the confederation for scrapping nuclear plants and promoting natural energy (Genjiren). Koizumi and Hosokawa serve as advisers for the group, which is headed by Tsuyoshi Yoshiwara, former president of Johnan Shinkin Bank.
Koizumi emphasized his intention to build closer ties with the Constitutional Democratic Party of Japan (CDP), an opposition party that aims to introduce a zero nuclear plant bill.
Other pillars of Koizumi and Hosokawa's bill include a ban on resuming operations of existing nuclear reactors and building new ones, withdrawal from the nuclear fuel recycling project and a freeze of nuclear plant exports.
After the news conference, Genjiren called on CDP members to reconsider their planned bill that would exceptionally allow nuclear plants to resume operations in an emergency, such as when Japan cannot import oil.
"The name of the game is the immediate halt on nuclear plants," said lawyer Hiroyuki Kawai, secretary-general of Genjiren.
The group is scheduled to discuss the issue with Kibo no To (Hope), another opposition party that supports phasing out nuclear energy, on Jan. 12.

Japanese coal criticised

January 13, 2018

EDITORIAL: Coal as a major power source represents huge step backward
http://www.asahi.com/ajw/articles/AJ201801130012.html
Japan is facing mounting international criticism over its coal-fired thermal power generation goals while the rest of the world is striving to reduce its carbon footprint.
Japanese utilities have a raft of plans to build new coal-fired power plants despite the fact that coal generates far larger amounts of carbon dioxide
when burned than other fuels for power generation. These projects could throw a monkey wrench into the policy campaign to stem global warming.

The government should rethink its policy decision to position coal as a “mainstay power source” to stop unbridled expansion of the use of coal in thermal power generation.

Since the catastrophic accident at the Fukushima No. 1 nuclear power plant in 2011, low-cost coal-burning thermal power generation has been greatly expanded in Japan to compensate for the loss of electricity generated with atomic energy.

Now, coal-fired power plants account for over 30 percent of all electricity produced in the nation. The expansion will likely continue with private-sector utilities planning to build 40 or so new coal-fired power stations in the coming years.

If all these plans are implemented, Japan’s overall coal-fired power generation capacity will increase by about 40 percent, causing its CO2 emissions to surge to levels far above the government’s estimates for years to come.

Japan’s coal expansion drive is criticized roundly by international environmental groups, a situation that is threatening to put the nation into international isolation along with the United States, where the Trump administration is promoting the use of coal as a fuel for power generation.

A major change in the world’s attitude toward coal came in 2015 with the Paris climate accord, which prompted many industrial nations in Europe to accelerate their efforts to reduce coal consumption. China, a leading power consumer, has also switched to curbing its consumption of coal.

In the world of business, there has been a growing trend toward pulling the plug on coal-related investments.

Even if it is unrealistic to try to slash Japan’s coal-fired power generation sharply right now, the government should at least realize that an energy policy that runs counter to the powerful global trend cannot be sustained over the long-term.

Swift actions should be taken to remake Japan’s energy policy through the review of the nation’s basic energy supply plan that is now being debated within the government.

First of all, the government should abandon its official position that coal is “a fuel for important baseload power sources.” This concept was introduced in the last revision to the basic energy plan in 2014.

It should also take steps toward steadily lowering the nation’s dependence on coal, as well as on nuclear power, through redoubled efforts to expand the use of renewable energy sources and reduce total energy consumption itself.

Among fuels for thermal power generation, natural gas, which produces less CO2 emissions, should be promoted as a mainstay power source.

The new basic energy plan needs to make these policy shifts clear.

Also important are efforts to cut CO2 emissions from thermal power plants.

The current regulations for thermal power plants based on the energy saving law and other related legislation only provide a weak system to slash CO2 emissions, mainly through requirements of certain levels of efficiency in power generation by utilities.

The system’s ability to lower the nation’s overall CO2 emissions is in doubt.

The power supply industry is making efforts to cut CO2 emissions, but only on a voluntary basis.

Many other countries have introduced a wide variety of more effective measures to cut greenhouse gas emissions, including a carbon tax, imposed on the burning of carbon-based fuels according to the amounts of CO2 emissions, emissions trading and regulatory restrictions on emissions by power suppliers.

Japan should also consider introducing such measures, and quickly.

Stricter regulations on CO2 emissions would make it difficult to operate coal-fired power plants profitably. We urge utilities planning to build new coal-fired power plants to reconsider their plans in response to the changing business environment.

--The Asahi Shimbun, Jan. 13

US-Japan pact on nuclear energy set to be renewed automatically

January 16, 2018

Japan, US decide against reviewing atomic energy accord to maintain status quo
https://mainichi.jp/english/articles/20180116/p2a/00m/0na/017000c#cxrecs_
The Japan-U.S. agreement on the peaceful use of atomic energy is set to be renewed without a review because both countries intend to maintain the status quo of their respective policies.

- 【Related】Unfinished nuclear fuel reprocessing plant faked safety records: NRA
- 【Related】Gov't set to continue nuclear fuel cycle project despite Monju closure
- 【Related】Editorial: Time to scrap nuclear fuel cycle, not just Monju reactor

It is set to be confirmed on Jan. 16 that the accord, which is officially known as the "Agreement for Cooperation Between the Government of the United States of America and the Government of Japan Concerning Peaceful Uses of Nuclear Energy," will be renewed in July.
Japan, which has pledged to the international community that it will not possess plutonium without specific purposes for using the material, cannot easily change its nuclear fuel cycle project, in which plutonium and the remaining uranium are extracted from spent nuclear fuel and reprocessed into mixed oxide (MOX) fuel for use in nuclear plants. The agreement explicitly allows Japan to promote the project.
The United States, which is cooperating with Japan in promoting exports of nuclear plants, has shown consideration to Tokyo's position.
The government of Prime Minister Shinzo Abe regards exports of atomic power stations as one of the pillars of its growth strategy. Since Japanese and U.S. companies, including Hitachi Ltd. and General Electric Co., are involved in exports of nuclear plants, the bilateral accord is indispensable for exports to other countries. This view is shared by the U.S. administration of President Donald Trump.
As the Japan-U.S. alliance is of growing significance in countering the threat posed by North Korea and other issues, neither Tokyo nor Washington prioritized a review of the agreement on the peaceful use of atomic energy.
U.S. Deputy Secretary of Energy Dan Brouillette said when he visited Japan in October 2017 that there is no reason for renegotiating the accord.
During a summit meeting in Tokyo the following month, Prime Minister Abe and President Trump apparently did not bring up the issue.
Speculation spread in Japan that calls for a review of the agreement could emerge after Prime Minister Abe appointed Taro Kono, who is critical of the nuclear fuel cycle project, as foreign minister as part of a Cabinet reshuffle in August 2017.
Since he became foreign minister, however, Kono has not intervened in nuclear energy policy, which is outside his jurisdiction.
Kono stopped short of mentioning a possible review of the accord when he appeared in a BS11 TV program aired on Jan. 11.
"The agreement forms the basis for Japan's peaceful use of atomic energy," Kono said, although he expressed concerns about the accord saying, "Japan needs and has a duty to create a situation in which we can explain with confidence how the country intends to use plutonium to the international community."

After the agreement is automatically extended on July 16, the accord can be scrapped in six months if either Japan or the United States notifies the other. Some officials within the U.S. Department of Defense and the State Department's Bureau of International Security and Nonproliferation are concerned about Japan's stockpiling of a massive amount of plutonium, which can be converted into nuclear weapons.
A source close to the Japanese Foreign Ministry is optimistic about the agreement. "Since there is mutual trust between Japan and the United States, Washington won't raise questions about the agreement for now," said the source.
Still, the possibility cannot be ruled out that the United States will call for a review of the accord.

Japan-US nuclear energy pact set to renew automatically in July 2018
https://mainichi.jp/english/articles/20180116/p2a/00m/0na/005000c
A nuclear energy cooperation agreement between Japan and the U.S. will renew automatically in July 2018, it is expected to be confirmed on Jan. 16.

- 【Related】Gov't set to continue nuclear fuel cycle project despite Monju closure

The existing accord, officially called the Agreement for Cooperation Between the Government of the United States of America and the Government of Japan Concerning Peaceful Uses of Nuclear Energy, recognizes Japan's extraction of plutonium from spent nuclear fuel and use of mixed oxide (MOX) fuel as part of its "nuclear fuel cycle." Renewing the pact will enable Japan to continue with its nuclear fuel cycle policy.
However, after the pact is renewed, if either Japan or the U.S. gives notice, then the agreement will be halted after six months -- which would mean that Japan's nuclear policy would be more easily affected by the will of the U.S.
The nuclear energy agreements that the U.S. has in place with other countries control the handling of nuclear materials and related equipment -- from the standpoint of non-proliferation -- whenever the U.S. provides nuclear technology to those other nations.
Under the existing agreement between Japan, a non-nuclear nation, and the U.S., nuclear fuel cycle operations such as the reprocessing of spent nuclear fuel and also uranium enrichment are recognized, in what is considered an exceptional case.
With the pact coming into effect in July 1988, the 30-year deadline of the current agreement will be reached on July 16, 2018. As long as neither Japan nor the U.S. give notice to withdraw six months prior to the deadline, the pact will be automatically renewed.
The Japanese government did try to negotiate with the U.S. about maintaining the agreement as it is. However, the administration under U.S. President Donald Trump has not been in a position to negotiate, and so the pact looks set to renew automatically, without any serious negotiations taking place.

Nukes: Are they worth it?

January 22, 2018

EDITORIAL: Backing Hitachi nuke project in Britain risks taxpayer money

http://www.asahi.com/ajw/articles/AJ201801220018.html

Using taxpayer money to help finance a company's project to build a new nuclear power plant overseas would **force the public to shoulder the huge risks of a questionable policy undertaking to rescue the embattled nuclear power industry.**

It is highly doubtful that massive public financing for such a project will receive broad support from the public.

The government is considering providing enormous loans to aid Hitachi Ltd.'s project to build and operate a new nuclear plant on the island of Anglesey off northwest Wales.

But the risks involved in the nuclear power business have surged globally since the 2011 Fukushima nuclear disaster, due mainly to sharp rises in construction costs caused by stricter safety standards.

Toshiba Corp.'s nuclear debacle in the United States, which has thrown the company into a financial crisis, is still fresh in our memories.

As Tokyo Electric Power Co.'s predicament has dramatically demonstrated, should a severe nuclear accident occur, the operator of the plant would face financial liabilities of a tremendous magnitude related to damages caused by the disaster.

If Hitachi's nuclear project fails, the government-affiliated financial institutions that provide financing for the project will incur heavy losses, which may eventually have to be covered with taxpayer money.

The government should rethink its headlong rush to help finance the project and make careful reassessments of the risks involved as well as the necessity of the measure from a policy perspective.

According to the plan, a British company that has been acquired by Hitachi will build two reactors with an eye to the beginning of operations in the mid-2020s.

The cost of the project, which is currently estimated at 3 trillion yen ($27.08 billion), will be covered with loans from Japanese and British lenders and investments from newly recruited business partners.

Hitachi will make the final decision on whether to build the reactors, possibly next year, after assessing the commercial viability of the project.

While major Japanese banks remain cautious about providing loans for the project, the public sector is notably keen to back it.

The government-affiliated Japan Bank for International Cooperation (JBIC) is ready to extend hundreds of billions of yen in loans for the project. In addition, the government is considering applying the trade insurance system to all the loans extended by Japanese commercial banks, which are expected to total in the hundreds of billions of yen.

This would mean the government will effectively guarantee all the private-sector loans. The government-affiliated Development Bank of Japan (DBJ) is also willing to chip in with funding.

The administration of Prime Minister Shinzo Abe is eager to support the project because it wants to salvage the floundering nuclear power industry.

The catastrophic accident at the Fukushima No. 1 nuclear power plant has seriously endangered the future of Japan's atomic energy industry by making it effectively impossible to build new reactors at home.

The Ministry of Economy, Trade and Industry, which regulates the power industry, makers of nuclear power generation equipment and major electric utilities are all pinning their hopes on overseas markets as they are facing the challenge of maintaining related technological and human resources under the current situation.

But it should not be forgotten that exporting nuclear power technology is a private-sector business. The risks involved should be borne by the private-sector companies that are engaged in the business.
If the government undertakes the risks, it needs to show the business is beneficial for society as a whole. Can the government make any argument that convinces many Japanese of the importance of supporting the Hitachi project?
The Abe administration and the business community have been working in tandem to promote exports of technology for nuclear power plants and other infrastructure.
As Hitachi Chairman Hiroaki Nakanishi is set to soon become the new chairman of Keidanren (Japan Business Federation), the nation's leading business lobby, the government's plan to support the company's nuclear project will be seen as a sign of mutual back-scratching between the public and private sectors if it lacks economic and policy rationality.
There are fundamental questions about Japan's efforts to sell its nuclear technologies overseas despite the devastating nuclear accident, in the first place.
The government and other organizations involved should rigorously re-examine the plan from a broad perspective and offer convincing and detailed explanations about its decision to the public.

Phasing out bill should be debated in Diet

February 24, 2018

EDITORIAL: Opposition CDP's zero nuclear bill merits earnest debate in Diet
http://www.asahi.com/ajw/articles/AJ201802240020.html
In what amounts to a direct challenge to the Abe administration, the main opposition Constitutional Democratic Party of Japan has drafted a bill to phase out nuclear power generation.
The proposal deserves serious consideration by the Diet and should serve as a platform to review the government's frayed energy policy.
The CDP plans to submit the bill to the Diet in March after rallying support from other opposition parties.
The central provision would require the government to pursue a policy goal of shutting down all nuclear reactors in Japan within five years after the legislation takes effect.
It proposes an ambitious goal for expanding the use of renewable energy sources, cast as the principal ingredient of the strategy, that far exceeds the target set by the government.
The CDP's bill is a full frontal challenge to the energy policy adopted by the Abe administration and the ruling camp, which views atomic energy as a vital core power source.
Since the 2011 Fukushima nuclear disaster, the Japanese public has shown profound distrust in the government's energy policy. Opinion polls have repeatedly shown a majority are opposed to restarting offline nuclear reactors.
While working on the bill, the CDP held meetings with citizens across Japan to hear their concerns about nuclear power.
The party's move has also been prompted by a powerful global energy trend: the decline of nuclear power and rapid rise of renewable energy.

While many of the elements of the bill make good sense, certain provisions concerning the time frame and process of pursuing the policy goal raise issues that need more careful consideration.
Terminating nuclear power generation within only five years would cause some “side effects.” Japan’s carbon dioxide emissions will remain at high levels, for instance, due to expanded use of thermal power generation by burning fossil fuels. Growth of renewable power generation could lead to increases in electricity charges.
The CDP’s bill doesn’t make clear how to tackle these problems, which need to be overcome to push forward without nuclear power.
The party needs to bolster the feasibility of its energy policy proposal by devising specific and convincing steps to deal with these challenges.
The Abe administration is currently working on a new “basic energy plan,” a legally mandated medium- to long-term energy policy blueprint.
The advisory council tasked with the work has indicated that the administration intends to maintain its basic energy policy stance, which stresses the importance of making active use of nuclear and coal-burning thermal power generation.
There has been no in-depth policy debate on key challenges facing the nuclear power policy, such as how to dispose of radioactive waste from nuclear power plants and the dismal outlook of the nuclear fuel recycling program. Government policymakers and advisers have also failed to consider seriously how much growth of renewable power generation we can realistically expect.
The Diet, which is composed of elected representatives of the people, has a responsibility to exert pressure on the reluctant government into responding to radical changes in the energy situation.
Even though it has an overwhelming majority in both houses of the Diet, the ruling coalition of the Liberal Democratic Party and Komeito should not be allowed to let the CDP’s energy bill wither on the vine.
The government’s decisions concerning which energy sources should be used in what way directly affect people’s lives and that of society.
The submission of the bill should trigger serious and constructive debate between the ruling and opposition camps to lay out a new vision for the nation’s energy future and a road map to realize it.

Time to rethink priorities

March 9, 2018
Editorial: 7 years after Fukushima meltdowns, time to review insistence on nuclear power
https://mainichi.jp/english/articles/20180309/p2a/00m/0na/013000c
Japan has no choice but to make fundamental changes to its energy policy. Weren't we all convinced of that when the crisis at the Fukushima nuclear power plant broke out seven years ago, and we were faced with the horrors and the massive impact of a nuclear disaster?

- 【Related】Civic group proposes bill for Japan to exit nuclear power
- 【Related】Nuclear power should be 'baseload power source': Hitachi president
- 【Related】Gov't reluctant to review energy plan as nuclear power policy could further hurt Cabinet
- 【Related】Editorial: Time to scrap nuclear fuel cycle, not just Monju reactor

And yet, time has passed with little change in policy or society. Rather, whether out of sheer **inertia or habit**, the past seven years have been spent on maintaining nuclear power plants.

Steps are being taken toward resuming the operation of nuclear reactors that had been halted, and though permitting the continued use of aging reactors had once been an exception, it is becoming more the rule. Japan also keeps holding out hope for the nuclear fuel cycle, which has repeatedly proven to be a failure. The process by which policy decisions are being made has not changed, which means there is no framework through which to turn the public's desire to break free from its dependence on nuclear power into reality. Although Japan's "Basic Energy Plan" maintains that the country will "lower dependence on nuclear power," it also regards nuclear power as "an important baseload electricity source." Moreover, some engaged in the ongoing discussions to review the plan have not only suggested the rebuilding of aging nuclear plants, but the construction of new and additional facilities.

While debate over energy policy in the very country that caused the 2011 nuclear disaster has stalled, energy policy around the world has seen great changes.

Last year, the global cumulative installed capacity of solar power amounted to a total of around 400 gigawatts, while that of wind-generated power reached approximately 540 gigawatts, which was an increase of 10 times and 2.5 times, respectively, since 2010. The installed capacities of such renewable energy surpass that of not only nuclear power, but also of coal-fired thermal power.

One reason for this change is that costs relating to renewable power have dropped. According to the International Energy Agency (IEA), since 2010, solar-power generation has dropped in cost by 70 percent, while wind-power generation has dropped by 25 percent. The IEA predicts that there will be a worldwide energy shift, in which coal will cease to be the major supplier of power, as it is overtaken by renewable energy sources.

In contrast to the growth seen in renewable energy, the proportion of the world's total power generation accounted for by nuclear energy has been falling since it peaked in the 1990s, and now stands at around 10 percent.

It is true that new nuclear power reactors are being built in countries such as China and India, but it would be ill-advised to take that fact alone as evidence that the world's nuclear power industry is growing. The aging of nuclear reactors is progressing in major industrialized nations. As a result of toughened safety measures in the wake of the Fukushima disaster, the cost of building nuclear reactors has ballooned, making the construction of new or additional nuclear facilities difficult even among major consumers of nuclear power such as France and the U.S. That's even truer in Japan.

Probably the most accurate take of the world's nuclear power market is that it is on the decline. Even China, which is marginally supporting the nuclear energy market, is increasingly being seen as a major force behind the expansion of renewable energy, more so than nuclear power. Japan, which is stubbornly trying to maintain nuclear power, is already falling behind global trends.

There is, however, a slight hint that change may be afoot within the Japanese government.

First, there has been a shift in the Ministry of Foreign Affairs. At a gathering for the International Renewable Energy Agency, Foreign Minister Taro Kono voiced his regret over the lack of a shift in Japan's energy policy toward renewable energy. A report released in February by an expert panel consulted by the foreign minister explicitly stated, "The notion that nuclear and coal-fired power are necessary as baseload electricity sources to secure a stable supply of power is a thing of the past," adding that expanding renewable energy and increasing energy efficiency were top priorities.

Objections are expected to arise from the prime minister's office and the Ministry of Economy, Trade and Industry (METI), which insist on keeping nuclear power a baseload power source. But we have come to a point where even METI cannot avoid addressing renewable energy, evidenced in a meeting of experts set

up at the end of last year to discuss the introduction of massive amounts of renewable energy and power grid reform.
Under current regulations, when renewable energy producers try to link to existing power transmission lines, they are often turned away for the reason that there are "no openings." This occurs because of a rule that power transmission lines must be kept open to the fullest to prepare for accidents, and out of consideration for electricity that will be transmitted by power plants whose operations are currently stopped or are in the planning stages.
Internationally, however, there is more flexibility in the use of transmission lines, allowing for more expansion of renewable energy. Japan may be lagging far behind the rest of the world, but we welcome the consideration that is finally being given to the renewable energy market in Japan, and urge the powers that be to make reforms for the efficient use of power transmission lines that suit actual flows of electricity.
Of course, there are many obstacles to such change. For example, realizing the large-volume injection of a variable power source like renewable energy will require making scrupulous adjustments to supply and demand using weather forecast technology. To adjust for varied supply, there will be a need to secure pumped-storage hydroelectricity and thermal power. The release of information and data possessed by major utilities is also crucial.
In the case that power transmission lines need to be increased or reinforced, renewable energy producers may be required to foot the massive costs, which raises concerns that potential newcomers will be discouraged from entering the renewable energy industry. Such roadblocks need to be reconsidered. The development of batteries that can store power when amounts exceeding demand are generated is another challenge. Efforts to bring renewable energy generation costs down to international levels are indispensable.
Assessing global trends, which power sources should we invest our limited resources in? The answer is crystal clear if we look squarely at reality.

Climate change: Where is the long-term vision?

March 10, 2018
Long-term climate plan needed
https://www.japantimes.co.jp/opinion/2018/03/10/editorials/long-term-climate-plan-needed/#.WqZInYhG1_8
Legislation promoting ways to adapt to climate change, recently submitted to the Diet, will require both national and local governments to work out plans to cope with and reduce damage from global warming, such as worsening floods due to extreme weather, intrusion of new diseases and decline in the quality of agriculture. Despite measures taken to fight climate change, further rises in global temperatures in coming decades appear unavoidable, the impact from which is already affecting our lives today. Adapting to climate change will require steady efforts based on a long-term strategy, so the efforts need to start today.
The Paris accord was adopted in 2015 by both developed and developing countries at a United Nations conference on climate change. Based on voluntary efforts by participants to cut their greenhouse gas emissions, the agreement aims to keep the rise in average global temperature from pre-industrial levels well below 2 degrees Celsius and pursue efforts to cut the increase even closer to 1.5 degrees. There is no guarantee, however, that the goal will be achieved. The United States, the world's second-largest emitter after China, has announced its departure from the Paris agreement under the administration of President

Donald Trump. The sum total of plans submitted by countries taking part in the accord is deemed insufficient to keep temperature rises below the levels feared to cause severe damage, such as more frequent natural disasters and destruction of ecosystems.
Global warming is progressing. The world's average temperature is already about 1 degree above pre-industrial levels. A special report of the United Nations Intergovernmental Panel on Climate Change warns that the average temperature may climb to 1.5 degrees above pre-industrial levels as early as the 2040s. The Meteorological Agency says Japan's average temperature has been rising by 1.2 degrees every century. One forecast says the temperature here will increase faster than the global average, increasing by as much as 5.4 degrees by the end of the 21st century compared with 100 years earlier.
Under the proposed legislation, local governments will be urged to develop plans to adapt to climate change — either alone or in cooperation with others — by taking their own conditions into account. The environment minister will assess the impact of global warming every five years, and the national government will review its adaptation plan, devised in 2015, on the basis of the assessment. The National Institute for Environmental Studies in Tsukuba, Ibaraki Prefecture, will serve as the center for analyzing the effects of global warming. The legislation also calls on the nation to push technological cooperation with developing countries on measures to adapt to climate change.
The legislation, once enacted, will make it easier for national and local governments to secure funding for measures to cope with global warming. It is also hoped that the legislation will facilitate inclusion of measures to mitigate the impact of climate change in the government's other programs and policies. A measure to build a higher seawall to guard against rises in sea levels due to global warming, for example, can be combined with anti-tsunami steps taken in coastal areas deemed at high risk of a major earthquake. Greater chances of flooding due to climate change may require a long-term effort to move communities and their public facilities, such as municipal offices, hospitals and schools, to higher and safer ground.
Japan is already experiencing various problems associated with climate change, such as more frequent and severe flooding caused by torrential rains, increases heatstroke cases, and lower crop yields due to higher temperatures. Assuming that the rises in temperature will continue, steps may need to be taken to develop new varieties of farm products that withstand warmer weather or encourage farmers to grow other types of crops. Agricultural experimental stations in each prefecture may not be fully equipped to develop such new varieties. The government should take the initiative for broad cooperation among national institutions, universities and the experimental stations.
Global warming may bring to Japan diseases now unknown in this country. Mosquitoes that spread dengue fever will likely become widespread. Changes in ecosystems are also likely to intensify. It will be important for both national and local governments to try to foresee what could happen and take steps to prepare for and mitigate the potential damage. While pushing measures to reduce the emission of greenhouse gases and contain climate change, Japan needs to work out a long-term strategy to live with the changes wrought by global warming.

Time to rethink Japan's energy policy

March 18, 2018

Time to rethink the nation's post-3/11 energy policy

https://www.japantimes.co.jp/opinion/2018/03/18/editorials/time-rethink-nations-post-3-11-energy-policy/#.Wq6jbH_A-os

The disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant seven years ago — in which three of its six reactors suffered core meltdowns after a giant tsunami crippled its emergency power supply and cooling system — swept away the safety myth of nuclear energy in this country. Nearly 50,000 people of Fukushima Prefecture are still displaced from their homes today and the return of residents to areas around the plant remains slow even after evacuation advisories were lifted following decontamination efforts. These facts testify to the lasting damage that a severe nuclear power plant accident can have on people's lives.

A vast majority of citizens remain wary of the safety of nuclear power — just as they were right after the disaster. According to a recent media opinion survey, more than 80 percent of respondents said they remain concerned with the risk of severe accident at a nuclear power plant. More than 60 percent called for phasing out nuclear energy in the future, while another 11 percent demanded the immediate scrapping of all nuclear power plants.

The government's current energy policy, including the use of nuclear energy, doesn't appear to reflect popular sentiment and the changing reality surrounding nuclear power. The Abe administration and the power industry have pushed for the reactivation of nuclear reactors idled in the wake of the Fukushima accident once they have cleared screening by the Nuclear Regulation Authority under safety regulations that were revamped to become what the administration has touted as the world's most stringent levels. The restart of the reactors, however, has remained slow. Since the new regulations were introduced in 2013, only six reactors at four plants run by Kyushu, Kansai and Shikoku Electric Power have been reactivated following the NRA's nod and the consent of host local governments. The operation of one of them — Reactor No. 3 at Shikoku Electric's Ikata plant in Ehime Prefecture — was ordered suspended in a court injunction issued in December in response to one of dozens of lawsuits filed across Japan seeking a halt to nuclear power plant operations. The share of nuclear power in the nation's electricity supply remained a mere 2 percent as of 2016 — compared with around 30 percent before the 2011 disaster. The feasibility of the government's energy mix target of nuclear energy accounting for 20-22 percent of the power supply in 2030 is in question.

The government's pledge in its 2014 basic energy plan to reduce the nation's dependency on nuclear energy as much as possible may have been a response to widespread popular sentiment against nuclear power. But in the seven years since 3/11, nuclear power has become less competitive vis as vis other power sources in many countries around the world due to rising construction costs and more stringent safety requirements. The economic advantages of nuclear power plants in Japan have also been challenged, particularly in view of the massive cost of dealing with the aftermath of the Fukushima plant accident. The government has extended various support measures to power companies that run nuclear reactors as they face an increasingly competitive environment with the liberalization of the electricity business.

The past seven years have also witnessed a significant decline in the cost of renewable energy sources such as wind and solar power, which have rapidly gained market share in power production around the world. Japan has lagged sharply behind this global trend, however. Foreign Minister Taro Kono, speaking at a gathering of the International Renewable Energy Agency in Abu Dhabi in January, called Japan's energy policy "lamentable" in that it is aiming for a 22-24 percent share of renewables in the electricity supply by 2030 even though such energy sources account for 24 percent of global power supply on average today.

The government's energy plan calls for maximum efforts to expand the use of renewable energy to reduce dependency on nuclear power. Following the introduction in 2012 of the feed-in tariff system, the share of renewables has indeed increased to account for around 15 percent of electricity generation. At the same time, some government policies raise questions about its commitment to boosting the use of renewable energy, such as its decision to allow major power companies the right to restrict the supply of solar and wind-generated electricity to their power transmission networks.

The world's energy landscape has significantly changed since the March 2011 Fukushima nuclear disaster. Seven years on, the government should revisit the lessons of the Tepco plant accident and reconsider whether it should continue to promote nuclear power despite the increased social and economic costs, or make a clear turn toward the greater use of renewable energy.

High time to reassess the economics of nukes

April 1, 2018

Reassess the economics of nuclear power

https://www.japantimes.co.jp/opinion/2018/04/01/editorials/reassess-economics-nuclear-power/#.WsNA-X8uCos

The recent decision by Shikoku Electric Power Co. to decommission the aging No. 2 reactor at its Ikata nuclear facility in Ehime Prefecture serves as yet another reminder that tightened safety regulations and market conditions in the aftermath of the 2011 Fukushima crisis are imposing a heavy financial burden on power companies that run nuclear power plants.

Whether or not they push for reactivating the reactors idled in the wake of the 2011 accident, both the government and the power industry are urged to reassess the economics of nuclear power to determine whether they are still worth the cost.

The Ikata reactor is the ninth at six nuclear power plants across Japan to be decommissioned after the 2011 disaster, not including the six at Tokyo Electric Power Co.'s Fukushima No. 1 plant, which was crippled by the meltdowns at three of its six reactors in March 2011 after the plant was flooded by giant tsunami in the Great East Japan Earthquake. All of the reactors were aging and nearing the 40-year limit on their operation, and the power companies were faced with the question of whether to decommission the reactors or apply to the Nuclear Regulation Authority for approval of a one-time extension of their operation for another 20 years — which would have entailed costly additional investments to bump up their safety under the post-Fukushima rules.

Shikoku Electric, which had already decided to scrap the No. 1 reactor at Ikata, reportedly determined that reactor 2, with a relatively small output capacity of 566,000 kilowatts, wouldn't be able to recoup the safety investments — estimated at nearly ¥200 billion — needed to get the NRA's approval if its operation were to be extended by 20 years. The power company had already spent roughly ¥190 billion on extra safety features on the plant's reactor 3 to clear the NRA screening under the revamped standards adopted in 2013. That unit, with a larger output capacity, was reactivated in August 2016 after the NRA granted approval, but its operation was ordered suspended in a Hiroshima High Court decision in December. Such a litigation risk is also believed to have weighed on the company's decision regarding the fate of reactor 2.

Most of the reactors that have been tagged for decommissioning have relatively small output capacity, which makes them unlikely, as in the case of the No. 2 unit at Ikata, to generate enough earnings to cover the cost of the safety investments. However, two of them — reactors 1 and 2 at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture — had a capacity of over 1 million kilowatt each. The extra safety investments that Kansai Electric has made to seek restarting its other reactors was estimated to have topped ¥800 billion, and additional spending to extend the operation of Oi units 1 and 2, with their unique structures requiring major work, could have expanded the entire cost beyond ¥1 trillion.

Major power companies that run nuclear power plants long monopolized the electricity markets in their respective regions. That changed with the liberalization of the electricity retail business that was completed in 2016, exposing them to tough competition. Added to that is the decline in electricity demand due to power-saving efforts and the declining population in rural markets. The extra cost of restarting the aging reactors come as an increasingly heavy burden on the power companies.

Meanwhile, 14 reactors at seven power plants have cleared the NRA's screening since 2013, and seven reactors at five plants have resumed operations. Two more — reactor 4 at the Oi plant and reactor 4 at Kyushu Electric Power's Genkai plant in Saga Prefecture — are expected to restart in May. However, the No. 6 and No. 7 units at Tepco's Kashiwazaki-Kariwa plant in Niigata Prefecture — the world's largest in terms of output capacity — cleared the NRA screening in December, but the prospect of their restart remains unknown due to opposition from the local governor.

Kyushu Electric will also have to decide whether to seek a restart of the No. 2 reactor at the Genkai plant — which in 2021 will have reached 40 years since its operation began and has a relatively small capacity. Tepco has not made a decision on what to do with the reactors at its Fukushima No. 2 plant — despite requests from Fukushima Prefecture to decommission the facility.

The government has a target of nuclear power accounting for 20 to 22 percent of the total electricity supply in 2030 — which is expected to require some 30 reactors in operation. The feasibility of meeting that target should be reviewed given the circumstances surrounding nuclear power plants.

Pushing renewables but remaining dependent on nukes

April 10, 2018

Japan pushes renewables, keeps nuclear in energy plan through 2050

https://mainichi.jp/english/articles/20180410/p2g/00m/0dm/063000c

TOKYO (Kyodo) -- Japan will accelerate the development of renewable energy and keep its current policy of lowering its dependence on nuclear power as it aims for a low-carbon society, a government panel report on the country's energy plan through 2050 showed Tuesday.

The long-term policy comes as Japan lags behind the global trend to invest in renewables, and nuclear power is no longer deemed a cheap energy source in the wake of the core reactor meltdowns at the Fukushima Daiichi plant in 2011, with utilities required to invest massively to meet tougher safety regulations.

"Japan will keep the policy of lowering its dependency on nuclear power generation as much as possible while seeking to expand economically independent and carbon-free renewable energy," the report by the eight-member panel said. The members include scholars and business executives.

The report did not set out numerical percentages of the country's future energy mix in 2050. An official at the Ministry of Economy, Trade and Industry said it is hard to predict a specific energy scenario as it depends on how technological developments in energy sources progress.
The most recent targets set out in 2015 seek to have renewable sources account for 22 to 24 percent and nuclear 20 to 22 percent of electric power generation in fiscal 2030.
Under the 2015 Paris climate accord, Japan aims for an 80 percent cut in greenhouse gas emissions by 2050 from 2013 levels.
The report acknowledged that while there have been global movements to phase out nuclear power following the Fukushima crisis, efforts have also been made to enhance the "safety, economic feasibility and mobility" of nuclear power generation.
Japan should first regain public trust in nuclear power following the Fukushima disaster, triggered by the March 2011 massive earthquake and tsunami, and strive to "strengthen personnel, technology and industry base" in pursuit of nuclear reactors with enhanced safety, the report stated.
"There have been concerns that our country's high-level nuclear technology and personnel will be lost following the Fukushima crisis. The panel members pointed out the need to maintain them to enhance safety of nuclear reactors," the ministry official said.
The official said the report puts an emphasis on the development of renewable energy out of a "sense of crisis," with the country currently slow to invest in such energies.
"Honestly speaking, Japan does not have competent companies in the field of renewable energy and we rely heavily on imports of renewable technology, such as solar panels. The panel is concerned Japan should recoup in the long-term," the official said.
Noting that output of solar and wind power generation tends to be influenced by the weather, the panel called for the development of batteries to store surplus renewable energy and converting it to hydrogen.
As for thermal power generation, the report said it will remain a major power source in 2050 but inefficient coal plants should be phased out with more focus on gas plants.
The report is set to be reflected in a separate government energy plan through 2030 that is due to be finalized this summer.

Japanese plant in Turkey?

March 15, 2018

Japan's nuclear export to Turkey in doubt as costs estimate doubles
http://www.asahi.com/ajw/articles/AJ201803150046.html
THE ASAHI SHIMBUN
The future of a Japanese-led nuclear power plant construction project in Turkey is in doubt after estimated costs more than doubled to over 4 trillion yen ($37.5 billion).
It will also be difficult to complete the plant, planned in the Sinop district on the Black Sea coast, by the target year of 2023, according to sources close to the project.
Plans call for the construction of four new-type reactors co-developed by Mitsubishi Heavy Industries Ltd. (MHI) and a French partner. Trading house Itochu Corp. and other Japanese companies also plan to get involved.

The Japanese side unofficially informed its Turkish counterpart of the bloated cost this year, and the Turkish side expressed its “disappointment,” the sources said.
Initially, the total project cost was estimated to be around 2.1 trillion yen ($19.7 billion). However, it became clear during the course of a feasibility study that the four reactors would cost more than 1 trillion yen each.
The project partners were expected to shoulder the construction expenses and recoup the cost of their investment through revenue from power generation.
But if construction costs increase and the operator cannot charge more for electricity, it would be difficult for the project to turn a profit.
Still, the Japanese government intends to proceed with the project, and the Japanese side will soon submit its final feasibility report to the Turkish government.
The Japanese side will report that if the plan goes ahead, the construction will require financial support from the Turkish government and that electricity charges will be increased from initial estimates.
It remains unclear whether the Turkish side will accept those conditions, the sources said.
The project has strong backing from the Abe administration, which is pushing exports of Japanese nuclear technology as part of its growth strategy.
However, tougher safety standards introduced after the triple meltdown at the Fukushima No.1 nuclear power plant in 2011 have made it difficult for Japanese companies to make money in the global nuclear power industry.

Time to switch to green

April 13, 2018

Editorial: Japan must make concerted push to switch to green energy economy
https://mainichi.jp/english/articles/20180413/p2a/00m/0na/017000c
An expert committee at the Ministry of Economy, Trade and Industry recently finalized long-term energy plan recommendations through the year 2050. Solar, wind and other renewables were given pride of place as "main power sources," and we commend the committee for its proactive attitude to expanding green energy, a sector in which Japan lags behind countries in Europe and elsewhere.

- 【Related】Japan pushes renewables, keeps nuclear in energy plan through 2050

However, there are many obstacles that must be overcome to realize this renewable energy future. To make sure this goal does not end up a mere flight of fancy, we call on the government to develop tactics that will get Japan steadily to its green energy goals.
The long-term energy plan recommendations were drawn up with the Paris Agreement limiting global warming in mind, and form the compass needle by which Japan's energy policy is plotted. Indeed, the government is looking to finalize Japan's revised basic energy plan as early as this summer, and it will reflect the committee's ideas.
The ultimate goal is for Japan to free itself entirely from carbon-based energy. That means ending dependence on fossil fuels -- oil, coal, and natural gas. Expansion of renewable energy plays the leading role in accomplishing this.

However, there are difficulties with renewables, including instability due to changes in the weather, high costs, and patching green energy generation sources into the electricity distribution network. That is likely why the committee recommendations set the target ratio of Japan's energy mix made up of renewables at 22 to 24 percent in 2030 -- the same as it is under the current basic energy plan.
For the sake of the long-term strategy and overcoming the aforementioned obstacles, the recommendations call for a plan to concentrate efforts on developing essential technologies such as storage batteries, hydrogen fuel systems, and smart electricity distribution systems. This idea is based on the belief that Japan cannot catch up with European countries and China if it uses existing technologies, and that it is necessary to put more efforts into developing next-generation technologies.
Creating new technology always takes time and money. Thus, the government must lay out a truly concrete path to get the work done. To cultivate renewables as the "main energy source," we call on Japan to leverage knowhow from the private and public sectors to make the best of existing high-efficiency electricity distribution technologies and the like, and to secure power sources that can compensate for the instability inherent in green energy generation.
One aspect of the recommendations is the positioning of nuclear power. The long-term energy strategy calls for atomic energy to be "reduced as much as possible," but also retains it as one option to help Japan free itself of fossil fuels. It would be difficult for the government to earn the public's understanding for retaining nuclear power by dressing it up as a just policy to wean the country off carbon.
Japan must end its dependency on nuclear power as quickly as possible. Making renewables this country's main energy source is a must for that to happen.

Niigata governor quitting will affect nuclear future

April 18, 2018

Niigata governor to quit
https://www3.nhk.or.jp/nhkworld/en/news/20180418_35/
Niigata Governor Ryuichi Yoneyama has announced he's stepping down over an alleged sex scandal. His sudden departure throws into question the future of a nuclear power plant in the central Japan prefecture. Yoneyama has been cautious about the plant operator's efforts to restart the facility.

Yoneyama held a news conference on Wednesday, the day before a weekly magazine was expected to run a story about the scandal.

Yoneyama revealed that he had tendered his resignation earlier in the day to the chairperson of the prefectural assembly.

He said he decided to resign to avoid further turmoil and take responsibility for his actions. He added that he wanted to offer his sincere apology for undermining the trust of many people.

Yoneyama was elected governor in October 2016, with the recommendation of the Japanese Communist

Party, the Liberal Party, and the Social Democratic Party.

He has been cautious about the restart of the Kashiwazaki-Kariwa nuclear power station in the prefecture.

It is run by Tokyo Electric Power Company, the operator of the Fukushima Daiichi nuclear plant, which was crippled by the March 2011 earthquake and tsunami.
The utility has been seeking local consent to restart the Kashiwazaki-Kariwa plant.

Governor quits over sex scandal, affects nuclear reactor restart
https://mainichi.jp/english/articles/20180418/p2g/00m/0fp/074000c
April 18, 2018 (Mainichi Japan)
NIIGATA (Kyodo) -- Niigata Gov. Ryuichi Yoneyama said Wednesday he will resign after admitting to a sex scandal in a move affecting the approval process for the restart of Tokyo Electric Power Company Holdings Inc.'s nuclear reactors in the central Japan prefecture.

- 【Related】Niigata governor to decide in few days if he'll resign over alleged affair
- 【Related】TEPCO's Niigata nuclear plant set to clear screening to restart reactors

"I sincerely offer apologies for betraying the trust of many people," Yoneyama told a press conference, admitting that his relationship with a woman, as described in a weekly magazine due out Thursday, may "look to some as prostitution."
Shukan Bunshun magazine alleged in an online teaser article Wednesday that the 50-year-old governor has been paying money to have sex with a 22-year-old college student. At a news conference Wednesday, the governor said he gave a woman he met online "presents and money so she would like me more."
Since being elected governor in 2016, Yoneyama has refrained from approving the restart of the No. 6 and 7 reactors at the Kashiwazaki-Kariwa nuclear complex.
The governor has said he cannot make the decision until the prefectural government completes its own assessment of what caused the Fukushima Daiichi nuclear disaster in 2011.
All seven Kashiwazaki-Kariwa units are boiling water reactors, the same as those at the Fukushima Daiichi nuclear plant where three of six reactors melted down in the days after a massive earthquake and tsunami in March 2011. Last December, two reactors at the Kashiwazaki-Kariwa complex cleared safety reviews under the stricter, post-Fukushima regulations.
On Tuesday, Yoneyama said he would consider whether to quit over a forthcoming magazine article about a "woman issue." Calls for his resignation were growing in the Niigata prefectural assembly.
The gubernatorial election to pick Yoneyama's successor is expected to be held in early June. Yoneyama will resign with two and a half years of his term remaining.
The seven-reactor Kashiwazaki-Kariwa complex is one of the world's largest nuclear power plants with a combined output capacity of 8.2 million kilowatts.
Facing huge compensation payments and other costs stemming from the Fukushima disaster, Tepco is keen to resume operation of its reactors to improve its financial performance.
The Japanese government of Prime Minister Shinzo Abe also supports restarting nuclear reactors that have cleared post-Fukushima safety reviews.
Yoneyama won the Niigata governorship in October 2016 with the support of the Japanese Communist Party and the Social Democratic Party, which are both opposed to nuclear power. He defeated contenders including a candidate backed by Abe's Liberal Democratic Party and its junior coalition partner Komeito.

Itochu withdraws from Turkey nuke project over costs

April 25, 2018

Japan's Itochu withdraws from nuclear power plant project in Turkey
https://www.japantimes.co.jp/news/2018/04/25/business/corporate-business/japans-itochu-withdraws-nuclear-power-plant-project-turkey/#.WuBr4n8uCos
Kyodo
Major trading house Itochu Corp. is backing away from a nuclear power plant project in Turkey because of a surge in safety-related costs, sources close to the matter said Tuesday.
Itochu withdrew at the end of March from a consortium that had been conducting a feasibility study for a 4,500-megawatt plant in the Black Sea coast city of Sinop. Another Japanese company, Mitsubishi Heavy Industries Ltd., will continue participating in the study.
It is now deemed difficult for the plant to become operational in 2023 as targeted, amid surging costs linked to safety measures and with total costs for the project ballooning to more than double the initially estimated ¥2 trillion (about $18.5 billion).
Safety-related costs to build nuclear plants have soared since the 2011 nuclear disaster at the Fukushima No. 1 plant, triggered by a magnitude 9 earthquake and ensuing tsunami.
Japan and Turkey agreed on the project in 2013, with the government of Prime Minister Shinzo Abe eager to export nuclear technology to emerging economies such as Turkey and India as part of the government's growth strategy.

Radical changes needed for Japan's energy strategy

April 21, 2018

EDITORIAL: Radically new thinking needed for Japan's energy strategy
http://www.asahi.com/ajw/articles/AJ201804210024.html
An expert panel reviewing the nation's energy strategy for the period to 2050 has proposed a number of initiatives to meet challenges stemming from radical changes in the global energy landscape.
The strategy is centered on ways to reduce the nation's carbon footprint to combat global warming.
The industry ministry panel sensibly argues that renewable energy sources like solar and wind power should become the "mainstay" of energy production.
Regrettably, however, its proposal remains wedded to the nation's energy policy legacy. It is based, for instance, on the assumption that nuclear power generation will continue. As a result, the strategy fails to serve as a convincing vision for the nation's energy future.
The ideas will be incorporated into the revised Basic Energy Plan that the government intends to revise this summer. They will also constitute core components of the long-term plan to reduce Japan's greenhouse gas emissions.
The Diet, along with related the ministries and agencies, should try to chart a path to a better future for the nation's energy supply through debate based on a broader perspective.
In developing its proposal, the panel took stock of the policy implications of the Paris climate agreement.

To achieve the government's official target of an 80-percent reduction in Japan's greenhouse gas emissions by 2050, it is vital to promote a shift to carbon-free energy sources.
The panel calls for "exploring all options" in this regard.
What is especially notable about the panel's proposal is the statement that renewable energy sources should become "main power sources that are economically viable."
Given that Japan has fallen behind the global trend of rapid expansion of renewable energy, the new energy strategy should be designed to move up the government's clean energy agenda.
Promoting green energy, however, requires dealing with a broad array of tough challenges, such as lowering costs that are higher than in many other countries, enhancing the power grid and developing more efficient storage batteries. The government needs to act swiftly to devise a specific plan to accelerate the use of renewable energy sources.
The panel contends that atomic energy is an option for building a low-carbon society on grounds that nuclear power generation doesn't emit carbon dioxide.
But it offers no viable solutions to the raft of problems plaguing nuclear power, such as the erosion of public trust in this energy source in the aftermath of the 2011 Fukushima nuclear disaster, difficulties over the disposal of radioactive waste and the problem-plagued nuclear fuel recycling program.
Any attempt to keep the nation dependent on atomic energy without offering solutions to these problems will never gain broad public support.
A growing number of countries have been adopting powerful policy measures to curb CO2 emissions, such as a carbon tax, which is a fee imposed on the use of carbon-based fuels according to the amounts of the CO2 emissions, and emissions trading initiatives.
But the panel's proposal doesn't refer to any such steps, making the strategy a less-than-satisfactory policy response to harmful climate change.
To be sure, there are so many unpredictable variables that make it difficult to map out a plausible energy policy vision for three decades down the road, ranging from future technological innovations, the long-term economic viability of various energy sources and the political situation in countries supplying energy sources.
It is, therefore, important for the government to be ready to make flexible policy reviews in response to changes in relevant variables.
The Ministry of Economy, Trade and Industry says it will consider creating a new organization in which experts would analyze situations concerning energy supply and related technological trends to provide materials helpful for policy decisions.
The new body should be based on a system to ensure that members can offer a wide range of ideas and information from viewpoints unfettered by influence from the forces promoting the current policy so that timely and reasonable policy proposals can be made.
The development of the energy policy has been led by the ministry, the industries it regulates and a small number of experts linked to them.
This traditional approach to policy development should be changed to enable the government to make effective policy responses to drastic changes occurring in the sector, which is in a transitional period.

London steps in to cover (Hitachi's) losses

May 9, 2018

London offers to backstop all debt for Hitachi's UK nuke plant project
https://mainichi.jp/english/articles/20180509/p2a/00m/0na/023000c
TOKYO -- The British government has proposed to Hitachi Ltd. that London backstop all loans to cover a new nuclear power plant in the country to be built and operated by a subsidiary of the Japanese firm.

- 【Related】Hitachi requests British PM's support for nuclear plant construction
- 【Related】Japanese gov't to guarantee bank loans for Hitachi's nuclear plant project in Britain

The Japanese government had been planning to guarantee the loans. However, London has signaled its willingness to up its financial commitment to the project with the debt guarantee, after Hitachi had called for increased support. With the move, Hitachi is expected to approve continued investment in the plant within the month.
On May 3, Hitachi Chairman Hiroaki Nakanishi met with British Prime Minister Theresa May in London to discuss UK government backing for the plant. It appears British officials indicated they would provide backing for the project including loan guarantees, and urged Hitachi to move ahead.
Hitachi, which bought the UK nuclear station development operation in 2012, plans to have the plant up and running in the mid-2020s. According to a source close to the project, it is expected to cost about 3 trillion yen (about 20.2 billion pounds, or $27.4 billion). The financing structure being considered would see 2 trillion yen of that covered by loans from British and Japanese financial institutions, with the remaining 1 trillion yen invested by Hitachi and both national governments.
Japan's three megabanks plus the government-backed Japan Bank for International Cooperation are set to provide loans for the project. Initially, the financing from the big banks was set to be guaranteed by the wholly Japanese government-owned Nippon Export and Investment Insurance body. However, in late April the British government apparently suggested to Hitachi that the UK was willing to cover loans for the plant issued by both Japanese and British financial firms. Just before this, Hitachi had told London that it may pull out of the project if Britain was not ready to up its support.
Under the loan guarantee, any nuclear plant project investment losses due to accidents or other causes may ultimately have to be covered by Britain's public purse. While the move does not directly lessen Hitachi's own risk as compared to the Japanese government guaranteeing the debt, London stepping in to cover losses should the project fail provides more assurance of continuing British support.

Japan's latest energy plan

May 16, 2018

Japanese government releases latest energy plan
https://www3.nhk.or.jp/nhkworld/en/news/20180516_34/

Japanese government officials have released the country's medium-to-long term energy policy. The plan focuses on making better use of solar power and other renewables to help fight climate change.

The policy is reviewed every 3 years. The new plan outlines targets toward 2050 in line with the Paris accord. It aims to reduce Japan's generating costs for renewable energy to international levels. The goal is to make renewables the country's main source of power.

The continued development of nuclear technology is still included as one way toward a carbon-neutral society.

But the plan does not include new construction of nuclear plants, calling for reducing reliance on nuclear energy as much as possible.

The total energy-mix target is unchanged from the previous plan. It puts renewables at 22 to 24 percent and nuclear power at 20 to 22 percent. It also puts thermal generation at about 56 percent.

Some panel members have urged a review of the energy-mix ratio. Experts say Japan may be lagging behind the global trend in promoting renewable resources.

Industry ministry officials say they will seek opinions on the plan, and aim for Cabinet approval as early as July.

Energy future: Govt's approach "outdated"

May 18, 2018

EDITORIAL: METI's new energy agenda is still powered by old thinking

http://www.asahi.com/ajw/articles/AJ201805180028.html

The government's new energy policy agenda is wedded to an old, outdated approach, turning its back on growing domestic and overseas movements toward new policy goals.

It clearly suggests that the government is failing to see the big picture.

The Ministry of Economy, Trade and Industry (METI) on May 16 unveiled a draft of the government's fifth basic energy plan intended for Cabinet approval this summer.

The draft says the government should maintain its traditional energy policy principles, making it clear that the new plan will be similar in many ways to the current one.

As in the past basic energy plans, nuclear and coal-based thermal power stations are described as "important base load power sources" despite the tough business situations for them.

In the world, radical structural changes are beginning to occur in energy supply and consumption. One important and growing trend is "decarbonization" of the energy mix, which means replacing fossil fuels with renewable energy sources such as solar and wind power.
Another is dispersed power generation, or widespread use of small-scale power-generation facilities combined with storage batteries and other necessary equipment for more efficient production and consumption of electricity. These trends will have far-reaching effects on society.
The draft energy plan raises some serious questions and concerns about the government's vision for the energy future of the nation. If it adheres to the traditional energy policy, can the government make effective responses to the powerful, transformative changes occurring in the energy sector? Will this stance not cause Japan to fall behind key energy policy trends in the world?
We cannot support the proposed new basic energy plan.

UNREALISTIC POWER SOURCE GOALS

The basic energy plan is supposed to define a medium- to long-term direction for the government's energy policy and is reviewed periodically by the government.
Since 2014, when the current basic plan was endorsed by the Cabinet, myriads of significant changes concerning energy have taken place both at home and abroad.
Renewable energy has been spreading at an accelerating pace in both industrial and emerging countries due to a spurt of technological innovations and declining costs.
The Paris climate accord to stem global warming has been negotiated and put into effect, creating strong headwinds for coal-burning thermal power generation, which emits large amounts of greenhouse gasses.
The costs of nuclear power generation have risen sharply mainly because of tighter safety standards introduced in many countries following the 2011 Fukushima nuclear disaster. As a result, production of electricity using atomic energy has been on the wane, especially in industrial nations.
Businesses have responded quickly to the changes. Business investment and technology development efforts in the sector have been focused mostly on such areas as renewable energy development, control on power transmission and consumption and power storage, creating huge new markets. Japan has been lagging behind these new trends.
But METI is refusing to face up to the changing reality.
Hiroshige Seko, the minister of economy, trade and industry, said, "We don't think there has been any major technological change, and it is too early to alter the (energy policy) framework." He could not be more grossly mistaken.
The biggest mistake METI has made is its decision to remain committed to the policy targets for the energy mix it set in 2015 under the current basic plan. The document says the government should step up its efforts to achieve the targets.
The targets are based on the assumption that nuclear power generation and renewable energy will account for around 20 percent each of Japan's overall power production in fiscal 2030. Under the plan, about 30 nuclear reactors will be running then, far more than the number of offline reactors that have been restarted so far, eight.
Accomplishing the nuclear power targets will require extending the life of many aging reactors and building many new ones. Experts have criticized the targets as "unrealistic."
Meanwhile, use of renewable energy sources has been growing steadily, provoking calls for raising the share target among lawmakers in both the ruling and opposition camps.

The vision for the nation's energy future laid out in the draft new energy plan is badly out of synch with the major trends at home and abroad. It cannot serve as an effective road map for policy efforts in this era of great transition.
METI should first reconsider the energy source targets themselves. It needs to sharply lower the share of nuclear power generation while substantially raising that of clean energy.

NUCLEAR POLICY SHENANIGANS KEPT INTACT

There are also many problems with specific policy proposals.
As for atomic energy, the key issue, the draft contains two key principles--promoting reactor restarts to maintain nuclear power generation as the core power source and "lowering the nation's dependence (on nuclear power) as much as possible."
In reality, however, Prime Minister Shinzo Abe's administration has been pressing ahead with plans to bring offline reactors back on stream. The proposed new policy would allow the administration to continue pushing the nation gradually back to heavy dependence on nuclear power and making stopgap responses concerning the sticky issue of disposal of radioactive waste and the troubled nuclear fuel recycling program.
The Abe administration should confront the harsh realities concerning nuclear power generation, including the fact that a majority of the people are opposed to reactor restarts.
It should totally abandon its efforts to keep the nation dependent on atomic energy while pulling the wool over the people's eyes.
If its new energy policy calls for lowering the nation's dependence on nuclear power, the government is responsible to swiftly work out specific plans to achieve the goal.
METI has proposed to turn clean energy into a "mainstay power source" with good reason. As specific measures to do so, however, the document only refers to ideas that have already been discussed.
The ministry needs to plan an effective "next move" to deal with obstacles to promoting renewable energy, including higher costs than in many other countries.
The past basic energy plans were all focused on "stable supply" and designed to preserve the continuity of the policy traditions.
But this stance has led to such serious evils as denials of obvious failures and absurdities, including the nuclear fuel recycling debacle, and rigidities like adamant refusal to change course.
With regard to the development of the new plan, METI decided to maintain the policy "framework" intact at an early stage, limiting the scope of debate.
The ministry has remained skeptical about the viability of renewable power generation, which is in the process of evolution, while assigning a major role to both nuclear power and coal thermal generation despite the raft of problems plaguing them. This stance seems to be a sign of inertia and inability to make gutsy decisions of the organization.

LAY OUT GRAND VISION FOR NEW AGE OF ENERGY

It is no doubt difficult to foresee the future. That makes multifaceted and transparency policy debate all the more important.
The Foreign Ministry has reportedly lobbied METI to sharply raise the target share for alternative energy sources in unofficial negotiations.
The Environment Ministry is critical of METI's proposal to make expansive use of coal.
Clearly, exhaustive, cross-ministry debate on the nation's energy future is in order.

Politicians also have a crucial role to play. Legally, the Diet has no power to reject the government's basic energy plan. The legislature is only briefed on the plan after the government decides on it.
But the Diet needs to get more actively involved in the process. It should take such steps as seeking opinions from experts and holding intensive discussions on related issues.
The government has a duty to present a viable future vision for the nation's energy supply system, which is part of vital infrastructure for social activities and people's lives, and chart a course toward that vision. Then it needs to thrash out concrete policy measures to realize the vision.
Unless it sends out convincing messages about a sustainable energy future for the nation, the government cannot open up a new age of energy.
--The Asahi Shimbun, May 18

May 16, 2018

Japan Announces Ambitious Plans For 20%-22% Nuclear Share By 2030
https://www.nucnet.org/all-the-news/2018/05/16/japan-announces-ambitious-plans-for-20-22-nuclear-share-by-2030
Policies & Politics
16 May (NucNet): Japan's government is committed to nuclear power accounting for at least one-fifth of the nation's electricity supply in fiscal year 2030, calling it an "important baseload energy source", according to a draft proposal.
For the first time, the government will specify the 20%-22% ratio in its basic energy plan. The draft was due to be presented today to an advisory panel with the Ministry of Economy, Trade and Industry, which oversees the nuclear industry.

The draft says the government will "further intensify efforts to achieve the target" and continue to push for nuclear fuel cycle policy in tandem with the export of nuclear technology.

The basic energy plan sets the government's mid- and long-term energy policy and is reviewed roughly every three years.

The government expects to gain Cabinet approval for the plan, the fifth of a series, this summer. The last one, approved by the Cabinet in 2014 and the first after the 2011 Fukushima-Daiichi accident, did not mention the breakdown of each energy source, although it described nuclear power as an "important baseload energy source."

The Japan Atomic Industrial Forum said about 30 reactors must be brought back online to meet the 20%-22% target.

The goal is achievable, according to the government, if existing reactors are allowed to operate for 60 years, beyond the 40-year lifespan in place under stringent regulations implemented after Fukushima-Daiichi.

Japan shut down all 42 commercial nuclear reactors after the accident. According to the International Atomic Energy Agency, the country's nuclear share in 2017 was about 3.6%. Before Fukushima, Japan generated about 30% of its electricity from nuclear and planned to increase that to 40%.

Last week the Ohi-4 nuclear reactor unit in Fukui Prefecture was connected to the grid as it approaches commercial operation. Ohi-4 will become the eighth nuclear plant at five sites to be restarted under new regulatory standards introduced following Fukushima-Daiichi.

Completing Shimane No.3 reactor

May 22, 2018

Power plant operator seeks consent for new reactor
https://www3.nhk.or.jp/nhkworld/en/news/20180522_21/
Chugoku Electric Power is seeking the consent of local governments to start the screening process to switch on a new nuclear reactor in western Japan.

The power company's No. 3 reactor at the Shimane Nuclear Power Plant was almost completed before the accident at the Fukushima Daiichi nuclear power plant in 2011. It's in the city of Matsue in Shimane Prefecture.

Under new regulations introduced after the Fukushima accident, the facility must pass a stringent screening process. Local governments must give their consent for the process to go ahead.

Chugoku Electric President Mareshige Shimizu visited the city and the prefectural offices on Tuesday.

Shimizu told Governor Zembee Mizoguchi that the reactor is essential for establishing a stable supply of power, reducing carbon dioxide emissions and stabilizing electricity rates.

The president handed the governor a consent request.

Mizoguchi replied that he will give the prefecture's response after consulting a safety committee whose members include local residents, as well as the prefectural assembly and neighboring municipalities.

This is the second time an operator has begun to start procedures to operate a new reactor since the Fukushima accident.

Meiji University professor Tadahiro Katsuta, who specializes in nuclear power policy, says he believes technological advances have made reactors safer.

But he says other aspects should be considered, including the social circumstances, such as the demand for power and the effectiveness of evacuation plans.

He said residents should be allowed to express their views and time should be given for discussion.

Nukes as clean energy?

23.05.2018_No101 / News in Brief
World Needs To Get Serious About Nuclear Energy, Says US DOE Official
https://www.nucnet.org/all-the-news/2018/05/23/world-needs-to-get-serious-about-nuclear-energy-says-us-doe-official

23 May (NucNet): If the world is serious about reducing emissions and improving economies, governments must consider all options when it comes to carbon-free power, including clean, reliable nuclear energy, Dan Brouillette, deputy secretary of the US Department of Energy, said.

Mr Brouilette said the Ninth Clean Energy Ministerial in Copenhagen, Denmark, which pens today, brings together the world's top energy officials to discuss of policies and programmes that will promote the transition to a global clean energy economy.

But frequently the definition of "clean energy"does not include nuclear energy—the world's second largest source of low-carbon electricity, following only behind hydropower.

Mr Brouilette said the US, Canada, and Japan are launching the Nuclear Innovation: Clean Energy (Nice) Future initiative, whose aim is to make sure nuclear has a seat at the table during discussions about innovation and advanced clean energy systems of the future.

Innovative nuclear systems will play a critical role in worldwide decarbonisation, including use in many energy intensive applications such as desalination, industrial process heat, integrated nuclear-renewable systems, flexible electricity grids, hydrogen production and energy storage.

Mr Brouillette said the Nice Future initiative is gaining momentum. More than a dozen countries have already expressed interest in joining. **The initiative engages various organisations and stakeholders to focus on full-scale nuclear for baseload electricity** as well as innovative, next-generation technologies and integrated renewable-nuclear energy systems across four key areas.

Nukes become issue again in governor race

May 24, 2018
Nuclear policy in focus as campaigning begins in Niigata governor race
https://mainichi.jp/english/articles/20180524/p2g/00m/0dm/077000c

NIIGATA, Japan (Kyodo) -- Official campaigning began Thursday for next month's gubernatorial election in Niigata, with three contenders filing their candidacies for a race that could have a bearing on the possible restart of the world's largest nuclear power plant.
Voters in the central Japan prefecture could also effectively hand down a judgment on Prime Minister Shinzo Abe following the recent series of scandals involving his administration including allegations of cronyism against the prime minister over a heavily discounted land sale and a vet school project.
The three candidates running for the June 10 election are Satoshi Annaka, a 40-year-old independent and former city assembly member from Gosen, Niigata; Hideyo Hanazumi, 60, backed by Abe's Liberal Democratic Party; and anti-nuclear former prefectural assembly member Chikako Ikeda, 57, endorsed by five opposition parties.
The LDP's junior coalition partner Komeito is expected to support Hanazumi, who has yet to clearly state whether he would approve the restart of the Kashiwazaki-Kariwa nuclear plant, sought by Tokyo Electric Power Company Holdings Inc.
Delivering a speech in the city of Niigata, Ikeda pledged to seek ways to "break with nuclear power" and promote the use of renewable energy. She also said she will continue safety checks of the nuclear plant and share the results with the public for a thorough discussion.
Hanazumi told an audience in the village of Awashimaura that he will improve medical and welfare services. "I will do all I can do to create a lively and comfortable prefecture to live in."
Annaka is opposed to nuclear power and has vowed to enhance agricultural policies.
The election comes after former Governor Ryuichi Yoneyama, who was reluctant to restart the nuclear complex, stepped down last month just before a weekly magazine disclosed that he had been paying several women for sex.

Hitachi still negotiating with UK (Wylfa nuclear power station)

29.05.2018_No105 / News in Brief
https://www.nucnet.org/all-the-news/2018/05/29/hitachi-agrees-to-continue-negotiations-with-uk-over-new-nuclear-at-wylfa
Hitachi Agrees To Continue Negotiations With UK Over New Nuclear At Wylfa
Plans & Construction
29 May (NucNet): Hitachi has agreed to continue negotiations with the UK on a planned £20bn nuclear power station in Wales after the government in London expanded financial support to ease the Japanese group's concerns about the project's price tag.
The Tokyo-based conglomerate's board voted on 28 May 2018 to move ahead with talks.

The vote means the board has accepted the principle of a tripartite investment structure under which Hitachi, the UK government and state-backed Japanese entities would become equal investment partners

According to reports in Japan and the UK, the UK is proposing an equal equity split of about £6.5bn among Hitachi, the UK public-private consortium and a group of government-backed Japanese entities.

Negotiations are said to be continuing on the make-up of the consortiums and other financial details.

The Financial Times reported that another key factor is the strike price – the guaranteed level at which the

plant sells electricity – which is still under discussion.

The newspaper said the UK government is expected to back a price about £15 a megawatt hour lower than the £92.50/MWh negotiated for the Hinkley Point C nuclear plant that is under development in the UK by EDF.

Nucler developer Horizon is planning to build and operate two Hitachi UK Advanced-Boiling Water Reactor (ABWR) units at Wylfa Newydd on the island of Anglesey in north Wales. The company submitted its site application in April 2017.

Last year British media reported that South Korea's state-owned Korea Hydro and Nuclear Power (KHNP) was in early talks to buy a stake in the project. The reports said KHNP, a subsidiary of Korea Electric Power Corporation, could invest in Horizon as a minority shareholder along with the governments of Japan and the UK.

Toshiba withdraws from Texas project for economic reasons

Toshiba Confirms Withdrawal From South Texas Project New-Build
https://www.nucnet.org/all-the-news/2018/06/01/toshiba-confirms-withdrawal-from-south-texas-project-new-build
Plans & Construction
1 Jun (NucNet): Japan's Toshiba Corporation is to withdraw from the project to build two of its advanced boiling water reactors (ABWRs) at the existing South Texas Project nuclear site in the US.
Toshiba America Nuclear Energy Corporation, the Japanese company's wholly owned US subsidiary, reached an agreement in March 2008 to build the third and fourth reactors for utility NRG Energy's South Texas Project.

But Toshiba said in a statement on 31 May 2018 that the project, which has failed to find investors, is **no longer financially viable**. Toshiba said its board had decided that Toshiba America Nuclear Energy Corporation will withdraw from the project.

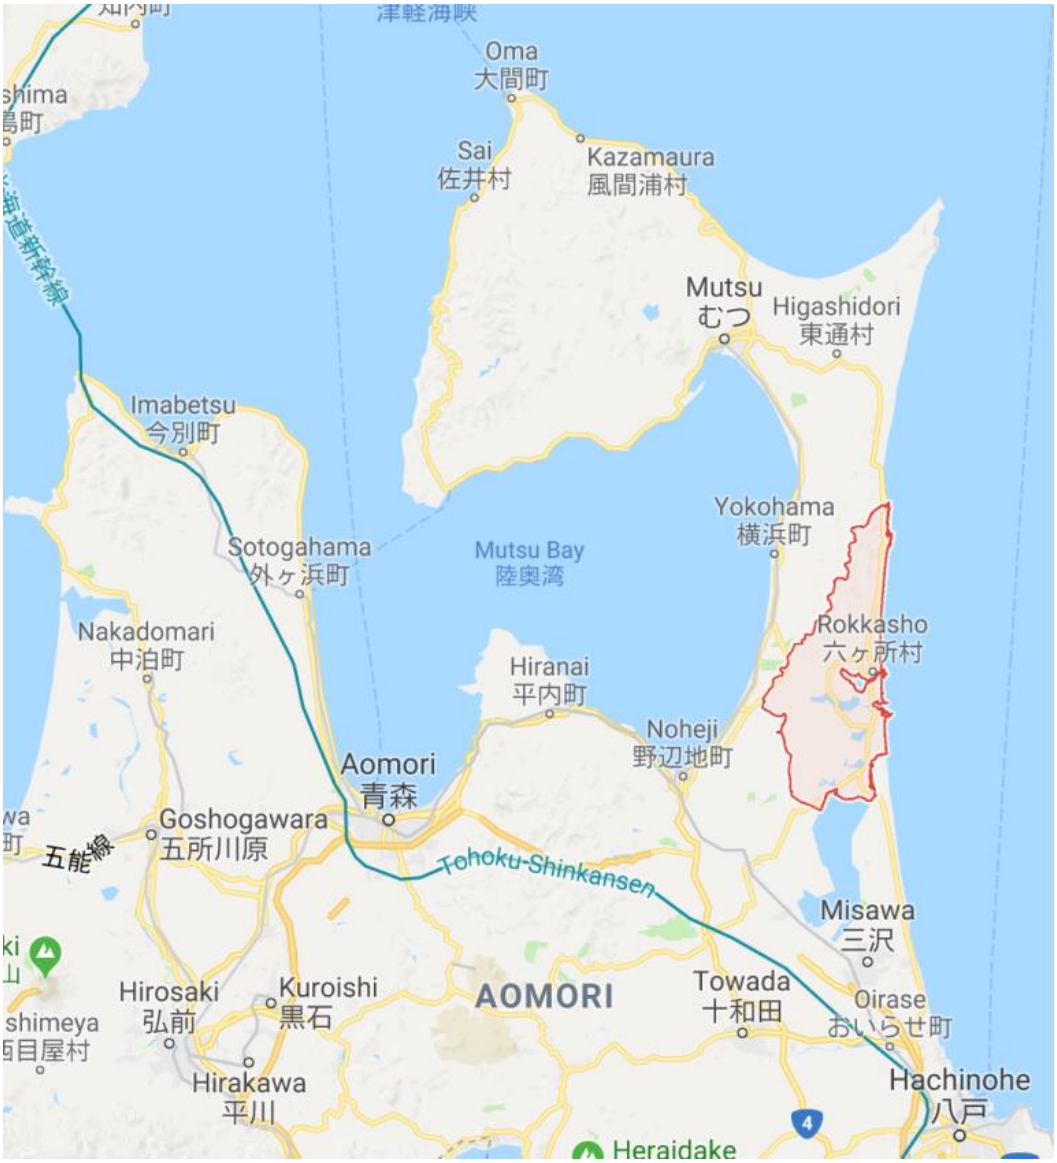
"Toshiba will proceed with the necessary procedures for the withdrawal with all related parties, and target its early completion," the statement said. It expects to complete its withdrawal by the end of this year.

In 2007, NRG Energy filed an application with the US regulator for the construction of the two new units at South Texas.

In 2011 NRG abandoned and wrote off its investment in the project, citing US regulatory uncertainty in the wake of Japan's 2011 Fukushima-Daiichi nuclear accident.

There are two 1,280 MW pressurised water reactors in commercial operation at the site.

Mayor election in Rokkasho & nuclear risk



June 10, 2018

Mayor election in Rokkasho Village, Aomori Prefecture, Japan: A small village where world nuclear risk is at stake.
https://fukushima311voices.com/2018/06/10/mayor-election-in-rokkasho-village-aomori-prefecture-japan-a-small-village-where-world-nuclear-risk-is-at-stake/
Don't let the Rokkasho nuclear fuel reprocessing plant start!
The Rokkasho village mayor election takes place on June 24, 2018.
We are calling for people to send encouraging comments for Ms Junko ENDO, anti-nuclear fuel cycle candidate!

For FB users, please write messages in the Facebook page of the candidate Ms Junko ENDO's political group "Rokkasho Mura ni atarashii kaze wo okosu kai" (Group to raise a new wind in Rokkasho Village)

The Facebook page is in Japanese, but you are most welcome to post your comments in your mother language. In fact, they prefer different foreign languages so that they can show that support is arriving from all over the world!

_____

Text below is partly based on an original text of Kiyohiko YAMADA with additions by Kurumi Sugita and Jon Gomon.

A brief historical and geographical reminder

There is a nuclear fuel cycle center in Rokkasho village, located at the root of Shimokita Peninsula in Aomori Prefecture, situated in the northernmost part of the main island of Japan.

On April 9, 1985, the governor of Aomori Prefecture decided to accept the center, composed of three facilities:

- a uranium enrichment (note 1) plant,
- a fuel reprocessing plant,
- and a low-level radioactive waste repository.

Afterwards, two facilities have been added:

- a temporary storage facility of high-level radioactive waste returned from overseas after reprocessing,
- and a MOX (note 2) fabrication plant.

Who is operating the nuclear fuel center?

This nuclear fuel cycle center of Rokkasho village is operated by Japan Nuclear Fuel Limited (JNFL), notorious for its incompetent management to say the least. In October 2017, Japanese Nuclear Regulation Autority (NRA) reported that JNFL violated safety measures. See a Mainichi Shimbun article below: Unfinished nuclear fuel reprocessing plant faked safety records: NRA (Mainichi Shimbun, October 11, 2017)

" The NRA concluded on Oct. 11 that Japan Nuclear Fuel Ltd. (JNFL) has violated safety measures after it was learned that the firm failed to carry out the required checks and nevertheless continued to write down "no abnormalities" in safety check records. There has been a spate of incidents such as the flow of rainwater into facility buildings at the plant in the Aomori Prefecture village of Rokkasho.

The plant, which is scheduled to reprocess spent nuclear fuel, was on the verge of hosting a final-stage NRA safety inspection, but the checkup is likely to be postponed considerably as JNFL now has to prioritize in-house inspections of all facilities at the plant. "

Major problems of the Rokkasho reprocessing plant

The Japanese nuclear fuel cycle collapsed with the fast breeder reactor "Monju"

The Japanese government persisted to continue research and development on the fast breeder reactors, even though they had been abandoned elsewhere in the world. It was in December 2016 that the government decided to finally decommission the prototype reactor "Monju".

The government is still trying to start the operation of the Rokkasho reprocessing plant in the first half of 2021 fiscal year, even though the prospect of the fast breeder reactor's commercialization has become improbable. There is a contradiction here. Why start a reprocessing plant when there is no usage plan for the end product (see below as for Mox fuel usage)? One possible reason is that for quite a while former

Liberal Democratic Party (LDP) ministers have been hinting at the possibility to possess nuclear weapons. They may want to have a plutonium extraction plant which can produce eight tons of plutonium annually.

Surplus Plutonium problem

The Japanese government has ordered the power companies to reprocess the total amount of used nuclear fuel resulting from nuclear power plants' operation. When there was no reprocessing plant in Japan, the reprocessing was entrusted to the UK and France. After that, a national reprocessing plant was built in Tokai village in Ibaraki prefecture, and then the construction of the private reprocessing plant in Rokkasho village in Aomori Prefecture was started in 1993.

The total amount of plutonium remaining in these reprocessing plants is about 48 tons. Since the commercialization of the fast breeder reactor has become improbable, the government wants to use the plutonium as MOX fuel at nuclear power plants (called plu-thermal in Japan).

However, since the TEPCO Fukushima Daiichi nuclear accident of March 11, 2011, the plu-thermal project is not progressing and it has become difficult to use up the surplus plutonium. If the Rokkasho reprocessing plant is put in operation, it will create a surplus of eight tons of plutonium annually. The possession of such an amount of plutonium will most certainly increase tensions in Asia.

Risks involved in the Rokkasho plant

① The reprocessing plant is on a fault

Japan is riddled with geological faults, and there is no stable stratum. The Rokkasho reprocessing plant is not on a stable stratum at all. A big active fault of about 100 km lies in the Pacific Ocean side. Scientists warn that in case of a big earthquake, a magnitude 8 tremor could seriously damage the reprocessing plant.

The operating company insists that a big earthquake will not occur in Rokkasho, but their seismograph is installed on bedrock, and is set so that it does not indicate more than a seismic intensity 3. Why? It is because when seismic intensity higher than 3 is detected, it is necessary to make a total inspection of the reprocessing plant.

② Hakkoda and Towada volcanoes are nearby

Recently, Hakkoda Mountain and Lake Towada, major tourist destinations in Aomori Prefecture not far from the plant, came to be monitored as a possible origin of a volcano-related catastrophe.

With a volcanic eruption, cinders and volcanic ash can fall thick in the vicinity of the reprocessing plant. This may make it difficult to secure external power supplies, to drive emergency power vehicles, and/or to secure cooling water. In addition, if the small volcanic ash can clog filters and destroy equipment.

③ Fighter jets fly near Rokkasho

Within 30km of the Rokkasho reprocessing plant, there is Misawa Airbase used by the US Air Force and Japanese Air Self Defense Force. There is also the Amagamori bombing exercise ground within 10km. Fighter jets exercising in Amagamori fly over the Ogawara port, passing through the vicinity of the reprocessing plant to repeat the training.

There is no doubt that a major disaster will occur if a fighter plane crashes into the reprocessing plant. Considering that the reprocessing plant is planned to go into operation in the coming years, it is very unlikely that the US Misawa Airbase and exercise ground would be relocated before the reprocessing operation begins.

Possibility of a serious accident

In the reprocessing project application submitted by JNFL, the following list cites as possible serious accidents:

① criticality in the dissolution tank,
② criticality by a transfer error of the solution containing plutonium,
③ evaporation to dryness by the loss of the cooling function,
④ explosion caused by hydrogen generated by radiolysis,
⑤ an organic solvent fire in a cell of the plutonium refining facility,
⑥ the damage to the used fuel aggregates in the fuel storage pool,
⑦ leakage from piping of liquid high-level radioactive waste storage facilities to cells.
If any of these major accidents occur simultaneously, or if the accident is triggered by a crash of a fighter plane or a volcanic eruption, the scale of the accident would be more than prepared for. However, the range of nuclear disaster prevention of the reprocessing plant is limited to a radius of 5 km only.
Existing radiation exposure of the entire Aomori prefecture and of the Pacific Ocean is already too high
After the Fukushima Daiichi nuclear accident, many tanks were created on the site of the Fukushima nuclear power plant to store the tritium contaminated water after processing the radioactive water by the multi-nuclide removal facility (Advanced Liquid Processing System = ALPS). In Fukushima prefecture, tritium contaminated water is not discharged in the ocean because of the opposition of fishermen, while in Rokkasho the same tritium water was released in a large amount during the active testing. Fishermen in Iwate once required that the reprocessing plant drainage be discharged in Mutsu Bay and not in the Pacific Ocean. The person in charge in Aomori Prefecture refused, saying, “Mutsu Bay would die”.
*****
Because of all these risks which involve not only Rokkasho village or Aomori Prefecture but the whole world, we need the village mayor who says NO! to Rokkasho Nuclear Fuel Center. **Please write either in a FB page or leave your comment at the bottom of this blog article page which we will transfer.**
Reminder:
For FB users, please write messages in the Facebook page of the candidate Ms Junko ENDO’s political group “Rokkasho Mura ni atarashii kaze wo okosu kai” (Group to raise a new wind in Rokkasho Village)
The Facebook page is in Japanese, but **you are most welcome to post your comments in your mother language**. In fact, they prefer different foreign languages so that they can show that support is arriving from all over the world!

Profile and manifesto of the candidate Ms Junko ENDO in English coming up soon

Profit comes first

June 20, 2018

Hitachi CEO promises to prioritize profitability in U.K. nuclear power plant project
https://www.japantimes.co.jp/news/2018/06/20/business/corporate-business/hitachi-ceo-promises-prioritize-profitability-u-k-nuclear-power-plant-project/#.Wyo1jYoyWos
JIJI

Hitachi Ltd. will put profitability first in a nuclear plant construction project in the United Kingdom, President and CEO Toshiaki Higashihara told shareholders Wednesday.
The machinery-maker will base any decision about the project on economic rationale and take the concerns of its shareholders into account, Higashihara said. The project is expected to cost some ¥3 trillion.
Hitachi officials told the shareholders that the company will reduce risk connected to its wholly owned British nuclear unit by reducing its stake in the subsidiary to less than 50 percent through the solicitation of outside investment.
They also said the company plans to aim for further growth by expanding businesses abroad, including railway operations.
Hitachi shareholders approved the appointments of 12 board members, including Higashihara and Chairman Hiroaki Nakanishi.
Nakanishi recently became the first Hitachi executive to assume the post of chairman at Keidanren, Japan's largest business lobby.

Clean energy for Japan

June 25, 2018

Japanese firms shift to clean energy despite state's enduring commitment to nuclear power
https://www.japantimes.co.jp/news/2018/06/25/business/japanese-firms-shift-clean-energy-despite-states-enduring-commitment-nuclear-power/#.WzDNqIoyWos

by Hidetoshi Takada
Kyodo
As Japan's government clings to nuclear power even after the Fukushima crisis, the private sector is moving ahead with greater use of renewables to power their operations amid growing international awareness of climate change.
As Japan's government clings to nuclear power even after the Fukushima crisis, the private sector is moving ahead with greater use of renewables to power their operations amid growing international awareness of climate change.
For instance, in March Daiwa House Industries Co. became a member of both RE100 (Renewable Electricity) and EP100 (Energy Productivity), two global initiatives by the Climate Group.
RE100 is a global, collaborative initiative of influential businesses committed to using 100 percent renewable electricity, while EP100 brings together companies committed to doubling energy productivity to lower greenhouse gas emissions. Among RE100's 136 members are U.S. General Motors Co. and Dutch consumer goods giant Unilever.

Printer-maker Ricoh Co., the first Japanese firm to join RE100, was followed by five firms such as online stationery retailer Askul Corp. and retail giant Aeon Co., aiming to meet the electricity needs of their global operations with renewable energy between 2030 and 2050.

Daiwa House says it is the world's first company in the construction and housing sectors to join both campaigns and the first to declare it is taking bold action, as part of EP100, among Japanese firms. Currently, there are 15 EP members. Daiwa aims to achieve both goals by 2040.

Katsuhiro Koyama, general manager of Daiwa's environment department, spurred debate over achieving the targets after returning to Japan from the COP23 global climate round in Germany last November.

He had previously taken a cynical view of such tech giants as Apple Inc., Google Inc. and Microsoft Corp. participating in the RE100 clean energy initiative, seeing it as an "atonement for their sins" for consuming huge amounts of electricity.

But as one of the Japanese delegate members to the global conference, Koyama said he was "inspired" by the firms' "serious aspirations to leverage clean energy producers" after hearing various discussions.

The Osaka-based Daiwa group has invested an estimated ¥46.6 billion in the construction of its own solar, hydro and wind-power plants nationwide since 2007, producing power equivalent to about 60 percent of the group's annual use of 481 million kilowatt hours. Meanwhile, it doubled its electricity use efficiency in fiscal 2016 compared to fiscal 2005.

Japanese businesses became much more aware of renewable energy in the wake of the Hokkaido Toyako summit in 2008, in which the Group of Eight countries set a long-term target to reduce greenhouse gas emissions. The 2011 Great East Japan Earthquake, which triggered the suspension of all nuclear power plants, also sparked public concerns over the country's energy mix.

The ratio of renewable energy to the nation's entire power output capacity has risen from 10 percent in fiscal 2010 to 15 percent in fiscal 2016, according to the Agency for Natural Resources and Energy, boosted by a feed-in tariff system that obliges utilities to buy electricity generated by renewable energy at fixed prices. The scheme has attracted businesses large and small — even individuals — to pour money into the field of photovoltaics as they requires less effort to install and operate in a shorter period of time compared to other types of energy sources, said Yushi Inoue, a research director at think tank Mitsubishi Research Institute.

Individual power producers are actively trying to connect with grids in northeastern Japan, and in a recent offering sought to supply "more than three times what we can accept," according to a spokesman of Tohoku-Electric Power Co., the regional utility.

The region, part of which was devastated by the mega-quake seven years ago and the subsequent nuclear disaster, has a number of favorable locations for wind power plants.

Meanwhile, a similar scheme in Europe that utilizes renewable energy certificates and a guaranteed origin of electricity generated from such sources has gained momentum among environmentally conscious firms, particularly after the 2008 summit in Hokkaido. The tradable green certificate proves "environmental added value" created by renewable energy producers, and can be purchased by electricity users.

Despite the financial burden, Ajinomoto Co. switched its energy source to renewables for its entire annual electricity use of 4.5 million kilowatt hours at its Tokyo headquarters and major sales bases at home in the business year to March 2018.

Japan's major seasoning- and food-maker extended the move to its four group arms in April, aiming to boost its renewable energy use to 50 percent of the group's total energy consumption by fiscal 2030.

The targeted figure is part of various nonfinancial targets compiled for the first time in its three-year business management plan that started in fiscal 2017, said Mototsugu Shiratsuchi, general manager of the environment management support group of Ajinomoto.
Although the volume of certified renewable energy is fairly small relative to the entire clean energy output in Japan, it has been steadily rising — reaching 378 million kilowatt hours in the year to March 2018, according to the Japan Quality Assurance Organization, the accreditation body.
Japan Natural Energy Co., the leading certificate issuer, has over 150 firms as long-term clients, such as Sony Corp., Asahi Breweries and about 300 customers on a one-time contract basis.
The company is the pioneer in the field with about an 80 percent market share, according to the accreditation body.
President Masaru Terakoshi said that one of Japan's global carmakers employed the certificate as part of its corporate social responsibility policy for 15 years but terminated a contract with the issuer two years ago.
The automaker, however, is set to repurchase the warrant this year following re-examination of how it can apply the certificate to its production activity.
Terakoshi declined to specify which automaker, but the example indicates that Japan's multinational corporations are becoming more aware of taking leadership roles in the fight against climate change.
"Otherwise, companies face a risk of losing clients," he said, as most of the world backs the landmark Paris accord goal of effectively reducing net carbon dioxide and other greenhouse gas emissions to zero in the second half of this century.
The tradable certificate is widely used. Some hotels, for example, buy the warrants to show that their banquets are sustained by clean energy.
In its latest draft energy mix plan, due to be finalized this summer, the Ministry of Economy, Trade and Industry called nuclear power "an important baseload energy source." This stance appears to conflict with public opinion, which shifted after the 2011 Fukushima disaster. In addition to public sentiment against nuclear power plants, the government's tougher safety standards led to the shutdown of all reactors.
In the fiscal year through March 2017, fossil fuels accounted for 83 percent of Japan's electricity output capacity. Renewables are currently at 15 percent.
The ministry proposes that nuclear power should account for 20-22 percent of the country's power sources in 2030, and renewables 22-24 percent, which still lags behind the equivalent figures seen for major European nations in 2015.

TEPCO still eyeing new nuclear plant

Experts from the Nuclear Regulation Authority (NRA) examine a geological layer at the site of the Higashidori nuclear power plant in Aomori Prefecture, on Dec. 14, 2012. (Mainichi)

TEPCO willing to resume Higashidori nuclear plant construction

https://mainichi.jp/english/articles/20180630/p2g/00m/0dm/004000c

June 30, 2018 (Mainichi Japan)

TOKYO (Kyodo) -- Tokyo Electric Power Holdings Inc. will launch a new site survey for its nuclear plant construction in northeastern Japan, suspended after the 2011 Fukushima disaster, with the company's president expressing readiness Friday to push the project forward.

- 【Related】Proposed storage of spent nuclear fuel sparks resistance in Aomori Pref. city
- 【Related】Election Battlegrounds: Area merger overshadows nuclear power debate in Aomori

TEPCO said it will conduct a full-fledged geological survey to devise stronger safety measures and see whether future facility expansion is possible on the site of the Higashidori nuclear power plant in Aomori Prefecture.

The survey will be carried out from later this year or early next year to around 2020, it said. Tepco has said it would seek participation of other companies in the Higashidori construction project.

"As we restart the (Higashidori) project, I want to make sure that a new plant would excel in safety," President Tomoaki Kobayakawa told a press conference, adding, "The geological survey is a very significant step to move forward on the joint development of Higashidori."

Construction of new nuclear power plants has stalled in Japan due to heightened safety concerns following the crisis at the Fukushima Daiichi plant, triggered by the March 2011 earthquake and tsunami disaster. The resumption of existent nuclear plants' operations has also been slow after the government implemented stricter safety regulations.

TWPCO expects the Higashidori project to expand its revenue as it faces huge compensation payments in connection with the Fukushima nuclear crisis and plant decommissioning costs.

TEPCO has asked major utilities, including Tohoku Electric Power Co., Chubu Electric Power Co., and Japan Atomic Power Co., to cooperate in the joint construction and operation of the Higashidori plant.

TEPCO said Friday it hopes the utilities would decide around 2021 whether to join the project by taking into account the results of the geological survey.

The company plans to build two reactors at the site, with construction of the No. 1 reactor having started in January 2011.
June 29, 2018

TEPCO to begin survey for new nuclear plant
https://www3.nhk.or.jp/nhkworld/en/news/20180629_39/
A Japanese electric power company that's grappling with the aftermath of a nuclear meltdown accident says it will begin a geological survey for a possible new nuclear plant.

Tokyo Electric Power Company, or TEPCO, said on Friday the survey is planned from the 2nd half of fiscal 2018 through fiscal 2020 in Higashidori in Aomori Prefecture, northern Japan.

It will be the first full-scale survey at the site since the March 2011 accident at TEPCO's Fukushima Daiichi nuclear plant.

The power company was due to start running its first reactor in Higashidori in March 2017. But construction has been suspended since the nuclear accident and the site remains vacant.

TEPCO says the survey will involve drilling to check soil and the structure underground. It says it will also consider how the new plant could meet tougher regulations introduced after the 2011 accident.

The company plans to ask other power companies to jointly build and operate the Higashidori plant, as it faces mounting costs to decommission the Fukushima reactors and pay compensation.

The deputy chief of TEPCO's Aomori office, Yoshinori Ono, said he hopes the potential partners will decide whether to join the project in around fiscal 2020.

Nukes: How many restarts yet?

July 3, 2018

Nuclear reactor restarts likely as Cabinet OKs new energy plan
By SHINICHI SEKINE/ Staff Writer
http://www.asahi.com/ajw/articles/AJ201807030061.html
A new wave of nuclear reactor restarts became more likely as the government approved the new Basic Energy Plan on July 3, confirming that nuclear power will remain a key component of Japan’s energy strategy.
The latest Basic Energy Plan, which charts the nation’s mid- and long-term energy policy, marks the fifth in a series that is required by law to be reviewed about every three years.
The second plan to be revised under the administration of Prime Minister Shinzo Abe stated for the first time that the country will strive to make renewable energy a major power source, although it noted fluctuations in output due to weather conditions.
Renewables can become a viable source of a stable power supply when they are combined with rechargeable batteries and hydrogen, according to the plan.

The plan also maintained the reliance on coal-fired thermal power as a base-load energy source despite high emissions of carbon dioxide.
The Abe administration decided to promote nuclear energy when it revised the plan in 2014, reversing the policy of the previous government led by the then-Democratic Party of Japan, which pledged to phase out nuclear power by 2039 in the face of mounting public concern over the safety of nuclear power following the 2011 Fukushima nuclear disaster.
Under the latest plan, the ratio of nuclear energy, renewables and coal thermal power in the nation's overall energy as of fiscal 2030 will remain at 20-22 percent, 22-24 percent and 26 percent, respectively, in line with the government's target set three years ago.
Experts say about 30 reactors need to be reactivated to achieve the 20-22 percent target, but only nine have gone back on line so far after they cleared the more stringent reactor regulations that took effect after the Fukushima accident.
The plan did not touch on the need for building a new nuclear plant in light of the widespread public opinion against nuclear energy. The last Basic Energy Plan did not mention the subject, either.
The latest plan re-endorsed using the nuclear fuel cycle, in which plutonium extracted from spent nuclear fuel at nuclear plants is used to generate power.
But the plan, noting calls from the United States, said that Japan "will make efforts to cut the stockpile of plutonium."
Japan holds a total of 47 tons of plutonium, equivalent to 6,000 Nagasaki-type atomic bombs, a source of criticism from the United States and other countries.
The country has failed to reduce its plutonium stockpile due to little progress in the nuclear fuel cycle over decades.
The project to operate the Monju prototype fast-breeder reactor in Fukui Prefecture, the core part of the nuclear fuel cycle, rarely worked over 20 years due to numerous glitches. The government finally decided to pull the plug on it in 2016.
Burning a mixed oxide form of plutonium and uranium has not spread among conventional nuclear reactors, although it was considered a way to reduce the plutonium stockpile.
In its attempts to export nuclear plants, the country has hit major problems wherever it has pitched them. But the government will maintain the export policy as a key component of the administration's strategy for expanding the Japanese economy.
According to the Basic Energy Plan, "Japan is determined to make a positive contribution to enhancing the safety of nuclear energy and the peaceful use of nuclear energy" through exports of nuclear plants.

Toward a reduction of the plutonium stockpile?

July 3, 2018
Tokyo plans shift toward renewable energy, planning for first time to cut plutonium stockpile
https://www.japantimes.co.jp/news/2018/07/03/national/tokyo-eyes-renewable-energy-plans-cut-plutonium-stockpile/#.WztfKIoyVLM
Kyodo, Staff Report
Japan will shift further toward renewable energy and cut dependence on fossil fuels and nuclear power, according to the country's energy plan approved Tuesday by the Cabinet.

Ahead of the automatic July renewal of the U.S.-Japan agreement on the peaceful use of nuclear energy, the plan for a medium- to long-term energy policy also mentioned that Japan will work to reduce its plutonium stockpile for the first time.

The increased focus on renewables under the 2015 Paris climate accord underscores the nation's daunting challenge to reduce greenhouse gas emissions drastically in the years ahead.

The government, which updates the energy plan roughly every three years, kept its goals the same for its mix of energy sources in fiscal 2030 but did not give specific numbers for fiscal 2050 — the year when it has to clear its specific commitment in fighting global warming.

Toward 2030, the government aims to have renewables account for 22 to 24 percent, fossil fuels 56 percent and nuclear power 20 to 22 percent of the country's electricity generation, the energy plan showed.

With its 2016 energy self-sufficiency ratio below 10 percent, resource-poor Japan needs to secure stable energy supplies for economic activity and national security while also ensuring the safety of nuclear power generation following the 2011 Fukushima accident.

The country also needs to accelerate efforts to fight global warming, now that it has set the goal of achieving an 80 percent cut in greenhouse gas emissions in fiscal 2050 from 2013 levels.

The energy plan calls for supporting the development of a sustainable market for renewables, such as solar, wind and geothermal power, and encourages the use of hydrogen.

Placing a priority on safety, the nation will cut dependence on nuclear power generation "as much as possible," the energy plan said.

Still, it also acknowledged that nuclear power is one of the viable choices to achieve a shift away from using coal and other fossil fuels and cut greenhouse gas emissions.

Much of the country's nuclear power plants have been taken offline since the Fukushima disaster. The administration of Prime Minister Shinzo Abe is seeking to restart plants that have cleared safety checks.

The Japan-U.S. nuclear pact currently enables Japan to continue its spent-fuel reprocessing program for 30 years to July 2018.

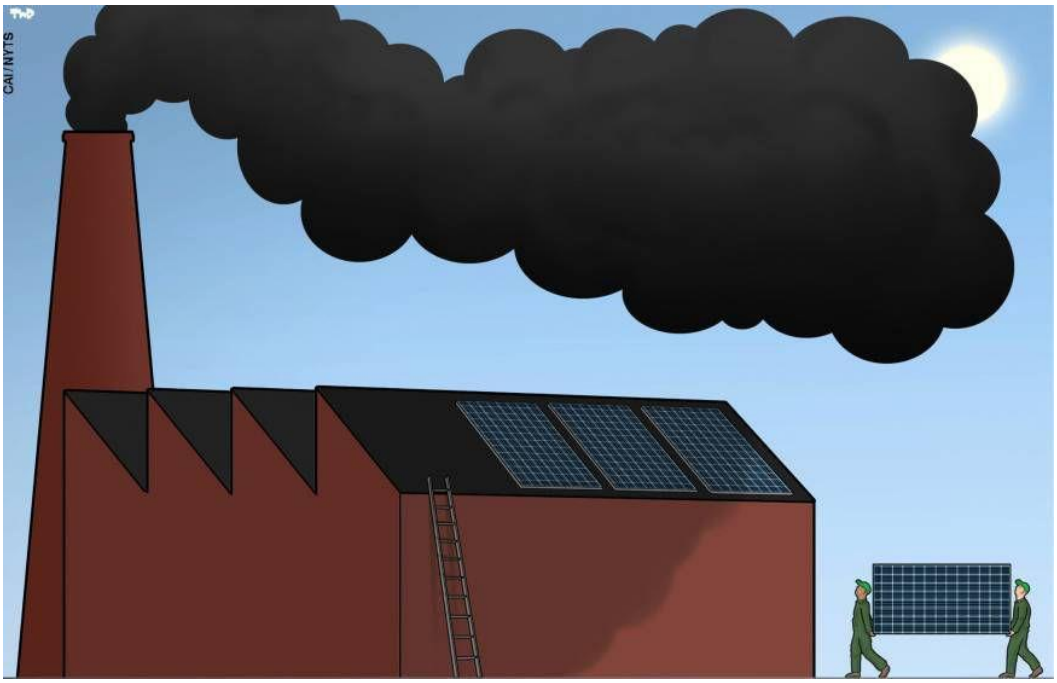
Spent fuel from nuclear reactors is reprocessed to extract uranium and plutonium, which is then recycled into fuel called mixed oxide, or MOX, for use in fast-breeder reactors or conventional nuclear reactors.

In a June 21st open letter to International Atomic Energy Agency Director General Yukiya Amano that expressed concern about the management of plutonium stocks, three anti-nuclear groups said efforts to restart nuclear reactors, especially those that use MOX fuel, to meet the long-term energy goal for nuclear power were unrealistic.

"Our analysis over recent years, and to the present, indicates that Japan will fail to meet its nuclear restart target of 30 gigawatts by 2030 by a wide margin. Many more nuclear reactors are likely to be decommissioned" in the coming years joining the 17 that have been declared such since 2011, said a letter jointly signed by Hideyuki Ban, co-director of Citizens' Nuclear Information Center, Aileen Mioko Smith, director, Green Action, and Shaun Burnie, a senior nuclear specialist at Greenpeace Germany.

"In addition to the four reactors that have resumed operation with partial MOX fuel cores, it is uncertain how many of the remaining six reactors that have received MOX approval will actually restart during the next 10 years. They are all confronted with multiple challenges, including seismic faults, as well as legal and political opposition," the letter added.

Decarbonisation & Japan



July 3, 2018

Japan's energy and decarbonization challenge
by Tomoaki Nakanishi
The government has just reviewed its energy strategy or Basic Energy Plan — the first review in four years. In the 2017 COP23 United Nations Climate Change Conference held in Bonn, Germany, an international network of nongovernmental organizations awarded the Fossil of the Day prize to Japan. But in reviewing its energy strategy, Japan has declared that it will meet the challenge of developing new energy sources and technologies and achieving decarbonization under a long-term timetable stretching to 2050 by taking into consideration the Paris agreement adopted at the 2015 COP21 conference.
The energy landscape has undergone rapid changes in recent years.
First, the prices of energy from renewable sources have fallen on a global scale and new endeavors to develop new technologies for decarbonization, such as energy storage and digital control technologies needed for large-scale introduction of renewable energy, have started with the participation of a wide range of industrial sectors.
Second, new risks that are qualitatively different from conventional geopolitical risks have arisen with the rising presence of emerging powers such as China and India.
Third, competition for dominance in technological development for decarbonization has kicked off among major countries and energy companies, leading people to anticipate the emergence of a society in which technologies will serve as key resources.
In foreseeing the situation in 2050, it must be recognized that the degree of uncertainty for the future is extremely high. At the same time, the high degree of uncertainty means that there will be possibilities in the future. In facing an era of both uncertainty and possibilities, it will be important not only to set an ambitious goal to pursue the possibility of every option but also to consider multiple scenarios that should be scientifically reviewed on the basis of the latest technological trend and global situation for flexible adjustments.

To begin with, Japan, poor in domestic energy resources, is an insular country with no power transmission networks connected with other nations. Therefore it has tried to cope with its intrinsic situation by exploring the possibility of every energy source to achieve the best mix of 3E+S — energy security, economic efficiency and environmental protection with safety serving as the major premise.

In developing Japan's energy strategy, the recent experience of Germany offers a useful suggestion. Germany is trying to achieve decarbonization by fading out nuclear power and expanding renewable energy sources. But now it faces difficulty in reducing its dependency on coal-fired thermal power generation although its use of renewable energy sources is expanding. It must be noted that as a result, its reduction of carbon dioxide emissions has become slow and household electricity bills have risen.

It also must not be forgotten that a nation like Germany, which can sell or buy electricity to and from neighboring countries through international power transmission networks, can absorb to some extent the fluctuation of power output from renewable energy sources by means of export and import of electricity.

In any case, each country is trying to build an optimum energy system under its given conditions, which are different from one country to another. In this situation, it is important to develop an energy policy under the 3E+S approach.

Let me discuss individual energy sources. The first is a zero-carbon emission power source consisting of renewable energy sources and nuclear power.

After the Great East Japan Earthquake of 2011, Japan reviewed its nuclear power policy from scratch. While seeking to reduce the dependency on nuclear energy for power supply as much as possible, the energy policy aims to squarely tackle the problem of the high cost of renewable energy sources — which remain relatively high compared with overseas — so as to turn the renewables into a major power source.

In view of the fact that nuclear power is an important option already in use for achieving decarbonization, Japan will immediately start seeking reactors excellent in safety, flexibility and economic efficiency as well as developing back-end technologies to win back public trust in nuclear power.

The second is coal-fired thermal power. Currently Japan has highly advanced technologies to utilize coal. For example, by introducing an integrated gasification combined cycle (IGCC), which uses a high-pressure gasifier to turn coal and other carbon-based fuels into pressurized gas, and an integrated gasification fuel cell cycle (IGFC), a fuel cell-based power cycle consuming gasified solid fuels such as coal and biomass fed directly to fuel cells operation at high temperature, it will become possible to cut carbon dioxide emissions significantly even compared with the latest coal-fired plant currently in use. (IGCC will be able to reduce the emissions by about 10 percent more and IGFC 30 percent.) Japan is currently building a large, commercial-use IGCC power plant and carrying out a demonstration experiment of IGFC.

Japan can greatly contribute to reducing global greenhouse gas emissions by passing its highly efficient coal-utilization technologies to countries that have no other choice but to rely on coal as an energy source. Japan, on the other hand, will phase out its low-efficiency coal-fired power generation.

Japan's journey toward 2050 has just begun. It will try to accomplish an ambitious goal of achieving an 80 percent reduction in greenhouse gas emissions on multiple scenarios that will be scientifically reviewed. Although the goal is ambitious, the approach will be flexible. Concrete measures must be worked out from now on.

To achieve the goal, the government and the private sector must fully cooperate. In partnership they will push innovative technological development in areas needed for decarbonization, such as power storage, use of hydrogen, nuclear power, diversification of energy sources and heat utilization.

In the financial market, where environmental, social and governance criteria are gaining importance recently, energy companies and the financial sector will have dialogue to build a funding circulation

mechanism, in which they will jointly write a scenario to change the energy landscape and pursue decarbonization.
Since the annual global carbon dioxide emissions top 30 billion tons, with Japan emitting roughly 1.1 billion tons, it is clear that worldwide proliferation of non-carbon technologies is indispensable. Japan will serve as a bridge to link energy-consuming nations and resource-rich countries.
Japan is determined to contribute to and fulfill development of new energy sources/technologies and decarbonization, a long-term goal of humankind, by implementing policies under the new basic energy plan.
Tomoaki Nakanishi is former director of the International Affairs Office of the Natural Resources and Energy Agency at the Ministry of Economy, Trade and Industry.

Reusing nuclear fuel

July 18, 2018

Japan OKs reuse of nuclear fuel from scrapped reactors for 1st time
https://mainichi.jp/english/articles/20180718/p2g/00m/0dm/075000c
The No. 1 and No. 2 reactors (from right to left) at Kansai Electric Power Co. (KEPCO)'s Oi Nuclear Power Plant in Oi, Fukui Prefecture, are seen from a Mainichi Shimbun helicopter. (Mainichi)
TOKYO (Kyodo) -- Japan's nuclear watchdog on Wednesday granted its first approval for a plan to reuse nuclear fuel taken out of decommissioned reactors in operational ones.

- 【Related】Nuclear watchdog OKs restart of aging nuclear plant hit by tsunami
- 【Related】TEPCO willing to resume Higashidori nuclear plant construction
- 【Related】Court rejects suspension of Oi nuclear power plant

The decision will allow Kansai Electric Power Co., the operator of the Oi nuclear power plant in central Japan, to load some nuclear fuel assemblies from its scrapped No. 1 and No. 2 reactors into its No. 3 and No. 4 reactors that resumed operation this spring.
A nuclear fuel assembly consists of fuel rods and those at the Oi plant in Fukui Prefecture are the same in size and interchangeable.
Fuel at a nuclear power plant is normally considered spent after three to five years of loading. Kansai Electric has stored some fuel assemblies from the No. 1 and No. 2 reactors that are still usable.
Of the 629 nuclear fuel assemblies from the two old reactors that the power company has decided to scrap, 264 are still usable. The remaining 365 units are expected to be sent to the Rokkasho plant in northeastern Japan for reprocessing.
A total of 216 new nuclear fuel assemblies prepared for the No. 1 and No. 2 reactors will also be used in the other two reactors at the Oi plant, according to Kansai Electric.
The Nuclear Regulation Authority will give its formal approval after hearing opinions from the Japan Atomic Energy Commission and other parties concerned.

In March, Kansai Electric notified the government of its plan to decommission Oi's aging No. 1 and No. 2 reactors. With a capacity of 1,175 megawatts each, the reactors would have been in operation for 40 years in 2019.
Since the 2011 Fukushima accident, most of the country's nuclear reactors remain offline.
Opposition to restarts remains strong in Japan despite the administration of Prime Minister Shinzo Abe maintaining its pro-nuclear policy.

Nuclear Japan-US pact on reprocessing extended

July 18, 2018

Japan To Continue Fuel Cycle Policy As Nuclear Pact With US Is Extended
https://www.nucnet.org/all-the-news/2018/07/18/japan-to-continue-fuel-cycle-policy-as-nuclear-pact-with-us-is-extended
18 Jul (NucNet): A nuclear pact between Japan and the US has been automatically extended, allowing Tokyo to continue to reprocess spent nuclear fuel, extract plutonium and enrich uranium.
The bilateral Japan-US pact, which came into force in July 1988, puts Japan in the position of being the only country without nuclear arms that is allowed to reprocess spent nuclear fuel, press reports said.

Japan has long limited its nuclear research, development and energy uses to peaceful purposes.

However, there are reports that the US is increasingly concerned about Japan's growing reserve of plutonium, a material which can be used to create nuclear weapons.

An energy policy plan approved by Japan earlier this month re-endorses using the nuclear fuel cycle, in which plutonium extracted from spent nuclear fuel at nuclear plants is used to generate power.

But the plan, noting calls from the US, said that Japan will make efforts to cut its stockpile of plutonium, which can be used in making nuclear weapons.

According to the Japan Atomic Industrial Forum (Jaif), Japan holds about 47 tonnes of plutonium. Of that 47 tons, around 10 tonnes were stored within Japan and the remainder in the UK and France as of the end of 2016, according to government data.

Spent nuclear fuel containing plutonium from nuclear power plants in Japan is sent to the UK and France for reprocessing and eventual fabrication into uranium-plutonium mixed oxide (MOX) fuel before being returned to Japan.

Most nuclear power plants in Japan remain offline following the 2011 Fukushima-Daiichi nuclear accident and need to pass revised safety regulations before they can be restarted.

The administration of prime minister Shinzo Abe has maintained its pro-nuclear policy, saying that plants

able to clear the new stricter safety checks will resume operations.

The energy plan calls for a nuclear share of around 20-22% by 2030. Jaif has said about 30 reactors must be brought back online to meet the target.

Nuclear regulators are also still assessing the safety of a planned spent nuclear fuel reprocessing plant in northeastern Japan after delays to its commissioning.

When fully operational the Rokkasho plant, a key pillar of the country's nuclear fuel recycling policy, will be able to produce around eight tonnes of plutonium a year, the Japan Times reported.

Pinning hopes on nuclear exports

July 29, 2018

Japan and Hitachi pin nuclear export hopes on U.K. project in Wales
https://www.japantimes.co.jp/news/2018/07/29/business/japan-hitachi-pin-nuclear-export-hopes-u-k-project-wales/#.W13MncIyWos
by Junko Horiuchi
Kyodo
A nuclear power plant project in Britain is giving Japan a glimmer of hope for spurring infrastructure exports, a key growth strategy of Prime Minister Shinzo Abe.
Hitachi Ltd. and the U.K. government started official talks last month on building new reactors in Wales, with a goal of firing them up in the first half of the 2020s.
The outlook for the ¥3 trillion project is unclear, with both sides facing a string of challenges in the talks going forward.
For Tokyo, the plan is one of its few remaining major overseas projects on the horizon, with other nuclear power generation plans discontinued or facing cancellation.
The government's bet on nuclear power plants as a pillar of infrastructure exports comes as the likes of Germany, Italy, Taiwan and South Korea are pulling out of atomic power generation.
Critics argue that a surge in safety costs and accident worries caused by the 2011 Fukushima disaster, in addition to the lack of viable disposal solutions for radioactive waste, mean there is no justification for keeping faith in nuclear energy. Compounding the sector's decline is the rapidly dropping cost of tapping such renewable energy sources as wind and solar power.
Still, some emerging economies look like they will need new nuclear power plants, and Japanese builders see few chances to construct new ones anytime soon in Japan.
"The Japanese government has been pushing hard for exports of nuclear power plants but it's clear that it's not going well," said Tadahiro Katsuta, a professor at Meiji University. "The government will spare no effort in giving momentum to the exports."

If the project in Britain proves successful, it will give the government "a good excuse" to push harder abroad, he said.

Before the official talks began, Hitachi had told Britain it might not take part in the project to build two advanced boiling water reactors on the Isle of Anglesey in Wales, because the price tag had soared higher than initially estimated.

But an offer by London to shoulder about two-thirds of the cost convinced Hitachi stay in. Tokyo welcomed its decision to begin the talks.

"The nuclear business overseas is significant … it would lead to strengthening and maintaining human resources and technology for nuclear power in Japan," Minister of Economy, Trade and Industry Hiroshige Seko told a news conference.

Under the agreement, the British government will subsidize much of the cost through direct investment and loan guarantees, according to sources close to the matter.

"We are currently examining the financial and cost issues of the project, before making a final decision in 2019 on whether to invest in the project," Hitachi Chief Financial Officer Mitsuaki Nishiyama said Friday at a news conference to announce earnings.

For Hitachi, nuclear power is a core operation. It wants to increase revenue from the business by more than 33 percent to ¥250 billion over the four years through March 2022, mainly through boosting overseas revenue.

Rival Toshiba Corp. exited overseas nuclear operations after incurring huge losses in the United States, a decision that could cripple Tokyo's efforts to promote Japanese nuclear plants abroad.

Mitsubishi Heavy Industries Ltd., is pursuing a nuclear power plant project in Turkey. But it hit a snag when it saw safety-related costs surge and trading house Itochu Corp. walked away from the project.

In another blow to the government, Vietnam in 2016 decided to abandon a plan to build its first nuclear power plant with Japanese assistance due to tight state finances.

Those failures have led to an increased focus on the new power station in Wales. But London and Hitachi still need to address such issues as how to spread the remainder of the costs among Hitachi, local companies and Japan-backed financial institutions. They also need to determine who should be held liable if there's a major accident.

They are also at odds over how much the electricity produced at the plant should cost. Britain at one point offered a price some 20 percent lower than what Hitachi wanted, a source familiar with the matter said.

"A key focus of discussions with Hitachi has been and will continue to be achieving lower-cost electricity for consumers," Greg Clark, British business and energy secretary, told Parliament last month.

The two sides also need to talk to residents and win over those worried about the new power station.

"We have a major multinational and two governments supposed to be democracies playing a high-stakes game of poker … without any transparency or scrutiny for the people that they are representing," Mei Tomos, a resident of Wales, said at a news conference in Tokyo during a recent visit to Japan.

"We have seen the destruction which nuclear power can cause. It is really too much to expect us to take the same risks. Even if such an accident didn't happen at Anglesey we will still be faced with over a hundred years of storage of nuclear waste on site which presents a massive danger to us," another resident, Robert Davies, said at the news conference.

Shimane 3

August 13, 2018

Japan's Chugoku Electric Asks Regulator To Assess Shimane-3
https://www.nucnet.org/all-the-news/2018/08/13/japan-s-chugoku-electric-asks-regulator-to-assess-shimane-3
Plans & Construction
13 Aug (NucNet): Japanese utility Chugoku Electric Power Company has asked the Nuclear Regulation Authority to assess the compliance of the unfinished Shimane-3 nuclear power plant with post-Fukushima revised safety standards.
In February 2018, Chugoku Electric announced plans to apply for permission to begin operation of Shimane-3, which is still under construction in Shimane Prefecture, southwest Japan.

Chugoku Electric said at the time it would seek to obtain the consent of both the prefecture and local municipalities before filing an application for an operational permit with the NRA.

According to the Japan Atomic Industrial Forum, construction of the 1,325-MW advanced boiling water reactor unit is "almost complete". Construction began formally in 2007.

Shimane-3 was scheduled to come online in 2012 but all reactors in Japan were shut down and new build projects suspended following the March 2011 accident at Tokyo Electric Power Company's Fukushima-Daiichi nuclear station.

The NRA's revised safety standards came into force in July 2013.

US firm withdraws from Hitachi plant in Wales

August 17, 2018
U.S. firm pulls out of building Hitachi nuclear plant in Britain
http://www.asahi.com/ajw/articles/AJ201808170035.html
Major U.S. construction firm Bechtel Corp. is to withdraw from its key role in building a nuclear power plant in Britain due to concerns over the Hitachi Ltd.-helmed project's profitability, sources said Aug. 16.
Bechtel made the decision based on its assessment that the drastic rise in construction costs would make it hard to make money on the project, the sources said.
The withdrawal deals a blow to Tokyo-based **Hitachi, which lacks experience in nuclear power plant construction**. The conglomerate could now face further difficulties in financing the project.
The Japanese government supports the construction project as an "export of nuclear power generation technologies," but even so, its future is becoming more and more uncertain.
Hitachi plans to build a nuclear power plant equipped with two reactors on the island of Anglesey in Wales. Overall costs are expected to reach about 3 trillion yen ($27 billion), mainly due to measures to meet safety standards strengthened globally after the 2011 accident at the Fukushima No. 1 nuclear power plant.

According to the sources, however, the overall costs estimated by Bechtel are higher than Hitachi's, making it impossible for Bechtel and Hitachi to agree on the price tag.
As a result, Bechtel decided to withdraw from its key role in construction and only offer a consulting service.
In 2012, Hitachi purchased a British nuclear power plant operator, Horizon Nuclear Power Ltd., to export its nuclear power generation technologies as a whole.
It was the first time for Hitachi to preside over the construction of an entire nuclear power plant, including not only reactors but also reactor buildings and related facilities.
Hitachi then formed a consortium with Bechtel and major Japanese engineering company JGC Corp. in 2016. Bechtel was chosen because it had constructed nuclear plants in the United States.
The consortium was expected to steer the nuclear plant's design and construction, with Bechtel taking the key role in the project. Now, a question mark hangs over whether Hitachi will be able to find a new partner that can replace Bechtel.
An idea has emerged that Horizon Nuclear Power, now a subsidiary of Hitachi, will be in charge of the construction while receiving advice from Bechtel and Japanese electric power companies.
One Hitachi executive played down the significance of Bechtel's withdrawal from its role in construction. "It only means that roles of companies will change. The impact to the project is not big," the executive said.
However, if Horizon replaces Bechtel, it faces the risk that the construction costs will become higher than anticipated.
Hitachi is aiming to lower its stake in Horizon from the current 100 percent to less than 50 percent as a condition for the start of construction of the nuclear plant, and so it is asking other companies to invest in Horizon.
But if other companies are concerned over Horizon's risk, they will hesitate to invest in it. As a result, Hitachi will face bigger difficulties in raising funds for construction and proceeding with the project.

Nuke tie-up?

August 22, 2018

4 firms in talks over nuclear business tie-up
https://www3.nhk.or.jp/nhkworld/en/news/20180822_20/
Four Japanese companies are negotiating a possible tie-up in the nuclear power business. They are utilities Tokyo Electric Power Company and Chubu Electric Power Company, and electronic makers Hitachi and Toshiba.

People familiar with the matter say the 4 firms are in talks on a future tie-up in the operation of nuclear power plants, their construction and maintenance.

The 4 companies are all involved in operating or manufacturing of boiling water reactors, which are the same type of reactors at the Fukushima Daiichi nuclear power plant.

The plant is in the process of decommissioning after a disaster occurred there in March 2011 following a

powerful earthquake and tsunami.

Hitachi and Toshiba are having difficulties to gain new orders for building nuclear plants in Japan, where the Fukushima disaster has effectively halted their construction.

The 2 makers are also facing a tougher business environment overseas, where stricter safety requirements have pushed up construction costs for nuclear power plants.

The 4 companies are discussing multiple plans, including one that calls for merging their nuclear businesses in the future.

However, their talks may not go smoothly as TEPCO is engaged in decommissioning the Fukushima plant and the 4 firms have different stances on overseas business.

Time to choose renewables

A large-scale solar power plant that started operation in Niigata in July (Provided by Orix Corp.)

August 27, 2018

EDITORIAL: Time is now to turn renewables into 'mainstay' energy sources
http://www.asahi.com/ajw/articles/AJ201808270016.html
A large-scale solar power plant that started operation in Niigata in July (Provided by Orix Corp.)
We know which direction we should be going.
The problem is how we should go about getting there. It is time to be working out strategies and putting them into practice over the years to come.

The latest edition of Japan's basic energy plan, which was approved by the government in July, includes a passage saying that efforts should be made to turn renewable energy options, such as solar and wind power, into "mainstay" power sources.

A substantial expansion in the use of renewables, which does not involve carbon dioxide (CO2) emissions, is indispensable for achieving the double goals of fighting global warming and becoming less reliant on nuclear power. The use of renewable energy sources also comes with the big advantage of domestic availability for Japan, a country poor in natural resources.

Many other nations are already speeding up efforts in that direction on the back of technological innovations and a sharp drop in costs. It is all too natural for Japan to follow that global trend.

The latest plan, however, also appears indecisive in some respects. For example, its future introduction target for renewables remains unchanged from a previously stated goal.

A mountain of challenges remains to be solved to make sure that the whole shebang will not end up as mere slogans. Ideas on how they could be solved should be sought both in Japan and abroad, and the undertaking should be sped up across the entire society.

NUMERICAL GOAL SHOULD BE RAISED

The latest plan, revised for the first time in four years, says in one passage, "We should address challenges squarely toward the goal of introducing renewable energy options in large scales and turning them into mainstay power sources that are self-reliant in economic terms."

Given that, the plan is too halfhearted in sticking to the previous goal of having renewable energy account for 22 to 24 percent of the total power to be generated in fiscal 2030.

The share of renewables has already grown to some 15 percent in Japan. The possibility has emerged that the numerical goal will be achieved ahead of the initially planned date.

Many European nations are aspiring to even higher levels. For example, the ruling coalition of Germany has agreed on setting a target share of 65 percent for renewables in 2030.

Japan should also pursue possibilities for raising the share of renewables to a maximum.

The first thing to be done in that respect is to lift the existing restrictions on the use of the power grid, which are practically serving as a barrier against power generated from renewable energy sources.

Renewable energy power producers often hesitate about working out development plans because major electric utilities, which own the power grid equipment, explain to them that they don't have enough capacity in their transmission capability.

Some leeway, in fact, is reserved in their transmission capacity, including a part that is kept unused in providing against a time of technical failures. The industry ministry and the power industry are discussing possible improvements to the operation of the power grid.

There is a pressing need for developing fair and transparent rules to allow a maximal use of the equipment that is currently available.

PAIR OF DRAWBACKS TO OVERCOME

Overcoming a pair of drawbacks is key to the goal of getting renewable energy options on a stable track of expansion. One is the cost of power generation, which remains higher than in other countries, whereas the other lies in the instability of the power supply potential, which varies depending on the weather.

The slowness of cost reduction in Japan is partly attributable to the feed-in tariff (FIT) system, which was introduced in 2012. The system has certainly been a driving force behind a spread of renewable energy sources, but experts have also pointed out that it is helping to allow the renewables industry to preserve its high-cost structure.

The FIT system is an assistance measure for guaranteeing a certain level of income to renewable energy power producers. The cost for doing so is added on top of electricity rates in the name of a levy, and the

total burden borne by the public has grown to some 2 trillion yen ($18 billion) a year. The system should inevitably be reviewed to keep that amount to a minimum.
The essential thing is to prompt competition and efficiency improvement on the part of power producers while at the same time ensuring the potential for growth will not be ruined. There are a variety of ways to do so, such as expanding a mechanism for purchasing electric power from a producer that has presented a lower price during a bidding process.
There should perhaps also be discussions on shifting the focus of policy initiatives in the coming years from direct subsidization through the FIT system to carbon tax, to be imposed on CO2 emissions, and to emissions trading. The use of market mechanisms would help allow renewables to become self-reliant at an earlier date.
In the meantime, how to level out variability in the output of wind and solar power will emerge as a major challenge as their output grows. There is no choice, for the time being, but to rely mostly on thermal power for that purpose, but the use of other means is indispensable for reducing CO2 emissions.
More specifically speaking, a variety of options are available, including the use of storage batteries and the development of a power grid that allows electric utilities to supply power to each other on a broader, regional scale. Different technological means should be assessed carefully for their extent of progress and economic efficiency so the most effective components can be combined and put to use.

DIFFERENT ROLES FOR PUBLIC, PRIVATE SECTORS

The effort to turn renewables into mainstay energy sources would take decades to complete. Sorting out the roles to be played by the public and private sectors and allowing a broad array of actors to work together are essential in overcoming hurdles and pressing ahead with that effort.
An important task to be done by the central and local governments is to develop an environment that allows private-sector players to actively engage in research, development and investments. Apart from designing the FIT and other basic systems, there is also a mountain of other things to do, such as working out rules for the use of offshore areas as wind farms and providing information on land plots that are suitable for hosting renewable power plants.
Businesses, which are the main players of action on the ground, should be ready to quickly seize business opportunities and pinpoint social agenda. Renewables account for a core part of energy-related investments overseas, thereby giving rise to a gigantic growth market.
There has been a noteworthy move in Japan's industrial circles, which appeared to be starting a bit late. More than 100 entities, including major businesses, local governments and other groups, in July set up the Japan Climate Initiative, a platform for working together to help spread the use of renewables and disseminate information on them. Its corporate participants come from a broad array of industrial sectors such as manufacturing, financing and construction.
An attempt to reshape society into one that is sustainable on the fronts of energy and the environment has now turned into a global swell and is generating new development opportunities. That momentum should be allowed to infiltrate public administrative bodies, businesses, consumers and other parties so that it will serve as a driving force for opening up a new age to come.

Hitachi & General Electric planning joint development of modular reactors

October 15, 2018

Hitachi, GE to jointly develop next-generation nuclear reactors

https://mainichi.jp/english/articles/20181015/p2g/00m/0bu/043000c#cxrecs_s

TOKYO (Kyodo) -- Hitachi Ltd. and General Electric Co. will jointly develop a new type of nuclear power plant with small modular reactors, sources close to the matter said Monday.

- 【Related】Hitachi to end own-brand TV sales in Japan, strengthen tie with Sony
- 【Related】Nuclear power should be 'baseload power source': Hitachi president
- 【Related】Hitachi, Mitsubishi Heavy, Toshiba to delay nuclear integration project

The two companies, which have been long-time partners in the nuclear business, aim to commercialize the reactors, said to be cheaper to produce and safer to run, in the 2030s, the sources said.

With construction of nuclear power plants stalled in Japan following the 2011 Fukushima nuclear crisis, Hitachi has been looking to expand its nuclear plant business overseas.

A small modular reactor can be mostly assembled at a plant and brought to a power plant site, cutting time and costs needed for the plant's construction work.

A conventional nuclear power plant usually costs about 1 trillion yen ($8.9 billion) to build. Construction in Japan would cost more after Japan raised safety requirements for nuclear reactors in the wake of the meltdowns of reactors at the Fukushima Daiichi power plant triggered by the major earthquake and ensuing tsunami in March 2011.

The small modular reactor, though offering a smaller output, is designed to be set up underground to better contain radioactive materials in the event of an accident.

Hitachi has been building boiling water reactors, the same type of reactor that suffered meltdowns in Fukushima. None of those reactors have been restarted in Japan after going offline following the nuclear crisis.

The company had been planning to build two nuclear reactors in Britain but is currently reviewing the project due to expanding costs, expecting to make a final decision in 2019.

Nukes growing but slower than Govt. hoped

November 1, 2018

Japan's nuclear industry growing but likely to miss government's 2030 target
https://www.japantimes.co.jp/news/2018/11/01/national/japans-nuclear-industry-growing-likely-miss-governments-2030-target/#.W9sHzzGNyos

by Aaron Sheldrick **and** Osamu Tsukimori
Reuters
The domestic nuclear industry will miss a government target of providing at least a fifth of the country's electricity by 2030, analysis shows, but the sector is showing signs of life more than seven years since the Fukushima crisis.

With eight reactors running and one more set to come online in November, nuclear has this year overtaken nonhydro renewables in power output for the first time since the 2011 catastrophe, when all of the country's nuclear plants were idled.

Yet operators can expect as few as six units to restart in the next five years, and fewer than 20 by 2030, the analysis shows. That is far short of the 30 needed to meet the government target reiterated this year.

Based on the analysis, the world's third-largest economy may get about 15 percent of its power from nuclear in 2030, compared with a government target of 20 to 22 percent.
"It's impossible to meet the target, that's pretty much confirmed," said Takeo Kikkawa, an energy studies professor at Tokyo University of Science, who sat on an official panel that reviewed the country's energy policy this year.

He said he did not expect another round of restarts before 2020.

One major trading house predicts nuclear will account for 14 percent of power production in 2030, according to a presentation given at a private seminar this year and shown to Reuters.

Nuclear remains an unpopular energy option in Japan and the country will reboot only a fraction of the 54 reactors it had before the disaster.

Six reactors at the Fukushima No. 1 nuclear power plant are being dismantled in a decadeslong exercise that is fraught with technological challenges and radioactive waste. Operators have decided to decommission another 10 units across the country since Fukushima. The Nuclear Regulation Authority created new safety standards from scratch after the disaster highlighted failings in the industry and its overseers. All reactors must be re-licensed before restarting.

Yet Japan's nuclear industry, which before Fukushima operated the world's third-largest number of reactors and provided about 30 percent of the country's electricity, has staged a significant recovery.
The turnaround has exceeded expectations of analysts and the utilities themselves. Kansai Electric Power and Kyushu Electric Power, for instance, have won approval to restart or are on course to win approval for all the reactors they applied to re-license.
Those units are far from Tokyo and are pressurised water reactors (PWR), unlike the boiling water reactor (BWR) designs favored in eastern Japan, including those that melted down at Fukushima.

Many court cases are pending for reactors in the eastern part of the country. Local political support varies, and the regulator is locked in disputes with operators over earthquake risk assessment.

The older BWR technology used in many of the reactors under review is also an issue because the stigma of Fukushima hangs over them.

“When you come to the BWRs, the issue becomes very politicized,” said Nobuo Tanaka, the chairman of the Sasakawa Peace Foundation who was the head of the International Energy Agency between 2007 and 2011 after a stint in the industry ministry.

The reputation of Fukushima plant operator Tokyo Electric Power Company Holdings Inc. also looms large, Tanaka said.

“Tepco does not have any support as a nuclear operator,” he said. The utility has to be removed from the equation before progress on BWR reactors can be made, he said.
Tepco has reached the first stage of approval, but faces strong opposition from local residents. But Japan’s utility lobby group said progress was being made.

“The safety reviews of PWR plants took time but they have been progressing steadily and there have been some developments in the BWR category as well,” Satoru Katsuno, the chairman of Japan’s federation of electric utilities and president of Chubu Electric, said of the outlook for restart approvals.

Chubu Electric has been locked in a dispute for years with the regulator over disaster resilience measures at its Hamaoka plant, which uses BWR reactors.

The analysis suggests that Japan will rely on fossil fuels, particularly liquefied natural gas and coal, as the pace of renewables expansion slows. That will make it harder to meet its emissions targets under international agreements.

The government estimates costs for replacement fuel — mostly LNG — to compensate for idled reactors totaling ¥14.6 trillion across the industry in the six years through March.

The lack of realistic energy targets makes it harder for the industry to plan for investment, utility officials say. And the issue of disaster resilience is not going away: a big earthquake struck Hokkaido in September and left a nuclear plant reliant on backup generators.

In careful moves, Japan's nuclear industry makes a comeback

http://www.asahi.com/ajw/articles/AJ201811020021.html

REUTERS
IKATA, Ehime Prefecture--On a side street near a darkened shopping arcade full of abandoned storefronts in southwestern Japan, the Sushi Ko restaurant is unusually busy on a weekday.

Balancing a tray full of drinks, Sachiyo Ozaki said most of her restaurant's customers were there because of an industry shunned elsewhere: nuclear power.

"He drives a minivan to take workers to the plant," she said, gesturing towards a man sitting at the counter. Pointing to another man sipping a beer, she added, "And he works in construction, so they've been busy, too."

"We're all for nuclear power, and you can print that," Ozaki said.

In the mostly residential neighborhood around her restaurant, hotel rooms and local inns were also packed with workers preparing to reopen Shikoku Electric Power's Ikata nuclear plant, nestled next to Japan's inland sea at the base of the verdant Sadamisaki peninsula.

Nearly eight years after an earthquake and tsunami triggered nuclear meltdowns at Tokyo Electric Power's Fukushima No. 1 nuclear power plant, the battered industry is making a quiet and somewhat unexpected return in Japan.

Ikata is a poster child for that recovery. In September, a court reversed a decision that had idled Shikoku Electric's sole nuclear reactor for about a year, paving the way for the operator to re-open the facility last week.

Regional utilities like Shikoku Electric have aggressively fought a string of lawsuits since 2011, hiring veteran lawyers to beef up their legal teams. At the same time, they wooed towns where nuclear plants are based, visiting with residents door to door while the government kept up a stream of generous subsidies for local projects.
Thanks in large part to this strategy, Japan is on track to have nine reactors running in the near future.

That is a far cry from the 54 running before 2011--all of which were idled after the Fukushima disaster--but more than analysts and experts expected, considering it seemed at the time like the end of the road for the country's nuclear industry.

A Reuters analysis calculates that as few as six more reactors are likely to restart within the next five years, eight will mostly likely be mothballed and that the prospects for two dozen others is uncertain.

Despite that cloudy outlook, nuclear power recently overtook renewables like wind and solar in Japan's energy mix for the first time since Fukushima.

COURT BATTLES

Japan embraced nuclear power after World War II, spurred by the promise of clean energy and independence from foreign suppliers.

But the botched Fukushima disaster response sowed public distrust in the industry and the government.

Given that skepticism, some see a recent run of court victories by utilities as the resurgence of an alliance of industry, government and host communities that for decades promoted the construction of nuclear facilities.

"If our losing streak continues, we could see 20 to 25 reactors come back online," says Hiroyuki Kawai, a prominent anti-nuclear lawyer who represented citizens in a suit against Shikoku Electric.

Since 2011, hundreds of citizens represented by volunteer lawyers like Kawai have filed nearly 50 lawsuits against the Japanese government and utilities in 25 district and appellate courts.

In Ikata, Shikoku Electric spent months gaining approval for a restart from the tougher post-Fukushima regulator, rebooting one of its plant's three reactors in 2016. But in December 2017, an appellate court issued a temporary injunction keeping the reactor, already idled for routine maintenance, shut down for nine more months.

In response, the company pulled more staff into its legal department and drafted its head of nuclear power to supervise the team. The utility also recruited outside lawyers who had handled cases for other operators.

"There are only a handful of lawyers knowledgeable about nuclear litigation, so they're popular and sought after," said Kenji Sagawa, the deputy general manager of the company's Tokyo office.

Yoshiaki Yamanouchi, 76, began his career in nuclear litigation in 1973 when he represented Shikoku Electric in a landmark suit brought by Ikata residents seeking to stop the plant from opening.

He still represents the utility and works with other companies, advising younger lawyers fighting similar cases, which he calls "superficial," in far-flung district courts.

"Utilities, in particular Shikoku, have gotten much smarter about fighting for the plants they know they can reopen and mothballing others that would cost too much time and money," Yamanouchi said. The utility is decommissioning two of the three reactors at Ikata.

Shikoku Electric would not disclose how much it has spent fighting legal challenges, but said it was a fraction of the cost of idling a plant.

Every month a nuclear reactor sits inoperative, the utility spends 3.5 billion yen ($31 million) for additional fuel at its conventional power plants. Shikoku has also spent 190 billion yen on safety upgrades to meet stricter rules set by the Nuclear Regulation Authority.

Activists have seen some victories. Western Japan's Kansai Electric Power Co., Inc., has had its reactors slapped with temporary injunction orders multiple times over the years. All of these decisions were later overturned by higher courts.

"Before Fukushima, these utilities won by default--now, they have to work harder," said Yuichi Kaido, a lawyer who has spent three decades dueling Yamanouchi in court.

Shikoku Electric still faces several lawsuits and injunction requests. A Hiroshima court rejected a request from residents to extend the suspension of the Ikata reactor on Oct. 26, a day before the operator restarted it.

A COMPANY TOWN

The quiet revival of Japan's nuclear industry is most tangible in rural areas like Ikata, which are home to the bulk of the country's nuclear plants.

Ikata is best known for its "mikan" mandarin oranges harvested on terrace farms on the sides of steep hills overlooking the Seto Inland Sea and Uwa Sea.

The town, with 9,500 residents, relies on nuclear power for a third of its annual revenue. Since 1974, Ikata has received more than 101.7 billion yen in such payments.

These funds literally built the town; Ikata's roads, schools, hospitals, fire stations and even five traditional "taiko" drums for festivals were all paid for with subsidies.

"My biggest struggle now is finding one or two more pillars for this town other than nuclear power," said Ikata Mayor Kiyohiko Takakado.

The town and utility's mutual dependence stretch back decades.

Kiyokichi Nakamoto was a city councilman in Ikata when he successfully wooed the utility to his hometown. On the walls of the dim parlor of his home are framed commendations from two prime ministers, thanking him for his contributions to Japan's energy policy.

"We were a poor village with only farming and fishing," the 90-year old said. Had the town failed to attract the plant, Ikata would have gone broke, Nakamoto said.

In the wake of the Fukushima disaster, Shikoku Electric campaigned to reassure residents of their plant's safety. Employees wearing the company's blue uniforms went from house to house to explain how their plant was different from Fukushima No. 1--and therefore safe.

"If something like Fukushima happened here, our reputation would be destroyed in an instant," said orange farmer Shigeto Suka, 54, as he checked the still-green mikan on branches.

He and other farmers in Yawatahama, a neighboring town 15 kilometers from the plant, worry that even a hint of contamination would devastate their brand.

After the 2011 nuclear disaster, Fukushima's farmers and fishermen were unable to sell their produce because of fears over contaminated food. Dozens of countries still have restrictions on Fukushima produce.

For others in the area, the Ikata plant feels like an inextricable part of life.

Hiroshi Omori, 43, spent most days over the summer at Shikoku Electric's visitors' house overlooking the Ikata plant. His three young children take free art classes there while Omori and other parents wait in air-conditioned rooms sipping water and tea.

But Ikata is projected to shrink to 5,000 residents over the next 20 years, and Takakado recently said he found it hard to imagine an industry that could replace nuclear power.
This year he joined dozens of other mayors across Japan to voice their support for the industry and ask the government to clarify its position on building new plants or replacing old ones.

"I'm just trying to prevent the town from losing even more people," he said.

Turnaround?

November 1, 2018

Japan's nuclear industry growing but likely to miss government's 2030 target

https://www.japantimes.co.jp/news/2018/11/01/national/japans-nuclear-industry-growing-likely-miss-governments-2030-target/#.W9sHzzGNyos

by Aaron Sheldrick **and** Osamu Tsukimori
Reuters
The domestic nuclear industry will miss a government target of providing at least a fifth of the country's electricity by 2030, analysis shows, but the sector is showing signs of life more than seven years since the Fukushima crisis.

With eight reactors running and one more set to come online in November, nuclear has this year overtaken nonhydro renewables in power output for the first time since the 2011 catastrophe, when all of the country's nuclear plants were idled.

Yet operators can expect as few as six units to restart in the next five years, and fewer than 20 by 2030, the analysis shows. That is far short of the 30 needed to meet the government target reiterated this year.

Based on the analysis, the world's third-largest economy may get about 15 percent of its power from nuclear in 2030, compared with a government target of 20 to 22 percent.

"It's impossible to meet the target, that's pretty much confirmed," said Takeo Kikkawa, an energy studies professor at Tokyo University of Science, who sat on an official panel that reviewed the country's energy policy this year.

He said he did not expect another round of restarts before 2020.

One major trading house predicts nuclear will account for 14 percent of power production in 2030, according to a presentation given at a private seminar this year and shown to Reuters.

Nuclear remains an unpopular energy option in Japan and the country will reboot only a fraction of the 54 reactors it had before the disaster.

Six reactors at the Fukushima No. 1 nuclear power plant are being dismantled in a decadeslong exercise that is fraught with technological challenges and radioactive waste. Operators have decided to decommission another 10 units across the country since Fukushima. The Nuclear Regulation Authority created new safety standards from scratch after the disaster highlighted failings in the industry and its overseers. All reactors must be re-licensed before restarting.

Yet Japan's nuclear industry, which before Fukushima operated the world's third-largest number of reactors and provided about 30 percent of the country's electricity, has staged a significant recovery.

The turnaround has exceeded expectations of analysts and the utilities themselves.

Kansai Electric Power and Kyushu Electric Power, for instance, have won approval to restart or are on course to win approval for all the reactors they applied to re-license.
Those units are far from Tokyo and are pressurised water reactors (PWR), unlike the boiling water reactor (BWR) designs favored in eastern Japan, including those that melted down at Fukushima.

Many court cases are pending for reactors in the eastern part of the country. Local political support varies, and the regulator is locked in disputes with operators over earthquake risk assessment.

The older BWR technology used in many of the reactors under review is also an issue because the stigma of Fukushima hangs over them.

"When you come to the BWRs, the issue becomes very politicized," said Nobuo Tanaka, the chairman of the Sasakawa Peace Foundation who was the head of the International Energy Agency between 2007 and 2011 after a stint in the industry ministry.

The reputation of Fukushima plant operator Tokyo Electric Power Company Holdings Inc. also looms large, Tanaka said.

“Tepco does not have any support as a nuclear operator,” he said. The utility has to be removed from the equation before progress on BWR reactors can be made, he said.
Tepco has reached the first stage of approval, but faces strong opposition from local residents. But Japan’s utility lobby group said progress was being made.

“The safety reviews of PWR plants took time but they have been progressing steadily and there have been some developments in the BWR category as well,” Satoru Katsuno, the chairman of Japan’s federation of electric utilities and president of Chubu Electric, said of the outlook for restart approvals.

Chubu Electric has been locked in a dispute for years with the regulator over disaster resilience measures at its Hamaoka plant, which uses BWR reactors.

The analysis suggests that Japan will rely on fossil fuels, particularly liquefied natural gas and coal, as the pace of renewables expansion slows. That will make it harder to meet its emissions targets under international agreements.

The government estimates costs for replacement fuel — mostly LNG — to compensate for idled reactors totaling ¥14.6 trillion across the industry in the six years through March.

The lack of realistic energy targets makes it harder for the industry to plan for investment, utility officials say. And the issue of disaster resilience is not going away: a big earthquake struck Hokkaido in September and left a nuclear plant reliant on backup generators.

Japan to reconsider Turkey nuclear project

December 4, 2018

Japan to scrap Turkey nuclear project
https://asia.nikkei.com/Economy/Japan-to-scrap-Turkey-nuclear-project?fbclid=IwAR1E1VLkj7ksYepPmzqA3NRnO9TczA7a_iHYJeVezQN86Z-xZheO26fooCE

asia.nikkei.com - décembre 4, 2018
TOKYO -- A Japan-led public-private consortium is set to abandon a Turkish nuclear power project that had been touted as a model for Tokyo's export of infrastructure, Nikkei has learned.

The delayed project's construction costs have ballooned to around 5 trillion yen ($44 billion), nearly double the original estimate, making it difficult for lead builder Mitsubishi Heavy Industries and its partners to continue with the plans.

The increase was due to heightened safety requirements in the wake of the 2011 meltdown at Japan's Fukushima Daiichi nuclear power plant. The recent fall in the Turkish lira has also contributed to the cost increases.

The decision to cancel the project, now in final negotiations among the parties, comes as a blow to Japan's nuclear industry, which is looking for avenues for growth overseas as it becomes increasingly unlikely that a new plant will be built at home post-Fukushima.

The Japanese and Turkish governments agreed in 2013 on the project, with an alliance of Japanese and French businesses centered on Mitsubishi Heavy to build four reactors in the city of **Sinop on the Black Sea**. Initial plans had construction beginning in 2017, with the first reactor coming online in 2023.

Mitsubishi Heavy submitted the revised cost estimate to the Turkish government in a late-July report. Though the company worked to rethink the overall costs, apparently no compromise could be reached with the Turkish government on financing terms, as well as prices for the electricity generated by the plant. Top Mitsubishi Heavy executives have said the company's decisions would be based "within the scope of what is economically rational."

Despite the nuclear plant's cancellation, the Japanese government intends to continue support for Turkey's energy sector, and new frameworks for cooperation are under consideration. Details remain to be settled, but building an advanced coal plant with reduced carbon dioxide emissions appears to be among the proposals on the table.
Japan's Ministry of Economy, Trade and Industry and nuclear plant builders such as Mitsubishi Heavy have worked in tandem to pursue nuclear projects overseas. With the Turkish plan canceled, the only remaining overseas project will be a plant in the U.K. planned by Hitachi. Hitachi signed a memo to advance the project in June with the British government, and parties are hurrying to iron out a final deal. But hurdles remain, including requests from London to trim the total cost.

Japan's effort to line up more overseas projects is aimed in part to maintain the scale of the country's nuclear power industry, as well as its skill in related technologies. If the energy sector remains mired in a harsh business environment, industry consolidation could accelerate.

In 2017, global investment toward building new nuclear projects plunged roughly 70% year on year to $9 billion, according to the International Energy Agency. With safety costs rising, nuclear has grown less competitive with other forms of energy.

A number of aging Japanese reactors are set to be decommissioned soon, with Kansai Electric Power planning to scrap the Nos. 1 and 2 reactors at its Oi plant in Fukui prefecture, and Tohoku Electric Power the No. 1 unit at a plant in Miyagi Prefecture's Onagawa. Meanwhile, new nuclear projects have hit a standstill in the face of deep public wariness.

December 7, 2018

Japan reconsidering Turkey nuclear project

https://www3.nhk.or.jp/nhkworld/en/news/20181207_15/

The Japanese government and a consortium of private firms are reconsidering involvement in a nuclear power plant project in Turkey. They say the cost of the planned venture has skyrocketed.

The government has been supporting the consortium consisting of Mitsubishi Heavy Industries and other private Japanese firms.

The export of infrastructure is a pillar of the Abe administration's growth strategy.

After conducting research into the project, the consortium decided that the cost of building a nuclear power plant on the Black Sea coast would be over 35 billion dollars, more than double the initial estimate.

The increase is due to higher safety requirements implemented after the 2011 disaster at Japan's Fukushima Daiichi nuclear plant.

The Japanese side had asked Turkey to increase the purchasing price of power generated at the nuclear plant.

But Japanese Prime Minister Shinzo Abe and Turkish President Recep Tayyip Erdogan were unable to reach consensus in talks in Argentina earlier this month.

Japan's trade and industry minister Hiroshige Seko is expected to discuss the matter with Turkish government officials as early as January.

Taiwan changes targets

06.12.2018_No242 / News in Brief

Taiwan's Cabinet Confirms Plans To Abolish 2025 Nuclear Phaseout Target

https://www.nucnet.org/all-the-news/2018/12/06/taiwan-s-cabinet-confirms-plans-to-abolish-2025-nuclear-phaseout-target
Policies & Politics
6 Dec (NucNet): Taiwan's cabinet today announced it has agreed to abolish the target it had previously set of making Taiwan a nuclear-free country by 2025, instead opting to make the planned nuclear phaseout a more long-term objective.
The announcement follows a referendum last month in which voters decisively rejected the nuclear phaseout, 59% to 41%.

The referendum asked whether voters agreed to repeal a paragraph in Article 95 of the Electricity Act, which states that "all nuclear-energy-based power-generating facilities shall cease to operate by 2025".

Press reports in Taiwan quoted cabinet spokeswoman Kolas Yotaka as telling a press conference today that the cabinet had agreed to delete Article 95-1 of the Electricity Act and that the proposal would be sent to the Legislative Yuan, or parliament, for consideration.

Ms Totaka said that during the meeting, Premier Lai Ching-te said the government's goal of promoting a non-nuclear Taiwan remained unchanged, but the deadline will be cancelled, according to the report.

The so-called 2025 Non-Nuclear Homeland goal was a policy pledged by president Tsai Ing-wen during the 2016 presidential election. The goal was to phase out nuclear power by 2025, while increasing the percentage of renewable energy and natural gas, and reducing the use of coal.

Taiwan has four commercially operational nuclear power reactors at two sites – Kuosheng and Maanshan. According to data by the International Atomic Energy Agency, nuclear power provided about 9% of Taiwan's electricity output in 2017.

Chinshan, Taiwan's third nuclear power station, has two units which were permanently shut down earlier this month, according to the IAEA. Operator Taipower announced yesterday that it intends to decommissions Chinshan-1.

Construction of a fourth nuclear power station at Lungmen was suspended following the March 2011 Fukushima-Daiichi accident in Japan. Two of four planned units were almost completed at the time the project was discontinued.

Hitachi may delay decision on Welsh plant

December 17, 2018

Hitachi may delay final decision on nuclear plant project in Wales
https://www.japantimes.co.jp/news/2018/12/17/business/corporate-business/hitachi-may-delay-final-decision-nuclear-plant-project-wales/#.XBgJJ2lCeos

JIJI
Hitachi Ltd. may have to delay its final decision, planned for 2019, on a nuclear plant construction project in Britain.

By the end of this year, Hitachi hoped to select a company that will acquire an equity stake in a British nuclear business subsidiary that will operate the project. However, according to informed sources, it is now difficult to secure an investor by the year-end.

Therefore, a final decision on the project will likely be delayed. This in turn could force a postponement of the start of plant operations, which is currently slated for the early 2020.

Through the subsidiary, Hitachi plans to start constructing two reactors on the island of Anglesey in Wales as early as 2020.

To reduce management risks associated with the project, Hitachi aims to lower its equity ownership of the subsidiary from the current 100 percent to less than 50 percent.

But Hitachi's negotiations with the British government on financial assistance to ensure profitability of the project have not been concluded, and the company has yet to start full efforts to invite applications for investment in the subsidiary, the sources said.

With the total project cost estimated at ¥3 trillion, well over the initial plan, Hitachi agreed in June with the British government to start full-scale negotiations in order to get the project going.

The two sides have discussed the possibility of the British government providing loans of more than ¥2 trillion or acquiring an equity stake worth some ¥300 billion, but they are believed to have not yet reached an agreement.
Prime Minister Shinzo Abe may hold talks with his British counterpart, Theresa May, in January.

Hitachi plans to decide carefully whether the nuclear project is still feasible while looking at the results of the bilateral summit talks, the sources said.

Focusing on nukes will lead Japan nowhere

December 25, 2018

Editorial: Japan must ditch nuclear plant exports for global trends in renewable energy
https://mainichi.jp/english/articles/20181225/p2a/00m/0na/011000c

Projects to export nuclear power plants, a pillar of the "growth strategy" promoted by the administration of Prime Minister Shinzo Abe, appear to be crumbling.

- 【Related】Hitachi may freeze British nuclear project due to swelling costs
- 【Related】Effects of suspected radiation exposure seen in Fukushima wild monkeys: researchers
- 【Related】Residents of nuclear crisis hit Namie to sue TEPCO, gov't after settlement talks fail

Factors behind the failures include ballooning construction costs due to strengthened safety standards after the triple core meltdowns at Tokyo Electric Power Co.'s (TEPCO) Fukushima Daiichi Nuclear Power Station in March 2011, and growing anti-nuclear sentiments around the world.

Nothing else can be said but that the export projects have effectively failed. The prime minister's office and the Ministry of Economy, Trade and Industry must bear the responsibility of continuing to promote these exports despite a massive change in the attitude toward nuclear power plants.

"We are really stretched to our limit," Hitachi Chairman Hiroaki Nakanishi recently said of the company's nuclear power plant construction plan in Britain. The statement came at a regular press conference of the Japan Business Federation, or Keidanren, indicating that continuing the project is not feasible.

Hitachi coordinated closely with the Japanese government to advance the U.K. project. The company was to build two nuclear power reactors in midwestern Britain through a local subsidiary, and to start operating the facilities in the first half of the 2020s.

But, the total estimated cost of the project has skyrocketed from the initial figure of 2 trillion yen to 3 trillion yen due to growing safety measure costs. Hitachi, hoping to distribute financial risk, sought investments from major power utilities and other firms, but the negotiations hit a snag due to the lowered profitability of the project.

In a bid to secure profits at an early stage, Hitachi requested that the British government raise the price of the electricity to be generated by the plants, which was guaranteed to be purchased in advance. This arrangement also hit a wall as confusion spread in the British political sphere over the nation's planned exit from the European Union. Hitachi, which has a stake in the local subsidiary, would lose some 300 billion yen if the project was cancelled.

Similar trouble has arisen in Turkey. A plan to export nuclear power plants, which began from a close relationship between Prime Minister Abe and Turkish President Recep Tayyip Erdogan, has also run aground.
Under the original plan, Mitsubishi Heavy Industries and other businesses were to build four midsized reactors in Turkey along the coast of the Black Sea at a total estimated cost of 2.1 trillion yen. The amount has more than doubled to 5 trillion yen, due in part to increased cost estimates for earthquake-proof measures. This development now requires the Japanese and Turkish governments to extend additional financial support for the project, but the two sides have apparently failed to reach an agreement.

The Abe administration has thrown its weight behind the export of nuclear power plants as a major element of its economic "growth strategy," with the trade ministry choreographing the moves for the projects. The ministry regards nuclear power generation as one of the main sources of power generation, always protecting and promoting the nuclear power industry.

However, after the Fukushima nuclear disaster in 2011, building such plants within Japan has become difficult, and the ministry hoped to maintain the size of the nuclear power industry through exports and the transference of relevant technologies and human resources to the next generation. But this has ignored the fact that international trends have shifted since the disaster.

The construction cost for nuclear power plants has grown exponentially with the increased focus on safety measures, while renewable energy sources such as solar power have become cheaper with the rapid expansion of their use. As such, the relative price competitiveness for nuclear power reactors has declined; it can no longer be called an "inexpensive energy source."

According to the International Energy Agency (IEA), global investments for new nuclear power plant construction in 2017 dropped to 30 percent of the previous year's figure. Global policy is moving away from nuclear power plants and instead tipping toward renewable energy sources.

The failure to reflect this trend led to the huge losses incurred by Toshiba Corp., which bought Westinghouse Electric Co. with backing from the trade ministry to pursue its troubled nuclear power projects in the United States.

In 2012, a national referendum in Lithuania voted down a project to build a Hitachi nuclear power plant, and then in 2016, Vietnam scrubbed a similar construction plan. The same year, Japan signed a nuclear cooperation agreement with India, eyeing exports of nuclear power plants despite concerns about the proliferation of nuclear materials to the nuclear weapon state outside of the Nuclear Non-proliferation Treaty. Still, the export plan has yet to materialize. It is clear that the export of nuclear power plants has been backed into a corner for quite some time already.

It is Japan that caused one of the world's worst nuclear accidents, and is now working on decommissioning the damaged reactors in a process that will take decades to complete. Many people in Japan hold deeply rooted feelings against the government's placement of nuclear power plant exports as a pillar of the nation's growth strategy.

In response, the government has simply justified the projects by saying they will contribute to developing countries with a growing power demand by offering a cheap source of power to support their economic growth. Rising construction costs, however, has rendered this explanation moot.

Japan still has many nuclear power plants to run, and the decommissioning of older plants will soon be in full-swing. The latest technology and skilled experts are vital for these projects to be completed successfully.

Continuing to focus on nuclear power export, however, will lead Japan nowhere. The government should take another look at global trends, and review the basis of its nuclear power policy to rid Japan of nuclear power as soon as possible.

Japan's nuke exports : Rising safety costs, dwindling profitability

January 4, 2019

Japanese gov't plan to export nuclear power technology floundering
https://mainichi.jp/english/articles/20190104/p2a/00m/0bu/030000c

TOKYO -- The Japanese government's strategy to export nuclear power technology has run aground amid rising safety costs and deteriorating prospects for project profitability. While the government has aimed to maintain the country's nuclear technology and expert resources through construction of atomic reactors abroad amid stalled nuclear plant development at home, its projects with Turkey and Britain have both hit snags.

- 【Related】Editorial: Japan must ditch nuclear plant exports for global trends in renewable energy
- 【Related】Hitachi may freeze British nuclear project due to swelling costs
- 【Related】Japan gov't, M'bishi Heavy to pull out of Turkey nuclear project

"The Turkish government is in the midst of evaluating the project. I believe it will respond to us in some way or other," said Shunichi Miyanaga, president of Mitsubishi Heavy Industries Ltd., in mid-December about a plan to build a nuclear power plant in Sinop, northern Turkey. Miyanaga's comment suggested that the fate of the project had been left up to the Turkish government.

At the end of July last year, Mitsubishi Heavy told the Turkish government that the cost of the project would total somewhere around 5 trillion yen, more than doubling from the original estimate of roughly 2.1 trillion yen. As the plan envisages recovering the costs through profits from power generation at the nuclear facility, it would not become profitable unless Turkey purchases the generated electricity at a higher price than originally expected. If Turkey does not comply with the increased burden, Japan would withdraw from the plan.

The nuclear plant project was pitched by Prime Minister Shinzo Abe to then Turkish Prime Minister Recep Tayyip Erdogan in 2013. At the time, Abe vowed at a press conference in Ankara, "We will share our experiences and lessons from the (2011) disaster at the nuclear plant (run by the Tokyo Electric Power Co. in Fukushima) with the rest of the world, and will strive to contribute to enhancing the safety of nuclear power generation."

However, the catastrophe prompted the international community to turn a wary eye toward nuclear power, leaving the costs for safety measures at nuclear plants to swell. The steep fall in the Turkish lira over the past year by more than 30 percent also added to the project's deteriorating profitability.

Under these circumstances, Tokyo plans to propose to Ankara that it would provide comprehensive energy cooperation in such spheres as coal-fired thermal power generation and liquefied natural gas, in place of the atomic plant project. Because the nuclear power project is based on an agreement struck by both leaders, such a proposal by Tokyo could face a backlash from Ankara, but Japan's focus is already shifting to how to withdraw from the project without undermining bilateral diplomatic ties with Turkey.

Meanwhile, a nuclear plant construction project undertaken by Hitachi Ltd. on the Isle of Anglesey in central Britain has also run into rough waters, after the project's costs soared to approximately 3 trillion yen, about 1.5 times the initial estimate.
In May last year, Hitachi Chairman Hiroaki Nakanishi held talks with British Prime Minister Theresa May, where the latter agreed to expand her government's support for the project. However, British citizens have been wary of the scheme out of concern that it could lead to rising electricity bills should Japan's request to raise the sale price of electricity be accepted.

As the May administration is suffering from sagging approval ratings amid turmoil over Britain's exit from the European Union, it is becoming increasingly difficult for London to comply with an increased burden. At home, Japanese companies are also becoming more reluctant to invest in the project out of fears of poor profitability and accident risks. Given the circumstances, Tokyo is also likely to exit the project.

The Abe administration has made the export of nuclear power technology a pillar of its growth strategy, but to little avail thus far. While the government intends to pursue measures to counter China and Russia's aggressive drive to export nuclear plants by stepping up financial support for partner countries and through other measures, such a strategy may end up bringing more harm than good.

"The empirical values of China and Russia, where nuclear power plants are still being built, are considerably high (compared with other countries including Japan)," said Tomoko Murakami of the Institute of Energy Economics, Japan. In China, where 100 nuclear reactors are planned to be operational by 2030, state-owned companies are securing a spate of orders for nuclear power projects mainly in emerging countries, with the financial backing from the Chinese government. Russia also is said to undertake the whole process from leasing nuclear fuel to other countries to reprocessing their spent fuel, with the possible aim of boosting its diplomatic and security influence as well.

Officials in the Japanese nuclear power industry are finding a ray of hope in the Czech Republic's plan to build a nuclear power plant, which has also attracted attention from China, Russia, South Korea and a joint venture of Mitsubishi Heavy and France's Framatome. However, financial issues are again casting a shadow over the plan.
Tadashi Narabayashi, a specially appointed professor at the Tokyo Institute of Technology, warns that at this rate, "Japan would lose its own atomic power industry, and would have to import Chinese-made nuclear plants 20 years from now. It's a critical situation."

Meanwhile, a senior official of an economy-related government body said, "It is difficult for Japanese manufacturers, which can't even build nuclear plants in their own country, to win confidence (abroad)," suggesting that the government's strategy to export nuclear power technology in itself is unreasonable.

Hitachi to suspend UK nuke project

January 11, 2019

Hitachi preparing to suspend Anglesey nuclear power project in U.K.
https://www.japantimes.co.jp/news/2019/01/11/business/corporate-business/hitachi-preparing-suspend-nuclear-power-project-u-k/#.XDkAt2lCeos

JIJI
Hitachi Ltd. is in the final stages of preparations to suspend a project to build a nuclear power plant in the U.K., it was learned Friday.

The major heavy machinery-maker will confirm the move at a board meeting that could be held as early as next week, sources with knowledge of the matter said.

Hitachi is settling on the suspension as it is unclear whether the company will be able to receive additional assistance from the U.K. government, the sources said. It has had difficulty finding investors for a subsidiary that will operate the plant amid concerns over profitability.
The firm is expected to book up to about ¥300 billion in related losses in the business year through March, the sources said.

The focus of the project is the construction of a nuclear power plant on the island of Anglesey in north Wales, which had been scheduled to go into operation in the early 2020s.

Due to the growing likelihood that the project's costs will far exceed the initial estimate, reaching ¥3 trillion, the company had proposed to London a review of the project including the level of financial assistance that would be available to the firm.

At a new conference on Thursday after a meeting with her Japanese counterpart, Shinzo Abe, U.K. Prime Minister Theresa May said that whether or not the project would go ahead was a commercial decision for Hitachi, leaving the future course of the project unclear.

The firm plans to suspend the project and reduce the related workforce, the sources said.

The company said in a statement that there has been no decision on the project, although it is closely examining a possible suspension and the potential financial impact from the perspective of economic rationality.

Hitachi to suspend all work on UK nuclear plant
https://asia.nikkei.com/Business/Business-Deals/Hitachi-to-suspend-all-work-on-UK-nuclear-plant

Funding deadlock looks set to sink Japan's last overseas nuclear project

TOKYO -- Hitachi plans to put a U.K. nuclear power project on hold as negotiations with the British government over funding hit an impasse, all but closing the book on Tokyo's vision for nuclear infrastructure exports.

The Japanese industrial conglomerate's board is expected to officially decide next week to suspend all work on the plant, including design and preparations for construction. Hitachi will freeze the roughly 300 billion yen ($2.77 billion) in assets held by its British nuclear business and write down their value, likely booking a loss of 200 billion yen to 300 billion yen for the fiscal year ending in March.

The move would bring to a halt Japan's last active overseas nuclear project after the news last month that a Japanese-led consortium including Mitsubishi Heavy Industries was scrapping a project in Turkey. With the aversion to nuclear power that took hold after the March 2011 Fukushima Daiichi disaster showing

little sign of abating, prospects look grim for a sector that the Japanese government had positioned as a pillar of its infrastructure export drive.

Hitachi had taken on the planned construction of two reactors on the Welsh island of Anglesey after acquiring U.K.-based Horizon Nuclear Power in 2012.

After Hitachi Chairman Hiroaki Nakanishi discussed the project with British Prime Minister Theresa May last spring, London agreed to arrange more than 2 trillion yen in financing for the project, about two-thirds of the total cost. Japanese and British public-private consortia and Hitachi would each cover a third of the remaining 900 billion yen.

But Hitachi had trouble finding corporate investors in Japan, with major utilities such as Tokyo Electric Power Co. Holdings and Chubu Electric Power proving reluctant to participate. The conglomerate asked London late last year for additional financing, but negotiations have made no headway, and mounting opposition to May's government within parliament over Brexit has raised questions about the future of U.K. nuclear policy.

<image: >

Hitachi set conditions on continuing its participation in the nuclear project in order to reduce its exposure to risk. It seeks to unload enough of its stake in wholly owned Horizon to take the company off its consolidated books, and it wants a guaranteed electricity price to ensure a steady stream of income once the plant goes online. But the odds of these requirements being met now look dim, which factored into the decision to halt the project.
The suspension will spare Hitachi from shelling out 3 billion yen to 4 billion yen a month on the plant.

The company is leaving the door open to a return. The project is "not being abandoned," a source close to Hitachi told Nikkei, suggesting the company would keep an eye on the situation and resume the project if possible.

While negotiations with London are apparently set to continue, reworking the project to the extent Hitachi requires will be no easy task. As things stand now, it appears likely that the company will ultimately be forced to bow out.

January 11, 2019

Hitachi to freeze UK nuclear power project, post $2 billion special loss – Nikkei

TOKYO (Reuters) - Hitachi Ltd (6501.T) has decided to freeze its 3 trillion yen nuclear project in Britain and to post **a special loss of about $2 billion** (1.6 billion pounds) for the year ending in March, the Nikkei business daily reported on Friday.
Hitachi is set to vote on the planned suspension at its board meeting next week, the Nikkei said without citing sources.
Hitachi's Horizon Nuclear Power unit has struggled to find investors for its plans to build a new power plant in northern Wales.
Hitachi said the asset value of the plant in Wales was 296 billion yen as of the end of September. The special loss from freezing the project is expected to be 200 billion to 300 billion yen, according to the Nikkei.
A Hitachi spokesman said nothing has been decided on the suspension.
Hitachi was hoping a group of Japanese investors and the British government would each take a one-third stake in the equity portion of the project. A company source has said the project would be financed one-third by equity, two-thirds by debt.
The Nikkei report comes after another Japanese industrial conglomerate, Toshiba Corp (6502.T**), scrapped its British NuGen project after its U.S. reactor unit Westinghouse went bankrupt and it failed to sell NuGen to South Korea's Korea Electric Power Corp.**
Shares of Hitachi rose by as much as 6 percent on the Tokyo stock exchange after the report.

Interview with Koizumi

January 17, 2019

Koizumi says Japan must say 'no' to nuclear energy
http://www.asahi.com/ajw/articles/AJ201901170010.html

THE ASAHI SHIMBUN

When he was prime minister, Junichiro Koizumi championed the use of atomic power to generate electricity.

Then the 2011 earthquake and tsunami disaster struck, triggering a crisis at the Fukushima No. 1 nuclear power plant in Fukushima Prefecture.
Koizumi, in office from 2001 to 2006, and widely regarded as one of Japan's most popular postwar leaders, started reading up on the nuclear issue, and had a change of heart.

Koizumi, 76, published his first book by his own hand titled “Genpatsu Zero Yareba Dekiru” (We can abolish all nuclear plants if we try) in December. It is available from Ohta Publishing Co.

In it, he lambasts consumers for lacking a sense of crisis and simply believing a serious accident like the Fukushima disaster will never happen again in Japan during their lifetime.

In a recent interview with The Asahi Shimbun, Koizumi said it was “a lie” to claim that nuclear power is “safe, low-cost and clean,” although that is precisely what he espoused when he held the reins of power.
* * *
Excerpts from the interview follow.

Question: An opinion poll by The Asahi Shimbun in February 2018 showed that 61 percent of people oppose the restart of idle nuclear reactors, and yet, reactors are successively being brought back online. What is your view about this?

Koizumi: Many people still support the zero nuclear power generation policy. When I teamed up with Morihiro Hosokawa, (a former prime minister), who ran for the Tokyo governor's election (in 2014), to call for abolition of nuclear power facilities, voters on the streets showed a positive reaction.

But now many people do not realize how dangerous nuclear reactors are. They probably believe a nuclear accident will never occur again while they live because of all the attention that has been paid to safety since the Fukushima crisis.

However, in the 2012 report compiled by the government’s panel to investigate causes of the disaster, the panel’s chair said, “Things that are possible happen. Things that are thought not possible also happen."

In other words, there are no totally safe technologies.

Q: Many people seemingly believe that they have no choice but to accept nuclear power because it costs less than other types of electricity generation and electricity rates are cheaper. Do you agree?

A: The argument is doubtful. Nuclear power is relatively cheap just because the government covers part of the costs. Nuclear plants cannot be operated without assistance from the government. Private financial institutions would not extend loans to operators of nuclear facilities if the state did not provide guarantees.

Were it not for governmental support and taxpayers' money, nuclear power would be more expensive than other kinds of energy.

Renewable energy (such as solar and wind power) currently accounts for 15 percent of total power production in Japan. The percentage is much higher than before the Fukushima crisis. Even if costs slightly increase, citizens would accept the zero nuclear policy.

Q: Is it really possible to replace all the nuclear reactors with other sorts of power plants?

A: No reactors were operated for two years after the Fukushima disaster. But no power shortages were reported during the period. That means Japan can do without nuclear plants. It is a fact.

Q: During your tenure as prime minister (between 2001 and 2006), it emerged in 2002 that Tokyo Electric Power Co. had concealed problems at its nuclear facilities. Didn't that cause you to lose your trust in nuclear power even then?

A: No. Power supply is important and the risk of power failures could damage the economy. It was then said to be difficult to replace (nuclear plants that produced) 30 percent of the nation's electricity needs with other power sources.

As there were few facilities to generate power based on renewables at the time, I believed nuclear reactors were essential. I simply trusted the Ministry of Economy, Trade and Industry, which said "nuclear energy is safe, low-cost and clean."
But that was a big lie.

Although some people argued "nuclear plants are dangerous" even before the Fukushima crisis, I was deceived by the ministry and did not take their words seriously.
I did some soul-searching and decided I ought to spread the word that Japan can do without nuclear plants.

Q: You said "deceived." Are you working to rectify your past mistake?

A: Yes. I am touring across Japan as I am keen to share my thoughts with many people.

Q: The issue of nuclear plants and their safety has hardly featured in recent national election campaigns. What's your take on this?

A: The construction of a nuclear reactor is estimated at 1 trillion yen ($9.28 billion) now. Building reactors requires many materials, so many companies are involved in the nuclear power business.

Many tiny, small and midsize companies benefit from nuclear plants. Many of them insist that abolishing nuclear power would throw people out of work.

Some labor unions that support opposition parties are engaged in the nuclear power generation industry, though the (main opposition) Constitutional Democratic Party of Japan says it is in favor of the zero nuclear power policy.

Q: What do you think is important in realizing a nuclear-free society?

A: Prime Minister Shinzo Abe insists nuclear plants are essential, so many lawmakers remain silent about the issue. But there are lawmakers even in the (ruling) Liberal Democratic Party who support the zero nuclear power policy.

If Abe declares the state will abolish all nuclear plants, the situation will drastically change. Both ruling and opposition parties can cooperate over the issue.

Why hasn't the government set dream-inspiring goals to promote solar, wind and geothermal power generation?

Q: Could you explain the words in your book that "it is regrettable and irritating that I was deceived"?

A: When meeting with Abe, I always tell him, "Be careful not to be deceived by the economy ministry." But he just smiles a wry smile and does not argue back.

He should not miss the current political opportunity that he has the upper hand (to change the government's conventional nuclear energy policy).

Q: Do you talk with your son and Lower House lawmaker Shinjiro Koizumi about the issue of nuclear plants?

A: He knows my opinion all too well. He is still young, so he should do what he wants after gaining power. (This article is based on an interview by Asahi Shimbun Staff Writer Takashi Arichika.)

Hitachi pulls the plug of Wales nuke plant project

January 17, 2018

Hitachi scraps £16bn nuclear power station in Wales

https://www.theguardian.com/business/2019/jan/17/hitachi-set-to-scrap-16bn-nuclear-project-anglesey-wales

Japanese giant unable to agree deal with UK as fears grow for Anglesey atomic plant

Adam Vaughan

Hitachi has scrapped plans to build a nuclear power station in Wales, becoming the second firm in two months to abandon a major nuclear project and triggering “a full-blown crisis” for the UK energy’s strategy.

The £16bn Wylfa plant on Anglesey was meant to be the next in a line of new nuclear plants behind Hinkley Point C but the Japanese conglomerate failed to reach a deal with the UK government.

A Hitachi board meeting pulled the plug on mounting costs on Thursday, and the company said it would take a 300bn yen (£2.14bn) hit from axing Wylfa.
The move was a “significant blow” to the UK’s future energy supply plans, the Confederation of British Industry said.

Unions expressed dismay over the cancellation, which will involve around 300 job losses at Hitachi’s UK subsidiary, Horizon Nuclear Power, and about a thousand more in the supply chain. It will also mean an anticipated 9,000 construction jobs will not materialise.

A second Hitachi plant at Oldbury in Gloucestershire will be shelved too.
Duncan Hawthorne, CEO of Horizon Nuclear Power, said that the company had been unable to reach a deal in talks with London and Tokyo and was therefore suspending Wylfa and Oldbury.

“I am very sorry to say that despite the best efforts of everyone involved we’ve not been able to reach an agreement to the satisfaction of all concerned.”

The collapse of the power stations and the Moorside project that Toshiba scrapped in November means the government has a huge hole to fill in a decade’s time after old nuclear and coal plants have closed.

Together the three new nuclear plants would have supplied 15% of electricity demand.
Questions will be raised over whether ministers should redouble their efforts to make the numbers work for nuclear, or pivot to a new strategy that hugely expands the build-out of renewables.

Business secretary Greg Clark said the government had offered the company a “generous and significant” package of support. That included providing a debt facility for the project, taking a one third stake and a guaranteed price of power of up to £75 per megawatt hour for 35 years. The wholesale price is about £50 per MWh.

While far below the £92.50 awarded to EDF Energy for Hinkley Point C**, the Hitachi offer is still much higher than the** £57.50 for some windfarms in the early 2020s**, a price that is expected to fall even lower in government auctions later this year.**

Clark told MPs that renewables had been getting cheaper in the past five years while nuclear had become more expensive because of safety measures. “The challenge of financing new nuclear is one of falling costs and greater abundance of alternative technologies, so that it is being outcompeted,” he said.

However, Clark said he was still committed to new nuclear and would be publishing details of a new approach to financing in the summer.

The nuclear industry insisted it still had a key role to play. "The urgent need for further new nuclear capacity in the UK should not be underestimated, **with all but one of the UK's nuclear power plant due to come offline by 2030,"** said Tom Greatrex, chief executive of the Nuclear Industry Association.

Hinkley's developer, EDF Energy, said its own projects – which include plans for a site at Sizewell in Suffolk – were making good progress and showed "nuclear has a strong future in the UK."

Rebecca Long-Bailey, shadow business secretary, said: "Just two months ago, the government's lack of clarity over funding for new nuclear led Toshiba to withdraw from Moorside. That was a blow to the UK's energy security, its decarbonisation goals, and the economy of Cumbria.

"But with Hitachi's decision to withdraw from the Wylfa nuclear power plant, this triple blow has escalated into a full-blown crisis."

Labour said that Theresa May had questions to answer over whether she had raised the issue during meetings last week with the Japanese prime minister, Shinzo Abe. The Japanese side has said she did not.

Greenpeace said it believed Clarks's comments marked a shift in government realising that renewables rather than nuclear were the future.

"The government's thinking seems to have finally caught up with reality. If the UK's ageing energy policy is at last opened up to scrutiny, we must ensure that the main question is not how best to make the taxpayer cough up for new nuclear," said Dr Doug Parr, chief scientist for Greenpeace UK.

RenewableUK, the green energy trade body, said it had a "pipeline of shovel-ready" onshore windfarms that could help fill the gap left by failed nuclear plans. The government has blocked onshore wind power projects from competing for subsidies.

The Liberal Democrats said it was time for the UK to prioritise renewables, batteries and imports over nuclear.

Hitachi still owns the Wylfa site on Anglesey, and said it would continue to talk with the UK government about new nuclear projects.

Japan Govt. continues to back export of nuke technology

January 18, 2019

Japan to press on with nuclear export drive after Hitachi blow
https://mainichi.jp/english/articles/20190118/p2g/00m/0bu/081000c#cxrecs_s

TOKYO (Kyodo) -- The Japanese government said Friday it will continue to back the export of nuclear power technology as part of the country's growth strategy, a day after Hitachi Ltd. announced it has suspended a nuclear plant project in Britain.

- 【Related】Hitachi mulls 300 bil. yen loss on halt in UK nuclear project
- 【Related】Japanese gov't plan to export nuclear power technology floundering

"There won't be any changes to our policy," Economy, Trade and Industry Minister Hiroshige Seko told a press conference, even though Hitachi's latest decision will leave Japan with no major overseas nuclear power plant project.

Chief Cabinet Secretary Yoshihide Suga told a separate press conference it is "essential" to secure human resources and enhance the technological and industrial base for nuclear operations, which would also help Japan deal with the aftermath of the 2011 Fukushima Daiichi nuclear power plant disaster and ensure the safe operation of other reactors.

Hitachi effectively withdrew from a 3 trillion yen ($27 billion) plan to build two reactors in Wales, with President and CEO Toshiaki Higashihara saying Thursday it had reached "limits" regarding further investment in the project as a private entity.

Toshiba Corp. decided in 2017 to exit nuclear power businesses outside Japan after incurring huge losses in the United States, while Mitsubishi Heavy Industries Ltd. is leaning toward withdrawing from a nuclear project in Turkey.

The Japanese government has been seeking to export nuclear technology amid difficulties in building reactors at home due to safety concerns following the Fukushima crisis. It had hoped overseas projects would offer opportunities for Japanese engineers to hone their skills.

Progress toward restarting existing reactors in Japan has also been slow. The country has introduced stricter safety rules which require equipment upgrades, resulting in higher costs.

Plenty enough to do for the nuke industry without building new plants

January 20, 2019

Plans to sell nuclear plants overseas derailed

https://www.japantimes.co.jp/opinion/2019/01/20/editorials/plans-sell-nuclear-plants-overseas-derailed/#.XERs6WlCeos

With the decision by Hitachi Ltd. to "freeze" its plan to build two nuclear power reactors in the United Kingdom, all of the overseas nuclear power plant projects pursued by Japanese firms — with the backing of the government seeking to promote export of nuclear power technology as a key pillar of its efforts to boost infrastructure sales in overseas markets — have now effectively been derailed. Hitachi cited its judgments on the "economic rationality" of the U.K. project as the reason for halting the plan — an allusion to the declining profitability of the nuclear power business due chiefly to the surging cost of safety investments in the wake of the 2011 meltdowns at Tokyo Electric Power Company Holding's Fukushima No. 1 nuclear power plant.

Prime Minister Shinzo Abe has long taken the initiative to promote the overseas sale of Japanese nuclear power plants through top-level diplomacy. However, the nuclear power plant business cannot be a part of the nation's growth strategy if its business feasibility is in doubt. The government and related industries need to face up to the situation surrounding the nuclear power business — which continues to face difficulties domestically as well — and reassess the way forward.

The Fukushima nuclear disaster, triggered by the March 2011 Great East Japan Earthquake and tsunami, has radically changed the global nuclear power market landscape. The cost of nuclear power, which had been promoted as a relatively inexpensive and "clean" source of energy that does not emit carbon dioxide, spiked as additional safety investments inflated plant expenses.

The cost of Hitachi's project to build the two reactors in Anglesey, Wales, which began in 2012, has ballooned from the initial estimate of ¥2 trillion to ¥3 trillion. Another project pursued by Mitsubishi Heavy Industries Ltd. to build four reactors in Turkey has also been hampered by the swelling cost — which reportedly shot up from an initially estimated ¥2.1 trillion to ¥5 trillion. Toshiba Corp. has pulled out from the overseas nuclear power business after the huge losses incurred by its subsidiary Westinghouse Electric Co. in its nuclear power plant projects in the United States.

Even with a spike in plant construction costs, the nuclear power business would make economic sense if the expected earnings surpass the investments. But Hitachi reportedly decided to halt the U.K. project after it became clear that even with public support from the British government it could not possibly realize profits. The economic competitiveness of nuclear power has also been blunted by the sharp expansion of renewable energy such as solar and wind power after the Fukushima nuclear accident and its plummeting costs — although Japan lags far behind other major economies in this respect.

Behind the government's drive to promote the sale of nuclear power plants overseas has been the domestic market's bleak business prospects. While the government and the power industry have pushed for restarting the nation's nuclear power plants idled in the wake of the Fukushima disaster, once they have cleared the tightened plant safety standards, only nine reactors at five plants have been put back online. The additional costs of safety investments required under the new Nuclear Regulation Authority standards to make the plants more resilient to natural disasters such as earthquakes and tsunami — estimated to range from ¥100 billion to ¥200 billion for each reactor — have prompted power companies to decide to decommission 23 aging reactors so far (including the six at Tepco's Fukushima No. 1 plant).

As popular opposition in Japan remains strong against reactivating the idled plants, there is no prospect that the construction of new plants will be approved in the foreseeable future. The drive to promote the export of nuclear power plants may have been intended to make up for the loss of demand in the domestic market. But earlier plans for Japanese makers to build plants in Lithuania and Vietnam were canceled, while a civil nuclear cooperation pact signed with India in 2016 — which was aimed at paving the way for Japanese nuclear plant exports to the country — has not resulted in any deal. Along with Hitachi's decision to halt the U.K. project, Mitsubishi Heavy Industries is reportedly set to abandon its plan in Turkey.

Even without construction of new plants, there will be demand for maintaining Japan's existing nuclear power plants, and for decommissioning its aging plants. What to do with the spent nuclear fuel and the high-level radioactive wastes from the plants will also be among the challenges that confront Japan's nuclear power business. There will be plenty of work for the industry, and it will be crucial to develop and maintain the technology and manpower to deal with the tasks.

New type of nuclear fuel?

December 26, 2018

Utilities ponder use of new type of nuclear fuel
https://www3.nhk.or.jp/nhkworld/en/news/20181227_01/

Electrical utilities across Japan are considering the adoption of a type of nuclear fuel that generates power for a longer time than varieties in current use.

Companies with nuclear plants that are back online keep spent fuel in storage pools. And those pools are now filling up.

The spent fuel is supposed to be taken to a reprocessing facility in the village of Rokkasho in Aomori Prefecture.

Completion of that facility is considerably behind schedule.

Against this backdrop, six utilities that use boiling water reactors have begun considering the possibility of introducing a new type of nuclear fuel that is both efficient and lasts longer.

That type of fuel is widely used in nuclear plants in the US and elsewhere.

Utilities that operate other types of reactors are also thinking of making the switch.

But long-term use of nuclear fuel has disadvantages as well, such as degradation of the cladding covering the fuel. Utility officials say they are carefully studying the matter.

What future for Japanese nukes?

February 5, 2019

Which way next for Japan's nuclear power industry?

https://www3.nhk.or.jp/nhkworld/nhknewsline/backstories/nuclearpowerindustry/

By Yuichiro Okawa

After the 2011 meltdown at Tokyo Electric Company's Fukushima Daiichi nuclear power plant, the Japanese government established exports of nuclear power technology as one of the key pillars of its growth strategy.

But that strategy appears to be at an impasse. A series of projects to build nuclear power plants abroad has stalled. For instance, Hitachi has decided to freeze a project in the UK. Japan may now be forced to review its policy of promoting nuclear exports.

Hitachi announced its decision to suspend a project to build a nuclear power plant on the island of Anglesey in Wales on January 17th. Company officials cite ballooning costs, including those related to safety measures, as a factor.

Hitachi's negotiations with the British government, mainly over its request for financial support for the project, were prolonged. Hitachi officials say their decision to freeze the project was based on doubts about its profitability. As a result, the company expects to book a loss of about 300 billion yen, or roughly 2.7 billion dollars.

Hitachi President and CEO Toshiaki Higashihara said the firm made the decision to ensure that risks will not be carried over into the future.

Infrastructure exports are virtually zero.

While nuclear power is designated an important energy source in the government's policy, the construction of new plants has become difficult in Japan because of Fukushima. Therefore, the

government has shifted its focus to overseas demand. It aims to help expand the operations of Japanese firms in the field.

Nuclear power projects have been planned not only in the UK, but also in Lithuania, Turkey and Vietnam as part of efforts to reduce greenhouse gas emissions. That led Japanese companies to prepare to do business in those countries.

Trade and Industry Minister Hiroshige Seko said: "There are many countries willing to use nuclear power. Since Japan has experienced the nuclear accident in Fukushima, we can contribute globally through technical know-how related to safety at nuclear power plants."

However, the companies have all decided to call off their plans for the UK, Lithuania and Vietnam. As for Turkey, the cost of a planned project has doubled, which makes it difficult for Japanese companies to take part. On top of that, Toshiba has pulled out of the nuclear power business in the US after incurring massive losses through a former nuclear power subsidiary there.

As a consequence, there's basically no Japanese company undertaking nuclear power projects abroad.

A changing environment

The environment surrounding the nuclear power sector has been transformed. After the accident at Fukushima Daiichi, safety requirements have been tightened, causing construction costs to increase. The amount per nuclear reactor used to be a few billion dollars, but that's risen to roughly 9-billion dollars. Critics point out that the private sector alone can be no longer handle safety on its own.

On the other hand, renewable energy sources, such as solar and wind power, have been winning favor worldwide as costs drop. Offshore wind power generation in the UK costs around the same as nuclear power. That led Hitachi to realize nuclear power was losing its economic advantage there and played a part in the decision to freeze the Anglesey project.

Chinese and Russian success

In contrast to Japan's tricky situation, Chinese and Russian state-run companies are increasing their influence. The construction of nuclear power plants is booming in China to meet soaring domestic demand for electricity. This boom, in turn, drives the development of home-grown technologies, which helps Chinese firms make inroads overseas.
Russia's State Nuclear Energy Corporation Rosatom is currently involved in projects to build 36 nuclear reactors abroad -- thought to be the world's largest portfolio of overseas nuclear development. The corporation not only handles construction, but also disposes of spent nuclear fuel and related operations.

Tomoko Murakami, an expert on global trends in the nuclear power business at IEE Japan, says: "China has just begun to rise. However, Russia has already succeeded in terms of acquiring new project orders worldwide."

Japan's nuclear industry at a crossroads

Several companies in Japan are looking at realigning their businesses. It has been revealed that negotiations for a possible tie-up are ongoing between several firms: Tokyo Electric Power Company, Chubu Electric Power Company, Hitachi and Toshiba.

Japan's nuclear-related companies face difficulties in keeping their technologies up to date at the same time as seeking to streamline operations further.

The number of people working in Japan's nuclear business and its affiliated industries has decreased by over 20 percent since the accident at Fukushima Daiichi.

Taking everything into consideration, it is clearly time for Japan to think about the future of its basic energy policy.

"Green" zones in Fukushima and nuclear future in Japan

March 12, 2019

EDITORIAL: 8 years after disaster, Japan must commit to a nuke-free future
http://www.asahi.com/ajw/articles/AJ201903120048.html

When I visited the crippled Fukushima No. 1 nuclear power plant in early February, I found that 96 percent of the plant grounds are now designated as “green zones.”
You can enter a green zone in normal work clothes without wearing special gear for protection against radiation.
In these areas, radiation levels have declined significantly due to measures including removing debris, cutting down plants and covering the soil with mortar.
Areas between the No. 2 and No. 3 reactor buildings are also green zones, and I could enter the areas in everyday clothes, wearing just an ordinary disposable mask. It was a dramatic change from several years ago, when I was restricted to seeing the facilities from the inside of a vehicle even though I was wearing a full-body radiation suit.
There are, however, still many gloomy vestiges of the nuclear devastation that occurred at this plant in March 2011.
The concrete walls of the No. 3 reactor building were blown off by hydrogen explosions and numerous iron reinforcing rods, violently bent and sticking out of the remnants of the walls, are visible. The outer walls of buildings remain colored a vivid green because of residues of an anti-scattering agent sprayed around immediately after the accident began to unfold to prevent radioactive materials from spreading.
Massive amounts of melted nuclear fuel debris remain in the No. 1 to No. 3 reactors.
Tokyo Electric Power Co., the operator of the plant, recently succeeded in using a remotely controlled probe to make the first physical contact with debris inside the containment vessel of the No. 2 reactor. But it is still unclear whether all the debris will be eventually removed.
The plant is generating a rapidly increasing amount of radiation-contaminated water as the reactors are being flooded to cool the cores and underground water keeps pouring in. Even after being treated with a

filtering system, the polluted water still contains tritium, a radioactive form of hydrogen, and has to be stored in on-site tanks.
The number of the storage tanks filled with contaminated water and placed within the premises has kept growing and is now approaching 1,000.
Obviously, a long, rocky road lies ahead for the work to decommission the reactors.

REACTOR RESTARTS CONTINUE

Serious nuclear accidents cause enormous damage and necessitate lengthy, costly and formidable cleanup work.
Japan, a nation that has learned these facts the hard way, should seek to build a society that is not dependent on nuclear power generation.
In an editorial in July 2011, The Asahi Shimbun argued that Japan should pursue the goal of transforming itself into a "zero nuclear power generation society."
The process of achieving the goal would involve decommissioning reactors gradually, starting with high-risk and aging units, while keeping the operation of only the ones that are necessary to meet demand for the time being. Through this process, Japan should eventually eliminate nuclear power generation in the not-so-distant future.
Following the Fukushima disaster, it has been decided that a total of 21 reactors, mostly units that have been in service for decades, will be decommissioned. But this does not mean that Japan is moving toward a nuclear-free future.
Prime Minister Shinzo Abe's administration has continued to maintain that nuclear power is an "important core power source" even though it has pledged to lower Japan's dependence on atomic power "as much as possible."
Under the administration's energy supply target, nuclear power generation should account for 20 to 22 percent of Japan's total power output in 2030. During the current Diet session, Abe has contended that seeking to end nuclear power generation is "not a responsible energy policy."
He has reiterated his administration's policy of allowing the restarts of reactors that have been confirmed by the Nuclear Regulation Authority to meet the new, stricter nuclear safety standards that were introduced after the Fukushima accident.
The Abe administration also refuses to abandon the government's policy of establishing a nuclear fuel recycling program, which has clearly become untenable.
Most Western industrialized nations have given up on their nuclear fuel recycling programs as they have proven economically unviable. But the Abe administration has not ditched the plan to start operating the plant to extract plutonium from spent nuclear fuel for recycling that is being constructed in Rokkasho, Aomori Prefecture, at an estimated cost of 2.9 trillion yen ($26.02 billion).
Shinichiro Tanaka, a specially appointed visiting associate professor at the Chiba University of Commerce, has scrutinized the government's draft budget for the new fiscal year and found that nuclear power-related expenditures account for 40 percent of the planned total energy policy spending by all ministries and agencies.
This clearly indicates what a large portion of government fiscal resources is being poured into nuclear power.

GLOBAL ENERGY SHIFT

In January, the Renewable Energy Institute released a report saying nuclear power generation is losing its competitiveness globally.

While the costs of nuclear energy have risen due to enhanced safety requirements following the Fukushima accident, the report says, those of renewable energy sources such as solar and wind power have fallen, thanks to technological innovations.
Some countries, including Germany and South Korea, have decided to phase out nuclear power generation. In other major countries, including the United States and Britain, the share of nuclear power in the overall power supply has dropped because of the rise of renewable energy.
Even France, a leading nuclear power producer, plans to significantly lower its dependence on atomic energy. In China and India, where the government has been eager to promote nuclear power, renewable energy production is growing faster than nuclear power generation.
Nuclear power once accounted for 17 percent of the world's total electricity production, but it is now responsible for only around 10 percent of the global power output. In sharp contrast, the share of renewable energy has risen to nearly a quarter of the total. The International Energy Agency predicts that renewable energy will contribute 40 percent of the world's energy supply in 2040.
A big global energy shift from nuclear power to renewable energy is taking place.

RESPONSIBLE DECISIONS NEEDED

The Abe administration's efforts to promote exports of nuclear power technology, a key component of its growth strategy, have run into the sands in Britain and Turkey.
It is a big irony that a nation that has suffered a catastrophic nuclear accident is making frustrating efforts to sell its nuclear technology to other countries while repercussions from the accident are driving the world toward a new energy future.
This nation's government still continues devoting huge amounts of resources to maintaining nuclear power generation, which is clearly in decline worldwide, while putting renewable energy, which will assume growing importance in the coming years, on the back burner. Sticking to this policy would cause Japan to be left out of the emerging mega-energy trend.
It is by no means easy to pull the plug on all nuclear plants in Japan. That makes it all the more important for the government to adopt this policy goal and start taking steps to decommission reactors as soon as possible while making greater efforts to expand the use of renewable power.
This is also vital for Japan's efforts to help stem global warming.
The sooner the policy shift is made the better. Ending nuclear power generation would also stop the growth in the amount of spent nuclear fuel.
Scrapping the nuclear fuel recycling program would save the government the enormous amount of additional funds needed to operate and upgrade the Rokkasho reprocessing plant.
Pursuing a goal of zero nuclear power is not an irresponsible policy. The Abe administration has taken an irresponsible stance toward the issue by allowing the opposition-drafted bill to phase out nuclear power generation to gather dust on the Diet shelf for as long as one year and permitting off-line reactors to be restarted one by one without serious debate on the steps.
It is the responsibility of political leaders to make the decision to phase out nuclear power generation and lay out a clear vision for the nuclear-free energy future of this nation.
--The Asahi Shimbun, March 12

Progress?

22.03.2019_No58 / News in Brief

Japan Survey Shows Increase In Support For Nuclear Plant Restarts https://www.nucnet.org/all-the-news/2019/03/22/japan-survey-shows-increase-in-support-for-nuclear-plant-restarts

Plant Operation
22 Mar (NucNet): Support for restarting nuclear power plants in Japan has increased to 27 % in 2018, up about eight points compared to the previous year, according to a survey of 1,200 people carried out by the Japan Atomic Energy Relations Organisation (Jaero) at the end of 2018.
The Japan Atomic Industrial Forum (Jaif) said Jaero has been conducting the same public opinion survey annually since 2006.

The survey has shown the percentage of those opposed to restarting nuclear plants fell by six points, from 25% in 2017 to 19%.in 2018.

On the other hand, Jaif said that solar, wind and hydro were listed by respondents as the top three preferred energy sources for Japan, a result which had been the same even before the Fukushima-Daiichi accident in March 2011.

According to Jaif, the preference for nuclear power rose to 17% in 2018 from 12% the previous year.

All of Japan's 48 reactors were taken offline as a result of the Fukushima-Daiichi accident for safety assessments and upgrading measures. Nine units have since renewed commercial operation.

Start Again

Is the wind turning ?

March 19, 2012

Heads of 4 municipalities favor restarting N-reactors after govt OK

http://www.yomiuri.co.jp/dy/national/T120318002934.htm

The Yomiuri Shimbun
The heads of four municipalities hosting nuclear power plants are in favor of allowing reactors currently idle for safety checkups or other reasons to be restarted if the central government approves their reactivation, a survey by The Yomiuri Shimbun has revealed.

A Yomiuri questionnaire was sent to a total of 34 prefectural and municipal heads in areas where nuclear power facilities are located. Responses were received by Thursday.

Seventeen of the respondents were city, town or village mayors in areas with nuclear complexes. They did not include municipality heads in Fukushima Prefecture.

One question in the survey was, "What do you think about the advisability of restarting the nuclear reactors that are located here, if the central government decides in favor of resuming their operation?"

The four who said they would "respect" the central government's judgment were the mayors of three villages--Tomari in Hokkaido, Higashidori in Aomori Prefecture and Kariwa in Niigata Prefecture--and the mayor of the town of Genkai, Saga Prefecture.

The government will decide whether to restart the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Oi nuclear plant in Fukui Prefecture through consultations among the prime minister and three Cabinet members in charge of nuclear power generation affairs, after obtaining the understanding of local entities involved.

The government is expected to apply this approach to the reactivation of reactors at other nuclear power plants as well.
Mayor Hiroo Shinada of Kariwa said in his response to the survey, "The government should act responsibly in line with its judgment" regarding reactivation.

None of the 17 municipality heads supported the idea of restarting the reactors right now, while seven said they would support reactor reactivation with some conditions attached.

Nine said they were undecided about the resumption issue, while Mayor Tatsuya Murakami of Tokai, Ibaraki Prefecture, said he opposed putting currently idled plants back into operation.

Ohi stress tests - A step to restart nuke plants

March 19, 2012
Evaluation on Ohi stress test results imminent

http://www3.nhk.or.jp/daily/english/20120319_25.html

The Nuclear Safety Commission says it may release its evaluation of the stress-test results on 2 nuclear reactors at a nuclear power plant in central Japan by the end of the week.

Commission Chairman Haruki Madarame told reporters on Monday that the commission's first-ever decision on stress-test results could be out before the week's end.

The government's Nuclear and Industrial Safety Agency earlier approved the results of the first-stage stress tests on the No. 3 and No. 4 reactors at the Ohi plant in Fukui Prefecture, conducted by its operator, the Kansai Electric Power Company.

The commission's panel, which is verifying the agency's evaluation of the test results, is compiling a report after listening to experts.

Verifying the results is a required procedure for restarting any nuclear reactor that has been shut down for a regular inspection.

Madarame said that in other countries, stress tests are conducted on reactors regardless of whether they are to be reactivated or not.

He emphasized that the first-stage stress test alone will not ensure a plant's safety, saying comprehensive safety checks must be conducted.

On the basis of the commission's report, the government will make its final decision on whether to approve restarting the reactors.

What about Ikata?

March 19, 2012

Ikata nuclear plant likely to pass safety test
http://www3.nhk.or.jp/daily/english/20120319_29.html

Japan's Nuclear and Industrial Safety Agency is to endorse the results of an initial safety stress test on an idled reactor at a nuclear power plant in Ehime Prefecture, western Japan.

The government agency is set to report to the Nuclear Safety Commission that the so-called stress test on the No. 3 reactor at Ikata nuclear plant of Shikoku Electric Power Company was carried out appropriately.

Stress testing nuclear reactors is a new method of assuring their safety. The government mandated the tests to obtain the consent of local residents to resume the operation of a suspended reactor after a regular checkup.

The Nuclear and Industrial Agency has so far received from power companies the results of the first-stage stress tests on 16 reactors, and is assessing the results.

On Monday, the agency met with nuclear experts to examine the results of the test on the No. 3 reactor at the Ikata plant.

In the meeting, the agency said the necessary measures have been taken at the Ikata to prevent a disaster like the one at Fukushima Daiichi.

Some participants said discussions are not complete and called for more talks on the many factors that could result in a serious nuclear accident.

But the agency concluded the discussions, saying it has looked into all aspects as required at this point.

It said it would soon submit its final assessment that the stress test was carried out appropriately.

The stress testing at the Ikata plant is the nation's second, the first being on 2 reactors at Kansai Electric Power Company's Ohi plant in Fukui Prefecture.

The safety commission is undertaking a final examination of the results of the stress tests at the Ohi plant. The government will decide whether to give the green light to restarting the 2 Ohi reactors on the basis of the commission's judgment.

March 20, 2012

Nuclear agency to approve Ikata reactor's initial stress test soon

http://mdn.mainichi.jp/mdnnews/news/20120320p2g00m0dm017000c.html

TOKYO (Kyodo) -- Japan's Nuclear and Industrial Safety Agency decided Monday to sign off on the results of an initial stress test on an idled nuclear reactor at the Ikata power plant in the near future, a move that would make it the third reactor to have cleared a key step for resuming operation.

The agency said in a revised draft report that it has confirmed through the test that the plant operator Shikoku Electric Power Co. has taken sufficient measures to prevent the reactor from getting into a situation similar to the accident at the Fukushima Daiichi power plant, even if it is hit by an earthquake and tsunami like the one that occurred in Japan's northeast a year ago.

Once the agency finalizes the report, the Nuclear Safety Commission, the five-member state body tasked with supervising the government's nuclear safety regulations, will check the adequacy of the agency's evaluation on the stress test on the No. 3 unit of the Ikata reactor in Ehime Prefecture, western Japan.

Prime Minister Yoshihiko Noda and three ministers concerned are then to judge whether to authorize the restart of the reactor.

The government mandated the two-stage stress test following the accident at Tokyo Electric Power Co.'s Fukushima Daiichi plant. Clearing the first stage of the computer simulation-based test is a precondition for reopening reactors that have been idled for scheduled checkups.

Only two of Japan's 54 reactors are online as many of them, including the No. 3 unit of the Ikata plant, remain idled for the routine checkup stipulated for Japanese reactors every 13 months.

The remaining two reactors -- the No. 6 reactor at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa plant in Niigata Prefecture and the No. 3 reactor at Hokkaido Electric Power Co.'s Tomari plant in Hokkaido -- will also be suspended by early May for routine checkups.

Shikoku Electric originally reported that the No. 3 reactor at the Ikata plant is capable of withstanding an earthquake 1.86 times stronger than the most powerful quake required to be taken into account under the safety criterion. But the utility later lowered the figure to 1.5, as some facilities' quake resistance was found to have been weaker than previously thought.

The two reactors that have already won the agency's approval on their stress test results are the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture.

Not clear who will decide

March 25, 2012

Confusion over 'local entities' / Definition unclear of who must approve reactors' reactivation

http://www.yomiuri.co.jp/dy/national/T120324003038.htm

The Yomiuri Shimbun

It is still uncertain whether local entities' consent can be obtained for reactivation of the No. 3 and 4 reactors at the Oi nuclear power plant in Oi, Fukui Prefecture, even after the Nuclear Safety Commission endorsed first-stage stress test results on the reactors.

Meanwhile, the delay in establishment of a new nuclear regulatory agency, which will be responsible for the integrated supervision of the safety of nuclear power, is hindering the restart of idle reactors at other nuclear power plants.

The commission on Friday endorsed the test results for the reactors at the Oi plant, which is operated by Kansai Electric Power Co.

After Prime Minister Yoshihiko Noda and three other Cabinet ministers concerned confirm the reactors are safe to operate, Economy, Trade and Industry Minister Yukio Edano will visit Fukui Prefecture in early April at the earliest to seek consent from "local entities" for reactivation of the reactors.

Edano's visit to the prefecture is likely to take place on a weekend in early April, after the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency evaluates on Wednesday the possible impact of an active seismic fault near the Oi plant, according to government officials.

Edano aims to present 30-point guidelines, which NISA has already compiled, to the Fukui prefectural government as tentative safety standards.

However, the definitions of "local entities" and "consent" still remain ambiguous.

Edano has only said, "We'll judge [the issue] from a comprehensive viewpoint."

The government plans to expand the range of its heightened disaster management measures in the event of a nuclear accident from the current radius of eight to 10 kilometers from a nuclear plant to a 30-kilometer radius.

If all local governments in the 30-kilometer zone are "local entities" from which consent needs to be obtained, the number of local governments involved will drastically increase, and the hurdle for reactivation will be much higher.

Some parts of Shiga Prefecture fall in the 30-kilometer radius around the Oi plant. Thus, the prefectural government said it will demand detailed explanations from the central government about the reactors' reactivation.

Opinions within the Democratic Party of Japan are divided.

On Thursday, the DPJ's project team on measures to bring the crisis at the Fukushima No. 1 nuclear power plant under control compiled a report saying it is too early to resume operations of nuclear reactors.

However, another DPJ project team is likely to soon issue a report that will support reactivation.
Under such circumstances, some observers say it will be difficult to eliminate the distrust of affected local governments and residents.
As the central government plans to compile before the Golden Week holiday period a plan regarding the supply and demand of electricity this summer, there is limited time to obtain local entities' consent.

If consent cannot be obtained by the end of April, the government will have to compile an energy-saving plan based on the premise that the Oi plant's reactors will not be reactivated, and seek cooperation from industrial circles and the general public.

In that case, some companies will have to change their production plans and personnel arrangements.

If the Oi plant reactors cannot be reactivated, the electricity supply in KEPCO's service area will be 3.86 million kilowatts, or 13.9 percent, below the expected maximum demand.

The No. 3 and 4 reactors of the Oi plant have a total output capacity of 2.36 million kilowatts. If they are reactivated, the shortage will be considerably smaller.
===
April 1 launch canceled

The most unstable factor in the reactivation of nuclear plants' reactors is uncertainty over when the nuclear regulatory agency will be established.

The Noda administration excluded bills to create the agency from Diet deliberations within the current fiscal year, effectively giving up on the launch of the agency on April 1.

Mayor Kazuharu Kawase of Tsuruga, Fukui Prefecture, which hosts Japan Atomic Power Co.'s Tsuruga nuclear plant and other nuclear facilities, said Thursday, "If the regulatory agency is not launched, we can't enter talks on whether to allow reactivation."

As Kawase's remark suggests, the situation will likely affect reactivation of not only the Oi plant but also reactors at other nuclear plants, including the No. 3 reactor of Shikoku Electric Power Co.'s Ikata nuclear power plant.

The new agency is the main pillar of reform of the country's nuclear power generation, which aims to separate the entities that promote and regulate nuclear energy, based on lessons from the Fukushima No. 1 nuclear plant crisis.
The agency was originally scheduled to be established on April 1 by integrating NISA and the Cabinet Office's Nuclear Safety Commission.

Due to the delay in establishing the new agency, NISA and the five-member commission will continue to examine results of stress tests on nuclear power plants conducted by plant operators.

But the three-year terms of three commission members will expire April 16, and all have said they wish to step down.
Chairman Haruki Madarame also expressed his intention to leave his post at the end of this month.

Although members' terms can be extended, one observer asked, "Can members who don't want to stay conduct safety checks diligently?"

Three plans to revise NISA guidelines, including a disaster management guideline requiring revision of local disaster management plans, will effectively be left untouched until the new agency is established.

The central government needs to take quick action before concerned local governments openly express their complaints.

Last Japanese reactor to be halted on May 5

March 26, 2012

Tomari reactor to be halted on May 5

http://www.yomiuri.co.jp/dy/national/T120325002878.htm

The Yomiuri Shimbun
Hokkaido Electric Power Co. plans to halt operations of the No. 3 reactor at its Tomari nuclear power plant on May 5 for regular inspections, according to sources.

Regular inspections are also scheduled to start at the No. 6 reactor at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture on Monday.

If Kansai Electric Power Co. does not get approval to restart the No. 3 and 4 reactors at its Oi nuclear power plant in Fukui Prefecture, which have been shut down for regular inspections, all of the nation's 54 reactors will be offline when the Tomari No. 3 reactor is halted. There is strong opposition to restarting the reactors.

According to the sources, Hokkaido Electric is preparing to file an application for the regular inspections with the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency. The application probably will be filed Monday.
The utility initially planned to shut down the No. 3 reactor on April 27.

===
Reactor's operations uncertain

Meanwhile, Chubu Electric Power Co. plans to remove a reference on when to start operating a new reactor at its Hamaoka nuclear power plant in Omaezaki, Shizuoka Prefecture, from its power supply plan for fiscal 2012, according to sources.
The company had said the planned No. 6 reactor would start operations in fiscal 2021. However, the timing is up in the air because construction has not yet started, the sources said.

However, Chubu Electric will not scrap its plan to build the new reactor, they said. It will provide details on the new reactor's operation timetable when the nation's nuclear policy becomes clearer, they added.

Utilities usually notify the government of their expected power demand and supply capacity for the next 10 years.

One economic viewpoint of reactor shutdown

March 27, 2012

Hardships loom with TEPCO reactor shutdown

http://www.yomiuri.co.jp/dy/national/T120326004507.htm

Tadaaki Inoue and Tomofumi Degawa / Yomiuri Shimbun Staff Writers

With Tokyo Electric Power Co.'s last nuclear reactor suspended, companies and households face dual hardships--possible prolonged power shortages and a rise in electricity charges to cover increased fuel costs at thermal power plants--unless nuclear reactors are reactivated after routine safety checks.

TEPCO has explained that it will be able to supply about 57 million kilowatts of electricity this summer, which is the same level as last year, even without running nuclear reactors.Beneath the surface, however, the company is walking a tightrope.

On the supply side, the number of compact power generators TEPCO has installed at thermal power plants after the Great East Japan Earthquake has increased to about 300. The company also expects thermal power plants hit by the March 11, 2011, disaster to be restored.

However, thermal power plants are meant to be used only for a short period of time when power demand reaches its peak. Therefore, keeping them in operation for as long as nuclear reactors tends to cause problems. There were at least four instances after the Great East Japan Earthquake when thermal power plants stopped working due to excessive operating times, among other reasons.

On the demand side, limitations in households' and companies' electricity-saving efforts are becoming evident. The maximum power demand this winter was 49.66 million kilowatts, larger than the 49.22 million kilowatts of last summer. It was the first time in 43 years that winter power demand surpassed that of summer. If this summer's power demand reaches 59.99 million kilowatts, which was recorded in the scorching summer of 2010, there will likely be a power supply shortage.

===

More power, more deficit

For TEPCO, which now relies on thermal power plants that entail high fuel costs, an increase in power supply would result in a higher deficit. TEPCO's fuel costs from April to December 2011 totaled 1.57 trillion yen, 1.4 times that of the same period in the previous year. The amount of money TEPCO paid to purchase electricity from other power companies increased 10 percent to 573.1 billion yen during the period.

In fiscal 2012, during which TEPCO will not be able to restart idled nuclear reactors, its fuel cost for thermal power plants and the cost of purchasing electricity from other power companies are expected to rise to as much as 3 trillion yen in total. TEPCO will go under unless public funds are injected into the company and additional loans are extended by banks.

TEPCO plans to raise electricity charges for large-lot users by an average of 17 percent in April and for households by about 10 percent as early as July. However, the planned price hike has drawn criticism from many people who say TEPCO should first carry out company restructuring wherever possible.

TEPCO will be put to the test by how much it voluntarily improves its high-cost setup and the extent to which it tries to gain understanding from its consumers.

The industrial sector has already been seriously affected by power shortages and rate hikes.

In addition to its Tokyo factory, Hoya Corp. built a factory in Shandong Province in China last year to manufacture optical glass for camera lenses due to power shortage concerns. Other companies have also been shifting their production overseas. Many midsize and small companies have no prospect of passing increased electricity rates onto the prices of their products, complaining that the suspension of nuclear power plants will jeopardize their operations.

According to an estimate by Koya Miyamae, an analyst at SMBC Nikko Securities Inc., if TEPCO increases household electricity rates by 10 percent, consumers in the Kanto region will need to pay an additional 300 billion yen a year for electricity. About 2,000 listed companies, excluding financial companies, will suffer an estimated 1.5 percent decrease in ordinary profits for the accounting term ending in March 2013.

Reactor's shutdown 'to hurt local economy'

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120326004542.htm

NIIGATA--Niigata Gov. Hirohiko Izumida on Monday again expressed fears about the safety of the No. 6 reactor at the Kashiwazaki-Kariwa nuclear power plant, which some local people want restarted as soon as possible to keep the local economy alive.

Speaking at a press conference following the shutdown of the reactor at around midnight Sunday, Izumida called on Tokyo Electric Power Co. to manage the nuclear power plant carefully.

"It's not safe merely because it's been shut down. TEPCO should manage it as a 'living nuclear power plant,'" he said.
Referring to the crippled Fukushima No. 1 nuclear power plant, Izumida said: "There are many unclear aspects about what happened to [that plant]. We can't move forward without clearing them up."

Kashiwazaki Mayor Hiroshi Aida also was opposed to the early restarting of the reactor, saying, "It's hard to believe that safety can be confirmed through tentative measures and a stress test." However, Aida also said, "It [shutting down the reactor] will certainly affect local industry and employment."

Kariwa Mayor Hiroo Shinada was also worried about the effect the reactor's shutdown would have on the local economy, especially employment and energy supplies.

However, he said: "We'll respect the regulatory authority's decision. If it says it's all right to restart the reactor, we'll do so."

About 6,900 people from 800 firms, including subcontractors, work at the Kashiwazaki-Kariwa nuclear power plant.
Of about 47,500 workers in Kashiwazaki and Kariwa, about 4,000 people, or 8 percent, have jobs related to the power plant.
Masao Nishikawa, chairman of the Kashiwazaki Chamber of Commerce and Industry, has called for the reactor to be restarted as soon as possible.

TEPCO halts the last one

March 27, 2012
All 17 of TEPCO's N-reactors now halted

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120326005002.htm

All 17 of Tokyo Electric Power Co.'s nuclear reactors are now suspended after TEPCO halted its last operating reactor around midnight Sunday at Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

TEPCO suspended operations of the 1.35 million-kilowatt No. 6 reactor at the power plant at around midnight Sunday for a regular checkup. Of the 54 commercial nuclear reactors in the nation, the No. 3 reactor of Hokkaido Electric Power Co.'s Tomari nuclear power plant is the only one still operating.

"We expect that we can ensure a steady supply of electricity for the time being, but we would like to request people's cooperation in saving electricity whenever possible," TEPCO President Toshio Nishizawa said Sunday.

It is the first time in about nine years that TEPCO has shut down all its reactors.

The last time all TEPCO's reactors were shut down was from April to May in 2003, after a scandal over falsified safety-inspection reports.

TEPCO's 17 nuclear reactors have a combined output capacity of 17.3 million kilowatts, which accounted for one-fourth of its total electrical power supply of 65 million kilowatts as of the end of March last year.

TEPCO is ready to take measures to secure a stable supply of electricity ahead of summer, when demand for air conditioning normally surges.

The utility plans to secure 57 million kilowatts of energy without nuclear power plants by installing gas turbines for thermal power generation as emergency measures. If this summer's maximum demand for power is the same as last year, a shortage of electrical power can be avoided. In TEPCO's service area, demand for power peaked at 49.22 million kilowatts last summer.

The government also imposed a restriction on power usage in TEPCO's service areas last year, requiring heavy users of electricity to reduce their power consumption by 15 percent from the peak of the summer in 2010. Economy, Trade and Industry Minister Yukio Edano has said the government does not plan to impose the same restrictions this year, and will also refrain from conducting rotating blackouts this summer.

However, electricity demand could surge due to a heat wave, or operation of thermal power plants--which are not designed to run continuously for a long period of time--could be halted due to troubles.

TEPCO's fuel expense has risen sharply, resulting from increased thermal power generation as a replacement for nuclear power.

The utility has said it will raise electricity charges for large-lot users such as buildings and factories by an average of 17 percent starting in April, and by about 10 percent for general households starting in July.

According to its plan, TEPCO plans to limit electricity rate hikes to three years based on the assumption that it can restart reactors at the Kashiwazaki-Kariwa nuclear power plant in fiscal 2013.

However, if nuclear reactors continue to be suspended, the price increase will likely continue

To restart operations, nuclear power plants need to pass stress tests.

TEPCO has already submitted to the government the first-phase assessment of stress tests on the No. 1 and No. 7 reactors at its Kashiwazaki-Kariwa plant.

Meanwhile, the local government is taking a cautious approach to restarting nuclear operations.

"As long as the root cause of the crisis at the Fukushima No. 1 nuclear power plant remains unclear, we can't judge what is safe," Niigata Gov. Hirohiko Izumida said.

From the late 1980s through the 1990s, TEPCO falsified reports relating to cracks detected at the Fukushima No. 1, No. 2 and Kashiwazaki-Kariwa nuclear power plants. After the false records were found in August 2002, TEPCO shut down all its reactors temporarily in 2003 to inspect its nuclear power plants.

March 26, 2012

Countdown to shutdown of all nuclear plants

http://www3.nhk.or.jp/daily/english/20120326_05.html

All Japan's nuclear reactors face a possible shutdown if none are allowed to resume operations before the last working reactor in northern Japan, is turned off in May.

At the time of the Fukushima nuclear accident last March, 37 out of Japan's 54 nuclear reactors were operating.

The Nuclear and Industrial Safety Agency has now received the results of stress tests of 16 reactors checked since last October. The tests are designed to see how well the reactors can withstand earthquakes and tsunami.

Japan's Nuclear Safety Commission on Friday endorsed the test results of 2 reactors at the Ohi plant on the Japan Sea coast.

Prime Minister Yoshihiko Noda and 3 Cabinet members in charge of nuclear issues will decide soon whether the government can obtain local agreement and restart the 2 reactors.

The Nuclear and Industrial Safety Agency also finished assessing another reactor in Ehime Prefecture, western Japan.

The Nuclear Safety Commission says a second stage of stress tests are needed that takes into account whether reactors are prepared for severe accidents such as a nuclear meltdown.

Local municipalities such as Fukui Prefecture are demanding the government show a temporary safety guideline that reflects lessons from the accident of the Fukushima plant.

The government was planning to set up a new nuclear safety agency in April to unify supervision of nuclear power generation. But, the negotiation between the ruling and the opposition parties is deadlocked.

The report from the government's investigative panel probing the Fukushima accident is expected to be released in July. Some experts say the inspection of the accident is not enough at the present stage.

The main focus of the issue is how the government will judge the safety of a nuclear plant and how it can convince the local governments.

OI nos.3 and 4 safe...

March 29, 2012

NISA endorses Oi reactors' safety / Edano to visit Fukui Prefecture as early as April to seek approval of restart

http://www.yomiuri.co.jp/dy/national/T120328005895.htm

The Yomiuri Shimbun

The nuclear safety agency on Wednesday endorsed Kansai Electric Power Co.'s assessment that the idled Nos. 3 and 4 reactors at its Oi nuclear power plant would be able to withstand a powerful multi-fault earthquake, officials said.

By concluding KEPCO's earthquake-resistance safety projection was "appropriate," the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency has completed its technical evaluation concerning the safety of the two reactors at the plant in Oi, Fukui Prefecture, according to the officials.

The reactors have been idle since being taken offline for regular safety checkups.

Prime Minister Yoshihiko Noda and three ministers in charge of nuclear policies will make a final confirmation of the reactors' safety. Following this, Economy, Trade and Industry Minister Yukio Edano will visit Fukui Prefecture as early as next month to brief local governments on the central government's stance and ask their opinions on resuming the reactors. The central government will then make a final decision on reactivation, the officials said.

KEPCO conducted stress tests on the two reactors as part of preconditions for resuming their operations. Its primary stress test results showed they could withstand a quake 1.8 times the strength of a quake predicted to hit the area.

While assessing the results, however, NISA instructed nuclear power plant operators to consider scenarios in which active fault lines at least five kilometers from each other move simultaneously.

If estimated seismic waves were upwardly revised, the results of previous stress tests would have to be reviewed.

In the case of the Oi nuclear power plant, the focus has been placed on a scenario in which three nearby active faults shift together, according to the officials.

NISA on Wednesday concluded such a phenomenon is unlikely "because each fault is located far from the others." It also approved KEPCO's projection that seismic waves triggered by the three active faults' synchronization would not exceed 1.8 times the conventional projection, the officials said.

However, the agency concluded that two or more active faults could move simultaneously at six other nuclear power plants, and instructed their operators to recalculate seismic wave assumptions.

The six facilities are Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture; Hokuriku Electric Power Co.'s Shika nuclear power plant in Ishikawa Prefecture; the Japan Atomic Power Co.'s Tsuruga nuclear power plant, Japan Atomic Energy Agency's Monju prototype fast-breeder reactor and KEPCO's Mihama nuclear power plant, which are in Fukui Prefecture; and Chugoku Electric Power Co.'s Shimane nuclear power plant in Shimane Prefecture.

Regarding the Japan Atomic Power's Tokai No. 2 nuclear power plant and JAEA's Tokai Reprocessing Plant--both in Ibaraki Prefecture--NISA concluded seismic waves associated with the movements on nearby active faults would not exceed those of a presumed subduction quake in the Pacific, according to the officials.

The agency also said it would instruct the operators of other nuclear power plants to examine whether they could withstand a magnitude-9 subduction quake. These facilities include Chubu Electric Power Co.'s Hamaoka nuclear power plant in Shizuoka Prefecture; Tohoku Electric Power Co.'s Higashidori nuclear power plant in Aomori Prefecture; and Tohoku Electric's Onagawa nuclear power plant in Miyagi Prefecture, the officials said.

Pleased to hear it

April 2, 2012

Noda: Safety is top priority to restart reactors
http://www3.nhk.or.jp/daily/english/20120402_19.html

Prime Minister Yoshihiko Noda says he will place top priority on nuclear safety in deciding the restart of 2 idled reactors in western Japan.

The 2 reactors at the Ohi nuclear power plant in Fukui Prefecture are currently halted for regular safety inspections.

Noda discussed the issue at an Upper House committee meeting on Monday.

He said the decision to restart the reactors will be made after taking into account opinion of local residents. He added that he and his Cabinet ministers will judge the matter in a comprehensive way.

Industry minister Yukio Edano said he is not convinced of the assessment by experts of the reactors recent stress tests.

Noda and nuclear safety

April 3, 2012

Noda orders drafting nuclear safety standards

http://www3.nhk.or.jp/daily/english/20120403_31.html

Prime Minister Yoshihiko Noda has instructed a minister to draw up new standards for nuclear safety as a precondition for resuming the operation of 2 reactors at a nuclear power plant along the Japan Sea coast.

On Tuesday, Noda and 3 ministers concerned discussed the Nuclear Safety Commission's favorable assessment of the first round of stress tests on the reactors at the Ohi nuclear power plant in Fukui Prefecture.

The ministers were briefed by the Nuclear and Industrial Safety Agency on the findings of its investigation into the nuclear crisis at the Fukushima Daiichi plant.

Some of the ministers said the safety standards proposed after the Fukushima Daiichi accident for preventing disasters are not clearly defined.

In response, Noda instructed Economy, Trade and Industry Minister Yukio Edano to come up with new standards for nuclear safety as a precondition for the resumption of the operation of the idled reactors.

Noda and the 3 ministers are to meet again later this week to discuss the necessary safety measures.

Safety first

Central gov't under pressure to ensure safety of Oi nuclear reactors

"(mainichi Japan) April 04, 2012"

http://mainichi.jp/english/english/newsselect/news/20120404p2a00m0na013000c.html

The Fukui Prefectural Government has been urging the central government to ensure the safety of two idled nuclear reactors at the Oi Nuclear Power Plant in the prefecture before reactivating them, and local

government chiefs in the neighboring prefectures of Kyoto, Shiga and Osaka are trying to get involved in decision-making on whether to restart the operations at the atomic power facilities. Hence, the central government has come under increasing pressure from local governments not to make a hasty decision to reactivate the two nuclear reactors idled for regular inspections.

Fukui Gov. Issei Nishikawa has repeatedly said, "The central government must show a provisional safety standard based on the findings from the Fukushima accident. That's the major precondition." He said in February, "The central government must first show the public its responsible opinions on the meaning of nuclear power and the need for the reactivation of nuclear reactors and make efforts to secure understanding."

On the fact that the central government has delayed its decision to call on the Fukui Prefectural Government to give the green light for the reactivation of the Oi reactors, a veteran prefectural assemblyman, a proponent of the reactivation of the reactors, said, "We were thinking that the reactors would be reactivated in late April, but our original schedule did not work out the way we had hoped. The impact on the local communities is immeasurable."

On the other hand, a prefectural assemblyman who opposes the reactivation of the reactors said, "The delay is attributable largely to opposition voiced in Shiga, Kyoto and Osaka prefectures (to the reactivation). But while findings from the Fukushima accident have not been confirmed, the government has hastily moved ahead with procedures to reactivate (the reactors) without presenting a provisional safety standard. So, it is a natural development."

On whether to reactivate nuclear reactors in Fukui Prefecture, local governments near the prefecture have also been demanding the right to take part in the decision-making process.

The "energy strategy council," jointly formed by the Osaka municipal and prefectural governments, decided on April 1 to urge the central government and Kansai Electric Power Co. to set eight conditions for restarting the idled reactors. One of the conditions is to secure the consent of local people and governments within a radius of 100 kilometers from the nuclear power station. Osaka Mayor Toru Hashimoto said on April 3, "We must widen the scope further to include more local municipalities (that need to be involved in the decision-making). Hashimoto then added, "The central government must either secure the understanding of local governments and residents in a wide region or seek public judgment through an election in a responsible way."

Shiga Gov. Yukiko Kada and Kyoto Gov. Keiji Yamada have said they would demand the right to get involved in deciding whether to reactivate the reactors. The two governors have been coordinating their plans to visit the No. 3 and No. 4 reactors at the Oi nuclear power station together. Gov. Yamada said, "We want to work together with Fukui Prefecture, which has accumulated knowledge (on nuclear reactors and nuclear issues). He wants to set up a forum in which officials from the Kyoto, Shiga and Fukui prefectural governments can exchange views.

In light of the fact that Prime Minister Yoshihiko Noda and three Cabinet ministers concerned held their first meeting to officially discuss the reactivation of the Oi nuclear reactors, Gov. Kada issued a statement on the evening of April 3, saying, "The investigations into the cause of the nuclear accident in Fukushima, the formulation of safety measures and the mechanism to ensure the safety of nuclear reactors are insufficient. Top priority should be placed on these issues. We want the central government to fully explain to us as 'disaster-stricken' local governments and residents that could sustain damage (from a nuclear accident)."

Not so simple

April 5, 2012
Local govts unhappy about nuclear plant restart policy

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120404005093.htm

Local governments in and near Fukui Prefecture, which hosts the Oi nuclear power plant, are critical of the central government's inconsistency over procedures to restart operations of the plant's Nos. 3 and 4 reactors, located in the town of Oi in the prefecture.

On Tuesday, Prime Minister Yoshihiko Noda instructed relevant Cabinet ministers to draw up new safety criteria for restarting idled reactors.

Oi Mayor Shinobu Tokioka maintained a cautious stance, just saying, "I'm not in a position to comment."

But Oi Town Assembly Chairman Kinya Shintani criticized the central government for its inconsistency.

"The government changes its views in the morning and in the evening, and different people say different things. I want them to unify their views," Shintani said.

As prerequisites for deciding on restarting the reactors, Fukui Gov. Issei Nishikawa has called on the central government to set tentative safety criteria based on lessons from the crisis at the Fukushima No. 1 nuclear power plant in Fukushima Prefecture and demand that Cabinet members make efforts to convince the public of the necessity to restart the reactors.

"Even if Fukui Prefecture approves the restart, the central government may not allow the reactors' restart, citing opposition from surrounding local governments," Toshiyuki Tanaka, chairman of the Fukui prefectural assembly, said.

Tanaka expressed his strong frustration, saying, "As long as the central government deals with this matter in such a way, we cannot make any decision on that."

Economy, Trade and Industry Minister Yukio Edano said at a House of Councillors Budget Committee meeting Monday that the government would seek understanding from the governors of Shiga and Kyoto prefectures. Northern areas of the two prefectures are close to the Oi plant. Kyoto Gov. Keiji Yamada welcomed Edano's comment the same day.
But Yamada said Tuesday he could no longer understand the government's response.

Shiga Gov. Yukiko Kada also said in a statement issued Tuesday: "I'd like to ask the central government about what it meant by local governments' 'understanding.' We won't be convinced unless the government provides us satisfactory explanations, without leaning too much toward restarting the reactors, by carefully examining the expected power supply-demand balance."

The Shiga prefectural assembly approved a letter of opinion in March demanding that the central government not approve restarting the Oi reactors until the cause of the accident at the Fukushima No. 1 nuclear plant is clarified and nuclear power plants' safety is ensured.

Kiyoji Nishikawa, mayor of Takashima, Shiga Prefecture, called on the central government to seek consent from neighboring local governments before restarting the operations of the Oi plant.

As a key to its disaster-management plans, the central government has decided to designate the area within a 30-kilometer radius of each nuclear power plant as an urgent protective action planning zone. The northwestern part of Takashima is within that zone for the Oi plant.

"[Takashima] also should be considered one of the local governments concerned. The central government should obtain consent from all neighboring local governments," Nishikawa said.

'Obtain wider consent'

Toru Hashimoto, the mayor of Osaka, which is the largest shareholder of Oi plant operator Kansai Electric Power Co., also said there is a need to obtain consent from local governments across a wider area before restarting the plant.
"[The government] is bound to the conventional framework of obtaining consent from prefectures hosting nuclear power plants. So it is failing to keep up with situations that have changed since the accident at the [Fukushima] nuclear power plant," he said Tuesday. "If the central government is going to obtain the consent of concerned local governments, it should definitely expand the areas to be covered."

Safety in 30 points ?

Govt to draft new criteria to restart reactors

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120404005785.htm

Aiming to restart idled reactors at the Oi nuclear power plant in Fukui Prefecture, Prime Minister Yoshihiko Noda has instructed ministers related to nuclear power safety to quickly draw up a new set of safety criteria based on lessons learned from the crisis at the Fukushima No. 1 nuclear power plant.

Economy, Trade and Industry Minister Yukio Edano was among those who attended the meeting on Tuesday, the first such meeting to be held.

The meeting was held to discuss the possible resumption of operations at the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s power plant in Oi.

The government will present the new safety criteria at the next meeting of related ministers scheduled for later this week, and will start consolidating opinions with the aim of making requests to relevant local governments, including the Fukui prefectural government, on resuming operations at reactors.

During the first meeting, Noda told the ministers: "Some have pointed out that the current criteria for judging whether to resume operations at nuclear reactors is difficult to grasp. I want you to draw up tentative safety criteria based on a causal analysis of the accident at the Fukushima No. 1 nuclear power plant."

The meeting was also attended by Chief Cabinet Secretary Osamu Fujimura, Goshi Hosono, state minister in charge of nuclear power policy, and Yoshito Sengoku, acting chairman of the Democratic Party of Japan's Policy Research Committee.

As a condition for agreeing to give his approval for restarting the reactors, Fukui Gov. Issei Nishikawa requested the central government to create new safety criteria based on knowledge and lessons learned from the nuclear accident in Fukushima Prefecture.

The Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency has drawn up a 30-item list of safety measures, which includes provisions for multiple emergency power sources and reinforcing a device to lower internal reactor pressure during a crisis.

The government is expected to present the new safety criteria in easy-to-understand ways. However, it is unlikely the new criteria will make restarting reactors any more difficult, according to informed sources.

If the government decides the new criteria are appropriate and the reactors at the Oi power plant meet these criteria, Edano will visit Fukui to seek the prefectural government's approval to restart the reactors.

"It will not take much time before the government holds explanatory sessions with local governments and residents to improve their understanding about potentially restarting the reactors," a government source said, hinting the government will make its requests to local governments at an early date.

However, following the first meeting, Edano said: "It will take a certain amount of time [for the government] to win people's understanding. As a rough-and-ready approach is not desirable, we haven't had any concrete prospects [for a government conclusion on restarting the reactors]."

The government will forecast the electricity supply and demand for this summer sometime around Golden Week, which starts in late April.
If operations at the Oi reactors are not decided within the month, there is a high likelihood that businesses and households in the Kansai region will be asked to undertake strict electricity-saving measures. Whether a political decision on resuming reactor operations is made quickly is the real issue at this point.

30-point safety measures for nuclear plants
http://www3.nhk.or.jp/daily/english/20120405_24.html

The government is drafting new safety standards for nuclear plants, based on steps drawn up by Japan's nuclear regulator following the Fukushima disaster.

The 30 steps are designed to address factors the Nuclear and Industrial Safety Agency has singled out for causing the fuel meltdowns and huge radioactive leaks at the Fukushima Daiichi nuclear plant last year.

The agency says the plant lost power sources needed to activate safety devices, and the operator installed key power sources in one place, which broke down due to a single cause. In addition, the tsunami disabled all functions to inject cooling water into reactors.

It says the operator was also slow to release radioactive air to prevent hydrogen explosions, and gauges and communication devices to grasp the situation inside the reactors were unusable.

The 30 steps call for plant operators to secure multiple emergency power sources, protect facilities from tsunami and install electrical equipment in different locations.

Other requirements include storing long-lasting emergency batteries and setting up headquarters that are quake-resistant and shielded from radiation.

The agency says 13 out of the 30 steps are emergency measures and some have already been implemented. The rest are mid- and long-term measures that require new equipment and facilities.

The agency explains that the 30 points are not the safety standards that communities are requesting before restarting reactors. Rather, it says, they are part of the process for drafting the standards.

Restart Oi nuclear plant?

April 6, 2012

Govt to check Oi procedures / Results of 30-point safety plan will affect possible resumption date

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120405004775.htm

The government will use a 13-point set of emergency criteria to evaluate the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Oi, Fukui Prefecture, as the first part of a two-stage inspection under new safety criteria for nuclear reactors, according to government sources.

To restart the reactors as soon as possible, the government will conduct the two-stage inspections based on safety criteria consisting of 30 points, compiled by the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency at the instruction of Prime Minister Yoshihiko Noda.

The first stage covers 13 points and is designed to prevent a serious crisis like the one at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

After approval of the safety criteria by the Cabinet ministers concerned, Economy, Trade and Industry Minister Yukio Edano will visit Fukui Prefecture to ask for the consent of the local government to reactivate the reactors as early as Sunday.
The government presented the 30-point safety criteria at a meeting of the ministers concerned Thursday.
The new guidelines were designed to further improve nuclear power plants' ability to withstand large earthquakes and tsunami.
Fukui Gov. Issei Nishikawa had demanded the government devise new safety standards as a prerequisite for consent on restarting the Oi reactors.
The 30-point safety criteria are divided into five categories:
-- External power supply.

-- Electrical equipment in buildings housing reactors.
-- Cooling functions of reactors.
-- Measures to prevent hydrogen explosions.
-- Accident responses.

The 13 points included in the first stage of the inspection are regarded as emergency measures, most of which were implemented in the wake of the Fukushima accident.

The government believes facilities that pass the first stage are able to prevent accidents, including meltdowns, resulting from a tsunami-triggered loss of all electrical power.

Key pillars of the first-stage accident-prevention measures include:
-- Deployment of power-supply vehicles to cover a loss of emergency power.
-- Measures to prevent buildings from flooding.
-- Deployment of fire pump vehicles to prepare for a loss of reactor cooling functions.
-- Measures to prevent hydrogen explosions.
-- Measures to facilitate the discharge of steam from a reactor's containment vessel, to lower internal pressure and prevent a hydrogen explosion, even during blackouts.

Apart from the emergency measures, the 30-point safety criteria include increasing external power supply networks, installing ventilation devices equipped with filters to catch radioactive substances and securing telecommunication lines in the event of an accident.

After the 13 emergency measures have been fully implemented, the government plans to improve reactors based on the remaining points while keeping them in operation.

The government intends to ensure the enhanced safety of nuclear power plants by requiring they meet the 30-point safety criteria in addition to regular inspections and stress tests, to dispel a sense of distrust among affected local governments, according to officials. The same procedures would be followed for the reactivation of other reactors in the country.

The government is expected to seek the Fukui prefectural government's consent in a meeting with the ministers concerned with nuclear safety. The final decision will take the opinions of local entities concerned into account.
In June last year, then Economy, Trade and Industry Minister Banri Kaieda asked Kyushu Electric Power Co. to resume operations at its Genkai nuclear power plant's Nos. 2 and 3 reactors in Genkai, Saga Prefecture. However, then Prime Minister Naoto Kan overturned the decision.

In light of this, the government will first clarify its stance and present relevant material to persuade the Fukui prefectural government and other local entities to restart their reactors.

The concerned entities' responses are expected to have a significant impact on the government's electricity supply-and-demand plan for this summer, to be compiled before the Golden Week holidays.

Is gov't trying to restart reactors without public consent ?

April 6, 2012

Govt. approves new nuclear plant safety standards
http://www3.nhk.or.jp/daily/english/20120406_27.html

Japan's government has adopted new safety standards for nuclear power plants as a step toward restarting 2 reactors supplying power to western Japan.

Prime Minister Yoshihiko Noda and 3 ministers approved the standards on Friday in their third meeting on the Ohi plant in Fukui Prefecture.

The standards call for utilities to take measures to retain some power sources to avoid a total blackout in the event of a powerful earthquake or tsunami. They also address steps to prevent the situation from worsening.

Plant operators are also asked to compile action plans to boost safety levels.

Economy minister Yukio Edano asked the government nuclear safety agency to make sure the Ohi plant, run by the Kansai Electric Power Company, meets the standards.

Edano also instructed the utility to draw up a timeline to implement the standards. The 4 ministers are to meet again after the utility turns over its replies to the requests.

Noda plans to send Edano to Fukui to seek understanding from local communities once the government confirms the plant's safety and determines that restarting the reactors can gain public support.

Despite growing public opposition to nuclear power, the government is trying to restart the reactors due to concern about power shortages this summer. The reactors are among 53 in Japan that have gone offline for safety checks.

The government says it hopes the standards will help convince host communities and the public of the safety of nuclear plants.

Can not-restarting nuke reactors be an option?

Edano wants concrete steps to boost nuclear safety
http://www3.nhk.or.jp/daily/english/20120406_16.html

Japanese industry minister Yukio Edano says he will order power companies to submit their nuclear maintenance timetables in order to further enhance safety at nuclear power plants.

Edano faced reporters on Friday, one day after the Cabinet basically agreed on new nuclear safety standards in connection with the possible restart of 2 reactors currently offline for inspections.

Edano said the most important lesson learned from the nuclear accident at Fukushima Daiichi was that power companies had failed to regularly enhance safety measures by incorporating new ideas.

He said the government will ask the power companies for their nuclear maintenance timetables to implement further safety measures incorporating the lessons learned from the Fukushima accident.

Edano said the Cabinet ministers will examine the timetables closely before making decisions on whether to approve any reactor restarts.

He also said there is no need to restart the reactors if the country has sufficient power, or if energy-saving measures can sufficiently reduce power consumption.

All but one of Japan's 54 nuclear reactors are now offline.

"Safety" standards

April 7, 2012

Ministers largely approve new nuclear safety standard

"(mainichi Japan) April 06, 2012"
http://mainichi.jp/english/english/newsselect/news/20120406p2g00m0dm066000c.html

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda and three ministers on Thursday largely approved a new safety standard for resuming idled nuclear reactors, industry minister Yukio Edano said after their meeting.

The four examined the new standard at their second meeting to consider whether to reactivate two reactors at the Oi nuclear power plant in Fukui Prefecture, western Japan. They will hold a third meeting Friday to finalize details of the standard, Edano said.

Edano will then instruct the Oi plant operator, Kansai Electric Power Co., as well as the government's Nuclear and Industrial Safety Agency to check whether the two idled reactors meet the new standard.

Provided the government decides to reactivate the Oi reactors, Edano will travel to Fukui Prefecture to explain the government's decision, Edano said.

Government sources said Edano may travel to Fukui as soon as Sunday to seek the approval of Fukui Gov. Issei Nishikawa for reactivating the two nuclear reactors.

To cope with remaining concerns about nuclear safety despite nuclear authorities' technical analyses through recent reactor stress tests, Noda earlier this week ordered that a new safety standard for resuming operation of idled reactors be set up.

A statement released after Thursday's ministers' meeting said nuclear power plants have been operated adequately and safety checks on reactors idled for periodic checks have been conducted in accordance with current laws.

But referring to the delay in establishing a new nuclear safety agency and enacting related new laws, the statement said the four ministers urge nuclear power operators when restarting reactors to "ensure safety exceeding the level required by regulations under the current law."

The new safety standard consists of three guidelines to reactivate idled reactors.

The first requirement is that reactors must have taken safety measures to prevent the loss of all power in the wake of earthquake and tsunami.

The second is that measures must have been taken to prevent the sort of situation seen at the crisis-hit Fukushima Daiichi nuclear power plant even if reactors are hit by similar size earthquake and tsunami.

The third guideline includes the implementation of 30-point safety measures based on the analysis of the Fukushima crisis.

The Fukui prefectural government has called for the central government to present a provisional safety standard before reactivating the Oi reactors.

Since last year's nuclear accident at Tokyo Electric Power Co.'s Fukushima Daiichi complex, triggered by a massive earthquake and tsunami, no Japanese reactors have resumed operation after being shut down for mandatory periodic checkups.

Among the dozens of reactors idled for routine checks, the Oi reactors are the first that the government is considering allowing to resume operating, given the recent endorsement of results from the first stage of stress tests on them by the nuclear safety agency and the Nuclear Safety Commission.

Nuclear disaster minister Goshi Hosono and Chief Cabinet Secretary Osamu Fujimura also attended the meeting with Noda and Edano

Govt to monitor reactor safety measures

Masayuki Takata and Keiichi Shimizu / Yomiuri Shimbun Staff Writers

http://www.yomiuri.co.jp/dy/national/T120407002810.htm

As the government has decided on new nuclear reactor safety standards, power companies will now be required to implement further safety improvement measures.

Meanwhile, local governments are trying to gauge how committed the central government is to quickly securing a stable electricity supply.

The central government will monitor whether power companies have implemented safety measures to prevent a crisis similar to the one that occurred at the Fukushima No. 1 nuclear power plant after the March 11, 2011, disaster. Companies must also commit to implementing further steps as soon as possible, according to the new safety standards.

With an eye on reactivating the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture, the government approved the safety standards at a meeting Friday attended by Prime Minister Yoshihiko Noda and three other Cabinet ministers in charge of nuclear policy.
The safety confirmation standards consist of two stages.
The first stage is divided into two sections:
-- Emergency measures to prevent a worse situation even if a reactor loses all power. This section consists of 16 checkpoints in four categories.
-- Government confirmation of stress test results for the reactor regarding whether it can maintain cooling functions to prevent a meltdown even if it is hit by a disaster as powerful as the Great East Japan Earthquake and the ensuing tsunami.
The emergency measures were decided by the central government, following the crisis at the Fukushima No. 1 nuclear plant.
The second stage relates to operators' commitment to medium- and long-term safety enhancements.

Economy, Trade and Industry Minister Yukio Edano emphasized the significance of the safety criteria during a press conference Friday night at the Prime Minister's Office following the four-minister meeting.

"We don't want another nuclear crisis like the one at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant--that's the starting point of the standards," he said.

The safety standards were established based on 30 points devised in March by the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency.

The 30 items, however, covered emergency measures the government instructed operators to implement immediately after the Fukushima crisis, as well as initial assessments of stress tests, which focused on whether nuclear reactors can withstand quakes or tsunami larger than predicted.

Some experts, therefore, consider the safety criteria as "hastily compiled measures that don't include anything new."

Chief Cabinet Secretary Osamu Fujimura countered such criticism.

"That's a misunderstanding," he said. "They have been made based on the accumulation of our knowledge and findings since the nuclear crisis started."

In deciding whether to resume operations of suspended reactors, the safety standards require the prime minister and three others in charge of nuclear policy to verify the measures nuclear plant operators have taken.

In the case of Oi's Nos. 3 and 4 reactors, operator KEPCO has set up emergency generators on high ground and installed alternate seawater pump facilities.

In addition to the verification of completed safety measures, the new standards require plant operators to submit timetables on concrete steps they will take to implement measures among the list of 30 items and remedy problems discovered through stress tests.

Future safety measures included in the safety criteria have been modeled after measures already implemented overseas to prevent nuclear crises, citing the 1979 Three Mile Island incident and others.

NISA will judge the measures taken by utility firms, while the four ministers will later confirm the agency's judgment, according to the standards.

KEPCO has already announced a schedule for building necessary facilities aside from reactor buildings at the Oi nuclear plant--for example, a quake-resistant building to house an emergency headquarters **to be built by fiscal 2016.**

On the other hand, the utility **did not indicate when it will carry out other long-term measures,** such as setting up filtered ventilation equipment for reactors, to suppress radioactive material from being discharged into the atmosphere in a severe incident.

Nonetheless, a KEPCO official said the utility will submit a timetable for the two Oi reactors as early as this week.

"We've been examining [when these steps can be taken]," he said. "It won't take long for us to sort out the issues."

The new safety standards have been devised at the urging of Fukui Gov. Issei Nishikawa, who asked that the government not only require nuclear power plant operators to conduct stress tests, but also compile provisional criteria based on the Fukushima crisis.

The standards are expected to be studied for legal enforcement following the planned launch of a nuclear regulatory agency, according to government officials.

Even if suspended reactors receive permission for reactivation based on the safety standards, the government will need to reassure nearby residents with careful explanations so that they can accept the criteria, experts pointed out.

It must do this because there will be many steps left to be implemented even after suspended reactors are reactivated, they said.
In other words, they added, people will question whether the government can properly assess plant safety measures, which used to be the utilities' responsibility.
"We [four ministers] would like to explain to the public what experts have decided in an easy-to-understand way," Edano said.
===
Summer shortage looms

With the Noda administration's decision on new guidelines to confirm the safety of nuclear power reactors, the process of restarting the reactors at the Oi nuclear plant in Fukui Prefecture has taken a step forward.

The administration regards a stable power supply this summer as the highest priority. For this reason, it has been aiming to restart the reactors by May 5, when the No. 3 reactor at Hokkaido Electric Power Co.'s Tomari nuclear power plant--the last reactor operating in Japan--will be suspended for regular inspections.

If none of the nation's reactors are online, "the hurdle to restarting the reactors [at the Oi plant] will become higher," a government source said.

Edano had been particularly optimistic about the resumption of the reactors' operations.

"If we can obtain the understanding from localities [hosting nuclear plants], we'll restart [operations] depending on the power demand-supply situation," he said.

However, Edano's recent comments suggest that his stance has changed. At a House of Councillors Budget Committee session Monday, he said, "At this point, I'm against the resumption [of the idle reactors at the Oi plant]."
Edano said consent would be needed from governors of neighboring Shiga and Kyoto prefectures. The apparently contradictory remarks have sparked controversy.

He then said at a press conference after a regular Cabinet meeting Friday, "If sufficient power supply is guaranteed, it won't be necessary to resume operations [of idled reactors]."

Parties concerned believe Edano was indicating the possibility that some nuclear power reactors would not resume operations.

Asked why Edano's remarks were so divergent, a Cabinet minister said, "We intended to have Mr. Edano **keep power utilities in check, since they may lag in implementing reforms and cutting costs if they believe the reactors will be restarted anyway."**

If the Oi reactors are confirmed safe to operate at a meeting of ministers related to nuclear safety, to be resumed as early as Monday, Edano is expected to visit Fukui Prefecture to secure the consent of the local government.
However, Edano's contrary remarks have brought "side effects," stoking suspicions among concerned parties in Fukui Prefecture toward the central government's position.

Hakuei Ishizuka, the head of the public safety and environment department at the Fukui prefectural government, on Friday refrained from talking about the government's new safety confirmation standards.

"We can't comment because the central government is still in the middle of the decision making process," he said.
However, Oi Mayor Shinobu Tokioka criticized the central government over the process.

"It should explain the significance and need for nuclear plants before creating standards," he said. "They're doing things backward."

Fujimura said at a press conference Friday, "From a legal perspective, there is no need to obtain consent [of the local governments]."

Although Fujimura emphasized that the central government takes full responsibility for settling the reactivation issue, prospects for restarting reactors remain unclear.

Choose the right mayor

Omaezaki mayoral race starts, focus on resumption of Hamaoka plant

April 08, 2012(Mainichi Japan)
http://mainichi.jp/english/english/newsselect/news/20120408p2g00m0dm056000c.html

HAMAMATSU (Kyodo) -- The mayoral race in Omaezaki, Shizuoka Prefecture, commenced Sunday with three candidates focusing on whether to restart the Hamaoka nuclear power station, which has been suspended at the request of the government in the wake of the March 2011 earthquake and tsunami.

The three candidates are incumbent Shigeo Ishihara, 64, who is seeking a third term, travel agent Haruhisa Muramatsu, 60, who is backed by the Japanese Communist Party, and former city councilor Katsuhisa Mizuno, 58.

In their campaign speeches, Ishihara said he would decide whether to restart the power plant through discussions with city residents and by taking into account lessons learned from the nuclear crisis at the Fukushima Daiichi complex, while Muramatsu said the Hamaoka plant should be decommissioned.

The voting and count will take place next Sunday.

Mizuno pledged he would not accept resumption of the plant during his term, saying, "Everybody hopes the plant will not be resumed."

The Hamaoka power station in the city, operated by Chubu Electric Power Co., has been suspended since last year after an unprecedented request from the government following the March 2011 disaster, based on a prediction that a magnitude 8-class quake could hit the region in the first half of this century.

Not to worry then

Kansai Electric to present timetable Monday for Oi reactors' safety

April 08, 2012(Mainichi Japan)
http://mainichi.jp/english/english/newsselect/news/20120408p2g00m0dm077000c.html

OSAKA (Kyodo) -- Kansai Electric Power Co. President Makoto Yagi is considering presenting a medium- to long-term timetable for the implementation of safety measures for two idled reactors at its Oi nuclear power plant to industry minister Yukio Edano on Monday morning, sources familiar with the move said Sunday.

Edano, Prime Minister Yoshihiko Noda and two other ministers will assess the timetable, submission of which is a prerequisite for resuming the Nos. 3 and 4 reactors at the Oi nuclear complex in Fukui Prefecture, to determine if the safety of the reactors will be ensured.

They will also examine projections for electricity supply and demand this summer in the Kansai region centering on Osaka that the utility serves, before determining whether they should seek local cooperation for the reactivation of the two reactors.

In the timetable, Kansai Electric will clarify time limits for achieving 30 safety measures required by the government's Nuclear and Industrial Safety Agency in the wake of the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi complex.

Since last year's Fukushima nuclear disaster, the government has required nuclear power plants to undergo two-stage stress tests and made it necessary for reactors idled for scheduled checks to pass first-stage tests before resuming operation.

Only one of Japan's 54 commercial reactors is currently in operation and it is scheduled to suspend operation on May 5 for routine checks, leaving Japan without an operating reactor if no others resume operation by then.

Among the dozens of reactors idled for routine checks, the Oi reactors are the first that the government is considering allowing to resume operation, given the recent endorsement of first-stage stress test results on them by the Nuclear and Industrial Safety Agency and the Nuclear Safety Commission.

Power shortage or not ?

April 9, 2012
Kansai may face 20% power shortage this summer

http://www3.nhk.or.jp/daily/english/20120409_38.html

The Japanese government says Kansai could face a power shortage of 20 percent this summer if the weather stays hot and idled nuclear reactors that serves the region are not restarted.

The government's new estimate on summer power shortages covers areas served by Kansai Electric Power Company.

The estimate says a shortage of up to 19.6 percent is possible if 2 off-line nuclear reactors at the Ohi plant in Fukui Prefecture remain shut and temperatures reach the sweltering levels of summer 2010.

A shortage of up to 17.2 percent is expected if summer temperatures stay within the average range of the past 5 years.

The estimate says the shortage will drop to 7.6 percent if factories operate on weekends instead of some weekdays to spread out power demands, power-saving measures are carried out by households, and temperatures stay at last summer's levels.

It says in each scenario, the rate of shortage may increase by about 2 percentage points if there is trouble at any of the thermal power plants, or if demand peaks in July.

Power shortages in areas served by Kansai Electric would be one of the conditions for the resumption of the utility's currently suspended nuclear reactors.

The government will decide on Monday whether or not to restart these reactors, after considering the estimate, along with a new set of safety standards the utility has submitted.

Getting there

April 9, 2012

Operator of Ohi nuclear plant submits safety plan
http://www3.nhk.or.jp/daily/english/20120409_23.html

The operator of 2 nuclear reactors on the Japan Sea coast has submitted a safety action plan to the industry minister as a step toward restarting the reactors.

Kansai Electric Power Company President Makoto Yagi handed the plan to Industry Minister Yukio Edano on Monday.

The government had asked the utility to come up with a timeline for implementing the government's new safety standards as a precondition for restarting the reactors. The 2 reactors at the company's Ohi power plant are currently offline for safety checks.

After meeting with Edano, Yagi said the company's accident-prevention measures are aimed at preventing incidents such as the disaster at Tokyo Electric Power Company's Fukushima Daiichi Plant. He said he hopes to get government approval soon to restart the reactors.

The plan includes the installation in 2015 of vents equipped with filters to scrub radioactive materials from steam. The vents are used to release pressure from the containment vessels in the event of a nuclear emergency.

The power company also plans to build an earthquake-resistant office building in 2015, one year ahead of schedule. The utility says the office will serve as a response center for dealing with nuclear accidents.

Prime Minister Yoshihiko Noda will convene his Cabinet on Monday to discuss whether the timeline can be used to help convince those living near the plant that it is safe to restart the reactors.

Getting there

April 9, 2012

Operator of Ohi nuclear plant submits safety plan
http://www3.nhk.or.jp/daily/english/20120409_23.html

The operator of 2 nuclear reactors on the Japan Sea coast has submitted a safety action plan to the industry minister as a step toward restarting the reactors.

Kansai Electric Power Company President Makoto Yagi handed the plan to Industry Minister Yukio Edano on Monday.

The government had asked the utility to come up with a timeline for implementing the government's new safety standards as a precondition for restarting the reactors. The 2 reactors at the company's Ohi power plant are currently offline for safety checks.

After meeting with Edano, Yagi said the company's accident-prevention measures are aimed at preventing incidents such as the disaster at Tokyo Electric Power Company's Fukushima Daiichi Plant. He said he hopes to get government approval soon to restart the reactors.

The plan includes the installation in 2015 of vents equipped with filters to scrub radioactive materials from steam. The vents are used to release pressure from the containment vessels in the event of a nuclear emergency.

The power company also plans to build an earthquake-resistant office building in 2015, one year ahead of schedule. The utility says the office will serve as a response center for dealing with nuclear accidents.

Prime Minister Yoshihiko Noda will convene his Cabinet on Monday to discuss whether the timeline can be used to help convince those living near the plant that it is safe to restart the reactors.

Moving "too hastily and in a sloppy manner"

April 9, 2012

New standards for reactivating nuke reactors are too hasty and sloppy

http://mainichi.jp/english/english/perspectives/news/20120409p2a00m0na018000c.html

The government should be criticized for having moved too hastily and in a sloppy manner when it set new standards for deciding whether to reactivate nuclear reactors, even though the criteria are crucial in ensuring the safety of the public.

Prime Minister Yoshihiko Noda and three Cabinet ministers concerned approved the standards on April 6 with an eye to approving resumption of operations at the No. 3 and 4 reactors at the Oi Nuclear Power Plant in Fukui Prefecture, which are currently suspended for regular inspections.

The standards apply to not only the Oi reactors but also to all nuclear plants across Japan. Nevertheless, the government spent only three days on working out the standards -- from the prime minister's instruction to do so until the adoption.

The government claims that the new standards are based on knowledge and lessons learned from the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant and were adopted earlier than initially intended, but it is hardly convincing. **The government has not yet got to the bottom of the accident, and the standards appear to contain nothing new.**

The first of the three pillars of the standards only calls for safety measures that can be implemented soon, such as the installation of power-supply vehicles, which had been simply gleaned from 30-point measures that the Nuclear and Industrial Safety Agency (NISA) compiled in late March.

The second pillar requires the government to confirm that nuclear fuel will never be damaged in case of earthquakes and tsunami similar to those that hit the Fukushima plant. However, the government maintains that it can confirm whether nuclear power stations meet this standard through a primary safety assessment.

The third pillar calls for the construction of quake-absorbing structures on the premises of nuclear plants and other mid- and long-term safety measures. However, the government will reportedly deem that nuclear plants meet this condition if their operators submit their plans to implement these measures.

In other words, the new standards were worked out by only putting together emergency safety measures and the results of safety assessments that power suppliers have already implemented, giving the utility firms an excuse for putting off time-consuming safety measures. **It even appears that the government intentionally worked out looser standards so that utilities can meet them in order to hasten the reactivation of Oi nuclear plant's idled reactors.**

Since the government has adopted a policy of cutting down its reliance on nuclear power with risks involving such plants fully in mind, it should not have worked out standards on the assumption that no reactor will fail safety assessments. Rather, the government should compare flaws involving various nuclear plants and improve the standards so that it can refuse to permit reactivation of high-risk plants.

Further questionable is that the standards are based on the principle that the government must confirm that nuclear fuel will never be damaged if hit by earthquakes and tsunami as massive as those that hit the Fukushima plant. **However, an important lesson learned from the Fukushima nuclear crisis is that nuclear plant operators must be prepared for massive disasters that are beyond the scope of assumptions**. Considering that a serious accident leading to reactor core meltdowns could occur, the government should assess the performance of nuclear plants' vents equipped with filters and the risks resulting from the lack of quake-absorbing structures as well as other factors in an appropriate manner.

Economy, Trade and Industry Minister Yukio Edano says there is no need for reactivation of nuclear reactors stopped for regular inspections if the overall supply of electric power is sufficient.

The government will further lose the public's confidence if it sticks to its stance to implement the safety standards worked out hastily in order to reactivate idled nuclear reactors without providing a sufficient explanation of its forecast of electricity supply and demand.

Seems like the decision has been made

April 10, 2012

KEPCO gives govt road map on Oi reactors

The Yomiuri Shimbun

Kansai Electric Power Co. President Makoto Yagi on Monday submitted to Economy, Trade and Industry Minister Yukio Edano a road map of safety measures for the reactivation of the idled Nos. 3 and 4 reactors at the Oi nuclear power plant in Fukui Prefecture.

This includes measures to set up filtered ventilation equipment for reactors in fiscal 2015 to suppress the release of radioactive substances.

The road map was formulated based on medium- and long-term nuclear reactor safety standards that KEPCO was instructed to implement by the government Friday.

Prime Minister Yoshihiko Noda was expected to hold the fourth meeting of related ministers Monday evening, with an eye on reactivating the reactors and making the final confirmation of the nuclear power plant's safety.

The road map was made to implement 30 nuclear reactor safety standards created in March by the ministry's Nuclear and Industrial Safety Agency, which are based on the lessons learned from the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

These standards include emergency measures to prevent serious accidents, even at a time when all power supply is lost, which have already been implemented at the two reactors. The road map clarifies the timing for the implementation of medium- to long-term measures to further improve the reactors' reliability.

They include further elevating breakwaters in fiscal 2013, and bringing forward by a year to fiscal 2015 the planned installation of a seismically isolated building from which the operation of reactors will be controlled during an emergency.

The enhancement of cooling and power-supply facilities were also included in the road map.

KEPCO is expected to spend at least 200 billion yen on safety enhancement measures at its power plants, including the one at Oi.

Edano called on Yagi to make further efforts to enhance nuclear safety by saying, "It is important for power companies to break away from the myth of [nuclear power plant's] infallible safety and to set a higher safety bar."

Yagi told Edano the firm is dedicated to taking every measure to improve the safety and reliability of its plants.

Noda was expected to make a final decision on the reactors' safety as early as Monday evening at the ministerial meeting after studying both the road map and verification results of emergency measures by the safety agency.

Should he judge the reactors are safe enough, a decision will be made on whether they will ask the local government to approve the reactivation.

If the reactors are not activated, the areas covered by KEPCO are expected to face a power shortage of up to 19.3 percent in summer, which makes it likely the reactivation will be endorsed.
(Apr. 10, 2012)

Osaka's conditions (prior to restarting reactors)

April 10, 2012

Osaka compiles new conditions for resumption of Oi nuclear plant
Asahi, April 10, 2012 - http://ajw.asahi.com/article/behind_news/politics/AJ201204100035

The central government is again marching steadily toward restarting reactors at the Oi nuclear power plant, but **local governments in the area have raised the stakes for consenting to such a move**.

Prime Minister Yoshihiko Noda and three of his Cabinet ministers on April 9 agreed that the road map for additional safety measures, submitted earlier in the day by Oi plant operator Kansai Electric Power Co., was generally appropriate.
"It is clear that the plant operator is taking a stance of ceaselessly implementing the measures needed to ensure the safety of the plant," said Yukio Edano, the industry minister who oversees the nuclear energy sector.

However, Edano indicated that a decision on resuming operations would not be made until the next meeting of the relevant Cabinet ministers, likely later this week.

In the meantime, the energy strategy council of the Osaka prefectural and municipal governments is putting together a set of eight conditions that it considers necessary before operations can resume at the Oi plant in Fukui Prefecture.

The Osaka municipal government is the largest shareholder of Kansai Electric, so its position will likely influence the central government's decisions regarding the Oi plant.

The council is calling on the central government to not only establish a new nuclear regulatory agency and comprehensively revise its safety standards, but it is also asking that a new safety agreement be signed between Kansai Electric and all local governments within a 100-kilometer radius of the Oi plant.

Currently, such safety agreements are signed only between the nuclear plant operator and the local governments that actually host the plant.

However, the accident last year at the Fukushima No. 1 nuclear power plant showed that leaked radiation can quickly spread to a much wider area than simply the municipalities where the nuclear plant is located. In addition, the governors of Kyoto and Shiga prefectures, which border Fukui Prefecture, have raised objections to an early resumption of operations at the Oi plant.

A 100-kilometer radius around the Oi plant would cover not only Kyoto and Shiga prefectures, but part of Osaka Prefecture as well.

The central government has so far been determined to approve a resumption of operations at the Oi nuclear plant to prevent an electricity shortage in the high-demand summer season.

The central government compiled new provisional safety standards for resuming operations just two days after Noda retracted his opposition to such standards. Kansai Electric also submitted its safety road map only three days after it was asked to do so.

According to the road map, Kansai Electric plans to install venting equipment with filters to prevent the spewing of radioactive materials in the event of an accident. That installation is scheduled for completion in fiscal 2015.

But almost all of the measures included in the road map have been proposed by the utility in the past. About the only new measure included was to install permanent emergency power generation equipment.

The road map contained no details on equipment numbers and their locations.

At an April 9 meeting, officials of the Agency for Natural Resources and Energy presented estimates of the effects of keeping idle all nuclear plants operated by Kansai Electric.

The officials estimated a 19.6-percent electricity shortage if temperatures reached levels of the hot summer of 2010. They also predicted an additional 800 billion yen ($9.8 billion) in fuel costs for Kansai Electric to operate its thermal plants in place of the nuclear reactors.

Not decided yet ?

April 11, 2012

Safety of Oi reactors 'confirmed' / Final decision to be made later this week

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120410005406.htm

Economy, Trade and Industry Minister Yukio Edano said the safety of the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture has been basically confirmed by four ministers concerned, as the reactors meet the government's new reactor safety guidelines.

"They met the safety standards we decided on, and the safety of the reactors is generally confirmed," Edano told a press conference held after a meeting of the four ministers on Monday.

However, Prime Minister Yoshihiko Noda, Edano and two other ministers did not make a final decision Monday on whether the reactors should be restarted. They are expected to decide at their next meeting, to be held later this week.

Edano likely will visit Fukui Prefecture on the weekend to request the prefectural government approve the reactivation of the reactors.

At last Friday's meeting of the relevant ministers, the government revealed new safety guidelines for restarting idled nuclear power reactors. At the Monday meeting, they screened a road map of safety measures toward the reactivation of the Oi reactors that KEPCO submitted to Edano on the same day.

Edano said at the news conference, "We'll continue to discuss safety confirmation and the necessity [of reactivating the reactors] in consideration of power supply and demand [at the next meeting]."

The ministers will comprehensively review the safety measures for the reactors and "check whether there were oversights," Edano added.

The government's new guidelines consist of two stages:

-- Confirmation of preventive measures to avoid a worst-case scenario in which a reactor loses all power sources due to an earthquake or tsunami, as well as confirmation of emergency measures to maintain cooling functions to prevent a meltdown during a severe accident.
-- Require power utilities to submit medium- and long-term measures to improve nuclear reactor safety.

KEPCO's safety improvement timetable applies the 30 points of the nuclear reactor safety standards created by the Nuclear and Industrial Safety Agency to 85 fields.

According to KEPCO, the power company has already completed emergency safety improvement measures in 52 of the 85 fields.

The firm has started implementing medium- and long-term measures in most of the remaining 33 fields, government sources said.

Through the road map, KEPCO has revealed its intention to swiftly implement the safety measures by moving up the schedule for conducting the medium- and long-term steps, the sources said.

Specifically, KEPCO brought forward by a year to fiscal 2015 the schedule for establishing a special "earthquake-resistant administration building."

Such a seismically isolated building played an important role as the command headquarters for the crisis at the Fukushima No. 1 nuclear power plant of Tokyo Electric Power Co.

KEPCO also set a target of fiscal 2015 for setting up filtered ventilation equipment for the reactors, which is designed to prevent the dispersal of radioactive substances when air or steam is released into the atmosphere to reduce the pressure within the reactor.
===
KEPCO to request power saving

KEPCO said Tuesday it will ask its customers to save electricity again this summer, irrespective of whether it resumes operation of the Nos. 3 and 4 reactors at the Oi nuclear power plant.

"Even if the reactors at the Oi plant are reactivated, we'll request customers to conserve," KEPCO Vice President Shigeki Iwane told reporters after a meeting of the joint energy strategy council of Osaka Prefecture and Osaka city.

According to government estimates, areas covered by KEPCO are likely to experience a power shortage of 19.6 percent this summer if the two reactors at the Oi plant do not resume operations, under possible power demand of 30.95 million kilowatts--the demand in the extremely hot summer of 2010.

Even if power demand is held down to last summer's level of 27.84 million kilowatts--when KEPCO requested its customers to cut power use by least 15 percent--it will face a shortage of 7.6 percent.

Regarding estimates that a serious power shortage is expected within the KEPCO coverage areas if the Oi reactors are not reactivated, Chief Cabinet Secretary Osamu Fujimura said at a press conference on Tuesday that planned power conservation should be implemented based on detailed predictions of power demand.

Unexpected respite

April13, 2012
Govt puts off decision on Oi N-reactors

Jiji Press
http://www.yomiuri.co.jp/dy/national/T120412006339.htm

Prime Minister Yoshihiko Noda and three other Cabinet members put off their decision on Thursday as to whether to approve the safety of two suspended nuclear reactors at the Oi power station in central Japan.

At their fifth meeting on the issue, the four had been expected to give their approval of safety measures drawn up by Kansai Electric Power Co. for the Nos. 3 and 4 reactors at the power plant, which the company operates in Fukui Prefecture.

But industry minister Yukio Edano said after the talks that the participants were unable to reach a conclusion.

Edano added that he hopes to hold a meeting of the four ministers again on Friday if possible.

The remaining two meeting participants were Chief Cabinet Secretary Osamu Fujimura and nuclear disaster management minister Goshi Hosono.

If the four ministers approve the safety measures for the two reactors, they would adopt a plan to send Edano to Fukui Prefecture in an attempt to overcome local opposition to the restart of the two facilities.

They are expected to meet again once Edano returns to Tokyo and finalize their decision on the restart if they believe the plan has local understanding.

At a meeting held Monday, the four ministers broadly agreed that Kansai Electric's safety measures for the two reactors are adequate to warrant a resumption of operations.

Kansai Electric has been instructed to take steps to reduce power supply shortages that are expected in the summer. The power utility's service areas are mostly in western Japan.

Yuhei Sato speaks out against govt's rush to restart reactors

April 13, 2012
Fukushima Gov. blasts gov't over push to restart nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20120413p2a00m0na014000c.html

FUKUSHIMA -- Fukushima Gov. Yuhei Sato, whose prefecture hosts the crippled Fukushima No. 1 nuclear plant, has spoken out against central government moves to restart reactors across the country idled for periodic maintenance.

"The investigation into the Fukushima No. 1 plant disaster isn't yet complete, but (the government) is already discussing restarting reactors. That is a problem," Sato told reporters at a regular news conference. "It makes me question whether the government really understands how severe nuclear disasters are.

"As the nuclear disaster progresses, we hear of new incidents every day," he added, referring to the frequent reports of spreading radioactive contamination and radioactive water leaks since the meltdowns at the No. 1 plant.

Sato also touched on the proposed new nuclear power regulatory agency, which was supposed to start work at the beginning of April but has not yet been launched, saying, "There's also a problem when the promotion of nuclear power is happening alongside the regulation of nuclear power, while the government has yet to present a long-term energy policy."

End of "suspense"?

April 14, 2013

Govt expected to approve Oi restart

Jiji Press
http://www.yomiuri.co.jp/dy/national/T120413005898.htm

Prime Minister Yoshihiko Noda and three other Cabinet ministers were expected to approve the restart of two suspended reactors at the Oi nuclear power plant at a meeting Friday evening.

At the meeting, the four were to discuss safety measures drawn up by Kansai Electric Power Co. for the Nos. 3 and 4 reactors at the power plant in Fukui Prefecture.

Another key issue on the agenda was the electricity supply and demand situation for KEPCO's service area.

The session marks the sixth meeting between Noda and the three ministers since April 3 in preparation for the restart of the two reactors, which have been idled for regular maintenance. The three are industry minister Yukio Edano, Chief Cabinet Secretary Osamu Fujimura and nuclear disaster management minister Goshi Hosono.

No suspended nuclear reactors have been allowed to resume operations since the onset of the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in March 2011. The only active reactor in the country is scheduled to be idled for routine maintenance in May.

So far, the four have agreed that Kansai Electric's safety measures for the two reactors meet new safety standards adopted by the government on April 6.

The government sees a need to reactivate the reactors as the firm's electricity supply capacity may fall up to 19.6 percent short of demand if temperatures this summer match that of a record-breaking heat wave in 2010.

End of suspense (2) ?

April13, 2012

Govt acknowledges need to resume Ohi nuclear plant
http://www3.nhk.or.jp/daily/english/20120413_53.html

The Japanese government has decided that 2 reactors at the Ohi nuclear plant in western Japan need to be restarted to ensure that the region will not have a power shortage this summer.

The 2 reactors in Fukui Prefecture are currently offline for regular safety checks.

The final decision was made on Friday at a meeting of Prime Minister Yoshihiko Noda, Chief Cabinet Secretary Osamu Fujimura, Nuclear Crisis Minister Goshi Hosono and industry minister Yukio Edano.

The ministers discussed whether the Ohi plant meets the government's new safety standards for nuclear plants.

They also discussed the estimated power demand this summer in the service areas of the plant's operator, Kansai Electric Power Company.

The ministers agreed that the safety action plan submitted by Kansai Electric conforms to the safety standards, and acknowledged the need to restart the 2 reactors.

But the government will need to obtain the consent of the local community before the plant's operations can be resumed.

The government has estimated a power shortage of about 18 percent if the 2 reactors at the Ohi plant remain shut down and temperatures reach the sweltering levels of the summer of 2010.

The industry minister said that after discussing the estimated power shortage and an increase in utility charges, they agreed that the 2 reactors are safe enough to be restarted and there is a need for their resumption.

"Why rush to conclusions?"

April 13, 2012

Japan must heed lessons from World War II in handling nuclear power

http://mainichi.jp/english/english/perspectives/news/20120413p2a00m0na002000c.html

Observing the developments surrounding the push to restart nuclear reactors idled for regular inspections, I was reminded of the words of a renowned political scientist, the late Masao Maruyama.

A year after World War II came to an end, Maruyama pointed out in his essay, "Chokokkashugi no ronri to shinri" (The theory and psychology of supernationalism), that Japan showed no evidence of any awareness that it had taken part in such a horrific war. He asked, "What does it mean that we were shockingly swept along by an unknown force into the midst of a war that the entire nation dedicated itself to?"

I think what Maruyama's analysis of postwar Japan applies also to Japan's situation regarding nuclear power. Despite having wreaked such a horrific disaster under a safety myth that buttressed the construction of nuclear reactors, it has yet to be clarified where the responsibility for the crisis lies. **Additionally, the government is moving toward the resumed operations of halted reactors as if it were the obvious path just a year after the disaster's outbreak, which evokes the manner in which the nation allowed itself to be swept into World War II.**

At an April 9 meeting of relevant ministers, the Yoshihiko Noda administration determined that the No. 3 and 4 reactors at Oi Nuclear Power Plant operated by Kansai Electric Power Co. "for the most part, met" provisional conditions established for resumed operations. The administration is expected to confirm this temporary assessment soon. The government's push toward resumed nuclear power generation, despite widespread warnings of more massive earthquakes, does not strike me so much as hasty, but rather reminds me of the structure of the United States' industrial military complex. It should be up to the public to decide whether or not we follow a path of coexistence with nuclear power, through such methods as national elections and referendums.

On March 23, at a symposium hosted by the Ministry of Foreign Affairs, journalists from eight countries came together in Tokyo to discuss the role of the media in the Great East Japan Earthquake. I participated as the moderator of the discussions, and while some of the remarks were painful to hear, I appreciated the honest input of journalists from around the world, especially since in Japan there is a sense that the disasters are now in the past.

Immediately after the quake, as we watched tsunami swallow whole communities and reactor buildings at the Fukushima nuclear plant explode, we all soberly reflected on the future of our country. It could have been characterized as an opportunity for Japan to start fresh, and some may have viewed it as Japan's second "postwar" moment.

Has the government, however, examined the nation's past in fully thinking about its future? Prime Minister Noda's approach to the Nuclear Security Summit held last month in Seoul -- which included the Fukushima nuclear disaster in its agenda -- clearly did not leave the impression that Japan was starting anew. In addition, Japan's countermeasures against nuclear terrorism and possible attacks on its nuclear reactors were shown to be sorely lacking.

As evidenced in how Japan has handled North Korea's launch of what it claimed was a "satellite," the Japanese government's crisis management is extremely haphazard. As such, it's hard to believe that Japan's crisis management policy with regards to nuclear power is watertight. At the aforementioned journalists' symposium, Hisashi Suzuki, chief editorial writer at Fukushima-Minpo, expressed deep concern over spent nuclear fuel at the stricken Fukushima plant, since another massive quake could further damage the plant's reactor buildings and bring about a far worse catastrophe. **The crisis, albeit quietly, is ongoing.**

A striking scene from the symposium involved CNN's Tokyo correspondent Kyung Lah and Hiroshi Ogasawara, chief editorial writer at Iwate Nippo, a daily paper in Iwate Prefecture. Lah said that she had been impressed to see disaster survivors form neat lines in front of convenience stores, and share one bowl of noodles among multiple people at an evacuation center. Ogasawara, meanwhile, said that residents in disaster-struck communities had always helped each other out, and that lining up at convenience stores was a normal thing to do. Because of this, he said, it was surprising to hear that people were struck by such behavior.

The remarks made by the two journalists sound like two sides of the same coin: that the Japanese are a forbearing people. Patience may be a virtue, but it could give ineffective politicians the impression that they are doing their job right. One British media outlet warns that excessive patience and endurance could have an adverse effect when it comes to reconstruction. The same could probably be said about the issue of nuclear power.

Needless to say, the media bears a heavy responsibility. Priscilla Jebaraj, a reporter at The Hindu, raised the question of neutrality in media coverage of nuclear power. She explained that in reporting on India's anti-nuclear movement, a major Indian newspaper that supports nuclear power has vilified members of the anti-nuclear camp. In response, some audience members stated that the Japanese mass media's investigations into nuclear power have been insufficient.

It is, of course, important to accept criticism. However, I think that it is not so much that the media's investigations have been insufficient, but that Japan -- including the government, utilities, and media -- does not have the capacity to accurately ascertain what has taken place in Fukushima, or the safety of nuclear reactors. Nuclear power is a critical energy security consideration for an island nation like Japan. Moreover, some people are likely to want to secure the latent ability to produce nuclear weapons. There's also the concern over a possible imbalance between energy supply and demand this coming summer. With so many factors at stake, it is not surprising for people to be divided over the matter.

All of this, however, must have as its prerequisite the safety of the country. The notion that the resumed operation of nuclear reactors is a must in our making a fresh start is nothing but arrogance. It is the job of the media to blow the whistle on a country being swept away into something bigger and darker than what's happened so far. I**t goes without saying that this is a lesson that we should have learned from**

World War II. We must take our time in deciding whether Japan really needs nuclear power. Why rush to conclusions? (By Hiroshi Fuse, Expert Senior Writer)

Doubts about safety

April 14, 2013

Doubts linger over safety, necessity of nuclear reactors as gov't eyes quick restart

http://mainichi.jp/english/english/newsselect/news/20120414p2a00m0na017000c.html

Prime Minister Yoshihiko Noda and other top government officials decided on April 13 that it is "appropriate" to restart the No. 3 and 4 reactors at Kansai Electric Power Co.'s Oi Nuclear Power Plant in Fukui Prefecture. Yet doubts still linger over the factors their decision was based on, namely the "safety" of the reactors and the "need" for nuclear power in terms of power supply and demand.

The government, which is hurrying to restart the reactors, has decided to send Minister of Economy, Trade and Industry Yukio Edano to Fukui Prefecture to call for cooperation, but it remains to be seen whether the government can present a convincing case to parties including local bodies in surrounding areas that have become increasingly critical of its "hasty decision."

For the Noda administration, the prospect of having no nuclear reactors in operation has created a sense of desperation. This is reflected in the fast progression to its decision on April 13 to restart the reactors at the Oi plant from an initial meeting on April 3.

Now, just one of Japan's 54 nuclear reactors is in operation -- the No. 3 reactor at the Tomari Nuclear Power Plant in Hokkaido. This reactor is due to be shut down for regular inspections on May 5, which would leave Japan without a single reactor in operation. According to one official at the Ministry of Economy, Trade and Industry (METI), this would raise the hurdle for restarting nuclear reactors even higher.

Meanwhile, some officials have raised fears about the hollowing out of Japan's manufacturing industry. So far power shortages have been made up through thermal power generation, but it is feared that if concerns about increased electricity charges resulting from surging fuel prices become entrenched, then Japanese businesses -- primarily those in the manufacturing sector -- could move overseas. At the same time, Iran has hinted that it could close the Strait of Hormuz -- strategically important in the transportation of oil -- sparking concerns of rising worldwide oil prices.

It is feared that if the government continues to put off decisions about restarting nuclear reactors, then it could affect the selection of a chairman at Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 nuclear plant. Officials close to the prime minister have commented that unless the government clearly states that reactors which can be restarted will be restarted, then nobody will come forward to fill the role of chairman at TEPCO.

But even if the government manages to restart the Oi plant's reactors, it plans to decide on the safety and necessity of other nuclear power generation facilities individually. In a news conference on April 13, Edano commented, "Each time, we will make a decision based on safety and necessity," stressing that restarting the Oi reactors would not automatically open the gates for reactors at other plants to be restarted. Niigata Prefecture, host to TEPCO's Kashiwazaki-Kariwa Nuclear Power Plant, for example, faces a gubernatorial election this autumn, and one government official commented that it is no time to restart the nuclear reactors there.

On April 14, the government was to send Edano to meet with Fukui Gov. Issei Nishikawa and Oi Mayor Shinobu Tokioka, and seek assistance in restarting the Oi plant's No. 3 and 4 reactors. But it is eying a different approach with other local bodies in surrounding areas, instead planning to dispatch members of METI's Nuclear and Industrial Safety Agency.

Kyoto Gov. Keiji Yamada and Shiga Gov. Yukiko Kada, who have expressed reservations about restarting the reactors in Fukui Prefecture, which neighbors their prefectures, have voiced disapproval over this treatment. Toru Hashimoto, the mayor of Osaka -- a shareholder in Kansai Electric -- has also boosted his opposition to restarting nuclear reactors, and if the government goes ahead and starts reactors with only the consent of local bodies in the areas where those reactors are located, then it is likely to face stronger public criticism.

It is not only the safety but the necessity of reactors that the government has focused on in its move toward restarting the Oi nuclear reactors. But since Kansai Electric Power Co. was able to avert power shortages last summer and winter by asking people to conserve electricity, the view among consumers is that if effective supply and demand measures are adopted, then there will be no shortage of power. (By Naoki Oita, Political News Department)

Govt keen to get local authorities' support

April 14, 2013

Edano seeks support for Fukui gov. to restart Oi nuke plant

http://mainichi.jp/english/english/newsselect/news/20120414p2g00m0dm067000c.html

FUKUI (Kyodo) -- Industry minister Yukio Edano on Saturday tried to drum up support for Fukui Gov. Issei Nishikawa to reactivate two idled reactors at Kansai Electric Power Co.'s Oi nuclear power plant in the prefecture.

Edano traveled to the prefecture on the coast of the Sea of Japan after he, Prime Minister Yoshihiko Noda and two other ministers confirmed Friday the safety and necessity of the Nos. 3 and 4 reactors at the Oi plant. He is also scheduled to meet later Saturday with Shinobu Tokioka, mayor of Oi town in Fukui, to explain the government's view.

Nishikawa has said the prefectural government will decide on whether to approve the reactivation of the reactors by taking into consideration experts' views, while Tokioka welcomed the central government's safety endorsement of the plant.

The Fukui governor is scheduled to hold a press conference after meeting with the economy, trade and industry minister.

After taking into account local opinions, Noda, Edano, Chief Cabinet Secretary Osamu Fujimura and nuclear disaster minister Goshi Hosono are due to make a final decision before July on whether to authorize the restart of the Nos. 3 and 4 reactors at the Oi plant.

Since the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi power plant triggered by the March 2011 earthquake and tsunami, no Japanese reactors have resumed operation after being shut down for mandatory periodic checks, and the two Oi reactors are the first to be considered for possible resumption by the central government.

With a number of reactors shut down for periodic checks, only the No. 3 reactor at Hokkaido Electric Power Co.'s Tomari plant in Hokkaido is currently in operation among Japan's 54 commercial reactors. If no others resume operation by May 5, Japan will have no operating reactors.

Kyoto Gov. Keiji Yamada and Shiga Gov. Yukiko Kada have aired concerns about possible adverse effects on their prefectures if an accident occurs at the plant.

Parts of Kyoto and Shiga prefectures fall within a 30-kilometer radius of the plant, and Lake Biwa in Shiga provides water for many people in western Japan.

Last reactor to be shut down on May 6, says Edano

April 17, 2012
Edano: All reactors to be idle / Comment indicates Oi reactors' restart unlikely in near future

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120416004238.htm

All the nation's nuclear reactors will be shut down "momentarily from May 6 onward," Economy, Trade and Industry Minister Yukio Edano has said, once Hokkaido Electric Power Co. halts operations at the No. 3 reactor of its Tomari nuclear power plant on May 5 for regular inspections.

Edano's statement was the first time a government official has said all the nation's nuclear reactors will be shut down. The No. 3 reactor at Tomari is the only one now in operation.

Edano made the comment during a lecture at a hotel in Tokushima on Sunday, reflecting the government's view it will be difficult to restart the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture before the Tomari No. 3 reactor is halted.

The Oi reactors also have been shut down for inspections.

Edano on Saturday sought the Fukui prefectural and Oi municipal governments' approval to restart the Oi reactors, but his remarks Sunday reflected the government's view that reactivation will likely take some time.

During a meeting of related Cabinet ministers Friday, the government confirmed the safety of the Oi reactors and concluded they need to be restarted given possible electric demand this summer in the service area covered by KEPCO.

On Sunday, Edano said, "I believe it's understood that many people will experience significant difficulties if no reactors are in operation this summer."

The government is expected to continue seeking approval to restart the Oi reactors, so as to ensure a sufficient energy supply in summer.

Regarding the nation's energy policy, Edano stressed the government will end its dependence on nuclear power generation as early as possible.

"We have to work to permanently break away from our dependence on nuclear power generation as soon as possible," Edano said.

Yoshito Sengoku, acting chairman of the Democratic Party of Japan's Policy Research Committee, accompanied Edano to the Tokushima lecture.

"We have to think of how and when we can realize denuclearization. We cannot live in pitch darkness until it is realized," Sengoku said.

Of the 54 commercial nuclear reactors in the nation, the Tomari No. 3 reactor is the only one still operating mainly because reactors that were halted for regular checkups have not been restarted since the outbreak of the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant.

Toru Hashimoto against resuming operations

April 16, 2012

Osaka mayor criticizes govt. on reactor restart
http://www3.nhk.or.jp/daily/english/20120416_21.html

Osaka Mayor Toru Hashimoto has pledged that his party will seek a public mandate on the central government's nuclear power policy.

Hashimoto criticized the government on Monday for giving the green light to restarting the Ohi nuclear power plant, which supplies electricity to Japan's second-largest city of Osaka and its surrounding areas.

He said the government had declared the plant safe without consulting the Nuclear Safety Commission. He added that if the plant resumes operation under the current procedures, Japan's system of government will face a state of crisis.

Hashimoto said he is against the government's handling of the matter and that his One Osaka Party will put up resistance.

The One Osaka Party is now a regional political group, and is preparing to field candidates in national-level elections.

Three in favour

3 members of nuclear panel OK gov't standards for judging safety of Oi reactors

http://mainichi.jp/english/english/newsselect/news/20120416p2a00m0na013000c.html

Three of the 12 members of Fukui Prefecture's nuclear safety expert committee have given the thumbs-up to government safety judgment guidelines accompanying the planned restart of the No. 3 and 4 reactors at the Oi Nuclear Power Plant in the prefecture, it has been learned.

Committee head Hideyuki Nakagawa, a professor emeritus at the University of Fukui, told the Mainichi that if the government's safety judgment standards and plant operator Kansai Electric Power Co.'s roadmap for safety measures were implemented, then the reactors "would be safe." Two other committee experts on nuclear power and earthquakes interviewed by the Mainichi also gave a positive valuation of the government's guidelines.

Fukui Gov. Issei Nishikawa is expected to respect the expert committee's evaluation when making a decision on restarting the reactors. The committee had previously expressed reservations when a 30-point list of safety countermeasures was presented by the Ministry of Economy, Trade and Industry's Nuclear and Industrial Safety Agency (NISA), but the latest development raises the possibility that the committee will back up the government's recent decision favoring a restart of the reactors.

The committee comprises experts in fields including nuclear power, seismology, geology and radiology. It independently evaluates issues such as the safety of nuclear power plants in the prefecture from a technical perspective, and provides suggestions to the prefectural government. In the past, when the Monju fast-breeder reactor in Tsuruga, Fukui Prefecture, was restarted following a sodium leak that forced it to shut down, Nishikawa conveyed his consent to the government after receiving a final report from the expert committee.

Seven other members of the committee interviewed by the Mainichi said they had not yet received an explanation of the latest measures from the government and Kansai Electric Power Co., while one member was unwell and was unable to be interviewed, and another member could not be reached for comment.

The government's standard for deciding whether to restart the two reactors at the Oi plant are based on NISA's 30-point list of safety countermeasures. In February, the expert committee held a discussion on these 30 items after receiving an explanation from NISA. At the time members sought further confirmation of safety issues, with Nakagawa commenting, "It's important for all things to be explained clearly, including numerical items," and Toshiyuki Meshii, a University of Fukui graduate professor, saying it was necessary to state how the latest knowledge and minority opinions would be scientifically incorporated and engineered into regulations. However, there was no direct criticism of the 30 points themselves.

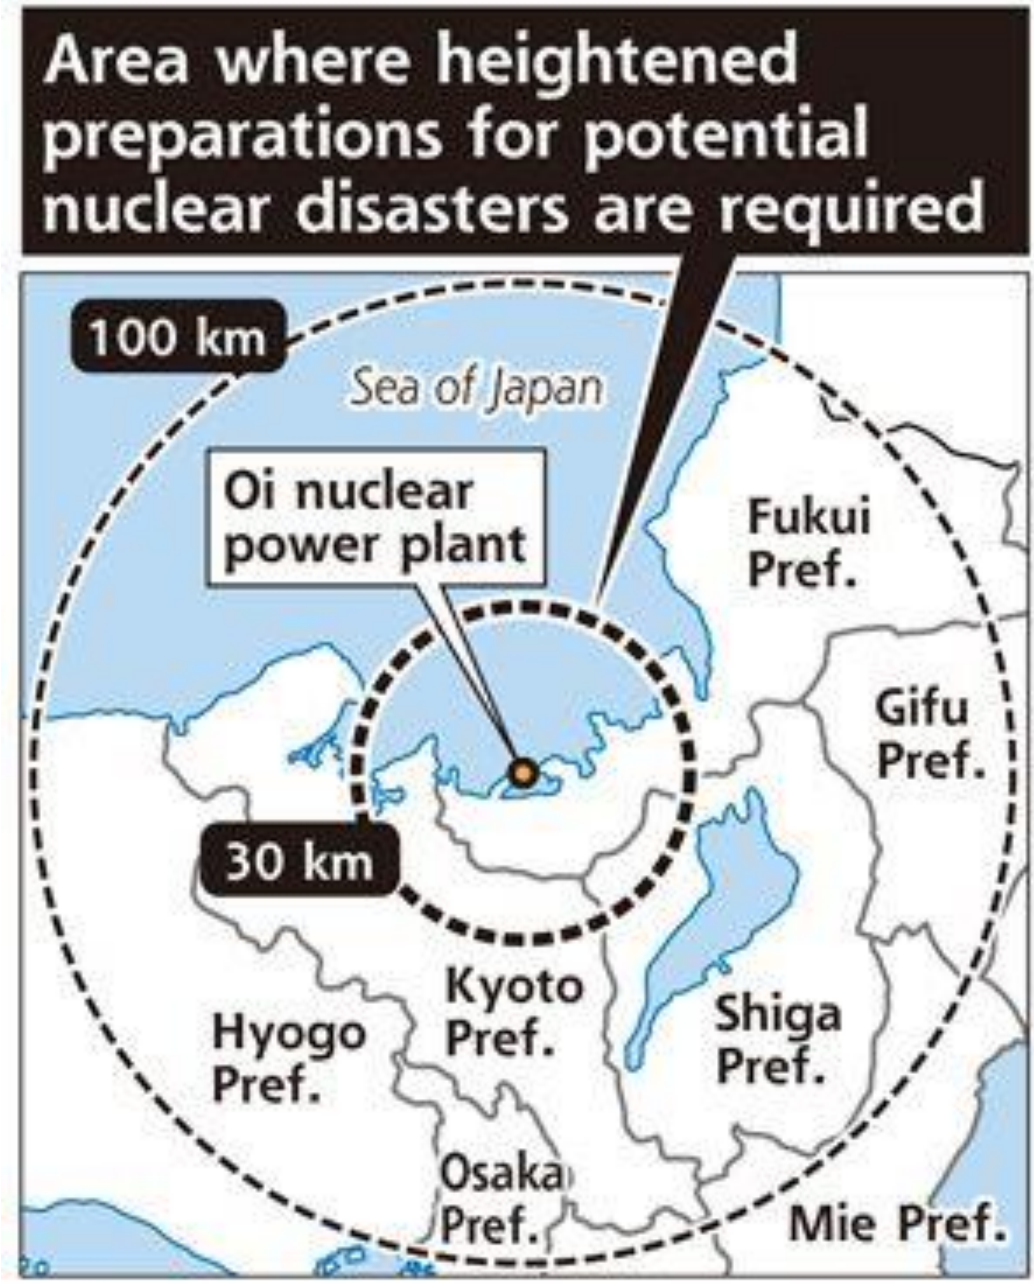
On April 16, the committee was set to hold its first meeting following the government's request to Fukui Prefecture to restart the reactors. It will conduct a number of field studies to evaluate the appropriateness of the government's judgment standards and whether the reactors at the Oi plant meet those standards.

Listen to us too

April 16, 2012

Surrounding govts want say in Oi restarts

Yoshiyuki Shimada and Hiroyuki Kume / Yomiuri Shimbun Staff Writers
http://www.yomiuri.co.jp/dy/national/T120415002741.htm



FUKUI--The focus in the issue of reactivating the two suspended reactors at the Oi nuclear power plant in Fukui Prefecture has now turned to the will of local governments around the plant, but the question remains of how many local governments should have a say.

Fukui Gov. Issei Nishikawa has said he will not make a hasty conclusion on whether to approve the restart of the Nos. 3 and 4 reactors of the plant, which is operated by Kansai Electric Power Co. Nishikawa added he has no specific timetable for when he will reply to the central government's request to approve the reactivation of the reactors.

Local government heads in neighboring prefectures, such as Osaka Mayor Toru Hashimoto and the governors of Kyoto and Shiga prefectures, remain opposed to the restart.

The central government has not clarified how much it will be guided by the opinions of local governments, making the path to a restart--critical to avoiding power shortages in the Kansai region this summer--increasingly unclear.

At a meeting with Economy, Trade and Industry Minister Yukio Edano held Saturday at the Fukui prefectural office, Nishikawa expressed his frustration with local governments around Fukui.

"For more than 40 years, Fukui Prefecture has earnestly dealt with various risks imposed by nuclear power plants--we have made continuous efforts to improve their safety. However, it seems regions that consume the electricity [produced by the plants] do not fully understand our hardships," Nishikawa said.

Nishikawa did not give specific names, but he was apparently talking about opposition from the heads of local jurisdictions with large populations, such as Hashimoto, to the restart of the nuclear reactors.

"The final decision should be made by the prefecture where the reactors are located," Nishikawa said at a press conference after the meeting with Edano.

Despite its cautious approach, Fukui Prefecture has also indicated a positive attitude toward restarting the Oi plant's nuclear reactors from the beginning. The prefecture is home to 14 nuclear reactors, the most in the nation, and expects to receive about 60 billion yen over five years in nuclear fuel tax from Kansai Electric and two other power companies.

With the precondition of ensuring the safety of the nuclear reactors, Nishikawa has said he "does not oppose the restart of the nuclear reactors."

According to sources, the Fukui prefectural assembly favors restarting the reactors.

"The prefectural assembly must not hinder the central government's decision to restart the nuclear reactors," a prefectural assembly member said.

A member of the Oi town assembly said: "The local economy will be hurt if the suspension of the nuclear power plant is prolonged. I have no reason to oppose resumption."

However, local governments adjacent to Fukui Prefecture are wary and want the central government to expand its interpretation of the "local consent" necessary to restart the nuclear reactors to include their voices as equal as those in Fukui Prefecture.

"I ask the central government to treat all areas that will be subject to potential nuclear accidents as 'local areas,' rather than deciding based on administrative boundaries," said Yuji Fujii, mayor of Nagahama, Shiga Prefecture. The city borders Fukui Prefecture on the north.

Kiyoshi Yamada, a senior Kyoto prefectural government official in charge of crisis management, said parts of the prefecture are included in the urgent protective action planning zones, areas within a 30-kilometer radius of nuclear power plants required to make heightened preparations for potential nuclear disasters.

It is meaningless for the governments to discuss the meaning of "local consent" without considering such factors, Yamada said.

Hashimoto has demanded KEPCO conclude agreements with prefectures within 100 kilometers of the Oi power plant, equivalent in content to those concluded with prefectures that host nuclear power plants.

At Saturday's meeting, Nishikawa told Edano the government should directly persuade the "power-consuming areas" to go along with the restart of Oi plant's nuclear reactors. The remarks were apparently made to urge the government not to give great weight to the pressure from Hashimoto and other opponents and waver from its stance on restarting the nuclear reactors.

Edano said he would "sincerely respond" to the opinions of Kyoto and Shiga prefectures. However, he did not clarify whether he would give the opinions of local governments surrounding Fukui Prefecture equal weight to those of Fukui.
Observers have called the concept of "local consent" ambiguous. The criteria for deciding which local governments have a say in the restart of the Oi power plant's nuclear reactors could be the focal point in deciding the plant's future.

New proposals on nukes future

April 17, 2012

Kyoto, Shiga compile draft proposals to gov't on nuclear policy

http://mainichi.jp/english/english/newsselect/news/20120417p2g00m0dm034000c.html

OTSU (Kyodo) -- The governors of Kyoto and Shiga prefectures have compiled a draft proposal to the central government on its nuclear policy, following discussions about the reactivation of two idled

reactors at Kansai Electric Power Co.'s Oi nuclear power plant in neighboring Fukui Prefecture, according to a draft made available Monday.

In the draft proposal, Kyoto Gov. Keiji Yamada and Shiga Gov. Yukiko Kada call on the government to set up a third-party committee to assess the supply-demand situation of electricity and establish a nuclear power regulatory body following the nuclear crisis at the Fukushima Daiichi power plant.

The governors, who plan to submit the proposal to the government soon, also ask the government to produce **a plan for ultimately abolishing usage of nuclear energy and beefing up the system to process spent fuel rods.**

The governors air concerns about a plan of the government to reactivate the idled reactors at the Oi plant, saying, "Explanation to people about safety and necessity is insufficient at present."

Parts of Kyoto and Shiga prefectures fall within a 30-kilometer radius of the plant on the Sea of Japan coast, and Lake Biwa in Shiga provides water for many people in western Japan.
April 17, 2012(Mainichi Japan)
On the same article:
Governors make proposals on reactor restarts
http://www3.nhk.or.jp/daily/english/20120417_19.html

Two governors in western Japan are asking the central government to implement 7 steps before restarting the first batch of reactors since the Fukushima nuclear disaster.

The governors of Shiga and Kyoto jointly announced the steps on Tuesday. Their prefectures neighbor Fukui, home to the Ohi nuclear plant. The central government wants 2 of the plant's reactors to be reactivated soon to avoid a power shortage this summer.

The 7-point proposal calls on the government to seek independent advice from nuclear experts before making a decision to restart the reactors.

It says a third-party panel should verify the region's power supply-and-demand estimates for the summer.

The governors also want the government to prove why the reactors must be restarted so urgently, before an official inquiry into the Fukushima disaster is complete.

They are also seeking a concrete timetable for reducing the nation's dependence on nuclear power.

Shiga Governor Yukiko Kada told reporters the 7-point plan is aimed at getting the government to clarify its policy on reactor-restarts, and to make sure that localities can be involved in the process.

Kyoto Governor Keiji Yamada said the 2 prefectures want the government to understand precisely what issues are concerning them most.

Hamaoka nuclear plant 'safe' against big tsunami, operator tells gov't

http://mainichi.jp/english/english/newsselect/news/20120417p2g00m0dm030000c.html

NAGOYA (Kyodo) -- Chubu Electric Power Co. reported to the government Monday that its Hamaoka nuclear power plant would be safe even if it were hit by a 21-meter-high tsunami after a massive earthquake.

The operator compiled its report on the assumption that the plant could be flooded by such high waves hitting the Pacific coast in Shizuoka Prefecture, central Japan, while it is still offline and the reactors are kept cool.

But in the report it submitted to the Nuclear and Industrial Safety Agency of the Ministry of Economy, Trade and Industry, the utility did not mention whether the plant could survive such a huge tsunami if it is in operation.

The agency had ordered the utility to file the report by Monday based on a new projection by the Cabinet Office's expert panel anticipating a tsunami of up to 21 meters near the Hamaoka plant in the event that a huge quake occurred in the "Nankai Trough" in the seabed off central and western Japan.

Chubu Electric said in the report it would be able to resume water supply to the plant's cooling system for reactors and spent fuel pools even if the cooling functions are lost in the wake of a huge tsunami, by using equipment including mobile pumps located at a higher place in the plant.

It would take at least six days before the water in a reactor's core fell below the fuel level even if the cooling system broke down, the report said.

The Hamaoka plant in the city of Omaezaki has been suspended since last May after the government asked the operator to halt it following the Fukushima Daiichi plant's crisis triggered by the March 2011

earthquake and tsunami, based on a prediction that a magnitude-8 quake could hit the region sometime in the first half of this century.

Strong words from Sengoku

DPJ's Sengoku describes halt of all nuclear plants 'mass suicide'

http://mainichi.jp/english/english/newsselect/news/20120417p2g00m0dm033000c.html

NAGOYA (Kyodo) -- Yoshito Sengoku, acting chief policymaker of the ruling Democratic Party of Japan, on Monday described the halting of all nuclear power plants in Japan as its "mass suicide."

"If we don't think about what the economy and livelihood would be like in the event of (the nuclear plants') halt, that would be, in a sense, something like the mass suicide of Japan," Sengoku said in a speech. He is one of the core members of the ruling party deliberating over whether to approve reactivating nuclear plants.

Sengoku's comment is believed to reflect his stance as a promoter of the resumption of nuclear plants. But his comparing the impact on the economy and on peoples' livelihoods of halting all nuclear plants to suicide caused controversy in political circles.

"I don't know the context," Chief Cabinet Secretary Osamu Fujimura told a news conference when asked to comment on Sengoku's analogy. "But judging from the words alone, it is not very good."

Do words make such a difference?

April 17, 2012

Edano apologizes for remarks on active reactors

http://mainichi.jp/english/english/newsselect/news/20120417p2g00m0dm076000c.html

TOKYO (Kyodo) -- Japanese industry minister Yukio Edano on Tuesday apologized for his recent remarks that Japan will be without operating reactors only "momentarily" from May 6, when its last currently active reactor goes offline for maintenance.

"I should have said (the number of operating reactors in Japan) will be zero at least for a while," Edano said at a press conference, referring to remarks he made in a speech in Tokushima Prefecture on Sunday.

He said his view remains unchanged that it will be difficult to restart two offline reactors at the Oi nuclear power plant in Fukui Prefecture before May 5 and that Japan will have a period with no operating reactors.

"I apologize for the concerns and effects that my remarks caused to various people," Edano said.

Prime Minister Yoshihiko Noda, Edano, and two other ministers confirmed Friday the safety and necessity of resuming the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi complex.

Meanwhile, the governors of Kyoto and Shiga prefectures, adjacent to Fukui Prefecture, remain reluctant to see the reactors reactivated and Fukui Gov. Issei Nishikawa asked Edano on Saturday during their meeting in Fukui Prefecture to carefully consider the views of other regional governments.

At the press conference on Tuesday, Edano denied that the government is in a rush to resume operation of the Oi reactors and said that it would be "very important to win understanding" for the reactivation from Shiga and Kyoto prefectures as a way to win support for the restart from Fukui Prefecture.

Since the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi power plant triggered by the March 2011 earthquake and tsunami, no Japanese reactors have resumed operation after being shut down for mandatory periodic checks, and the two Oi reactors are the first to be considered for possible reactivation by the central government.

With a number of reactors shut down for periodic checks, only the No. 3 reactor at Hokkaido Electric Power Co.'s Tomari plant in Hokkaido is currently operating among Japan's 54 commercial reactors. That reactor too is slated for shutdown on May 5 for a periodic checkup, meaning Japan will have no operating reactors at that point if none are reactivated.
Noda, Edano, and two other ministers are to make a final decision on whether to resume operation of the two Oi reactors after assessing the reactions of local authorities near the Oi plant and public opinion.

Suspense

April 19, 2012

Govt to give Oi restart explanation next week

The Yomiuri Shimbun

The government will brief local residents next Thursday about the restart of the suspended Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Oi, Fukui Prefecture, the town government has said.

The town, which hosts the nuclear power plant, has been asked by the government for its cooperation in restarting the two suspended reactors.

Oi Mayor Shinobu Tokioka said he would decide whether to approve the reactivation of the Oi reactors in light of the central government's safety measures, which will be explained in the briefing, and the opinions of the town assembly.

"I'd like a senior vice minister [from the Economy, Trade and Industry Ministry] or those in higher posts to come and clarify the extent to which the government can ensure the safety of the nuclear reactors at this point," Tokioka said at a press conference Tuesday.

A risk of rolling blackouts this summer

April 18, 2012

Edano hints at possible rolling blackouts again this summer

http://mainichi.jp/english/english/newsselect/news/20120418p2g00m0dm030000c.html

TOKYO (Kyodo) -- Industry minister Yukio Edano hinted for the first time Tuesday that rolling blackouts may be implemented again this summer if it is deemed necessary amid the potential halt of all nuclear reactors in Japan.

"If there is concern (over electricity supply and demand this summer), even if only slightly, we could devise a plan to implement rolling blackouts not only for areas covered by Kansai Electric Power Co.," he said at a press conference, referring to the utility which is facing an especially tight electricity supply situation.

Rolling blackouts were implemented after the start of the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi power plant in March 2011 due to power supply shortages in the utility's service area, disrupting daily life.

With a number of reactors shut down for periodic checks, only the No. 3 reactor at Hokkaido Electric Power Co.'s Tomari plant in Hokkaido is currently operating among Japan's 54 commercial reactors. That reactor too is slated for shutdown on May 5.

Edano also apologized for his comments Sunday that Japan would be without operating reactors only "momentarily" from May 6 as the remarks were taken to suggest that some offline reactors could be restarted soon, although it has yet to be decided amid local concern about ensuring nuclear safety.

"I should have said (the number of operating reactors in Japan) will be zero at least for a while," Edano said. "I apologize for the concern and effects that my remarks caused to various people."

He added that his view remains unchanged that it will be difficult to restart two offline reactors at Kansai Electric's Oi nuclear power plant before May 5 and that Japan will face a period with no operating reactors.

Meanwhile, the governors of Kyoto and Shiga prefectures, near the Oi nuclear complex, urged the central government to set up a third-party committee to examine if electricity will really be in short supply without nuclear power, and Chief Cabinet Secretary Osamu Fujimura said the government will do so.

The committee, to be chaired by Katsuyuki Ishida, senior vice minister at the Cabinet Office, is expected to hold its first meeting as early as next week.

Kyoto Gov. Keiji Yamada and Shiga Gov. Yukiko Kada, who have been reluctant about restarting the Oi reactors, also urged the central government in seven requests released in Kyoto to establish a time schedule for the creation of a society that does not rely on nuclear power.

In a report on their requests, the two governors said Kyoto and Shiga prefectures, parts of which lie within a 30 kilometer radius of the Oi plant, could be as adversely affected as the municipality that hosts the plant if an accident occurs.

"It is hard to say that there is national understanding on the reactivation (of the Oi reactors)," the report said. The governors also called for the early establishment of a new nuclear regulatory agency.

Since the Fukushima nuclear crisis triggered by the March 2011 earthquake and tsunami, no Japanese reactors have resumed operation after being shut down for mandatory periodic checks, and the two Oi reactors are the first being considered for possible reactivation by the central government.

Prime Minister Yoshihiko Noda, Edano and two other ministers are to make a final decision on whether to resume operation of the two Oi reactors after assessing the reactions of local authorities and public opinion.

Ohi neighbours against a restart

April 19, 2012

Survey shows mixed reaction to restarting reactor
http://www3.nhk.or.jp/daily/english/20120419_30.html

An NHK survey indicates that over half of the residents in Ohi town in Fukui Prefecture support the government's plan to restart 2 idle nuclear reactors there, while one-third in neighboring areas support it.

The telephone survey last weekend asked local residents as well as people living in 4 neighboring municipalities about the plan to restart the Ohi plant reactors operated by Kansai Electric Power Company.

In Ohi town, 54 percent of people support the government's plan, while 37 percent oppose the plan.

Support among people living in neighboring towns and cities was much lower, with 32 percent of them saying they support the government plan. 60 percent in the neighboring areas oppose the restart.

Asked whether they worry about the possibility of the restarted reactors causing a severe accident resulting in a release of radiation into the environment, 71 percent of locals said yes, and so did 84 percent of their neighbors.

The survey also asked whether the government has done a good job explaining to local people and the public in general about the safety of restarting the reactors.

Only 29 percent of local residents and 19 percent of their neighbors said yes.

Safety panel says it's OK

April 20, 2012

Fukui govt committee deems Oi N-plant safe

http://www.yomiuri.co.jp/dy/national/T120419005380.htm

OI, Fukui (Jiji Press)--The head of the Fukui prefectural government's nuclear safety committee suggested that Kansai Electric Power Co.'s Oi nuclear power plant has adequate safety measures against earthquakes and tsunami.

After inspecting the Nos. 3 and 4 reactors of the plant, Hideyuki Nakagawa, the panel head, told reporters Wednesday that he broadly confirmed that a possible severe accident at the plant could be handled safely.

He suggested KEPCO has taken steps that would allow it to continue cooling the reactors if the plant is hit by a strong quake and subsequent tsunami.

Nakagawa and five other members of the prefectural panel inspected the two reactors after Economy, Trade and Industry Minister Yukio Edano asked Fukui Gov. Issei Nishikawa and other local officials for cooperation in restarting the reactors to help avoid power shortages in the utility's service area this summer.

Prime Minister Yoshihiko Noda, Edano and two other Cabinet ministers last week agreed that it is appropriate to resume operations of the two reactors.

Following the central government approval, the committee is inspecting the reactors from a technical point of view based on the government's new reactor safety standards.

The prefectural committee is expected to summarize its views in about a week. The panel will then compile a full report of its assessment of the safety measures taken at the reactors.

On Wednesday, panel members inspected the locations of emergency generators that would be used in the event all electricity sources are lost and a reactor cooling system that can run without electricity.

The inspection lasted 4-1/2 hours, two hours longer than initially scheduled.

Although Kansai Electric plans to construct a quake-resistant building, which would serve as a base in the event of a crisis, in fiscal 2015, the plant's central control room can be used as an alternative base until the completion of the new building, Nakagawa said.

No real surprise

April 20, 2012

Fukui govt committee deems Oi N-plant safe

http://www.yomiuri.co.jp/dy/national/T120419005380.htm

OI, Fukui (Jiji Press)--The head of the Fukui prefectural government's nuclear safety committee suggested that Kansai Electric Power Co.'s Oi nuclear power plant has adequate safety measures against earthquakes and tsunami.

After inspecting the Nos. 3 and 4 reactors of the plant, Hideyuki Nakagawa, the panel head, told reporters Wednesday that he broadly confirmed that a possible severe accident at the plant could be handled safely.

He suggested KEPCO has taken steps that would allow it to continue cooling the reactors if the plant is hit by a strong quake and subsequent tsunami.

Nakagawa and five other members of the prefectural panel inspected the two reactors after Economy, Trade and Industry Minister Yukio Edano asked Fukui Gov. Issei Nishikawa and other local officials for cooperation in restarting the reactors to help avoid power shortages in the utility's service area this summer.

Prime Minister Yoshihiko Noda, Edano and two other Cabinet ministers last week agreed that it is appropriate to resume operations of the two reactors.

Following the central government approval, the committee is inspecting the reactors from a technical point of view based on the government's new reactor safety standards.

The prefectural committee is expected to summarize its views in about a week. The panel will then compile a full report of its assessment of the safety measures taken at the reactors.

On Wednesday, panel members inspected the locations of emergency generators that would be used in the event all electricity sources are lost and a reactor cooling system that can run without electricity.

The inspection lasted 4-1/2 hours, two hours longer than initially scheduled.

Although Kansai Electric plans to construct a quake-resistant building, which would serve as a base in the event of a crisis, in fiscal 2015, the plant's central control room can be used as an alternative base until the completion of the new building, Nakagawa said.

No idled nuclear reactors have restarted operations since the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant began last March.

Edano - Restart nuclear reactors to avoid "confusion in society"

April 23 ,2012-04-23

Edano's take on restarting nuclear power plants in Japan

http://mainichi.jp/english/english/perspectives/news/20120423p2a00m0na012000c.html

Has Minister of Economy, Trade and Industry Yukio Edano been wavering over the restarting of nuclear reactors in Japan? Last weekend I met and interviewed him, and the comment that left the greatest impression on me was: "I don't want to become a Robespierre."

Maximilien Robespierre (1758-1794), was a leader in the French Revolution, and his name is symbolic of the Reign of Terror. Robespierre was a lawyer faithful to ideals. Once he grasped power, however, he introduced radical reforms and executed political foes, and in the end he himself was executed.

Edano considers the choice not to restart any of the nuclear reactors in Japan that have been shut down for inspections to be a kind of radical reform. He thinks that if he speedily progresses in this direction, confusion could spread and he could end up further away from the ideal of being free from reliance on nuclear power. In the interview below, Edano's gradualist approach is evident.

***

Question: Have you been amending your statements as a result of third parties' moves?

Edano: "No, that's not the case. I'm fundamentally in favor of abandoning nuclear power generation, but if all nuclear power plants remain out of operation, it will force unreasonable power restrictions and

electricity charge price increases, small- and medium-sized companies will collapse, and employment will become unstable in a chain of events that will cause confusion in society. And if that happens, then the momentum that has built up toward breaking away from nuclear power will die out, reliance (on nuclear plants) will return in force, and we'll be helpless to do anything about it. For me, that's the scariest scenario."

Q: I think there should be a mid-term vision for reform. What are your thoughts on this?

Edano: "In terms of political theory, I think that's right, but if we release something that's half-baked, then we'll be caught out and pay the price. It's not the kind of thing that can be easily released.

"One major factor is the regulation on decommissioning nuclear reactors after 40 years (legislation that sets the life of a nuclear reactor at 40 years, which has already been submitted to the Diet as a bill). If the bill is passed and we gain a grip on governmental and ministerial ordinances, then we'll be able to do quite a lot."

(If the restarting of reactors is allowed but construction of new reactors is not allowed, then the rate of reliance on nuclear power will fall to 15 percent by 2030 -- half the level marked before the March 2011 disasters that triggered a nuclear crisis at the Fukushima No. 1 Nuclear Power Plant. After this nuclear reactors will continue to decline in number, leaving none in operation in 2050.)

Q: Has there been any clash in opinions between you and (Democratic Party of Japan Policy Research Council Acting Chairman Yoshito) Sengoku?

Edano: "We share the opinion that if we suddenly stopped using nuclear power plants, then circumstances would become quite difficult. I think this would eventually result in a return to dependence on nuclear power plants, and I think Mr. Sengoku probably feels the same way."

***

Sengoku has the role of handling the administration's energy policies, and observations that he is leading the process are widespread, but at a Democratic Party of Japan gathering of members of the House of Representatives in Tokushima on April 15, Sengoku had the following to say:

"The media likes the scenario of a conspiracy, with somebody pulling the strings behind the scenes. I don't really care (if such things are written about me), but if the formation of mid- to long-term policies become distorted as a result of that, then it becomes serious. ... It's a case of us adopting realistic methods

to find solutions to the homework that the Liberal Democratic Party procrastinated on, one issue at a time, as we move toward an ideal situation."

Unlike Robespierre, both Edano and Sengoku embrace realism, and say they are willing to **allow nuclear reactors to be restarted to prevent confusion in the economy.** Indeed, not restarting reactors may result in economic confusion. But it may turn out that we can get by without restarting them. Since there are no trustworthy predictions, public opinion becomes divided. I want to understand the government's decisions, but with so little to go by, I'm not really able to.

Looking at the situation simply from a safety perspective, the decision to restart the No. 3 and 4 reactors at Kansai Electric Power Co.'s Oi Nuclear Power Plant in Fukui Prefecture is questionable. I have no confidence that the lessons learned from the Fukushima nuclear crisis have been adopted.

I want people to refrain from calling those who wish to break away from nuclear power and who question the restarting of reactors as "extremists." I want them to be sensitive about the deterioration of realism. And these are the things I seek from the leaders of a moderate faction. (By Takao Yamada, Expert Senior Writer)

Tomari, Tsugara, Monju, Shimane plants, beware

4 nuclear plants asked to review quake safety
http://www3.nhk.or.jp/daily/english/20120424_04.html

Japan's nuclear safety agency is set to ask the operators of 4 nuclear power plants to re-examine the effects of seismic activities that it says became more active after the March 2011 earthquake in northern Japan.

The Nuclear and Industrial Safety Agency will request the reassessment of quake resistance for the Tomari plant in Hokkaido, Tsuruga and Monju plants in Fukui Prefecture and the Shimane plant in Shimane.

It says the risk has increased of active faults more than 5 kilometers away from each other shifting simultaneously and causing a greater earthquake than predicted.

Hokkaido Electric Power Company says even if the 2 active faults on the sea and the land move at the same time, the assumed temblor in part of the Tomari facility will be a little larger than that previously calculated. It says quake resistance can be secured as important buildings are little affected by the quake.

But experts at the agency pointed out at a meeting that the tremor will be further intensified if the 2 active faults shift simultaneously.

They asked the company to reassess quake resistance based on the new assumption.

The company says it will respond appropriately in line with the experts' views, but it insisted that there will be no problem with the ability of key equipment to safeguard the nuclear plant.

Results of the reassessment could force a revision of quake resistance standards at the plants.

They could also affect the outcome of the stress tests required for restarting the idled plants.

The power companies say they will submit reports on their reassessments.

"We have doubts regarding the transparency of information"

April 24, 2012

Govs still cautious on reactors / Official asks Shiga, Kyoto leaders for understanding on Oi reactors

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120423004448.htm

OTSU--A senior vice industry minister visited Shiga Gov. Yukiko Kada on Monday, seeking cooperation on the reactivation of two suspended reactors at the Oi nuclear power plant in neighboring Fukui Prefecture.

Seishu Makino, senior vice minister of the Economy, Trade and Industry Ministry, visited the governor at the prefectural government office in Otsu to explain why the government gave the green light to resuming operations at the Nos. 3 and 4 reactors at the facility operated by Kansai Electric Power Co.

"We'd like to ask for your understanding on the reactivation, as it is crucial considering electricity demand estimates for the coming summer," Makino said.

Kada, who criticized the government's safety confirmation for the two reactors along with Kyoto Gov. Keiji Yamada, maintained her cautious stance on the issue, saying, "Should a nuclear accident occur, damage would spread throughout the Kinki region [including Shiga Prefecture]."

Makino also visited Yamada later that day to provide similar explanations.

The senior vice minister was accompanied by Takaya Imai, director general for natural resources and energy policy at the ministry's Natural Resources and Energy Agency, and Hiroyuki Fukano, director general at the Nuclear and Industrial Safety Agency.

Makino referred to estimates that KEPCO's capacity will be as much as 18.4 percent short during peak demand periods if the two reactors remain offline.

In a discussion of the results from initial stress tests, the senior vice minister emphasized, "External experts have confirmed the safety of each location in efforts to maintain transparency."

Makino then sought Shiga Prefecture's understanding for the restart, saying, "The government has made a political decision considering the necessity [of restarting the reactors] and their confirmed safety."

"Fukui Prefecture has asked the government to take responsibility for obtaining support from the power-consuming areas," Makino added.

Kada said she was not satisfied with the government's reactivation process.
"We can understand the local economy will be negatively affected [if the reactors remain offline]," she said. "**But we have doubts regarding the transparency of information** [for making the government's decision, such as the electricity supply estimates]."

Following the talks, Makino said he believed he "made progress even though we have yet to obtain full support."
Kada, on the other hand, expressed a different view. "[Makino's briefings] were too abstract for us to move toward supporting [the restart]."

Quake safety?

Tuesday, April 24, 2012

http://www.japantimes.co.jp/text/nn20120424b5.html
Tomari, Tsuruga nuke plants at risk of stronger than expected quakes
Kyodo
The Tomari nuclear plant in Hokkaido and the Tsuruga plant in Fukui Prefecture are at risk of being surprised by earthquakes that exceed their quake-resistance specifications, a report by three utilities said Monday.

The finding, based on the plants' current quake-resistance standards, was included in analyses they drafted at the request of the Nuclear and Industrial Safety Agency, which is still struggling with the Fukushima disaster.

The three utilities were asked to examine the possibility of interlocked movements taking place on active faults around their plants. The Tomari plant is run by Hokkaido Electric Power Co. and Tsuruga plant by Japan Electric Power Co.

Potential quakes near Tokyo Electric Power Co.'s massive Kashiwazaki-Kariwa plant in Niigata Prefecture, Hokuriku Electric Power Co.'s Shiga plant in Ishikawa Prefecture, and Kansai Electric Power Co.'s Mihama and Oi plants in Fukui Prefecture, were estimated as below the scale of the largest jolts that were anticipated when they were designed.

It is unclear if that includes any adjustments prompted by the magnitude 6.8 quake that triggered a fire and radiation leak at Kashiwazaki-Kariwa, the world's largest nuclear power facility, in July 2007 **after it was learned that none of Japan's nuclear plants had been designed to withstand the horizontal ground movement displayed by that quake.**
The three utilities concluded that the quake resistance of their nuclear power plants does not need to take interlocked movements on faults into account.

The magnitude-9.0 quake in March 2011 prompted the agency to drop its past rule that quake-resistance standards do not need to take into account the possibility of linked movements on faults separated by 5 km or more, and to order utilities to look into the possibility.

Tsugara, again

April 26, 2012

Fault under nuclear plant feared active / Doubt cast on reactivation of Tsuruga plant

http://www.yomiuri.co.jp/dy/national/T120425006492.htm

The Yomiuri Shimbun

A panel of the Nuclear and Industrial Safety Agency (NISA) has suggested that faults beneath the Tsuruga nuclear power plant in Tsuruga, Fukui Prefecture, may be active--potentially putting the plant in violation of the government's criterion that prohibits building nuclear reactors above active faults.

NISA, which is examining earthquake-resistance capabilities of nuclear power plants, released Tuesday the results of the hearing panel's inspection of the plant of the Japan Atomic Power Co. (JAPC)

The burden is now on JAPC to prove the faults are not active. The hurdle for reactivating the reactors at the Tsuruga plant has thus become extremely high.

What the NISA panel sees as problematic are faults in zones of crushed rock left fragile by past earthquakes.
There are about 160 such crushed-rock zones on the plant's premises, including spots just below its Nos. 1 and 2 reactors.
Though JAPC knew of the crushed-rock zones when it applied for permission to construct the plant in 1965, the company's geological research apparently led it to believe the zones showed no significant signs of seismic activity.
However, the Great East Japan Earthquake changed the stress patterns applied to the layers of rock beneath Japan, and it may now be easier for earthquakes to be triggered by different mechanisms from past ones. Therefore, reexamination of past research on faults has become necessary.

The latest research found a possibility that the crushed-rock zones beneath the nuclear plant may move together with a nearby active fault, known as the Urasoko fault.

JAPC has conducted research on the possibility since February.

On Tuesday, four experts inspected four locations, including places where parts of the crushed-rock zones are visible on the surface of the ground, and confirmed clear signs of the existence of faults.

Shinji Toda, associate professor of Kyoto University's Disaster Prevention Research Institute, who conducted the inspection, said, "It's highly likely that they have moved, being pulled by the Urasoko fault, within the past several hundred thousand years."

The other three experts concurred.

Based on the new research, NISA asked JAPC to conduct additional drilling research and more detailed analysis of components of the geological layers near the Urasoko fault.

JAPC has already submitted first-stage results of stress tests on the Tsuruga plant's No. 2 reactor as a precondition to reactivating the reactor.

But before evaluating the stress test results, a prerequisite to restarting the reactor, JAPC now must prove with detailed geological research that faults under the reactor buildings are not active and will not move together with the Urasoko fault.

Thus it has become extremely uncertain whether the plant's reactors will be able to be reactivated.

Experts have also voiced doubts about interlocking active faults beneath Monju, a fast breeder reactor of the Japan Atomic Energy Agency in Tsuruga; Hokkaido Electric Power Co.'s Tomari nuclear power plant; Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture; and Chugoku Electric Power Co.'s Shimane nuclear power plant in Matsue.

Detailed research on those nuclear plants is also under way.

The Tsuruga plant is the nation's oldest commercial nuclear power plant. Its No. 1 reactor, with an output capacity of 357,000 kilowatts, began operation in 1970. The No. 2 reactor, with an output capacity of 1.16 million kilowatts, started operation in 1987.

Both reactors have been idled since their most recent regular inspections. There are plans to build two more reactors at the plant, but the government's pre-construction safety checks have been suspended because of the crisis at the Fukushima No. 1 nuclear power plant.

Active faults are those with a record of repeated activity that also exhibit the potential to move in the future.

The Cabinet Office's Nuclear Safety Commission revised in 2006 its safety guideline on nuclear power plants' abilities to withstand earthquakes.

The revised guideline stipulates that faults believed to have moved since the Late Pleistocene age--120,000 to 130,000 years ago--are called active faults.

Govt briefing (Ohi)

April 27, 2012
Govt. briefs on restart to people near Ohi plant
http://www3.nhk.or.jp/daily/english/20120427_03.html

People living near the Ohi nuclear plant in central Japan are wrestling with whether to sign off on a plan to restart two of the facility's four reactors. The plant could be the first unit to resume operation in the year since an earthquake and tsunami triggered an accident at the Fukushima Daiichi plant.

Local residents brought various concerns to a public meeting to hear a government briefing Thursday on why it wants to restart the reactors.

Some 550 people attended the gathering that was open only to local residents. Activists opposed to the resumption of the reactors held a rally outside the venue.

Senior Vice-Minister for Industry, Mitsuyoshi Yanagisawa explained that experts have confirmed that technology is in place to keep the Ohi reactors cool even in the event of an earthquake and tsunami like the one that hit Fukushima.

A resident said Japan will not recover without the resumption of the Ohi plant and added that he is in favor of restarting the reactors if the government will seriously think about protecting people's lives.

Some participants expressed concerns that there is no quake-resistant office building at Ohi that would serve as a crisis center if an accident occurs. Others questioned whether restarting the reactors is even necessary.

A recent NHK poll suggests 54 percent of Ohi residents are in favor, or slightly in favor, of restarting the reactors for economic reasons. But 71 percent of survey respondents voiced concerns about the risk of an accident if the units go back on-line.

The mayor of Ohi says the town council will decide whether to approve restarting the reactors now that they have heard what residents have to say.

Of the country's 50 reactors only one is currently operating, but it will go off-line in about ten days. If the Ohi reactors are restarted they'll be the first to resume operations since March 11, 2011.

Residents to be briefed on Ohi plant restart plan

http://www3.nhk.or.jp/daily/english/20120426_03.html

Residents of a town hosting the Ohi nuclear power plant in Fukui Prefecture will gather a meeting on Thursday to hear about the Japanese government's plan to restart the plant's 2 reactors.

Ohi town officials say they will decide whether to approve restarting the reactors after hearing what the residents have to say.

The meeting is in response to a request by Ohi Town, following calls by industry minister Yukio Edano earlier this month for understanding on the need to restart the reactors.

Senior Vice Minister Mitsuyoshi Yanagisawa will explain how the 2 reactors have met the government's safety standards for resuming operations, and why they need to be restarted.

The meeting will be open only to local residents. More than 700 people are expected to attend.

All 50 of Japan's nuclear reactors will be offline when the last reactor still online in the northernmost prefecture of Hokkaido is shut down for regular inspections early next month.

If the government goes ahead and restarts the Ohi reactors, they will be the first to resume operations since the disaster at the Fukushima Daiichi nuclear power plant.

Time to look at standards

New tsunami standards to be set for nuclear safety
http://www3.nhk.or.jp/daily/english/20120427_41.html

Japan's nuclear regulator says it will draw up new safety guidelines for designing nuclear power plants against tsunami. The Nuclear and Industrial Safety Agency held a meeting of experts on Friday to discuss the safety measures.

A tsunami twice as high as expected struck the Fukushima Daiichi plant during the March 2011 disaster, flooding emergency electricity generators and leading to core meltdowns. Experts say the plant was ill-prepared for tsunami floods or water pressure, which forced open doors at the facility.

Officials explained at Friday's meeting that the new guidelines estimate the maximum scale of tsunami for each plant by calculating the pressure of surging waves and flood areas at the facilities.

Each plant will be checked to see if reactors and other pieces of important equipment are designed strong enough to withstand any tsunami.

The agency also says it will check that safety measures are in place to prevent a severe radioactive accident, even if a larger-than-expected tsunami strikes and causes a meltdown.

It will also study tsunami cycles of maximum size.

An expert in earthquake engineering, Professor Tsuyoshi Takada at the University of Tokyo, says such points should be included in secondary stress tests to check the safety of nuclear plants.

At present, primary assessment of stress tests for restarting nuclear plants cover only the height of tsunami, not water pressure or flooding.

Check again... before the next tsunami

April 27, 2012

TEPCO to recalculate potential tsunami height near Niigata nuke plant

http://mainichi.jp/english/english/newsselect/news/20120427p2a00m0na015000c.html

Tokyo Electric Power Co. (TEPCO) announced April 26 that it will recalculate the height of a potential tsunami that may strike its Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture.

The move was pushed forward after four prefectures located along the Sea of Japan released their own estimates, which state that the scale of a potential earthquake in the area where the nuclear plant is located is in fact up to around 2.8 times stronger than what TEPCO has estimated.

Based on current TEPCO estimations, a magnitude 7.85 quake may occur at a fault extending some 131 kilometers near Niigata Prefecture's Sado Island, which could trigger a 3.3-meter-high tsunami. Based on these estimations, the company is currently proceeding with the construction of an embankment that would resist waves of up to some 15 meters in height.

However, based on a report issued by the Tottori Prefectural Government, there is a risk that a fault running for 220 kilometers located within the same area may trigger an 8.15 magnitude earthquake. Separate reports released by the Shimane and Ishikawa prefectural governments point to a risk of magnitude 8.01 and magnitude 7.99 earthquakes in the area, respectively.

Judging the reports to be of "valuable information that must be reflected in safety assessments," TEPCO submitted a report on those estimates to the Ministry of Economy, Trade and Industry's Nuclear and Industrial Safety Agency.
Results of the recalculation may affect future safety assessments, including stress tests, at the plant.

Summer demand

April 23, 2012

3 of 9 utilities may fail to meet demand / Power curbs seen likely this summer

http://www.yomiuri.co.jp/dy/national/T120424005735.htm

The Yomiuri Shimbun

Supply-and-demand outlook for nine utilities in summer

	Demand (unit: million kilowatts)	Surplus or shortfall
Hokkaido Electric Power Co.	5	-3.1%
Tohoku Electric Power Co.	14.34	2.9%
Tokyo Electric Power Co.	55.2	4.5%
Chubu Electric Power Co.	26.48	5.2%
Kansai Electric Power Co.	30.3	-16.3%
Hokuriku Electric Power Co.	5.58	3.6%
Chugoku Electric Power Co.	11.82	4.5%
Shikoku Electric Power Co.	5.85	0.3%
Kyushu Electric Power Co.	16.34	-3.7%
Total	170.91	-0.4%

**Demand calculated on assumption economy expands compared with last year and electricity-saving measures are carried out in hot weather mirroring 2010's summer.*

Three of the country's nine electric power companies may be unable to meet expected demand this summer, the government says.

Kansai Electric Power Co.'s (KEPCO) supply may fall 16.3 percent short of maximum demand, according to power supply-and-demand projections compiled by the nine utilities and released by the government Monday.
Supply also is expected to fall short of demand in areas covered by Kyushu Electric Power Co. and Hokkaido Electric Power Co.

The government said Shikoku Electric Power Co., Tohoku Electric Power Co. and three other utilities with low power-generation capacity may ask large-lot users to curb power consumption.

However, the power supply in areas covered by Tokyo Electric Power Co. is expected to meet demand this summer, in contrast to last year when restrictions were imposed on large-lot users, and households and small and midsize firms were asked to reduce consumption.

On Monday, the government started examining power supply-and-demand estimates presented by the nine utilities at the first meeting of a study committee chaired by Katsuyuki Ishida, senior vice minister at the Cabinet Office.
The estimates were made on the assumptions that no nuclear power reactors will be reactivated and the weather will be as hot as the summer in 2010.

According to the projections, the nine power companies are expected to face a combined power shortage of 0.4 percent this summer. This is a vast improvement from estimates made in July last year, when the power shortage was put at 9.2 percent.

This year, western Japan is expected to face a power shortfall of 3.6 percent, while eastern Japan will enjoy a surplus of 3.7 percent.

A total of 7.29 million kilowatts of electricity has been added to the nation's supply thanks to an increase in output at thermal power stations and the purchase of electricity from businesses with private electrical power facilities. An additional 350,000 kilowatts were obtained from solar power generation.

To deal with the expected power shortages, the government sees a need to restrict power usage this summer through contracts with large-lot users such as factories and offices .

However, the combined effect of power conservation in areas covered by the nine utilities based on such contracts would only result in saving 4.91 million kilowatts, 2.9 percent of demand.

Of the 4.91 million kilowatts, the amount saved in areas covered by KEPCO would likely be 370,000 kilowatts, or about 1.2 percent of demand.

TEPCO is likely to see a supply surplus of 4.5 percent in summer thanks mainly to an increase in output from thermal power stations, exceeding the 3 percent benchmark figure that indicates a tight power supply.

However, if the reactivation of nuclear reactors is delayed, electricity rates are likely to rise regardless of whether power supplies meet demand.

The study committee will hold several meetings to verify the power supply-and-demand estimates before hammering out final estimates and countermeasures in mid-May.

For TEPCO, recovery is linked to restart

Wednesday, May 2, 2012

Tepco Recovery Plan Includes Restart Of Kashiwazaki Kariwa Units

http://www.nucnet.org/all-the-news/2012/05/02/tepco-recovery-plan-includes-restart-of-kashiwazaki-kariwa-units

Plant Operation
2 May (NucNet): As part of a recovery plan Tokyo Electric Power Company (Tepco) aims to cut costs by nearly 41 billion US dollars (31 billion euro) over the next decade and restart units at its Kashiwazaki Kariwa nuclear plant in 2013.
The operator of the Fukushima-Daiichi nuclear plant, which was shut down by a March 2011 earthquake and tsunami, has submitted a recovery plan to the government under which the state will inject about $12 billion for a controlling stake in the company. Banks will lend a further $12 billion, and costs will be cut and electricity rates increased.

The seven-unit Kashiwazaki Kariwa plant was struck by an earthquake in July 2007 leading to the automatic, safe shutdown of units 3, 4 and 7. Units 1, 5 and 6 were already shut down at the time of the earthquake for periodic inspections.

Unit 2 was technically undergoing a periodic inspection and start-up operations had just begun, but the unit was also shut down safely.

Tepco restarted units 1, 5, 6 and 7 at the plant after repair of damaged systems and inspections. But these units have since been shut down for planned refuelling and maintenance and not yet restarted following government-mandated safety checks in the wake of the Fukushima-Daiichi accident.

The recovery plan, which has been under discussion since January, aims to ensure Tepco can pay compensation for victims of the Fukushima-Daiichi accident and of decommissioning its reactors and fuel ponds.

In return for injecting $12 billion, the government will take an initial stake of 50.1 percent in Tepco along with rights to a further one-sixth of the company's shares that it can exercise later if it deems necessary.

The Japan Atomic Industrial Forum (JAIF) said Tepco hopes to return to the black by March 2015. The recovery plan needs to be approved by the industry minister, JAIF said.

Maybe not safe enough

Kyoto's top crisis manager slams safety explanation for Oi reactors' restart

Kyodo
http://www.japantimes.co.jp/text/nn20120502a7.html

KYOTO — The Ministry of Economy, Trade and Industry sought support Tuesday from the Kyoto Prefectural Government for restarting two idled reactors at the Oi nuclear plant in Fukui Prefecture.

Kyoto Gov. Keiji Yamada demanded the Agency for Natural Resources and Energy and the Nuclear and Industrial Safety Agency give further explanations about the issue, despite having been briefed by Senior Vice Industry Minister Seishu Makino last month that the two reactors are safe to restart, based on the results of computer-simulated stress tests.

On Tuesday, Kyoto's chief crisis manager, Kiyoshi Yamada, told the officials from the organizations that the prefecture cannot fully accept the state's explanations about the safety of the reactors.

In response, Tetsuya Yamamoto, chief nuclear safety officer at NISA, said the government's safety measures were compiled after learning lessons from the crisis at the Fukushima No. 1 plant.

Yamamoto also said the central government will set up a teleconference system with local governments within a 30-km radius from the Oi complex to share information in the event of a nuclear disaster, and the industry ministry will deploy more antidisaster equipment to the Oi plant.

In a joint statement issued in mid-April, Yamada and Shiga Gov. Yukiko Kada called on the central government to work out a road map to build up a society free of nuclear power.

Complete suspension on May 5

Friday, May 4, 2012

Last reactor halts Saturday

Jiji

http://www.japantimes.co.jp/text/nn20120504a5.html

The nation's last active nuclear reactor will go offline Saturday, leaving Japan completely devoid of an energy source that accounted for around 30 percent of its electricity when all systems were operating.

Hokkaido Electric Power Co. is set to halt reactor 3 at its Tomari nuclear plant for maintenance. It is the only one of Japan's 50 usable reactors still active.

None of the suspended reactors has been restarted because of safety concerns sparked by the triple-meltdown crisis at Tokyo Electric Power Co.'s Fukushima No. 1 power plant in March last year. The nation had an inventory of 54 reactors before the crisis.

If Japan continues to shun nuclear energy, power shortages will become a constant threat each summer, inconveniencing the public and acting as a drag on economic activity.

When the Tomari reactor is idled, it will mark only the second time that all of Japan's nuclear reactors have been halted since the industry got its start in 1966.

The last time was April 1970, when Japan had only two reactors — one in Tokai, Ibaraki Prefecture, and the other in Tsuruga, Fukui Prefecture. Both were run by Japan Atomic Power Co. It will also be the first total suspension since nuclear energy became a key energy source.

In hopes of easing the public's concerns, the government has introduced strict procedures for nuclear reactors to undergo before they can be restarted, although the deadlines for completing some of them can apparently be ignored.

One of the key procedures is computerized stress tests, which are simulations designed to check if reactors can withstand severe incidents like the quake and tsunami that crippled the Fukushima plant.

Last month, the government approved the stress test results for reactors 3 and 4 at Kansai Electric Power Co.'s Oi plant in Fukui and declared them safe to restart. But the government, which forfeit public trust in

atomic energy via lax oversight and by witholding data that could have reduced fallout exposure at the height of the crisis, has been struggling to persuade a wary public to agree to any reactor restarts.

Government estimates claim power supplies will come up 0.4 percent short of demand this summer if all the reactors stay suspended and if Japan goes through a repeat of the record-breaking heat wave of two years ago.

In Kepco's area in western Japan, power is projected to be 16.3 percent short of demand in a record-hot summer, while Hokkaido's shortage is projected to be 3.1 percent.

This raises the possibility that more of the public will be asked to engage in power conservation like last summer, unless an unusually cool summer like that of 2003 occurs, when Tepco's customers in eastern Japan were spared from outages after it was forced to shut down all 17 of its reactors amid a defect scandal.

Trade minister Yukio Edano has hinted that Japan may have to resort to rolling blackouts or mandatory curbs on power consumption in some regions to survive the summer.

Businesses, especially manufacturers, aren't keen on that idea.

"Last summer, we cooperated by saving electricity without considering the cost, but it is difficult to continue," said an official at a machinery maker.

Another headache is the soaring cost of procuring LNG and other fossil fuels for thermal power generation to offset the loss of atomic energy.

The nine major utilities outside Tepco booked a combined ¥3.6 trillion in fuel costs for thermal power plants in the year that ended in March.

Seven of them incurred net losses for the year, which means soaring fuel costs may force them to raise prices.

While problems are mounting from the break with atomic power, the movement for fully denuclearizing is winning growing public support.

Late last month, mayors of municipalities from 35 prefectures set up a forum to pursue the goal of completely abandoning nuclear power.

Hiroshi Takahashi, an analyst at Fujitsu Research Institute, said it would not be appropriate to force the public to make a choice over two extremes, such as reactor restarts or rolling blackouts.

"We should have calm discussions, separating long-term visions from short-term measures," he said.

Nagasaki mayor's plea

Kyodo

VIENNA — Nagasaki Mayor Tomihisa Taue has called on global leaders to work toward a world free of nuclear weapons at a preparatory meeting in Vienna for the 2015 nonproliferation review conference.

At the first session Wednesday of the committee tasked with organizing the event, Taue said he trusts the Nuclear Non-Proliferation Treaty Review Conference "will clearly show how and in what time frame a world without nuclear weapons will be realized," as urged by U.S. President Barack Obama.

Calling on leaders to make further efforts toward nuclear disarmament, Taue described the global amount of defense-related spending as "absurd" and "only leading to a more dangerous world."

"I wonder if representatives from the nuclear powers understand the true horror of nuclear weapons," Taue said, urging participants at the 2015 conference to "consider the inhumanity of atomic weapons."

Referring to hibakusha who are also visiting Vienna for the preparatory meeting, Taue said their voices enable the world to "see and discuss the humanitarian consequences of nuclear weapons."

Japan to be without nuclear power for 1st time in 42 years

http://mainichi.jp/english/english/newsselect/news/20120505p2g00m0dm006000c.html

TOKYO (Kyodo) -- Japan's last operating commercial nuclear reactor is set to go offline Saturday night for mandatory routine maintenance, leaving the nation without atomic-generated electricity for the first time in 42 years.

Hokkaido Electric Power Co. is scheduled to have the No. 3 unit of its Tomari nuclear power plant in the northern Japan prefecture reduce its output power gradually from around 5 p.m. and end electricity generation at around 11 p.m.

Since the huge earthquake and tsunami on March 11, 2011 triggered the Fukushima nuclear crisis, resulting in radiation leaks, mass evacuation and heightened public concern over nuclear safety, no Japanese reactors that were halted for scheduled checkups have been restarted.

The government is trying to restart two offline reactors at the Oi nuclear power plant in Fukui Prefecture to cope with an expected rise in the electricity use over the coming summer in western Japan. But it is still struggling to persuade a wary public that it is safe to restart them in the wake of the world's worst nuclear crisis in 25 years.

The last time that all of Japan's commercial reactors went offline was the period between April 30 and May 4, 1970, just four years after commercial nuclear power generation began in Japan. At that time, Japan had only two nuclear reactors -- one at Japan Atomic Power Co.'s Tokai power plant in Ibaraki Prefecture and the other at its Tsuruga plant in Fukui Prefecture.

Currently, Japan has a total of 50 commercial reactors, down from 54 now that the Nos. 1 to 4 reactors at the Fukushima Daiichi plant have been declared defunct following the disaster.

Prime Minister Yoshihiko Noda and key ministers of his Cabinet judged last month that restarting the Nos. 3 and 4 reactors at the Oi plant on the Sea of Japan coast is necessary to help ensure a stable supply of electricity during summer's high temperatures.

Industry minister Yukio Edano, who oversees nuclear power plant operators, has said the possibility of introducing rolling blackouts cannot be ruled out if there is no atomic power available.

Prior to the Fukushima crisis, nuclear power provided about one third of Japan's electricity. The government, together with electricity firms, used to promote the development of nuclear power, touting

its efficiency and arguing that nuclear power plants can contribute to preventing global warming as they do not emit carbon dioxide during electricity generation.

The government is now crafting a new energy mix in light of the Fukushima crisis, terminating its earlier plan to boost the country's reliance on nuclear energy to more than 50 percent of total power supply by fiscal 2030.

In the wake of the accident at the Fukushima Daiichi plant, operated by Tokyo Electric Power Co. in Fukushima Prefecture, northeastern Japan, the government instructed emergency safety measures to be implemented at all the country's reactors.

In addition, then-Prime Minister Naoto Kan in May last year asked Chubu Electric Power Co. to suspend operation of its Hamaoka power plant in Shizuoka Prefecture due to concern about a powerful earthquake predicted for the area. In July, Kan's administration also introduced ''stress tests'' to check reactors' ability to withstand earthquakes and tsunami.

Under the stress-test system, reactors undergoing scheduled checkups cannot be restarted unless they pass the first round of stress tests. Test results on the Nos. 3 and 4 reactors of the Oi plant operated by Kansai Electric Power Co. have been endorsed by Japan's nuclear authorities, making them at the forefront of the government's efforts to restart offline reactors

But efforts to regain public support for restarting the Oi reactors appear to have made little headway. Leaders of local governments near the Oi plant, such as the governors of Kyoto and Shiga as well as the mayor of Osaka, have been voicing concern over restarting the reactors.

A recent poll conducted by Kyodo News also showed that 59.5 percent of respondents are opposed to restarting the Oi reactors, while 26.7 percent are in favor.

Meanwhile, the utilities powering the world's third biggest economy have been forced to turn to thermal power generation to keep factories, offices and households supplied with electricity. Buying oil and liquid natural gas is driving up the utilities' fuel costs and may lead to higher electricity bills.

The prolonged and widespread halt of reactor operations has also cast a shadow over the local economies in communities hosting nuclear power plants.

It is still uncertain how long Japan will continue keeping its commercial reactors offline. Noda and three ministers concerned are to make a formal decision on whether to restart the Oi reactors after taking into account the opinions of local authorities and of the public.

Kan on Hamaoka

May 5, 2012

Gov't never issued restart guarantee for Hamaoka nuke plant: Kan

http://mainichi.jp/english/english/newsselect/news/20120505p2a00m0na018000c.html

The Japanese government never issued any conditional guarantees that the Hamaoka nuclear plant would be given permission to restart, former Prime Minister Naoto Kan told the Mainichi recently in an exclusive interview.

On May 6 last year, then Prime Minister Kan demanded that operations at the Hamaoka plant in Shizuoka Prefecture -- on the Pacific coast and close to a major undersea fault line -- be halted. However, plant operator Chubu Electric Power Co. said it had received a guarantee from then Economy, Trade and Industry Minister Banri Kaieda for permission to restart the reactors after the firm had implemented a raft of new safety measures.

"That was just something they (Chubu Electric) wished for," Kan told the Mainichi, denying any such guarantee had been made.

Chubu Electric decided on May 9, 2011, to shut down the Hamaoka plant's reactors, three days after the government demand. At a news conference that day, Chubu Electric President Akihisa Mizuno revealed that he'd talked with Kaieda on the phone, and that the minister had "promised to allow the reactors' restart" if the completion of new tsunami safety measures was confirmed. Mizuno also announced items that confirmation would be based on.

"I won't deny that the utility presented something they were hoping for," Kan told the Mainichi in the interview. "But the Hamaoka plant is on a different level from the problem of Japan's energy policy as whole. That issue goes beyond whether a promise can be made based on a confirmation list or not. ... The Fukushima nuclear disaster proved that the risks involved cannot be borne by just one company.

"This is a policy issue that the entire nation must consider," Kan added.
On the Hamaoka shutdown demand, Kan pointed out that both the Tomei Expressway and the Tokaido Shinkansen bullet train line pass within 20 kilometers of the plant -- the same radius around the Fukushima No. 1 nuclear station now barred to human habitation.

"If a Fukushima-like disaster happened at Hamaoka, Japan's aorta would wind up inside the exclusion zone. I think the impact would be greater than that of the Fukushima crisis," Kan said, emphasizing the special characteristics of the Hamaoka area.

Regarding the possible restart of reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Oi, Fukui Prefecture, Kan stated: "The opinions from the power supply side of the debate are very strong. But is it really true that we don't have enough electricity? I think that we can get through if each individual cuts back on consumption at peak times, among other measures."

How much electricity this summer?

May 7, 2012

Gov't checks electricity supply after halt of last running reactor

http://mainichi.jp/english/english/newsselect/news/20120507p2g00m0dm105000c.html

TOKYO (Kyodo) -- The Japanese government held its fourth meeting Monday to ascertain electricity supply and demand for this summer, as the nation is without nuclear power-generated electricity for the first time in 42 years.

The last operating commercial reactor, the No. 3 unit of Hokkaido Electric Power Co.'s Tomari nuclear power plant, was brought to a stable state of cold shutdown at around 11 a.m. Monday after ending its electricity generation Saturday night for routine maintenance.

With all of Japan's 50 commercial reactors now suspended, the government is accelerating efforts to verify how much electricity will be available this summer, with the aim of compiling the outcome as early as later this week.

At the latest meeting with experts, the government presented an estimate that the areas covered by Kansai Electric Power Co. will face a power shortage of 14.9 percent this summer, slightly better than the 16.3 percent shortage the utility projected in April but still a severe situation.

The government is trying to restart two offline reactors of Kansai Electric, which relied particularly heavily on nuclear power before the Fukushima nuclear crisis, but its efforts in relation to the firm's Oi nuclear power plant in Fukui Prefecture appear to have made little headway.

Since the massive earthquake and tsunami on March 11, 2011, triggered the world's worst nuclear crisis in 25 years at Tokyo Electric Power Co.'s Fukushima Daiichi power plant, resulting in radiation leaks, mass evacuations and heightened public concern over nuclear safety, none of the Japanese reactors halted for scheduled checkups have been restarted.

The reactor in the village of Tomari on Japan's northernmost main island reduced its output power from 5 p.m. Saturday and had its nuclear fission reaction ended at around 4 a.m. Sunday.
To check the nation's electricity supply and demand condition for this summer, the government launched the meeting with experts on April 23.

Renewed pressure to restart Oi reactors

May 11, 2012
Power crisis 'can be averted' / Govt says restarting Oi reactors key to preventing blackouts

http://www.yomiuri.co.jp/dy/national/T120510006329.htm

The Yomiuri Shimbun

This summer's expected power shortage in Kansai Electric Power Co.'s service area may be averted if two reactors at the Oi nuclear power plant are restarted in combination with power-saving efforts by businesses and households, according to the government's new power supply projection released Thursday.

This is the first time the government has presented a power demand-supply outlook on the assumption that a nuclear reactor will resume operations.

With no nuclear reactors operating in the country, KEPCO's service areas are expected to suffer a particularly serious power shortage this summer.

However, the government apparently believes a power crisis can be prevented if the resumption of the Oi nuclear reactors is coupled with energy-saving efforts from the public and private sectors, which initially took root after serious power shortages last summer.

The projection is likely to affect ongoing discussions among local governments and residents living near the Oi nuclear plant in Fukui Prefecture on whether to restart the Nos. 3 and 4 reactors, which were shut down last year for regular maintenance.

The government submitted a draft report on the assumption that nuclear reactors will not be reactivated to an expert panel tasked with verifying the country's power demand-supply outlook. It also presented projections on the assumption the Oi reactors were reactivated.

According to the government projections, reactivating the Oi reactors is expected to push up KEPCO's power supply capacity by 4.46 million kilowatts--2.36 million kilowatts of which are to be generated by the two reactors, plus an additional 2.1 million kilowatts to be generated by pumped storage hydropower using nighttime surplus power from the reactors.

The pumped storage hydropower system works most effectively in combination with nuclear reactors, which are able to generate a constant amount of electricity around the clock.

According to the projections, even if Japan experiences a record-breaking heat wave as it did in 2010, no power shortage is expected during peak hours if the Oi reactors are reactivated and KEPCO asks large-lot users to reduce their electricity consumption in accordance with a special contract asking them to do so in the event of a tight energy supply. Even if no such request were to be made, the power shortage will only reach 0.9 percent.

However, the figure is still short of a 3 percent power surplus--the amount generally considered necessary for sufficient supply if power generation facilities malfunction.

Even so, it will be possible for the government to avoid implementing compulsory energy-saving measures, such as power consumption limits and rolling blackouts.

The government projects that KEPCO's service areas will face a 15.7 percent power shortage, or 4.73 million kilowatts, if no nuclear reactors resume operation.

In that case, even if large-lot users are asked to curb their energy consumption, the region will still suffer a power shortage of 14.9 percent, or 4.45 million kilowatts.
Rene"

If no nuclear reactors are reactivated nationwide, nine electric power companies will suffer a combined electricity shortage of 0.3 percent, according to government projections. But this figure is expected to

recover to a 0.1 percent surplus if large-lot consumers take measures to save electricity under their special contracts with the utilities.

If the Oi reactors are restarted, there is expected to be an energy supply surplus even without efforts by large-lot users to reduce consumption, according to the projections.

Does this sound like blackmail?

May 11, 2012
Gov't forces choice on local bodies: restart nuclear reactors or face power restrictions

http://mainichi.jp/english/english/newsselect/news/20120511p2a00m0na006000c.html

The government released preliminary calculations on May 10 stating that areas serviced by Kansai Electric Power Co. (KEPCO) could avert a major power shortage this summer if the No. 3 and 4 reactors at the Oi Nuclear Power Plant in Fukui Prefecture were restarted and companies and households made an effort to conserve power.

The government is considering placing restrictions on power use this summer if the nuclear reactors, which have been shut down for inspections, are not restarted -- setting large power-saving targets and penalizing companies that fall short of them. However, local bodies have been reluctant to side with the government in its push to quickly restart the reactors.

The latest calculations can be viewed as forcing a choice on local bodies: restart the nuclear reactors or face restrictions on power use. However, KEPCO, which operates the Oi plant, originally predicted that it would face a power shortage of about 5 percent this summer even if the nuclear reactors were restarted. As such, the new calculations that equate restarting the reactors with alleviation of a power shortage seem abrupt.

If the government's approach of taking the restarting of the reactors for granted without a sufficient explanation prevails, then distrust toward the government could spread in Fukui Prefecture, the neighboring prefectures of Kyoto and Shiga, and among local bodies in Osaka Prefecture and elsewhere.

The new calculations were initially presented by KEPCO in a May 10 morning meeting of the government's supply and demand inspection committee. They state that if Japan experiences a scorching summer this year similar to that seen in 2010, then even if contracts were adjusted to have major power consumers conserve electricity at peak times, supply would fall short of demand by 14.9 percent (about

4.45 million kilowatts). On the other hand, if the No. 3 and 4 reactors at the Oi plant were restarted, in addition to the 2.36 million kilowatts of electricity they would produce, pumped water storage -- in which water is pumped to a high elevation at night, when demand for electricity is low, and then released during the day -- could be used to produce an additional 2.1 million kilowatts of electricity. This would raise supply by 4.46 million kilowatts, giving KEPCO a 10,000 kilowatt surplus. Taking into account assistance from Chubu Electric Power Co. and Chugoku Electric Power Co., supply could be raised even further.

The supply and demand inspection committee was originally to compile figures on electricity supply and demand on the presupposition that the nuclear reactors would not be restarted. However, a representative of the government's National Policy Unit, which serves as secretariat, commented, "We presented preliminary calculations envisaging the restarting of the Oi reactors this time because committee members asked us to do so at the last meeting (on May 7)."
The government is considering introducing power restrictions in areas serviced by KEPCO if it cannot restart the Oi reactors, but time is needed by companies to prepare for such restrictions, and there is little time to decide whether restrictions should be put in place.

A representative of Panasonic commented, "We would have to make full-scale adjustments in our dealings with clients and take our employees into consideration." In response to such industry concerns, the government plans to hold a meeting of Cabinet ministers concerned with the issue as early as next week to decide on summer power conservation measures in KEPCO's service areas.

The government wants to avoid power restrictions which greatly affect companies' operations and are unpopular. In a news conference on May 10, Chief Cabinet Secretary Osamu Fujimura commented that the explanations to local bodies with a view to restart the Oi reactors were "ripening," hinting that the government hoped the reactors would be restarted.

Oi OK for restart

Local town assembly OKs Oi nuclear reactors' restart

http://mainichi.jp/english/english/newsselect/news/20120514p2g00m0dm102000c.html

TOKYO (Kyodo) -- The assembly of Oi town, Fukui Prefecture decided Monday to support the restart of two idled reactors at Kansai Electric Power Co.'s Oi nuclear power plant.

The assembly made the decision in consideration of the damage to the local economy and employment that a prolonged halt of the reactors could bring, and is expected to convey its view to town Mayor Shinobu Tokioka later in the day.

The mayor will make a decision on whether to approve the reactors' restart after taking into account the assembly's decision as well as the results of an appraisal by the western Japan prefecture's nuclear safety commission and other matters. The mayor's decision will then be conveyed to Fukui Gov. Issei Nishikawa.

Since the massive earthquake and tsunami in March last year triggered the nuclear accident at the Fukushima Daiichi plant in Fukushima Prefecture, northeastern Japan, no Japanese reactor halted for scheduled checkups has been restarted amid heightened public concern over the safety of nuclear power.

Japan's last operating commercial nuclear reactor at Hokkaido Electric's Tomari plant went offline on May 5 for mandatory routine maintenance, resulting in the complete idling of nuclear power sources. Nuclear power had supplied about 30 percent of the nation's electricity before the Fukushima crisis.

At the mayor's request, the Oi town assembly has been examining the central government's steps to ensure the safety of the Oi plant, located on the Sea of Japan coast, as well as its measures to support the local economy. At its meetings, there were many opinions voiced that although safety concerns remain, the town should support the reactors' restart to protect the local economy and jobs.

The central government is trying to resume operation of the Nos. 3 and 4 reactors of the Oi plant to help ensure the stable supply of electricity ahead of the summer when demand for electricity peaks with the use of air conditioning.

Prime Minister Yoshihiko Noda and key members of his Cabinet judged in mid-April that the two Oi reactors meet the government's safety standards for reactivation. But leaders of municipalities near the plant, such as the Kyoto and Shiga governors, remain cautious and have been voicing reluctance to see the reactors restarted.

Tokioka has called on the central government to offer sufficient explanation about the reactors' safety as well as the nation's energy policy, claiming that insufficient explanations so far have led to the cautious views among municipality leaders.

Town assembly to accept Ohi nuclear plant restart
http://www3.nhk.or.jp/daily/english/20120514_07.html

The Ohi Town assembly is set to approve a resumption of nuclear reactors at the Ohi power plant.

Assembly members have agreed that restarting the plant is necessary to help maintain jobs and the

town's finances. The decision will become official when assembly members meet on Monday. They also plan to convey their decision to Mayor Shinobu Tokioka.

The assembly had been discussing the issue since local people were briefed by the government and Kansai Electric Power Company in late April about plans to restart the nuclear reactors.

Some local residents expressed their concerns over resumption. Assembly members of the township were asked to consider opinions of local people as well as those in other municipalities.

In April, the government asked officials of Ohi Town and Fukui Prefecture to approve the plan to restart the nuclear reactors.

Mayor Tokioka has said he will make a decision after considering the opinions of the local assembly and a prefectural panel of experts.

Doubts about Hamaoka

May 14, 2012
Hamaoka plant's neighboring governors not ready to permit reactivation: survey

http://mainichi.jp/english/english/newsselect/news/20120514p2a00m0na018000c.html

Seven of the eight governors of prefectures located close to the Hamaoka Nuclear Power Plant in central Japan -- whose operations were halted under government orders two months after the massive quake and tsunami hit northeastern Japan last spring -- are wary of restarting the plant, a Mainichi survey has found.

The governors said there remain large obstacles to restarting the plant, including obtaining "the consent of local bodies."

On May 14, 2011, some two months after the Great East Japan Earthquake and tsunami triggered a nuclear crisis, the national government ordered the halt of operations at the Hamaoka Nuclear Power Plant in the Shizuoka Prefecture city of Omaezaki.

In early May this year, ahead of the one-year anniversary of the plant's halt, the Mainichi surveyed the governors of eight prefectures within 150 kilometers of the plant -- Tokyo, Kanagawa, Yamanashi, Shizuoka, Nagano, Aichi, Gifu and Mie prefectures. The governors were asked about their views on the possibility of reactivating the Hamaoka plant and their assessment of the national government's handling of the issue.

Shizuoka Gov. Heita Kawakatsu said: "We are planning to independently run tests to determine the engineering safety of the plant and the economic rationality of power generation costs, and for the time being, will not approve reactivation of the plant."

Other governors echoed the sentiment, with Kanagawa Gov. Yuji Kurosawa saying, "Unless there is a guarantee of sufficient safety, consent will not be easily given." Mie Gov. Eikei Suzuki said, "There has been too little explanation from the national government about the need (to reactivate the plant) based on the plant's safety and power demand," while Gifu Gov. Hajime Furuta said, "A major prerequisite for consent is a watertight plan, including research on tsunamis' possible effects, and an explanation to the public."

Many governors also criticized the government's handling of the nuclear power issue after operations at the Hamaoka plant were stopped. "Reduction of our dependence on nuclear power is the direction that's been indicated, but we have yet to be presented with a process that will get us there, nor a vision of future energy demand and supply," said Aichi Gov. Hideaki Omura. Nagano Gov. Shuichi Abe likewise argued that "the government should promptly indicate a clearly defined vision." Kawakatsu, meanwhile, said, "The government has not informed us of the process leading up to the plant's reactivation, and has not taken any appropriate action toward the local economy that's been affected by the plant's halted operations."

Despite such concerns, governors are also worried about the risk of power outages, with Yamanashi Gov. Shomei Yokouchi saying, "After talks with local communities, I would like to see nuclear plants that can be restarted to be reactivated as soon as possible."

Meanwhile, unlike the seven other governors, Tokyo Gov. Shintaro Ishihara gave a single answer to the two-tiered survey.

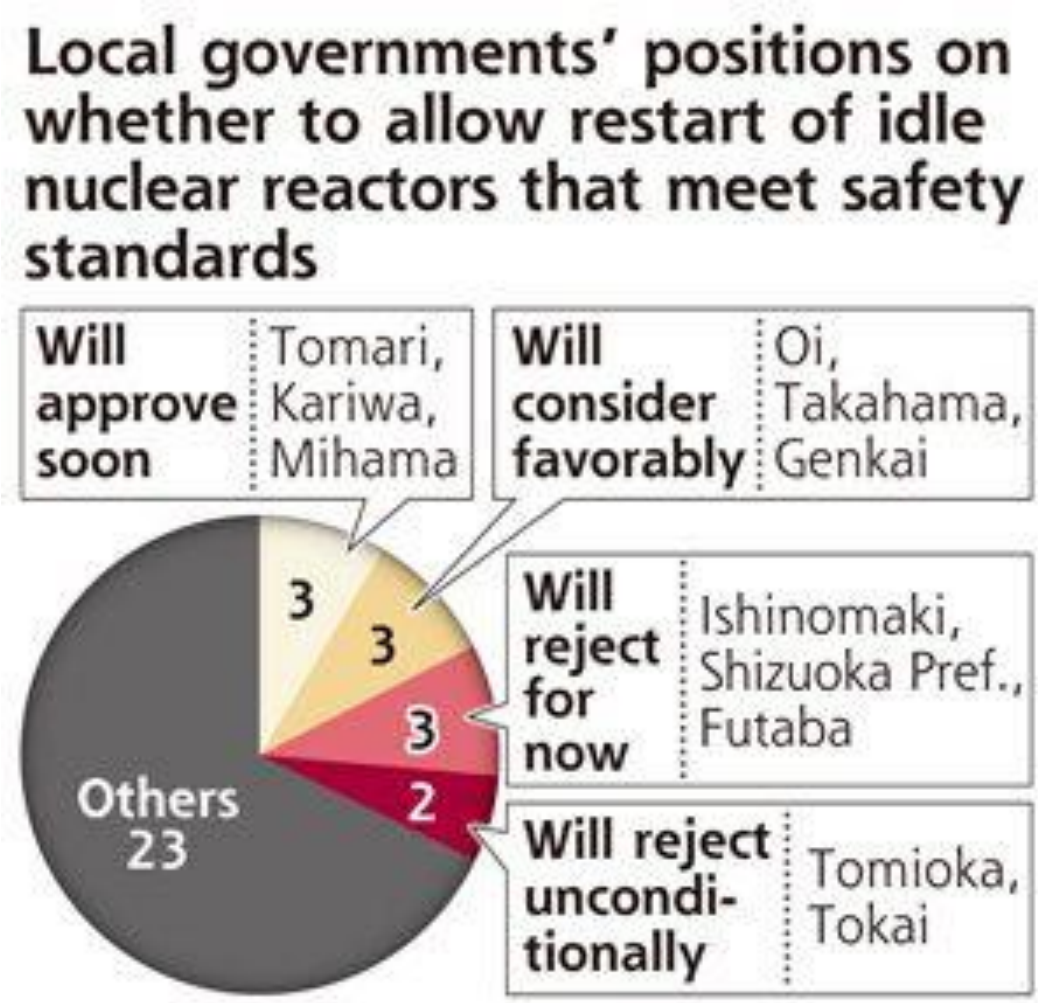
"The important thing is to construct a basic national strategy regarding the degree of economic growth we are seeking, and what kind of energy and how much of it we need to secure. If nuclear power does turn out to be necessary, the national government should take the responsibility of operating them appropriately," he said.

Not so simple a decision

6 local heads favor restart of N-reactors

http://www.yomiuri.co.jp/dy/national/T120513002371.htm

The Yomiuri Shimbun



Six out of 34 heads of prefectures and municipalities where nuclear power plants are located favor restarting suspended nuclear reactors if they meet government safety standards, according to a survey conducted by The Yomiuri Shimbun.

The survey, covering 13 governors and 21 heads of municipalities, was conducted this month after all the nation's nuclear reactors suspended their operations mainly due to regular checkups following the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

Five local government leaders said they disapproved of restarting the idle nuclear reactors, while 23 refrained from stating their position on the issue.

Many of the undecided leaders said they would decide based on the position of the central government and local residents on the restart of the Nos. 3 and 4 reactors at the Oi nuclear power plant in Fukui Prefecture, on which discussions have heated up.

The central government's safety standards were established in April to prepare for the restart of the Oi reactors. The plant is operated by Kansai Electric Power Co., and the restart of its reactors is considered essential in avoiding serious power shortages in the Kansai region this summer.

Among the six leaders in favor of restarting suspended reactors, the heads of Tomari village in Hokkaido and Kariwa village in Niigata Prefecture and the mayor of Mihama town in Fukui Prefecture said they "would approve [restarts] soon" after the reactors meet the safety standards.

The three municipalities are home to Hokkaido Electric Power Co.'s Tomari nuclear power plant, TEPCO's Kashiwazaki-Kariwa nuclear power plant and Kansai Electric's Mihama nuclear power plant, respectively.
Hiroomi Makino, the head of Tomari village, said: "In the case of the Fukushima No. 1 nuclear power plant, human errors have been reported in its operation. The Tomari nuclear power plant has established sufficient safety measures."
Kariwa village head Hiroo Shinada said, "It's desirable for the nuclear power plants to provide electricity under the precondition of securing safety."

Mayor Shinobu Tokioka of Oi town, where the disputed Oi nuclear power plant is located, was among the three mayors who said they "will consider [restarts] favorably."

"Our town has long supported the nation on nuclear policies and coexisted with the power plant," Tokioka said. However, Tokioka said, "Public consensus on the necessity of nuclear power is required" for the restart of nuclear reactors.

The other two were from Takahama town in Fukui Prefecture and Genkai town in Saga Prefecture. Kansai Electric's Takahama nuclear power plant and Kyushu Electric Power Co.'s Genkai nuclear power plant are located in the two towns.

Meanwhile, the mayor of Tomioka town in Fukushima Prefecture and the head of Tokai village in Ibaraki Prefecture said they will reject the restart of nuclear reactors "unconditionally."

TEPCO's Fukushima No. 2 power plant is located in Tomioka and Japan Atomic Power Co.'s Tokai No. 2 nuclear power plant is in Tokai.

Tatsuya Murakami, the head of Tokai village, has asked the central government to scrap the Tokai No. 2 nuclear power plant. "I don't think the hastily prepared safety standards will appease public criticism of nuclear power plants," Murakami said.

The mayors of Ishinomaki, Miyagi Prefecture, and Futaba town in Fukushima Prefecture and Shizuoka Gov. Heita Kawakatsu said they will reject restarts "for now."

Tohoku Electric Power Co.'s Onagawa nuclear power plant is located in Ishinomaki, the Fukushima No. 1 nuclear power plant is in Futaba and Chubu Electric Power Co.'s Hamaoka nuclear power plant is in Shizuoka Prefecture.
"We'll decide after conducting our own inspections of the [Hamaoka plant's] measures against tsunami and resistance to earthquakes," Kawakatsu said.

Many of the 23 local government heads who did not clarify their stance on the issue said they want to monitor developments regarding the restart of the Oi nuclear power plant's reactors, especially the opinions of local residents.
"I want to carefully study the movements of the government and local residents regarding the restart of the Oi nuclear power plant," Saga Gov. Yasushi Furukawa said.

Is GOv't winning or not ?

May 15, 2012
Fukui gov. calls on gov't to clarify nation's nuclear policy
http://mainichi.jp/english/english/newsselect/news/20120515p2g00m0dm124000c.html

FUKUI, Japan (Kyodo) -- Fukui Gov. Issei Nishikawa told visiting senior vice industry minister Seishu Makino on Tuesday that the central government should clearly outline the nation's nuclear policy as it seeks to restart two offline reactors in the prefecture.

"We want (the government) to clearly show its stance and system (toward the nation's nuclear policy) to citizens," Nishikawa said during a meeting with Makino at the prefectural government office in Fukui.

Makino responded by saying, "There is no change in our view that nuclear power is an important source of power." He promised to deal with Nishikawa's request with responsibility.

Makino was visiting Fukui in an effort to win local consent to reactivate the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in the Sea of Japan coastal town of Oi.

The government is trying to restart the two reactors to cope with an expected shortfall of electricity this summer as all of Japan's 50 commercial reactors are now suspended amid heightened public concern over nuclear safety in the wake of the Fukushima nuclear crisis.

Since local leaders near the Oi plant, such as the governors of Shiga and Kyoto, remain cautious about firing up the reactors again, Nishikawa has been calling on the central government to convince them of the need to do so.

The Oi town assembly decided Monday to support the restart of the two offline reactors in view of the damage a prolonged halt would cause the local economy and employment.

Industry minister Yukio Edano said Tuesday at a press conference in Tokyo, "I think this is a sign that we are winning a certain degree of consent" for the reactors' restart.

On April 14, Edano asked the Fukui governor to support the restart. During the meeting with Makino on Tuesday, Nishikawa asked about the government's recent approach to winning consent from local governments reluctant to see the reactors restarted, as well as for an explanation of the nation's electricity supply and demand situation for this summer.

To cope with an expected shortfall of electricity, the government is considering asking electricity users in wide areas of the nation to voluntarily save the use of electricity this summer by setting numerical targets.

For Kansai Electric's service areas, where electricity supply and demand condition is expected to be especially severe, the government said Monday it would prepare for the possible issuance of an order for companies' reduced electricity consumption as well as for possible rolling blackouts.

Gov't winning approval for Oi reactors' restart: Edano

http://mainichi.jp/english/english/newsselect/news/20120515p2g00m0dm123000c.html

TOKYO (Kyodo) -- Japanese industry minister Yukio Edano said Tuesday the decision by Fukui Prefecture's Oi town assembly to support the restart of two idled nuclear reactors shows the government is winning approval for their resumption.

Vowing to make further efforts to win public approval for restarting the two reactors, Edano dispatched senior vice industry minister Seishu Makino to the prefecture the same day to explain the government's approach to Gov. Issei Nishikawa.

The government is trying to restart the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant to cope with an expected shortfall of electricity this summer as all of Japan's 50 commercial reactors are now suspended amid heightened public concern over nuclear safety in the wake of the Fukushima nuclear crisis.

Since local leaders near the Oi plant, such as the Shiga and Kyoto governors, remain cautious about firing up the reactors again, Nishikawa has been calling on the central government to convince them of the need to do so.

The Oi town assembly decided Monday to support the restart of the two offline reactors on the Sea of Japan coast in view of the damage a prolonged halt would do to the local economy and employment.

Edano said Tuesday at a press conference in Tokyo, "I think this is a sign that we are winning a certain degree of consent" for the reactors' restart.

On April 14, Edano asked Nishikawa in Fukui to support the restart. During a meeting with Makino on Tuesday, Nishikawa is expected to ask about the government's recent approach to winning consent from local governments reluctant to see the reactors restarted, as well as for an explanation of the nation's overall nuclear policy.

Kyushu to reduce its consumption this summer

May 17, 2012

Kyushu Electric to request cut in power use July 2-Sept. 7

http://mainichi.jp/english/english/newsselect/news/20120517p2g00m0dm117000c.html
FUKUOKA (Kyodo) -- Kyushu Electric Power Co. plans to ask customers to limit the use of electricity between July 2 and Sept. 7 while compiling details about possible rolling blackouts in its service area, company officials said Thursday.

Kyushu Electric, which suspended all its nuclear power stations in the wake of the crisis at the Fukushima Daiichi plant triggered by the March 2011 quake-tsunami disaster, plans to ask customers to save power from 9 a.m. to 8 p.m. on weekdays during the three-month period, they said.

The utility covering the southwestern region of Kyushu has come up with the plan as the government is considering seeking a cut in power consumption of 12 percent from 2010 levels, which is sharper than the 7 percent cut achieved last year, in its service area.

Earlier this week, the government said it could request electricity users in areas covered by up to seven of Japan's 10 utilities, including Kyushu Electric, to reduce power consumption this summer to cope with tight supply conditions given all 50 commercial atomic power plants have been suspended nationwide.

The officials also said Kyushu Electric is considering dividing its service area into two groups and having them take turns picking zones in the event of possible rolling blackouts.

But it could exclude locations such as hospitals and railway facilities from such power outage plans, they added.

Not everybody wants a restart

Oi town bombarded with protests after nuke reactors' restart approved

http://mainichi.jp/english/english/newsselect/news/20120517p2a00m0na009000c.html

OI, Fukui -- Following the Oi Municipal Assembly's approval to restart two reactors at the Oi Nuclear Power Plant here, the municipal government has been receiving hundreds of protests against the decision, it has been learned.

As of May 16, two days after the town assembly decided by majority vote to support the central government's request to restart the No. 3 and 4 reactors of Kansai Electric Power Co.'s Oi plant, the Oi Municipal Government had received some 300 fax and e-mail messages, most of which were against the assembly's decision.

The number of protests made via telephone on May 14 alone was nearly 40, with most of them coming from residents living outside of Fukui Prefecture. In one of the phone calls, the caller spoke for over 30 minutes.

The municipal government has increased the number of night-duty staff, among other measures, to cope with the increasing queries.

The number of protests began to increase noticeably after Economy, Trade and Industry Minister Yukio Edano requested the Fukui prefectural and the Oi municipal governments approve the reactors' restart on April 14.

Meanwhile, although the town assembly has approved the reactors' restart, Oi Mayor Shinobu Tokioka has not announced the town's official stance on the issue yet.

"If I say OK (to the restart of the reactors), it will mean that the Oi town residents have assisted in reaching this decision," Tokioka said during a press conference after he was informed of the town assembly's decision. "It is necessary to base my decision on careful consideration."

Part of Tokioka's reluctance to finalize the decision on the reactors' restart may be related to the opposition of other related nearby municipalities.

Kansai leaders against Oi restart but pressure from gov't continues

May 21, 2012

Kansai leaders oppose govt call to back Oi reactor restarts

http://www.yomiuri.co.jp/dy/national/T120520002663.htm

OSAKA (Jiji Press)--Local government leaders in the Kansai region have voiced their opposition to restarting reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture, despite calls from central government officials asking for their support.

At a meeting with local leaders in Osaka on Saturday, nuclear disaster management minister Goshi Hosono asked them to approve the reactivation of the Nos. 3 and 4 reactors at the Oi power plant.

However, Osaka Mayor Toru Hashimoto and other participants at the meeting cast doubt over the safety of nuclear power.

Deputy Chief Cabinet Secretary Tsuyoshi Saito also attended the meeting.

"The economy and people's lives cannot be sustained if all the country's nuclear reactors stop operating," Saito said.
The last operating nuclear reactor in Japan was taken offline earlier in May for regular maintenance. No idled reactor has been reactivated since the onset of the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 plant triggered by the March 2011 earthquake and tsunami.

Hosono explained measures implemented by the government and power firms emphasized the safety of the two Oi reactors.

In response, Hashimoto said: "I expect the new nuclear regulatory agency will put together comprehensive safety standards. Until then, the reactors should not be allowed to resume full operations."

The government plans to create the new regulatory agency by integrating the industry ministry's Nuclear and Industrial Safety Agency and the Cabinet Office's Nuclear Safety Commission. The new agency will operate under the Environment Ministry.

Hashimoto also suggested that even if the Oi reactors are restarted, they should only be used when the supply-demand balance is tight.

Wakayama Gov. Yoshinobu Nisaka criticized the government for pushing reactor restarts. "Politicians should wait for the green light from experts, but they are taking the initiative," he said.

Nishikawa's consent sought

http://www3.nhk.or.jp/daily/english/20120615_33.html

Fukui governor meets Kansai Electric chief

The governor of Fukui Prefecture, host of the suspended Ohi nuclear power plant, has confirmed steps to ensure safety at the facility in a meeting with its operator's chief.

Issei Nishikawa met Kansai Electric Power Company President Makoto Yagi on Friday, one day before

Nishikawa is likely to convey his approval to restart two of the plant's reactors to Prime Minister Yoshihiko Noda.

Yagi briefed Nishikawa on the firm's plan to ensure safety at the plant, put more workers there, and carry out measures under his direct supervision.

Yagi also explained the firm's implementation of measures such as building an anti-earthquake structure to be used as headquarters during emergencies such as nuclear accidents. The structure was initially to be built in three years.

Yagi said he will keep in mind the significance of restarting the plant, which he said will decide the future of the country's nuclear power generation.

In Tokyo, Chief Cabinet Secretary Osamu Fujimura said at a news conference that the prime minister and 3 cabinet members will meet Nishikawa on Saturday.

Fujimura said the 4 ministers will then convene a meeting, and Economy and Industry Minister Yukio Edano will hold a news conference.

The government says it wants to officially approve the restart after obtaining Nishikawa's consent on Saturday.

Safe enough?

June 14, 2012
Fukui gov. visits Oi nuclear plant over safety issue
The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120613004902.htm

FUKUI--Fukui Gov. Issei Nishikawa appears to be satisfied with the safety measures taken at Kansai Electric Power Co.'s Oi nuclear power plant, which the government hopes to restart as summer power shortages loom.

On Tuesday, Nishikawa inspected the idled Nos. 3 and 4 reactors during a three-hour visit to the plant in Oi, Fukui Prefecture. He was accompanied by Hideyuki Nakagawa, the head of the prefectural nuclear safety commission, and Hideki Toyomatsu, vice president of KEPCO.

"Safety measures have been carried out" **to a certain degree**, the governor said.

The nuclear safety commission has already concluded the reactors' safety measures are adequate. During his visit to the plant, Nishikawa inspected the emergency electricity generators that have been installed on higher ground as a tsunami countermeasure, a facility that will be used as a command headquarters in the event of a nuclear accident until a seismically isolated headquarters building is completed, and seawalls, which are under construction.

Hundreds of thousands of signatures ignored

June 19, 2012

Tokyo metro assembly votes down proposed nuclear reactor restart referendum bills

http://mainichi.jp/english/english/newsselect/news/20120619p2a00m0na013000c.html

A citizens group demand that the Tokyo Metropolitan Government hold referendums on the restart of idled nuclear reactors went down to a narrow defeat in the metropolitan assembly committee on June 18.

Parties backing Tokyo Gov. Shintaro Ishihara, including the Liberal Democratic Party (LDP) and New Komeito, voted down the original bill, as well as two revised bills on the referendums put by opposition parties at the metropolitan assembly's general affairs committee. If passed, the bills would have required the assembly and the metropolitan government to make efforts to implement policy reflecting the results of local referendums on the restart of reactors run by Tokyo Electric Power Co. (TEPCO), which operates the disaster-stricken Fukushima No. 1 nuclear plant.

A full assembly vote on the original referendum bill is scheduled for June 20, though with the ruling parties holding a solid majority it is likely to be defeated.

A similar bill was rejected by the Osaka Municipal Assembly in February.

The citizens group "Minna de kimeyo 'genpatsu' kokumin tohyo" (Let's everyone decide on nuclear power national referendum) collected 323,076 signatures on a petition to have the proposal put to the Tokyo government in May this year under the Local Autonomy Law; well above the just over 210,000 necessary.

In submitting the bills to the metropolitan assembly, Gov. Ishihara wrote in his opinion that "deciding on the restart of nuclear reactors is the responsibility of the central government."

After the June 18 vote, Akira Miyazaki, secretary-general of the LDP's Tokyo Metropolitan Assembly caucus, explained his party's opposition to the bill, saying, "A steady electricity supply is essential to protect the economic activities of Tokyo's small- and medium-sized businesses and the livelihoods of its citizens. Energy policy is an issue that must be discussed on a national scale, and not something for individual local governments to get involved with."

Meanwhile, Yoshio Nakajima, secretary-general of Komeito's metropolitan assembly caucus, called the vote "the result of careful discussion within our assembly bloc." However, he also stated that "regarding the movement to build a society freed from dependence on nuclear power," his party was "in agreement" with anti-nuclear Tokyoites and wanted to "work toward that end."

Opposition parties, meanwhile, were bitterly disappointed at the bill's failure, particularly as the proposal was backed by over 320,000 signatures.

"It's sad that even the revised bills put together by the assembly factions were defeated," said Taro Yamashita, secretary-general of the opposition Democratic Party of Japan (DPJ) caucus.

Nobuo Yoshida, leader of the assembly's Communist Party members, said that he could "feel the anger at this result, which ignored the people's intent.

"Even if a referendum isn't held, we must deepen discussion on the restart of nuclear reactors," Yoshida added.

Time for citizens to redress the national policy

June 19, 2012

Time for Japan to introduce national referendum on role of nuclear reactors

http://mainichi.jp/english/english/perspectives/news/20120619p2a00m0na016000c.html

A citizens' group failed to win the hearts and minds of many members of the metropolitan assembly for its proposal to hold a local referendum to determine whether nuclear reactors in Tokyo Electric Power Co.'s service area should be reactivated. The reason for this was because many assembly people have feelings of resistance toward the local government deciding through a referendum on what the central government is supposed to be in charge of handling.

Taking a different form than an election being fought on various campaign issues, a local referendum can be used to reflect the intentions of local residents in policy. A local referendum is particularly suited to deal with issues that are closely linked to the local community such as construction of troublesome facilities and preservation of the appearance of the streets in the local community.

Nevertheless, in the latest case of the civic group's request to hold a local referendum on the nuclear reactors, even if a majority of voters voted against restarting the nuclear reactors, the Tokyo Metropolitan Government has no authority to put it into effect. Moreover, Tokyo's intention could be taken to turn its back on the intention of municipalities that are hosting nuclear power plants to supply electricity to Tokyo residents.

The civic group that had called for the direct petition to the Tokyo Metropolitan Government has said, "Let's decide on the rights or wrongs of the nuclear reactors through a national referendum." The civic group has already collected about 120,000 signatures for its proposal, but unlike European countries, Japan does not have a law that stipulates procedures to hold a national referendum on issues other than amendments to the country's Constitution. Therefore, the ordinance for the proposed local referendum emerged as a next best possible means under the direct claim system provided by the Local Autonomy Act.

Shinji Miyadai, a 53-year-old sociologist and one of the representatives who collected and submitted the signatures directly to the metropolitan assembly, said, "Although we are told that 'nuclear power is national policy,' people as sovereign members of society have to correct the distorted national policy." His words sound convincing when we come to look back on the accident at the Fukushima No. 1 Nuclear Power Plant and subsequent handling of it. The civic group collected more than 320,000 effective signatures for the direct petition to the Tokyo Metropolitan Government and a similar trend is spreading elsewhere in the country, an indication that the time has come for Japan to introduce a national referendum to decide on its future path after the earthquake disasters. (By Kenji Shimizu, Tokyo City News Department)

Japan Forum on International Relations Inc. on restarting

June 20,2012

Forum still pushes nuclear power with strict safety proviso added

http://www.japantimes.co.jp/text/nn20120620f3.html#.T-G88FJIwpU

By HIROKO NAKATA
Staff writer

The nonprofit think tank Japan Forum on International Relations Inc. has issued a policy proposal calling for the restart of nuclear reactors after making every effort to improve their safety.

"Those nuclear power stations now . . . shut down should resume operations as soon as possible, after their safety has been verified, their facilities structurally reinforced, and their operational management improved in line with the lessons learned from the accident at the Fukushima (No. 1) nuclear power station," says a JFIR proposal released Monday.

The proposal was endorsed by some 70 academics and business leaders and submitted to Prime Minister Yoshihiko Noda last week.

"(Industry chiefs) had repeatedly said the nuclear reactors were safe. But they are actually very dangerous," Haruo Shimada, president of Chiba University of Commerce, told reporters in explaining the need for strict safety inspections of reactors.

Shimada is one of the academics who contributed to the proposal and signed the recommendations.
The forum said that even though more use of renewable energy would improve energy self-sufficiency and provide alternative sources of power, renewables can't immediately replace nuclear power.

"We cannot share the optimistic view of some that the introduction of renewable energy would serve as a quick remedy or substitute for nuclear power and instantly enable denuclearization," it said.

But at the same time, too much dependence on thermal power plants will lead to a rise in electricity prices, the forum said.

In its policy recommendations, the forum also said the country should actively contribute to peace and safety in the Middle East to ensure a stable supply of energy, as well as build cooperation with other East Asian nations, including South Korea, to enable Japan to purchase electricity from those countries.

The country should also promote globalization of the shale gas market, which started in the United States, it said.

And now Ohi No.4

June 21, 2012

Work starts to restart Ohi No.4 reactor
http://www3.nhk.or.jp/daily/english/20120621_36.html

The operator of the Ohi nuclear plant in Fukui Prefecture has begun work to restart the No. 4 reactor, following similar operations at the No. 3 reactor last Saturday.

Kansai Electric Power Company began the 2-week job of cleaning pipes connected to the turbine at the No. 4 reactor on Thursday.

The company then plans to spend about 10 more days checking pipes connected to the reactor, and testing control rods.

The No. 3 reactor is scheduled to restart on July 1st, and the No. 4 reactor, on the 17th.

Full operation is expected to start at the No. 3 reactor on July 8th, and the No. 4, on July 24th.

Restart of Oi plant imminent

June 26, 2012

Oi nuclear power plant reactor to be reactivated July 1

http://mainichi.jp/english/english/newsselect/news/20120626p2g00m0dm027000c.html

TOKYO (Kyodo) -- One of the two reactors slated to be fired up again at Kansai Electric Power Co.'s Oi nuclear power station is expected to be restarted on July 1, utility officials said Monday.

Work to restart the No. 3 reactor at the Oi plant in Fukui Prefecture has been largely progressing well, said officials, noting rods used to control nuclear fission reactions will be pulled from the reactor core sometime during the evening to late night on July 1.

The operator suggested earlier it would reactivate the No. 3 unit between July 1 and 3.

In a related development, the Nuclear and Industrial Safety Agency suggested it will not immediately disclose incidents involving some alarm activations at the seaside power plant, following several recent incidents when alarms sounded, indicating abnormalities with equipment used to monitor power transmission lines.

"Similar alarm activations have occurred about 200 times a year," said Yoshinori Moriyama, an agency official in charge of nuclear disaster countermeasures, at a news conference.

After reporters protested the move, asking for prompt disclosure, Moriyama later said he would consult with the press over the matter.

The Nos. 3 and 4 reactors at the Oi plant will be reactivated to help alleviate potential summertime power shortages in areas served by the Osaka-based utility, amid lingering public concerns over nuclear safety following the accident at the Fukushima Daiichi nuclear power plant triggered by an earthquake and tsunami in March 2011.

Pdt Naomi Hirose on the restart of Kashiwazaki-Kariwa plant

June 28, 2012

New TEPCO president says utility not set on reactivating Kashiwazaki-Kariwa nuclear plant

http://mainichi.jp/english/english/newsselect/news/20120628p2a00m0na008000c.html

Newly appointed Tokyo Electric Power Co. (TEPCO) President Naomi Hirose has denied that the company is set on reactivating its idled Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture -- a move stiffly opposed by local communities.

In an interview with the Mainichi Shimbun, Hirose also described TEPCO's situation and called for a review of current nuclear regulatory legislation that holds power suppliers primarily responsible for any accident at nuclear power stations they operate.

Excerpts of the interview follow:

Question: Would you please describe the current situation of TEPCO and its future business plan?

Answer: Residents of Fukushima Prefecture and the Kanto region have been adversely affected not only by the crisis at the Fukushima No. 1 Nuclear Power Plant, but also by our request to customers to accept rolling blackouts and an electricity charge hike, and to save power in summer. We've lost a significant amount of public confidence. We'd like to make good use of advice from newly appointed Chairman Kazuhiko Shimokawabe and others who have experience both in and out of the company in our effort to rehabilitate the company and restore the public's trust in us.

Q: Why did you incorporate a plan to reactivate the Kashiwazaki-Kariwa nuclear plant sometime after fiscal 2013 even before the government works out its atomic power policy?

A: We only tentatively decided to reactivate the plant around that time. Otherwise, we can't make any plan on reactivation. We haven't decided to make an all-out effort to resume operations at the power station or developed a specific schedule for that.

Q: You said, "tentatively." Does that mean the plant won't necessarily have to be in operation again?

A: Unless it's reactivated, it will affect the cost of electric power we supply. The question of whether or not to resume operations at nuclear plants is a major factor that determines the original cost of generating power.

Q: If the plant isn't restarted, will electricity fees increase?

A: Yes, they'll certainly rise. The cost of generating power at nuclear plants is quite low, and the suspension of operations at nuclear power stations is the biggest factor behind the fare hike. There is a wide gap in the expenses of generating power at nuclear plants and thermal power stations. In particular, the gap in fuel costs is quite wide. However, we'd like to minimize the fare hike by rationalizing our operations.

Q: Do you think TEPCO's plan to reduce its costs by about 3.3 trillion yen over the next decade is sufficient?

A: We incorporated all possible measures we can take now to reduce expenses in our cost-cutting plan. We've received tough suggestions from the Nuclear Damage Liability Facilitation Fund, and I believe we've incorporated substantial rationalization measures in our cost-cutting plan.

Q: What do you think about the responsibility for the nuclear accident?

A: The Act on Compensation for Nuclear Damages stipulates that power suppliers must assume unlimited liability for any accident at nuclear plants they operate even if they're not at fault. At the same time, it stipulates that the government must take necessary measures to respond to such accidents. Therefore, it's unclear where the responsibility lies. There could be cases where power suppliers can't assume full responsibility, such as our case, and I'd like discussions on the issue to be held. The government will review the system under which the Nuclear Damage Liability Facilitation Fund extends assistance to utilities. We would like to participate in discussions on the issue if we're allowed to do so.

Restart of Oi No.3 reactor on Sunday

June 29, 2012
Ohi nuclear power plant to restart on Sunday
http://www3.nhk.or.jp/daily/english/20120629_34.html

Kansai Electric Power Company, the operator of the Ohi nuclear power plant in Fukui Prefecture, will restart the No.3 reactor on Sunday night for the first time in 15 months.

The company has been cleaning cooling water pipes, checking for water leaks and making other preparations. The government decided on the resumption on June 16th.

The reactor will be resumed at 9 PM on Sunday in the presence of senior vice industry minister Seishu Makino.

This will be the first reactor to be restarted since the earthquake and tsunami in March of last year.

It will reach the critical stage on Monday morning. This is where a self-sustaining chain reaction of nuclear fission is established.

The reactor is expected to start generating power 2 days later. It will then take 4 more days to operate at full capacity.

The utility also plans to restart the No.4 reactor on July 17th and it will reach full capacity a week later.

The 2 reactors have been undergoing strict around-the-clock monitoring since June 16th by plant workers and officials of the national and prefectural governments.

An interruption in the power grid monitoring signal, an accidental switch-off of the power source for monitoring instruments and six other minor problems have taken place.

Reboot of Oi reactor

July 1, 2012

Ohi nuclear reactor back online

http://www3.nhk.or.jp/daily/english/20120701_22.html

A reactor at the Ohi nuclear plant in Fukui Prefecture, central Japan, is back online for the first time in 15 months.

The operator, Kansai Electric Power Company, began lifting the control rods of the Ohi plant's No.3 reactor at 9 PM on Sunday.

Senior Vice Industry Minister Seishu Makino and Ohi Town Mayor Shinobu Tokioka were at the site to watch the resumption.

The reactor is the first to resume operation in Japan since early May. All 50 of the country's reactors had been offline following the accident in March last year at the Fukushima Daiichi nuclear plant.

KEPCO said the fission chain reaction in the reactor is expected to reach criticality around 6 AM on Monday.

The reactor will start generating power on Wednesday and operate at full capacity 4 days later.

The utility has been preparing for the restart since June 16th. Nine minor problems were reported, but the utility says the reactor is not affected by them. It says it found no problem in its final review at 3:30 PM.

The central and Fukui prefectural governments have stationed officials at the Ohi plant to monitor the reactor around the clock.

Reactor to be rebooted, 1st after checkups since Fukushima accident

http://mainichi.jp/english/english/newsselect/news/20120701p2g00m0dm015000c.html

FUKUI (Kyodo) -- A reactor at the Oi nuclear power plant in western Japan will become late Sunday the first in the country to be reactivated after regular checkups since last year's Fukushima nuclear crisis, bringing an end to the situation since early May in which Japan has had no operating reactors and easing power constraints.

Kansai Electric Power Co. said it plans to pull out control rods that have contained fission reactions from 9 p.m. at the No. 3 reactor of the plant in Fukui Prefecture on the Sea of Japan coast. It aims to attain a sustained nuclear fission chain reaction, known as criticality, early Monday, begin power transmission Wednesday, and bring it to full operation possibly July 8.

Although a growing group of protestors has blocked a road leading to the plant since Saturday, preventing workers' access, the utility serving western Japan expects there will be no impact on Sunday's work as it has already secured enough workers for the job, officials said.

Once the 1.18 million kilowatt reactor runs at full capacity, the utility will likely see its projected power shortage in its service area fall to 9.2 percent from 14.9 percent this summer.

Following government approval June 16, it is also preparing to reboot the plant's No. 4 reactor to put it back into full service possibly in late July.

Senior Vice Minister of Economy, Trade and Industry Seishu Makino is set to witness Sunday's work as part of the government's efforts to enhance monitoring of the plant's resumption amid lingering public concerns about nuclear safety in the wake of the meltdowns of three reactors at Tokyo Electric Power Co.'s Fukushima Daiichi plant in northeastern Japan.

A series of minor troubles has haunted preparations to restart the plant, however, with alarms activated at such locations as a place where the plant receives external power supply and equipment used to monitor power transmission lines.

Oi restart effective

July 2, 2012

Oi plant's No. 3 reactor reaches criticality

http://mainichi.jp/english/english/newsselect/news/20120702p2a00m0na013000c.html

FUKUI -- The No. 3 reactor at the Oi Nuclear Power Plant in Fukui Prefecture attained criticality, or a self-sustaining nuclear fission chain reaction, at 6 a.m. on July 2.

The nuclear plant operated by Kansai Electric Power Co. (KEPCO) is the first in Japan to restart after mandatory inspections and regular checkups following the nuclear disaster at the Fukushima No. 1 nuclear plant.

KEPCO will accelerate the 1.18-million kilowatt reactor's heat output while checking the movement of the turbines. If everything goes as planned, the reactor will start generating electricity July 4 before becoming fully operational July 8.

Plant workers reactivated the reactor at 9 p.m. on July 1. They then pulled out the reactor's 53 control rods that prevent nuclear fission and lowered the concentration of boric acid before it reached criticality.

Once the reactor's heat output reaches around a dozen percent, workers will pump vapor into the generator turbine before starting electricity transmission. If the reactor operates without a hitch for about a month , the Nuclear and Industrial Safety Agency will give the go-ahead for resumption of commercial operations.

Meanwhile, demonstrators at the Oi plant, some of whom had blocked the road to the plant, ended their anti-nuclear rally and left the area in the wee hours of July 2.

Oi reactor restarted, 1st reactivation since Fukushima accident

http://mainichi.jp/english/english/newsselect/news/20120702p2g00m0dm013000c.html

FUKUI, Japan (Kyodo) -- A reactor at the Oi nuclear power plant in western Japan became late Sunday the first in the country to be reactivated after regular checks since last year's Fukushima nuclear crisis, bringing an end to the halt since early May of Japan's nuclear reactors and easing power constraints.

In reactivating the reactor, the plant's operator, Kansai Electric Power Co., pulled out control rods from around 9 p.m. that have contained fission reactions at the No. 3 reactor at the plant in Fukui Prefecture on the Sea of Japan coast.

The utility is aiming to attain a sustained nuclear fission chain reaction, known as criticality, early Monday, begin power transmission Wednesday, and bring the reactor to full operation possibly on July 8.

Although a growing group of protesters had blocked a road leading to the plant since Saturday, preventing workers' access, officials of the utility serving western Japan said the protest had no impact on Sunday's reactivation as it had already secured sufficient workers.

Meanwhile, local police started Sunday evening to forcibly remove the protesters for alleged trespass on the plant's premises.

Senior Vice Minister of Economy, Trade and Industry Seishu Makino arrived at the site Sunday evening to witness the reactivation as part of the government's efforts to enhance monitoring of the plant's resumption amid public concern over nuclear safety in the wake of the meltdown of three reactors at Tokyo Electric Power Co.'s Fukushima Daiichi plant in northeastern Japan.

Makino had to use a boat to enter the plant from the sea because the road was blocked by the protesters.

"I've watched it with a tense feeling. The government was able to take a necessary step forward amid a controversy that split the nation," Makino told reporters after monitoring the reactivation.

In Tokyo, more than a thousand people rallied in front of JR Shinjuku Station and Shinjuku Central Park to protest at the restart of the reactor.

Once the 1.18 million kilowatt reactor runs at full capacity, the utility will likely see its projected power shortfall for this summer drop to 9.2 percent from 14.9 percent and the government will lower its summer power-saving target for the utility's service area to 10 percent from 15 percent.

Following government approval on June 16, the utility is also preparing to restart the plant's No. 4 reactor to return it to full operation possibly as early as July 17.

Since mid-April, when Prime Minister Yoshihiko Noda and related ministers confirmed the safety of the Oi reactors, the government had been seeking approval for the reactors' restart from Fukui Prefecture and the coastal town of Oi where the plant is located.

After recognizing power shortages were likely to occur this summer, governors and mayors in western Japan backed off from their earlier opposition in late May, and the Union of Kansai Governments effectively gave consent for the reactivation.

Since the last operating reactor in Hokkaido was deactivated for routine checks in early May, all of Japan's 50 operational commercial reactors had been idled amid heightened public concern over the safety of nuclear power following the Fukushima disaster, triggered by the March 2011 earthquake and tsunami.

Makino's relief

Makino reaction to Ohi plant restart
http://www3.nhk.or.jp/daily/english/20120702_12.html

After the Ohi nuclear power plant reached criticality, senior vice industry minister Seishu Makino said the restart operation went smoothly.

Makino spoke at a video news conference at the Ohi plant in Fukui Prefecture. He watched the restart procedure from the central control room.

He looked relieved and said that the operation should continue with utmost caution.

Makino said the government will take responsibility for supervising the situation on behalf of the people. He said officials have learned from the accident in Fukushima and, for the sake of safety, they will work with the plant's operator and discuss even minute operational changes.

What does it mean?

July 4

Power transmission by Oi nuclear plant's No. 3 reactor to be delayed

http://mainichi.jp/english/english/newsselect/news/20120704p2g00m0dm026000c.html

FUKUI, Japan (Kyodo) -- The No. 3 reactor at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture will resume power transmission on Thursday at the earliest, instead of Wednesday as initially expected, the utility said Tuesday.

The delay is unavoidable as the power-generation turbine needs to be adjusted, Kansai Electric said.

After being idled for over 15 months for mandatory checks, the 1.18 million kilowatt reactor was reactivated Sunday night, the first reactor restart in Japan since the Fukushima Daiichi nuclear plant disaster triggered by the earthquake and tsunami in March last year.

The reactor attained a sustained nuclear fission chain reaction, known as criticality, early Monday.

July 3, 2012
Ohi No.3 reactor power generation postponed

http://www3.nhk.or.jp/daily/english/20120703_35.html

The operator of the Ohi nuclear plant in Fukui Prefecture has decided to postpone by at least one day the start of power generation at the facility's Number 3 reactor.

Kansai Electric Power Company restarted the reactor for the first time in 15 months on Sunday night. It reached criticality on Monday morning.

On Tuesday, the utility began adjusting a turbine so that the reactor could start generating power on Wednesday. But as the procedure took more time than expected, power generation was put off until at least Thursday.

The reactor was to operate at full capacity by next Sunday, but that too has been delayed by at least one day.

No nuclear reactor in Japan has produced power since a reactor at the Tomari plant in Hokkaido was halted for tests in May.

Japan back in the nuclear club

July 5, 2012

Japan regains nuclear power supply with Oi reactor's transmission

http://mainichi.jp/english/english/newsselect/news/20120705p2g00m0dm032000c.html

FUKUI, Japan (Kyodo) -- Japan regained supply of nuclear-generated electricity early Thursday when a reactor at the Oi plant in western Japan was connected to the generator and transmission grid, with all other reactors in the country remaining idled for prolonged checkups in the wake of last year's Fukushima nuclear crisis.

Following its reactivation Sunday after being idled for 15 months for mandatory checks, the No. 3 reactor at the Kansai Electric Power Co. plant in Fukui Prefecture had its turbine linked and began generating and supplying power around 7 a.m. It will gradually increase output and run at full capacity as early as from Monday, officials said.

The resumption of the 1.18 million-kilowatt reactor is expected to ease the utility's projected power shortfall for this summer to 9.2 percent from 14.9 percent and lead the government to lower its summer power-saving target for the firm's service area in western Japan to 10 percent from 15 percent.

"We have made a step toward the safe and stable supply of electricity by being able to deliver nuclear-generated electricity for the first time in four and a half months," Kansai Electric President Makoto Yagi said in a statement, referring to the shutdown in February of the last of its 11 reactors.

The reactor attained a sustained nuclear fission chain reaction, known as criticality, early Monday and had been expected to resume power generation Wednesday, but it took another day to adjust the turbine.

Following government approval on June 16, Kansai Electric is also preparing to reactivate the plant's No. 4 reactor as early as July 18 and return to full operation possibly on July 25.

Since the last operating reactor in Hokkaido was deactivated for routine checks in early May, all of Japan's 50 commercial reactors had been idled amid heightened public concern over the safety of nuclear power following the disaster at Tokyo Electric Power Co.'s Fukushima Daiichi plant, triggered by the March 2011 earthquake and tsunami.

Gov't and TEPCO have ignored the lesson from 3/11

July 6, 2012

Irresponsible reactor startup

http://www.japantimes.co.jp/text/ed20120706a1.html#.T_bRlpFIwpU

The No. 3 reactor at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture started transmitting electricity Thursday morning, ending a two-month period in which Japan has been without nuclear power.

The reactor is expected to reach full-capacity operation on Monday at the earliest. Kepco is also expected to restart the plant's No. 4 reactor on July 18 at the earliest and have it running at full-capacity on or after July 25.

The reactor restart at the Oi plant shows that both the government and Kepco have ignore the lesson from the catastrophe at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant following 3/11 — that **building and operating nuclear power plants in this quake-prone country could lead to an irreparable catastrophe and that Japan should pursue the path of decreasing and eventually ending its reliance on nuclear power.**

Almost one year and four months have passed since the Fukushima nuclear crisis began, yet the government has not worked out a time-bound road map to reduce and end the nation's reliance on nuclear power. The fact that the reactor restart has taken place in the absence of such a plan shows that the government and the power industry are not serious about reducing and ending the reliance on nuclear power.

The government and the power industry must honestly look at the long-term problems that nuclear power generation will continue to impose on human beings. It takes 100,000 years for the radiation levels of high-level nuclear waste from nuclear power plants to drop to a safe levels. At present, the technology to safely dispose of such high-level waste has not been established. Even if materials to contain such waste are developed, nobody can predict with precision what will happen to them 100 years or 1,000 years later.

Safety procedures in the restart of the Oi reactors are based only on provisional standards written before a full study of the Fukushima nuclear crisis was completed, and on a stress test consisting of computer simulations whose results can change depending on the data and computer programs used. It will take three years for Kepco to install filters to remove radioactive materials that might have to be vented from reactor cores in an emergency and establish a seismically isolated emergency command center.

The government and Kepco have also restarted the Oi reactor without working out an evacuation plan based on the worst-case scenario — a reactor core meltdown. This is completely irresponsible. The government and Kepco, which once roused fears of power shortages during the summer months, at the very least, should limit Oi reactor operations to this summer.

Despite jellyfish... Ohi no.3 reactor has just reached full capacity

July 8, 2012
Ohi No.3 reactor reaches full capacity

http://www3.nhk.or.jp/daily/english/20120709_04.html

A nuclear reactor in central Japan has achieved its full operating capacity. The nuclear reactor was restarted on July first after being shut down for maintenance that lasted 15 months.

The output of the electric generator at the No.3 reactor at the Ohi nuclear plant Fukui Prefecture reached 100-percent power output of 1.18 million kilowatts on Saturday.

On Sunday afternoon, a swarm of jellyfish prevented sea water from being absorbed to cool the reactor.

Kansai Electric was forced to reduce the power output, but went ahead with the work as scheduled when the amount of jellyfish receded.

At one o'clock on Monday morning, the No.3 reactor's output reached full capacity.

Senior Vice Industry Minister Seishu Makino and Ohi Town Mayor Shinobu Tokioka are observing the event at the plant's central control room.

This is the first time since the Fukushima Daiichi nuclear power plant accident in March, 2011 that a nuclear reactor has achieved full operating capacity after having been idled for such a long time.

Kansai Electric officials say they will make every effort to bring the No.4 reactor up to full operating capacity on 25th this month.

Oi reactor back on tracks

July 10, 2012

KEPCO's Oi reactor now fully operational

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120709004611.htm

The No. 3 reactor at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture resumed full operations early Monday, the utility said.

The 1.18 million kilowatt reactor increased its output to 100 percent at 1 a.m., becoming the first reactor to attain full capacity since the No. 3 reactor at Hokkaido Electric Power Co.'s plant in Tomari, Hokkaido, suspended operations for scheduled inspections May 5.

Due to the increased power output, the government will reportedly reduce a voluntary summer power-saving target for the region covered by KEPCO on Tuesday. The government had previously requested at least 15 percent cuts from 2010 levels in KEPCO's service area from 9 a.m. to 8 p.m. on weekdays. The revised figure will only ask for a 10 percent reduction, sources said.

The reactor is the first to return to full capacity after regular inspections since the crisis broke out at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant on March 11, 2011.

Having the No. 3 reactor back up to speed will allow KEPCO to generate an additional 530,000 kilowatts through supplemental storage power generation using surplus nuclear power generated during off-peak hours, in addition to the reactor's original capacity.

It was thought the Kansai region would face a 15.7 percent power shortage during peak hours if hit by a severe heat wave similar to what was seen in 2010. However, with the reactor back online, this figure declines to 10 percent. If the No. 4 reactor at the nuclear plant resumes full operations, which could happen as early as July 25, experts believe the region will be nearly into the black in terms of electricity.

The No. 3 reactor restarted July 1, and resumed power generation and electricity transmission last Thursday, gradually increasing power output.

A smack of jellyfish clogged the reactor's seawater intake Sunday afternoon and prevented it from taking in sufficient cooling water, but the jellyfish were removed and the reactor resumed operations that night.

Commenting on the reactor attaining full capacity, Fukui Gov. Issei Nishikawa said in a statement, "Through continued safe operations, I hope nuclear power can regain the public's trust, and that the

restart of this reactor will become the first step in practical discussions on the use of nuclear power as a reliable energy source."
===
Kansai power cuts to be eased

Chief Cabinet Secretary Osamu Fujimura announced Monday the government will relax power-saving targets in service areas of the Kansai, Chubu, Hokuriku and Chugoku electric power companies beginning Tuesday, as the No. 3 reactor at the Oi nuclear power plant has resumed full operations.

KEPCO's target rate will be cut to 10 percent from the original 15 percent reduction from the power consumption level for the summer of 2010. The government had asked Chubu, Hokuriku and Chugoku power companies to set a 5 percent power-saving target. This rate will be reduced to 4 percent for Chubu and Hokuriku power companies, while Chugoku Electric's target will be cut to 3 percent.

The three firms had been asked to observe the 5 percent energy-saving rate because they have to supply electricity to KEPCO.

No.4 reactor at Oi plant to restart very soon

July 11, 2012
No.4 reactor at Ohi plant to restart July 18th

http://www3.nhk.or.jp/daily/english/20120711_38.html

The operator of the Ohi nuclear plant in Fukui Prefecture, central Japan, says it aims to restart a second reactor at the facility next Wednesday.

The No.4 reactor at the plant has been shut down for routine inspections.

Kansai Electric Power Company said on Wednesday that it will lift the reactor's control rods on July 18th. It is expected to reach criticality the following morning.

The reactor is expected to start generating power on July 21st, and to reach full output capacity by July 25th.

The plant's No.3 reactor, which was restarted on July 1st, went into full-scale operation on Monday.

Reactor no. 4 at Ohi will restart whatever happens

July 16, 2012

Alarms go off during unit 4's restart in Oi

Kyodo
http://www.japantimes.co.jp/text/nn20120716x2.html#.UARbv5FIwpU

TSURUGA, Fukui Pref. — Alarms sounded Sunday evening and early Monday at the Oi nuclear power plant in Fukui Prefecture, raising doubts about efforts launched Wednesday to restart the second reactor since the Fukushima nuclear crisis erupted in March 2011.

Government officials ruled out any delay in the restart procedure.

The first alarm sounded around 6:20 p.m. Sunday, indicating a rise in pressure at a tank for reactor 4's primary coolant system. The second, which went off around 1:20 a.m. Monday, showed an auxiliary motor for the reactor's emergency diesel generator was malfunctioning, Kansai Electric Power Co. said.

But the Nuclear and Industrial Safety Agency said the incidents won't impact its restart schedule because the rise in pressure was marginal and the emergency generator is functioning normally, although its auxiliary motor may now be useless.

Reactor 4 is slated to be restarted Wednesday night, achieve criticality the next morning and return to full service four days later.

Here we go again

July 18, 2012

Ohi plant restarts second reactor
http://www3.nhk.or.jp/daily/english/20120718_34.html

Kansai Electric Power Company has restarted another reactor at its Ohi nuclear power plant in Fukui Prefecture, central Japan.

The utility started lifting control rods at the No.4 reactor at 9 PM on Wednesday in the presence of senior vice industry minister Seishu Makino.

Kansai Electric says that if things go as planned, chain reactions will begin on Thursday morning. It adds that the reactor will start generating power as early as Saturday and begin operating at full capacity next Wednesday.

The plant on the Sea of Japan coast is the only one operating in the country. The facility's No.3 reactor began full operation on July 9th.

Nuclear power generation resumed ahead of possible power shortages in the country this summer.

The government plans to remove the power-saving targets allocated to Chubu Electric, Hokuriku Electric, and Chugoku Electric when the No.4 reactor generates at full capacity.

Another reactor at Oi power plant to be reactivated Wednesday

http://mainichi.jp/english/english/newsselect/news/20120718p2g00m0dm042000c.html

TOKYO (Kyodo) -- The No. 4 reactor at the Oi nuclear power plant in Fukui Prefecture is due to be reactivated Wednesday night, becoming the second reactor to resume operation after regular checks since last year's Fukushima nuclear crisis.

The 1.18 million kilowatt No. 4 reactor is scheduled to begin power transmission on Saturday and commence full operation on July 25, further easing power constraints in western Japan.

Kansai Electric Power Co., the operator of the plant, reactivated the No. 3 reactor on July 1 and brought it to full operation on July 9, prompting the government to lower summer power-saving targets imposed for the service areas of four power suppliers in western Japan.

When the No. 4 reactor begins full operation, the government plans to remove power-saving targets for Chubu Electric Power, Hokuriku Electric Power and Chugoku Electric Power companies, while further easing the target for Shikoku Electric Power Co. from 7 percent to 5 percent. However, it intends to maintain the 10 percent target -- recently reduced from 15 percent -- for Kansai Electric.

The No. 4 reactor was idled on July 22 last year for regular checks. As in the case of the No. 3 reactor, Senior Vice Minister of Economy, Trade and Industry Seishu Makino will witness the No. 4 reactor's reactivation as part of the government's efforts to enhance monitoring of the plant's resumption amid

public concern over nuclear safety in the wake of the meltdown of three reactors at Tokyo Electric Power Co.'s Fukushima Daiichi plant.

Meanwhile, investigations into fault fracture zones, or soft earth layers, running under the Oi plant appear unavoidable as many members of an expert panel of the Nuclear and Industrial Safety Agency pointed to the risk posed by them at a meeting the same day.

Experts, including Toyo University professor Mitsuhisa Watanabe, said in June that the zones could move the surface of the ground by acting together with nearby active faults.

"We will immediately study countermeasures as experts' views are extremely important," an agency official said.

But Kansai Electric was more reserved, with an official saying, "We will make studies based on (experts') views."

Given the developments related to the plant's safety, some residents of the town of Oi in Fukui Prefecture seem puzzled by the moves to restart the facility's reactors.

A local man who runs a company said, "When building a nuclear power plant there, it must have been determined after consultations with experts that there was no problem. It is difficult to understand why they are saying now that a reinvestigation is necessary."

Members of the nuclear safety agency panel also called for investigations into Hokuriku Electric Power Co.'s Shika plant in Ishikawa Prefecture due to the possibility of active faults under the plant's No. 1 reactor unit.

In a related development, a group of residents of Kyoto and Shiga prefectures presented the Cabinet Office and the Ministry of Economy, Trade and Industry with around 23,000 signatures calling for the government to rescind its decision to allow the Nos. 3 and 4 reactors at the Oi plant to resume operation.

Before the reactivation of the No. 3 reactor, a group of protestors blocked a road leading to the plant, prompting local police to forcibly remove them.

No.4 reactor at Oi plant reactivated -What about checking for faults?

July 19, 2012

Kepco again fires up Oi plant's reactor 4

Probe the fault fracture zones under Fukui site: NISA panel

Kyodo
http://www.japantimes.co.jp/text/nn20120719a1.html#.UAgtHaBIwpU

Reactor 4 at the Oi nuclear plant in Fukui Prefecture was reactivated Wednesday night and became the second to be restarted since the Fukushima nuclear crisis began in March 2011.

The reactor, capable of generating 1.18 million kw, is scheduled to begin transmitting power Saturday and commence full operation July 25, further easing power constraints in western Japan.

Kansai Electric Power Co. reactivated the plant's reactor 3 on July 1 and brought it to full operation July 9, prompting the government to lower summer power-saving targets for the service areas of four power suppliers in western Japan.

When reactor 4 begins full operation, the government plans to remove power-saving targets for Chubu Electric Power, Hokuriku Electric Power and Chugoku Electric Power, while further easing the target for Shikoku Electric Power from 7 percent to 5 percent. However, it intends to maintain the 10 percent target — recently reduced from 15 percent — for Kansai Electric.

Reactor 4 was idled July 22, 2011, for regular inspections and maintenance. It also had to pass disaster-stress tests introduced in light of the Fukushima crisis.

As was the case with reactor 3, Seishu Makino, senior vice minister of economy, trade and industry, observed unit 4's restart as part of the government's efforts to enhance monitoring to ease the public outcry over the Fukushima nuclear crisis.

Meanwhile, investigations into fault fracture zones, or soft layers also known as crushed zones, running under the Oi plant appear unavoidable after several members of an expert panel of the Nuclear and Industrial Safety Agency pointed Tuesday to the risk they pose.

Experts, including Toyo University professor Mitsuhisa Watanabe, said in June that the zones could move the surface of the ground by acting together with nearby active faults.

"We will immediately study countermeasures as experts' views are extremely important," a NISA official said.
But Kepco was more reserved. "We will make studies based on (experts') views," an official with the utility said.
The conflicting responses appeared to puzzle Oi residents.

"When building a nuclear power plant there, it must have been determined after consultations with experts that there was no problem," said a local business owner. "It is difficult to understand why they are saying now that another investigation is necessary."

Members of the NISA panel also called for investigations into Hokuriku Electric Power Co.'s Shika plant in Ishikawa Prefecture due to the possibility of active faults under the now-idled plant's reactor 1.

In a related development, a group of residents of Kyoto and Shiga prefectures presented the Cabinet Office and METI with around 23,000 signatures calling for the government to rescind its decision to allow the two reactors at the Oi plant to restart.

Restarted Oi nuclear power reactor reaches criticality

http://mainichi.jp/english/english/newsselect/news/20120719p2a00m0na006000c.html

OI, Fukui -- The No. 4 reactor at the Oi nuclear power plant here reached criticality on the morning of July 19 after becoming the country's second nuclear reactor to have been restarted since all of Japan's 50 commercial reactors were halted in May.

Senior Vice Minister of Economy, Trade and Industry Seishu Makino and other officials were present in the plant's central control room when officials from plant operator Kansai Electric Power Co. (KEPCO) reported that the No. 4 reactor reached criticality at 6 a.m.

The No. 4 reactor was restarted the previous night at 9 p.m. for the first time in almost a year, with Makino, Fukui Vice Gov. Homare Mitsuda and Oi Town Vice Mayor Masaharu Tokioka present in the central control room. If inspections proceed smoothly, the reactor will resume power transmission on July 21 before operating at full capacity on July 25.

Because citizens from across the country had staged a protest near the plant in Oi, Fukui Prefecture, when the No. 3 reactor was reactivated on July 1, blocking the road leading to the plant, the government deployed riot police and patrol cars and checked vehicles on the road leading to the plant prior to the No. 4 reactor's restart on July 18. There were, however, no protests near the facility against the latest reactivation.

The government is poised to eliminate the energy-saving target set earlier for the service areas of Chubu Electric Power Co., Hokuriku Electric Power Co. and Chugoku Electric Power Co. once the No. 4 reactor at the Oi nuclear plant operates at full capacity. The energy-saving target will also be eased for the service area of Shikoku Electric Power Co. from 7 percent to 5 percent, while that for KEPCO's service area will be retained at 10 percent.

Meanwhile, the government's Nuclear and Industrial Safety Agency (NISA) ordered KEPCO and Hokuriku Electric Power Co. on July 18 to conduct additional surveys on the faults running directly under the premises of the Oi nuclear power plant and Shika nuclear power plant in Ishikawa Prefecture, respectively, to determine whether they are active faults or not. NISA indicated that it will withhold from making a final decision on the screening of the preliminary assessment on the safety of the No. 1 and No. 2 reactors at the Shika nuclear plant as part of the stress test on the facility until the results of the fault surveys are produced. The preliminary assessment has already been submitted to NISA.

NISA, however, said it will not demand the suspension of the No. 3 and No. 4 reactors at the Oi nuclear plant, which were reactivated earlier this month, during the additional fault surveys.

During an expert meeting at NISA on July 17, experts pointed out that the "S-1" fault running directly under the No. 1 reactor at the Shika nuclear power plant is highly likely to be an active fault. During the upcoming survey, the relationship of the S-1 fault with another fault running nearby will be examined, among other things.

NISA demanded that Hokuriku Electric and KEPCO submit their survey plans by July 25 and July 31, respectively. Those plans will be screened for their validity at an expert meeting later this month. Once they are approved, experts will also take part in on-site surveys of the faults.

Under the instruction of Economy, Trade and Industry Minister Yukio Edano, NISA will also examine to see how and why the possibility that the S-1 fault may be active had earlier been overlooked during the quake-resistance reappraisal of the No. 1 reactor at the Shika nuclear plant, which was conducted in accordance with a revision to the seismic-resistant design screening guidelines in 2006. NISA will interview officials who were in charge at the time and examine documents, while checking whether such a

possibility was also overlooked at other nuclear complexes. However, the construction permit for the Shika nuclear plant and other past safety screenings will not be reviewed.

As for the Oi nuclear power plant, some experts pointed out during a July 17 meeting that faults called "fracture zones" running under the plant's premises are "not active faults," but an additional survey was called for due to lack of relevant material.

Ishikawa Gov. Masanori Tanimoto released a comment, saying, "The fault to be subject to the (additional) survey had already been declared safe by the central government when the Shika nuclear plant was constructed. It is extremely regrettable that doubts have been raised for the fault, which undermines the public's confidence in the government's screening."

Oi Town Mayor Shinobu Tokioka hailed NISA's order that the "F-6" fracture zone running directly under the Oi nuclear plant be surveyed, saying, "I hope they will conduct a solid survey for the sake of residents' safety and security."

Danger of faults not severe enough to halt restart process, says S.Makino

July 20, 2012

Oi's reactor 4 achieves criticality

Kyodo
http://www.japantimes.co.jp/text/nn20120720a4.html#.UAkj_KBIwpU

FUKUI — Reactor 4 at the Oi nuclear power plant in Fukui Prefecture reached criticality Thursday morning following its reactivation the night before by Kansai Electric Power Co.

The 1.18-million-kw reactor is scheduled to begin generating and transmitting power Saturday after turbine checks, and reach full operation on July 25.

The reactor is the second to be brought back online since the use of nuclear power briefly ceased earlier this year. All commercial reactors were kept offline after regular checks as the Fukushima nuclear crisis

rekindled nuclear safety fears in March 2011. The first to resume operation was Oi's reactor 3, which resumed full operation on July 9.

When reactor 4 reaches full operation, the power-saving targets issued by Chubu Electric Power Co., Hokuriku Electric Power Co. and Chugoku Electric Power Co. are expected to be scrapped, and the target for Shikoku Electric Power Co. is expected to be cut from 7 percent to 5 percent. The target for Kepco, however, is expected to be kept at 10 percent, following an earlier reduction from 15 percent.

On Wednesday, the Nuclear and Industrial Safety Agency told Kepco to re-examine fault fracture zones, or soft earth layers, running under the Oi plant, after experts pointed out the earthquake risks the previous day.

Seishu Makino, senior vice minister of economy, trade and industry, said he does not believe the danger is great enough to justify halting the restart process.

Kepco reactivated reactor 4 at 9 p.m. Wednesday by extracting the control rods used to moderate the fission reaction in the core. As Makino watched, the utility began adjusting the control rods and the boron level in the primary coolant water through early Thursday until it achieved a self-sustaining fission reaction.

Reactor 4 was idled on July 22 last year for regular checks. After the government decided June 16 to restart it, the unit was tested with reactor 3 under a special monitoring regime hastily drawn up by the nuclear safety agency, Kansai Electric and the Fukui Prefectural Government so its reactivation could proceed despite regional opposition.

Oi No.4 starts transmitting power

July 21, 2012

Oi nuclear plant's No. 4 reactor begins generating power

http://mainichi.jp/english/english/newsselect/news/20120721p2g00m0dm018000c.html

TSURUGA, Japan (Kyodo) -- The No. 4 reactor at the Oi nuclear power plant in Fukui Prefecture started generating and transmitting electricity Saturday, its operator Kansai Electric Power Co. said.

Power transmission from the 1.18-million-kilowatt reactor will cover the Kansai area in western Japan and part of Fukui Prefecture along the Sea of Japan, the operator said, adding the reactor is expected to start full-capacity generation next Wednesday after gradually raising power output.

The reactor is the second to go back online after all of Japan's commercial reactors were taken offline for regular checks in the wake of the March 2011 nuclear accident at Tokyo Electric Power Co.'s Fukushima Daiichi plant in northeastern Japan. The first to resume operation was the Oi plant's No. 3 reactor which was brought to full operation on July 9.

When the No. 4 reactor begins full operation, the government will remove power-saving targets for Chubu Electric Power Co., Hokuriku Electric Power Co. and Chugoku Electric Power Co., while further easing the target for Shikoku Electric Power Co. from 7 percent to 5 percent. It is considering maintaining the 10 percent target -- recently reduced from 15 percent -- for Kansai Electric.

The No. 4 reactor was booted up Wednesday night and the following morning reached criticality -- the state at which a chain reaction of nuclear fissions becomes self-sustaining. Its operations were idled July 22 last year for a periodic checkup.

Oi 3 & 4 now both at full speed

July 25, 2012

Oi plant's No. 4 reactor starts capacity operation

http://mainichi.jp/english/english/newsselect/news/20120725p2g00m0dm025000c.html

FUKUI (Kyodo) -- The No. 4 reactor of Kansai Electric Power Co.'s Oi nuclear plant in Fukui Prefecture started full-capacity power generation early Wednesday to ease electricity shortages in western Japan, the operator said.

It is the second reactor to do so, following the plant's No. 3 reactor, after all of Japan's 50 commercial reactors were suspended gradually in the wake of the March 2011 nuclear disaster at Tokyo Electric Power Co.'s Fukushima Daiichi plant.

While the government has decided to restart the two reactors to ease electricity shortages, there are no prospects for any of the other 48 reactors resuming operation, leaving Japan's future electricity supply uncertain.

The government plans to inaugurate a new nuclear regulation body in September to take procedures to restart the remaining reactors.

The No. 4 reactor was reactivated on the night of July 18 for the first time in about one year, reached criticality for a self-sustaining chain reaction of nuclear fissions the following morning and began to transmit electricity Saturday.
The Oi Nos. 3 and 4 reactors' full operation is expected to nearly eliminate an estimated electricity shortage of 14.9 percent based on the peak 2010 consumption in Kansai Electric's service area including Osaka.

But the government plans to retain an electricity-saving target of 10 percent for the area set after the No. 3 reactor's start of full operation July 9, while lowering the target to around 5 percent for firms that feel affected seriously by the 10 percent restriction.

Instead, it plans to remove power-saving targets for three other utilities' service areas neighboring the Kansai Electric area. They are 4 percent power-saving targets for Chubu Electric Power Co. and Hokuriku Electric Power Co., and a 3 percent target for Chugoku Electric Power Co.

The three power companies are providing part of their electricity output to Kansai Electric to ease the supply crunch.
The government is also expected to ease the 7 percent target set for Shikoku Electric Power Co.'s service area to 5 percent.

The government plans to retain power-saving targets of 10 percent for the Kyushu Electric Power Co. area and 7 percent for the Hokkaido Electric Power Co. area due to tight electricity supply conditions there. No targets have been set for the areas served by Tokyo Electric Power and Tohoku Electric Power Co.

Since the government-requested power-saving period began July 2, electricity supply and demand conditions have been stable due to relatively low temperatures in Japan.

But utilities' electricity supply operations have been temporarily disrupted by glitches and for other reasons at some non-nuclear power plants. Furthermore, temperatures are expected to rise, raising the likelihood of increased power usage for air conditioning.

Ohi No.4 reactor working at full capacity
http://www3.nhk.or.jp/daily/english/20120725_01.html

The second reactor to resume operation in Japan after the nuclear accident in Fukushima is now generating power at full capacity.

Officials raised the output of the No.4 reactor at the Ohi nuclear plant in Fukui Prefecture, central Japan, at midnight on Tuesday after final safety checks.

The reactor reached its full capacity about one hour later on Wednesday morning. Senior vice industry minister Seishu Makino was at the plant's central control room to oversee the procedure.

The plant operator, Kansai Electric Power Company, restarted the No.4 reactor on July 18th.

Ohi's No.3 reactor resumed operation earlier this month and is running at full capacity.
The 2 reactors have the biggest output of those run by Kansai Electric, whose service area covers the country's second-largest city, Osaka.

Now that the 2 reactors are working at full swing, the government plans to lift the power-saving targets imposed on the service areas of 3 other utilities in central and western Japan.

These firms are supposed to supply electricity to Kansai Electric in the event of power shortages.

The government gave the go-ahead for Ohi's restart last month, saying its safety has been confirmed.

But a panel of experts is calling for a fresh survey of the underground cracks at the plant to check if they are active faults.

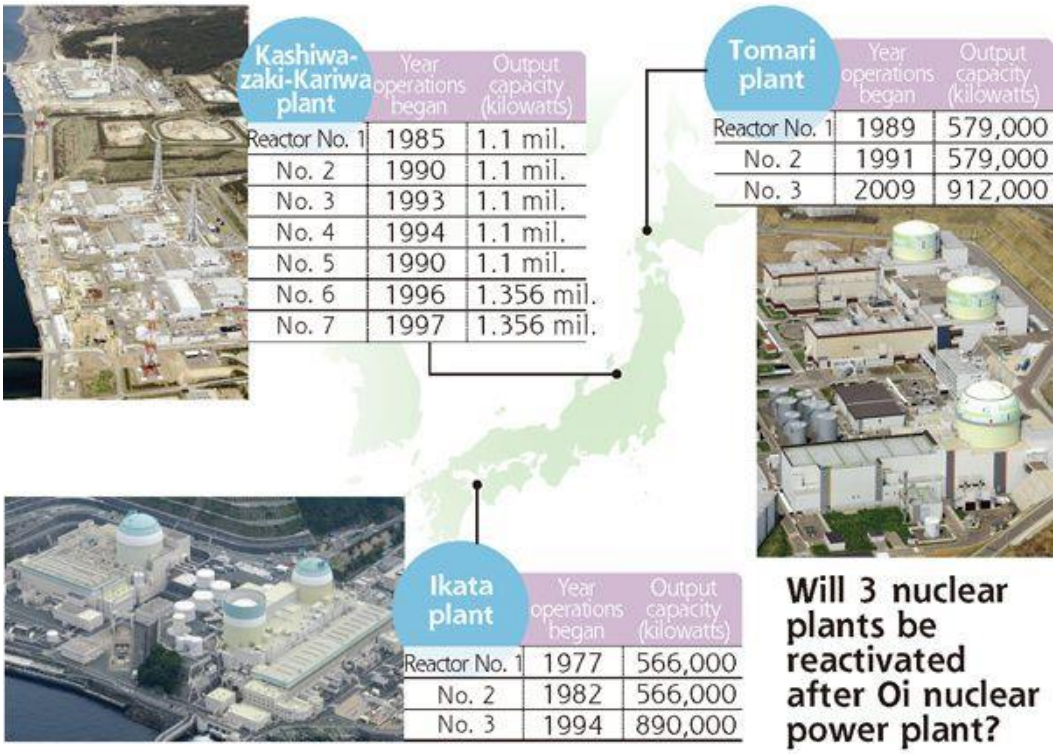
Three more facilities to be restarted?

July 26, 2012

3 N-facilities eyed following Oi plant restart / Process to bring Ikata, Tomari and Kashiwazaki-Kariwa reactors back online filled with hurdles

http://www.yomiuri.co.jp/dy/national/T120725005032.htm

Fumitsuki Funaki and Koichiro Shigematsu / Yomiuri Shimbun Staff Writers



Following the reactivation of Kansai Electric Power Co.'s Oi plant this month, the focus is now on whether to restart three other power facilities--Shikoku Electric Power Co.'s Ikata plant, Hokkaido Electric Power Co.'s Tomari plant and Tokyo Electric Power Co.'s Kashiwazaki-Kariwa plant.

The No. 4 reactor of the nuclear plant in Oi, Fukui Prefecture, reached full capacity at 1 a.m. Wednesday, which will greatly improve KEPCO's ability to meet power demand in its service area.

However, the road map for restarting the three other power facilities remains unclear.

Hokkaido faces the most serious challenge if the Tomari plant, which is hosted by Tomari village, is not restarted, as people in the region cannot live without heating in winter, when power demand peaks.

Hokkaido Electric Power has a total output capacity of 5.35 million kilowatts, excluding the Tomari plant. The maximum demand in the winter of fiscal 2010 was 5.79 million kilowatts, indicating a potential shortfall of 440,000 kilowatts.

Regarding the Oi plant, it took more than two months from the time the government asked for consent from local entities to when the reactors could be restarted.

For the Tomari plant to be reactivated by the start of next winter, discussions in Hokkaido over whether to allow the restart need to begin no later than September.

As personnel decisions for a new nuclear regulatory commission have been delayed, Hokkaido residents have complained the government must make progress more steadily.

On July 18, the Hokkaido government asked Hokkaido Electric Power to review the supply-demand situation for next winter.

The No. 3 reactor of Shikoku Electric Power Co.'s Ikata nuclear plant in Ehime Prefecture is seen as the next to be reactivated after the Oi plant.

This is because it is the only idle reactor to have its first-stage stress test results deemed appropriate by the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency.

Normal procedures, such as examination by the Cabinet Office's Nuclear Safety Commission, have effectively been shelved.

Ehime Gov. Tokihiro Nakamura criticized the central government's nuclear energy policy at a meeting of the National Governors' Association on July 19.

"Until the new regulatory commission is launched, members [of the existing commissions] should do their jobs," the governor said.

He made the remark partly because even if all thermal power plants operate at full capacity, the region's power supply reserve rate in August will be only 0.3 percent.

"If a thermal power plant is halted due to trouble, the negative impact on the economy and people's lives in the prefecture would be enormous," Nakamura said.

In the town of Ikata, which hosts the nuclear plant, regular inspections of the No. 2 reactor were completed this spring. Since then, inns and hostels in the area, which usually accommodate about 20,000 workers a year, have seen a steep drop in reservations.

In July, the town's commerce and industry union submitted written requests for the swift restart of the Ikata plant to the town government and assembly.

Kiyokichi Nakamoto, head of the union, said, "Restarting nuclear reactors whose safety has been confirmed can help protect the livelihoods of this town's residents."

Whether the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture is restarted will have a significant impact on TEPCO's business reform, as it tries to shoulder huge amounts of compensation over damage related to last year's nuclear crisis at its Fukushima No. 1 power plant.

Under TEPCO's special comprehensive business plan, which was approved by the government in May, reactors at the Kashiwazaki-Kariwa plant are to be restarted one after another starting next April.

If the reactors are not restarted, thermal power plant fuel costs will increase and TEPCO's business conditions will become even more difficult.

To avoid this situation, TEPCO Chairman Kazuhiko Shimokobe and President Naomi Hirose visited Niigata Gov. Hirohiko Izumida on July 13 in preparation for the restart.

However, the governor said, "It's impossible to discuss the restart before the cause of the Fukushima accident is clear."
Kashiwazaki and other municipalities in the prefecture are also cautious about restarting the plant, making it difficult to know when the plants can go back online.

In addition, there is a gubernatorial election in the prefecture slated for October and Kashiwazaki and Kariwa village mayoral elections for November, the results of which may make the restart more difficult.

Kansai in too much of a hurry to restart

July 26, 2012

Kansai Electric irks industry minister over nuclear reactor plan

http://mainichi.jp/english/english/newsselect/news/20120726p2g00m0dm057000c.html

TSURUGA, Japan (Kyodo) -- The president of Kansai Electric Power Co. displeased the energy minister Wednesday by expressing an intention to reactivate more nuclear power reactors following the recent restart of two reactors without sufficient coordination with the state government.

Kansai Electric Power President Makoto Yagi said the utility serving western Japan wants to see two reactors at its Takahama nuclear power station restarted now that two reactors at its Oi complex, both on the Sea of Japan coast in Fukui Prefecture, have gone into full operation.

But Economy, Trade and Industry Minister Yukio Edano, whose portfolio includes the electricity industry, said of Yagi's comments, "They are very unpleasant remarks."

Edano also said none of the reactors will be reactivated before their safety is thoroughly checked, urging utilities to await a judgment by a new nuclear regulation authority the government is trying to launch in September.

Yagi told reporters in the town of Oi, "We think Takahama's Nos. 3 and 4 reactors are the most promising."

"We intend to make adjustments with the state toward giving priority to their reactivation," he said, referring to the four-reactor plant in the town of Takahama.

Yagi said nuclear power is important in terms of energy security, climate change response and the economy, while expressing readiness to continue putting efforts into safe operations.

The Oi plant's No. 4 reactor started full-capacity power generation early Wednesday to help supply electricity to the Kansai region, being only the second reactor to do so following the plant's No. 3 reactor after all of Japan's 50 commercial reactors went offline by early May in the wake of the March 2011 nuclear disaster at Tokyo Electric Power Co.'s Fukushima Daiichi plant.

The judgment on whether to restart any of the remaining 48 reactors will rest with a nuclear regulation authority slated to be launched in September. **But with exact procedures for their possible restart yet to be worked out, it remains uncertain when or if any of them will get go online again.**

Senior Vice Minister of Economy, Trade and Industry Seishu Makino, who oversaw the restart at the Oi plant to help ease safety concerns, expressed a sigh of relief at the start of full-capacity generation at both reactors, saying, "I feel relieved to be able to provide electricity to the Kansai region in a stable manner."

Beginning Thursday, the government will remove power-saving targets for three other utilities' service areas neighboring Kansai Electric's, and ease the 7 percent target set for Shikoku Electric Power Co.'s area to 5 percent. But it will retain the electricity-saving target of 10 percent for Kansai Electric's service area.

Reactor still OK after 58 years!!

July 28, 2012

Nuclear agency deems aging No. 1 reactor at Genkai plant safe until 2033

http://mainichi.jp/english/english/newsselect/news/20120728p2a00m0na012000c.html

The Nuclear and Industrial Safety Agency (NISA) has deemed that the idled No. 1 reactor of the Genkai Nuclear Power Plant in Saga Prefecture, whose pressure vessel is feared to have deteriorated more than expected, will remain safe until 2033 -- **58 years after the start of its operations,** agency officials have announced.

NISA's view is inconsistent with the government's general policy of decommissioning nuclear reactors 40 years after the start of their operations for safety reasons. The assessment is expected to influence a review of the government's policy by a new nuclear power regulatory body that the government will launch in September.

Pressure vessels of nuclear reactors become fragile after being constantly exposed to neutrons generated through nuclear fission. In order to check the extent of deterioration, nuclear plant operators insert test specimens made of the same materials into such vessels, and take them out and examine them during regular inspections to ascertain the so-called "fracture appearance transition temperature." An extremely high temperature raises the risk of the vessels being damaged if water is injected in the event of an accident.

Kyushu Electric Power Co., the operator of the Genkai nuclear plant, checked the test specimens in the its No. 1 reactor's pressure vessel in 2009 and confirmed that the fracture appearance transition

temperature was 98 degrees Celsius, about 14 degrees higher than the estimated level, and the highest figure observed in Japan -- raising questions about the safety of the vessel.

In response, NISA's panel of experts began to examine the safety of the vessel in November last year. Experts precisely examined the specimens using an electronic microscope, and concluded that the vessel is still safe.

The inner wall of the reactor pressure vessel is farther from the reactor core than the spot where the specimens are placed, and is therefore exposed to fewer neutrons. Because of this, it deteriorates at a slower pace than that of the specimens, according to NISA officials.

The experts deemed that the No. 1 reactor's pressure vessel would not deteriorate to the extent of its specimens being damaged by water injection until around 2033 -- 58 years after it began operations in 1975.

Setbacks at Hamaoka

July 31, 2012

Construction of tsunami defenses delayed at Hamaoka nuke plant

http://mainichi.jp/english/english/newsselect/news/20120731p2a00m0na009000c.html

NAGOYA -- Chubu Electric Power Co. announced July 30 that construction of tsunami defenses at its suspended Hamaoka Nuclear Power Plant in Shizuoka Prefecture will be delayed by a year, pushing the completion date back to December 2013.

The rescheduling is the result of unforeseen difficulties in installation work, including the installation of emergency power equipment. The total cost of construction is expected to remain unchanged at about 14 billion yen.

"Reactivation (of reactors at the plant) will be delayed because of this, and it will be quite tough on finances," the utility's president, Akihisa Mizuno, told a news conference.

After construction is completed, the utility hopes to win understanding from local bodies and other related parties in restarting reactors at the plant. However, as a result of the setback, the schedule for restarting the reactors remains in doubt.

Power company officials said that delays had been seen in the installation of a platform 40 meters above sea level for gas turbine power generators, and an emergency seawater intake facility next to the reactor buildings. Officials said that the spot where the platform was being installed was narrow, and cables for the water intake facility and generators were getting tangled.

Construction of a seawall standing 18 meters above sea level -- a main feature of the tsunami defenses -- would be completed as scheduled in December 2012, officials said.

Oi, Oi

August 17, 2012

Ohi No.4 reactor begins commercial operation

http://www3.nhk.or.jp/daily/english/20120816_38.html

Another reactor at the Ohi nuclear power plant in central Japan has returned to full commercial operation.

The reactor had been in test-run mode since operator Kansai Electric Power Company began to generate power at full capacity on July 25th.

Japan's Nuclear and Industrial Safety Agency told the utility on Thursday that the No.4 reactor is operating safely after completing a final 2-day check on the facility.

Last month, the plant's No.3 and No.4 reactors became the nation's first to resume operation since the Fukushima accident. The reactors had been shut down for routine inspection.

Kansai Electric is allowed to run the reactors for up to 13 months, until September next year, when regular inspection begins again.

But, experts have urged the utility to carry out a fresh survey of underground cracks near the plant to check whether they are active faults.

The company plans to reassess the potential risks of the faults by drilling the ground. It will submit a report to the government by the end of the year.

A referendum to decide on Hamaoka's restart?

August 28, 2012

Shizuoka governor supports idea for referendum on restart of Hamaoka nuke plant

http://mainichi.jp/english/english/newsselect/news/20120828p2a00m0na008000c.html

SHIZUOKA -- Shizuoka Gov. Heita Kawakatsu has expressed his support for the establishment of an ordinance to hold a referendum over whether to restart the Hamaoka Nuclear Power Plant in the prefecture, which has been suspended following the Fukushima nuclear disaster.

The move came after a citizens group called "Genpatsu Kenmin Tohyo Shizuoka" (Referendum over a nuclear plant in Shizuoka) filed a direct petition with the governor on Aug. 27, demanding the introduction of the referendum ordinance and handing him 165,127 signatures the group collected.

"Signatures of 160,000 people mean a lot. I will strive to implement the referendum," said Kawakatsu during a regular press conference that day.

The governor is expected to propose the ordinance to the Shizuoka Prefectural Assembly in September. The assembly's largest faction, Jimin Kaikaku Kaigi, and the second largest group, Minshuto Fujinokuni Kengidan, have not decided whether to approve the initiative.

"I was really surprised that the governor has upheld the ordinance as I had thought that he was against a referendum," said Nozomu Suzuki, representative of the citizens group, during a press conference following the direct petition. "I want the prefectural assembly to take the governor's decision seriously and pass the ordinance bill."

The Hamaoka nuclear plant, located in the prefectural city of Omaezaki, is the only nuclear power station run by Chubu Electric Power Co. Its operation has been suspended since May last year following the central government's request out of consideration for potential quake damage.

After the nuclear crisis at the Fukushima No. 1 Nuclear Power Plant broke out in March 2011, citizens groups in the city of Osaka and Tokyo filed direct petitions for referendums over nuclear power, but the Osaka mayor and the Tokyo governor disapproved of the initiatives, with the Osaka Municipal Assembly and the Tokyo Metropolitan Assembly voting down the ordinance bills, respectively.

A referendum for Hamaoka?

September 19, 2012

Shizuoka Gov. seeks referendum on whether to restart nuclear plant

http://mainichi.jp/english/english/newsselect/news/20120919p2g00m0dm022000c.html

SHIZUOKA (Kyodo) -- Shizuoka Gov. Heita Kawakatsu on Wednesday submitted an ordinance bill to the prefectural assembly calling for a referendum on whether to restart the suspended Hamaoka nuclear power station.

The move came after a civic group collected a total of 165,127 signatures to urge the prefectural government to enact an ordinance to hold a nonbinding referendum on the restart of the plant on the Pacific coast.

The Hamaoka complex in Omaezaki is known to be standing on an assumed epicenter area for a massive earthquake.
The proposal will be discussed and voted on at a plenary session of the assembly on Oct. 11.

Kawakatsu had been negative on holding a plebiscite on the issue but changed his stance after seeing the petition, saying, "The nuclear power plant is an attention-grabbing matter. I fully understand" people's wish to express their opinions.

People's bids in Tokyo and Osaka for similar referendums were rejected by their respective assemblies.
The Hamaoka plant, operated by Chubu Electric Power Co., has been suspended since May last year at the government's request in the wake of the March 2011 accident at the Fukushima Daiichi nuclear plant.

Wait for new standards

September 20, 2012
No restart for nuke reactors until new standards drawn up: Regulation chief

http://mainichi.jp/english/english/newsselect/news/20120920p2a00m0na008000c.html

No additional nuclear reactors will be restarted in Japan until new regulatory standards are drawn up sometime after next spring, the chief of the newly launched Nuclear Regulation Authority (NRA) said on Sept. 19.

NRA Chairman Shunichi Tanaka made the statement during a press conference on the NRA's inauguration in Tokyo the same day, saying, "It is impossible to give the green light until we finish reviewing the current provisional standards (for reactivating reactors)."

Tanaka's remarks suggest that 48 nuclear reactors across the country -- whose operations have been suspended for regular inspections and other reasons -- will not be restarted within fiscal 2012 as it is expected to take around 10 months for the NRA to formulate new regulatory standards. The remaining two reactors -- the No. 3 and No. 4 reactors at the Oi nuclear plant in Fukui Prefecture -- have already been reactivated, drawing harsh criticism from the public still reeling from last year's Fukushima nuclear disaster.

"The Oi nuclear plant was restarted based on political judgment, out of consideration for energy supply and demand during the summer. The provisional standards are incomplete, allowing the plant to be restarted with no disaster-prevention measures in place," Tanaka said, criticizing the government's hasty decision for the restart.

The NRA has begun reviewing the framework of the current standards, including stress tests on nuclear reactors. Regarding whether the 40-year cap on the operation of reactors will be extended by 20 years, Tanaka said, "It will be considerably difficult." However, he stopped short of clarifying whether the No. 1 and No. 2 reactors at the Mihama nuclear plant and the No. 1 reactor at the Tsuruga nuclear plant -- both more than 40 years old -- should be decommissioned. "I can't make any prejudgment," he said.

The NRA is adopting a so-called "backfit system" in judging whether reactors under construction -- including the No. 3 reactor at the Shimane nuclear plant -- meet the new regulatory standards while allowing their construction to continue. If those reactors -- as well as other existing reactors -- fail to meet the new criteria, the NRA will suspend their operations.

"The most important thing is to recover confidence in the nuclear safety administration, which has reached rock-bottom," Tanaka said during the NRA's inauguration ceremony.

New safety standards before any restart

September 22, 2012
No more reactors likely to go online until next year: NRA
http://www.japantimes.co.jp/text/nn20120922a7.html

By KAZUAKI NAGATA
Staff writer

The newly launched Nuclear Regulation Authority suggested Friday that reactor restarts will be on hold at least until next year because it needs about six months to draft new safety standards.

This means the nation will have to pass the winter without atomic energy, except for two reactors at the Oi nuclear plant in Fukui Prefecture, the only reactivations to date since the triple meltdowns in Fukushima in March 2011.

In an interview published Friday by the Nikkei Shimbun, NRA chief Shunichi Tanaka said drawing up the safety regulations will take time.

Hideka Morimoto, a spokesman for the new nuclear watchdog, concurred, saying, "We want to draft them as soon as possible, but we have to review a lot of things so it will be a tough job."

The NRA, which was launched Wednesday, is required by law to come up with new safety measures within 10 months.
Under the regulatory system overseen by its predecessor, however, the 10 regional utilities were required to check the ability of reactors to withstand quakes and tsunami through stress tests introduced in response to the disaster at the Fukushima No. 1 nuclear plant.

The first stage of the tests examined the possibility of natural disasters damaging reactor cores, while the second stage gauged how much radioactive fallout might be discharged into the environment by such events. Reactors had to pass the first stage to be considered for reactivation, and results for 30 reactors were submitted before the NRA was launched.

It is unclear what will happen to that requirement under the new watchdog. Morimoto said the NRA has yet to decide how the results of stress test will be reflected in its new safety standards.

Public hearings and no immediate restart

September 26, 2012

NRA chief: 'No plant restarts before summer'

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120925003804.htm

There will be no additional restarts of the nation's nuclear facilities until at least next summer following the reactivation in July of the Nos. 3 and 4 reactors at the Oi nuclear power plant in Fukui Prefecture, remarks by the chief of the newly launched nuclear safety watchdog indicated.

In an exclusive interview with The Yomiuri Shimbun on Monday, Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said the NRA plans to finish working out the outline of safety rules before the end of this fiscal year as a precondition for resumption of reactor operations.

It will take considerable time to finalize the envisioned safety rules, which Tanaka said will be preceded by about two months of public hearings on the outline.

The remarks by the head of the NRA, which was inaugurated on Sept. 19, appear to indicate reactor safety screening by the NRA, based on the new reactivation rules, will not happen before the summer of 2013.

According to the law for establishing the NRA, the task of working out new nuclear safety rules must be completed within 10 months of its launch, or by July next year.

Tanaka said the NRA is determined to undertake a radical review of existing safety standards.

"Such tasks as drawing up countermeasures against severe nuclear accidents and [deciding] how to deal with possible active faults beneath nuclear facilities will take a lot of time. I think the time frame is very tight," he noted.

Regarding criteria to judge whether to restart reactors, the NRA chief stressed the regulatory body will dedicate itself exclusively to scientific evaluations. It will not consider issues such as future electricity supply and demand or utilities' difficulties stemming from idle reactors, Tanaka said.

He also made it clear the NRA--in working out its safety standards--will not take into account the stress tests the Democratic Party of Japan administration imposed on utilities as prerequisites to restart reactors after the Great East Japan Earthquake.

"Our criteria to judge whether a reactor should be considered safe will be made independently of the stress tests the government adopted before the launch of the NRA," he said.

Tanaka brushed off Prime Minister Yoshihiko Noda's statement on the role of the NRA to the effect the authority is supposed to "play a leading role" in making decisions on restarting reactors.

"Making such decisions is not our duty, that is up to the government, in particular, the Economy, Trade and Industry Ministry's Natural Resources and Energy Agency," he said, emphasizing **the NRA will concentrate exclusively on objective safety screening.**

The NRA will make no specific efforts to obtain the public's acceptance of restarting reactors, which Tanaka said should be undertaken by government organizations concerned.

Regarding radiation-related health issues involving residents in areas around Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, Tanaka said the NRA will produce its proposal by the year-end.

Will J-Power finish Ohma plant?

September 29, 2012
Japan's 1st recycled-fuel plant
http://www3.nhk.or.jp/daily/english/20120928_37.html

A Japanese power company plans to finish building Japan's first nuclear power station to run exclusively on recycled fuel, a mixture of plutonium extracted from spent fuel and uranium.

J-Power's plant in Ohma Town, Aomori Prefecture, would have a maximum power output of 1.38 million kilowatts, the most in Japan.

The firm began building the plant in 2008 but stopped after the Fukushima nuclear accident last year. The facility is nearly 40 percent complete.

J-Power initially aimed to start operating the plant in November 2014, but told the government in March that the start date was undecided.

Ohma Town still supports the construction even after the accident.

But Hokkaido's Hakodate City, located 20 kilometers from the town, has asked the central government that the project be suspended indefinitely. A group of Hakodate citizens has filed for a court injunction to stop the project.

Hakodate Mayor Toshiki Kudo said at a hastily arranged news conference on Friday that the city will never approve resuming the construction.

Kudo said J-Power told him that a senior official will visit Hakodate next Monday to explain the matter. He suggested that he will renew the city's request.

He added that the city is considering filing a lawsuit if J-Power goes ahead with its plan.

J-Power may resume building nuke plant

Utility hopes to restart work at Aomori facility

http://www.japantimes.co.jp/text/nb20120929a1.html

Kyodo

J-Power plans to resume construction of its nuclear plant in Aomori Prefecture this year, sources close to the matter said Friday, which would make it the first utility to do so since the Fukushima nuclear crisis.

The plan by the company otherwise known as Electric Power Development Co. is consistent with government policy but will be controversial.

Under the new national energy strategy the Cabinet weakened earlier this month, a nuclear power phaseout is to be pursued and new reactors are not to be built.

But trade minister Yukio Edano said that incomplete nuclear plants that were already under construction at the time of the Fukushima disaster would not be categorized as new.

The sources said that J-Power officials will visit Aomori on Monday to discuss the issue. The plant is being built in the city of Oma.

The move is certain to stir controversy among local and prefectural governments, and Hokkaido leaders have called for work on the facility to be suspended.

J-Power started building the plant, which is to have an advanced boiling water reactor, in May 2008 with the goal of bringing it online by November 2014.

The work, about 40 percent completed, was suspended because of the Fukushima nuclear crisis.

The utility does not need government permission to resume construction.

The Oma complex and two other reactors elsewhere in Japan were approved for construction by the government before the Fukushima crisis started in March 2011.

Restart of Ohma plant

October 1, 2012

Construction resumes at Oma nuclear plant in conflict with gov't policy

People protest the resumption of construction of the Oma Nuclear Power Plant, at a park in the Chiyogadai district of Hakodate, Hokkaido, on Sept. 30. (Mainichi)

http://mainichi.jp/english/english/newsselect/news/20121001p2a00m0na021000c.html

OMA, Aomori -- Electric Power Development Co. (J-Power) has resumed construction of its Oma Nuclear Power Plant following a suspension of work in the wake of the Fukushima nuclear disaster, the company announced on Oct. 1.

J-Power President Masayoshi Kitamura announced the move at a special Oma town council committee meeting. It is the first time for construction of a nuclear power plant to resume since the nuclear disaster triggered by the March 11, 2011 Great East Japan Earthquake and tsunami.

Completion of construction would enable the plant to run until the 2050s. This conflicts with the government's policy of abandoning nuclear plants by the end of the 2030s, and the construction is likely to stir controversy. Kitamura said the company would present a detailed construction schedule in the future.

"Government policy has provided clear stipulations on power plants under construction," he said.
Oma Mayor Mitsuharu Kanazawa said he was "very relieved" over the announcement.

Kitamura also visited the adjacent municipality of Kazamaura, where mayor Koichi Iida grilled him about evacuation in the event of a combined natural- and nuclear-plant disaster.

Hakodate, Hokkaido Prefecture, located on the coast opposite Oma and 23 kilometers away from Oma at its nearest point, is calling for an indefinite halt to the plans. Kazamaura, too, is hesitant over the resumption of construction, partly because evacuation routes have not been established.
Construction of the Oma Nuclear Power Plant began in May 2008 and 37.6 percent of the work is finished. Industrial minister Yukio Edano has said that "there will be no change" in the permission given for plants already under construction.

Nuclear plant construction to resume in Japan
http://www3.nhk.or.jp/daily/english/20121001_31.html

A Japanese power company says it will resume the construction of a nuclear power plant. This is the first such move in the country since last year's nuclear accident at Fukushima.

President Masayoshi Kitamura of the Electric Power Development Company, or J-Power, announced the decision on the Ohma plant in Aomori Prefecture on Monday.

Kitamura told a special session of the Ohma town assembly that his company decided to restart the project because of the government's recent clarification of its stance on uncompleted nuclear plants.

The assembly members welcomed the decision.

J-Power also dispatched officials to Hakodate City in Hokkaido to explain the decision. The city is located about 20 kilometers from the plant and is against the project.

Hakodate Mayor Toshiki Kudo told the officials that his city will never accept the decision, because the Ohma project received government approval based on criteria set before the Fukushima accident.

Kudo told reporters that the city will take legal action to stop the project.

J-Power began building the plant in 2008 but stopped after the Fukushima accident. The facility is nearly 40 percent complete.

Public protest in Ohma

Public disapproval: Protesters show their displeasure with the resumption of work to build J-Power's nuclear power plant in Oma, Aomori Prefecture, on Monday. KYODO

Work resumes at Oma nuclear plant

J—Power boss visits, explains situation to local communities

http://www.japantimes.co.jp/text/nn20121002a4.html

Kyodo

Electric Power Development Co. (J-Power) said Monday it has resumed construction of a nuclear plant in Aomori Prefecture, becoming the first utility to do so since the disaster at the Fukushima No. 1 complex last year.

Speaking in the town of Oma, site of the construction project, J-Power President Masayoshi Kitamura said he expects the plant's start to be delayed for at least about 18 months from the initially planned November 2014.

To explain the decision to resume the work, Kitamura visited Oma, located at the northernmost tip of Honshu, and two adjacent villages. He told reporters Monday that the three municipalities accepted the company's decision.

The government is allowing utilities to finish building reactors that have already been approved.

The decision is controversial, seeming to contradict another government plan to phase out nuclear power generation by the 2030s and forbid construction of new plants under an energy strategy worked out in September.

"Given that it has become clear how nuclear plants in the process of construction should be handled, we have decided to resume construction work with the understanding of locals," J-Power said in a statement.

Economy, Trade and Industry Minister Yukio Edano told a news conference in Tokyo that it is up to the operator to decide to resume the work, but he added that the new nuclear regulatory commission will check the safety of the plant before it goes into operation.

The Oma plant, which J-Power started building in May 2008, was slated to open in November 2014. The Fukushima crisis halted construction when it was about 40 percent complete.

The plant will house an advanced boiling-water reactor, with plans to use plutonium-uranium mixed oxide (MOX) fuel, which contains plutonium extracted from spent fuel.

"The plant will be highly safe and reliable, using the most advanced technology," the company said in the statement.
Local governments in Aomori Prefecture have called for construction of the plant to continue.

Mitsuharu Kanazawa, the mayor of Oma, said he is "extremely relieved" that the utility will resume the project, which will create jobs for the town.

But the city of Hakodate, Hokkaido, which lies within a 30-km radius of the plant, separated by a strait, is against the plan.

Sumitomo worker freed

Kyodo

JAKARTA — A Japanese employee of trading house Sumitomo Corp. and his Indonesian driver were briefly abducted Saturday on Java Island by local residents opposed to a power plant project, police and people affiliated with the project said.

The Sumitomo employee is connected with the project to build Indonesia's largest power plant. The pair, who were not injured, were rescued by the police about five hours later, they said.

The Japanese employee, who was on a business trip from Japan, and the driver were abducted Saturday afternoon while visiting a village in Batang in north-central Java, police said, adding they were taken to a private residence.

The protesters threw rocks at the police, who responded with warning shots and tear gas. The vehicle in which the man was riding was destroyed, and the police temporarily detained some of the protesters.

Public protest in Ohma (2)

October 2, 2012
Hakodate mayor to file suit demanding halt to construction of nuke plant

Citizens group members call for a suspension of the resumption of construction of the Oma Nuclear Power Plant, in this picture taken in front of the Hakodate Municipal Government office in Hakodate, Hokkaido, on Oct. 1. (Mainichi)
http://mainichi.jp/english/english/newsselect/news/20121002p2a00m0na014000c.html

HAKODATE, Hokkaido -- The mayor of this city has announced a plan to file a suit demanding the suspension of the construction of the Oma Nuclear Power Plant, which lies only 23 kilometers away from this exotic port city.

Hakodate Mayor Toshiki Kudo made the announcement on Oct. 1, after Electric Power Development Co. (J-Power) announced a resumption of the construction of the plant in Oma, Aomori Prefecture, earlier the same day. The construction had been suspended following the disaster at the Fukushima No. 1 Nuclear Power Plant in Fukushima Prefecture in March last year.

Local governments neighboring Hakodate are also opposing J-Power's move, prompting the issue to extend beyond the Tsugaru Straits between mainland Honshu, where Aomori Prefecture is located, and Hokkaido.

J-Power President Masayoshi Kitamura visited the Aomori Prefecture village of Kazamaura, adjacent to the town of Oma, on Oct. 1, but Kazamaura Village Mayor Koichi Iida expressed displeasure, saying, "I didn't expect J-Power would come here this hastily. We haven't approved of the construction yet."

The village has demanded that J-Power prepare evacuation routes in case of a nuclear disaster as a prerequisite for restarting the plant's construction. However, no progress has been made on such routes, nor has the location of an off-site center to serve as a base in the event of a nuclear disaster been determined yet. "If the village is cut apart by tsunami or other disasters, where can we escape to?" questioned Mayor Iida.

Meanwhile, J-Power Managing Director Toshifumi Watanabe visited Hakodate, where he told Mayor Kudo, "As a plant operator, we have secured enough evidence to support a resumption of the construction."

However, Kudo demanded an indefinite freezing of the construction, arguing that the reason for building a new nuclear plant is unclear; no briefings have been held for residents in southern Hokkaido; and that the mayor is concerned about possible damage to local tourism and the fishing industry due to harmful rumors in case of a nuclear accident.

The city of Hakodate will fall under the Urgent Protective Action Planning Zone (UPZ) within a 30-kilometer radius from the Oma plant in case a disaster hits the nuclear complex. At a press conference following their meeting, Mayor Kudo said, "I'm considering filing a suit if construction gets into full swing, in order to protect the safety and security of our citizens." If filed with a court, the lawsuit will be the nation's first for a local government to demand the suspension of a nuclear power station.

The mayors of neighboring municipalities also voiced concern about a resumption of the plant's construction. Hokuto Mayor Toshimine Takaya said, "We, along with the city of Hakodate, will call on the company to freeze the construction," while Nanae Town Mayor Yasukazu Nakamiya said, "They've learned nothing from the lessons of the Fukushima nuclear disaster."

J-Power Vice President Minoru Hino visited the Hokkaido Prefectural Government and sought understanding for the construction, saying, "We've made a comprehensive decision as a company." However, Hokkaido Vice Gov. Kenichiro Tada counter-argued, saying, "The decision to restart the construction is extremely regrettable. Our awareness toward the safety of nuclear plants has changed a great deal in the aftermath of the Fukushima nuclear crisis."

Not our job

October 3, 2012

NRA: No judgment on reactors resumption
http://www3.nhk.or.jp/daily/english/20121003_29.html

The head of Japan's new Nuclear Regulation Authority, or NRA, says his authority will not make judgments on whether currently idled nuclear reactors should be allowed to be restarted after safety checks.

Shunichi Tanaka told reporters on Wednesday that the NRA should be in a position to enforce scientific and technical regulations and check whether nuclear plants satisfy safety standards.

Tanaka noted that his authority is responsible only for judgments on nuclear safety.

He added that plant operators and the state government should take on the task of deciding on the resumption of reactors and building consensus with local communities.

The NRA is expected to provide an outline of new safety standards by next March as a precondition for restarting halted reactors.

New guidelines raise new questions

October 4, 2012

New nuclear disaster guidelines raise hurdles for nuke plant reactivation

http://mainichi.jp/english/english/newsselect/news/20121004p2a00m0na013000c.html

The new nuclear disaster guidelines released by the Nuclear Regulation Authority (NRA) largely expanded the municipalities to fall under anti-disaster measures from 45 to 135 cities, towns and villages, raising hurdles for the reactivation of nuclear plants that require local permission.

The NRA released the new guidelines on Oct. 3 and they presuppose that "nuclear accidents could happen," according to an NRA member. Under the latest guidelines, the number of municipalities subjected to disaster prevention measures was raised from 45 in 15 prefectures to 135 in 21 prefectures. Because power companies are required to gain understanding from local municipalities surrounding nuclear plants before reactivating reactors, the new guidelines apparently made it more difficult for early plant restarts.

Meanwhile, areas that had thus far been free from nuclear disaster prevention are now faced with the need to pursue measures for resident evacuation and other steps, leaving some municipalities at odds.

"We have yet to examine where and how all our residents would be evacuated," said an official with the Ibaraki Prefectural Government's nuclear safety measures department. The prefecture hosts the Tokai No. 2 Power Station, whose Urgent Protective Action Planning Zone (UPZ) is home to some 930,000 residents -- the nation's largest.

According to an estimate by the Ibaraki Prefectural Government, the 7,080 buses registered in the prefecture can only transport up to 240,000 people. The prefectural government also envisages evacuation using private cars but is faced by a mountain of challenges including traffic jams.

The Tokai Municipal Government has repeatedly asked the Ibaraki Prefectural Government to "take the initiative in deciding where to evacuate residents as it is expected to become an extensive evacuation," whenever information exchange meetings were held between village and prefectural officials in charge.

In June, the Ibaraki Prefectural Government organized a study meeting at its office inviting representatives from 14 cities, towns and villages that will fall under the UPZ in case of a nuclear accident at the Tokai No. 2 Power Station.

The UPZ surrounding the Hamaoka Nuclear Power Station in Shizuoka Prefecture -- which has been under suspension at the government's request in the wake of the Fukushima nuclear disaster -- hosts some 740,000 residents.

"We still can't specifically designate the UPZ and draw up concrete evacuation methods because the central government hasn't presented us with the results of radioactive material diffusion simulations," said Kunihiko Sugiura, head of the nuclear safety measures department at the Shizuoka Prefectural Government. The prefectural government is also faced with challenges including the relocation of an off-site center from the current location only about 2.3 kilometers away from the Hamaoka plant to somewhere else.

Kyoto Prefecture, which is only 4.4 kilometers away from the Takahama nuclear power plant in Fukui Prefecture and has thus heretofore formulated disaster-prevention measures with the UPZ in mind, is apparently upset with the central government's delayed initiatives. The prefectural government is waiting for the central government to come forward with radioactive material diffusion simulation results before deciding where to evacuate residents in the event of a nuclear disaster at the Takahama plant.

Specifically, the city of Kyoto -- which falls under a 30-kilometer radius from the Oi nuclear power plant in Fukui Prefecture and is the nation's only government-designated major city to fall under the UPZ -- mapped out a provisional plan on the city's nuclear disaster responses in March. On Sept. 1, the city conducted radiation dosimetry tests on residents near the UPZ. "The central government should make decisions with a greater sense of urgency," complained Fujio Yoshida, head of the crisis control department at the Kyoto Prefectural Government.

Shiga Prefecture, which is only 13 kilometers away from the Tsuruga nuclear plant in Fukui Prefecture, used to be ineligible to receive information from the System for Prediction of Environmental Emergency Dose Information (SPEEDI) under the former government guidelines. While the prefectural government used to predict the extent of radioactive material diffusion on its own and designated areas up to 43 kilometers away from the Tsuruga plant as falling under the UPZ, the new guidelines allow the prefecture to receive SPEEDI information. The prefectural government is planning to combine its own projections and data from SPEEDI in demanding the central government to take fiscal measures for preparing protective equipment and iodine tablets.

Power supply situation may sway gov't decision to restart

October 4, 2012

Gov't may judge resumption of reactors to be unnecessary: spokesman

http://mainichi.jp/english/english/newsselect/news/20121004p2g00m0dm008000c.html

TOKYO (Kyodo) -- The government may not back the restart of nuclear reactors even if they are judged to be safe by the nation's new regulatory body, **depending on the power supply situation**, Chief Cabinet Secretary Osamu Fujimura said Wednesday.

"The problem of power supply and demand will naturally crop up. The government may decide it is unnecessary (to restart reactors)," the top government spokesman said, suggesting the government will exercise its discretion on the reactivation issue that has become highly controversial since the disaster at the Fukushima Daiichi nuclear complex last year.

Uncertainty has arisen over who is the main actor in making judgments on the issue following a recent revamp of the country's nuclear regulatory framework, with Prime Minister Yoshihiko Noda saying the new Nuclear Regulation Authority will play "a leading role" but the regulatory body objecting.

During its regular meeting Wednesday, the NRA took up the issue and reached a consensus that its mission is to assess the safety of reactors from a scientific standpoint and not to make judgments on reactivation.

Noting that electricity supply and demand, and economic aspects should be taken into account when rebooting reactors, commission head Shunichi Tanaka said, "Government offices in charge of energy policy as well as plant operators should make the decision on activating reactors and reach a consensus with local people."

Another member of the NRA said clearing the safety assessments carried out by the authority is a "necessary condition" for reactivation but "not a sufficient condition."

The regulatory commission also unveiled at its meeting a rough draft of new guidelines for nuclear disaster mitigation measures, including expanding areas that should make special preparations from the current radius of 10 kilometers from a plant to 30 km.

Under the draft guidelines, to be compiled later this month, the number of prefectures to be designated as such areas will increase to 21 from 15, officials of the authority's secretariat said.

The draft also notes the need to be fully prepared for accidents that result in the massive release of radioactive substances due to hydrogen explosions that may damage reactor containers and the buildings housing the reactors.
Regarding the distribution of iodine tablets to help prevent thyroid cancer among residents living close to nuclear plants, the draft says, "Organizations closer to the residents should issue instructions."

The recommendation is based on the experience of the Fukushima crisis, in which the distribution of iodine tablets was limited due to delayed action by the central government.

So many contradictions

October 4, 2012

Editorial: Resumption of construction on Oma nuclear plant contradicts zero-nuclear policy

http://mainichi.jp/english/english/perspectives/news/20121004p2a00m0na001000c.html

The resumption of construction work on the Oma Nuclear Power Plant in Aomori Prefecture contradicts with the government's policy of eliminating all nuclear plants by the 2030s.

Economy, Trade and Industry Minister Yukio Edano has given the green light to the resumption of the work, which had been suspended since the outbreak of the crisis at the tsunami-stricken Fukushima No. 1 plant.

In addition to an end to Japan's reliance on atomic power, the government's Innovative Strategy for Energy and the Environment stipulates that nuclear reactors must be decommissioned after 40 years in operation and that no more nuclear plants must be build in principle.

If the Oma plant is put into operation in accordance with these principles, Japan cannot achieve its goal of eliminating nuclear power by the 2030s. The explanation that the construction of the Oma nuclear plant, which had begun before the strategy was worked out, does not constitute new construction under the strategy is purely a fabrication.

Since the owner of the plant J-Power, which is officially called Electric Power Development Co., is a private company, it is difficult for the government to ban the firm from resuming its construction work. However, nuclear power plants in Japan have been built in accordance with national policy. The government should stick to its new nuclear power policy it has worked out in the wake of the Fukushima nuclear accident.

Other questions remain about the Oma plant. Currently, the newly established Nuclear Regulation Authority (NRA) is drafting new safety standards for nuclear power stations. The authority is scheduled to unveil the outline of the standards in spring 2013 and complete the standards in the summer of the same year. Even if the power supplier continues construction of the Oma plant, it cannot be operated if it fails to meet the new standards.

Since the world's first reactor that uses only plutonium-uranium mixed-oxide fuel will be installed at the power station, the NRA needs to conduct a particularly cautious and strict inspection on the facility's safety. As such, one cannot help but wonder why J-Power is making haste in building the plant.

Under the new guidelines for nuclear disasters, priority zones where special nuclear disaster prevention measures must be implemented will soon be expanded to cover areas 30 kilometers from nuclear plants. Therefore, it is only natural that the city of Hakodate in Hokkaido, which falls in such a zone around the Oma plant, has voiced stiff opposition to the construction.

Furthermore, the government's decision to continue the nuclear fuel cycle project, in which plutonium is extracted from spent nuclear fuel and used for fast-breeder reactors, is also currently inconsistent with the zero nuclear power policy. Needless to say, it is necessary for the government to show consideration to the local community that is expected to host a fuel processing plant, but the government has failed to clarify how it intends to keep consistency between the project and the no nuclear power policy.

The government has been confused over how to judge whether idled nuclear reactors can be reactivated. The NRA says it will judge the safety of nuclear reactors but not whether operations at the reactors can be resumed. However, Prime Minister Yoshihiko Noda states that the regulation authority will play a leading role in deciding whether to give the green light to reactivation.

Noda has expressed concern that political intervention could impair the independence of the regulation authority. However, politics must not intervene in the scientific judgment of the safety of nuclear reactors. The government must take responsibility for deciding whether to grant permission for the reactivation of nuclear reactors based on judgment of safety made by the authority and in line with its energy policy.

The government should seriously try to achieve its goal of eliminating nuclear power by the 2030s, instead of taking ad hoc measures to respond to the situation.

Pass the buck?

October 5, 2012

Government tries to duck reactor-restart decisions

Fujimura hints decision rests with new body

http://www.japantimes.co.jp/text/nn20121005a1.html

By MASAMI ITO
Staff writer

Chief Cabinet Secretary Osamu Fujimura suggested Thursday that the central government does not have the ultimate say, or responsibility, in reactivating nuclear reactors, triggering confusion over who is in charge of making the decision.

At a news conference, Fujimura repeatedly stressed that the new Nuclear Regulation Authority is in charge of assessing the safety of reactors and that power companies are only tasked with explaining reactor restarts to host municipalities and seeking their consent.

But Fujimura refused to clarify the government's precise role in the process, saying only that once the safety of a reactor has been confirmed by the NRA, it will be brought back online.

"As I have repeatedly stated, confirming the safety of reactors is the most important thing when considering a reactivation, and the NRA is in charge of making a decision over their safety as an independent entity," Fujimura said. "The government has decided to utilize nuclear reactors that have been confirmed as a safe source of power."

But Fujimura repeatedly refused to give a straight answer when asked whether the government is ultimately responsible for approving reactor restarts, reiterating that units judged to be safe would be "used as a source of energy."

"In terms of giving approval, that duty has shifted from the trade minister and the (now-defunct) Nuclear and Industrial Safety Agency to the regulatory committee that is now in charge of authorizing" reactor restarts, Fujimura said, dumping the responsibility squarely on the NRA.

But this view was flatly contradicted by the NRA just a day before, when its new head, Shunichi Tanaka, stated that its responsibility is to scientifically assess the safety of nuclear reactors and that ultimate responsibility to authorize restarts does not lie with the nuclear watchdog.

Restarting reactors "is a major decision that must be made by somebody, and I believe that our safety assessment plays an important role in making that judgement," Tanaka said. "But to reactivate the reactors, there are various issues to consider, including gaining permission from local residents and municipal officials, and that is beyond the bounds of our authority."

After the Great East Japan Earthquake triggered the Fukushima meltdowns, all of Japan's commercial reactors were gradually brought to a halt by May.

In June, Prime Minister Yoshihiko Noda authorized the restarts of two units at the Oi nuclear plant in Fukui Prefecture amid widespread public outrage. After that chastening experience, it now appears the government is trying to wriggle its way out of approving any more reactivations and to find some other entity to which it can pass the buck.

During a news conference Sept. 21, Noda said the NRA would play a "leading role" in resuming operations at nuclear plants. Trade minister Yukio Edano also said last week that reactors would be restarted once the NRA confirms their safety and host municipalities have given their blessing, suggesting the central government would play no role in the final decision.

Last month, the government adopted a new energy policy that aims to completely abolish nuclear power in the 2030s. But depending on future energy demand, the government may eventually decide that not all idled reactors will need to be brought back online. Fujimura, however, insisted that such a decision will not be made in the short term.
"It might be a few years from now, but naturally there might come a time to review energy demand if other issues surface, including renewable energies," he said.

Nuke safety: so many hurdles ahead

October 13, 2012

Nuke chief hints no restarts this year

By MARI YAMAGUCHI
AP
http://www.japantimes.co.jp/text/nn20121013a4.html

The head of the new nuclear regulatory agency says reactors will not be allowed to restart until they pass seismic inspections and meet safety standards to be instituted next year.

Under the new requirements, emergency procedures for accidents and terrorist attacks will become compulsory for nuclear plant operators, said Shunichi Tanaka, chairman of the Nuclear Regulation Authority.

This follows criticism that collusion between the plant operators and authorities left the Fukushima No. 1 power plant unprepared for last year's crisis. Before the disaster struck, operators were allowed to decide for themselves whether to follow safety guidelines recommended by regulators.

Tanaka has criticized as political the government's decision to restart two reactors in Oi, Fukui Prefecture, in July to avoid a power crunch during the high-demand summer. The reactors are the only ones to resume operations since all reactors were shut down for safety checks and disaster countermeasures in light of the Fukushima disaster.

"Right now we don't have the legal basis to make any judgment over reactors," Tanaka said Thursday in an interview. "We don't have the legal power to stop the Oi reactors."

Tanaka said his agency will draft the new requirements by March and they should become law by July.

Nuclear power provided a third of Japan's electricity before the March 11, 2011, earthquake and tsunami, and the intention was to increase that to 50 percent. But last month, a Cabinet panel called for Japan to phase out nuclear power over the next three decades.

Tanaka said his five-member regulatory commission needs the new rules to make clear what it takes to safely restart a reactor.

The agency will also raise safety hurdles, ordering reactors shut down if ongoing seismic inspections find active faults in their vicinity. Tanaka said towns around the plants must come up with expanded emergency procedures by March before any reactor is considered for a restart.

Under a guideline issued by the agency last week, communities around the plants must compile emergency measures as far as 30 km from the plant, tripling the current requirement and affecting more than 130 municipalities and nearly 5 million people across the country.

Tanaka acknowledged that some of the densely populated areas will face difficulties compiling feasible emergency plans.

Reactors 3 and 4 at the Oi power plant are also under scrutiny for suspected active fault lines, and the regulatory commission and independent seismologists are to inspect the ground structure underneath the reactors.

The plant's operator, Kansai Electric Power Co., had failed to submit key data about possible faults, but the then-regulator, the Nuclear and Industrial Safety Agency, allowed the reactors to operate without further checks.
Tanaka said the two reactors will have to be halted if the faults are confirmed.

He said Japan has faced increased seismic activity in recent years, causing temblors exceeding designed quake resistance at some plants, including Kashiwazaki-Kariwa, which is run by Tokyo Electric Power Co.

The regulatory agency was inaugurated in September after a delay due to demands from opposition lawmakers for more independence and criticism from some pronuclear agency members.

A nuclear physicist and Fukushima native, Tanaka is a former executive of the Japan Atomic Energy Agency, which promotes nuclear energy. Tanaka, 67, has helped decontaminate areas around Fukushima No. 1.

"We must clear questions and concerns one by one, otherwise we will never regain the public trust," Tanaka said. "No reactor should operate unless the community has emergency plans that residents can accept."

Reform panel hit
Kyodo

A panel of experts monitoring Tepco's efforts to reform its under-fire nuclear division held its first meeting Friday, with its leader calling for the utility to be thoroughly revamped.

The Nuclear Reform Monitoring Committee, which is headed by Dale Klein, a former chairman of the U.S. Nuclear Regulatory Commission, serves as an advisory body to Tokyo Electric Power Co.'s board of directors
Tepco set up the committee as part of its drive to improve safety measures and technical capabilities, whose shortcomings were glaring when the Fukushima nuclear disaster hit. But some are continuing to

speculate that the utility is simply laying the groundwork to restart its idled reactors by restoring public confidence in nuclear power.

The need to bring its reactors back online is stipulated in a 10-year comprehensive special business plan.

Hakodate Mayor against resumption of work at Oma plant

October 16, 2012

Hakodate mayor urges gov't to freeze construction of Oma Nuclear Power Plant

http://mainichi.jp/english/english/newsselect/news/20121016p2a00m0na008000c.html

Hakodate Mayor Toshiki Kudo and other local government officials filed a petition with the central government on Oct. 15, urging Prime Minister Yoshihiko Noda and Chief Cabinet Secretary Osamu Fujimura to freeze the work recently resumed to construct the Oma Nuclear Power Plant in Aomori Prefecture.

Kudo and other officials submitted the petition addressed to Noda and Fujimura when they met Deputy Chief Cabinet Secretary Tsuyoshi Saito at the Prime Minister's Office on Oct. 15. In his reply to their calls, Saito stopped short of making any firm commitment, saying only, "We will discuss it among ourselves including with the Nuclear Regulation Authority (NRA)."

The construction of the Oma Nuclear Power Plant was resumed this month by Electric Power Development Co. (J-Power) for the first time in one year and seven months since the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant.

After holding talks with Saito, Hakodate Mayor Kudo told reporters that of the total population within a radius of 50 kilometers from the Oma nuclear power station, about 90,000 people live on the Aomori side while as many as about 370,000 people live on the Hokkaido side.

"I think the resumption of the construction should be endorsed by all municipalities within a radius of 30 kilometers or 50 kilometers (from the nuclear plant)," Kudo said.

"Impossible for utilities to survive"

November 10, 2012

Senior industry ministry official 'begs' for reactor restarts

http://www.japantimes.co.jp/text/nn20121110a4.html

KYODO

Sapporo — Senior vice industry minister Isao Matsumiya said he is "begging" the Nuclear Regulation Authority to allow the restart of the country's idled nuclear reactors, a statement that could be seen as pressuring the independent body.

His remarks Thursday during a meeting with officials of the Hokkaido Prefectural Government and the ministry's local bureau on winter power-saving measures, contrasts with those of industry minister Yukio Edano, Matsumiya's boss, who has placed importance on the NRA's independence in making key decisions.

"I am begging the NRA to enable the restart of suspended reactors nationwide as soon as possible," Matsumiya said. "It is impossible for utilities to survive if a situation like this continues next year and the year after next. I hope this kind of problem will not emerge again next year."

Of the 50 operational reactors nationwide, only two — at Oi in Fukui Prefecture — have been allowed to restart since the Fukushima meltdowns the March 2011. Since the crisis started, the public has turned against atomic power and all reactors are required to undergo stress tests to ascertain their survivability.

Matsumiya, a Lower House member from Fukui Prefecture, site of many reactors, is also an ex-industry ministry bureaucrat.

Impact of inspection delay at Hamaoka plant

November 20, 2012

Hamaoka reactor inspection delay may push back planned restart

http://mainichi.jp/english/english/newsselect/news/20121120p2a00m0na004000c.html

The planned restart of a reactor at the Hamaoka Nuclear Power Plant may be pushed back due to an inspection delay, plant operator Chubu Electric Power Co. announced on Nov. 19.

Chubu Electric was set to complete its inspection on the Hamaoka plant's No. 5 reactor, which was flooded with seawater in May 2011, in preparation for its planned restart of the unit in September 2014.

According to the utility, however, the completion of the inspection must be delayed all the way to September 2014 while spent fuel rods from the plant's No. 1 and 2 reactors -- now being dismantled -- are transferred to the No. 5 unit's quake-resistant fuel pool from January 2013.

The transfer of the 1,099 used fuel rods is expected to continue until March 2014, forcing Chubu Electric to delay the completion of its inspection of the No. 5 reactor until September 2014 to secure enough space to store the spent fuel rods.
If, however, inspectors detect any damage in the No. 5 reactor, restart could be further pushed back for repairs.

"In order to reassure local residents, we decided it was necessary to proceed with the plans (to disassemble the No. 1 and 2 reactors," Hiromu Masuda, head of the utility's nuclear power division, told reporters at a Nov. 19 news conference.
The No. 3 and 4 reactors at the plant in Omaezaki, Shizuoka Prefecture, are also idle.

The utility is seeking a quick restart to the nuclear plant, but in addition to the delay in the reactor check, completion of tsunami-resistance improvements have also been pushed back by a year, to December 2013.

Rates hike or restart?

November 22, 2012

Utility may up rates beyond hike eyed for April

Kepco plans two reactor restarts

http://www.japantimes.co.jp/text/nn20121122x1.html

Kyodo

OSAKA — Kansai Electric Power Co. has presented to potential lenders a business plan that includes reactivating two reactors, in addition to the pair that were brought back online this summer, according to sources.

Kepco, one of the most nuclear-dependent of the nation's 10 utilities, aims to return to profitability in fiscal 2013 if it wins government approval to raise electricity rates in April and gets two more reactors fired up, the sources said Wednesday.

It wants to hike rates by an average of 10 to 15 percent for homes and 15 to 25 percent for businesses. Kepco says it also plans to streamline operations.

However, it remains to be seen if the utility can pull off the reactor plan because the government and the Nuclear Regulation Authority have not yet outlined a road map for bringing reactors back online after they were sidelined by the Fukushima crisis.

It did manage to get two of the reactors at its Oi power plant in Fukui Prefecture online in July following government-mandated "stress tests" quickly put in place after Fukushima.

If Kepco can't restart the reactors it's counting on, it could be forced to seek higher rate hikes.

Targeted for reactivation are units 3 and 4 at the Takahama power plant in Fukui Prefecture. In July, immediately after Kepco rebooted the two Oi reactors, President Makoto Yagi said, "we are thinking Takahama reactors 3 and 4 are most promising" for a next round of reactivation.

"We would like to hold discussions with the government with the view to giving top priority to reactivating them," he added.

The remark drew anger from Yukio Edano, head of the Ministry of Economy, Trade and Industry, and others in the government because it was made before the September inauguration of the NRA, which is aiming to draw up a new set of safety criteria by next July.

METI's Nuclear and Industrial Safety Agency, before it was disbanded, released the results of preliminary stress tests for the Takahama reactors. But an NRA official said, "safety will be judged under the new set of guidelines."

Kepco has 11 reactors, all in Fukui Prefecture, and derived 51 percent of its power supply from nuclear sources in fiscal 2010, before the Fukushima crisis.

Tokyo Electric Power Co. raised electricity rates for households by an average of 8.46 percent in September and is counting on further easing the pressure of fossil fuel costs on its bottom line by restarting reactors at its massive Kashiwazaki-Kariwa nuclear plant in Niigata in April.

But with no prospects for reactivation in sight, industry watchers are speculating another Tepco rate hike may loom.
Kepco posted a heavy ¥116.7 billion in consolidated net loss for the first half of this business year through Sept. 30 because of increased fuel costs for its nonnuclear power plants.

A Kepco official said that if the two Takahama reactors are rebooted, "fuel costs would be cut by around ¥160 billion per year."

Sharp Corp. said later Wednesday that its costs could grow by ¥1 billion to ¥2 billion annually if electricity rates are increased by 10 to 20 percent.

A senior Sharp official told reporters the company would be dealt a blow if Japan's second-largest power utility raises its rates, as Sharp's major production bases are located in and around Osaka.

The official said it is "difficult to transfer such large facilities," indicating the company would not move its plants outside the Kansai region to avoid rising costs.

The planned power rate hike has not been factored into Sharp's projected largest-ever group net loss of ¥450 billion for fiscal 2012, which ends next March 31, it said.

Japan Future Party OK with restarting reactors?

December 1, 2012

Nuke power foe Kada open to reactor restarts

Jiji
http://www.japantimes.co.jp/text/nn20121201x3.html

Shiga Gov. Yukiko Kada, who founded the antinuclear Nippon Mirai no To (Japan Future Party) last week, on Saturday signaled the possibility of supporting the restart of atomic reactors if their safety is verified.

"If the Nuclear Regulation Authority guarantees their safety and the government concludes there is a need, (reactors) would resume operations," Kada said on a TV program.

"It may sound correct in theory to say that we can approve (reactor) operations if there are safety standards. But, first of all, we will not allow any further increase in (nuclear) waste," she said.

Kada has previously insisted that none of Japan's 48 idled reactors should be restarted because the NRA has yet to lay down new safety rules.

Her remarks could cause controversy at a time when Nippon Mirai no To is gearing up for the Dec. 16 election on a platform backing the complete elimination of atomic energy, and given the strong opposition to firing up reactors within her party.

Kada said she will make her first poll speech Tuesday in Fukushima Prefecture, home to the crippled Fukushima No. 1 plant

Another lawsuit against Kepco

November 30, 2012

Another suit filed against Kansai Electric over Oi nuclear plant

http://mainichi.jp/english/english/newsselect/news/20121201p2g00m0dm006000c.html

FUKUI, Japan (Kyodo) -- A group of 154 people in Fukui and other prefectures filed on Friday a lawsuit seeking suspension of the Oi nuclear power plant, contending Kansai Electric Power Co. resumed the operation of two reactors there while their safety has yet to be guaranteed.

The complaint filed with the Fukui District Court said the Fukushima Daiichi disaster last year had demonstrated the "totally unacceptable risks of nuclear power plants."

The move came a day after a group of around 1,100 people in 17 prefectures filed a similar complaint seeking stoppage of the Oi plant against the power company and the central government.

The 154 plaintiffs from 19 prefectures argued that the nuclear plant should be halted immediately instead of continuing fault surveys while keeping it in operation.

They pointed out that experts are still divided on whether faults believed to be running underneath the Oi plant are active or not.

The plaintiffs claimed there is a strong possibility of the fault being an active one, making the plant prone to a serious accident in case of a major earthquake.

They also said the Fukushima disaster triggered by last year's devastating earthquake and tsunami had shown the inadequateness of the conventional safety standards and that any approval of nuclear plant operation based on those standards is now invalid.

The Oi plant located in Fukui Prefecture, western Japan, resumed operation of two of its four reactors in July after all of the country's reactors went offline amid strong public concern over the nuclear safety in the wake of the Fukushima disaster.
The complaint said the prospect of power shortage, a reason cited in the resumption of the two reactors at the Oi plant, had proved wrong as power supply would have been sufficient in July and August without the resumption.
Fukui Prefecture hosts 14 nuclear reactors, the largest number in Japan.

Situation at Tsuruga not so obvious

December 6, 2012

Tsuruga nuke plant's reactivation faces further obstacles

http://mainichi.jp/english/english/newsselect/news/20121206p2a00m0na011000c.html

The Nuclear Regulation Authority (NRA) chief has suggested the possibility that the reactivation of the No. 1 and No. 2 reactors at the Tsuruga nuclear power plant could be disapproved even though the reactors do not sit directly above an active fault.

"It's not that nuclear reactors can be reactivated because an active fault is not running directly beneath reactor buildings. Under special circumstances, the way such faults should be assessed needs to be reviewed," NRA Chairman Shunichi Tanaka said during a press conference on Dec. 5.

Tanaka apparently put weight on the fact that an active fault line called the "Urazoko fault" runs underneath the premises of the Tsuruga plant in Fukui Prefecture, which is operated by the Japan Atomic Power Co., when he suggested that a decision over whether to reactivate the reactors could be made regardless of conventional standards.

The central government has heretofore not approved construction of such key facilities as reactor buildings right above active faults. However, the government has approved the operation of reactors situated away from active faults after assessing their seismic resistance and determining their safety.

The NRA dispatched a team of experts to the Tsuruga plant on Dec. 1 and 2 to conduct field surveys. The authority is now looking into the possibility of whether the crush zone running right underneath the building housing the No. 2 reactor could move in conjunction with the Urazoko fault, which lies some 200 meters away from the reactor. The NRA will decide whether to allow the plant's reactivation following a meeting scheduled for Dec. 11.

The Tsuruga 'series' continues

December 10, 2012
Tsuruga nuclear power plant may be on active fault
http://www3.nhk.or.jp/daily/english/20121210_27.html

Japan's Nuclear Regulation Authority has determined that faults running underneath the Tsuruga nuclear power plant in Fukui Prefecture are active.

The NRA Chairman Shunichi Tanaka said the body cannot give a permit to restart the plant's reactors, which have been off-line since last year's nuclear accident at the Fukushima Daiichi power plant.

This comes after NRA official Kunihiko Shimazaki and 4 other experts carried out an on-site inspection earlier this month to see whether crush zones under the Tsuruga plant are actually active faults.

The Tsuruga plant sits near the major Urasoko Fault. The team conducted a boring survey on Urasoko Fault and a fault called the D-1. The D-1 Fault branches out from Urasoko and runs directly beneath the Number 2 reactor.

The experts said the Urasoko Fault is active and its possible impact on the fault under the plant in the

event of an earthquake cannot be overestimated.

They said that the stratum deformation found near the D-1 Fault was caused by forces similar to those that cause the Urasoko Fault to move.

State regulations prohibit building nuclear reactors above active faults. Tanaka expressed readiness to convene a NSA meeting to hear opinions of members on what to do.

Tsuruga nuclear plant may have to be decommissioned as active fault found

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201212100096

REUTERS

Japan Atomic Power Co. may have to decommission one of its reactors after seismologists concluded the plant is sitting over an active faultline, potentially the first permanent shutdown of a nuclear unit in Japan since the Fukushima disaster last year.

"There is no way we can carry out safety assessments for a restart," the chairman of Japan's Nuclear Regulation Authority (NRA), Shunichi Tanaka, said on Dec. 10 at an open meeting after being presented with an assessment there is an active fault under the No. 2 reactor at the Tsuruga nuclear plant.

The government in Japan, one of the world's most seismically active countries, does not allow nuclear plants to be situated over active faultlines. An NRA panel of seismologists has been reviewing geological records and this month visited Tsuruga to watch the results of boring and other tests.

A fault line extending from below the reactor was assessed to have moved in the past in tandem with another nearby fault, Kunihiko Shimazaki, an NRA commissioner who led the seismic panel, told the meeting.

While Tanaka has no authority to order a permanent shutdown, his comment implies he will not allow the reactor to be restarted, forcing a decision on Japan Atomic over whether to mothball the unit.

A Japan Atomic official who attended the meeting said the company would carry out further seismic studies.

The agency will meet at a later date to make an official announcement on the 1,160 megawatt reactor, the larger of two at the plant in western Japan. The No. 2 unit started operating in 1987, while the 357-megawatt No. 1 reactor started in 1970.

The NRA is reviewing possible faultlines under or near Tsuruga and five other nuclear stations as part of moves to beef up safety and Tanaka has said any reactors sitting above won't be allowed to restart.

All but two of Japan's nuclear reactors are idled for safety checks after the Fukushima disaster, forcing the country to spend billions of dollars extra on fossil fuels to run power stations.

An earthquake and tsunami in March last year knocked out cooling and power at Tokyo Electric Power Co.'s Fukushima No. 1 plant north of the Japanese capital, causing the biggest release of radiation since Chernobyl in 1986.

Fault under reactor at Tsuruga likely active

Kyodo
http://www.japantimes.co.jp/text/nn20121210x3.html

in the Yomiuri

Fault running under Tsuruga plant reactor likely to be active: panel

http://mainichi.jp/english/english/newsselect/news/20121210p2g00m0dm078000c.html

---

December 9, 2012

Active fault under Tsuruga nuclear power plant
http://www3.nhk.or.jp/daily/english/20121210_03.html

Japan's Nuclear Regulation Authority and other experts will hold discussions Monday on whether another active fault exists beneath the Tsuruga nuclear power plant in Fukui Prefecture.

The Tsuruga nuclear plant is the only one in Japan that has an active fault running beneath it.

If another fault underneath the plant's reactors is determined to be active the plant will be barred from restarting.

Regulation Authority official Kunihiko Shimazaki and 4 scientists examined the plant on the Japan Sea coast on December 1st and 2nd.

They conducted a so-called trench survey by digging into the ground beneath the compounds to examine the active Urasoko Fault and those branching out from it.

They confirmed that the Urasoko Fault is active. They also found stratum deformation near another fault, called D-1, which runs directly beneath the Number 2 reactor.

Shimazaki said his team shared the view that the deformation was caused by a force similar to the one that caused the Urasoko Fault to move.

Government's guidelines prohibit building a key nuclear power facility on an active fault.

Monday's meeting is drawing attention as the Number 2 reactor may have to be scrapped. That will depend on the assessment reached by the Nuclear Regulation Authority and the experts.

Tsuruga update - Dec.11

December 11, 2012
UPDATE: Tsuruga nuclear plant may have to be decommissioned as active fault found

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201212110030

THE ASAHI SHIMBUN AND WIRE REPORTS

Japan Atomic Power Co. may have to decommission one of its reactors after seismologists concluded the plant is sitting over an active fault line, potentially the first permanent shutdown of a nuclear unit in Japan since the Fukushima disaster last year.

A panel of seismologists and geologists with Japan's Nuclear Regulation Authority (NRA) has been reviewing geological records and this month visited the Tsuruga nuclear power plant to watch the results of drilling and other tests.

"There is no way we can carry out the safety assessments (that are required) for a restart," the chairman of the NRA, Shunichi Tanaka, said on Dec. 10 at an open meeting after being presented with the panel's assessment that there is an active fault under the plant's No. 2 reactor.

The government in Japan, one of the world's most seismically active countries, does not allow nuclear plants to be situated over active fault lines.

But about 160 geological fault lines cut across the premises of the Tsuruga nuclear power plant, including some that lie directly beneath its two reactor buildings. In addition, the Urasoko fault, which is active, runs about 200 meters east of the reactor buildings.

Much attention has been given to whether the fault lines situated directly beneath the reactor buildings could slide in tandem with the Urasoko fault when the latter shifts.

A fault line called D-1, situated directly beneath the No. 2 reactor building, was assessed to have moved in the past in tandem with the Urasoko fault and thus likely active, according to Kunihiko Shimazaki, deputy chairman of the NRA and head of the seismic panel.

"You could call it an active fault," Shimazaki told reporters after the Dec. 10 meeting. "It likely represents simultaneous movement induced by the motion of the Urasoko fault."

The experts intensively studied the vicinity of the point where the D-1 fault branches out from the Urasoko fault during an on-site survey on Dec. 1-2. The survey revealed a new fault line near D-1, and the experts agreed that the fault line was formed under approximately the same stress that drives the activity of the Urasoko fault. The panel concluded that future slippage along that fault line could not be ruled out.

Though Tanaka has no authority to order a permanent shutdown, his comment implies he will not allow the reactor to be restarted, forcing a decision on Japan Atomic over whether to mothball the unit.

A Japan Atomic official who attended the meeting said the company would carry out further seismic studies.

The results of the Dec. 10 expert panel meeting will be presented to a regular meeting of the NRA on Dec. 12, when the agency may make an official announcement on the 1,160-megawatt reactor, the larger of two at the plant in western Japan. The No. 2 unit started operating in 1987, while the 357-megawatt No. 1 reactor started in 1970.

The NRA is reviewing possible fault lines under or near Tsuruga and five other nuclear plants as part of moves to beef up safety, and Tanaka has said any reactors sitting above won't be allowed to restart.

All but two of Japan's nuclear reactors are idled for safety checks after the Fukushima disaster, forcing the country to spend tens of billions of yen extra on fossil fuels to run power stations.

An earthquake and tsunami in March last year knocked out cooling and power at Tokyo Electric Power Co.'s Fukushima No. 1 plant north of the Japanese capital, causing the biggest release of radiation since Chernobyl in 1986.
THE ASAHI SHIMBUN AND WIRE REPORTS

Utility yet to decide on scrapping Tsuruga reactor

http://www3.nhk.or.jp/daily/english/20121211_35.html

The operator of the Tsuruga nuclear power plant on the Sea of Japan coast says it has not decided whether to decommission one of the facility's reactors.

The Nuclear Regulation Authority said in an assessment meeting with experts on Monday that a fault directly under the Number 2 reactor is likely active. The assessment could lead to decommissioning of the reactor. Government guidelines prohibit building key nuclear power facilities above active faults.

Speaking to reporters on Tuesday, officials of Japan Atomic Power Company said it is studying what would make decommissioning unavoidable. They said the utility will consult other energy firms that buy power from it, as the matter could affect plans to raise electricity rates.

The utility's Vice President Hiroshi Masuda said it will provide a scientific explanation to the authority to win its approval for restarting the reactor.
Dec. 11, 2012 - Updated 11:58 UTC (20:58 JST)

N-plant operator questions regulator's assessment

http://www3.nhk.or.jp/daily/english/20121211_31.html

The operator of the Tsuruga nuclear power plant on the Sea of Japan coast has asked a nuclear regulator to explain its assessment that faults running under one of the facility's reactors may be active.

Japan Atomic Power Company on Tuesday sent an open letter to the Nuclear Regulation Authority, saying its assessment is beyond comprehension.

On Monday, an NRA expert panel concluded that so-called crush zones under the Number 2 reactor of the plant in Fukui Prefecture may be active faults.

The firm asked the authority why it concluded that the nearby active Urasoko fault and a fault called D-1 that runs beneath the reactor could move together.

The company's Vice President Hiroshi Masuda said he understands that the authority makes judgments based on science, and that he hopes it will provide scientific responses.

A senior official of the NRA secretariat says the authority will examine the letter and respond.

Government guidelines prohibit building key nuclear power facilities over active faults. If fissures lying beneath the Tsuruga plant's reactor are officially determined to be active, the plant may have to be scrapped.

Tsuruga - Legal obstacles

Scrapping Tsuruga nuclear plant faces legal hurdles

http://mainichi.jp/english/english/newsselect/news/20121211p2a00m0na019000c.html

While the Nuclear Regulation Authority (NRA) suggested on Dec. 10 that it would not allow reactivation of a reactor at the Tsuruga Nuclear Power Station in Fukui Prefecture due to an active fault line running beneath the building, actually scrapping the reactor faces serious legal obstacles.

NRA Chairman Shunichi Tanaka said at a meeting of experts, "My impression is that if it were to remain the way it is now, we would not be able to carry out safety assessments for the resumption (of reactor operations)." His remark serves to back up NRA's determination to adopt "the world's best safety regulations," but under the current law, it does not have legal authority to order the suspension or decommissioning of nuclear power plants.

A senior official of the NRA secretariat, meanwhile, said, "That was Mr. Tanaka's personal view." Therefore, a decision on decommissioning the No. 2 reactor at the Tsuruga plant is up to Japan Atomic Power Co., the owner and operator of the facility.

The Nuclear Reactor Regulation Law stipulates that measures necessary to prevent nuclear disasters can be taken when there is "imminent danger." Furthermore, government safety inspection guidelines for earthquake-resistant designs forbid construction of important facilities such as reactor buildings above active faults.

Nevertheless, with respect to the legal interpretation of "imminent danger," the NRA secretariat says, "It points to cases in which danger cannot be clearly predicted such as missile attacks, satellites falling to earth and volcanic eruptions."

Active faults are said to move about every 1,000 years, and therefore it is deemed difficult to recognize active faults as "imminent" dangers. Moreover, the guidelines are designed to be used when the government decides on whether to give authorization to build new nuclear plants. Thus, the guidelines have no teeth when it comes to nuclear facilities already built.

And yet **a so-called "back-fit system" to judge whether even pre-existing reactors meet the new regulatory standards will take effect in July 2013 under the law authorizing the establishment of NRA, paving the way for the NRA to order the suspension of operations at nuclear reactors affected by active faults**. The Tsuruga nuclear plant is currently offline for regular inspections.

A senior official with the NRA secretariat told the Mainichi that "it's difficult to order the decommissioning of the Tsuruga plant." But NRA Chairman Tanaka has suggested that decommissioning orders would be inevitable if reactors are judged to be -- or highly likely to be -- sitting above active faults.

Scrapping Tsuruga No.2 won't help Japan Atomic's financial crisis

Japan Atomic financial fears deepen

By KAZUAKI NAGATA
Staff writer
http://www.japantimes.co.jp/text/nn20121211x2.html

Concern over Japan Atomic Power Co. suffering a major financial crisis is spreading after the nuclear industry watchdog determined this week that a fault running directly beneath reactor 2 at the firm's Tsuruga nuclear plant is active and poses a serious danger.

The announcement by a Nuclear Regulation Authority panel Monday could force Japan Atomic Power to decommission the unit, and also makes it highly unlikely that it can proceed with the planned construction of two more reactors at the facility in Fukui Prefecture.

Nuclear safety guidelines ban power companies from building reactors and other critical safety equipment on top of active faults, meaning Japan Atomic Power will likely be left with no alternative other than to scrap the No. 2 reactor.

To make matters worse, the only other unit at the complex is 42 years old and, according to revised legislation enacted this year to regulate nuclear plant operators, reactors in operation for more than 40 years should in principle be decommissioned.

The company's only other commercial nuclear reactor, at the Tokai No. 2 power station in Ibaraki Prefecture, has meanwhile been suspended in the wake of the Fukushima meltdowns and there appears little prospect of it resuming operations anytime soon.

If Japan Atomic Power were forced to scrap both reactors at the Tsuruga facility as well as the Tokai No. 2 plant's sole unit in the current fiscal year, the loss it would incur from writing off equipment and t**he company's shortage of reserves for the decommissioning work w**ould total some ¥256 billion, according to estimates released by the industry ministry in May.

This figure greatly exceeds the firm's total net assets of around ¥162.6 billion. Japan Atomic Power posted a ¥12.8 billion net loss for the business year through last March, its first net loss in 12 years.

Tsuruga - New episode in the 'series'

NRA queried over active fault beneath Tsuruga nuclear plant

http://mainichi.jp/english/english/newsselect/news/20121212p2a00m0na005000c.html

Japan Atomic Power Co. sent an open letter of inquiry to the Nuclear Regulation Authority (NRA) on Dec. 11, asking it to clarify the scientific basis for its conclusion that it is highly possible that a fault running underneath a reactor at JAPC's Tsuruga nuclear plant in Fukui Prefecture is in fact active.

Arguing that NRA did not provide sufficient scientific explanations about its assessment of a fault running right beneath the No. 2 reactor at the Tsuruga nuclear power station, JAPC submitted the open letter to NRA in which the power company asked the nuclear regulator to answer its questions in writing.

JAPC Vice President Hiroshi Masuda visited the nuclear regulatory agency, which serves as NRA's secretariat, and handed the open letter to Deputy Director-General Tetsuo Nayuki.

The open letter contained 10 questions, including those about the basis for which NRA judged that the "Urasoko" fault, which runs on the plant's premises, had moved simultaneously with a fault zone of crushed rock called D-1, which runs right underneath the plant's No. 2 reactor, and about how the regulatory authority simulated that the Urasoko fault had moved in tandem with D-1.

The power company also asked why NRA had drawn the conclusion before JAPC conducts an additional survey. In the open letter, JAPC called on NRA to make a fresh judgment after examining overall assessments of the results of the additional survey to be conducted later by the power firm.

After submitting the open letter, JAPC Vice President Masuda said at a news conference in Tokyo, "I think they will sincerely answer our questions." Asked about the envisaged impact on corporate management of the possibility of the company being forced to decommission the nuclear facility for safety reasons, he only said, "That's hypothetical. I decline to comment."

The reason why JAPC adopted a rather confrontational approach to NRA is that if it is forced to decommission the Tsuruga plant's No. 2 reactor, which has been running for less than 30 years since it was first put into operation, it could be crushed by huge debt stemming from disposition of losses and lose the foundation of its very survival.

There is no provision in the current Nuclear Reactor Regulation Law for procedures for decommissioning nuclear power plants. Therefore, not only the power industry but also the Ministry of Economy, Trade and Industry were taken by surprise [????]by NRA's decision on the Tsuruga plant. Complaining about NRA's decision, people concerned said that at the very least they would need to put off the inevitable.

Tsuruga nuke plant operator disputes NRA verdict on fault

http://www.japantimes.co.jp/text/nn20121212a4.html

Kyodo

The operator of the Tsuruga nuclear plant in Fukui Prefecture is rejecting the finding of a team of experts Monday that an earthquake fault under the plant precludes the restart of one of its reactors.

Japan Atomic Power Co. said the conclusion is "totally unacceptable," noting the experts focused largely on geological formation data and not other aspects, and vowed to continue an additional probe on the plant's premises to counter the assessment.

But Kunihiko Shimazaki, the Nuclear Regulation Authority commissioner who led the team, said at a news conference they had "reached a decision based on the data we have now" and there is no need for the company to carry out further studies.

It is the first time that a panel under the newly launched NRA has concluded that an existing reactor may be sitting directly above an active fault, a situation banned by safety screening guidance for nuclear power stations.

The NRA will release its own judgment based on the outcome of the experts' discussions Monday, but NRA Chairman Shunichi Tanaka, who attended the meeting, said he feels the authority "cannot implement safety assessments for the resumption (of the plant) in the current situation."

Some local residents were stunned by the NRA-led team's conclusion. Tsuruga Mayor Kazuharu Kawase said the outcome was "very tough," but added it is possible safety could be confirmed through additional studies.

It has been known for years that a major active fault, called Urazoko, lies about 250 meters from the reactor buildings. But the focus of the latest discussions has been on whether another fault called D-1, with a zone of crushed rock, located beneath the No. 2 reactor could move in conjunction with the Urazoko fault.

The experts agreed that what appears to be an extended section of D-1 had moved as an active fault in the past, together with the movement of the Urazoko fault, Shimazaki said in wrapping up the meeting.

The extended section of D-1 falls within the definition of an active fault Shimazaki thinks appropriate, which is a fault that has moved in the last 400,000 years.

He also said the experts took into consideration the fact that a large fault like Urazoko exists on the premises of the plant.

"If plant operators know there is an active fault at the site in the first place, they will usually not build (a nuclear complex) there," Shimazaki added.

The Tsuruga plant has two units, with reactor 1 starting commercial operation in 1970 and reactor 2 in 1987. But it was not until 2008 that the Urazoko fault was confirmed to be active by Japan Atomic Power.

Another NRA-appointed team has already visited the Oi plant to check for faults, but it has not yet reached a conclusion. The NRA plans to send similar teams of experts to at least four other facilities around the country.

The Yomiuri on the Tsuruga conclusions

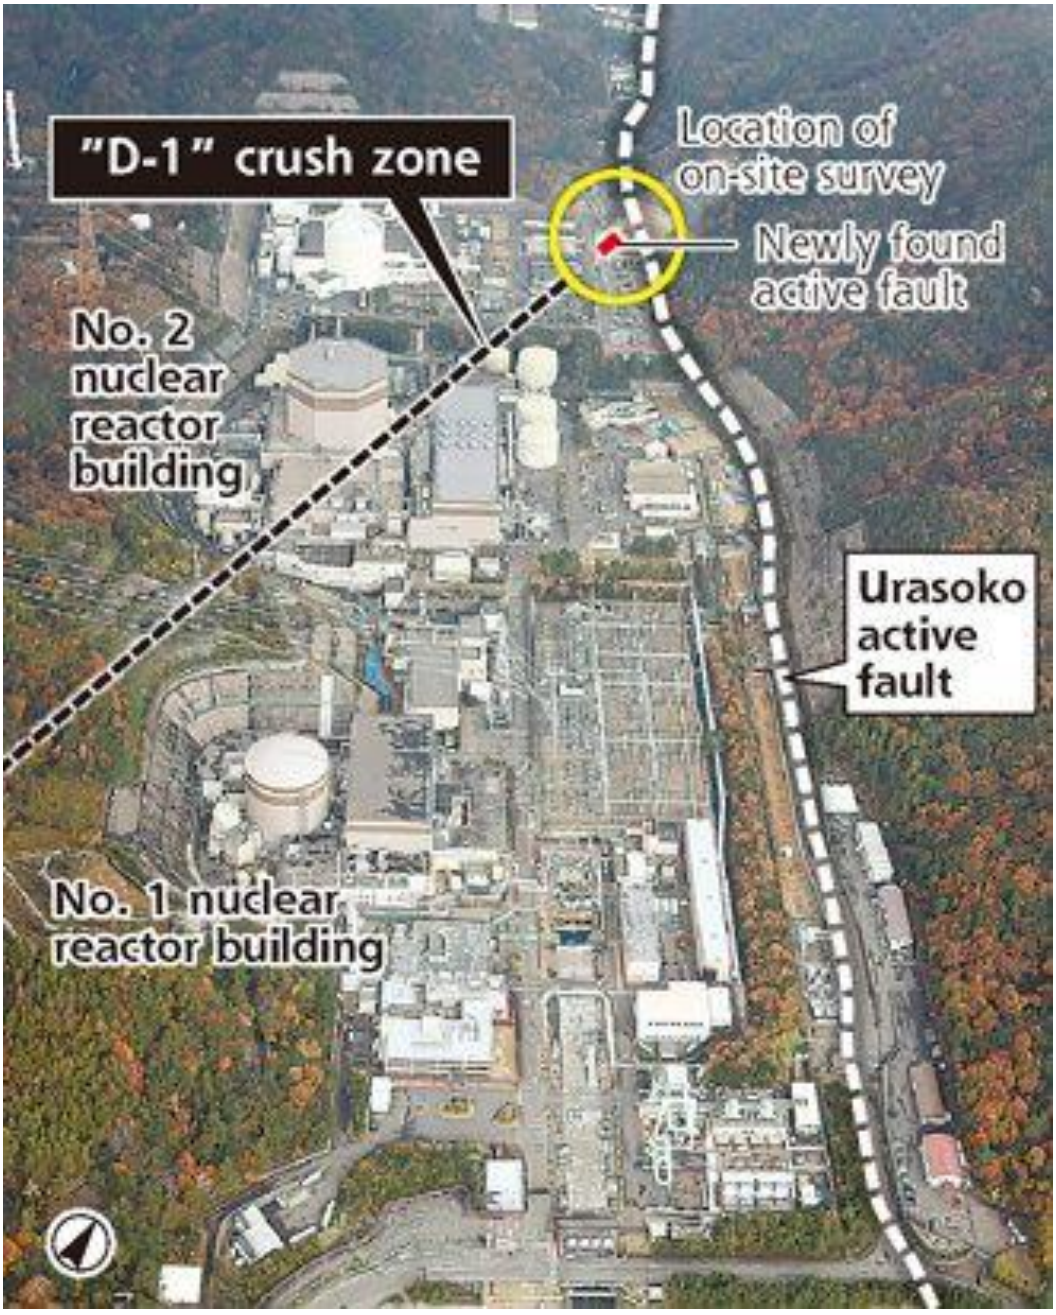
OK unlikely for restart of N-plant / Authority cites possible fault at Fukui site

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T121211004106.htm



A Nuclear Regulation Authority expert panel has concluded a crush zone underneath the No. 2 reactor building of the Tsuruga nuclear power plant in Fukui Prefecture is highly likely to be an active fault, leading the NRA chairman to indicate the authority will not approve restarting the idle reactor.

"As things stand now, we cannot conduct a safety evaluation of the [No. 2] reactor to resume operation," NRA Chairman Shunichi Tanaka said Monday.

The crush zone--called D-1--was found through surveys and discussions by the experts to be at risk of moving in tandem with the Urasoko active fault, which runs under the plant.

This fails to meet the criteria under the guidelines for the quake-resistance of nuclear power plants.
Even if additional quake-resistant reinforcements are made, it is difficult to ensure the safety of the reactor if restarted, experts said.

Since the nation's first commercial nuclear power plant began operations in 1966, this would be the first time for a national nuclear regulatory authority to disapprove the operation of a nuclear reactor because of an active fault under it.
The authority is expected to formally adopt the chairman's policy as its own shortly.

There was no reference made Monday by the panel or Tanaka to the No. 1 reactor building, which also sits atop the D-1 crush zone. In addition to the fault zone, the No. 1 reactor began operations more than 40 years ago, making it highly unlikely the authority will approve its restart, either.

Meanwhile, a spokesperson of Japan Atomic Power Co. (JAPC), the plant's operator, said: "We can hardly accept it [the conclusion]. We'll continue our surveys and prove our assertions with evidence," indicating JAPC's stance of refuting the authority's findings.

Yet it is deemed quite difficult to gather data that would overturn the authority's decision, making it likely the operator will have to scrap the reactor.

JAPC was established in 1957 as a power company solely engaged in nuclear power generation. It currently has three nuclear reactors--two at the Tsuruga plant and the Tokai No. 2 power station in Ibaraki Prefecture.

During the meeting, the panel led by NRA Acting Chairman Kunihiko Shimazaki and experts on earthquakes and active faults, discussed the topographic features and geological data, obtained at survey points on the premises, to judge whether the crush zone may move in the future.

As the person in charge of judging the safety of the nuclear power plant, Tanaka also attended the meeting.
Through their discussions, the experts agreed that:

-- As surface material was excavated at the survey point, a new active fault was found, which is believed to have sometime within the past 120,000 to 130,000 years.

-- The crush zone directly beneath the No. 2 reactor building is highly likely to be linked with the newly found active fault.
-- If the nearby Urasoko active fault moves again, the crush zone is at risk of moving in tan

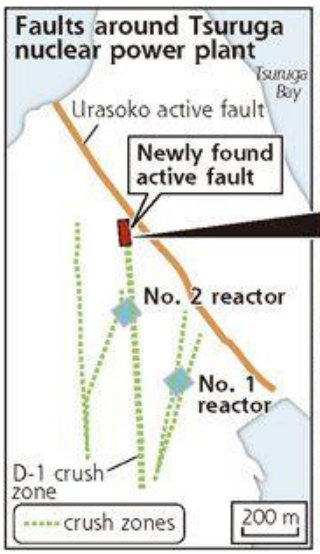
NRA's strict assessment errs on side of safety / Based on circumstantial evidence, experts agree fault under Tsuruga nuclear plant is likely active

Sho Funakoshi and Yusuke Tomiyama / Yomiuri Shimbun Staff Writers
http://www.yomiuri.co.jp/dy/national/T121211003624.htm



The fault believed by Nuclear Regulation Authority expert panel to be active

(Chart was created by adding explanations to NRA-provided material)

Events involving Tsuruga nuclear power plant

1970	Mar.	No. 1 reactor begins operating
1987	Feb.	No. 2 reactor begins operating
2008	Mar.	Japan Atomic Power Co. acknowledges Urasoko fault is an active fault
2011	Mar.	Crisis begins at Fukushima No. 1 nuclear power plant
	Apr.	Now-defunct Nuclear and Industrial Safety Agency orders reassessment of active faults at all nuclear power plants
2012	Apr.	At NISA's hearing session, experts point to the possibility that crush zone directly under No. 2 reactor is an active fault
	Dec. 1-2	Experts from Nuclear Regulation Authority conduct on-site inspections
	Dec. 10	NRA's expert panel concludes crush zone is highly likely to be an active fault

After a two-day on-site inspection and a two-hour discussion, the five Nuclear Regulation Authority panel experts were unanimous in their opinion.

"If there is data, experts' opinions will agree," Kunihiko Shimazaki, acting chairman of the NRA, said at a press conference. "It would be regrettable if people think we reached our decision easily."

The panel concluded Monday that the crush zone directly under the No. 2 reactor of the Tsuruga nuclear power plant of Japan Atomic Power Co. in Fukui Prefecture is highly likely to be an active fault.

Following the panel's assessment, the NRA is expected to decide shortly not to allow the restart of the idled reactor, clearly indicating that the country's nuclear regulatory policy has taken a strict stance to "stop reactors unless their safety is proven."

The decision will leave Japan Atomic Power Co. unable to expect the restart of all three of its nuclear reactors in the near future.

The Tsuruga plant is the country's only nuclear power plant with an active fault under its premises.

The active fault, called Urasoko fault, is only 250 meters east of a reactor building. This prompted experts and others to worry that the fault's movement could affect a crush zone directly under the reactor building, causing movement.
During the NRA experts' on-site inspection on Dec. 1 and 2, the group found stratum deformation at its drilling survey point near the Urasoko fault, prompting them to suspect an active fault.

Japan Atomic Power Co., which has argued the Urasoko fault is not related to the crush zone, insisted the newly discovered active zone was a "local stratum deformation" that would not affect the reactor.

But the NRA experts concluded that the active fault most likely constitutes part of the D-1 crush zone running directly below the No. 2 reactor, after analyzing stratum samples collected in the drilling survey.

"It's natural to think [the active zone] was induced to shift by the nearby Urasoko fault," said Hiroyuki Tsutsumi, associate professor at Kyoto University and one of the five panel members.

The panel thus concluded there is a possibility the Urasoko fault's movement may affect as far away as the area beneath the No. 2 nuclear reactor building.

Though the panel was unable to obtain any proof that directly links the Urasoko fault with the D-1 crush zone, it pointed to the possibility that the crush zone will move by stacking up pieces of circumstantial evidence.

The panel also extended the period used to define active faults.

Government antiquake guidelines for nuclear reactors define faults as active if movement was observed during the last 120,000 to 130,000 years, partly because it is easy to specify the age of stratum during that time frame.

But in an NRA meeting three days earlier, Shimazaki proposed making the standard stricter by extending the period to 400,000 years.

The panel made their decision about the newly discovered active fault based on their observation that the stratum moved between 100,000 and 200,000 years ago.

===

'Not a 100% conclusion'

It is certainly difficult, however, to obtain clear proof to determine whether a crush zone is an active fault.
In sharp contrast to past nuclear regulation authorities, who mostly took a wait-and-see attitude, the NRA will adapt a tough stance of not allowing the restart of nuclear reactors if the presence of an active fault is highly suspected.
In other words, the NRA will move in a new direction by putting more focus on safety. Indeed, members of the expert panel used such expressions as "there is a possibility" and "it can be considered" in their meeting Monday.
"We're not necessarily 100 percent [sure about the conclusion]," said Koichiro Fujimoto, associate professor of Tokyo Gakugei University, in the meeting.

The NRA plans to conduct on-site inspections at Oi and Mihama nuclear power plants of Kansai Electric Power Co. in Fukui Prefecture, Higashidori nuclear power plant of Tohoku Electric Power Co. in Aomori Prefecture, Shika nuclear power plant of Hokuriku Electric Power Co. in Ishikawa Prefecture and the Monju fast-breeder reactor of Japan Atomic Energy Agency in Fukui Prefecture.

Observers noted that the NRA may be inclined to make tough assessments, owing to its increased focus on the safety of nuclear reactors.

===

Govt to closely watch

Chief Cabinet Secretary Osamu Fujimura said the government will closely watch developments in response to NRA Chairman Shunichi Tanaka's statement that it would be difficult to restart the No. 2 reactor of the Tsuruga nuclear power plant.

"I'd like to decline to comment, as the issue is still being considered. We'll closely watch the situation," Fujimura said.

A question of common sense

December 12, 2012

EDITORIAL: Why flirt with disaster? Decommission Tsuruga nuclear reactor

http://ajw.asahi.com/article/views/editorial/AJ201212120026

Breaking away from the “safety myth” that surrounded nuclear energy, the Nuclear Regulation Authority (NRA) has changed the way Japan judges the safety of nuclear power plants.

The new industry watchdog said Dec. 10 there is a high possibility that a fault line running directly beneath a reactor at Japan Atomic Power Co.'s Tsuruga nuclear plant in Fukui Prefecture is active. "Under the current circumstances, there is no way we can carry out the safety assessments (that are required) for a restart (of the reactor)," NRA Chairman Shunichi Tanaka said.

This signals a major turning point in the nation's nuclear regulation administration.

The focus was whether the active Urasoko fault, which runs about 200 meters east of the reactor, could affect the building that houses the reactor.

Five experts said they clearly recognized that the fault situated directly beneath the No. 2 reactor building is linked to the active Urasoko fault and could move in tandem with it.

"The very fact that the active fault is running beneath the compound of a nuclear power plant is abnormal in itself," said one of the experts.

"The (possible) influences from the Urasoko fault are immeasurable," said another.

Their warnings expressed in a meeting show the high level of danger in the current situation at the Tsuruga nuclear power plant.

According to government guidelines, key facilities of nuclear power plants must not be constructed on active faults. If the No. 2 reactor cannot be operated, its decommissioning is inevitable.

Japan Atomic Power should take the NRA's judgment seriously and swiftly review its business plans on the safety of nuclear reactors and future management of the company.

As many as 160 fault lines run beneath the compound of the Tsuruga plant. Why was a nuclear power plant constructed in such a location in the first place?

When construction of the Tsuruga plant began in the 1960s, studies of faults were certainly not as advanced as they are now. However, we suspect that the people concerned brushed aside the geological conditions because of the safety myth that serious accidents would never occur at nuclear power plants in Japan.

Even when experts warned about the danger of possible active faults, the government allowed nuclear plants to continue operating. We must learn the lessons from the lax screenings of the Nuclear and Industrial Safety Agency, the predecessor of the NRA.

The NRA plans to conduct similar geological surveys at six other locations that may be above active faults. They include the compound of the Shika nuclear power plant operated by Hokuriku Electric Power Co. and the site of the Higashidori nuclear power plant operated by Tohoku Electric Power Co.

Electric power companies have maintained a stance that evidence must be 100-percent clear to label a fault as an active one. This stance is simply unacceptable.

In surveying the compound of the Tsuruga nuclear plant, Kunihiko Shimazaki, deputy chairman of the NRA, asked the experts to make purely scientific judgments without thinking about economic and other issues.

It is obviously common sense not to operate dangerous nuclear plants.

However, if the NRA continues to base its judgments on common sense, many other issues will emerge.

It is also necessary to drastically review the future plans of local governments that have depended on nuclear-related grants from the central government, including the Tsuruga city government.

But will it?

December 14, 2012

Noda says Tsuruga reactor will be decommissioned if safety is at risk

http://mainichi.jp/english/english/newsselect/news/20121214p2g00m0dm029000c.html

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda said Thursday a nuclear reactor at Japan Atomic Power Co.'s Tsuruga Power Station will be decommissioned if the Nuclear Regulation Authority determines that safety is at risk at the reactor that is seen as likely to be sitting on an active quake fault.

"The government must respect a judgment by the NRA," Noda told on a night program on TV broadcaster TBS. "I believe if it doesn't go operational, no profits will be earned and it will be decommissioned on a judgment by the operator."

Asked about what action may be taken if the Tsuruga No. 2 reactor is not authorized to resume operating, NRA chairman Shunichi Tanaka told reporters Wednesday that, "We will not be making a judgment on decommissioning the reactor but would like to swiftly request any necessary safety measures be taken, if any."

Noda's remark is a stronger indication of the government's readiness to retire the reactor if necessary.

Experts presented a unanimous view at a meeting of NRA officials on Monday that the fault in question is likely to be active, raising the likelihood of the No. 2 reactor being placed out of service.

Ahead of the TV program, Noda criticized in an election campaign speech the former government led by the Liberal Democratic Party for allowing the construction of the No. 2 reactor.

"I wonder which government under what party permitted the establishment by leaving (geological) survey work solely in the hands of the (plant) operator," he said.

On the active fault, Noda said, "It became clear for the first time after an investigation by the Nuclear Regulation Authority with a high degree of independence."

"We are seeking to stop all nuclear power stations in the 2030s," said Noda, the president of the Democratic Party of Japan. "The LDP is for continuing nuclear power generation. There is a crucial difference" between the two.

Gov't will respect NRA's judgment, says Noda

December 14, 2012

Noda says Tsuruga reactor will be decommissioned if safety is at risk

http://mainichi.jp/english/english/newsselect/news/20121214p2g00m0dm029000c.html

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda said Thursday a nuclear reactor at Japan Atomic Power Co.'s Tsuruga Power Station will be decommissioned if the Nuclear Regulation Authority determines that safety is at risk at the reactor that is seen as likely to be sitting on an active quake fault.

"The government must respect a judgment by the NRA," Noda told on a night program on TV broadcaster TBS. "I believe if it doesn't go operational, no profits will be earned and it will be decommissioned on a judgment by the operator."

Asked about what action may be taken if the Tsuruga No. 2 reactor is not authorized to resume operating, NRA chairman Shunichi Tanaka told reporters Wednesday that, "We will not be making a judgment on decommissioning the reactor but would like to swiftly request any necessary safety measures be taken, if any."

Noda's remark is a stronger indication of the government's readiness to retire the reactor if necessary.

Experts presented a unanimous view at a meeting of NRA officials on Monday that the fault in question is likely to be active, raising the likelihood of the No. 2 reactor being placed out of service.

Ahead of the TV program, Noda criticized in an election campaign speech the former government led by the Liberal Democratic Party for allowing the construction of the No. 2 reactor.

"I wonder which government under what party permitted the establishment by leaving (geological) survey work solely in the hands of the (plant) operator," he said.

On the active fault, Noda said, "It became clear for the first time after an investigation by the Nuclear Regulation Authority with a high degree of independence."

"We are seeking to stop all nuclear power stations in the 2030s," said Noda, the president of the Democratic Party of Japan. "The LDP is for continuing nuclear power generation. There is a crucial difference" between the two.

Restart?

December 19, 2012

LDP energy review may lead to N-plant restarts

http://www.yomiuri.co.jp/dy/business/T121218004205.htm

The Yomiuri Shimbun

Major energy policy issues and LDP's plans

Restart of nuclear power plants	Make a decision on each plant within three years
Nuclear policy in medium and long term	Establish a new stable supply structure within 10 years
Renewable energy and energy saving	Introduce and promote as much as possible for the next three years
Nuclear fuel cycle	Carefully assess future policy
Electricity system reform	Create a competitive environment in which consumers can choose electricity providers

With next summer's House of Councillors election in mind, the incoming Liberal Democratic Party administration is certain to carefully work out an energy strategy that could lead to the restart of nuclear power plants.

Without nuclear power generation there is a great possibility of a power shortage in summer.

LDP President Shinzo Abe constantly criticized the Democratic Party of Japan as irresponsible for pledging to end nuclear power generation.

The LDP, which leaves open the possibility of nuclear power plant use, scored an overwhelming victory in Sunday's election. Parties that argued for abandoning nuclear power, such as the DPJ and Nippon Mirai no To (Tomorrow Party of Japan), suffered major defeats.

However, the LDP's coalition partner New Komeito also included an election campaign pledge to abandon nuclear power generation as soon as possible.

Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan, released a statement Monday saying the DPJ's strategy to halt use of nuclear power left utilities with problems that are extremely difficult to resolve.

Yagi, also president of Kansai Electric Power Co., said the federation hoped the new administration would review this policy.

A senior official of a government economic organization said, "The new administration will probably take considerable time to come up with a new energy policy" to avoid confusion within the administration over nuclear power policy, due to considerations related to the upper house election.

A subcommittee of the Economy, Trade and Industry Ministry's Advisory Committee for Energy and Natural Resources, which has been discussing the country's energy policy, will replace all of its members and make a fresh start, according to LDP sources.

Separately from medium- and long-term energy policies, the new administration has to consider whether to reactivate idled reactors.

Abe said political judgments would be made on whether to reactivate reactors after their safety has been confirmed.
But he needs to come up with concrete rules to allow suspended reactors to be reactivated--including the range of the government's responsibility and how to persuade local governments to understand that restarting reactors is necessary--by the end of this fiscal year.

If Abe fails to do this by then, when the Nuclear Regulation Authority will have completed an outline of safety standards for reactors, a power shortage next summer will likely become a reality.

Appointments of NRA staff members, including Chairman Shunichi Tanaka, were held up in the Diet due to opposition from some DPJ lawmakers. But this problem probably will be solved when the new administration takes over.
The LDP has not made clear its stance on electric power system reform.

METI's Expert Panel on Future Energy Policy is scheduled to compile measures for electricity system reform as early as next month, with complete liberalization of electric power retailing and separation of power producers and power transmitting and distributing companies as the main pillars.

Early restarts not on the cards

December 20, 2012

Early Japan reactor restarts unlikely despite LDP win

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212200087

REUTERS

Hopes within an anxious business community that Japan's idle nuclear power stations would be rapidly restarted will almost certainly have to be placed on the backburner despite last weekend's landslide election victory by a pro-nuclear party.

Shares of nuclear operators surged after the Liberal Democratic Party (LDP), with a reputation for close links to the nuclear industry, was returned to power. The reasoning was it would respond quickly to industry demands to get reactors going more than 18 months after the Fukushima nuclear disaster.

Tokyo Electric Power Co., operator of the crippled Fukushima plant, climbed 53 percent. Kansai Electric Power Co., the most nuclear reliant of the utilities, is up almost 18 percent.

But restarts are likely to be a slow process, subject to rules still to be drafted by a new nuclear regulator and to wary public opinion, mobilized against the industry since the March 2011 earthquake and tsunami that led to meltdowns at Fukushima.

"(Their) hopes might be a little premature, to the extent that they assume their travails are over and income streams ready to go right back into the black," said Andrew DeWit, a professor at Tokyo's Rikkyo University who researches energy policy.

And that will also mean continued high bills for fuel imports to run conventional power plants.
The Nuclear Regulation Authority (NRA), set up with more independence after the disaster discredited its predecessor, is expected to draw up safety standards by July 2013. It will judge whether plants are safe to restart, but its head says elected officials must take the final decision.

"It is unlikely the LDP-led government will want to interfere at an early stage with the operation of the recently established independent NRA, the creation of which they supported," said Tom O'Sullivan, a Tokyo-based energy consultant.

During its years of almost uninterrupted rule before the Democratic Party of Japan (DPJ) won power in 2009, the LDP helped foster Japan's "nuclear village," a web of vested interests including utilities, bureaucrats and lawmakers who promoted atomic power and kept independent oversight minimal.

Now the party says it will decide gradually on restarting reactors deemed safe by the watchdog over the next three years and devise an optimal energy mix over 10 years.

The LDP's caution may be explained in part by its coalition partner New Komeito's call to phase out nuclear power. Komeito's support is crucial for the LDP to maintain the two-thirds majority it needs in parliament's Lower House to overcome a policy deadlock as it has no majority in the Upper House.

Media surveys have shown a majority of Japanese want to abandon atomic energy by 2030, if not sooner. The outgoing DPJ government promised to end reliance on an energy source that supplied about 30 percent of Japan's needs before Fukushima.

The NRA has also signaled it will take a tougher stance on nuclear stations situated over possible seismic fault lines and prevent risky plants from restarting.

UNRELENTING

But pressure from business interests will be unrelenting.

Both the Keidanren, Japan's biggest business lobby, and the Federation of Electric Power Companies, called on the new government this week to bring nuclear back into the energy mix.

"They have opposed the policy of phasing out nuclear power which they claim is significantly increasing electricity charges for industrial and domestic customers, jeopardizing the international competitiveness of Japanese industry," O'Sullivan said.

Fossil fuel imports have risen sharply since the Fukushima meltdowns, helping push the country into a trade deficit that increased to the largest in 10 months in November.

Utilities have mostly increased purchases of natural gas. Liquefied natural gas (LNG) imports rose 11.6 percent to almost 80 million tons, in the first 11 months of 2012, from a year earlier, according to Ministry of Finance data issued on Dec. 19.

That is equal to one third of global trade in LNG in 2011.

The Fukushima disaster, the worst nuclear accident in the world in a quarter century, prompted the gradual shutdown of all Japan's nuclear reactors until there were none left operating in May 2011.

The DPJ government's decision to restart two reactors last July to prevent possible summer power shortages galvanized the country's previously dormant anti-nuclear movement and sparked the biggest demonstrations in decades.

With no evidence subsequently that the two reactors were vital to meet demand, protesters still gather en masse every week outside the prime minister's office and parliament.

"Any restarts might inflame public opinion, particularly in the large urban centers and those prefectures that do not host nuclear power facilities," O'Sullivan said.

Both political considerations and safety issues will probably mean no early decision on restarting reactors even if the NRA declares them safe, J.P. Morgan analysts said this week.

"It is uncertain if there will be restarts prior to peak summer power demand, as media polls suggest that over half of the Japanese population favors phasing out nuclear power," they said in a research note.

"The impending Upper House election, which takes place in July 2013, may also encourage policymakers to put off decisions to a later date."

Bad news (for utilities)

December 21, 2012
Active fault decision could affect all nuclear facilities in Aomori Prefecture

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201212210079

THE ASAHI SHIMBUN

The new industry watchdog said faults under a nuclear plant in Aomori Prefecture are likely active, an assessment that could have far-reaching ramifications for the operators of the many nuclear facilities in the prefecture.

The judgment of a Nuclear Regulation Authority panel on Dec. 20 is expected to prompt further studies not only at Tohoku Electric Power Co.'s Higashidori plant, but also at other nuclear-related operations in the northern end of Honshu.

The web of fault lines that may be active could force electric power companies to further postpone plans to restart their reactors and enhance quake-resistance measures at their plants, further hammering their bottom lines.

"It is our shared understanding that (Tohoku Electric's) argument that they are not active faults is totally unacceptable," said Kunihiko Shimazaki, an NRA commissioner and head of the panel that studied the fault lines--called F-3 and F-9--on Dec. 13-14.

Four outside experts are on the panel.

Despite the panel's assessment, Tohoku Electric repeated its argument to reporters that the faults are not active.

The panel's decision is unlikely to result in the immediate decommissioning of the sole reactor at Tohoku Electric's plant in Higashidori village because the fault lines do not run directly beneath it. Under current safety guidelines, reactors cannot be built directly above active faults.

But the F-3 fault is located only about 400 meters west of the reactor building and stretches several kilometers. The F-9 fault runs parallel to the F-3.

Tohoku Electric will be forced to study how possible earthquakes and land slippage triggered by the two active faults would affect the plant, prolonging the period when it will be allowed to restart the reactor.

Depending on the results of the study, the company could be required to spend huge sums to reinforce the plant against earthquakes.

Tohoku Electric, much like other regional utilities, has already been saddled with rising fuel costs for its thermal plants since all reactors were shut down in Japan after the accident at the Fukushima No. 1 nuclear power plant last year.
The panel experts said other faults known to exist at the Higashidori plant could also be active.

Heitaro Kaneda, associate professor of earth sciences at Chiba University and a member of the NRA panel, said Tohoku Electric should be prepared for a temblor with a magnitude exceeding 7.0 and its focus directly below the plant.
Shimazaki noted the difficulty in predicting the impact of an earthquake and the scale of the slippage because of the proximity of the faults.

"We have no adequate measures" to figure out them, Shimazaki said.

Tohoku Electric operates three other reactors. Those at its Onagawa plant in Miyagi Prefecture were damaged by last year's Great East Japan Earthquake and tsunami that led to the triple meltdown at the Fukushima plant.

When Tohoku Electric applied to the central government for a permit to build the Higashidori reactor in 1996, it acknowledged signs of strata slippage resembling those caused by active faults.

But the utility insisted they were created by clay that swelled up after the infusion of underground water.

The central government granted the permit in 1998, and the reactor went online in 2005.

However, the Nuclear and Industrial Safety Agency, the predecessor of the NRA, ordered the utility to conduct additional studies after guidelines for the quake resistance of nuclear facilities were revised in 2006.

Other operators could be affected by the panel's assessment of the fault lines.

The F-3 fault extends into the grounds of Tokyo Electric Power Co.'s Higashidori nuclear plant, which is under construction to the north of Tohoku Electric's plant of the same name.

"A string of faults also go into (the site of) TEPCO," Shimazaki said at the panel meeting on Dec. 20.

Work to construct the No. 1 reactor at TEPCO's plant was suspended after the Great East Japan Earthquake. About 10 percent of the work has been completed.

TEPCO, operator of the crippled Fukushima plant, could be asked to re-evaluate the Higashidori plant's ability to withstand the impact of a major earthquake.

In Oma, a town west of Higashidori, Electric Power Development Co. (J-Power) has completed about 40 percent of the construction work for a one-reactor nuclear plant.

Geologists now warn that faults running below Oma plant's premises could be active.

TEPCO and J-Power, like Tohoku Electric, argued that the signs of active faults were simply caused by swollen clay.
The NRA is set to conduct an on-site inspection of the Oma plant, depending on the results of J-Power's studies.

Particularly worrisome is the continental shelf edge fault running north to south for about 80 kilometers off the Pacific coast of the Shimokita Peninsula in the prefecture.

If active, it could unleash an earthquake with a magnitude of 8.0 or more, putting at risk the many nuclear facilities concentrated in the peninsula, according to the experts.

In addition to the Higashidori plants and the Oma plant, the peninsula is home to the spent nuclear fuel recycling plant in Rokkasho village and a temporary storage facility for spent nuclear fuel under construction in Mutsu.

Some experts say the branches of the continental shelf edge fault extend beneath the grounds of the reprocessing facility.

Shunichi Tanaka, chairman of the NRA, has indicated that additional studies will be needed on the faults of the entire peninsula.

The NRA panel concluded earlier this month that a fault under Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture is active, and that the plant's No. 2 reactor building likely sits directly above an active fault.

Safety first, really?

December 22, 2012

LDP likely to restart N-reactors

http://www.yomiuri.co.jp/dy/national/T121221004317.htm

The Yomiuri Shimbun

The Liberal Democratic Party and its likely coalition partner New Komeito will approve the restart of nuclear reactors as long as safety requirements are met, The Yomiuri Shimbun learned Friday.

The plan was revealed in the final draft of policy accords for formation of a coalition government that will be signed by LDP President Shinzo Abe and Komeito leader Natsuo Yamaguchi on Tuesday.

According to its draft statement on nuclear power and energy policy, "restarting will be based on the expert judgment of the Nuclear Regulation Authority, which pursues the safety-first principle in line with international standards."

The final draft reflects the LDP's campaign platform for Sunday's general election in which the party pledged it would aim to draw a conclusion on whether to approve restart of nuclear reactors within three years.

In its manifesto, Komeito pledged not to approve construction of new nuclear power stations. Taking this into consideration, the draft incorporated the wording of "reducing reliance on nuclear power generation as much as possible."

In addition to nuclear power and energy, the final draft lists policy accords on the following seven other items: reconstruction from last year's disasters and preventive measures; economic and pump-priming measures; comprehensive reform of social security and tax systems; revitalization of education; diplomacy and security; the Constitution; and administrative, political and government employee system reforms.

Regarding the Trans-Pacific Partnership free trade framework, the draft said it was possible that Japan would take part in the ongoing negotiations, saying that the country "will explore the best way of serving national interest."

In its campaign pledge, the LDP said it "opposes taking part in the talks as long as TPP is premised on abolishing tariffs without exceptions." In the final draft of its policy accords, however, the LDP seems to have changed its position.

"There is a possibility that TPP participation will be in Japan's national interest," a top LDP lawmaker said.
In connection with the comprehensive reform of social security and tax systems, the draft clearly states that the planned coalition government will surely carry out measures for low-income earners such as setting multiple tax rates when the rate for daily necessities is lowered.

Regarding stimulus and economic measures, the draft calls for implementing drastic monetary easing steps such as "setting a 2 percent inflation target" to lift Japan out of deflation.

New survey at Oi plant

December 28, 2012

Fault survey at Ohi plant may take months

http://www3.nhk.or.jp/daily/english/20121228_38.html

A senior official from Japan's Nuclear Regulation Authority has suggested surveys at the country's only online nuclear plant may take months before experts determine whether fissures at the facility are parts of an active fault or not.

Kunihiko Shimazaki, a commissioner from the regulatory body, made the announcement on Friday, after a 5 member team he is leading conducted an inspection at the Ohi plant in Fukui Prefecture on the Sea of Japan.

Shimazaki said the team plans to analyze what they have studied at the trench dug in the northern part of the plant's site, but he added a conclusion won't be easy to obtain.

He said the team needs to inspect another trench which the operator, Kansai Electric, plans to dig at a site closer to the reactor, as early as next February.

In a previous inspection in November, the team could not determine whether the fissures beneath the plant were parts of an active fault or traces of a landslide. So the team ordered the operator to double the length of the inspection trench to 100 meters.

Kansai Electric has been insisting the fissures are traces of a past landslide.

The expert team will continue the on-site inspection on Saturday.

The authority plans to recommend the halt of the 2 reactors that were restarted in July if it determines fissures running beneath the plant's important facilities are an active fault.

Second survey at Ohi nuclear plant
http://www3.nhk.or.jp/daily/english/20121228_19.html

Experts from Japan's nuclear regulatory body are conducting a second inspection at the country's only operating nuclear power plant, to determine whether fissures under the facility is an active fault.

The five-member Nuclear Regulation Authority team is inspecting a trench on Friday at the Ohi plant in Fukui Prefecture, on the Sea of Japan.

In an on-site inspection in November, the team was unable to determine whether or not fissures running beneath the plant were an active fault.

The team ordered the plant's operator, Kansai Electric, to double the length of the trench to 100 meters for further inspection.

The team will meet early next year to form an assessment based on the results of Friday's inspection.

Kansai Electric has been insisting that the fissures are caused by land slips and are not an active fault.

The plant's numbers 3 and 4 reactors resumed operation in July, the first to do so since the March disaster last year.

The regulatory body says it will ask the operator to shut down the plant if the fissures are confirmed to be an active fault. Government guidelines ban building key facilities in such areas.

The experts have already determined that fissures beneath two other nuclear plants are probably active faults.

Not ready to restart

February 2, 2013

NRA safety rules may keep reactors offline for years

http://www.japantimes.co.jp/news/2013/02/02/national/nra-safety-rules-may-keep-reactors-offline-for-years/#.UQwvr_L1tEs

Bloomberg, JIJI

The Nuclear Regulation Authority has approved an outline of safety standards for severe accidents at atomic power plants that may require years of reinforcement work for some reactors idled after the Fukushima disaster.

Nuclear plants will need to build secondary control centers at least 100 meters from reactor buildings to manage emergency cooling systems and radiation filter vents, according to the rules approved Thursday. They also stipulate tougher tsunami defenses.

Under the outline, however, plant operators are not required to have implemented all of the measures when they apply for rebooting their nuclear plants. For instance, operators just need to submit plans on the construction of secondary control centers, which may take some time to build, when applying to restart reactors.

Measures that must be immediately implemented are basically enough to prepare for severe accidents, said NRA Commissioner Toyoshi Fuketa.

The leniency, however, may spark speculation that the government set the exemption because it wants power firms to restart halted reactors as soon as possible.

It will take three to four years to finish all the necessary measures, Fuketa told a news conference. In addition, firing up a reactor that has been halted for a long time will pose a different safety concern, he said.

Utilities will need to secure transportable spare power sources and pumps in case their reactors lose ordinary power sources and reactor cooling functions.

Operators of boiling water reactors, like those that suffered core meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 plant, are required to immediately install venting facilities with filters that will be used to release radioactive steam to ease pressure inside reactors in an emergency.

Meanwhile, firms operating pressurized water reactors, used mainly in western Japan, are allowed to take time to install such equipment because such containers are large and it takes more time for the pressure inside to increase.

All but two of Japan's 50 reactors have been idled for safety assessments after the earthquake and tsunami of March 11, 2011, caused three meltdowns and radiation leaks at Fukushima No. 1. The NRA was set up after the crisis started to provide reviews independent of the industry ministry, which used to oversee the nuclear power sector.

The NRA will set the final standards by July after soliciting public opinions.

Earlier this week, another NRA panel led by Kunihiko Shimazaki, a seismologist and agency commissioner, approved rules for assessing earthquake and tsunami risks. Currently, power companies are required to assess geological faults using rock and earth samples from the last 120,000 to 130,000 years, or the Late Pleistocene era. The new rules require investigation of faults going back 400,000 years if studies of Late Pleistocene geology are inconclusive.

The NRA is investigating quake faults under nuclear plants owned by Kansai Electric Power Co., Tohoku Electric Power Co., Japan Atomic Power Co., Hokuriku Electric Power Co. and Japan Atomic Energy Agency. The widened definition may prompt the regulator to investigate faults under other atomic energy facilities, Murakami said.

On tsunami defenses, utilities must estimate the risks based on the latest scientific assessments, according to rules approved by the Shimazaki panel. Tsunami defenses including seawalls and watertight doors must be able to withstand the largest estimated waves, under the rules.

After the Fukushima disaster, it was revealed that Tepco's own research showed the No. 1 power plant could be hit by tsunami in excess of 10 meters, but its defensive seawall was only 5.6 meters high. The tsunami that wrecked the plant in March 2011 reached 13 meters.

With both safety standards, power companies will be required to take steps to prevent their reactors and reactor containers from being severely damaged even in case of a huge natural disaster or terrorist attack.

Utilities are braced for massive costs to take the required steps. Kyushu Electric Power Co. President Michiaki Uriu said the firm's costs are likely to reach tens of billions of yen. The additional costs are likely to be passed on to customers.

Bots to clean No. 1 plant

Kyodo

Tokyo Electric Power Co. will start using robots from late July to accelerate radiation mitigation work in the damaged buildings housing the Fukushima No. 1 plant's three crippled reactors.

Tepco said Thursday it needs workers to get into the buildings to conduct preliminary surveys to decommission the reactors, which contain melted fuel.

Under the plan, remote-controlled robots are to clean the interiors of reactor buildings 1 to 3 using high-pressure water and other means.

The robots are being used on a trial basis at the Fukushima No. 2 plant to check whether their abilities can be improved.

The government and Tepco plan to spend around 40 years scrapping the four reactor units that were severely damaged during the nuclear crisis, including the three that suffered core meltdowns, causing widespread fallout.

February 1, 2013

Agency drafts new safeguards for reactors that may delay restarts

http://ajw.asahi.com/article/0311disaster/recovery/AJ201302010085

THE ASAHI SHIMBUN

New standards being drafted by the Nuclear Regulation Authority (NRA) call for strict new safety measures that could delay the restart of idled reactors and place a heavy financial burden on operating companies for the cost of retrofitting plants.

The wide-ranging measures would deal with some of the failings encountered during the 2011 disaster at the Fukushima No. 1 nuclear plant, such as difficulty venting over-pressured reactors, a lack of back-up power sources, and a control room that eventually became unusable.

Broadly, the measures would require utilities to prepare each reactor for a serious accident arising from an earthquake or tsunami, as well as a fire, plane crash or terrorist attack.

The measures would become legally binding, whereas compliance with similar measures in the past was voluntary.

The new standards would apply to all of Japan's 50 functional reactors, 48 of which have remained idle since 2012. **Those reactors that fail to meet the new requirements would be ineligible, in principle, for restarts.**

Implementing all new measures could require several years of work, **so a grace period is envisaged to allow operators to resume power generation before they have completed all retrofitting work.**

But people familiar with the plans said such exceptions would be granted only for certain items of equipment, suggesting significant delays in restarting reactors would nevertheless be likely.

The standards envisage a scenario like that of 2011, when a double-whammy quake and tsunami previously billed as improbable struck northeastern Japan.

To ensure continued electricity supply to the cooling systems of reactors, the plan would mandate installation of multiple power sources adjacent to each reactor. Plant operators would need to be in a position to deploy several fire trucks and power-supply vehicles at each reactor building. And the generators, pumps and storage tanks of the cooling systems would need to be located on high ground to guard against the risk from flooding.

To guard against the release of radioactive materials in an accident, filtered venting equipment would need to be installed at reactor cores so that operators can lower the pressure inside without blasting particles into the atmosphere.

At each plant, operating companies would need to construct buildings capable of withstanding an earthquake, tsunami or radioactive contamination to serve as an emergency disaster response center.

The new standards also call for additional mechanisms to cool the reactor core in the event that the central control room is destroyed by an event such as an airplane crash. One measure would mandate the construction of a second, back-up control room off-site. Another would require the replacement of vulnerable electric cables at the plant with flame-resistant ones.

LONG DELAY

The new safety standards will be combined with separate proposals compiled Jan. 29 by a panel of experts acting under the NRA to prepare for an earthquake or tsunami. Officials would now open the proposals to consultation and aim to adopt them formally in July.

Once the standards become law, the agency will receive applications from electric power companies for reactor restarts and will inspect the safety measures at each site.

The new standards could prove to be especially burdensome for operators of boiling water reactors, such as those at the Fukushima No. 1 plant. Such reactors have a particularly small containment vessel, meaning they are vulnerable to a rapid rise in internal pressure in the event of a meltdown.

For that reason, the new standards call for the installation of two separate mechanisms to vent pressure through a system fitted with a filter to catch escaping radioactive materials.

Sources said the agency will require that at least one such venting equipment be already in place when electric power companies submit requests for permission to resume the reactor's operation.

The NRA brought up the question of requiring two independent mechanisms during consultations with representatives of electric power companies. They responded by saying such redundancy was unnecessary, but the agency over-ruled them.

Of Japan's 50 nuclear reactors, 26 are boiling water reactors and none so far possesses filtered venting equipment of the kind the rules would require.

Hokuriku Electric Power Co. and Chugoku Electric Power Co. have announced plans to fit such devices at their Shika and Shimane plants, respectively, but the timetable for installation foresees completion in fiscal 2015. An official with Chubu Electric Power Co. said there is a lag of two to three years between deciding to invest in such equipment and its actual installation.

It is likely that Japan's boiling water reactors will remain idle for some time yet if the agency decides to mandate such equipment when the new safety standards formally take effect in July. One of the NRA commissioners, Toyoshi Fuketa, said he did not think operators of such reactors would be submitting applications to resume operations in July.

By contrast, a pressurized water reactor has a larger containment vessel and therefore a less urgent need to ease the contents in the event of an accident. Such reactors would likely receive a grace period for the installation of filtered venting equipment.

A decision has yet to be made on whether a grace period will be granted for implementing other required measures, such as creating quake-resistant emergency response centers and secondary, off-site reactor control rooms.

Only seven nuclear plants currently possess buildings that could be used as the former. Those that don't could find that constructing a center comprises the costliest part of the new requirements, approaching the cost of building up seawalls to protect against tsunami waves.

Kansai Electric Power Co. has estimated it would need to spend 285 billion yen ($3.1 billion) in medium- to long-term safety measures for the 11 reactors at its three nuclear plants. Chubu Electric has said it would need to spend about 150 billion yen on anti-tsunami measures alone at its Hamaoka plant.

And because some nuclear plants have separately been identified as sitting on or near active faults, only a few reactors operated by Shikoku Electric Power Co. and Kyushu Electric Power Co. are expected to file applications to resume operations in July.

HEAVY COST

The new safety standards would place a heavy financial burden on electric power companies because it may cost several tens of billions of yen to make even one reactor comply.

"It could mean that some electric power companies will face excess liabilities as early as next year," said an executive at a financial institution with loans in the sector.

Although five electric power companies operate boiling water reactors, the two utilities that will be especially hard-hit by the new standards are Tokyo Electric Power Co., the operator of the Fukushima No. 1 plant, and Tohoku Electric Power Co., which has been recording large losses ever since the disaster.

TEPCO's corporate recovery plan includes the envisaged resumption of power generation at the seven reactors at its Kashiwazaki-Kariwa plant in Niigata Prefecture from April 2013, a move which it believes will return the company to profitability in fiscal 2013.

However, work to install filtered venting equipment has begun only at one of the plant's reactors. Any delay would force the utility to revise its recovery plan.

It may consider pushing up the prices for electricity it sells to users but would likely face huge resistance. It could also prompt some customers to argue that the company should instead be placed under legal bankruptcy protection.

The outlook for Tohoku Electric is equally bleak.

Serving the region hit hardest by the quake and tsunami, the power company has sustained huge losses since 2011. It has said it will try to cope by raising household electric rates by 10 percent this summer.

But it may now need to consider an even greater price hike to meet the cost of reactor upgrades, further burdening local disaster victims as they try to rebuild their lives and the local economy.

TOUGH DECISION FOR ABE

During questioning in the Diet on Jan. 31, Prime Minister Shinzo Abe spoke of his government's readiness to do everything necessary to improve nuclear safety. He also suggested it would allow those reactors that meet the new standards to restart.

"We will make every effort to ensure an energy supply so there are no problems in the daily lives of the people and for the economy," Abe said.

But recognizing the need to retain public confidence, the Abe administration intends to respect whatever decisions are made by the NRA.

People close to Abe have said any decision on resumption of operations could only come after the adoption of the new safety standards.

However, the Abe administration could face a dilemma if the new safety standards significantly raise the bar for reactor restarts.

Some within the ruling Liberal Democratic Party have spoken of the need to pressure the NRA.

"It should be overseen by a Lower House special committee responsible for nuclear energy," said one participant at a Jan. 29 meeting of LDP executives.

Pressure of the opposing kind continues to be applied by the weekly Friday night anti-nuclear protests outside the prime minister's official residence.

And if the electricity supply reaches capacity this summer despite efforts to conserve energy, the Abe administration may find itself in the position of having to make a political decision about resuming operations at nuclear reactors.

"We will consider various alternatives from now on, as we prepare for the summer," said Chief Cabinet Secretary Yoshihide Suga at a Jan. 31 news conference.

THE ASAHI SHIMBUN

Time to restart, says industry

March 30, 2013

Abe's advisory council calls for early restart of nuclear reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303300054

By TOMOYA FUJITA/ Staff Writer

Private-sector members in Prime Minister Shinzo Abe's economic growth council have submitted a proposal calling for the early restart of idled nuclear reactors despite continued public resistance.

The proposal was compiled by an Industrial Competitiveness Council subcommittee and submitted to the council at a meeting on March 29.

The council is currently discussing Abe's growth strategy, and the subcommittee, led by Yasuhiro Sato, president of Mizuho Financial Group Inc., has been tasked with tackling issues in the electric power industry.

The proposal outlines measures that will be described in the government's growth strategy, including the promotion of renewable energy, such as wind power, and higher-efficiency of thermal power generation, as well as the separation of electricity transmission from generation.

But the proposal seems to strongly favor industries seeking reactor restarts, despite widespread calls among the public for the government to be cautious due to the Fukushima No. 1 nuclear power plant disaster.

"The government should restart nuclear reactors as early as possible and maintain nuclear power generation as a national policy so that it accounts for a certain ratio of the energy supply in Japan," said committee member Sadayuki Sakakibara, chairman of Toray Industries Inc.

According to the subcommittee, nuclear power plants are needed to fill the role of providing cheap, reliable energy.

However, some of the private-sector members have expressed opposition to the suggestion, emphasizing instead the need to separate the electricity transmission business from major electric power companies.

"The government must be cautious in restarting nuclear reactors," said Takeshi Niinami, president of Lawson Inc., after the March 29 meeting.

Heizo Takenaka, a professor of economics at Keio University, added: "The government should take a cautious stance in relation to the restart of nuclear reactors. Rather than the issue of the restart, the government should first resolve the problem of high (operating) costs of electric power companies."

During the subcommittee meeting, Takenaka insisted that the government should first tackle the separation issue. However, his assertion was described only as an "individual opinion" in the outline of proposals.

The proposal noted that such a separation is expected to promote competition and help to make the electricity bills cheaper. But in a show of further consideration for the industry, it also said that the costs of making the separation requires "certain attention and measures."

Hiroshi Mikitani, chairman and president of Rakuten Inc., said, "What is important is to produce competition (among companies) based on the viewpoints of the people."

In the March 29 meeting, industry minister Toshimitsu Motegi said, "The government plans to steadily implement the separation of the electricity transmission business from major electric power companies."

However, discussions on the issue did not progress.
Abe says he plans to make the separation of electricity generation and transmission a key policy in his growth strategy. But the Industrial Competitiveness Council apparently regards the restart of idled nuclear reactors as the key feature in the growth strategy

High and costly hurdles to restart

April 10, 2013

New NRA rules impose costly roadblocks to restart idle reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304110062

By JIN NISHIKAWA/ Staff Writer

For the next several years at least, Japan will probably have very limited ability to generate electricity through nuclear power.
This is because the vast majority of the nation's idle nuclear reactors are unlikely to resume operations anytime soon due to proposed new regulation standards that set high and costly hurdles.

On April 10, the Nuclear Regulation Authority released its proposal for new regulation standards that are expected to go into effect in July.

For electric power companies to resume operations at nuclear plants, their reactors will have to meet the new standards and pass an NRA appraisal.

Although some of the new standards have a grace period, some of the measures that will be required could take years for the utilities to install. That means a majority of the 48 reactors that are currently offline will not likely resume operations over the next few years.

One measure included in the new standards, which is based on lessons from the 2011 reactor meltdowns at the Fukushima No. 1 nuclear power plant, is the requirement for installing venting equipment with a filter attached for boiling water reactors like the ones at the Fukushima plant. The lack of such equipment led to the release of large volumes of radioactive materials during the Fukushima nuclear disaster.

However, the installation of such equipment normally takes several years. That means operations will not likely be resumed in the near future at the 26 boiling water reactors operated by Tohoku Electric Power

Co., Tokyo Electric Power Co., Chubu Electric Power Co., Hokuriku Electric Power Co., Chugoku Electric Power Co. and Japan Atomic Power Co.

Another obstacle for resuming operations is the construction of coastal levees to prevent tsunami from swamping a nuclear reactor. The tsunami that hit the Fukushima No. 1 plant on March 11, 2011, caused a loss of electric power sources that resulted in meltdowns at three reactors.

Again, however, construction of such levees often takes several years.

Another problem facing some reactors is the presence of active faults at the site. Central government officials plan to study active faults that may lie within the grounds of the Shika nuclear plant operated by Hokuriku Electric and the Mihama nuclear plant operated by Kansai Electric Power Co. Those studies will also delay the resumption of operations at those plants.

Candidates for early resumption of operations are reactors that do not use the boiling water system for generation. These include the No. 3 reactor at the Ikata nuclear plant operated by Shikoku Electric Power Co. and the No. 1 and No. 2 reactors of the Sendai nuclear plant in Kagoshima Prefecture operated by Kyushu Electric Power Co.

The operators of those reactors are expected to submit applications with the central government to resume operations in July after the new standards go into effect.

The only reactors now in operation--the No. 3 and No. 4 reactors at the Oi nuclear plant--will be allowed to operate until September, when they will face another periodic inspection, before facing an appraisal of whether the new standards are being met.

Based on the lessons from the Fukushima nuclear crisis, each reactor will be required to have several possible electric power sources to prevent a severe accident caused by a failure to cool the reactor.

Although plant operators will also be required to install emergency control rooms that are capable of remote-controlled cooling of reactor cores, they will be given a five-year grace period because of the time needed to construct such facilities.

A major problem facing some of the older reactors in meeting the new standards will be installing flame-retardant electric cables inside reactor buildings and other areas of the plants as a precaution against fires.

Excluding the Fukushima No. 1 and No. 2 plants, 12 of the 14 reactors that have been in operation for more than 30 years have not installed such flame-retardant cables.

While some electric power companies have tried to get around the provision by painting cables with materials to prevent the spreading of fires, the new standards call for a high level of flame-resistance that may force the utilities to replace all of the cables. Experts said replacing all of the cables would be a major technological challenge.

The strict new standards will likely mean that some electric power companies may decide to decommission older reactors rather than spend huge amounts of money to upgrade them.

Stricter standards regarding active faults will also be a burden for the utilities. The companies will have to expand their studies about the existence of active faults 400,000 years into the past.

Under the stricter interpretation, that may mean the reactor buildings of the No. 1 and No. 2 reactors at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture could lie directly above an active fault.

The utilities have criticized the stricter standards, as well as the manner in which the central government will determine if an active fault exists, because the companies will not be able to resume operations at a reactor if an active fault is found to lie directly below the reactor building.

Can Kepco restart Takahama?

Kepco mulls Takahama plant restart
Kyodo
Apr 28, 2013

http://www.japantimes.co.jp/news/2013/04/28/national/kepco-mulls-takahama-plant-restart/#.UXzvqsoR2vM

OSAKA – Kansai Electric Power Co. could apply for government permission in July to restart reactors 3 and 4 at its Takahama nuclear plant in Fukui Prefecture, sources said Saturday.

The utility is eyeing a resumption of operations at the plant after confirming whether it is in line with the Nuclear Regulation Authority's new safety requirements that will take effect in July, the sources said.

Kepco operates the Oi nuclear power plant, also in Fukui, which boasts the only two operational reactors nationwide after safety fears arising from the 2011 Fukushima meltdowns disaster led to the suspension of all atomic energy generation.

According to the sources, the company considers it essential to also fire up the two Takahama reactors to secure an additional stable supply of electricity. But even if Kepco obtains state approval to restart the Takahama facility, on the Sea of Japan coast, it will still have to win consent from the local community, making a resumption of operations uncertain.

Kyushu Electric Power Co. may also ask for government permission around the same time to reactivate the Sendai nuclear power station in Kagoshima Prefecture, while Shikoku Electric Power Co. could seek approval to restart the Ikata atomic plant in Ehime Prefecture.

The NRA's examination process may take longer if these two utilities also apply for a resumption of nuclear operations, the sources said.

In a bid to meet the watchdog's new requirements, Kepco is taking measures to enhance the safety of the Takahama reactors, including the construction of additional tsunami barriers. The utility's president, Makoto Yagi, has repeatedly said that once these safety measures are confirmed, Kepco intends to ask for permission to bring reactors 3 and 4 back online.

The company has already factored in the reactors' reactivation while calculating a hike of household electricity rates in its Kansai service area.

Autumn restart

Minister indicates autumn restarts of nuclear reactors

April 24, 2013
THE ASAHI SHIMBUN
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304240061

Industry minister Toshimitsu Motegi on April 23 said an idled nuclear reactor could be restarted as early as autumn, the first time a Cabinet member has mentioned a timetable for bringing at least one of the nation's 48 suspended reactors back online.

On a BS Japan Corp. TV program, Motegi was asked about the earliest possible date for the restart of nuclear reactors.
"I think it will probably be in autumn," he replied.

Currently, 48 of the nation's 50 nuclear reactors are idled, a consequence of the accident at the Fukushima No. 1 nuclear power plant following the Great East Japan Earthquake and tsunami on March 11, 2011.

Only the Nuclear Regulation Authority, an independent nuclear industry watchdog, can decide whether an idled reactor can be restarted. Motegi's statement could affect the NRA's decision on restarts, as the agency prepares to put in place new safety standards on earthquake and tsunami preparedness for nuclear plants.

"The world's strictest regulation standards, drawn up by the independent NRA, will be completed on July 18," Motegi said.
Following the NRA's inspections based on the new standards, an autumn restart of a reactor could be expected, he said.
When asked whether the government can obtain the understanding of residents living near reactors, Motegi said, "We are making an effort to do so."

The Abe Cabinet has previously said the NRA will complete examinations of all reactors within three years, and the government will allow restarts from those reactors that are confirmed to be safe. However, no specific goal for the restarts has been given.

JAIF on nuke restart

01.05.2013_No111 / News in Brief

JAIF Chairman Calls For Early Decision On Reactor Restarts http://www.nucnet.org/all-the-news/2013/05/01/jaif-chairman-calls-for-early-decision-on-reactor-restarts

1 May (NucNet): Japan still needs nuclear energy as a power source and an "appropriate political judgment" must be made as soon as possible on the restart of the country's reactors, most of which remain offline after the March 2011 Fukushima-Daiichi accident, the chairman of the Japan Atomic Industrial Forum (JAIF) has said.

In his opening address to the 46th JAIF annual conference in Tokyo, Takashi Imai stressed the importance of restarting plants whose safety has been confirmed. He said they need to be restarted not just because of the immediate need for energy, but also to maintain a stable energy supply and ensure energy security.

Mr Imai said it was Japan's responsibility to share the experience and information from the Fukushima-Daiichi accident and contribute to improving nuclear safety.

He emphasised that the expansion of nuclear energy overseas would continue to be part of Japan's growth strategy.

Referring to new nuclear safety standards due to be issued by Japan's Nuclear Regulation Authority (NRA), Mr Imai said it was important to maintain "total transparency" and "hear the opinions of nuclear operators and domestic and overseas experts" with the aim of implementing true, effective regulation.

On the restoration and reconstruction of the area around the plant, Mr Imai said wisdom should be collected from all corners of the world in the application of "human, capital and material resources" to solve the matter at hand.

He noted the nuclear industry's support for the creation of an international R&D centre in Fukushima for decommissioning technology and said that Japan, as a whole, needed to better understand the effects of radiation.

In March 2013, Japan's prime minister told parliament that idled nuclear reactors will be restarted if it is proven safe to do so.

Shinzo Abe said he would work with the NRA to establish a new safety culture to strengthen the safety of the country's nuclear plants in the wake of Fukushima-Daiichi.

Only two of Japan's 50 commercial reactors have restarted since the Fukushima-Daiichi accident – Ohi-3 and Ohi-4.

Ohi-3 resumed electricity generation on 5 July 2012 after an extended outage, ending a 60-day period without any of Japan's 50 reactors online.

Confusion reigns as deadline nears

May 9, 2013

Confusion prevails as decision deadline approaches on Tsuruga nuke plant

http://mainichi.jp/english/english/newsselect/news/20130509p2a00m0na007000c.html

Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka stated during a regular press conference on May 8 that there is no need to rush toward reaching a final conclusion on whether there is an active fault line running directly underneath the Tsuruga nuclear power plant in Fukui Prefecture.

The comments revealed the possibility that the decision may be postponed until sometime after July, when procedures for restarting the reactor are set to begin.

Following numerous questions from reporters regarding the intent of his comments, however, Tanaka backtracked from his earlier position, releasing a statement indicating that "a consensus among NRA members with respect to the issue would be reached without delay."

If the NRA concludes that the fault line is indeed active, the decommissioning of reactor No. 2 will likely ensue, along with administration problems for the Japan Atomic Power Co. (JAPC).

JAPC has indicated that it will undertake all measures at its disposal to deal with the matter, including the possibility of taking legal action against the government.

The comments by Tanaka have exposed the **confusion existing with regard to this matter as the deadline approaches for making a final decision.**

An inspection team comprised of influential individuals from the regulatory panel released a draft report in January stating that there was a "high possibility that the fault line is active." This position is not expected to change with respect to a follow-up report due to be compiled at a meeting scheduled for May 15. The NRA will render a conclusion based upon the report.

JAPC has requested that the final decision be held off until the results are released from an additional study that is scheduled to be completed by the end of June.

Tanaka stated during a meeting of the inspection team members held last December, "Under present conditions, (the No. 2 reactor) cannot be analyzed as safe" -- thereby indicating that the restart was not likely to be approved. He later clarified on May 8, however, that he "may have spoken too strongly" with regard to the matter.

Hamaoka : We don't want it, say 8 mayors

May 14, 2013

Mayors of municipalities near idled Hamaoka nuke plant oppose reactivation

http://mainichi.jp/english/english/newsselect/news/20130514p2a00m0na012000c.html

SHIZUOKA -- The mayors of eight Shizuoka Prefecture municipalities around the idled Hamaoka Nuclear Power Plant have voiced opposition to the reactivation of the power station at the current stage, a Mainichi Shimbun survey shows.

Some of the mayors demanded that Chubu Electric Power Co. establish the methods of disposing of spent nuclear fuel as a precondition for the resumption of operations at the plant in Omaezaki. The survey results show that it is becoming increasingly difficult to restart the nuclear power station.

"We'll do our best to enhance the safety of the plant and reassure the local community and the public as a whole," an official of the utility said, commenting on the results of the poll.

The Mainichi Shimbun conducted the survey as two years have passed since the power plant was stopped on May 14, 2011, at the urging of the national government following the outbreak of the Fukushima nuclear crisis. The Mainichi sent a questionnaire on the issue to Shizuoka Gov. Heita Kawakatsu and the mayors of 11 municipalities, all or part of which fall under the so-called urgent protective action planning zone within a radius of 30 kilometers from the nuclear plant.

The mayors of Makinohara, Kikugawa, Kakegawa, Fukuroi, Iwata, Fujieda, Yoshida and Mori said they cannot agree to reactivation of the power plant under the current conditions. Four of them, including Makinohara Mayor Shigeki Nishihara, replied that they would oppose resumption of operations at the Hamaoka plant even if the national government confirmed its safety.

Nishihara went on to demand that the plant be permanently shut down. "The power station is situated in an area where the epicenter of the Tokai quake is expected to be located. There is a large population and industrial facilities are concentrated around the plant," Nishihara said.

The mayors of Kikugawa, Fukuroi, Iwata and Fujieda as well as Shizuoka Gov. Kawakatsu demanded that a method for the disposal of spent nuclear fuel be firmly established as a precondition for the resumption of operations at the plant.

Shigeo Ishihara, mayor of Omaezaki that hosts the plant, stopped short of clarifying his stance toward reactivation of the plant, while pointing to the need for nuclear plants.

"It's premature to talk about whether the plant should be reactivated as the national government hasn't worked out safety standards yet," he answered. "Nuclear power is necessary because fuel costs have risen and little progress has been made on the practical use of renewable energy."

Shizuoka Gov. Kawakatsu said he will hold a prefectural referendum on the pros and cons of resuming operations at the power station if he is re-elected in the June gubernatorial race

Close Tsuruga for good?

Panel to conclude Tsuruga nuclear reactor sits above active fault

http://mainichi.jp/english/english/newsselect/news/20130515p2g00m0dm008000c.html

TOKYO (Kyodo) -- A panel under the Nuclear Regulation Authority is set to finalize a report Wednesday saying that a geologic fault running beneath a reactor in western Japan is active, raising the possibility of the unit's permanent shutdown.

The move is expected to lead NRA commissioners to decide that the No. 2 unit of Japan Atomic Power Co.'s Tsuruga plant does not meet the conditions for undergoing a safety assessment that the country's reactors need to clear to resume operations in the wake of the 2011 Fukushima Daiichi complex disaster.

Japan Atomic Power will still have a chance to seek a review of the panel's judgment if it can provide new findings, but it is doubtful that the company can present convincing data disproving the activity of the fault in question.

In quake-prone Japan, nuclear power plant operators are not allowed to build reactors and other facilities with important safety functions directly above faults that could move in the future.

The panel, consisting of NRA commissioner Kunihiko Shimazaki and four academics from outside, had agreed at its first gathering in December after a field survey that the No. 2 reactor is likely to be sitting above an active fault.

But it spent five more months on further discussions amid criticism from Japan Atomic Power and some ruling Liberal Democratic Party lawmakers that the panel had not sufficiently listened to the arguments of the plant operator.

Japan Atomic Power officials have called on the panel to wait until June for more data to come up, but Shimazaki said during the panel's previous meeting in April that an assessment at the present moment will be compiled at the next meeting scheduled for Wednesday.

Based on a large-scale trench excavation investigation conducted at the two-unit nuclear complex in Fukui Prefecture, the panel is expected to conclude that a zone of crushed rock called D-1, running beneath the No. 2 reactor, is an active fault.

The D-1 is feared to move together with a confirmed major active fault called Urazoko, which is located only about 200-300 meters away from the No. 1 and No. 2 reactor buildings.

Japan has been reviewing the activity of fracture zones existing beneath nuclear facilities following the Fukushima crisis, which was triggered by a huge earthquake and tsunami on March 11, 2011. The Tsuruga plant is one of the six facilities the NRA has decided to inspect from that aspect.

The panel's envisioned assessment, meanwhile, is expected to add pressure to the financial standing of Japan Atomic Power, which is unable to sell electricity to its major shareholders such as Tokyo Electric Power Co. and Kansai Electric Power Co. because all of its three reactors are now offline.

Restarting Japan Atomic Power's two other reactors -- the No. 1 unit at the Tsuruga plant and one reactor at the Tokai No. 2 plant in Ibaraki Prefecture -- is also unlikely to be easy due to the oldness of the facility and due to local opposition.

The company is currently surviving on such revenues as basic fees from major utilities that have contracts to receive electricity, but the utilities are also struggling amid increasing fuel costs for thermal power generation to make up for the loss of nuclear power.

Of the 50 commercial reactors in Japan, only two operated by Kansai Electric are online.

Panel to conclude reactor sits on active fault
http://www3.nhk.or.jp/nhkworld/english/news/20130515_07.html

An expert panel at Japan's Nuclear Regulation Authority is to conclude that one of the country's nuclear reactors sits on an active fault.

The panel is to release a final report on its 6-month probe into the Number 2 reactor at the Tsuruga nuclear power plant in Fukui Prefecture, central Japan.

The panel said in its draft report in January that the fault may be active.

The plant operator, Japan Atomic Power Company, has presented data and photos to disprove that the fault is active. But the panel rejected the evidence as unconvincing.

The government's guidelines ban plant operators from building reactors right above active faults due to concerns about damage from earthquakes.

If the plant operator cannot show data that overturns the panel's argument, the Number 2 reactor could be scrapped. It is currently offline for safety inspections.

The operator says it will conclude its own survey into the fault by June. The panel says it may review the report if the operator comes up with new findings.

The panel's probes into suspected active faults cover 6 nuclear power stations. Tsuruga is the first for which a final report will be released.

The Nuclear Regulation Authority plans to decide what to do with the Tsuruga reactor as early as next week.

Floating alternative

May 17, 2013

World's 1st floating hybrid power generation system set to test in fall

THE ASAHI SHIMBUN
http://ajw.asahi.com/article/economy/technology/AJ201305170066

Taking advantage of continuous sea breezes and the ocean currents below, the world's first floating hybrid power-generation system, to be installed off the coast of Karatsu, Saga Prefecture, will be tested in autumn.

Saga Prefecture and MODEC Inc., the system developer, made the announcement on May 16.

Leading offshore technology company MODEC specializes in floating oil and gas production and storage facilities. Making use of its expertise of facilities floating on the ocean, the company developed a new hybrid power generation system that generates electricity both via a windmill as well as a water wheel circulating the water under the sea by tidal currents.

The new system, Savonius Keel and Wind Turbine Darrieus, dubbed SKWID, utilizes a long vertical wind turbine, designed to capture twice as much wind as compared to land-based wind turbines of the same diameter, resulting in the delivery of twice as much power.

The water wheel rotates at the speed of tidal currents so as not to harm the marine ecosystem.

Tsuruga

Decision a step closer to dooming reactor restart

NRA backs Tsuruga active fault finding

http://www.japantimes.co.jp/news/2013/05/23/national/nra-backs-tsuruga-active-fault-finding/#.UZ0KYEpsFEs

Kyodo

The Nuclear Regulation Authority on Wednesday accepted an assessment that reactor 2 at the Tsuruga nuclear plant in Fukui Prefecture is sitting on an active fault, increasing the likelihood that the unit can never be restarted.

"We have received a report from a panel of experts that said there is an active fault. . . . I think there is a need to accept the conclusion sincerely," NRA Chairman Shunichi Tanaka told a meeting attended by other commissioners to discuss the panel's conclusion.

It is the first time regulatory authorities have acknowledged that an existing reactor is located on a fault that is feared might shift. The judgment may leave plant operator Japan Atomic Power Co. with no option but to scrap reactor 2.

The NRA also wants Japan Atomic Power to study how the spent-fuel pool inside the No. 2 reactor building would be affected in the event the fault moves.

Most of Japan's nuclear reactors are currently offline because of the Fukushima No. 1 complex disaster that started in 2011, and they are required to undergo the NRA's safety assessment process to check whether they satisfy the new regulatory requirements to be introduced in July before they can resume operations.

The NRA, however, is unlikely to go ahead with a safety review for reactor 2 of the two-unit Tsuruga plant, given the panel's assessment, if Japan Atomic Power submits an application.

The panel, consisting of NRA Commissioner Kunihiko Shimazaki and four outside experts concluded last week that a zone of rock fragments called D-1, running directly beneath reactor 2, is an active fault, rejecting Japan Atomic Power's objections.

The panel also said the D-1 fault could move along with a confirmed major active fault called Urazoko that is located about 200-300 meters from the reactor 1 and 2 buildings, and may affect facilities located above.

Nuclear plant operators are not permitted to build or operate reactors and other important safety facilities directly above active faults — currently defined as those that have moved in the last 120,000 to 130,000 years.

Japan Atomic Power, however, is still conducting its own investigation at the plant in a bid to overturn the panel's assessment, while the company's president, Yasuo Hamada, said last week the firm may eventually have to consider taking the issue to court.

Major utilities holding a stake in Japan Atomic Power are closely watching how the issue unfolds, fearing that the company may fall into negative net worth if it has to scrap reactor 2 because of a shortage of decommissioning funds and loss in asset value.

The company has set aside money for future decommissioning costs on the assumption that reactor 2 will operate for 40 years, but it has been commercially operating for only 26 years.

Restarting Japan Atomic Power's two other reactors is also unlikely to be easy, with reactor 1 at the Tsuruga plant aging and a reactor at the Tokai No. 2 plant in Ibaraki Prefecture facing local opposition.

Japan Atomic Power is currently surviving on revenues such as basic fees from major utilities that have contracts to receive electricity.

But the utilities may not be able to offer support forever because they are also struggling amid increased fuel costs for thermal power generation to make up for the loss of nuclear power.

1,705 fuel assemblies lie in Tsuruga

May 27, 2013

End of the line for Tsuruga reactor

http://www.japantimes.co.jp/opinion/2013/05/28/editorials/end-of-the-line-for-tsuruga-reactor/#.UaOrUNhBpg4

The Nuclear Regulation Authority on May 22 accepted its five-member expert panel's report that the D-1 fracture zone of pebbles and sediment running beneath the No. 2 reactor at Japan Atomic Power Co.'s Tsuruga nuclear power plant in Fukui Prefecture is an active fault.

JAPC has long contended that the zone is not an active fault. But given the NRA's position, it will likely have no other choice but to give up on restarting the reactor and to decommission it.

The NRA has not only refuted the company's contention but also demonstrated that the safety check done by the now-defunct Nuclear and Industrial Safety Agency of the trade and industry ministry was shoddy. The NRA's conclusion has shown that it will give priority to nuclear power plant safety over profitability and will not approve nuclear power plant operations if there is even the slightest chance of danger.

The NRA faithfully followed the lesson from the Fukushima nuclear catastrophe: that even the smallest possibility of an accident must be eliminated. It should maintain this position even in the face of pressure from the government and the power industry. The power industry should learn from the Fukushima disaster and not ignore any potential dangers however small.

NRA Chairman Shunichi Tanaka said his organization will not carry out a safety review of the reactor in question for licensing because safety standards ban the construction of important nuclear-related facilities above an active fault.

Although JAPC is strongly opposing the NRA's conclusion, it should be remembered that both it and the Nuclear and Industrial Safety Agency in the past failed to recognize the danger from the Urazoko fault, an active fault lying 200 to 300 meters from the Nos. 1 and 2 reactors of the Tsuruga plant.

The NRA concluded that the D-1 fracture zone running beneath the No. 2 reactor should be considered an active fault because it cannot be proven that the zone has not moved in the past 130,000 years and pointed to the possibility that it will move with the Urazoko fault, thus affecting facilities constructed above the zone.

The NRA panel is now carrying out geological studies at six nuclear power plants. The government should allocate enough funds and personnel to ensure the NRA can rapidly yet thoroughly carry out its studies. The government also should work out necessary measures to help accelerate the decommissioning of the No. 2 reactor, including securing a storage site for its radioactive waste. Similar preparations may be needed for other reactors facing the same fate.

Even though the Tsuruga reactor contains no nuclear fuel, **1,705 fuel assemblies are stored onsite in a fuel pool.** If the pool is damaged by a quake, the fuel assemblies could rupture and emit radioactive substances. This shows that even a nuclear power plant kept offline can pose dangers, and is all the more reason why the government should adopt a policy to end Japan's reliance on nuclear power generation as soon as possible

Utilities will apply for restart

May 27, 2013

KEPCO to apply for resumption of 2 reactors

http://www3.nhk.or.jp/nhkworld/english/news/20130527_33.html

A Japanese nuclear power plant operator says it will ask for permission to restart 2 of its reactors once the government introduces new safety guidelines in July.

The president of Kansai Electric Power Company, Makoto Yagi, on Monday said his firm intends to apply for permission to restart the Number 3 and 4 reactors at the Takahama plant in Fukui Prefecture.

KEPCO is seeking the resumption as soon as possible as it has already implemented an electricity price hike on the basis of future earnings from the nuclear reactors.

Yagi said the operator is also preparing to apply for permission to restart other plants.

But the Nuclear Regulation Authority says that some of KEPCO's nuclear power stations still have to be checked to see if they have active faults beneath their sites before it can start screening them for the new guidelines.

The majority of Japan's nuclear reactors have been shut down in the wake of the accident at the Fukushima Daiichi nuclear power plant.

May 27, 2013 - Updated 13:00 UTC

Nuclear operators seeking authorization to restart

http://www3.nhk.or.jp/nhkworld/english/news/20130528_05.html

Four Japanese nuclear plant operators have said they will apply to restart reactors once the government introduces new safety guidelines in July.

NHK interviewed personnel on Monday from 10 utilities across the country.

Officials at Kansai Electric Power Company and Kyushu Electric Power Company each said they plan to apply to restart 2 reactors.

Shikoku Electric Power Company personnel said they will ask to put one reactor online. Hokkaido Electric Power Company officials said they aim to restart 3.

All the reactors are pressurized-water reactors, distinct from the boiling-water type used at the defunct Fukushima Daiichi plant.

New safety regulations will be implemented by July 18th. Operators will be required to fulfill precautions against accidents and natural disasters.

Examiners from the Nuclear Regulation Authority will then check applications before granting authorization.

Plant operators are still calculating elements like the potential height of tsunami and risks of volcanic eruptions.

Most of Japan's nuclear reactors have been shut down since the March 2011 earthquake and tsunami disrupted the Fukushima Daiichi plant.

Not ready to give up

May 30, 2013

4 utilities to apply for early screening for restart of reactors

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201305300059

THE ASAHI SHIMBUN

Four electric power companies are expected to apply to the Nuclear Regulation Authority in July for screening to restart eight idle reactors, sources said May 29.

The four utilities are Hokkaido Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.

The four will apply at the earliest possible opportunity after the NRA stipulates new regulation standards on nuclear power generation by July 18.

Tokyo Electric Power Co. is also making preparations to apply as soon as possible.

Based on the new regulation standards, the NRA will check safety measures and other items at nuclear power plants, and subsequently determine whether it will allow the restarts.

The eight reactors involved in the applications are the Nos. 1, 2 and 3 reactors at Hokkaido Electric Power's Tomari nuclear power plant; the Nos. 3 and 4 reactors at Kansai Electric's Takahama nuclear power plant in Fukui Prefecture; the No. 3 reactor at Shikoku Electric's Ikata nuclear power plant in Ehime Prefecture; and the Nos. 1 and 2 reactors at Kyushu Electric's Sendai nuclear power plant in Kagoshima Prefecture.

They are all pressurized water reactors. The stricken Fukushima No. 1 nuclear power plant, operated by TEPCO, used boiling water reactors.

Because the containment vessels of pressurized water reactors are large, the new regulation standards are expected to grant those reactors a moratorium on the installment of filter-attached vent equipment, which prevents radioactive materials from leaking to the outside. That will allow the four electric power companies to apply for restarts immediately after the new regulation standards are stipulated.

The Fukushima nuclear disaster in 2011 led to the shutdown of all the nation's reactors, forcing operators to rely on thermal power generation.

So if a conventional nuclear reactor with an output capacity of about 1 gigawatt is restarted, its operator can reduce monthly thermal power fuel costs by 8 billion yen to 20 billion yen ($80 million to $200 million).

The electric power companies have cited huge fuel costs as a reason for seeking restarts as early as possible.

"Safety measures (to meet the new regulation standards) will be completed (at the Ikata No. 3 reactor) by the end of June," said Akira Chiba, president of Shikoku Electric. "If the new standards are enforced, we will make the application (for the restart of the reactor) as soon as possible."

TEPCO plans to complete safety measures at some of the seven reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture this summer and apply for restarts.

But Niigata's governor, Hirohiko Izumida, has said that he will not discuss the restart of the reactors until the cause of the accident at the Fukushima nuclear plant and recurrence prevention measures are made clear.

The NRA said applying early for restarts will not necessarily expedite the process because the number of NRA staff members who can be engaged in screening for restarts is limited: They can check only three reactors simultaneously.
"Screening for each reactor is expected to require at least six months," said NRA chairman Shunichi Tanaka.

Even if a reactor passes NRA screening, consent for the restart is required from local governments that are hosting the nuclear power plant.

As for Tohoku Electric Power Co., Chubu Electric Power Co., Hokuriku Electric Power Co., Chugoku Electric Power Co. and the Japan Atomic Power Co., they will face difficulties making applications for restarts in the near future.

This is because it will take time for them to install safety measures, such as vent equipment and the construction of sea walls. The NRA is also currently evaluating faults running below the compounds of the utilities' nuclear power plants to determine if they are active.

Currently, there are 50 nuclear reactors in Japan. Of them, only the Nos. 3 and 4 reactors at Kansai Electric's Oi nuclear power plant in Fukui Prefecture are in operation.

Restart & Abenomics

June 6, 2013

Momentum builds for LDP to push for nuclear reactor reactivation to back 'Abenomics'

http://mainichi.jp/english/english/newsselect/news/20130606p2a00m0na012000c.html

Momentum is building quickly for the ruling Liberal Democratic Party (LDP) to press for reactivating nuclear reactors that were shut down following the outbreak of the nuclear crisis at the Fukushima No. 1 Nuclear Power Plant in a move to throw its weight behind Prime Minister Shinzo Abe's economic policy mix, dubbed "Abenomics."

In its draft "growth strategy," the government says it will "utilize nuclear reactors whose safety has been confirmed." A majority of lawmakers within the LDP have voiced support for measures to place priority on stable energy supply in a bid to prop up "Abenomics." On the backdrop of Abe's penchant for reactivation of nuclear reactors and mounting concerns among local governments hosting nuclear plants over the cooling of their local economies, momentum is building quickly for the LDP to seek reactivation of nuclear reactors.

"The Nuclear Regulation Authority (NRA) has been making demands one after another, but this legislators' group needs to discuss whether such demands are necessary from a scientific viewpoint," Hiroyuki Hosoda, executive acting secretary general of the LDP, told a meeting on June 5 of the LDP legislators' group that advocates for the promotion of a stable power supply.

The LDP legislators' group was launched with about 90 members on May 14. It is a core group that pushes for reactivation of nuclear reactors. It is comprised of many veteran lawmakers from those prefectures that host nuclear power stations, including Hosoda from the Shimane No. 1 district and former LDP Vice President Tadamori Oshima from the Aomori No. 3 district.

During the ordinary Diet session last year, the LDP, which was in the opposition camp at the time, criticized the then ruling Democratic Party of Japan (DPJ) for its handling of the Fukushima nuclear disaster and took the lead in debate in favor of establishing a nuclear regulatory body with a high degree of independence. In its election manifesto for last year's House of Representatives election, the LDP said, "We will place top priority on the NRA's decisions and decide on whether to reactivate nuclear reactors within three years." Although LDP lawmakers are deeply dissatisfied with the NRA over its refusal to soften its harsh stance toward power companies, they would have to respect new regulatory standards due to take effect in July.

On the other hand, the LDP is concerned about the likelihood that it will take a long time to reactivate nuclear reactors after applications are filed as the NRA is likely to evaluate the applications very carefully.

Tsuyoshi Takagi, LDP lower house lawmaker, became increasingly frustrated and said, "It is unfortunate if no decision is made and reactors remain abandoned." The LDP, therefore, plans to press the government to improve the NRA's way of evaluating applications for reactivation of nuclear reactors before the current Diet session ends on June 26.

The LDP has come increasingly forward to press for reactivation of nuclear reactors as it said in its draft election promises for the upcoming House of Councillors election that "the government will take responsibility for reactivating nuclear reactors" while taking heed of its manifesto for last year's lower house election.

On the government's draft "growth strategy," a senior member of the LDP legislators' group expressed its intention to press the government even harder through the LDP Policy Research Council to reactivate nuclear reactors, saying, "There are only a few references to reactivation of nuclear reactors. The issue must be placed in a firm position."

"Ill-timed and unwise" restart

June 5, 2013

EDITORIAL: Abe's growth strategy misses the big picture by reverting to nuclear energy

http://ajw.asahi.com/article/views/editorial/AJ201306050052

The Shinzo Abe administration reportedly has its mind set on encouraging the “effective use of nuclear power generation” in the economic growth strategy it will decide on June 14. That plan complies with the wishes of the electric power industry and the business community in general to restart their nuclear reactors.

The idea is ill-timed and unwise, and we urged the administration to drop it. Reviving the nation’s reliance on nuclear energy could nip newly emerging energy-related businesses in the bud.

The government, of course, should be concerned about the immediate economic consequences of power shortages and the higher costs to be incurred by relying more on thermal power generation. We are fully aware that politicians are responsible for preventing undesirable consequences.

However, an economic growth strategy is meant to provide a “new direction” to the Japanese economy over the medium to long term.

In fact, the economic growth strategy is expected to include energy policies such as promoting the introduction of high-efficiency thermal power generation and the development of floating wind turbines and energy-saving “smart communities.”

More than two years after the Fukushima nuclear disaster, some businesses are finally beginning to venture into these new fields. And surely, the government's economic growth strategy should focus on supporting those newcomers that are braving such odds as uncertain profitability and insufficient infrastructure.

If the government now make its intention clear to revert to the use of nuclear energy, it will only help to preserve the traditional power industry and raise the bar for new energy businesses. This runs counter to the government's power supply reform plans that aim to end regional monopolies by major utilities and encourage deregulation and free competition.

And more than anything, it contradicts the Abe administration's stated policy of "reducing the nation's dependence on nuclear power generation as much as possible."

Fukushima's problems are still far from resolved. The entire world is watching how Japan will deal with this dilemma. The government would be missing the big picture by going along only with the parties that want to quickly resume nuclear power generation.

Back in the 1970s, Honda Motor Co. had a poor reputation in the U.S. market. But the automaker took the introduction of America's stringent emission regulations as the cue for developing eco-friendly, high fuel-efficiency engines. The innovation laid the foundations for its present-day success.

History shows that bold ideas are born and technological leaps occur in times of great difficulty.

We believe Japan's superior technology and human resources will shine most brightly if the country decides that the road to growth lies in doing away with nuclear power generation.

Even within the government's Industrial Competitiveness Council, which is discussing the economic growth strategy, some members from the private sector are reportedly voicing caution against any hasty reversion to the traditional reliance on nuclear energy.

There is still time before the Abe administration finalizes its economic growth strategy. We want it to be of a nature that will give us hope for the future.

--The Asahi Shimbun, June 1

OK... but only if Oi No.1 and No.2 are not restarted

June 12, 2013

Safety measures to delay restarts of 2 Oi nuclear reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306120042

THE ASAHI SHIMBUN

Revised plans to build an emergency response center for the only two nuclear reactors running in Japan will delay the restarts of two other reactors at the power station, the plant's operator said.

Kansai Electric Power Co. said it will set up the makeshift response center at the Oi nuclear plant in Fukui Prefecture to deal with potential accidents at the currently online No. 3 and No. 4 reactors.

But the emergency center will be located next to the central control room--a key safety facility--for the now-idle No. 1 and No. 2 reactors. Under the instructions of the Nuclear Regulation Authority, these reactors will likely remain offline until the first half of fiscal 2015, when construction of the permanent center is complete.

Kansai Electric presented the plan to the NRA on June 11 in a meeting in Tokyo to discuss whether the No. 3 and No. 4 reactors meet new safety regulation standards that will take effect in July.

Under the new standards, emergency response centers for nuclear reactors must be housed in seismically isolated buildings. The Oi plant's current emergency response center fails to meet those standards.

Kansai Electric plans to build a quake-proof control center building at the Oi plant, but it needs a temporary facility to house the emergency center in the meantime.

The utility initially proposed housing the emergency center in a conference hall next to the central control room for the No. 3 and No. 4 reactors. But the NRA said the location does not qualify as a base for dealing with potential problems at the No. 3 and No. 4 reactors.

That led Kansai Electric to propose the use of the conference hall next to the central control room for the No. 1 and No. 2 reactors. The NRA has given its basic endorsement to the plan on condition that the No. 1 and No. 2 reactors remain idled.

If no key safety problems are found, the No. 3 and No. 4 reactors will continue to run until they are shut down for regular inspections in September.

They will have to pass safety screenings based on the new regulation standards if they are to be reactivated.

Push to restart MOX facilities

June 15, 2013
Utilities seek resumption of plutonium-thermal power generation

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306150055

THE ASAHI SHIMBUN

Two utilities in western Japan will seek permission to restart reactors for plutonium-thermal power generation, a key part of a program touted by the government but plagued by safety concerns and local opposition.

Kansai Electric Power Co. plans to apply for restarts of its No. 3 and No. 4 reactors at the Takahama nuclear plant in Fukui Prefecture while Shikoku Electric Power Co. is eyeing a restart of the No. 3 reactor at the Ikata nuclear plant in Ehime Prefecture.

The requests will be made in July in their applications to restart idle nuclear reactors. The Nuclear Regulation Authority's new safety standards for reactors will take effect in the same month.

The "pluthermal" process consumes mixed-oxide fuel, which contains plutonium extracted from spent nuclear fuel, to generate power.

Kansai Electric is currently running the only two of Japan's 50 nuclear reactors that are online—the No. 3 and No. 4 reactors at the Oi nuclear plant, also in Fukui Prefecture.

The two reactors are expected to go offline in September for regular inspections. The utility says these reactors already meet the new safety standards, and it will apply to resume their operations.

A new shipment of processed mixed-oxide fuel is expected to arrive at the Takahama plant from France later this month.

"Our application will be one that takes account of the use of mixed-oxide fuel," Makoto Yagi, president of Kansai Electric, said at a June 14 news conference, although he did not elaborate on whether his company would actually resume the plutonium-thermal process. "We will make a decision based on the understanding of the local communities."

Shikoku Electric said the plutonium-thermal process was active at the No. 3 reactor at the Ikata plant before it was shut down in April 2011.

"We did generate power (with the plutonium-thermal process) for 14 months," a Shikoku Electric representative said. "Safety remains our foremost priority."

However, some experts doubt the safety of the plutonium-thermal process, saying the use of mixed-oxide fuel reduces the effectiveness of control rods that suppress fission in nuclear reactors.

The NRA is expected to examine the appropriateness of safety measures to deal with potential accidents during the use of mixed-oxide fuel.

Behind the expected requests of Kansai Electric and Shikoku Electric is a surplus of plutonium reserves from Japan's stalled nuclear fuel cycle policy.

As a key part of the nuclear fuel cycle project, the plutonium-thermal process was supposed to have been implemented at 16 to 18 nuclear reactors across Japan.

But opposition by communities hosting nuclear reactors has allowed actual operations at only four reactors--the No. 3 reactor at Takahama; the No. 3 reactor at Ikata; the No. 3 reactor at the Fukushima No. 1 nuclear plant; and the No. 3 reactor at the Genkai nuclear plant in Saga Prefecture.

The March 2011 meltdowns at the Fukushima No. 1 nuclear plant further strengthened the opposition of host communities.

In addition, some existing nuclear reactors are expected to be labeled unsafe and inoperable after the new regulation standards are applied.

Observers said utilities are eager to continue with the plutonium-thermal process, even if doing so would fall far short of attaining the initial goals of the project.

Although uncertainties surround the fuel cycle project, especially after the Fukushima nuclear accident, the central government has maintained its initial stated goal of reprocessing, or extracting plutonium from, all of Japan's spent nuclear fuel. But Japan is now stuck with growing stockpiles of plutonium with the reactors offline.

The international community discourages nations from possessing excess plutonium for fear it could be used to build nuclear weapons.

The Japan Atomic Energy Commission said utilities and other entities in the country possess about 45 tons of plutonium reserves both in Japan and abroad, including products from reprocessing overseas. That figure is prominently large for a nation that does not possess nuclear weapons.

(Toshio Kawada contributed to this article.)

What's "Pluthermal"?

http://www.greenaction-japan.org/modules/english0/index.php?id=5

What is "Pluthermal" ?

"Pluthermal" is a Japanese word which combines two English words, "plutonium" and "thermal". Pluthermal refers to the utilization of 'plutonium' fuel in commercial ('thermal') nuclear power plants. The fuel is commonly referred to as plutonium uranium mixed oxide fuel, or MOX fuel. Japanese government policy calls for electric utilities to use MOX fuel in 16-18 nuclear power plants by the year 2010.

Japan's pluthermal program was originally scheduled to get under way by the end of 1999. However the falsification of quality control data for Japanese MOX fuel by the British fuel manufacturer BNFL in December 1999, a referendum in Kariwa village in Niigata Prefecture held in May 2001, and an on-going energy policy review by the Fukushima Prefecture government have prevented MOX fuel from being loaded at any of the nuclear power plants thus far.

Why have a Pluthermal Program?

A decade ago, the pluthermal program was called an interim program, a 'bridge' to consume plutonium until fast breeder reactors were developed for full-scale plutonium utilization. However, since the 1995 accident at the prototype fast breeder reactor Monju, Japan's fast-breeder reactor development program has come to a standstill, and there are no concrete plans to build a commercial fast-breeder reactor in sight.

Over the last several years the government and electric utilities have argued that the pluthermal program is a method of recycling precious resources. They claim that it is in Japan's best interest to extract the uranium and plutonium contained in spent nuclear fuel rather than directly disposing of it as some countries do. The argument used is that Japan is an energy poor country which needs to conserve uranium resources and use plutonium for energy security purposes.

Recently promoters of the pluthermal program have begun to argue that the program is also necessary in order to reduce the amount of surplus plutonium accumulated as a result of overseas reprocessing.

Since mid- 2001, the Japanese government and electric utilities have put forward yet another argument for the pluthermal program. They claim that without the pluthermal program Japanese nuclear power plants would be unable to continue to produce power. The government and electric utilities are threatening residents who live near nuclear power plants and the general public by telling them that opposing the pluthermal program will force reactor shutdowns because without this program spent nuclear fuel will not be able to be sent to the Rokkasho Reprocessing Plant.

Status of MOX fuel utilization

Reactor	Prefecture	Intended Start-up Date	Reason for delay	Kansai Electric
Takahama Unit 4	Fukui	Dec.99	BNFL falsified quality control data	Tokyo Electric
Fukushima Daiichi Unit 3	Fukushima	Dec.99	governor objection and energy policy review	Tokyo Electric
Kashiwazaki-Kariwa Unit 3	Niigata	Feb.00	citizens object to MOX fuel use through a local referendum	**Utility**

In all three prefectures scheduled to use MOX fuel (see above), there is considerable opposition to the use of the fuel. However, in spite of this wide-spread opposition, the utilities and the government continue to promote the program without the consent of the local residents.

What is Wrong with the Pluthermal Program?

The use of MOX fuel increases the risk and severity of a nuclear accident. When using MOX fuel, the control rods' capacity to function is reduced and power output is less stable and harder to control. The Japanese government claims that there has been many years of MOX fuel utilization experience in Europe, but fails to inform the Japanese public that experience with MOX fuel is minimal when compared to uranium fuel. Importantly, the government fails to inform the public that the scale of MOX fuel use in Japan will be unprecedented. There will be a higher concentration of plutonium in the fuel, a higher burn-up rate ---experimentation has shown that there are serious safety concerns with high burn-ups, and no reactor adaptations such as increasing the number of control rods.

Does Japan really need the Pluthermal Program?

Although the government and utilities claim that the pluthermal program would recoup precious resources and is therefore necessary for securing Japan's energy supply, the actual quantity of uranium saved would be negligible, and the cost of fabricating and shipping MOX fuel is far greater that uranium fuel.

As for addressing the problem of the surplus Japanese plutonium in Europe, it would make much more sense to immobilize it rather than burn it as MOX fuel while reprocessing even greater quantities of plutonium from the spent nuclear fuel.

The real need for the Pluthermal Program

Then why have the Pluthermal Program? Although plutonium is a major liability for electric utilities, the pluthermal program remains in place because at present reprocessing facilities are the only place for Japanese electric utilities to send their spent nuclear fuel. Failing to carry out the pluthermal program would imply that there is no need for plutonium, thereby making the Rokkasho Reprocessing Plant now being constructed in Aomori Prefecture unnecessary.

This would then leave the utilities with no place to send their spent nuclear fuel. If this were to happen, some of the reactors at nuclear power plant sites would have to be shut down since there would be no space to store the used fuel coming out of them.

Clearly, reprocessing and the pluthermal program are little more than a makeshift solution for Japan's nuclear waste disposal problems.

Kashiwazaki - Restart or not restart?

June 17, 2013

TEPCO mulls putting off application to restart Kashiwazaki-Kariwa nuke plant

http://mainichi.jp/english/english/newsselect/news/20130617p2a00m0na013000c.html

Tokyo Electric Power Co. (TEPCO) is mulling putting off its application for safety screening of the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture until a plan to restart the plant gains local approval, it has been learned.

TEPCO started considering the postponement of its application with the Nuclear Regulation Authority (NRA) on June 17, despite the utility's earlier plans to file the application for safety equipment screening even without approval from Niigata Prefecture. With the implementation of the new regulatory standards for nuclear plant safety set for early July, multiple power companies are expected to file screening applications with the NRA for resumption of their nuclear plants.

While TEPCO's turnaround is apparently aimed at avoiding fueling prefectural opposition through a hasty decision, the utility -- the operator of the stricken Fukushima No. 1 Nuclear Power Plant -- is highly likely to miss out on a chance to join the first batch of applicants for NRA screenings, which possibly include Kansai Electric Power Co. and Shikoku Electric Power Co.

For a power company to restart a nuclear plant, it needs to gain approval from local municipalities based on their safety accord after passing NRA screening on whether the facility conforms to the new standards. Previously, TEPCO had considered applying for safety screening right after the July implementation of the new standards while gaining local approval concurrently. Foundation work has already been under way to install filtered vent systems at the plant's No. 1 and No. 7 reactors -- a necessary step to restart the facility.

Niigata Gov. Hirohiko Izumida, however, has voiced opposition to the plan, saying, "Verifications of the Fukushima No. 1 nuclear plant disaster should come first." On June 12, the governor insisted that TEPCO needs to gain prior approval from the prefecture and other entities to install the vent systems, saying, "Even though (filtered) vents are intended to reduce radioactive material emissions, they are inherently designed to emit such materials outside. There's no way the utility can win our trust without explaining how it is going to operate them."

Under the new standards, utilities can apply for safety screenings even if vent systems are not installed in time, as long as they are planning to install them. However, the Niigata Prefectural Government is certain to fiercely oppose such applications. If that is the case, a plan to restart the Kashiwazaki-Kariwa complex would further be delayed, prompting TEPCO to procrastinate its application with the NRA until it is expected to gain prior approval from the prefecture.

In its rehabilitation plan, TEPCO had envisaged improving its earnings by reactivating the Kashiwazaki-Kariwa plant as early as the start of fiscal 2013. Now that the utility is uncertain when to apply for safety screenings, its promise to financial institutions to turn itself profitable this fiscal year may need to be reviewed. While TEPCO raised electricity rates in September last year, the utility is likely to be forced to decide whether to further raise the rates to improve its earnings.

Since there is a limited capacity to NRA's screenings, a delay in applying for safety screenings means a further delay in restarting a nuclear plant.

Nuclear plants to seek restart under new guideline

http://www3.nhk.or.jp/nhkworld/english/news/20130618_29.html

Six nuclear power plants will apply for restart under new safety guidelines to be adopted by the country's nuclear regulators on Wednesday.

The Nuclear Regulation Authority is expected to implement a new set of rules that oblige power companies to put in place measures to deal with serious accidents. Until now, such measures had been deemed voluntary.

Utilities will also be asked to draw up safety scenarios for bigger earthquakes and higher tsunami.

NHK has learned through interviews with 10 Japanese power companies that 6 nuclear plants are preparing to apply for resumption of operation as soon as the new guidelines go into effect on July 8th. The plants are Tomari in Hokkaido, Ohi and Takahama in Fukui Prefecture, Ikata in Ehime Prefecture, Genkai in Saga Prefecture and Sendai in Kagoshima Prefecture.

All 6 have pressurized water reactors, a relatively new type of reactor. The stricken Fukushima Daiichi plant uses older boiling water reactors.

The nuclear regulatory body has said screening of applications will take about 6 months. Reactor restarts would also require a go-ahead from local communities.

Six this morning... 12 tonight

June 20, 2013

Utilities to apply to restart 12 reactors at 6 nuclear plants

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306200069

THE ASAHI SHIMBUN

Four utilities are planning to apply for permission to restart 12 reactors at six nuclear power plants across Japan as soon as a set of new safety requirements, approved June 19 by the Nuclear Regulation Authority, enter into force on July 8.

Ten of the 12 reactors are idle. The other two are running, but are expected to go offline for regular inspections in September.

With the Nuclear Regulation Authority expected to need about six months for screening the restart applications, the first of their kind, it appears unlikely any of the reactors will be brought back online by the end of this year.

The applications are being prepared for reactivating the No. 1, No. 2 and No. 3 reactors at Hokkaido Electric Power Co.'s Tomari nuclear plant; the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Oi nuclear plant in Fukui Prefecture; the No. 3 and No. 4 reactors at Kansai Electric's Takahama nuclear plant, also in Fukui Prefecture; the No. 3 reactor at Shikoku Electric Power Co.'s Ikata nuclear plant in Ehime Prefecture; the No. 3 and No. 4 reactors at Kyushu Electric Power Co.'s Genkai nuclear plant in Saga Prefecture; and the No. 1 and No. 2 reactors at Kyushu Electric's Sendai nuclear plant in Kagoshima Prefecture.

They are all pressurized water reactors, different in type from the crippled boiling water reactors at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Pressurized water reactors have been granted a five-year grace period for installing filtered venting equipment for suppressing the discharge of radioactive substances during a severe accident.
They are all relatively new, being in service for less than 30 years, which makes it easier for them to meet the revised safety requirements.

Some experts have argued that a geological fault line running across the premises of the Oi plant may be active. The debate could protract the safety screenings for the No. 3 and No. 4 reactors at Oi, which are the only two of Japan's 50 nuclear reactors that are currently up and running.

Once the two Oi reactors go offline in September, there will be no active nuclear reactors in Japan, as was the case between May through July 2012. That was the first time since 1970 that such a situation had occurred.

Kyushu Electric could delay the restart applications for the No. 3 and No. 4 reactors at Genkai, where retrofitting work is expected to last through September. Observers say the No. 3 reactor at Ikata faces the fewest technical hurdles to a restart of all 12 reactors being considered for reactivation.

Leaders of local governments that host reactors being considered for early restarts have hailed the official endorsement of the reinforced safety requirements.

"Rigorous safety standards have been set on the basis of up-to-date knowledge and the lessons learned from the Fukushima nuclear disaster," said Kazuhiko Yamashita, mayor of Ikata, where the Ikata nuclear plant is located.
"We are one step higher on a flight of steps to a restart," said Hideo Iwakiri, mayor of Satsumasendai, home to the Sendai nuclear plant.

But critics have said the new safety requirements are not enough.

"I can hardly believe lessons were learned from the Fukushima nuclear disaster," said Hirohiko Izumida, governor of Niigata Prefecture, which hosts Tokyo Electric's Kashiwazaki-Kariwa nuclear plant. He pointed out the new regulation standards do not clearly define who should make decisions to deal with a potential nuclear accident, such as whether to pump in seawater to cool down an overheating reactor.

"The central government has to make up for the shortcomings, including by amending laws and regulations," Izumida added.

The Citizens' Commission on Nuclear Energy, which organizes researchers and civil advocacy groups, submitted a 10-item emergency recommendation to the Cabinet Office and the Nuclear Regulation Authority on June 19.

"The new regulations have been pushed through under political pressure, and are questionable in so many points," said Harutoshi Funabashi, a Hosei University sociology professor who chairs the organization.

Are PWR safer?

June 20, 2013

Utilities set to apply for screening of pressurized-water reactors under new safety rules

http://mainichi.jp/english/english/newsselect/news/20130620p2a00m0na012000c.html

The Nuclear Regulation Authority announced on June 19 its new nuclear reactor safety requirements, which are aimed at averting disasters like that which hit the Fukushima No. 1 Nuclear Power Plant.

The NRA will begin accepting applications for permission to reactivate idled nuclear reactors on July 8, when the new regulations take effect after receiving Cabinet approval. Based on the results of the Mainichi's inquiries into 10 power companies nationwide, four utilities are expected to submit applications for a total of 12 reactors at six nuclear power stations by the end of July.

Numerous pressurized-water reactors (PWRs) mostly in western Japan are a different type than those which existed at the troubled Fukushima No. a plant. Because utilities will be given a longer time under the new regulations to implement some of the required safety measures for PWRs than for other types of reactors, more applications will likely be filed from power firms in western Japan than in eastern Japan. In addition to the new regulations, the 40-year operational limit for all nuclear reactors nationwide will in principle take effect simultaneously. Therefore, the overall process to drop aging reactors will gain momentum.

The 12 nuclear reactors for which the four utilities are expected to apply for the NRA safety screening are as follows: reactors Nos. 1 to 3 at the Tomari Nuclear Power Plant in Hokkaido (Hokkaido Electric Power Co); reactors Nos. 3 and 4 at the Takahama Nuclear Power Plant, and reactors Nos. 3 and 4 at the Oi Nuclear Power Plant in Fukui Prefecture (Kansai Electric Power Co.); the No. 3 reactor at the Ikata Nuclear Power Plant in Ehime Prefecture (Shikoku Electric Power Co.); reactors Nos. 3 and 4 at the Genkai Nuclear Power Plant in Saga Prefecture, and reactors Nos. 1 and 2 at the Sendai Nuclear Power Plant in Kagoshima Prefecture (Kyushu Electric Power Co.). All of the reactors are PWRs that had been in operation for less than 30 years. There are a total of 24 PWRs in the country, mainly in western Japan. Under the new regulations, power companies are given five years to equip their PWRs with filtered venting systems designed to prevent the outflow of radioactive substances into the atmosphere.

There are 26 boiling water reactors (BWRs) in the country that are the same type as those of the troubled Fukushima reactors. The cubic content of the BWR's containment vessel is smaller than that of the PWR, and it could plunge into a critical situation quickly due to increased pressure in the vessel. Therefore, no grace period is given under the new regulations to equip BWRs with filtered venting systems. Tohoku Electric said it was not sure when and whether it would be able to apply for safety screening for BWR reactors at its Higashidori Nuclear Power Plant in Aomori Prefecture and its Onagawa Nuclear Power Plant in Miyagi Prefecture.

Tokyo Electric, Hokuriku Electric, Chubu Electric, Chugoku Electric and Japan Atomic Power Co. (JAPC) all said that it was too early to say when they could apply for the safety screening. It costs billions of yen to install a filtered venting system, and with the exception of the No. 2 reactor at JAPC's Tsuruga Nuclear Power Plant, all of their reactors are BWRs. Clearly, the types of reactors will affect the outcomes of safety screenings.

The NRA will set up three teams within its secretariat to conduct the screenings. If the regulators determine that the reactors meet the new safety requirements, the government will decide whether to reactivate them after securing the consent of concerned local municipalities. The new regulations will also oblige power companies to take measures to deal with severe accidents. Previously, such measures had only to be undertaken as "voluntary efforts." The new regulations will also require utilities to set up "specific safety facilities" to be used to cool down reactors by remote control in case of disaster.

The new regulations will forbid power firms from setting up key facilities such as reactor buildings directly above active faults. The regulations will ask operators of nuclear power plants to conduct surveys, if necessary, regarding whether faults have moved during the past 400,000 years -- as opposed to the past stipulation of 120,000- 130,000 years. In addition, power firms will be required to beef up measures against fires, including the replacement of flammable cables that are often seen in aging reactors. A 40-

year operational limit for all nuclear reactors will also be introduced, and extension of this period will require a widened scope of inspections.

"Electric power companies will likely emphasize cost-effectiveness, and make capital investments in younger nuclear reactors with larger power output," commented Takuya Hattori, president of the Japan Atomic Industrial Forum Inc. (JAIF).

NRA Chairman Shunichi Tanaka said during a news conference on June 19, "There will be clashes (between the NRA and power companies) over the screening outcomes."

Restart asap

June 26, 2013

9 utilities want to restart idled reactors as soon as possible

http://ajw.asahi.com/article/economy/business/AJ201306260059

THE ASAHI SHIMBUN

Nine regional electric power companies said on June 26 that they want to restart the operations of their idled nuclear reactors at the earliest possible date

.

The companies, which include Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear power plant, declared their “pro-nuclear” stances in their annual shareholders’ meetings.

Of the nation's 10 regional utilities, Okinawa Electric Power Co. is the only one that does not operate a nuclear reactor.

“It is vital to continue to use nuclear power as an important source of electricity after thoroughly taking safety measures,” said Akihisa Mizuno, president of Chubu Electric Power Co., based in Nagoya.

The comment signals Chubu Electric's intent to seek the resumption of operations of reactors at its Hamaoka nuclear power plant in Shizuoka Prefecture.

Currently, 48 of the nation's 50 nuclear reactors are offline as a consequence of the accident at the Fukushima No. 1 nuclear power plant following the March 11, 2011, Great East Japan Earthquake and tsunami. The only two reactors currently operating are Kansai Electric Power Co.'s No. 3 and No. 4 at the Oi nuclear power plant in Fukui Prefecture.

Of the nine utilities with nuclear power plants, four plan to apply to the Nuclear Regulation Authority to restart 12 nuclear reactors soon after new stricter safety standards take effect on July 8.

The four are Kansai Electric, Hokkaido Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.

"It is essential that we restart operations of the Tomari nuclear power plant to stabilize our management and supply electricity in a stable manner," said Hokkaido Electric President Katsuhiko Kawai.

Pluthermal spells problems for Japan

June 28, 2013

ANALYSIS: Negatives abound for Japan's 'pluthermal' power generation plans

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306280076

THE ASAHI SHIMBUN

It doesn't appear Japan's troubled plutonium-thermal (pluthermal) power generation program is going to see the light at the end of the tunnel anytime soon.

The utilities are being forced to continue using the pluthermal process because it constitutes a key component of Japan's nuclear fuel recycling program.

Past problems have delayed the reprocessing of spent nuclear fuel, and some utilities face the possibility of having to halt their nuclear plant operations, even if they are allowed to restart idled reactors, because they simply have no place to store the spent fuel.

In addition, the utilities have poured trillions of yen into the nuclear fuel recycling program with little to show for it.

The problem of where to store spent nuclear fuel has major ramifications for not only the electric power companies.

A total of 14,200 tons of spent fuel were being kept at storage pools at nuclear plants around Japan as of the end of September 2011. That figure represents about 70 percent of the total capacity of the storage pools.

As a stopgap measure, the government decided on a less-than-desirable process called pluthermal, which uses mixed-oxide fuel or MOX (plutonium extracted from spent fuel), to generate electricity in conventional light water reactors.

A key to Japan's future storage plans has always been the spent nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture. But the government never envisioned the problems that have plagued the facility.

Under initial plans, Japan Nuclear Fuel Ltd. was to have completed construction of the reprocessing plant in 1997. However, a total of 19 test runs have failed, and the facility has not been completed.

Nearly 3,000 tons of spent fuel is already being stored at Rokkasho, which is close to capacity. Once that reprocessing plant begins operations though, it's expected to be able to handle 800 tons of spent fuel annually, freeing up more storage space.

Until then, electric power companies are scrambling to find alternatives for their spent nuclear fuel, including the construction of intermediate storage facilities. On June 26, Kansai Electric Power Co. established a project team to study the feasibility of constructing such a facility.

MOX fuel is problematic in other ways. Kansai Electric accepted a shipment of the fuel on June 27 for use in a pluthermal reactor at its Takahama nuclear power plant in Fukui Prefecture.

But even if the pluthermal reactor is allowed to resume operations, Kansai Electric faces another potential headache, which is what to do with the spent MOX fuel. MOX fuel generates large amounts of heat, creating handling problems.

The plutonium that results from the processing of MOX fuel also presents another dilemma: the production of nuclear weapons.

An ever-increasing stockpile of the nuclear fuel could raise eyebrows in a world already concerned over nuclear proliferation and the production of weapons of mass destruction

.

Japan currently has 44.3 tons of plutonium in storage at home and abroad.

Another problem is that the accident at the Fukushima No. 1 nuclear power plant in March 2011 following the Great East Japan Earthquake and tsunami turned public opinion sharply against nuclear power, meaning a continuation of the pluthermal generation process will likely face many difficulties.

Long before that disaster, the government plan was to extract plutonium from spent nuclear fuel using a fast-breeder reactor. All that went up in smoke, though, after sodium leaked from the Monju prototype reactor in 1995.

Financing is also a concern. The pluthermal program has been nothing but an economic nightmare for the utilities.
Not only have the utilities poured trillions of yen into the nuclear fuel recycling program, the cost of MOX fuel is between seven to eight times more expensive than the uranium fuel normally used in nuclear reactors.

A major reason is spent fuel has to be shipped to France for reprocessing before it is shipped back to Japan as MOX fuel.

According to trade statistics compiled by the Finance Ministry, **each fuel assembly transported to the nuclear plant in Takahama in 2010 costs 880 million yen ($9 million).**

The justification until now for paying the higher prices has been to maintain the nation's nuclear fuel recycling program.
The nine electric power companies that operate nuclear plants and Japan Atomic Power Co. have set aside funds for use in reprocessing spent fuel once the plant begins operations, in addition to paying for tests at the facility.

By March 2012, a total of 3.6 trillion yen had been paid to the Radioactive Waste Management Funding and Research Center for the reserve that will be used once operations begin at the Rokkasho facility.

The power companies have also made advance payments to Japan Nuclear Fuel for future reprocessing as a means of propping up that company.

So far, a total of 1.1 trillion yen has been paid. The total cost to the 10 companies comes to 6.6 trillion yen.

What remains clear, is that even if the Rokkasho facility begins operations, it will not be cost-effective.

The Federation of Electric Power Companies of Japan in 2003 estimated a total of 19 trillion yen would be needed over a 40-year period for the reprocessing program there.

However, that covers the reprocessing of MOX fuel of an amount equivalent to uranium fuel worth 900 billion yen. The major reason for the price discrepancy is only 1 percent of plutonium can be extracted from spent nuclear fuel to create MOX fuel.

But as is usually the case, in the end, it will be consumers who will bear the huge costs that have resulted from the massive problems plaguing Japan's nuclear industry in the form of higher electric bills.

(This article was compiled from reports by Toshio Kawada, Rintaro Sakurai, Shin Matsuura and Mari Fujisaki.)

Japan unlikely to use MOX fuel in nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20130627p2a00m0na014000c.html

TEPCO wants to restart Kashiwazaki Kariwa

03.07.2013_No167 / News in Brief

Tepco To Apply For Restart Of Kashiwazaki Kariwa Units 'As Soon As Possible'

Plant Operation
http://www.nucnet.org/all-the-news/2013/07/03/tepco-to-apply-for-restart-of-kashiwazaki-kariwa-units-as-soon-as-possible

3 July (NucNet): Tokyo Electric Power Company (Tepco) has announced that it will apply for the restart of units 6 and 7 at the seven-unit Kashiwazaki Kariwa nuclear plant "as soon as possible".
Japan's nuclear regulator announced new safety guidelines last month that will have to be met before any reactors can be restarted. The guidelines come into effect on 8 July and applications for restarts will begin to be accepted on the same day.

In a statement, Tepco said it has been implementing new safety measures based on the lessons learned from the March 2011 accident at the Fukushima-Daiichi nuclear plant.

Tepco will also consult on the restart of the units with Niigata prefecture, where the Kashiwazaki Kariwa plant is located, some 220 kilometres northeast of Tokyo.

Tepco said it wants to continue communication with Niigata prefecture and local districts to ensure that the population develops a nuclear safety culture and understands the enhancement measures being carried out for nuclear plants.

Units 6 and 7 at the plant are both 1,315-megawatt boiling water reactors. Unit 6 began commercial operation in November 1996 and Unit 7 in July 1997.

In May 2012, Tepco announced that it would return to profit in 2013 if it was allowed to bring the Kashiwazaki Kariwa plant back online. It suffered a 685.3 billion yen (6.9 billion US dollars, 5.3 billion euros) loss in 2012.

In March 2013, Japan's prime minister Shinzo Abe said nuclear reactors will be restarted only if it is proven safe to do so.

Japan has 50 commercial nuclear reactors, only two of which, Ohi-3 and Ohi-4, have been restarted since the Fukushima-Daiichi accident.

In July 2007, Kashiwazaki Kariwa was struck by an earthquake that led to the automatic, safe shutdown of units 3, 4 and 7. Units 1, 5 and 6 were already shut down at the time of the earthquake for periodic inspections.

4 utilities (10 reactors) apply for restart

July 5, 2013

4 utilities to file for procedures to restart some reactors

http://mainichi.jp/english/english/newsselect/news/20130705p2g00m0dm072000c.html

TOKYO (Kyodo) -- Four utilities said Friday they will apply to the Nuclear Regulation Authority to have 10 of their reactors confirmed safe enough to restart operations, when new nuclear regulations take effect on Monday.

Hokkaido Electric Power Co. said it will make the application for the Nos. 1 to 3 reactors at the Tomari nuclear power plant, while Kansai Electric Power Co. will apply for a safety examination of the Nos. 3 and 4 reactors at its Oi complex and the Nos. 3 and 4 reactors of the Takahama complex, both in Fukui Prefecture.

Shikoku Electric Power Co. has also applied for an assessment of the No. 3 reactor at the Ikata complex in Ehime Prefecture.

Kyushu Electric Power Co. made the first step toward the application for the Nos. 1 and 2 reactors at the Sendai plant in Kagoshima Prefecture, and said it may also file with the NRA to restart the Nos. 3 and 4 idled reactors at the Genkai plant in Saga Prefecture on July 12, utility officials said.

The NRA is set to check the safety of reactors in accordance with new regulations after accepting applications from Monday.

The authority asked utilities to inform them by 3 p.m. Friday if they were going to apply on Monday so it could avoid a rush of applications from those eager to restart their reactors.

Following the NRA's safety checks, the government will make a final decision on whether the reactors can restart.

TEPCO's plan to restart "deplorable"

July 5, 2013

Irrational reactor restart plan

http://www.japantimes.co.jp/opinion/2013/07/05/editorials/irrational-reactor-restart-plan/#.UdhsKKxSb9k

Tokyo Electric Power Co. said Tuesday that it will ask the Nuclear Regulation Authority to examine the Nos. 6 and 7 reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture for a possible restarting under the NRA’s new safety regulations that will take effect Monday.

Tepco's reactor restart plan is deplorable because it comes at a time when it is making scant progress in its efforts to safely shutter its stricken Fukushima No. 1 nuclear power plant, clean up contaminated areas, compensate victims and determine the causes of the crisis.

Given that Tepco's gross mismanagement of the Fukushima crisis, people are questioning whether Tepco is qualified to operate a nuclear power plant. In the past months, Fukushima No. 1 has suffered a series of contaminated water leaks, and 150,000 people from Fukushima Prefecture are still forced to live away from their homes because their communities remain contaminated.

Tepco executives must realize that they have done nothing to regain people's trust, but they do not seem to care. They did not even have the courtesy to give Niigata Prefecture Gov. Hirohiko Izumida advance notice about the restart plan. His criticism of their actions is most understandable.

Tepco is basically employing blackmail tactics in filing its request with the NRA. It effectively asserts that if the reactors are not restarted, it will have no choice but to further raise electricity fees. Tepco suffered a net loss of ¥685.2 billion in the business year that ended March 31. It is reported that operating one reactor will improve its income and expenditure balance by ¥100 billion a year. But the decision to restart the reactors appears to be short-sighted.

The safety measures that are required under the new regulations will be costly to implement. Since the two reactors at the Kashiwazaki-Kariwa plant are boiling light water reactors — the same type as the Fukushima No. 1 reactors — the safety regulations are more severe than those for pressurized light water reactors. They include the immediate installation of filters to remove radioactive substances when such substances are vented from reactor cores in an emergency.

It is also suspected that a geological fault under a reactor building in the Kashiwazaki-Kariwa plant is active. If the NRA determines that it is active and then calls for the decommissioning of the plant's reactors, Tepco will have wasted a huge sum on safety upgrades. Even if the plant passes the NRA's safety examination, Tepco's expenditures for the disposal of accumulated spent nuclear fuel will increase, and the power company is also facing rising costs associated with the cleanup of the stricken Fukushima plant, decontamination efforts and compensation.

The experience in Europe shows that it is cheaper and less risky to operate numerous small-scale renewable electricity sources spread across a country rather than a small number of large nuclear power plants. Since the Kashiwazaki-Kariwa plant has seven reactors, one accident could shut down the entire plant. Tepco has no financial means to cope with a new nuclear disaster. Its reactor restart plan is irrational both economically and socially.

Winning local understanding - Has TEPCO forgotten?

July 6, 2013

Editorial: TEPCO must not automatically assume that its nuclear reactors can be restarted

http://mainichi.jp/english/english/perspectives/news/20130706p2a00m0na008000c.html

Tokyo Electric Power Co. (TEPCO) President Naomi Hirose failed to impress Niigata Gov. Hirohiko Izumida during their July 5 meeting in connection with the utility's bid to restart reactors at the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture.

The cold response comes as no surprise, as the utility acted rudely by failing to provide an explanation to locals before announcing that it would file for a safety assessment from the Nuclear Regulation Authority (NRA) to restart the reactors.
TEPCO is hurrying to start the reactors again because its business plans have come to an impasse. The government bears heavy responsibility for this situation, as it allowed the power company to adopt an unreasonable business plan built on the premise of putting the reactors back into use.

TEPCO seeks a safety assessment of the No. 6 and 7 reactors at the seven-reactor Kashiwazaki-Kariwa plant -- a necessary step in ensuring that they meet new safety regulations. Even if the company were to force through a safety assessment application without prior approval from the prefecture, however, it would still need to obtain approval from local bodies to restart the reactors. By going over local officials' heads with its latest announcement, TEPCO has only ended up raising the hurdle to restart the reactors.

In the past, Hirose had reiterated that the power company would work on the premise of winning local understanding. TEPCO's dire financial situation, however, resulted in its announcing over the heads of locals that it would seek the safety assessments. Last fiscal year, the power company registered a pretax loss for the second year in a row -- a result of increased fuel costs for the thermal power plants that it has fired up to compensate for suspending operations at its nuclear plants. The company's losses do not include the compensation that TEPCO must pay for the disaster that befell its Fukushima No. 1 nuclear plant.

Last year, TEPCO raised electricity prices on the assumption that the company's nuclear reactors would be fired up in succession beginning this fiscal year. If that assumption crumbles, and TEPCO registers a loss for the third consecutive business year, then banks could sever their loans to the utility. TEPCO

believes that to return to the black without further increasing electricity rates, it has no option but to reactivate its nuclear reactors.

The four main power companies in the Hokkaido, Kansai, Shikoku and Kyushu regions plan to seek safety assessments for 12 nuclear reactors. Considering the screening capacity of the NRA, reactor assessments are likely to be delayed for a year or more among those companies that fail to make it into the first round of screening. Under such circumstances, it would be no easy task to produce a business plan that could convince banks to keep lending them money.

The boiling water reactors at the Kashiwazaki-Kariwa Nuclear Power Plant are the same type as those at the crisis-hit Fukushima No. 1 Nuclear Power Plant. Furthermore, a geological fault lies directly beneath the plant in Niigata Prefecture. Meanwhile, the Fukushima nuclear disaster has not been brought to a conclusion, and the probe into the cause of the accident is incomplete. TEPCO should know full well that restarting its reactors under such conditions is a difficult task. If TEPCO's aim were simply to portray itself as putting in its "best effort" while knowing the difficulties involved in restarting the reactors, it would be trampling on its relationship of trust with the prefectures. Such a stance is impermissible.

There is no option for TEPCO other than that of drawing up a new business plan that does not lean on the assumption of restarting its reactors. Of course, efforts to further streamline its operations and procure less expensive fuel are necessary. But if TEPCO still cannot survive after all this, it must consider passing its financial burden on to consumers through an increase in electricity prices.

These issues cannot be avoided when aiming for a society that does not rely on nuclear power, as they are tied up with the financial burden that residents must shoulder. The government needs to clarify the role of nuclear power in its energy policy, and aim to win understanding from the Japanese public.

TEPCO forced to delay application for restart

July 6, 2013

Governor’s opposition forces TEPCO to delay restart application

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307060063

THE ASAHI SHIMBUN

Tokyo Electric Power Co. has been forced to postpone an application for restarting two reactors in Niigata Prefecture due to staunch opposition from the prefectural governor.

TEPCO President Naomi Hirose on July 5 sought to gain support from Governor Hirohiko Izumida for plans to restart the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant.

TEPCO had hoped to file an application with the Nuclear Regulation Authority as early as July 8, when new nuclear safety standards take effect.

Izumida refused to approve the plans and criticized TEPCO for making a decision on July 2 to apply for restarting the reactors without offering any explanation to the local community.

Emerging from the 30-minute meeting at the prefectural government office, Hirose told reporters he wants to meet Izumida again to state his case.

Hirose said after he briefed a senior official of the industry ministry about his meeting with Izumida on the evening of July 5 that the setback will make it difficult to file an application on July 8.

"We have entered a thorny path," a senior TEPCO official said. "We may not be able to bring the reactors back online."

At the Kashiwazaki-Kariwa plant, TEPCO is installing filtered venting equipment, which is required under the new safety standards, to release steam from reactor containment vessels in the event of a severe accident.

Izumida told Hirose that TEPCO needs to obtain prior approval for the installation from the local community based on a nuclear safety agreement between TEPCO and the prefecture and two other local governments that host the nuclear plant.

All seven reactors at the plant, which straddles Kashiwazaki city and Kariwa village, have remained offline since March 2012, a year after TEPCO's Fukushima No. 1 nuclear power plant was crippled by the Great East Japan Earthquake and tsunami.

TEPCO, which posted 780 billion yen ($7.78 billion) in combined pretax losses over the past two years, plans to return to the black in the current fiscal year by restarting reactors at the Kashiwazaki-Kariwa plant.

When Izumida said TEPCO is putting profit ahead of safety, a red-faced Hirose said the utility needs to avoid a third consecutive loss.

Izumida emphasized that TEPCO should not file an application without prior approval from the local community.

Hirose said TEPCO plans to consult with the local community after filing an application.

"We think it is possible for the prefecture's technical committee to conduct its checks in parallel with the NRA's safety screening," Hirose said.

But Izumida disagreed. Doing things that way, he said, does not constitute prior approval.

"Only by keeping a promise and not telling a lie can you stand at the starting line," he said.

Hirose also met separately with Kashiwazaki Mayor Hiroshi Aida and Kariwa Mayor Hiroo Shinada on July 5.

While Izumida refused to accept a written request for prior understanding on the installation of filtered venting equipment, both Aida and Shinada had no problem doing so.

Aida and Shinada were later asked to comment on the meeting between Hirose and Izumida.

Aida said he expects TEPCO to take steps so that a relationship of trust will not be damaged, while Shinada questioned Izumida's refusal to accept documents from Hirose.

The nation's 50 nuclear reactors, except for two in Fukui Prefecture, remained offline after the Fukushima nuclear disaster.

Hokkaido Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co. will apply on July 8 for restarting 10 reactors at five plants, NRA officials said July 5.

Kyushu Electric said it plans to file an application for two additional reactors on July 12.

TEPCO fears that the reactivation of reactors at the Kashiwazaki-Kariwa plant will be substantially delayed if an application is not submitted early.

The pro-nuclear Abe administration was backing TEPCO's plans for restarts.

In its growth strategy adopted in June, the central government said it will make efforts to win the understanding and cooperation of local communities for restarting reactors whose safety has been confirmed by the NRA.

When TEPCO decided at a board meeting on July 2 to apply for restarting the two reactors, industry minister Toshimitsu Motegi said the central government would "come to the fore" to persuade the local community.

A senior ministry official said TEPCO had no choice but to seek restarts because it cannot expect to return to the black soon without restarting the reactors.

If TEPCO incurs a third consecutive loss, banks could suspend additional loans.

"TEPCO needed to show to banks that it is doing whatever it can," the official said.

In Kashiwazaki, the economy has stalled since all the reactors stopped operating at the nuclear plant in March 2012.

"We want the plant to get restarted if it is safe," said the president of an electrical installation contractor, which inspects water meters at the plant. "In the first step, we want an application to be made for safety screening to be carried out."

The number of employees at subcontractors working for the plant fell from 5,448 in March 2012 to 3,829 in June.

A taxi driver in his 50s, who was waiting for a customer in front of the JR Kashiwazaki Station, said he hopes an early restart, noting that, "Business stopped when all the reactors stopped."

But the chief of a neighborhood association in the Shiiya district of Kashiwazaki, 5 kilometers from the plant, is opposed to a restart.

"The local economy is important, but the nuclear plant can threaten our lives," he said.

The 69-year-old said he is concerned what would happen if a geological fault near the plant moves and a large earthquake occurs.

Four utilities, 10 reactors

Four utilities apply for safety examinations of 10 reactors

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201307080099

By JIN NISHIKAWA/ Staff Writer

Four electric power companies applied for safety examinations of 10 reactors on July 8, the day tougher standards took effect to prevent a recurrence of the 2011 Fukushima nuclear crisis.

The new safety rules, imposed by the Nuclear Regulation Authority, are intended to protect reactors from damage caused by natural disasters in this earthquake-prone nation.

The NRA will set up three teams consisting of about 80 members in total for the safety examinations. Each examination, which will include interviews with employees and on-the-spot checks, is expected to take at least about six months to complete.

Utilities can restart reactors that pass the examination if they obtain consent from local governments and approval from the central government.

Shikoku Electric Power Co. and Kansai Electric Power Co. applied for examinations for three reactors that will be used in plutonium-thermal (pluthermal) power generation, which burns mixed oxide (MOX) fuel containing plutonium extracted from spent nuclear fuel.

The new safety rules fall under the Nuclear Reactor Regulation Law and were drafted after the earthquake and tsunami on March 11, 2011, caused the triple meltdown at the Fukushima No. 1 nuclear plant and shattered government assurances that Japanese nuclear plants were safe from natural disasters.

If the NRA concludes that a reactor does not meet the standards, it can order the electric power company to improve certain equipment or continue to suspend the operations.

The NRA introduced the “backfit” system, in which utilities are required to improve or renew existing equipment to meet the latest standards.

The new standards require utilities to install a filtered system to curb emissions of radioactive materials to the outside environment when venting is needed to reduce pressure within a reactor.

The standards also call for the establishment of quake-resistant buildings that can be used as emergency headquarters if a nuclear accident occurs.

The new standards also urge companies to upgrade their measures to deal with tsunami and earthquakes, as well as to minimize damage from terrorist attacks using aircraft.

The NRA as of July 8 also limits the operations of a reactor to 40 years in principle.

A utility wanting to operate a reactor for more than 40 years must not only meet the new standards, but also must inspect in detail possible deterioration at the facility.

Since repair work and upgrades for aging reactors could prove expensive, electric power companies may decide to decommission them instead.

Of Japan’s 50 nuclear reactors, only two are currently online.

The pluthermal reactors that will undergo the examinations are the No. 3 reactor at Shikoku Electric’s Ikata plant in Ehime Prefecture and the Nos. 3 and 4 reactors at Kansai Electric’s Takahama plant in Fukui Prefecture.

The seven other reactors are: the Nos. 1 to 3 reactors at the Tomari nuclear power plant, operated by Hokkaido Electric Power Co.; the Nos. 3 and 4 reactors at Kansai Electric’s Oi nuclear power plant in Fukui Prefecture; and the Nos. 1 and 2 reactors at the Sendai nuclear power plant in Kagoshima Prefecture, operated by Kyushu Electric Power Co.

4 power companies apply to restart reactors

http://www3.nhk.or.jp/nhkworld/english/news/20130708_24.html

New nuclear safety regulations for Japan's power utilities came into effect on Monday. Four utilities have filed applications to the Nuclear Regulation Authority to restart 10 nuclear reactors.

Plant operators are now legally required to take steps to prevent accidents like the one at Tokyo Electric Power Company's Fukushima Daiichi plant in 2011.

The new regulations also require operators to be prepared for more powerful earthquakes and tsunami.

All of Japan's nuclear reactors were halted after the accident at Fukushima. Only 2 has been restarted.

The power companies must conform to the new rules to bring their reactors back online.

Four utilities have filed applications to restart 10 reactors at 5 plants. They are, the Tomari plant run by Hokkaido Electric Power Company, Kansai Electric's Ohi and Takahama plants, Shikoku Electric's Ikata plant, and Kyushu Electric's Sendai plant.

NRA officials say it will take at least 6 months to process an application for each plant.

Operators must also obtain the consent of local communities to restart the reactors.

Kyushu Electric is also expected to apply on Friday to restart the reactors at its Genkai plant.

Tokyo Electric Power Company is still facing opposition from the government of Niigata Prefecture to resume operations at its Kashiwazaki-Kariwa plant.

Japan moving even closer to restart

July 7, 2013

Japan set to restart reactors after nuclear crisis

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201307070025

THE ASSOCIATED PRESS

Japan is moving a step closer to restarting nuclear reactors as utilities are set to ask for safety inspections at their idled reactors, the clearest sign of Japan's return to nuclear energy nearly two and a half years after the Fukushima disaster.
With all but two of its 50 reactors off line since the crisis, Japan has been without nuclear energy that once supplied about a third of its power.
Four of nine Japanese nuclear plant operators--supplying the regions of Hokkaido, Kansai, Shikoku and Kyushu--will apply for safety inspections by the Nuclear Regulation Authority for a total of 10 reactors at five plants on July 8, when new safety requirements take effect.
Kyushu Electric Power Co. is expected to apply for two more reactors at another plant later in the week.
The new standards are stricter than in the past and for the first time compulsory, and only reactors that pass the inspections will be allowed to reopen--possibly early next year.

Each inspection could take several months, according to the watchdog, plus obtaining local consent may take another few weeks.

Critics say the rules have loopholes, including grace periods for some safety equipment.

Hit by soaring gas and oil costs to run conventional power generation plants to make up for the shortfall, Japanese utility companies have desperately sought to put their reactors back online.

Nearly all the utilities owning nuclear power plants reported huge losses last fiscal year due to higher costs for fuel imports.

Hokkaido Electric Power Co., for example, said it has been hit with additional daily fuel costs of 600 million yen ($6 million) to make up for three idled reactors. Nuclear operators have already requested rate hikes or plan to do so.

Prime Minister Shinzo Abe, who took office in December, scrapped a phase-out plan set by the previous government. Resumption of nuclear power plants is part of his ruling party's campaign platform in parliamentary elections in two weeks.

The new requirements specify for the first time that plants must take steps to guard against radiation leaks in the case of severe accidents, install emergency command centers and enact anti-terrorist measures.

Operators are required to upgrade protection for tsunamis and earthquakes, as well as tornadoes and aviation accidents.

Safety was previously left up to the operators, relying on their self-interest in protecting their own investments as an incentive for implementing adequate measures.

Tokyo Electric Power Co. came under fire for underestimating the risk of a tsunami and building a seawall that was less than half the height of the wave that hit the Fukushima No. 1 plant on March 11, 2011, knocking out power and cooling systems, which led to meltdowns in three of its reactors. About 160,000 evacuees still cannot return to their homes.

“We decided to apply because we're confident about the safety measures we've taken,” said Shota Okada, a spokesman at Hokkaido Electric Power Co., filing for the triple-reactor Tomari plant. “We'll do everything to accommodate a smooth inspection process.”

Hokkaido Electric hopes to restart them in time for the long, cold winter on the northern main island, said company president Katsuhiko Kawai recently.

Critics say the requirements still have loopholes that make things easier for operators, including a five-year grace period--given to reactors known as PWRs, that come with larger containment chambers considered less likely to suffer from pressure buildup than ones like those ravaged at Fukushima--for installing some mandated new equipment and a full-fledged command center.

This means about half of the 48 reactors that are PWRs, or pressurized water reactors, could operate without the safety features up to five years.

All 10 reactors set for inspections are PWRs, and filtered vents and command centers are reportedly still under way at many of them.

Opponents say the approvals are aimed at resuming reactor operations, although nearby communities lag in enacting needed emergency and evacuation procedures.

All set for restart?

Japan reopens application procedures for rebooting idled nuclear reactors

Kyodo

http://www.japantimes.co.jp/news/2013/07/08/national/japan-reopens-application-procedures-for-rebooting-idled-nuclear-reactors/#.UdqNhaxSb9k

Japan on Monday reopened procedures to allow idled reactors to be brought back online, putting in place new nuclear regulations that reflect the lessons learned from the 2011 Fukushima No. 1 meltdown disaster.

While power utilities are expected to rush to file applications with the Nuclear Regulation Authority for safety assessments on a total of 10 reactors, none will be restarted anytime soon, because it may take around six months for each safety-screening process to finish.

Facing what the NRA calls the world's toughest level of nuclear regulations, utilities may also opt to give up efforts to restart some of the country's 50 commercial reactors and scrap them instead of investing in costly safety measures.

Four regional utilities filed applications Monday morning for the restart of 10 reactors at five nuclear power plants, in Hokkaido, Fukui, Ehime, and Kagoshima prefectures.

Tokyo Electric Power Co. has also expressed its intention to request an NRA safety review for two reactors at its seven-reactor Kashiwazaki-Kariwa complex in Niigata Prefecture, but local opposition has made it difficult for the utility to apply Monday.

Among those applying for restarts, reactors that could precede others include unit 3 at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture, which has been found not to have geologic faults that need to be checked and has already prepared a newly required seismic-isolated emergency response center.

Reactors must also have a venting system with filters that can reduce the amount of radioactive substances when pressure needs to be released from reactor containers during emergencies, but pressurized water reactors like unit 3 at the Ikata plant are given a five-year moratorium to meet the requirement.

But prospects appear bleak for aging units that will not only have to satisfy the new regulations but also undergo special inspections to continue to operate beyond 40 years.

The existence of active faults running beneath atomic plants could also be a critical factor that will result in the permanent shutdown of reactors.

The NRA has already acknowledged that reactor 2 at Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture sits above a fault where movement cannot be ruled out in the last 120,000 to 130,000 years — a situation not allowed in the quake-prone country.

Japan entered a period of no nuclear power generation in May last year, but the government agreed two reactors at Kansai Electric Power Co.'s Oi plant to address power shortage concerns in the summer in western Japan.

No other reactors have resumed operation since, while the NRA was launched in September to replace the previous, discredited nuclear regulator and to devise the new reactor safety regimen.

After the NRA confirms that a reactor satisfies the new regulations, the operator will seek the consent of the host communities to restart them.

Prime Minister Shinzo Abe's government has made clear it will push for the restart of reactors that are deemed safe and has also vowed to play a part in winning local-level cooperation.

LDP "in a rush" to restart

July 8, 2013

Ruling LDP in a rush to restart nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20130708p2a00m0na015000c.html

Prime Minister Shinzo Abe signaled his readiness to restart idled nuclear power reactors during a TV appearance on July 7 but leaders of other parties were cautious about the plan in the run-up to the House of Councillors election on July 21.

Abe, also president of the ruling Liberal Democratic Party (LDP), said his government is responsible for providing affordable and stable energy, referring to the implementation from July 8 of new nuclear standards by the Nuclear Regulation Authority in the aftermath of the disaster at the Fukushima No. 1 Nuclear Power Plant.

"We will not restart nuclear reactors unless they meet the (new) standards. Safety comes first," Abe said during a special election program on public broadcaster NHK. But he also said Japan is running a deficit of 3 trillion yen because it depends on other countries for most energy sources, suggesting his government will rush to restart idled nuclear reactors.

The premier also said Japan possesses the most advanced nuclear power technology and is receiving inquiries from other countries about importing the technology. He added that Japan should share its high level of nuclear power safety with other countries.

Abe is in a rush to restart nuclear reactors because atomic power will affect his "Abenomics" economic policy mix. The Japanese business community is worried about a spike in electricity bills due to the suspension of operations at most nuclear power plants after the Fukushima disaster triggered by the 2011 Great East Japan Earthquake and tsunami.

Abe's government believes it has to bring back idled nuclear reactors online to produce results from its growth strategy.
But other parties are cautious because Japanese voters are extremely concerned about restarting nuclear reactors.

Natsuo Yamaguchi, leader of New Komeito, the LDP's coalition partner, said on the same NHK program that the government has to carefully make a judgment on restarting nuclear reactors after checking if it can win understanding from the public and municipalities hosting nuclear power plants.

Winning public understanding about building new nuclear power plants is not feasible, Yamaguchi said, adding Japan will be devoid of nuclear reactors according to regulations for decommissioning them after

40 years, in sharp contrast to Abe's remarks that his government would reduce its dependence on nuclear power.

Opposition parties are focusing their criticism against the LDP on its nuclear power policy.

Banri Kaieda, leader of the main opposition Democratic Party of Japan (DPJ), said Japan can only make a full-fledged commitment to the development of natural energy by setting a zero-nuclear power objective. Your Party chief Yoshimi Watanabe emphasized that nuclear power is a costly and risky source of electricity. Tadashi Hirono, deputy chief of the People's Life Party, said his party would strive to end nuclear generation in 10 years.

Kazuo Shii, chairman of the Japanese Communist Party (JCP), blasted the new nuclear standards as a plot to restart nuclear reactors and said they are out of the question. Mizuho Fukushima, leader of the Social Democratic Party (SDP), also criticized the new standards, saying measures against earthquakes are insufficient. Toru Hashimoto, co-leader of the Japan Restoration Party and Osaka mayor, said nuclear safety regulations will get tougher and nuclear reactors will die out.

In a stump speech in Tokyo's Shinjuku Ward, Kuniko Tanioka, leader of Green Wind, criticized the Abe government for trying to restart nuclear reactors and abandoning victims of the Fukushima nuclear disaster.

Five Nuclear Plants Apply for Restart

July 8, 2013

Five nuclear plants apply for restart : Tomari - Ohi -Takahama - Ikata - Sendai

but will the utilities address the process seriously?

A bright sign? But for whom?

July 8, 2013

NRA starts accepting applications for reactor restarts

Kyodo

http://www.japantimes.co.jp/news/2013/07/08/national/japan-reopens-application-procedures-for-rebooting-idled-nuclear-reactors/#.UdsxgqxSb9k

Japan on Monday restarted the procedures for allowing idled reactors to be brought back online, putting in place new safety regulations that reflect the lessons learned from the 2011 Fukushima No. 1 meltdown disaster.

Power utilities rushed to the Nuclear Regulation Authority to apply for safety assessments on 10 reactors in hopes of cutting their fuel costs, which have soared since the loss of atomic power forced them to revert to thermal power generation.

But none of the reactors is likely to be restarted anytime soon because it could take at least six months for each assessment to finish.

Facing what the NRA calls the world's toughest level of nuclear regulations, utilities may also opt to give up efforts to restart some of the other 50 commercial reactors and scrap them instead of investing in costly safety upgrades.

Four regional utilities filed Monday morning to restart the 10 reactors, which are situated at five nuclear power plants in Hokkaido, Fukui, Ehime and Kagoshima prefectures.

Tokyo Electric Power Co. has expressed plans to request an NRA safety review for two reactors at its giant seven-reactor Kashiwazaki-Kariwa complex in Niigata Prefecture, but local opposition made it difficult for the utility to apply Monday.

Under the new standards, utilities will for the first time be obliged to install specific countermeasures for major contingencies ranging from core meltdowns to tsunami — the direct cause of the Fukushima crisis.

Among those applying for restarts, reactors that could precede others include unit 3 at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture, which has been found not to have geologic faults that need to be checked and has already prepared a newly required seismic-isolated emergency response center.

Reactors must also have a venting system with filters that can reduce the amount of radioactive substances when pressure needs to be vented from reactor containers during emergencies, but

pressurized water reactors like unit 3 at the Ikata plant are given a five-year moratorium to meet the requirement.

"We believe the reactor satisfies the state's standards," an official from Shikoku Electric Power told reporters after submitting an application to the NRA, at the same time calling on regulators to conduct a "scientific, rational and efficient" safety assessment.

But prospects appear bleak for aging units that will not only have to satisfy the new regulations but also undergo special inspections to continue to operate beyond 40 years.

The existence of active faults running beneath atomic plants could also be a critical factor that will result in the permanent shutdown of reactors.

Some residents living near nuclear power plants have expressed hope about the economic benefits when they come back online, while others are wary about the dangers.

Masumi Shibuta, 54, who runs an inn often used by workers at Hokkaido Electric Power Co.'s Tomari plant, was relieved at the start of the process for reactivating the complex, saying, "Finally, we are starting to see a bright sign."
But Hideko Hayashi, 81, who is now an evacuee after fleeing the town of Futaba where the Fukushima No. 1 plant is located, said, "No matter how strict the standards may be, an accident could occur. Having standards for restarting reactors is outrageous."

Restart, restart

July 12, 2013
Utility applies to restart 2 reactors
http://www3.nhk.or.jp/nhkworld/english/news/20130712_27.html

Kyushu Electric Power Company has filed an application to restart 2 reactors in western Japan under new nuclear safety regulations.

The utility handed in papers for 2 reactors of its Genkai plant in Saga Prefecture to the Nuclear Regulation Authority on Friday.

The step brought the number of reactors under NRA review to 12, at 6 plants.

Applications for the 10 other reactors were made on Monday, when the new, stricter regulations took effect to prevent accidents like the 2011 Fukushima disaster.

All of Japan's nuclear reactors went offline after the crisis. Two have been restarted.

Kyushu Electric's application says the utility will need more than 2 and a half years to build a full-fledged emergency control room at the Genkai plant.

The new regulations require that such facilities deal with severe accidents, earthquakes or tsunamis. The utility plans to build a temporary facility by September.

The firm also raised its expected tsunami height by 1 meter, to 3 meters. But it says no new levee is needed because the plant is 11 meters above sea level.

Saga Prefecture Governor Yasushi Furukawa says he wants thorough safety checks by the NRA. But he also stresses that the central government should clarify the procedure for allowing restarts after screenings.

The NRA is to start screenings by 3 teams next Tuesday. Work on the Genkai plant is to start later.

Meanwhile, Tokyo Electric Power Company, the operator of the damaged Fukushima plant, has said it will apply to restart 2 reactors at its Kashiwazaki-Kariwa plant in Niigata Prefecture at an early date.

But the utility has yet to reveal the exact date amid opposition by the prefecture.

Japan Atomic Power to seek restart at all reactors

THE ASAHI SHIMBUN
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307120056

Japan Atomic Power Co. aims to resume operations at all three of its nuclear reactors in order to avoid bankruptcy.
But getting those reactors back online will mean overcoming a mountain of issues: an active fault under a reactor, another aging reactor, and virulent local opposition to any restart of the third reactor.
On July 11, Yasuo Hamada, the company president, held a news conference at which he indicated applications would be submitted with government agencies seeking the resumption of operations at the No. 1 and 2 reactors at the Tsuruga nuclear power plant in Fukui Prefecture and the Tokai No. 2 nuclear power plant in Ibaraki Prefecture.
In May, the Nuclear Regulation Authority released a report by an expert panel that said an active fault ran directly under the No. 2 reactor building at Tsuruga. Japan Atomic Power on July 11 submitted its own report challenging the finding.
While Hamada stopped short of specifying when applications for the resumption of operations would be submitted, he said the company would seek to restart all three reactors.

The No. 1 reactor at Tsuruga went into service more than 40 years ago, and there is strong opposition in the local community toward reactivating the Tokai No. 2 plant. Under new safety standards for nuclear reactors, operations can only be extended beyond 40 years after passing a special inspection.

The Nuclear Regulation Authority has ordered Japan Atomic Power to submit a report by the end of July on the effects on the spent nuclear fuel at the Tsuruga plant if there were to be movement along the active fault.

Hamada said the company would submit a formal objection under the terms of the administrative appeals law.

The alternative, decommissioning the reactors, would decrease the asset value of the reactor facilities and nuclear fuel to zero, creating a tremendous financial burden that would lead to the collapse of the company.

That devaluation would have to be processed as a loss along with the shortage in the reserve for decommissioning expenses that would normally be accumulated over the course of at least 40 years.

Total estimated losses from decommissioning all three reactors would likely come to 260 billion yen ($2.6 billion).

But as the company only has net assets of about 160 billion yen, it would face excess liabilities if it has to decommission the reactors.

Unless the Nuclear Regulation Authority revises its conclusion about the active fault under the No. 2 reactor building at the Tsuruga plant, there would appear to be little chance of it resuming operations.

Given this state of affairs, an application for a resumption of operations would merely serve as a delaying tactic. If the application were to be rejected, the company would likely submit an administrative lawsuit seeking to overturn that decision. While the courts were looking into the case, the company would be able to buy time before making a decision about decommissioning.

The company has had electric power companies guarantee huge loans that it receives, meaning that those entities would be severely affected should Japan Atomic Power go into bankruptcy.

Another factor at play is the central government, which has not pushed forward with discussions on the possibility of measures such as subsidies being used for decommissioning. This inaction has resulted in little pressure being placed on the electric power companies and Japan Atomic Power to consider decommissioning their reactors.

Meanwhile, Japan Atomic Power on July 11 opened up the Tsuruga plant to reporters to illustrate its contention that no active fault runs directly under the No. 2 reactor building.

One contention made by company officials is that movement along the fault was smaller the closer the fault was to the reactor building. One official claimed that a new study found that the active fault disappeared before directly reaching under the building.

Another new contention made by the company was the existence of volcanic ash that shows the active fault was in an active period earlier than between 120,000 and 130,000 years ago.

Although the Nuclear Regulation Authority would have to carry out an evaluation should Japan Atomic Power submit an application for a resumption of operations, the likelihood that it would approve a restart is very low without a complete revision of its previous position that an active fault runs under the No. 2 reactor building.

For their part, local communities have expressed their concerns about the reactors operated by Japan Atomic Power.

On July 11, Tokai Mayor Tatsuya Murakami said: "President Hamada has never visited the village to personally explain what the company is considering. I cannot find any intention on his part to try to gain the understanding of the local community."

In mid-June, Japan Atomic Power began work at the Tokai No. 2 plant to install venting equipment with filters as well as begin construction of a coastal levee. Village officials protested the move because no explanation was given beforehand. They suspected the move was made with an eye toward eventual resumption of operations.

In the meantime, Tsuruga Mayor Kazuharu Kawase directed his criticism toward the Nuclear Regulation Authority.

He called for another evaluation of the active fault under the Tsuruga plant and asked that a wider range of experts be included in the panel when considering whether an active fault actually existed.

Japan Atomic Power co.defiant

July 12, 2013

Operator bullish over Tsuruga reactor restart despite active fault row

http://mainichi.jp/english/english/newsselect/news/20130712p2a00m0na006000c.html

The operator of the Tsuruga nuclear power plant in Fukui Prefecture has defended its denial of any active faults running beneath the facility's No. 2 reactor, saying the company is going to prepare for reactor reactivation.

Yasuo Hamada, president of the Japan Atomic Power Co. (JAPC), stated during a press conference on July 11, "If they scrutinize our report for deliberations, they can fully understand (that there are no active faults)," referring to a survey report the company has filed with the Nuclear Regulation Authority (NRA).

The JAPC report denies the existence of active faults underneath the No. 2 reactor, despite the NRA's conclusion on May 22 that the fault running right beneath the No. 2 reactor is active. If the NRA does not overturn its decision, the reactor is likely to be decommissioned.

"We will prepare for reactivating the reactors," Hamada nevertheless stated in defiance of the NRA decision, pledging to restart the Tsuruga plant's No. 1 and No. 2 reactors as well as the No. 1 reactor at the Tokai No. 2 power plant in Ibaraki Prefecture.

Behind the company's tough stance lies the fact that the firm is dedicated to nuclear power generation and whether to restart the reactors is a make-or-break issue for its management. Because the company has received "basic fees" for equipment maintenance and other costs from five major power companies including Tokyo Electric Power Co. (TEPCO) during the suspension of the reactors, and four utilities including Kansai Electric Power Co. and Chubu Electric Power Co. have supported JAPC through debt guarantee and other measures, JAPC reportedly faces no financial problems this fiscal year. However, if the reactors remain suspended, utilities could stop funding JAPC after the next fiscal year, leaving the company financially-strapped.

While it remains to be seen if the NRA could overturn its decision that the fault running under the No. 2 reactor is active in compliance with the JAPC report, the other two reactors run by the company are also fraught with challenges before being restarted.

The No. 1 reactor at the Tsuruga nuclear plant is aging, with 43 years having passed since the start of its commercial operation. Under the new regulatory standards that came into effect earlier this month, special inspections are required for running nuclear reactors that are over 40 years old, making it more costly for JAPC to take safety measures for the No. 1 reactor. The Tokai No. 2 plant's reactor is 34 years old and faces strong opposition from local residents against reactivation. Hamada avoided clarifying when his company is going to apply for the safety screening of the reactors.

With no prospects for restarting many idled reactors, an expert panel to the Ministry of Economy, Trade and Industry has started reviewing an accounting system aimed at leveling the financial burdens from decommissioning reactors, in anticipation of a situation in which reactors are scrapped one after another.

Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan, said, "If the Tsuruga plant's No. 2 reactor is to be decommissioned, it is because of a policy change. The costs for decommissioning the reactor should be discussed with the government," suggesting that the central government be called upon to share the financial burden

More applications for restart

July 13, 2013

Kyushu Electric applies to restart two more reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307130060

By JIN NISHIKAWA/ Staff Writer

Kyushu Electric Power Co. submitted applications to the Nuclear Regulation Authority on July 12 to reactivate the No. 3 and No. 4 reactors at the Genkai nuclear power plant in Saga Prefecture.

The utility also submitted applications for the No. 1 and No. 2 reactors at the Sendai nuclear plant in Kagoshima Prefecture on July 8.

Three other electric power companies that day applied to restart eight reactors at four nuclear power plants.

According to Kyushu Electric's latest application, the quake-resistant building that would be used as emergency headquarters if a nuclear accident occurs will be completed in fiscal 2015. Until then, a temporary facility, which will be readied by September, will be used for that function.

The utility also revised its expectations for the largest tsunami that could possibly hit. Since such a tsunami would fall below the height of the plant site, no coastal levee will be required.

The No. 3 reactor will be used in plutonium-thermal (pluthermal) power generation, which burns mixed oxide (MOX) fuel containing plutonium extracted from spent nuclear fuel. The reactor had used such fuel before the March 2011 accident at the Fukushima No. 1 nuclear power plant.

Of the 12 reactors that have had applications submitted, the two at Genkai have comparatively fewer issues to deal with since there are no active faults within the plant site and the risk of tsunami is low.

The Genkai reactors, therefore, are considered among those that have progressed the most in implementing safety measures, along with the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture operated by Shikoku Electric Power Co.

A key issue in resuming operations at the Genkai reactors will be obtaining the consent of local governments.

The Nuclear Regulation Authority on July 16 will begin its evaluation of the applications submitted for the 10 reactors on July 8. Although the evaluation of the applications for the Genkai reactors will begin later, those reactors will be considered part of the first group of reactors seeking to resume operations.

Kyushu Electric files for safety checks on 2 more reactors

http://mainichi.jp/english/english/newsselect/news/20130713p2g00m0dm024000c.html

TOKYO (Kyodo) -- Kyushu Electric Power Co. on Friday filed for state safety assessments on two more reactors, raising the number of units in Japan seeking to restart operation to 12 after the new safety requirements were introduced earlier this week.

Power utilities are hurrying to file for safety reviews by the Nuclear Regulation Authority as they want to restart reactors that have remained idled due to concerns over the use of nuclear power in the wake of the 2011 Fukushima Daiichi complex disaster.

Kyushu Electric Power filed applications Friday for the Nos. 3 and 4 reactors at the Genkai nuclear power station in Saga Prefecture. It has already taken the same procedures for the Nos. 1 and 2 reactors at the Sendai plant in Kagoshima Prefecture.

Reactors applying for resumption of their operations have so far all been pressurized water reactors, which are different from the type of reactors that suffered core meltdowns at Tokyo Electric Power Co.'s Fukushima Daiichi plant.

Under the new safety regulations, reactors must have a venting system with filters that can reduce the amount of radioactive substances when pressure needs to be released from reactor containers during emergencies. The installation of the system involves major refurbishment.

But pressurized water reactors have been given a five-year moratorium to meet the requirement, enabling utilities to more swiftly file for the restart of this type of reactor.

Of the 50 commercial reactors in Japan, all but two are currently offline. To resume operation, reactors will have to be checked by the NRA to see whether they satisfy the new safety criteria.

The new requirements for the first time oblige utilities to put in place specific countermeasures against possible severe accidents like reactor core meltdowns, as well as against huge tsunami -- the direct cause of the Fukushima crisis.

Monju survey

July 18, 2013

Nuclear experts in 2nd day of Monju fault survey

http://www3.nhk.or.jp/nhkworld/english/news/20130718_20.html

Japan's nuclear regulators on Thursday continued their geological survey at the site of a fast-breeder reactor on the Sea of Japan coast. They are trying to find out if there are any active faults that pose safety risks.

Nuclear Regulation Authority Commissioner Kunihiko Shimazaki and 3 other experts began their 2-day survey at the prototype Monju reactor in Fukui on Wednesday.

Thursday's survey focused on a linear fissure found in an off-site area southeast of the reactor. Some experts suspect the fissure to be part of an active fault.

Researchers also inspected the coastal area north of the reactor to see if any similar fissures exist, which would suggest an extension of the fissure in question.

After Wednesday's survey, the experts asked the reactor's operator, the Japan Atomic Energy Agency, to survey a wider area for possible faults.

The operator agreed and decided to carry out additional surveys to find out whether the fissure extends into the sea.
Jul. 18, 2013 - Updated 05:14 UTC

Regulators inspecting fault under Monju reactor
http://www3.nhk.or.jp/nhkworld/english/news/20130717_12.html
Japan's nuclear regulator is checking the country's 6 nuclear power plants built over faults.

On Wednesday, experts launched a 2-day examination of faults at the prototype Monju fast breeder reactor in Fukui Prefecture.

The team comprises Nuclear Regulation Authority commissioner Kunihiko Shimazaki and 3 other experts.

The reactor compound is over 8 faults. One is under the reactor. Experts say shifts could occur if an active fault about 500 meters west of the site moves in an earthquake.

The team was first briefed on locations of the faults by officials of the reactor's operator, the Japan Atomic Energy Agency.

They then saw where part of the active fault appears in the ground, and scraped the soil to get a clear view.

The government does not allow building of key reactor facilities above active faults.

If the fault under the reactor were determined to be at risk of moving with the active fault, the reactor would no longer be operable.

In the afternoon, the team was to visit a point where an extended section of the fault beneath the reactor can be observed.

Panel starts investigation on geologic faults at Monju reactor site
http://mainichi.jp/english/english/newsselect/news/20130717p2g00m0dm062000c.html

TOKYO (Kyodo) -- A team of experts appointed by the Nuclear Regulation Authority started a two-day investigation Wednesday on the activity of some geologic faults running beneath the Monju prototype fast-breeder reactor in Fukui Prefecture.

The Japan Atomic Energy Agency's Monju reactor is the fourth location visited by an NRA-led team to check whether shattered zones, or zones of crushed rock, at the site could move in the future and undermine the safety of the facility.

In quake-prone Japan, nuclear reactors are not allowed to be located directly above active faults. The Monju reactor sits above eight small shattered zones, which may move together with an active fault running about 500 meters west of the facility.

The Monju reactor has effectively been banned from operation in the meantime because of the operator's lax safety management. If the shattered zones are acknowledged to be active faults, it will be highly difficult to resume operation.

Japan has already spent over 1 trillion yen on the Monju project, hoping the facility would play a key role in the country's spent fuel recycling policy.

But the reactor has remained largely offline since it first achieved criticality in 1994, due to a sodium coolant leak and subsequent problems.

The investigation team is led by NRA commissioner Kunihiko Shimazaki and four other experts recommended by academic circles. One of the outside experts will not participate in the two-day field survey and will visit the site later.

Among the four nuclear facilities that have accepted NRA investigation teams, the NRA has reached a conclusion that the No. 2 unit at Japan Atomic Power Co. Tsuruga nuclear plant is located above an active fault. But the operator has argued against the assessment, which could leave the company with no option but to scrap the reactor.

NRA screening

July 16, 2013

Nuclear regulator begins screening applications

http://www3.nhk.or.jp/nhkworld/english/news/20130716_23.html

Japan's nuclear regulator has begun screening applications from power companies to restart nuclear reactors.

This is the regulator's first meeting since Japan's new nuclear safety standards went into effect last week.

Officials of the Nuclear Regulation Authority met with representatives of Kyushu Electric Power and Hokkaido Electric Power on Tuesday.

Kyushu Electric explained the safety measures that it has put in place as part of its bid to restart the No. 1 and 2 reactors at its Sendai plant in Kagoshima Prefecture.

The utility briefed regulators about the level of earthquakes and tsunamis it has prepared for, and said it plans to build a temporary facility to serve as a command center for an emergency task force in the case of an accident.

Nuclear regulators pointed out areas that the inspections focus on and said they need to confirm the chain of command at the emergency task force and the number of workers the temporary facility can hold.

They also noted that in the event of a volcanic eruption, up to 15 centimeters of ash could accumulate, so they will have to see if the utility's measures are in line with the new safety standards.

So far, 4 utilities have submitted applications to restart reactors at 6 plants. Representatives from Shikoku Electric and Kansai Electric are scheduled to present their safety measures later in the day.

Inspection delayed at Tomari plant

July 24, 2013

Tomari reactor checks suspended

JIJI

The Nuclear Regulation Authority will suspend safety checks for two nuclear reactors run by Hokkaido Electric Power Co. because the utility's applications were far from adequate.

Hokkaido Electric is "clearly unprepared" for checks to be carried out on reactors 1 and 2 at its Tomari nuclear power station in Hokkaido, NRA Commissioner Toyoshi Fuketa said Tuesday.

The checks will go ahead when the firm submits additional materials, the NRA said.

An official from Hokkaido Electric said the decision is unfortunate, adding that the utility will file revised applications for the reactors as soon as possible.

The NRA said Hokkaido Electric submitted analysis results showing how the reactor cooling water systems would cope in a severe nuclear catastrophe based on data from another type of cooling system.

It also said the power company failed to adequately explain whether the two reactors meet new safety standards. It told the company to withdraw its applications or file revised ones.

The NRA plans to continue screening the Tomari reactor 3. But Fuketa said the authority sees a lack of preparation.
Hokkaido Electric is one of four companies that applied for NRA checks on July 8, when new nuclear safety standards came into effect.

As for safety check applications for other reactors, the NRA said it will not screen those for reactors 3 and 4 at Kansai Electric Power Co.'s Oi power plant in Fukui Prefecture until the authority knows the results of the ongoing fault research there. It will not take up reactors 3 and 4 at Kepco's Takahama plant in the same prefecture at the next screening session due to the operator's poor understanding of the underground structure of the plant site.

Regulators to hold open session on Tsuruga reactor

http://www3.nhk.or.jp/nhkworld/english/news/20130724_15.html

Japan's nuclear regulators plan to hold an open-door meeting to discuss the results of an additional survey by a nuclear power plant operator. The results run counter to their assessment that one of its reactors sits on an active fault.

The Nuclear Regulation Authority determined in May that an active fault runs under the Number 2 reactor of the Tsuruga nuclear plant in Fukui Prefecture.

The reactor may have to be scrapped because the government bans building nuclear reactors on or above active faults.

But earlier this month, plant operator Japan Atomic Power Company submitted the results of an additional survey that show the reactor does not sit on an active fault.
The company asked the authority to discuss the issue again.

At a meeting on Wednesday, the authority decided to hold an open session to hear the company's explanation and discuss what to do with the new results based on views of experts, if necessary.

Commissioner Kunihiko Shimazaki said they will examine whether the results require them to take new steps. The regulatory body says it may review its decision if it obtains any new knowledge.

The nuclear regulator also decided to reject Japan Atomic Power Company's request that it withdraw an order to report what would happen to more than 1,700 units of fuel rods at the plant if an active fault moves.

The order says the operator should outline preventive measures.
The authority says it is hard to imagine that the order would seriously damage the company.

First four

July 25, 2013

4 nuclear reactors on restart screening

http://www3.nhk.or.jp/nhkworld/english/news/20130725_46.html

Japan's nuclear regulators have chosen the first group of 4 reactors for a review of severe accident measures. The move is a step toward restarting the facilities.

On Thursday, Nuclear Regulation Authority officials conducted a hearing with the operators of the Tomari plant in Hokkaido, the Ikata plant in Ehime, and the Sendai plant in Kagoshima.

The plants' 4 reactors are prioritized for the review.

The operators explained new measures to prevent damage to nuclear fuel in case of a total blackout, like the one that occurred at the Fukushima Daiichi plant in 2011.

The utilities also provided an analysis on the effectiveness of the proposed measures.

The regulators quizzed them on the details of the procedures. They also asked about the number of workers onsite to deal with any accident, and their roles.

Operators have submitted applications to restart another 8 reactors.

At the Genkai plant in Saga, the NRA asked preliminary questions on active faults at the site and the plant's preparedness for an emergency.

But the NRA put on hold screenings of the remaining 6 reactors, saying they are not ready for inspection.

Nuke plant workers and eye examinations

July 27, 2013

Hundreds of nuke plant workers missed crucial eye exams

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307270048

By TOSHIO TADA/ Staff Writer

Despite a higher risk of developing cataracts, nearly 40 percent of Tokyo Electric Power Co. employees who worked in the Fukushima No. 1 nuclear power plant after the 2011 disaster have not undergone annual eye examinations required by the government.
Of the 647 employees required to undergo the examination in fiscal 2012, 247 people, or 38.2 percent, failed to do, sources said July 26. Exposure to radiation can increase the risk of developing cataracts.
The overall figure would be sharply higher if subcontractors' employees who also did not undergo the examinations are added, the sources said.
The health ministry is still trying to determine the total number of workers who have not had the mandatory inspections. It plans to announce the figure shortly.
In October 2011, seven months after the onset of the nuclear accident at the Fukushima plant, the ministry stipulated guidelines on health management for about 20,000 people who were engaged in emergency work at the stricken plant.
According to the guidelines, if a person is exposed to radiation exceeding 50 millisieverts, the individual must receive an eye examination once a year. If the exposure exceeds 100 millisieverts, an annual cancer screening is required.
According to TEPCO, 647 of its employees were required to receive eye examinations in fiscal 2012, but only 400 did so. It said 146 TEPCO employees were required to receive cancer screenings, and all but two had them.

The failure of many employees to have eye examinations reflects TEPCO's tardiness in explaining the risk of developing cataracts from exposure to radiation.
"We will make sure that all employees who are required to receive eye examinations do so," a TEPCO official said.
TEPCO said it does not know if employees of its subcontractors are receiving eye examinations.
Many of those subcontractors are small companies that do not have sufficient safety management systems. In addition, many of their workers were temporary help who are no longer employed with the subcontractors.
Thus, it seems likely that the ratio of workers hired by subcontractors who did not receive eye examinations is higher than that of TEPCO employees.
In October 2011, the health ministry announced that it will compile a database by gathering the results of examinations from TEPCO and subcontractors. When it checked data sent to the ministry from those companies, however, it found as many as 8,000 cases in which names or birth dates of workers were incorrect. Because of that, the database has yet to be compiled.
"Many unexpected errors were found in the data," a ministry official said, adding, "We have set up offices to receive individual consultations from workers."

Ohi to be shut mid-September

August 1, 2013

Ohi plant to shut 9/15; no reactors online
http://www3.nhk.or.jp/nhkworld/english/news/20130801_35.html

The operator of the Ohi nuclear plant in central Japan has started the process of shutting down the nation's 2 operating reactors.

Officials at Kansai Electric Power Company on Thursday applied to the Nuclear Regulation Authority to halt the plant's No. 3 reactor on September 2nd for regular inspections. They also plan to stop the No. 4 reactor of their plant in Fukui Prefecture on September 15th.

That would put all nuclear reactors in Japan offline for the first time in 14 months.

Officials from four utilities have applied to the authority for safety screening. They hope to restart 12 reactors at 6 nuclear plants, including Ohi.
But there are no clear indications of when that can happen.
Aug. 1, 2013 - Updated 09:55 UTC

July 31, 2013

Ohi to be shut down 9/15, turning Japan no-nuke
http://www3.nhk.or.jp/nhkworld/english/news/20130801_03.html

Japan's 2 remaining nuclear reactors still in operation will be shut down for regular inspections next month.

Kansai Electric Power Company is set to submit to regulators on Thursday an application to shut down the Number 3 reactor at the Ohi plant in Fukui Prefecture. The company says it will stop the reactor on September 2nd for a regular maintenance check.

The Number 4 reactor will be halted 2 weeks later. The move will bring all reactors in Japan offline for the first time in 14 months.

Four utilities have asked the Nuclear Regulation Authority to restart 12 reactors in 6 power plants. Their applications are currently being screened.

But no clear prospects for restarting any of the reactors have emerged.

Niigata governor still not convinced

August 6, 2013

Tepco gets partial local approval to apply for reactor checks

http://www.japantimes.co.jp/news/2013/08/06/national/tepco-gets-partial-local-approval-to-apply-for-reactor-checks/#.UgEfWqxSab0

Kyodo

Tokyo Electric Power Co. said Tuesday it has won backing from two municipal governments to apply for a safety assessment of its idled nuclear reactors in Niigata Prefecture.

But Tepco has not yet gained approval from Niigata Gov. Hirohiko Izumida and it remains uncertain when the utility will be able to apply for the assessment, which is a necessary step in restarting the reactors at the Kashiwazaki-Kariwa plant.

The facility is the world's largest nuclear power station. It is in the city of Kashiwazaki and the village of Kariwa.

Kashiwazaki Mayor Hiroshi Aida indicated his approval Tuesday for the assessment, telling a news conference that whether to file applications is "up to the plant operator."

Kariwa Mayor Hiroo Shinada has already expressed its intention to give Tepco the go-ahead.

But Gov. Izumida has been reluctant to allow the utility to apply for the safety checks, citing insufficient investigation into the March 2011 nuclear crisis at the Fukushima No. 1 complex and other reasons.

"I want to meet the governor" for another round of talks, following discussions in July, before applying for the assessment, Tepco President Naomi Hirose told reporters after informing the head of the Natural Resources and Energy Agency of the latest development.

Tepco wants to reactivate its reactors at the Kashiwazaki-Kariwa plant to cut fuel costs for thermal power generation to make up for the halt of its other nuclear power plants.

To resume operation of offline reactors, utilities have to seek confirmation from the Nuclear Regulation Authority regarding whether their facilities satisfy new safety requirements introduced in July.

Other utilities have already applied for the inspection of some of their reactors, but Tepco's application would be more controversial because it is the operator of the crippled Fukushima No. 1 complex.

No restart before Ohi shutdown -TEPCO's profits

August 13, 2013

No restarts before shutdown

Oi reactor halt Sept. 15 to see all plants idled

Kyodo

http://www.japantimes.co.jp/news/2013/08/13/national/oi-reactor-halt-sept-15-to-see-all-plants-idled/#.UgpCdaxSab0

TSURUGA, FUKUI PREF. – Two reactors will go offline for routine checks on Sept. 15, the first time the nation will be without electricity generated by nuclear power in more than a year, government sources said.

It will be the second time that all of the nation's 50 commercial reactors are offline at the same time since the 2011 Fukushima No. 1 plant disaster started, sparking public fears about the safety of nuclear power.

The two reactors currently online are units 3 and 4 at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture. The utility has reported to the Nuclear Regulation Authority that the checks for reactor 3 unit will start Sept. 2, and plans to report that checks for unit 4 unit will commence Sept. 15.

Nuclear reactors are required to undergo inspections every 13 months. Utilities have to file applications with authorities a month ahead of time.

Last year, Japan was without nuclear power for the first time in more than 40 years amid the Fukushima nuclear crisis,triggered by a huge earthquake and tsunami on March 11, 2011.

After about two months, the government allowed the restart of the two reactors at the Oi plant to address possible power shortages in the summer in western Japan.

No other reactors have been brought back online since, but Japan is now moving closer to restarting some units as procedures to check their safety based on a set of new regulations commenced in July.

The safety evaluation of the reactors, however, may take around six months, meaning Japan will see nuclear power generation drop to zero again after the two Oi plant reactors are taken offline.

Before the nuclear crisis, nuclear power supplied around 30 percent of Japan's total electricity.

Tepco to turn profit?

kyodo

Tokyo Electric Power Co. expects to log a pretax profit of about ¥34 billion in the fiscal year through next March if it can restart its idled reactors in January, sources close to the utility and its lenders said Tuesday.

Tepco, which is struggling with the heavy costs of the 2011 Fukushima nuclear disaster, is trying hard to turn a profit in fiscal 2013 because it is a condition for the utility to continue to receive bank loans.

According to an estimate Tepco presented to its lenders, the condition will be satisfied if the Kashiwazaki-Kariwa plant in Niigata Prefecture resumes operation in January, because returning to atomic power will help the utility reduce fuel costs for thermal power generation.

But the prospects on when Tepco can restart the plant are unclear, with Niigata Gov. Hirohiko Izumida opposed to the firm's plan to apply for state safety evaluation of two reactors at the seven-reactor facility.

The estimate also showed that, even if no reactors are brought back online, Tepco could still post a pretax profit of ¥60 billion if it resorts to an 8.5 percent electricity rate hike in January.

Restart Takahama reactors? No way.

August 15, 2013

Revised tsunami projection dashes hopes of early Takahama reactor restarts

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308150054

By RYUTA KOIKE/ Staff Writer

A revised estimate of maximum tsunami heights means additional measures are needed at the Takahama nuclear power plant in Fukui Prefecture before the go-ahead can be given to restart the plant's idled reactors.

Kansai Electric Power Co., the plant's operator, had projected the maximum tsunami height at 2.6 meters when it applied on July 8 to restart the Takahama plant's No. 3 and No. 4 reactors. The Nuclear Regulation Authority, however, ordered Kansai Electric to make plans based on the Fukui prefectural government's projection that a 3.7-meter wave could inundate the facility.

Kansai Electric later presented new simulation results to an NRA meeting that monitors compliance to industry safety standards. The utility said its simulations showed a tsunami could reach as high as 50 centimeters above the height of the plant site, which lies at an elevation of 3.5 meters.

Some facilities, including a pump chamber adjacent to the No. 3 and No. 4 reactor buildings, could be swamped, Kansai Electric said Aug. 14.

The NRA's new standards do not allow key nuclear plant facilities to be inundated. Kansai Electric's previous worst-case scenario predicted no flooding, and the utility volunteered to build a 6-meter-high seawall and a levee along a water intake channel for completion by March 2015 and March 2016, respectively.

The current NRA safety standards, which were upgraded to incorporate lessons learned from the 2011 Fukushima nuclear disaster, took effect on July 8.

In response to the latest review of projected worst-case tsunami scenarios, Kansai Electric said it will build an additional levee to surround key facilities that are under threat of flooding.

The utility said it has yet to determine the final details on how it plans to proceed or the completion date for the additional work.

"We hope to present details on our plan at the earliest date possible to an NRA screening meeting as soon as we have determined them," a Kansai Electric official said.

Start again, under the circumstances?

August 29, 2013

Fukushima spill snags reactor restart quest

Hosts appear split despite nation's inability to quickly solve water crisis

by Eric Johnston
Staff Writer
http://www.japantimes.co.jp/news/2013/08/29/national/fukushima-spill-snags-reactor-restart-quest/#.UiBEr39Sb9k

OSAKA – The Fukushima No. 1 power plant's continued pollution of the Pacific is fueling growing domestic and international concern about radiation hazards, clouding plans by utilities and the government to quickly restart a dozen reactors.

The Nuclear Regulation Authority's decision to raise the severity assessment of a tank leak Wednesday to level 3 ("serious incident") on the International Nuclear and Radiological Event scale comes over a month after Tokyo Electric Power Co. admitted radioactive groundwater under crippled Fukushima No. 1 power plant is flowing to the Pacific Ocean, and six weeks after applications were filed to restart reactors in Hokkaido, Fukui, Ehime, Saga, and Fukui prefectures under new safety standards.

But there is something of an east-west divide among regional governments as to the wisdom of restarting the reactors. On Wednesday, Fukushima Gov. Yuhei Sato called on Prime Minister Shinzo Abe's government to declare a national state of emergency over the water leaks.

"Under the recognition that this is a declared national emergency, the government should respond in a concerted effort, and with a sense of urgency," Sato told Minister of Economy, Trade, and Industry Toshimitsu Motegi.

In Niigata Prefecture, home to Tepco's giant seven-reactor Kashiwazaki-Kariwa complex, plans to apply for restarting two of the reactors ran into problems even before the most recent water leak, when the governor signaled he was opposed.

"Now is not the time to talk about restarting the reactors, because the investigation into the causes of the Fukushima accident is not finished" Niigata Gov. Hirohiko Izumida warned last week.

In western Japan, the political rhetoric is different.

In Fukui Prefecture, which has 13 commercial reactors, the local townships hosting them, as well as Gov. Issei Nishikawa, are continuing to lobby hard to get them up and running again. Nishikawa has been especially critical of the way the NRA examined the prefecture's plants.

"For no logical reason, the NRA has delayed plant safety inspections" on the new safety standards, Nishikawa said.
The staunchly pro-nuclear Fukui governor has met with senior Abe administration officials twice since June. He called on the government to create a separate body to monitor the operations of the NRA and to make recommendations for improving its operations.

In a passage that came almost verbatim from previous statements by Kansai Electric Power Co., he also asked that a new body of experts be hired to come to a "fair and impartial" scientific conclusion about the fault lines under Fukui's reactors, which were judged active in the case of the Tsuruga plant's reactor 2.

In June, reactors 3 and 4 at Kepco's Oi power plant — currently the only two online in Japan — were allowed to continue operating until they have to halt for regular inspections in September, after the NRA said there were no immediate safety problems.

In Saga Prefecture, Kyushu Electric Power Co. is pushing to restart the reactors 3 and 4 at the Genkai power plant. But the Fukushima water leak has magnified the concerns of local fisherman, and about 20 members of a fisherman's union in neighboring Nagasaki Prefecture last week agreed to protest the effort.

Local opposition, however, isn't as strong as it is in other parts of the country, and there is speculation among anti-nuclear groups that the Genkai reactors will be the first restarted under the new safety guidelines.

In Ikata, Ehime Prefecture, where Shikoku Electric Power Co. officials are moving forward with plans to start the Ikata plant's reactor 3, company officials went door to door earlier this week visiting homeowners and small businesses to explain the safety policy for the plant, also encountering little opposition.

But the questions of if, when and where reactors should be restarted is likely to rely not only on local politics, but also available personnel.

Earlier this month, the NRA took out a help-wanted ad in a utility industry newspaper, seeking 20 people with experience working in nuclear power to help judge whether reactors targeted for restarts meet its new safety standards, which took effect in July.

At present, about 80 people are employed in such work. The NRA wants the new employees to begin in October. Given the amount of work and the number of applications, doubts remain about whether even 100 additional inspectors would speed up the process.

All out soon

September 15, 2013

All nuclear reactors in Japan to be halted
http://www3.nhk.or.jp/nhkworld/english/news/20130915_11.html

The only nuclear reactor in Japan that is generating power will go offline soon for regular inspections.

Kansai Electric Power Company will begin lowering the output of the Number 4 reactor at Ohi nuclear power plant in central Japan on Sunday evening.

The reactor will stop generating electricity late at night, and will come to a halt early Monday morning.

When that happens, all 50 nuclear reactors in Japan will be offline for the first time in about 14 months.

After the nuclear accident at the Fukushima Daiichi plant in 2011, all of the country's reactors went offline for safety inspections.

Two reactors at the Ohi plant restarted operation last year.

Utilities have asked the Nuclear Regulation Authority for approval to restart 12 reactors at 6 power plants.

The regulators began safety assessments in July. They say the process takes about 6 months. Local municipalities must also give approval before reactors can restart.

None of the reactors appear likely to resume operations in the near future.

Last reactor out

September 15, 2013
Japan halts last nuclear reactor

http://www3.nhk.or.jp/nhkworld/english/news/20130916_05.html

The only nuclear reactor in Japan that was generating electricity was halted on early Monday morning.

Kansai Electric Power Company is the operator of Ohi nuclear power plant in central Japan. It began lowering the output of the Number 4 reactor on Sunday evening.

The reactor stopped generating electricity Sunday night and was halted at about 1:30 AM on Monday Japan time. This means all 50 of the country's reactors have ceased operation for the first time in 14 months.

After the accident at the Fukushima Daiichi nuclear power plant in 2011, all reactors in the country went offline for safety inspections. Two reactors at the Ohi plant restarted operation last year.

Ohi's Number 4 reactor was the only one running in Japan after another reactor at the same plant stopped generating power earlier this month for regular checks.

Electric power companies have asked the Nuclear Regulation Authority for approval to restart 12 reactors at 6 power plants, including the Ohi power plant.

The regulators began safety assessments from July in a process they say will take about 6 months.

Local municipalities must also give their approval before reactors can be restarted.

None of the reactors are likely to resume operations in the near future.
Sep. 15, 2013 - Updated 20:16 UTC

Japan's only operating reactor halts generation

http://www3.nhk.or.jp/nhkworld/english/news/20130916_01.html

The only nuclear reactor in Japan generating power has stopped generating electricity for regular inspections.

The Number 4 reactor at Kansai Electric Power Company's Ohi nuclear power plant in central Japan stopped generating electricity at 11PM Japan time on Sunday.

All nuclear reactors in Japan to be halted

http://www3.nhk.or.jp/nhkworld/english/news/20130915_11.html

The only nuclear reactor in Japan that is generating power will go offline soon for regular inspections.

Kansai Electric Power Company will begin lowering the output of the Number 4 reactor at Ohi nuclear power plant in central Japan on Sunday evening.

The reactor will stop generating electricity late at night, and will come to a halt early Monday morning.

When that happens, all 50 nuclear reactors in Japan will be offline for the first time in about 14 months.

After the nuclear accident at the Fukushima Daiichi plant in 2011, all of the country's reactors went offline for safety inspections.

Two reactors at the Ohi plant restarted operation last year.

Utilities have asked the Nuclear Regulation Authority for approval to restart 12 reactors at 6 power plants.

The regulators began safety assessments in July. They say the process takes about 6 months. Local municipalities must also give approval before reactors can restart.

None of the reactors appear likely to resume operations in the near future.

Scrap reactors 5 & 6, says Abe

September 19, 2013

Abe tells TEPCO to scrap two surviving Fukushima reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309190091

THE ASAHI SHIMBUN AND WIRE REPORTS

Prime Minister Shinzo Abe on Sept. 19 urged Tokyo Electric Power Co. to decommission the two surviving reactors at the stricken Fukushima nuclear plant and set a time frame to resolve the radioactive water problem.

Abe requested Naomi Hirose, the TEPCO president, to secure a sufficient budget for safety measures and to deal with the tons of contaminated water accumulating and leaking at the plant.

"In order for them to concentrate on this, I have asked them to decommission the No. 5 and No. 6 reactors that are now halted," Abe told reporters.

Four reactors were destroyed by meltdowns and hydrogen explosions after the 2011 Great East Japan Earthquake rocked the Tohoku region and a tsunami slammed into the Fukushima No. 1 nuclear plant. The No. 5 and No. 6 reactors were not operating at the time and escaped serious damage.

Abe quoted Hirose as saying that TEPCO "will secure another 1 trillion yen ($10.1 billion) in addition to 1 trillion yen already obtained." The TEPCO chief also promised that the purification of contaminated water will be completed by the end of fiscal 2014.

Hirose also said TEPCO will make a decision on decommissioning the reactors by the end of the year, according to Abe.

Scrapping the two reactors could complicate a turnaround plan the plant's operator has presented to creditors.

TEPCO, which has posted more than $27 billion in net losses since the 2011 disaster, is negotiating with a syndicate of Japanese banks for a refinancing of 80 billion yen due next month.

As of April, the company listed 745.5 billion yen in nuclear power generation assets. Those included the No. 5 and No. 6 reactors as well as the utility's Fukushima No. 2 nuclear plant and Kashiwazaki-Kariwa--the world's largest nuclear plant--in Niigata Prefecture.

The Fukushima No. 2 and Kashiwazaki-Kariwa plants are now halted, and it is uncertain whether they can be restarted in the face of local opposition.

TEPCO has come under heavy criticism for a series of mishaps and delays in releasing information about the situation at the Fukushima No. 1 plant. The water leakage problem even threatened to derail Tokyo's bid to host the 2020 Summer Olympics.

After the government decided to take a more central role in the cleanup at the plant, Abe assured International Olympic Committee members on Sept. 7 that the situation at the Fukushima plant "was under control."

However, Kazuhiko Yamashita, a technology adviser to TEPCO, later said at a meeting with opposition lawmakers, "We regard the current situation as not being under control."

Still, Abe stood by his words on Sept. 19.

"I will work hard to counter rumors questioning the safety of the Fukushima plant," he said.

The visit to the stricken plant was Abe's first since his trip last December shortly after taking office. The prime minister was shown the Alps multi-nuclide removal equipment, which can eliminate 63 radioactive substances from contaminated water but has not been used since corrosion holes were found in one of its storage tanks.

The accident at the nuclear plant, 240 kilometers north of Tokyo, triggered the evacuation of 160,000 people and led to the radioactive contamination of air, sea and food.

Abe asks TEPCO to decommission 2 more reactors

http://www3.nhk.or.jp/nhkworld/english/news/20130919_28.html

Japan's Prime Minister Shinzo Abe has urged the operator of the troubled Fukushima Daiichi nuclear power plant to decommission 2 more of its idle reactors.

Abe was speaking to reporters after inspecting the plant on Thursday. Tokyo Electric Power Company, or TEPCO, has been decommissioning the plant's No.1 to 4 reactors.

Abe said he urged the utility to decommission the plant's No.5 and 6 reactors to concentrate efforts to address problems left by the 2011 nuclear accident.

He quoted TEPCO President Naomi Hirose as saying the firm will decide this year how to deal with the 2 reactors.

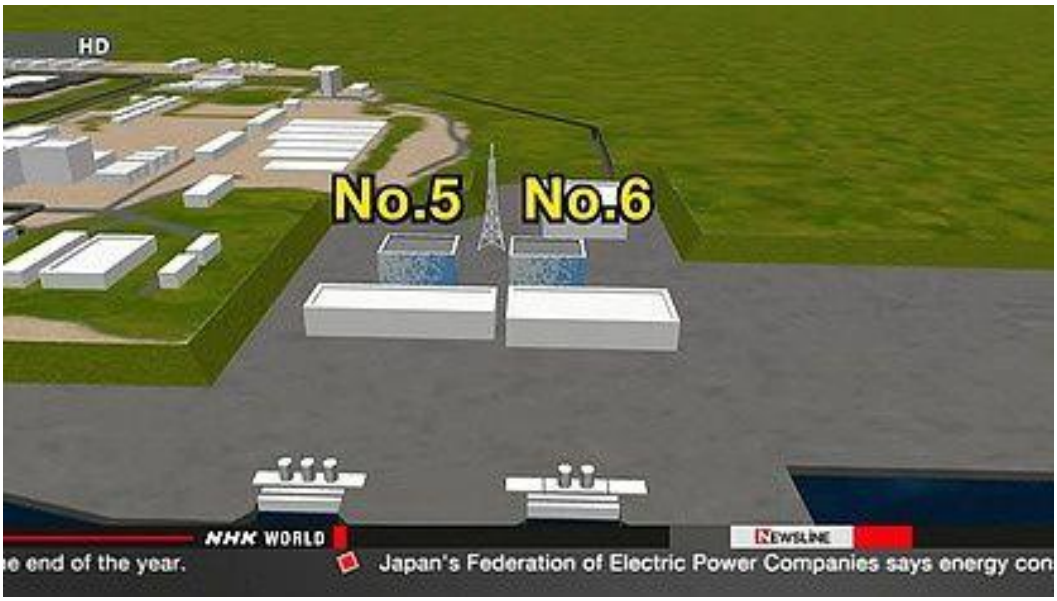
Abe also said he asked TEPCO to earmark discretionary funds that can be used by managers at the site to implement necessary safety measures. He urged the utility to set a deadline for completing purification of contaminated water stored in tanks at the plant.

Hirose reportedly replied that another 1 trillion yen, or about 10 billion dollars, will be added to funds that the company has already earmarked. He also said the company plans to complete purification by March 2015.

Abe stressed that monitoring data collected in the ocean off Fukushima shows that the radioactive water affects only 0.3 square kilometers in the plant's port. He had explained this to the general assembly of the International Olympic Committee in Argentina this month.

The prime minister added that the government will play a major role in the cleanup and that he will be responsible for handling the issue.
Sep. 19, 2013 - Updated 09:06 UTC

status of Number 5 and 6 reactors



http://www3.nhk.or.jp/nhkworld/english/news/20130919_29.html

Tokyo Electric Power Company has not said anything officially about what it plans to do with the Number 5 and 6 reactors at the crippled Fukushima Daiichi nuclear power plant.

The two reactors were off-line due to regular safety inspections when the earthquake and tsunami hit the power plant on March 11th, 2011. The reactors were stable, in a state of cold shutdown.

In March 2012, TEPCO started procedures for decommissioning reactors Number 1 to 4.

Izumida apparently reassured by promise of extra venting equipment

September 26, 2013

TEPCO makes progress toward restarting idled reactors in Niigata

http://mainichi.jp/english/english/newsselect/news/20130926p2g00m0dm103000c.html

NIIGATA, Japan (Kyodo) -- Niigata Gov. Hirohiko Izumida said Thursday that he basically approves Tokyo Electric Power Co.'s plan to apply for a safety assessment of its two idled reactors in Niigata Prefecture, a key step toward resuming their operation.

The announcement came a day after TEPCO President Naomi Hirose met Izumida and promised to install at the Kashiwazaki-Kariwa plant reactors additional safety equipment to deal with severe nuclear accidents.

The approval from Izumida is expected to pave the way for the utility to apply to the Nuclear Regulation Authority for the safety assessment of the Nos. 6 and 7 units at the Kashiwazaki-Kariwa plant. Only reactors that satisfy a set of new safety requirements introduced in July will be allowed to restart.

TEPCO said it will file the application on Friday.

The company, which is struggling to turn its business around following the 2011 accident at its Fukushima Daiichi nuclear complex, wants to reactivate its idled reactors to cut fuel costs, which increased when it returned to thermal power generation following the closure of its other nuclear power plants.

The need to restart the Kashiwazaki-Kariwa plant was stipulated in a 10-year special business plan for TEPCO, which is under effective state control after its receipt of 1 trillion yen in public funds last year.

TEPCO owns the Fukushima Daiichi and Daini plants as well as the Kashiwazaki-Kariwa complex -- the world's largest nuclear power plant with a combined output capacity of 8.2 million kilowatts.

Niigata governor approves TEPCO reactor-restart plan on one condition

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309260077

THE ASAHI SHIMBUN

Niigata Governor Hirohiko Izumida, who has criticized and humiliated Tokyo Electric Power Co., has now removed a hurdle in the utility's drive to restart two nuclear reactors.

Izumida on Sept. 26 approved TEPCO's plan to apply for a safety screening for restarting the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

But he attached one condition.

In a document handed to a TEPCO executive on Sept. 26, the prefectural government demanded that the utility promise, in an application request, not to use filtered venting equipment without prefectural approval in the event of an accident at the nuclear plant.

Filtered venting equipment is required for nuclear power plants under new safety standards that took effect in July. The equipment is designed to release steam to keep pressure from building within the containment vessel after radioactive materials are filtered. Still, the steam released would contain radioactive substances.

TEPCO plans to file an application for the safety screening with the Nuclear Regulation Authority on Sept. 27.

In a meeting with Izumida on Sept. 25, TEPCO President Naomi Hirose explained the company's plans to install additional filtered venting equipment at the Kashiwazaki-Kariwa nuclear plant.

Hirose also said TEPCO will abide by a safety agreement with the prefectural government and promised not to apply for an NRA safety screening until it obtains prefectural approval for the construction of filtered venting equipment.

Izumida appeared impressed by TEPCO's policies to take additional safety measures and respect its relationships with the local communities, the sources said.

After the meeting at the prefectural government office on Sept. 25, Izumida said he will decide how to respond after consulting with prefectural government officials.

"I have taken note of the new proposal," he said, referring to the additional filtered venting equipment.

Hirose said: "We are looking forward to (Izumida's) judgment. We want to file an application (for restarting the reactors) as soon as possible based on it."

TEPCO, operator of the crippled Fukushima No. 1 nuclear power plant, is desperate to restart the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa plant to improve earnings.

Securing a profit for the current fiscal year is a precondition for TEPCO to continue to receive loans from creditors. The utility has suffered losses due to fuel costs for thermal power generation to make up for lost capacity at its nuclear plants.

Izumida previously criticized TEPCO's proposals to ensure safety in case of a major accident at the plant, as well as the utility's handling of the Fukushima nuclear crisis and its response to the growing problem of radioactive water at the site.

The governor spurned Hirose's request for approval when they last met on July 5.

Izumida has questioned TEPCO's plans to put filtered venting equipment on foundations different than those for the reactor buildings.

He repeatedly asked Hirose what would happen if piping that connects the two facilities came off during an earthquake.

"To what extent would residents be exposed to radioactive materials if an accident occurs?" Izumida asked Hirose on Sept. 25.

Hirose said TEPCO will have heavy machinery in place to reconnect piping in case of an accident. He also said the utility will install additional filtered venting equipment underground, which is more quake-resistant than on the surface.

A senior prefectural government official said Sept. 25 that progress has been made since an irate Izumida showed Hirose the door on July 5.

"We cannot tell whether (Izumida) has stopped shaking his fist (at TEPCO), but there is no question that the situation has moved forward," the official said. "We have at last come to a stage where we can talk."

On Sept. 25, Hirose handed a document to the governor requesting prior approval for construction of filtered venting equipment. Izumida refused to accept the document during his previous meeting with Hirose.

Officials of Kashiwazaki and Kariwa, the municipalities that together host the nuclear power plant, received the same document when they met with Hirose on July 5.

They gave prior approval for construction of filtered venting equipment in August.

Niigata gov. gives conditional nod to TEPCO plan

http://www3.nhk.or.jp/nhkworld/english/news/20130926_34.html

The governor of Niigata Prefecture has granted conditional approval to TEPCO to apply for a safety screening at its Kashiwazaki-Kariwa nuclear plant.

The screening will test whether the plant meets stringent new guidelines. Tokyo Electric Power Company cannot resume operations at the compound until it satisfies these standards.

The power company is expected to file an application with the Nuclear Regulation Authority on Friday to restart 2 reactors at the plant, which is on the Sea of Japan coast.

A prefectural official handed a document of approval from Governor Hirohiko Izumida to TEPCO executive Yuji Masuda on Thursday.

Izumida granted his consent after meeting with TEPCO President Naomi Hirose.

Hirose promised to install additional filtered vents at the plant. The vents are designed to release pressure in containment vessels in an emergency, while limiting emissions of radioactive substances.

TEPCO is required to install them before it can restart the reactors.

Hirose also promised to work hard to increase trust in TEPCO by local governments in areas where it has operations.

The Niigata governor says that as a condition of his approval, the firm has to discuss with Niigata and municipal governments how it will avoid exposing residents to radiation from the vents.

Go ahead

September 27, 2013

TEPCO seeks screening toward Niigata plant restart
http://www3.nhk.or.jp/nhkworld/english/news/20130927_17.html

Tokyo Electric Power Company has applied to Japan's nuclear regulator for safety screening needed to restart 2 idle reactors at the firm's Kashiwazaki-Kariwa plant.

The application is the first filed for such reactors -- the same type as those where meltdowns occurred at the Fukushima Daiichi plant.

Officials of the firm visited the Nuclear Regulation Authority and submitted the application for the Number 6 and 7 reactors on Friday.

The move came one day after the governor of Niigata Prefecture, which hosts the Kashiwazaki-Kariwa plant, gave conditional approval for the application.

Under safety requirements put into effect in July, boiling water reactors like the 2 at the plant must have filtered vents. Such vents are designed to release pressure in reactor containment vessels during emergencies while limiting emissions of radioactive substances.

The firm's Managing Executive Officer Takafumi Anegawa said it will tell the authority that the use of such vents will be subject to approval by the prefecture as requested by its governor.

Eighty experts at the regulator are screening applications by 6 other plants with pressurized water reactors. It has yet to announce how it would handle screening of boiling water reactors.

Where is Gov't roadmap on ending reliance on nukes?

September 27, 2013

Editorial: Chubu Electric Power should reconsider reactivating Hamaoka nuclear plant

http://mainichi.jp/english/english/perspectives/news/20130927p2a00m0na003000c.html

Chubu Electric Power Co. reportedly intends to apply with the nuclear power regulating agency for a safety inspection of its Hamaoka Nuclear Power Plant in Shizuoka Prefecture by the end of this fiscal year, in preparation to restart the idled power station.

The utility suspended operations at the atomic power plant shortly after the outbreak of the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant in March 2011, following the strong urging of then Prime Minister Naoto Kan. Since resumption of operations at the plant is highly risky, the power company should rather consider decommissioning the complex.

Chubu Electric Power is considering applying for safety inspections of the No. 4 reactor at the Hamaoka plant to restart the unit ahead of its idled No. 3 and 5 reactors. Its No. 1 and 2 reactors are set to be decommissioned. The company cannot restart the No. 4 reactor until October 2015, because it needs to implement additional safety measures.

Nevertheless, the company intends to hastily apply for safety inspections because its increasing reliance on thermal power stations has resulted in a sharp rise in fuel expenses. The utility estimates that it will suffer from a net loss in the business year ending in March 2014 for the third consecutive year. To make up for its increasing losses, the company plans to raise its electricity charges sometime around April next year. Under these circumstances, the Chubu Electric Power board has apparently deemed it indispensable to restart the Hamaoka plant in order to improve its profitability.

However, the conditions of its site have posed a unique danger to the power station. When he urged Chubu Electric Power to suspend operations at the power station, then Prime Minister Kan explained that he considered the huge impact that a serious accident at the Hamaoka nuclear plant could have upon Japanese society as a whole. His explanation is rational.

The plant is situated just above the focus area of a powerful earthquake feared to be triggered by the Nankai trough -- and it could be hit by a massive tsunami if one were to be generated by such a temblor. Furthermore, there is a major industrial district near the power station, and the Tokaido Shinkansen bullet train line and the Tomei Expressway -- two main transportation arteries between eastern and western Japan -- also run nearby. Should a serious nuclear accident occur at the plant, it could cause extremely serious damage to neighboring areas alone. Moreover, such a disaster could divide the Japanese archipelago, dealing a serious blow to the livelihoods of all members of the public, as well as to the industry as a whole.

Even if the nuclear plant's operator implemented various safety measures, it would be difficult to overcome the risks involved with the facility being situated in such an area. The city assembly of Makinohara, situated within 10 kilometers from the Hamaoka plant, has adopted a resolution demanding that the power station be permanently shut down unless its safety is guaranteed. It is expected to be difficult to gain consent from the Shizuoka Prefectural Government, as well as nearby municipalities, for reactivation.

Although business performance improvements are certainly something that company executives should think about, Chubu Electric Power board members should reconsider whether resumption of operations at the Hamaoka plant will truly lead to improvements in its business performance.

Under the Act on Compensation for Nuclear Damage, electric power companies are liable for damages from any accident at nuclear plants that they operate. Since such responsibility is too heavy for a single private company to fulfill, however, even Tokyo Electric Power Co. -- the largest company in the industry -- has been placed under state control following the outbreak of the Fukushima disaster. Therefore, it makes no rational sense for Chubu Electric Power executives to consider restarting the Hamaoka plant.

Behind Chubu Electric Power being so desperate to restart the Hamaoka plant is that the government of Prime Minister Shinzo Abe is leaning toward approving reactivation of idled nuclear reactors without showing a future vision concerning Japan's nuclear power policy. The government needs to show a road map toward ending Japan's reliance on nuclear power, and put its utmost efforts into urging power companies to shut down dangerous nuclear plants.

TEPCO? "Chastened"?

September 27, 2013

Chastened TEPCO applies for safety screenings for restarting 2 reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309270071

THE ASAHI SHIMBUN

Claiming it had learned a painful lesson from the disaster at its Fukushima No. 1 nuclear power plant, Tokyo Electric Power Co. on Sept. 27 applied for safety screenings for restarting two nuclear reactors in Niigata Prefecture.

Takafumi Anegawa, managing executive officer of TEPCO, submitted applications to the Nuclear Regulation Authority for screenings for the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant.

The requests marked the utility's first applications since the Great East Japan Earthquake and tsunami in March 2011 overwhelmed the defenses of the Fukushima No. 1 nuclear plant.

"We have asked (the NRA) to confirm whether our safety measures are sufficient after we learned hard lessons from the accident at the Fukushima No. 1 plant," Anegawa said. "It is a sobering experience."

TEPCO President Naomi Hirose said the same day the company is preparing to apply for safety screenings for other reactors at the Kashiwazaki-Kariwa plant.

The utility hopes to bring the No. 6 and No. 7 reactors back online by the end of March, but hurdles abound.

It is generally believed to take six months for the NRA to check whether a reactor complies with the new nuclear safety standards that took effect in July. But the screenings for the Kashiwazaki-Kariwa reactors could take longer.

One reason is different screening standards depending on the type of reactors.

Four other regional utilities have already applied for safety screenings for 12 reactors at six plants. While these reactors are all pressurized water reactors, the Kashiwazaki-Kariwa reactors are boiling water reactors, the same type as those crippled at the Fukushima No. 1 plant.

Officials at the NRA secretariat have also been preoccupied with the screenings for 10 of the 12 reactors.

The screenings could also be prolonged by NRA investigations into suspected active fault lines at the Kashiwazaki-Kariwa plant.

Under the new safety standards, important facilities of a nuclear power plant are not allowed to be sited immediately above active fault lines, which must be taken into account in seismic designs.

The Kashiwazaki-Kariwa plant has seven reactors, and fault lines below the buildings that house six of them have moved over the past 300,000 years or so.

The only exception is the No. 4 reactor building. In particular, experts suspect that fault lines that run below the No. 1 and No. 2 reactor buildings are active.

TEPCO filed applications for the safety screenings a day after Niigata Governor Hirohiko Izumida gave consent on condition that the company will not use filtered venting equipment in the event of an accident without prefectural approval.

The equipment is designed to release steam to keep pressure from building within the containment vessel after radioactive materials are filtered. Still, the steam released would contain radioactive substances.

However, Izumida, who has criticized TEPCO over its handling of the Fukushima nuclear crisis, has expressed reservations over the utility restarting nuclear reactors.

TEPCO has concluded a nuclear safety agreement with the Niigata and other local governments and is required to obtain their consent before it restarts the Kashiwazaki-Kariwa reactors.

TEPCO has been under pressure to apply for the safety screenings because it must refinance about 80 billion yen ($800 million) in outstanding loans in October.

Securing a recurring profit for the current fiscal year is a precondition for new loans. TEPCO, which incurred more than 300 billion yen in recurring losses in the fiscal year that ended in March, has to at least explain to creditors that it can expect to return to the black.

The company expects an improvement of 100 billion yen in annual earnings if one reactor at the Kashiwazaki-Kariwa plant gets restarted, which will reduce fuel costs for thermal power generation.

The deepening radioactive water crisis at the Fukushima No. 1 plant has also added pressure on TEPCO to restart reactors at the Kashiwazaki-Kariwa plant.

TEPCO has announced it will secure an additional 1 trillion yen for countermeasures against the contaminated water and other problems over the coming 10 years. But a senior industry ministry official said it will not be possible unless reactors are restarted.

TEPCO seeks screening toward Niigata plant restart

http://www3.nhk.or.jp/nhkworld/english/news/20130927_17.html

Tokyo Electric Power Company has applied to Japan's nuclear regulator for safety screening needed to restart 2 idle reactors at the firm's Kashiwazaki-Kariwa plant.

The application is the first filed for such reactors -- the same type as those where meltdowns occurred at the Fukushima Daiichi plant.

Officials of the firm visited the Nuclear Regulation Authority and submitted the application for the Number 6 and 7 reactors on Friday.

The move came one day after the governor of Niigata Prefecture, which hosts the Kashiwazaki-Kariwa plant, gave conditional approval for the application.

Under safety requirements put into effect in July, boiling water reactors like the 2 at the plant must have filtered vents. Such vents are designed to release pressure in reactor containment vessels during emergencies while limiting emissions of radioactive substances.

The firm's Managing Executive Officer Takafumi Anegawa said it will tell the authority that the use of such vents will be subject to approval by the prefecture as requested by its governor.

Eighty experts at the regulator are screening applications by 6 other plants with pressurized water reactors. It has yet to announce how it would handle screening of boiling water reactors.

Sep. 27, 2013 - Updated 02:40 UTC

TEPCO wants to restart two more reactors at Kashiwazaku-Kariwa

September 29, 2013

TEPCO president keen to restart 2 more nuclear reactors in Niigata

http://mainichi.jp/english/english/newsselect/news/20130929p2a00m0na011000c.html

TOKYO (Kyodo) -- Tokyo Electric Power Co. President Naomi Hirose expressed a desire Saturday to make preparations for restarting two more nuclear reactors at a power plant it operates in Niigata Prefecture.

A day after TEPCO filed for state safety assessments for the idled Nos. 6 and 7 reactors at the Kashiwazaki-Kariwa plant, Hirose said in an interview with Kyodo News that he would also like to start the process toward restarting the Nos. 1 and 5 reactors as well.

"The case (of the Nos. 6 and 7 units) will set the example," Hirose said, adding, "The general rule is to abide by the agreement we made with the local community regarding safety."

All of Japan's 50 commercial reactors are currently offline and have to be checked by the Nuclear Regulation Authority to determine whether they satisfy a set of new safety requirements before they can be restarted.

Hirose also said TEPCO can now expect to swing back to a pretax profit for the current financial year through March 2014, even without a further electricity rate hike.

TEPCO, which is struggling due to heavy costs stemming from the 2011 Fukushima nuclear crisis, has set a target to become profitable this year because that is a condition for continuing to receive bank loans.

Despite uncertainty over when the Nos. 6 and 7 reactors will be restarted, Hirose said the goal of posting a pretax profit this year "can be achieved" by implementing more cost-cutting measures and recording certain facility maintenance expenses in fiscal 2014 or later.

Based on an estimate the utility presented in August to its lenders, it would be necessary to raise electricity rates again if no reactors were restarted within fiscal 2013.

TEPCO raised electricity rates last year and increasing rates further is feared to spark a public backlash.

Hirose said a further rate hike would be "the last resort" if the safety checks required before a reactor can be restarted take two to three years to complete.

When asked when he thought the Nos. 6 and 7 reactors can be restarted, Hirose said he did not see it happening in "January or February" and pointed to March or later as more likely.

Once the two reactors resume operating, TEPCO's fuel costs for non-nuclear thermal power generation -- now running at 240 to 330 billion yen annually -- can be reduced, according to the company.

Hirose said the application for safety assessments has increased the likelihood that the Nos. 6 and 7 units will restart within fiscal 2014 starting next April, a move that would improve TEPCO's business situation.

Decommissioning made easier for utilities

October 1, 2013

New accounting rules make axing reactors cheaper

Kyodo
http://www.japantimes.co.jp/news/2013/10/01/business/new-accounting-rules-make-axing-reactors-cheaper/#.Ukq901M0_9k

The government revised accounting rules Tuesday for utilities to prevent their business from deteriorating abruptly if they decommission nuclear reactors earlier than planned.

Power firms are required to set aside reserves for scrapping each of their reactors while they are still in service. The new rules allow them to continue to recoup the funds through electricity rates for up to 10 years beyond the end of a reactor's operational life.

According to an industry ministry official, the rules are likely to be first applied to reactors 5 and 6 of the Fukushima No. 1 complex, which the government recently urged Tokyo Electric Power Co. to scrap in addition to the stricken reactors 1 to 4.

Decommissioning a 1.1 million kw-class atomic unit costs an estimated ¥57 billion to ¥77 billion, the official said.
Under the previous rules, decommissioning funds had been set aside on the assumption that a reactor would be used over a period of 40 years or longer. An operator would have had to post an extraordinary loss if it faced a shortfall in the funds when shutting down a reactor earlier than planned.

The rule change, however, now enables an operator to avoid booking a large extraordinary charge in a single year by extending the period for collecting the decommissioning funds.

The depreciation cost of certain equipment, such as reactor containment vessels, is also permitted to be booked beyond the end of the unit's operation.

The rules have been revised because the Nuclear Regulation Authority introduced new regulations July 8, which could lead utilities to give up on restarting some of their reactors rather than investing in costly safety measures to meet the new standards compiled in view of the 2011 Fukushima meltdowns.
The nation now has a total of 50 commercial reactors, excluding units 1 to 4 at Fukushima No. 1 that Tepco is struggling to keep stable for decommissioning. More than 10 reactors are currently being checked over whether they are safe enough to resume operation.

Scrap Fukushima Daini too, says Motegi

October 1, 2013

Motegi sides with locals calling to scrap Fukushima Daini nuke plant

http://mainichi.jp/english/english/newsselect/news/20131001p2g00m0dm037000c.html

TOKYO (Kyodo) -- Industry minister Toshimitsu Motegi on Monday suggested he supports local calls to scrap the Fukushima Daini nuclear power plant, located near the accident-stricken Fukushima Daiichi complex.

"Thinking about the current feelings of the people in Fukushima Prefecture, I don't think we can treat Fukushima Daini in the same way as other nuclear power plants," the economy, trade and industry minister told a parliamentary committee.

The Daini complex is located 12 kilometers south of the Daiichi plant. The four-reactor plant achieved a stable state of cold shutdown shortly after the natural disasters in 2011.

But he also said plant operator Tokyo Electric Power Co. should make a decision by "comprehensively" considering discussions on Japan's energy policy, local opinion and other factors.

Locals and the prefectural government of Fukushima have been calling for all 10 reactors at the Fukushima Daiichi and Daini plants to be scrapped in the wake of the nuclear crisis, triggered by a huge earthquake and tsunami in March 2011.

TEPCO is already moving to scrap the Nos. 1 to 4 units at Fukushima Daiichi, which were severely damage in the crisis. But it has not been clear about the fate of the remaining six reactors in the northeastern prefecture.

Earlier this month, Prime Minister Shinzo Abe urged TEPCO to scrap the Nos. 5 and 6 reactors at the Fukushima Daiichi plant that avoided meltdowns, saying that the utility should focus more on the plant's cleanup efforts.

October 01, 2013(Mainichi Japan)

Back to active faults issue (Ohi, Takahama)

October 3, 2013

Safety screening of 2 KEPCO plants to take time

http://www3.nhk.or.jp/nhkworld/english/news/20131003_13.html

The operator of 2 nuclear plants in central Japan and the country's nuclear regulatory body remain at odds over safety screenings for the plants' restart.

Kansai Electric Power Company aims to resume operations at the Ohi and Takahama nuclear plants in Fukui Prefecture.

Japan's Nuclear Regulation Authority on Wednesday held discussions over 3 active faults that run near the plants. The faults are the basis for assessing the plants' earthquake resistance.

Kansai Electric repeated its claim that the faults would not shift simultaneously, after assessing sonar surveys of regional topography.

But experts say such an interpretation is convenient for the utility.

Regulation authority member Kunihiko Shimazaki said the assessment won't continue, as there is no definite proof that the faults will not shift simultaneously. He has instructed Kansai Electric to conduct additional surveys.

Is NRA putting screening of Kashiwazaki-Kariwa on hold?

October 10, 2013

NRA chief hints at delaying safety screening of Kashiwazaki-Kariwa nuke plant

http://mainichi.jp/english/english/newsselect/news/20131010p2a00m0na015000c.html

The Nuclear Regulation Authority (NRA) chief has hinted at the possibility of delaying a safety review of the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture for a planned restart amid the Fukushima contaminated water crisis, during an interview with the Mainichi Shimbun.

NRA Chairman Shunichi Tanaka made the suggestion during the interview on Oct. 9, saying, "We will first and foremost evaluate the situation at the Fukushima No. 1 Nuclear Power Plant," amid a series of blunders at the plant including leakages of radioactively contaminated water.

Tokyo Electric Power Co. (TEPCO), the operator of the Fukushima No. 1 nuclear plant, had earlier filed a request with the NRA on Sept. 27 for a safety screening of the No. 6 and No. 7 reactors at the utility's Kashiwazaki-Kariwa plant for a planned restart of the facility.

On Oct. 4, the NRA instructed TEPCO to file a written report on its measures to address contaminated water at the Fukushima plant and whether the utility would be able to properly manage safety at the Kashiwazaki-Kariwa plant. TEPCO is scheduled to submit the report by the end of this week.

With a new leak of highly radioactive water from a desalination facility at the Fukushima plant on Oct. 9 in mind, Tanaka told the Mainichi, "The Fukushima No. 1 nuclear plant has been hit by trouble almost every day. We must wait until the current situation is settled and the utility can properly manage the facility. We will examine if TEPCO is actually implementing what it states in its report (to be submitted)."

"The work environment at the Fukushima plant is fairly harsh. For such tough work, TEPCO's regular employees should take the lead, but I wonder what actually has been going on at the site. TEPCO tends to use subcontractors and is likely to have avoided directly tackling (the trouble-hit work)," Tanaka said.

He said the NRA will take about a month to examine TEPCO's report before determining its validity.

So far, five power companies have filed for safety screenings on a total of 14 reactors at seven nuclear power stations.

While Tanaka withheld from clearly stating that the NRA was putting on hold the screening of the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa plant, he told the Mainichi, "We can't work on the (Kashiwazaki-Kariwa) plant as quickly as with other nuclear plants (whose safety screening is under way). The public won't tolerate that."

Regarding other utilities whose nuclear reactors are currently under review by the NRA for planned restarts, Tanaka said, "Some utilities have shown resistance (to our screenings). It is the power companies themselves that would suffer losses from any delayed screenings. Even if they lag behind, we will not become lenient."

He especially criticized Kansai Electric Power Co. for denying possible links between three active faults surrounding the No. 3 and No. 4 reactors at the Oi nuclear power plant and the No. 3 and No. 4 reactors at the Takahama nuclear plant, both in Fukui Prefecture, saying, "The screening has been sluggish because the utility is maintaining things like that."

NRA delays inspections

October 14, 2013

NRA nuclear reactor inspections for restarts delayed

http://mainichi.jp/english/english/newsselect/news/20131014p2a00m0na013000c.html

Nuclear Regulation Authority (NRA) safety inspections on 10 reactors at six power plants -- required for the reactors to restart -- have made little progress as the plant operators have yet to submit necessary documents, NRA officials said.

The NRA has urged the four power companies that operate the 10 reactors to submit the documents and arrange a time to clarify their content during an inspection meeting on Oct. 16.

The NRA has announced how many of the 29 inspection items it has already begun at the 10 reactors. The authority has begun work on the largest number of inspection items at the No. 3 reactor of Hokkaido Electric Power Co.'s Tomari plant -- 11 of the 29 items, or 38 percent. Tomari is followed by the No. 3 reactor at Shikoku Electric Power's Ikata plant at 10 items, or 34 percent. The NRA has started to inspect nine items, or 31 percent, at the No. 1 and 2 reactors at Kyushu Electric Power's Sendai plant and eight items, or 28 percent, at the No. 3 and 4 reactors at the firm's Genkai power station.

Although the NRA has begun inspecting the largest number of items at Tomari power plant, the process is in fact delayed further than inspections at the Ikata plant. This is because the authority has instructed Hokkaido Electric to analyze the subsurface structure below the Tomari plant, as it could amplify earthquake vibrations.

The NRA began examination of four and three items (14 and 10 percent), respectively, at the No. 3 and 4 reactors at Kansai Electric Power's Oi plant and the No. 3 and 4 reactors at its Takahama plant, both in Fukui Prefecture.

NRA safety inspections on nuclear reactors are expected to take about half a year. However, a delay in the submission of relevant documents could prolong the examinations. Five utilities have so far applied for safety inspections of 14 reactors at seven nuclear plants.

The authority has put its inspections on the No. 1 and 2 reactors at the Tomari plant on hold.

Negative impact of Fukushima water crisis on restart

October 23, 2013

Fukushima water crisis threatens TEPCO's plan to restart reactors in Niigata

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310230078

THE ASAHI SHIMBUN

KASHIWAZAKI, Niigata Prefecture--The growing problem of radioactive water at the stricken Fukushima No. 1 nuclear power plant is stymieing attempts by Tokyo Electric Power Co. to reactivate an idled nuclear power plant here and return to profit.

The Nuclear Regulation Authority decided on Oct. 23 that its chairman, Shunichi Tanaka, will soon meet with TEPCO President Naomi Hirose to discuss safety control measures in light of leaks of contaminated water at the Fukushima plant, among other issues.

Restarting the reactors at the Kashiwazaki-Kariwa nuclear power plant offers the utility the best chance of turning its finances around following the catastrophic meltdowns at the Fukushima plant triggered by the 2011 earthquake and tsunami.

The company started installing new venting equipment at the Kashiwazaki-Kariwa site to put it in compliance with the NRA's safety regulation standards that took effect in July.

However, the NRA is not expected to start full-scale safety screenings for the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa facility until Tanaka and Hirose have talked things over.

The NRA has not set a date to start the safety screenings due to TEPCO's mishandling of the radioactive water problem at the Fukushima plant.

The agency instructed TEPCO on Oct. 4 to show how it intends to thoroughly implement safety controls at the Fukushima plant. The utility submitted its report on Oct. 15. But the NRA was dissatisfied with the report and decided that Tanaka would have to hear directly from Hirose.

In addition, the boiling water reactors at Kashiwazaki-Kariwa are the first to undergo safety screenings. Some of the conditions required for these reactors are different from those that apply to pressurized water reactors.

Another obstacle is Niigata Governor Hirohiko Izumida's wariness about reactor restarts.

The Kashiwazaki-Kariwa plant is named after the two municipalities it straddles on the Sea of Japan. Its seven reactors have a combined output capacity of 8.212 gigawatts, making it one of the world's largest for a single power plant.
Its boiling water reactors are the same type as the ones at the devastated Fukushima plant.

TEPCO hopes to bring two of the Kashiwazaki-Kariwa reactors--No. 6 and No. 7--online by the end of fiscal 2014. Apart from the Fukushima No. 1 site and the Fukushima No. 2 site, which are not likely to be reactivated anytime soon, the Kashiwazaki-Kariwa plant is the only nuclear facility that TEPCO has any hopes of restarting.

The new safety regulation standards for nuclear reactors stipulate that boiling water reactors can only be restarted after filtered venting equipment is installed.

The equipment is designed to lower pressure inside a reactor containment vessel in the event of a major accident while suppressing the amount of radioactive substances released into the environment.

Work at the Kashiwazaki-Kariwa plant on Oct. 22 involved installing a tank component for removing radioactive substances from vapor, a core element of the filtered venting equipment, on the No. 7 reactor.

Work started in January to reinforce the ground where the heavy equipment was to be installed.

TEPCO plans to finish installing filtered venting equipment on the No. 6 and No. 7 reactors before the current fiscal year ends in March.

TEPCO is reeling under ballooning costs for liquefied natural gas and other fuel to power its thermal plants, which are operating at full capacity to make up for its nuclear reactors that were shut down after the Fukushima disaster.
The utility was in the red in fiscal 2011 and 2012.

Each reactor restart at the Kashiwazaki-Kariwa plant means that TEPCO will not have to shell out for additional fuel costs, which would improve its bottom line by more than 100 billion yen ($1.02 billion) annually.
The utility has no choice but to bank on early restarts to turn its financial situation around.

TEPCO needs to take out 300 billion yen in new loans, partly to repay its bonds, in December. In trying to persuade creditor banks to extend those loans, TEPCO is under pressure to present financial projections that ensure a return to the black in fiscal 2013.

Hirose, the TEPCO president, has said steady cost cutting will allow the utility to post a profit in fiscal 2013.
But that presupposes Kashiwazaki-Kariwa restarts in fiscal 2014, because it is only pushing back necessary expenditures to next fiscal year or later in an effort to make both ends meet in the current fiscal year.

Hirose has pledged to set aside 1 trillion yen to deal with the Fukushima radioactive water crisis over the coming decade, but that amount will be hard to find without nuclear restarts.

TEPCO is expected as early as in November to review its corporate rehabilitation plan and present financial projections incorporating reactor restarts.
(This article was compiled from reports by Kohei Tomida, Takashi Ebuchi and Ryuta Koike.)

NRA : Get a grip on Fukushima before restarting elsewhere

October 28, 2013

NRA to Tepco: Get a grip on No. 1 before thinking of restarts

Jiji, Kyodo
http://www.japantimes.co.jp/news/2013/10/28/national/nra-tepco-heads-discuss-fukushima-no-1-water-woes/#.Um5pD1OwT9k

FUKUSHIMA – Hirose said the safety screening process for the Kashiwazaki-Kariwa units was not among the topics discussed with Tanaka.

The NRA did not open the Tanaka-Hirose meeting to the media, except for the beginning, to allow them to engage in what it called “frank discussions.”

Tepco, which continues to struggle with the massive buildup of radioactive water at the Fukushima plant, filed for NRA safety assessments for idled reactors 6 and 7 at Kashiwazaki-Kariwa in September.

But a formal safety screening meeting for the reactors, usually held in public, has not convened, meaning the assessment process has yet to enter full swing.

Tepco is desperate to curtail the heavy costs it's paying to buy fuel for thermal power generation in place of atomic power.

ALPS unit resumes tests

Following a suspension of about four months, Tokyo Electric Power Co. said Monday it resumed test operations at one of the three high-tech water filtering at the crippled Fukushima No. 1 nuclear plant.

The start of the Advanced Liquid Processing System, or ALPS, which removes most radioactive materials from tainted water at the plant, follows the resumption of another ALPS unit in September.

The daily water processing capacity at the plant now stands at 500 tons, with each unit capable of cleaning 250 tons.
Tepco began using the system in March but halted it in June when corrosion was discovered inside one of the tanks where contaminated water was being stored. A senior official at the Nuclear Regulation Authority suggested Monday that Tokyo Electric Power Co. improve its management of the crippled Fukushima No. 1 power plant before restarting any reactors at its huge complex in Niigata.

Referring to two reactors at the seven-unit Kashiwazaki-Kariwa plant Tepco is seeking to restart, NRA Secretary-General Katsuhiko Ikeda told reporters, "The NRA will decide whether to go ahead with the safety assessment by seeing how the situation at Fukushima No. 1 improves."

He made the comments after joining a rare meeting Monday between NRA Chairman Shunichi Tanaka and Tepco President Naomi Hirose to discuss ways to get a grip on the radioactive water leaking at Fukushima No. 1.

Tanaka was quoted by Ikeda as telling Hirose: "I want you to take drastic measures (to improve the situation) and respond, based on a long-term perspective."

Clearing NRA safety checks is required before Tepco can restart the Kashiwazaki-Kariwa reactors, a move that would improve the firm's tough business predicament resulting from the Fukushima disaster.

The repeated flows, spills and leaks of radioactive water plaguing Fukushima No. 1 have led NRA commissioners to doubt Tepco's management adequately grasps the situation of the workers at the plant or whether the utility has the wherewithal to ensure the safety of the Kashiwazaki-Kariwa reactors.

Tepco has submitted an analysis of the recent water spills and measures it plans to prevent further incidents. This includes transferring about 20 workers from Kashiwazaki-Kariwa to Fukushima No. 1, but the steps didn't impress the NRA.
At Monday's meeting at the NRA building in Tokyo, Tanaka told Hirose to improve the working environment at the Fukushima plant, such as by reducing radiation levels.

"Work efficiency is not good when wearing full-face masks . . . and especially communication is difficult. I expect radiological countermeasures to be taken at the site to end this kind of situation," Tanaka reportedly said.

Hirose separately admitted to reporters that there are still many areas where workers have to put on such masks and that he hopes to secure enough staff to deal with the stricken plant, where three reactors suffered core meltdowns.

Fukushima situation to affect restart of TEPCO's other plant: NRA

http://mainichi.jp/english/english/newsselect/news/20131028p2g00m0dm064000c.html

TOKYO (Kyodo) -- A senior official of the Nuclear Regulation Authority suggested Monday that Tokyo Electric Power Co. should improve its management of the crippled Fukushima Daiichi nuclear power plant before restarting reactors at another nuclear complex.

Referring to the Kashiwazaki-Kariwa plant that TEPCO seeks to restart, NRA Secretary General Katsuhiko Ikeda told reporters, "The NRA will decide whether to go ahead with the safety assessment by seeing how the situation at the Fukushima Daiichi improves."

He made the comments after joining a rare meeting between NRA Chairman Shunichi Tanaka and TEPCO President Naomi Hirose held following a series of radioactive water leaks and other troubles at the Fukushima plant.

Tanaka was quoted by Ikeda as telling Hirose, "I want you to take drastic measures (to improve the situation) and respond, based on a long-term perspective."

Clearing NRA safety checkups is essential for TEPCO to restart the Kashiwazaki-Kariwa plant in Niigata Prefecture, a move that would improve the company's tough business conditions stemming from the nuclear crisis at Fukushima Daiichi in 2011.

The utility filed for assessments of the idled Nos. 6 and 7 reactors in late September. But the NRA has not yet convened a formal safety screening meeting for the reactors, indicating that the assessment process is not yet in full swing.

At the request of the NRA, TEPCO submitted on Oct. 15 a report that analyzed the cause of the leak incidents at the Fukushima plant and presented measures to prevent a recurrence, including transferring about 20 staff from Kashiwazaki-Kariwa to Fukushima Daiichi.

But NRA commissioners have expressed doubts about whether the utility's management personnel fully understand the situation faced by workers on site and whether the company can ensure the safety of the Kashiwazaki-Kariwa plant.

During the meeting on Monday at the NRA's office building in Tokyo, Tanaka told Hirose to improve the working environment at the Fukushima plant, such as by reducing the radiation level.

"Work efficiency is not good when wearing full-face masks...and especially communication is difficult. I expect radiological countermeasures to be taken at the site to end this kind of situation," Tanaka was quoted as telling.

Hirose separately admitted to reporters that there are still many areas where workers have to put on such masks and that he hopes to secure enough staff to deal with the accident-stricken plant, where three reactors have suffered core meltdowns.

Hirose said the safety screening process of Kashiwazaki-Kariwa plant was not among the topics that were discussed with Tanaka.

To allow for "frank discussions" between Tanaka and Hirose, the NRA decided not to make the meeting open to media, except for the outset.

TEPCO, which has been placed under effective state control after receiving a capital injection, is eager to restart the Kashiwazaki-Kariwa plant to curtail fuel costs for thermal power generation that is making up for the loss of nuclear power

Concentrate on Fukushima

October 30, 2013

Editorial: TEPCO should focus on Fukushima crisis, not trying to reactivate idled reactors

http://mainichi.jp/english/english/perspectives/news/20131030p2a00m0na004000c.html

Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka told Tokyo Electric Power Co. (TEPCO) President Naomi Hirose in a recent meeting that the utility should "drastically reform itself from a long-term perspective," in the wake of leaks of radioactive water on the premises of its tsunami-hit nuclear plant. The NRA will consider when it should start safety inspections on the No. 6 and 7 reactors at the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture, which TEPCO is eager to reactivate, after ascertaining whether the situation at the Fukushima No. 1 plant has substantially improved.

TEPCO regards restarting the Kashiwazaki-Kariwa plant as the key to its efforts to rehabilitate its deficit-ridden finances. However, it should rather place priority on countermeasures against leaks of radioactively contaminated water on the premises of the Fukushima nuclear complex. Such being the case, the NRA's decision to effectively freeze its safety inspections on the Niigata Prefecture plant, a process that is a prerequisite for reactivation, is appropriate.

Earlier this month, TEPCO submitted to the NRA a report stating that the power company can take effective countermeasures against contaminated water leaks while resuming operations at the two reactors at the Kashiwazaki power plant. However, some NRA commissioners raised questions about the report, with one of them saying, "Looking at the situation at the Fukushima plant, doubts remain over whether the Kashiwazaki power station is absolutely safe." It is only natural that such questions have been raised. It is highly doubtful that the company which cannot even control contaminated water can be tasked with operating nuclear reactors. TEPCO must concentrate its human resources and funds on efforts to bring the Fukushima No. 1 Nuclear Power Plant under control.

Careless mistakes have occurred one after another at the Fukushima nuclear complex. A pump stopped because a worker pushed the wrong button, while several workers were exposed to radiation because a pipe was erroneously disconnected. The working environment at the plant is severe as workers are required to put on masks to avoid inhaling radioactive substances. In at least one case, an experienced worker was forced to withdraw from the site because his radiation exposure came close to the permissible level. It is easy to imagine that worker morale has declined considerably.

In his meeting with the NRA chief, TEPCO's Hirose admitted that it is now difficult to secure enough personnel to bring the Fukushima plant under control, and then promised that the company will improve the working environment at the crippled power station and add workers to the site. The power supplier should promptly carry out these promises.

Katsuhiko Ikeda, head of the secretariat of the NRA, said, "If TEPCO were to continue making such mistakes from now on, we couldn't say the crisis is under control." The authority should closely monitor TEPCO's efforts to improve its response to the crisis.

The national government should also step up its involvement in efforts to end the crisis. Prime Minister Shinzo Abe has repeatedly pledged that the central government will play a leading role in efforts to bring the situation under control to fulfill its responsibility for the crisis. The government has decided to spend 47 billion yen in taxpayers' money on such efforts, but the funds can only be used exclusively for the construction of underground walls to block ground water from flowing onto the premises of the Fukushima nuclear reactors, for the installation of additional devices to remove radioactive substances from contaminated water and other work that requires high levels of technology.

The government has also solicited experts to offer proposals on technologies necessary to store and treat radioactively contaminated water. The panel on the treatment of contaminated water will incorporate proposed technologies that it deems are feasible in an outline of countermeasures against contaminated water it will draw up by the end of this year. Still, the share of costs between TEPCO and the government and other key issues have not yet been determined.
The government should offer specific proposals on how to steadily treat radioactive water at the Fukushima No. 1 plant and decommission its reactors while considering ways to restructure TEPCO, and the Diet should thoroughly deliberate such proposals.

Restart after verifying safety

November 2, 2013

Ishiba calls for restart of nuclear power plants

http://www3.nhk.or.jp/nhkworld/english/news/20131103_01.html

The secretary general of Japan's governing Liberal Democratic Party says the country's idle nuclear reactors should be restarted once their safety is verified.

Shigeru Ishiba delivered a speech in Sapporo on Saturday on the government's energy policy.

Ishiba said Japan should reduce nuclear dependence by working on renewable sources such as wind and solar.

But he said the current supply is on a tightrope. He advocated putting back online those reactors that pass screenings.

All the reactors are currently offline for safety checks.

Ishiba noted that new reactors are being built in many countries including China, most with Japan's technology.

The LDP secretary general stressed Japan should further advance its nuclear technology and promote its export.

Safety checks at Kashiwazaki-Kariwa

November 13, 2013

Niigata Governor calls for more explanation

http://www3.nhk.or.jp/nhkworld/english/news/20131113_33.html

The Governor of Niigata wants officials at the Nuclear Regulation Authority to provide a more detailed explanation of their decision to start safety checks on reactors in the prefecture.

Governor Hirohiko Izumida noted that the NRA decided to proceed, even though radioactive water continues to leak at the Fukushima Daiichi nuclear plant.

Izumida said that even if the checks show that the reactors in Kashiwazaki-Kariwa meet current safety standards, there is no guarantee that they will be safely operated.

Izumida said it is irresponsible for the NRA to say it will leave the final decision about restarting the reactors in the hands of government officials.

He said the NRA should also examine ways to ensure that residents living near the reactors will be safe in the event of an accident.

Japan's nuclear body to start safety checks
http://www3.nhk.or.jp/nhkworld/english/news/20131113_25.html

Japan's Nuclear Regulation Authority has decided to start safety checks at one of Tokyo Electric Power Company's idle nuclear plants.

The utility asked the NRA in September to conduct checks of the Number 6 and 7 reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture. The reactors must pass safety checks before TEPCO can restart them.

But NRA officials said they wanted to see first how TEPCO would deal with leaks of radioactive water at the Fukushima Daiichi plant. Regulators held off on calling a public meeting to discuss TEPCO's request for the safety checks.

At a meeting in Tokyo on Wednesday, some participants said it's unfair for the NRA not to convene a meeting to discuss TEPCO's application.

Other people said they appreciate the utility's latest plan to secure enough workers and improve working conditions at the Fukushima Daiichi plant.

After participants decided to proceed with safety checks at the Kashiwazaki-Kariwa plant, the head of the regulators, Shunichi Tanaka, said that the NRA should continue to prioritize the issue of radioactive water leaks at the Fukushima plant.

Tanaka also instructed staff at the Nuclear Regulation Agency to consider the specific procedures for conducting the checks at the Kashiwazaki-Kariwa plant.

NRA forced to get on with safety checks?

November 13, 2013

NRA to hold safety screening meeting for restarting Tepco reactors in Niigata

Kyodo
http://www.japantimes.co.jp/news/2013/11/13/national/nra-to-hold-safety-screening-meeting-for-restarting-tepco-reactors-in-niigata/#.UoSaziewT9k

The Nuclear Regulation Authority said Wednesday it will begin a formal safety screening process for Tokyo Electric Power Co.'s massive Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, which the utility is seeking to restart to improve its battered finances.

Although Tepco applied for safety inspections of reactors 6 and 7 at the plant in late September, the NRA has not held an official safety screening meeting, which will be open to the public, amid concerns over the utility's poor handling of the shattered Fukushima No. 1 plant.

But the NRA commissioners said Wednesday that the agency should at least hold a meeting to listen to the outline of Tepco's application and check whether there are problems that should be addressed.

The decision was reached after Tepco last week announced steps, in response to NRA suggestions, to improve the tough working conditions for people struggling to clean up the mess at Fukushima No. 1. The complex has been plagued with mishaps caused by human error.

As one of the reasons for moving ahead with the safety screening process, NRA Chairman Shunichi Tanaka told his fellow commissioners at their meeting: "It is the NRA's legal obligation to conduct screenings. . . . If we continue to keep the matter on hold, a legal problem could emerge."

TEPCO's plans for Kashiwazaki-Kariwa

November 19, 2013

TEPCO aims to restart Kashiwazaki plant next July
http://www3.nhk.or.jp/nhkworld/english/news/20131120_03.html

NHK has learned that Tokyo Electric Power Company aims to restart some of the reactors at its nuclear plant in central Japan next July.

TEPCO is drawing up a 10-year business plan. Restarting the Kashiwazaki-Kariwa plant in Niigata Prefecture will help to revive the firm's business after the nuclear accident at Fukushima Daiichi.

The No.6 and 7 reactors are to undergo safety checks by the government's Nuclear Regulation Authority as part of the procedures for restarting nuclear plants.

TEPCO has set the target date for next July because the checks will take at least 6 months and the utility needs to negotiate with the plant's host communities.

If all goes well with TEPCO's plan, the utility is estimated to post a pretax profit of more than 1 billion dollars in the business year that starts next April.

TEPCO says if the reactors cannot return online until January 2015, it will post a pretax loss of 130 million

dollars. The loss is projected to grow to 800 million dollars if the restart is delayed until March 2015.

The business plan is to include further cost-cutting measures such as a voluntary retirement program for about 1,000 officials.

TEPCO aims to coordinate the details with its main lenders and win approval for the business plan from the industry minister next month.
Nov. 19, 2013 - Updated 19:09 UTC

Safety screening starts in Niigata

November 21, 2013

NRA weighs safety of idled Niigata reactors

http://www.japantimes.co.jp/news/2013/11/21/national/nra-weighs-safety-of-idled-niigata-reactors/#.Uo5cTyewT9k

Kyodo

Nuclear regulators on Thursday began assessing the safety of two reactors at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa plant, nearly two months after the utility filed an application to restart them.

The move is a sign of progress for Tepco, which is eager to restart the seven-reactor plant in Niigata Prefecture to improve the tough business conditions it faces due to the crisis at its Fukushima No. 1 complex. Earlier, the Nuclear Regulation Authority suggested the process may not go smoothly.

Open safety screening meetings, which the NRA has convened dozens of times for other reactors, had not been held until Thursday for the Kashiwazaki-Kariwa plant. Tepco's poor handling of the Fukushima No. 1 crisis has made regulators wary.

Ultimately though, NRA Chairman Shunichi Tanaka said, the agency could not continue to put off the screening process for reactors 6 and 7 now that documents submitted by the utility have been completely checked.

He also said that he viewed positively a recent announcement by Tepco that it had taken steps to improve the working conditions at the Fukushima plant, which could help the company to address mishaps caused by human error.

But Tanaka has warned that regulators may temporarily suspend the assessment process if serious problems occur at Fukushima No. 1. The screening period could also be prolonged because the two Kashiwazaki-Kariwa units are the first boiling water reactors to undergo safety assessments since Japan revamped its nuclear regulations in July.

Under the new safety requirements that reflect the lessons learned from the Fukushima crisis, BWRs must be equipped with filtered venting systems so that radioactive substances will be reduced when gas and steam need to be released to prevent damage to containment vessels.

The venting facilities are not an immediate requirement for pressurized water reactors, which are housed in containers larger than those of BWRs, giving more time until pressure rises inside the containers.

The activity of small geological faults beneath the two Kashiwazaki-Kariwa reactors could also become a contentious point, although Tepco has denied that the faults are active.

In quake-prone Japan, nuclear plant operators are not permitted to build reactors directly above faults that could move.

For Tepco, bringing its idled reactors back online would help it cut the huge cost of importing fuel for thermal power generation to meet electricity demand in Tokyo and surrounding areas.

The utility and a state-backed bailout fund have approached main creditor banks to seek about ¥2 trillion in fresh loans, sources close to Tepco said Thursday.

Tepco wants to secure the funds for capital investment, such as to renew its aging thermal power generation facilities, but financial institutions are expected to view the request skeptically, having already provided over ¥4 trillion in loans to the ailing company.

Fuel rods transferred

Tokyo Electric Power Co. on Thursday transferred the first batch of fuel rod assemblies pulled from the reactor 4 fuel pool at the crippled Fukushima No. 1 nuclear plant to another building with more stable storage conditions.

The move came three days after Tepco started a yearlong mission to eventually remove over 1,000 fuel assemblies from the spent fuel pool of the damaged reactor 4 building.

After filling a container with 22 unused fuel assemblies by Tuesday, workers on Thursday used a crane to lower the container from the fifth floor of the building housing the spent fuel pool to the ground about 32 meters below.

The container was then placed on a trailer and taken to a building about 100 meters away. There is a pool inside the building.

Safety assessment process for TEPCO's Kashiwazaki-Kariwa plant begins

http://mainichi.jp/english/english/newsselect/news/20131121p2g00m0dm074000c.html

TOKYO (Kyodo) -- Nuclear regulators on Thursday began a safety assessment process to decide whether two reactors at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa plant are qualified to restart, nearly two months after the utility filed an application.

The move is a sign of progress for TEPCO, which is eager to restart the seven-reactor plant in Niigata Prefecture to improve the tough business conditions it faces due to the crisis at its Fukushima Daiichi complex, but the Nuclear Regulation Authority suggested earlier that the process may not go smoothly.

At the outset of the first safety review session for the Nos. 6 and 7 reactors, TEPCO Managing Executive Officer Takafumi Anegawa said, "We are deeply aware that we are facing doubts over our safety awareness, organization, technical abilities and management. We are expecting strict screening."

Questions from regulators during the 90-minute session focused on a filtered venting system TEPCO plans to install so that radioactive substances will be reduced when gas and steam need to be released to prevent damage to reactor containment vessels.

The installation of the equipment has become a requirement for boiling water reactors for the first time in Japan, after the 2011 Fukushima nuclear crisis led to the release of a massive amount of radioactive material amid the meltdown of three reactors.

Regulators said they want to check the system's filtering ability as well as its operation procedures, given that TEPCO stated in its application document that it will start using the equipment after securing local approval.

TEPCO has included the statement as a result of exchanges with Niigata Gov. Hirohiko Izumida, who has been critical of TEPCO's behavior.

The activity of small geological faults beneath the two reactors could also become a contentious point in the following review process, although TEPCO has denied that the faults are active.

Open safety screening meetings, which the NRA has convened dozens of times for other reactors, had not been held until Thursday for the Kashiwazaki-Kariwa plant as regulators have been wary following TEPCO's poor handling of the Fukushima Daiichi crisis cleanup activities.

As for why the NRA decided to go ahead with the screening process, Chairman Shunichi Tanaka has said the NRA could not continue putting off a screening meeting as format checks of documents submitted by the utility have finished.

He also said that he took positively a recent announcement by TEPCO on a set of measures to improve the working conditions at the Fukushima plant, which could help the company to address mishaps caused by human error.

But Tanaka has warned that regulators may temporarily suspend the assessment process if serious problems occur at Fukushima Daiichi.

For TEPCO, bringing its idled reactors back online would help it cut the huge cost of importing fuel for thermal power generation to meet electricity demand in Tokyo and surrounding areas.

The Nos. 6 and 7 reactors are advanced boiling water reactors and the newest among the seven units at the Kashiwazaki-Kariwa plant, the world's largest nuclear power plant with a combined output capacity of 8.2 million kilowatts.

Sources close to TEPCO said Thursday that the utility and a state-backed bailout fund have approached main creditor banks to seek around 2 trillion yen of fresh loans.

TEPCO wants to secure the funds for capital investment, such as to renew its aging thermal power generation facilities, but financial institutions are expected to cautiously consider whether to respond to the request as they have already provided over 4 trillion yen in loans to the ailing company.

Safety screening begins for TEPCO plant in Niigata

http://www3.nhk.or.jp/nhkworld/english/news/20131121_34.html

Japan's nuclear regulator has begun safety checks on a huge nuclear plant in Niigata Prefecture on the Japan Sea Coast. The checks are the first step toward starting two of the plant's seven reactors.

Nuclear Regulation Authority officials on Thursday held the first open meeting to assess safety measures at the Kashiwazaki-Kariwa plant. The plant is operated by Tokyo Electric Power Company and has the same type of boiling water reactors as Fukushima.

TEPCO applied for the screening in September to restart reactors 6 and 7 at the plant. But the regulator shelved the process because the utility was struggling with tainted water leaks and other problems at Fukushima.

TEPCO executive Takafumi Anegawa told the meeting the utility has learned lessons from Fukushima and incorporated them in new safety measures. He described plans to deal with serious accidents and natural disasters.

The discussion focused on an emergency filtered vent system that lowers air pressure in a containment vessel while curbing radioactive emissions. The system is required for boiling water reactors under tighter guidelines that took effect earlier this year.

NRA officials wanted to know the details of this filtering system and about how the utility plans to get local approval before starting the venting process.

The utility says restarting the plant is the key to its reconstruction but accepts difficulties are expected in the screening process. NRA officials are set to weigh how the company has been dealing with the Fukushima aftermath.

Niigata Governor Hirohiko Izumida criticized the NRA for starting the screening now when the utility has failed to stop contaminated water leaks in Fukushima. He said he will closely follow the discussion.

Local residents who watched the meeting online said the regulator should examine evacuation plans, not just whether the plant clears safety guidelines

TEPCO's hopes

November 23, 2013

TEPCO eyes restarting 4 reactors by 2015

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311230052

THE ASAHI SHIMBUN

Tokyo Electric Power Co. hopes to have four nuclear reactors in Niigata Prefecture back online by 2015, including two planned for next summer, despite the crisis at its hobbled Fukushima nuclear plant.

The company intends to reactivate the No. 1 and No. 5 reactors at the Kashiwazaki-Kariwa nuclear plant during the first half of 2015 after restarting the No. 6 and No. 7 reactors as early as July 2014, sources said.

Both plans will be included in the utility's rehabilitation program when it is revised toward the end of this year.

The Kashiwazaki-Kariwa plant has seven reactors. TEPCO estimates that for each reactor restart its annual profit will increase by about 100 billion yen ($1 billion).

The revised rehabilitation program will state that electricity rates will be lowered when the four reactors are back online, the sources said. TEPCO raised rates last year, citing increased fuel costs for thermal power plants.

A warning, though, about possible additional rate hikes if the reactors remain idle for an extended period is expected to be included in the revised rehabilitation program, the sources said.

The Nuclear Regulation Authority began full-scale safety screenings for the No. 6 and No. 7 reactors on Nov. 21. The examination, which is done to confirm whether a reactor meets new safety standards, is a prerequisite for reactivation.

TEPCO said it can expect a pretax profit of about 100 billion yen for fiscal 2014 if the two reactors restart operations next summer.

President Naomi Hirose has said the company will also apply for NRA screenings for the No. 1 and No. 5 reactors as soon as preparations are completed.

Safety equipment required under the new safety standards is being installed at the two reactors, including filtered venting equipment.

However, it remains unclear whether TEPCO can restart the reactors under its proposed time frame.

NRA screenings could drag on if regulators demand detailed investigations to confirm that no active faults run immediately under the reactors.

Consent of local communities is also essential, but Niigata Governor Hirohiko Izumida remains cautious. He has criticized plans to restart the two reactors next summer as a pipe dream.

Meanwhile, TEPCO will speed up streamlining its operations while expanding investments, the sources said.

The company plans to adopt a holding company structure as early as fiscal 2016 in view of the electric power industry reform planned by the government.

When the holding company is established, all 10 branch offices will be abolished and employees rendered redundant will be reassigned to other tasks, such as providing compensation to those affected by the 2011 nuclear disaster.

Branch offices fall between the head office and service centers in TEPCO's three-tier organizational structure.

TEPCO will rejuvenate its work force by hiring new graduates in fiscal 2014 for the first time in three years while introducing an early retirement program targeting about 1,000 employees.

The company will also reduce procurement from affiliates by purchasing 60 percent or more of equipment and materials through competitive bidding in fiscal 2015, up from the current 30 percent.

The revised rehabilitation program will include new investment plans, such as an expanded gas business.

"Preparations are indispensable for future growth," a senior TEPCO official said.

The company, which already sells gas to town gas utilities, is looking for new customers because the government plans to liberalize town gas retailing.

TEPCO will introduce "smart meters," or power meters equipped with telecommunication functions, to all 27 million households it serves by around 2020.

New businesses capitalizing on the next-generation meters will be developed with start-ups and other partners.

TEPCO will also resume overseas investments, which were suspended after the Fukushima nuclear disaster. It plans to take part in projects for building power plants in Asia and elsewhere and selling electricity to local utilities.

Can TEPCO ignore NRA's safety regulations?

November 28, 2013

NRA wary of conditional use of safety system at TEPCO nuclear plant

http://mainichi.jp/english/english/newsselect/news/20131128p2g00m0dm033000c.html

TOKYO (Kyodo) -- Nuclear Regulation Authority Chairman Shunichi Tanaka said Wednesday that it could be difficult for reactors at the Kashiwazaki-Kariwa nuclear plant to pass the safety screening process if Tokyo Electric Power Co. says it will only use a planned key safety system after securing local approval.

"In that situation, we will probably not give a green light," Tanaka told a press conference, referring to the process of checking whether the plant's Nos. 6 and 7 units are qualified to resume operations in light of new regulations introduced following the 2011 Fukushima Daiichi nuclear power plant disaster.

The safety equipment in question is a filtered venting system, which can reduce radioactive substances when gas and steam need to be released to prevent damage to reactor containment vessels.

Installation of such systems has become mandatory for commercial reactors in Japan, but there is concern over the radiation exposure risk the systems pose to residents living around nuclear power plants.

TEPCO, facing strong distrust from Niigata Gov. Hirohiko Izumida, said the equipment will not be used without securing local approval when it filed for NRA safety assessments of the Kashiwazaki-Kariwa reactors in late September.

While noting that the NRA will "not interfere in the relations between local governments and utilities," Tanaka also expressed concern that regulators may have to reassess the reactors' safety in the event that TEPCO fails to secure local approval.

"We cannot allow the operation of various facilities that should ensure safety to be changed without permission," he said.

The NRA plans to hold its second safety screening session for the Kashiwazaki-Kariwa reactors on Thursday, during which regulators are expected to present what they see will be the main points of discussion.

TEPCO is eager to bring the idled Kashiwazaki-Kariwa plant back online as it is facing a tough business situation due to the massive costs stemming from the Fukushima crisis that began in March 2011. Restarting some of its reactors will help the utility cut huge costs for importing fuel for thermal power generation.

The Nos. 6 and 7 reactors are advanced boiling water reactors and the newest among the seven units at the Kashiwazaki-Kariwa plant, the world's largest nuclear power plant with a combined output capacity of 8.2 million kilowatts.

All 50 commercial reactors in Japan are currently offline and safety checks on some of them started after new regulations were introduced in July.

Restart all Kashiwazaki reactors by 2016, says TEPCO

December 3, 2013

TEPCO eyes restart of all Kashiwazaki-Kariwa reactors by FY2016

http://mainichi.jp/english/english/newsselect/news/20131203p2a00m0na013000c.html

Tokyo Electric Power Co. (TEPCO) and the Nuclear Damage Liability Facilitation Fund (NDF) have decided the outline of a comprehensive special business plan under review in which the beleaguered utility is to restart all of the seven reactors at its Kashiwazaki-Kariwa Nuclear Power Plant by around fiscal 2016 to improve its earnings.

Under the revised business plan, TEPCO, the operator of the crippled Fukushima No. 1 Nuclear Power Plant, is also to issue corporate bonds to stabilize its cash flow. If there are prospects for the restoration of the utility's finances and if the NDF makes profits from selling its holdings of TEPCO shares, the fund will consider setting aside such profits to reduce TEPCO's debts. Nevertheless, there is no guarantee that the rehabilitation scenario, including the envisaged early restart of reactors at the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture, will be put into practice as planned.

Under the plan, TEPCO aims to restart the No. 6 and 7 reactors, on which the Nuclear Regulation Authority has been conducting safety assessments, in July 2014. The utility anticipates about 100 billion yen in current account surplus in fiscal 2014 by reducing fuel costs for thermal power generation. While

restarting the No. 1 and 5 reactors in the spring of 2015, the utility plans to restart the remaining three reactors by fiscal 2016, when power retailing will be fully liberalized. In doing so, the utility intends to steadily secure current account surplus of 100 billion to 200 billion yen.

By showing banks a path toward its earnings recovery, the utility intends to secure bank loans and to make a comeback to the bond market in fiscal 2016 where it has not been able to issue corporate bonds in the wake of the outbreak of the Fukushima nuclear crisis.

The utility will also consider measures to reduce its debts. The government currently invests 1 trillion yen in the utility through the NDF. The government also extends loans to help the utility pay damages from the nuclear disaster. TEPCO plans to repay the debts over an extended period of time from profits it makes each business year. Under the revised plan, if the NDF makes profits from selling TEPCO shares after prospects emerge that the utility will be able to rehabilitate its finances, it will consider using the profits for the utility's debt repayments.

The NDF and TEPCO want to make clear how the profits on the sale of such shares will be used in an effort to keep the morale of TEPCO employees from deteriorating, but it is hard to foresee when the NDF will actually sell the shares and whether it will be able to make profits.

Therefore, there are skeptics about the plan within the government. There are cases in which the Industrial Revitalization Corporation of Japan, which provided business revitalization assistance to Daiei Group and other ailing firms, returned capital gains to national coffers. Thus, the scheme could face objections from those who argue that TEPCO is receiving preferential treatment.

The utility also intends to beef up its business operations overseas by investing tens of billions of yen in power projects in Southeast Asia, where it has so far refrained from launching new business projects since the outbreak of the nuclear disaster. On the domestic front, the utility plans to make a full-scale entry into the business of supplying gas to factories, among other projects. TEPCO also plans to introduce next-generation "smart meters," which record details of power consumption data, to all of the 27 million households in its service areas. Based on the power consumption data, the utility will produce diversified electric rate structures in an effort to prepare for the complete deregulation of electricity retailing.

TEPCO will carry out further restructuring by shutting down all of its 10 branch offices and accepting voluntary retirement from about 1,000 employees, among other steps. By doing so, it intends to secure public understanding of public funding for measures it is taking to deal with radioactively contaminated water at the Fukushima No. 1 nuclear plant and other problems.

Apart from spinning it off into a separate company tasked with decommissioning the Fukushima No. 1 nuclear plant, TEPCO aims to turn itself into a holding company in fiscal 2016. It also plans to build cutting-edge coal-fired thermal power stations in two locations in Fukushima Prefecture as early as fiscal 2020 and start using the "J-Village" facility near the crippled nuclear plant, which has been used as a base for dealing with the nuclear disaster, as a soccer training center again by around 2018.

The new business plan will be submitted to the minister of economy, trade and industry at the end of this year, and the government is to approve it as early as the beginning of next year.

December 03, 2013(Mainichi Japan)

Fukushima's six reactors now officially defunct

December 18, 2013

Tepco formally declares surviving Fukushima No. 1 reactors defunct

Kyodo

Tokyo Electric Power Co. officially declared Wednesday that the two reactors that suffered no major damage at the Fukushima No. 1 plant in the 2011 disaster are defunct, meaning the nation will have only 48 operable commercial reactors.

With this decision, all of the plant's six reactors will be classified as defunct," Tepco said in a press release following a meeting of its board. "It is extremely regrettable that we hugely betrayed the local people's trust due to the accident and are deeply ashamed of ourselves."

Reactors 5 and 6 will be classified as defunct on Jan. 31, but instead of dismantling them, Tepco may use them as experimental facilities to support the challenging task of scrapping the three reactors that experienced meltdowns and the other one crippled by a hydrogen explosion.

The public has been demanding that Tepco scrap both the Fukushima No. 1 and nearby Fukushima No. 2 plants. The utility has not made clear what it intends to do with the four-reactor Fukushima No. 2 complex, located about 12 km south of the crisis-ridden Fukushima No. 1 facility.

As new accounting rules regarding decommissioning came into force in October, Tepco is likely to avoid booking a large extraordinary charge for the current business year through next March due to a shortfall in funds for decommissioning.

We are currently examining the impact of the latest decision on our accounting," Tepco said.

After the Fukushima No. 1 plant was hit by the March 11, 2011, magnitude 9.0 earthquake and tsunami, reactors 1, 2 and 3 experienced core meltdowns. And the building housing reactor 4, which did not have fuel inside its core because it was under maintenance, was damaged by a hydrogen explosion.

But reactors 5 and 6, which were also under maintenance at the time of the earthquake, achieved cold shutdowns through the use of an emergency diesel generator that avoided flooding.

Reactors 1 to 4 were deemed defunct in April last year. In September, Prime Minister Shinzo Abe visited the severely damaged nuclear plant and urged Tepco to also scrap reactors 5 and 6 as well, saying the utility should focus more on the crisis cleanup efforts. Just scrapping the crippled reactors alone will take decades, and radiation levels in and around them will remain dangerous at least over that time.

Fukushima No. 1 is Tepco's first nuclear power station. It started commercial operation in 1971. Electricity supplied by the plant supported the economy after the oil crisis in the 1970s, said Tepco, which serves Tokyo and nearby areas.

Tepco is seeking to bring its remaining Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture back online to improve its tough business condition in light of the nuclear crisis.

The utility estimates that if it can restart that plant's reactors 6 and 7 as planned, it can cut between ¥240 billion and ¥330 billion annually in fuel costs for thermal power generation.

Tepco has been under effective state control after receiving a ¥1 trillion capital injection from a government-backed fund.

TEPCO decides to decommission 2 more reactors

http://www3.nhk.or.jp/nhkworld/english/news/20131218_35.html

The operator of the Fukushima Daiichi nuclear plant has officially decided to decommission the facility's 2 reactors that escaped serious damage in the 2011 disaster.

Tokyo Electric Power Company, or TEPCO, made the decision at its board meeting on Wednesday. Four of the plant's 6 reactors were crippled due to meltdowns or hydrogen explosions in their buildings.

Japan's Prime Minister Shinzo Abe in September urged the utility to decommission the plant's No. 5 and 6 reactors. The 4 others were already being decommissioned.

TEPCO gained approval for the decision from 2 host towns last week. The firm's president Naomi Hirose plans to report on the move to Fukushima Prefecture on Thursday.

The decision means the utility needs at least 260 million dollars more for decommissioning. Part of the additional cost is expected to be passed on to consumers through higher electricity fees.

TEPCO does not plan to immediately dismantle the No. 5 and 6 reactors and their buildings. They are to be used to test technologies and train workers to remove melted fuel and dismantle facilities at the plant's No.1 to 4 reactors.

The utility is moving fuel assemblies from the No. 5 and 6 reactors to cooling pools in their buildings. The work is to be completed by next September.

The company says it will keep a total of more than 3,000 fuel units in the pools for the time being. How to finally dispose of the fuel has yet to be decided.

The decision reduces the number of reactors in Japan that could be restarted to 48. Japan had 54 operating reactors before the disaster.
Dec. 18, 2013 - Updated 10:21 UTC

TEPCO to permanently shut down 2 surviving Fukushima reactors

http://mainichi.jp/english/english/newsselect/news/20131218p2g00m0dm094000c.html

TOKYO (Kyodo) -- Tokyo Electric Power Co. decided at its board meeting Wednesday to permanently shut down two reactors at the Fukushima Daiichi plant that avoided meltdowns in the 2011 accident, responding to a request by Prime Minister Shinzo Abe in September.

The Nos. 5 and 6 reactors, however, will not be dismantled and will be used as research facilities to support the challenging task of scrapping the four other reactors that have suffered core meltdowns or have been affected by hydrogen explosions.

Local calls are strong that TEPCO scrap both the Fukushima Daiichi and the nearby Fukushima Daini plants. But the utility has not made clear what it will do with the four-reactor complex about 12 kilometers to the south.

As new accounting rules regarding decommissioning came into force in October, TEPCO is likely to avoid booking a large extraordinary charge in the business year through March 2014 due to a shortfall in funds for decommissioning.

After the plant was hit by a magnitude 9.0 earthquake and tsunami on March 11, 2011, the Nos. 1 to 3 reactors suffered meltdowns and the building housing the No. 4 reactor, which did not have fuel inside its core because it was under maintenance, was damaged by a hydrogen explosion.

But the Nos. 5 and 6 reactors, which were also under maintenance at the time of the earthquake, achieved cold shutdowns through the use of an emergency diesel generator that avoided flooding.

The Nos. 1 to 4 reactors were classified as defunct in April last year as TEPCO decided to decommission them, reducing the total number of operable commercial reactors in Japan to 50.

In September this year, Abe visited the stricken plant and urged TEPCO to also scrap the No. 5 and 6 reactors, saying that the utility should focus more on the crisis cleanup efforts.

On the other hand, TEPCO is seeking to bring its remaining Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture back online to improve its tough business conditions after the nuclear crisis.

The utility estimates that if it can restart the plant's Nos. 6 and 7 reactors as planned, it can cut between 240 billion yen and 330 billion yen of annual fuel costs for thermal power generation.

TEPCO has been under effective state control after receiving 1 trillion yen in capital injection from a state-backed fund.

Cut power rates by restarting Kashiwazaki-Kariwa

December 16, 2013

TEPCO to cut power bills, restart nuclear plant
http://www3.nhk.or.jp/nhkworld/english/news/20131216_40.html

Tokyo Electric Power Company is drawing up a business plan to cut electricity rates by restarting all the reactors at a nuclear power plant in central Japan.

TEPCO raised the rates to cover its losses after the nuclear disaster at the Fukushima Daiichi plant in 2011. The increases averaged about 8.5 percent for households, and 17 percent for businesses.

But the plan TEPCO is drawing up includes reactivating all seven reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture over the next several years. The utility wants to show that it will be able to reduce electricity bills through the full-scale resumption of operations. All nuclear reactors at the plant are now offline.

TEPCO also plans to slash fuel costs by replacing old thermal power plants with more efficient facilities.

Industry sources say the utility could lower electricity rates in stages if it can realize the resumption. They say the rate cuts would total about 10 billion dollars a year in 10 years.

TEPCO plans to finalize the business program by the end of the year.

Heightened breakwater for Hamaoka

December 20, 2013

Chubu Electric eyes Hamaoka reactor restart with heightened breakwater

A four-meter-tall steel plate is moved into position to raise the height of the breakwater at the Hamaoka nuclear power plant in Omaezaki, Shizuoka Prefecture, on Dec. 19. (Yoichi Kawatsu)

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312200069

By SO OUCHI/ Staff Writer

OMAEZAKI, Shizuoka Prefecture--Chubu Electric Power Co. has reported progress in its effort to heighten the breakwater at its Hamaoka nuclear power plant, a requirement to bring the facility back online.

The utility showed reporters Dec. 19 the construction site where it is adding an additional four meters of steel plates to the existing breakwater to prevent a future tsunami from damaging the plant.

Chubu Electric originally completed an 18-meter-tall barrier stretching 1.6 kilometers to protect the plant in December 2012. However, it decided to heighten the structure after a Cabinet Office panel predicted a major quake in a worst-case scenario could trigger a 19-meter tsunami along the Pacific coast.

The tsunami generated by the Great East Japan Earthquake that caused reactor meltdowns at the Fukushima No. 1 nuclear power plant in March 2011 was about 13 meters high.

The Cabinet Office's report predicted a major quake along the Nankai Trough, an underwater trench stretching from Suruga Bay off Shizuoka Prefecture along Japan's Pacific coastline to Kyushu, could strike the region within decades.
By satisfying the new regulatory standards against tsunami and other disasters, the utility hopes to restart at least one reactor soon after the barriers are completed in September 2015.

The company is expected to apply to the Nuclear Regulation Authority for a safety review of the No. 4 reactor by the end of March as one of the steps toward its eventual restart.

Shimane restart

December 25, 2013

Screening sought to restart Shimane reactor

http://www3.nhk.or.jp/nhkworld/english/news/20131225_13.html

Chugoku Electric Power Company has applied to Japan's nuclear regulator for a safety screening needed to restart an idle reactor. The reactor is at the firm's Shimane nuclear power plant in Matsue City, Shimane Prefecture, western Japan.

The application is the 2nd filed for boiling water reactors --- the same type as those that melted down at the Fukushima Daiichi nuclear power plant, in northeastern Japan, in March, 2011.

Chugoku Electric Vice President Mareshige Shimizu visited the Nuclear Regulation Authority and submitted the application on Wednesday.

The utility says it has not yet decided when to bring the reactor back online.

It says it hopes to install a filtered vent at the reactor next May at the earliest. Under safety requirements, boiling water reactors must have such vents, which are designed to release pressure in a reactor containment vessel during an emergency while limiting emissions of radioactive substances.

The firm has raised the height of a breakwater in front of the reactor by 6.5 meters, to 15 meters, as a tsunami prevention measure.

The nuclear regulator has been occupied with screening 7 other plants. Plants around the country, including the Onagawa plant, in northeastern Japan, which suffered damage in the March 2011 disaster, may also apply for a restart.

It is unknown how long the screening of the Shimane plant will take.
After the screening by the nuclear regulator, the company must get agreement on restarting the reactor from Shimane Prefecture, Matsue City and other local governments, such as neighboring Tottori Prefecture.

Restart Onagawa

Restart sought for reactor damaged in 2011 tsunami disaster
December 28, 2013
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312280050

THE ASAHI SHIMBUN

In a step toward restarting its Onagawa nuclear power plant, Tohoku Electric Power Co. has filed an application with the government's nuclear watchdog for safety checks, a first among nuclear facilities affected by the 2011 earthquake and tsunami.
The utility is keen for the No. 2 reactor at the Onagawa plant in Miyagi Prefecture to come back online as its net profit has been weighed down with ballooning fuel costs to operate thermal power plants to make up for the suspension of nuclear plants.
Tohoku Electric filed the application with the Nuclear Regulation Authority on Dec. 27.
Operators of nuclear plants that are deemed to have higher risks have either applied or are preparing for safety screening applications for a restart at an earliest possible date to improve their financial standings.
Chugoku Electric Power Co. applied Dec. 25 for the NRA's checks for its Shimane nuclear plant in Matsue, capital of Shimane Prefecture.
Chubu Electric Power Co. is expected to file an application for its Hamaoka nuclear plant in Omaezaki, Shizuoka Prefecture, in January.
The Hamaoka plant is particularly controversial because it sits on the projected epicenter area of a long-predicted earthquake that could devastate the Tokai region. Chubu Electric is now building a 22-meter barrier to protect the plant from tsunami, 4 meters taller than initially planned, after scientists said there was a greater likelihood of a temblor spawning a tsunami taller than 18 meters.
Tohoku Electric's Onagawa plant, with three reactors, was damaged by fire and other problems due to the Great East Japan Earthquake and tsunami in March 2011.

The plant was shaken by a temblor registering lower 6 on the Japanese scale of 7. The tsunami that reached the plant was 13 meters, nearly as high as the ground where the plant stands.

Tohoku Electric's safety check application is for the No. 2 reactor, which suffered relatively less damage than the other two reactors. Work to bolster quake resistance for the No. 2 reactor is already in progress.

The utility, based in Sendai, Miyagi Prefecture, has also begun work to raise the height of the coastal levee near the plant to 29 meters to prepare for a projected tsunami of 23.1 meters.

The company hopes to restart the No. 2 reactor in April 2016 or later.

Shigeru Inoue, vice president of Tohoku Electric, expressed confidence about the plant's safety features.

"We have confirmed the safety of the plant on our own by conducting a special study," he said.

The utility was in a hurry to proceed with the Onagawa plant first as it is expected to take a lot longer to prepare for safety screenings for its other facility, the Higashidori nuclear plant in Higashidori, Aomori Prefecture.

The Higashidori plant emerged basically unscathed from the 2011 disaster.

But experts say the facility sits on a possible active fault, forcing the company to halt preparations for safety applications.

The balance sheets of utilities have been hit hard since all their nuclear plants were shut down to meet the new safety standards, following the triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant in the wake of the 2011 quake and tsunami.

The situation is particularly serious for Kansai Electric Power Co., which relies on nuclear energy for roughly half of its electricity output, higher than any other utilities.

"If we cannot restart our idled reactors by summer, we may be forced to consider an additional hike in electricity rates," said a Kansai Electric official.

The government is also pushing reactor restarts to prevent another rise in electricity rates.

It fears a further increase in rates could deliver an additional blow to the nation's economy, which has begun to pick up with Prime Minister Shinzo Abe's economic measures, since the consumption tax rate will rise from 5 percent now to 8 percent in April.

But no reactors are likely to go online during the current fiscal year ending in March due to a delay in the NRA's safety evaluations.

The NRA has accepted applications of 16 reactors at nine nuclear plants since July, including the Onagawa plant reactor, and has reported progress in checks of 10 reactors at six plants.

The screening process is stalled for the rest either due to a lack of sufficient measures to prepare for a severe accident or because applications were submitted only recently.

Even safety evaluations of the 10 reactors are not moving as fast as expected because the safety standards for nuclear facilities became more stringent after the Fukushima disaster, particularly in regard to preparedness for earthquakes and tsunami.

Even if electric power companies clear the new safety standards, they need to gain consent from local governments over a restart, a process that could require more time.

(This article was compiled from reports by Miho Tanaka, Norihisa Hoshino, Toshio Kawada and Ryuta Koike.)

No plant ready to go back online, says NRA

January 1, 2013

Nuclear plants unlikely to resume operations soon

http://www3.nhk.or.jp/nhkworld/english/news/20140101_18.html

Officials with the Nuclear Regulation Authority in Japan say no nuclear plants are likely to resume operations in the near future.

They set new safety standards last July following the 2011 accident at Fukushima Daiichi. The guidelines call on operators to prepare for severe accidents and to reinforce facilities to make them earthquake-resistant.

Seven utilities have applied for safety screenings for 9 plants so they can restart operations.

The regulators have held 65 meetings to examine those applications. They say none of the plants is ready to go back online because operators have not appropriately renewed their estimations of the scale of possible earthquakes.

Nuclear Regulation Authority Chairman Shunichi Tanaka says he has no clear idea how long the screening process will take.

All commercial reactors in Japan are currently offline. Utilities want to restart them as soon as possible because the cost of importing fuel for thermal power generation is straining their bottom lines.

If and when regulators give them the green light, the firms still need consent from local governments before they can fire up their nuclear plants.

JNFL applies for safety assessment on Rokkasho plant

January 7, 2014
Japan Nuclear Fuel files for safety checks of fuel reprocessing plant
http://mainichi.jp/english/english/newsselect/news/20140107p2g00m0dm051000c.html

TOKYO (Kyodo) -- Japan Nuclear Fuel Ltd. on Tuesday applied for a state safety assessment on its spent fuel reprocessing plant in Rokkasho in northeastern Japan to put it onstream.
Although it is not clear how long the safety assessment process will take, the company said it hopes to secure the permission of authorities to use the plant in Aomori Prefecture by October and start its actual operation after securing local consent.
The plant was designed for a key role in Japan's fuel recycling policy that aims to reprocess spent uranium fuel and reuse the extracted plutonium and uranium as reactor fuel.
After submitting the application, Japan Nuclear Fuel Senior Executive Vice President Kazuhiro Matsumura told reporters that he expects the Nuclear Regulation Authority to implement the safety review "efficiently" and that the company is making preparations so that it will not see a delay in completing the plant in October.

Japan Nuclear Fuel started building the plant in 1993 and a trial operation began in March 2006. But its completion has been repeatedly postponed following a series of problems, including leakage of high-level radioactive waste liquid.

For the NRA, an entity launched after the 2011 Fukushima Daiichi nuclear power plant disaster, it will be the first safety checkup of a spent fuel reprocessing plant. The NRA put in place related regulations in December.

Under the new safety standards, spent fuel reprocessing facilities are required to take measures to respond to severe accidents such as criticality incidents. They are also required to enhance protection against earthquakes and other natural disasters.

The safety assessment process could be long, as the reprocess flow is complicated and involves a lot of equipment. The activity of a fault located off the coast of Rokkasho could also become a contentious point.

The Rokkasho plant is designed to reprocess 800 tons of spent fuel per year, extracting about 8 tons of plutonium in the process.

Japan, as the only non-nuclear weapons state in the world that is carrying on with a commercial reprocessing project, says it upholds the principle of not keeping excessive plutonium stockpiles.

Matsumura suggested that plutonium generated through the planned operation of the Rokkasho plant will be consumed by existing reactors in the form of plutonium-uranium mixed oxide fuel, a project called "pluthermal" in Japan.

"The pluthermal plan is promoted by the state and electric power companies and we believe it will steadily show progress," he said.

All of the country's commercial reactors are currently offline. About 15 reactors are waiting for their safety to be confirmed by the NRA to move ahead with resumptions.

Restart

January 12, 2013

Nuclear plant restarts on the table

http://www.japantimes.co.jp/opinion/2014/01/12/editorials/nuclear-plant-restarts-on-the-table/#.UtLiBrSao_g

Japan is going through its first winter without nuclear power since the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 plant. All of the nation's 50 nuclear power reactors have remained offline since the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture were shut down for maintenance last September.

The Nuclear Regulation Authority, which examines idled nuclear power plants that utility firms want to restart, must proceed strictly on scientific grounds — focusing on whether their restart plans comply with the new safety regulations, introduced in 2013, that incorporated lessons learned from the Fukushima nuclear disaster. The NRA must not be swayed by political considerations.

As soon as the new safety regulations took effect last July, power companies rushed to apply for the NRA's assessment of their plans to restart the reactors. Six months on, the NRA has under consideration seven utilities' plans to restart a total of 16 reactors at nine plants across the country.

The assessment process is taking longer than was initially thought due partly to delays on the part of the power companies preparing massive volumes of paperwork. It remains uncertain how soon the NRA will conclude its examination of any nuclear power plant included in the plans.

Under the new standards — billed as the world's toughest nuclear regulations — utilities are obliged to install specific countermeasures for major contingencies ranging from core meltdowns to tsunamis. Reactors will be required to be equipped with a filtered venting system to reduce the amount of radioactive substances released into the environment when pressure needs to be vented from a reactor core during emergencies.

But pressurized water reactors, used mainly at plants in western Japan, have been given a five-year grace period to meet the requirement. (Most of the reactors used in eastern Japan, including Fukushima reactors, are boiling water reactors.)

Utilities are also required to make a strict assessment of whether geological faults running underneath nuclear plants are active, a factor that would result in permanent shutdown of reactors.

Power companies have reason to hurry. They need to restart nuclear power plants to reduce the massive cost of imported fuel for increased thermal power generation, which has been making up for the shutdown of nuclear plants.

The Abe administration, which now calls nuclear power an "important baseload power source" for the nation's energy supply stability, says it is ready to reactivate reactors that have passed the NRA's examination **once the consent of local authorities hosting the power plants is obtained.**

More utilities are expected to apply to restart their plants. Japan Nuclear Fuel Ltd. also recently filed for NRA screening of its spent nuclear fuel reprocessing plant and related facilities in its complex at Rokkasho, Aomori Prefecture.

Assessment of the Rokkasho facilities will be made according to a separate set of safety regulations that took effect in December. That work is expected to take longer because of the complicated process of spent-fuel reprocessing and the sheer number of facilities to be examined.

Manpower support for the NRA will be needed if the screening process becomes backlogged due to staff shortages or work overloads. NRA assessment is a crucial process toward ensuring that nuclear power plants are adequately safe and can withstand major disasters on the basis of the experience with the Fukushima disaster. The NRA needs to point out any safety shortcomings in the utilities' plans and get them corrected before approving the restarts.

Delay likely for Hokkaido restart

February 5, 2014
Construction may delay restart of Tomari reactor

http://www3.nhk.or.jp/nhkworld/english/news/20140205_11.html

The operators of a nuclear power plant on Japan's northern main island of Hokkaido say they will start major construction to improve the safety of one of their reactors. The work will significantly delay their plan to restart the reactor.

Hokkaido Electric Power Company announced the work on the Tomari plant No. 3 reactor at a meeting on Tuesday with the Nuclear Regulation Authority or NRA.

Tomari is one of 6 nuclear plants that applied for NRA safety inspections in July. The inspections are required under new safety guidelines for restarting reactors.

The NRA has been assessing the safety of the plant's No. 3 reactor for more than half a year. The reactor has only one pipe for spraying water into the containment vessel in the event of an accident.

NRA officials say the reactor does not meet the government's safety standards because the operator's assumptions about the possibility of a malfunction are insufficient.

Hokkaido Electric Power officials say the planned construction work will take more than a few months.

NRA officials say the plant's No. 1 and 2 reactors are also not ready for safety inspections.

Inspection of the No 3 reactor is also hampered by estimates of the scale of an earthquake that could hit the plant.

Tokyo election will help restart

February 10, 2014

INSIGHT: Tokyo vote emboldens moves for reactor restarts
http://ajw.asahi.com/article/behind_news/politics/AJ201402100058

THE ASAHI SHIMBUN

Yoichi Masuzoe's landslide victory in the Feb. 9 election for Tokyo governor strengthened the hand of the Abe administration in its efforts to forge ahead with restarts of idled nuclear reactors.

The 65-year-old Masuzoe, a former welfare minister backed by the ruling Liberal Democratic Party and its junior coalition partner New Komeito, garnered 2.11 million votes, more than the combined tally of the two anti-nuclear runners-up.

Kenji Utsunomiya, 67, former president of the Japan Federation of Bar Associations, ended with 983,000 votes, while former Prime Minister Morihiro Hosokawa, 76, gained 956,000 votes. At 46.14 percent, voter turnout was the third lowest on record.

"It was good that a person facing in the same direction as the government was elected," Chief Cabinet Secretary Yoshihide Suga told reporters when he visited Masuzoe's office Feb. 9 to congratulate him on his win.

Takeo Kawamura, chief of the LDP's election strategy committee, said that having an ally as head of the metropolitan government "will give the administration great leverage in advancing its policies."

The Abe administration, which threw its full support behind Masuzoe, views his victory as a signal that the public approves of its policy to reactivate reactors this year once they are declared safe by nuclear regulators.

Seven utilities have applied for safety screenings to the Nuclear Regulation Authority for 16 reactors at nine nuclear plants as a condition for bringing them back online.

The nation's 48 reactors are all shut down for safety checks following the triple meltdown at the Fukushima No. 1 nuclear power plant triggered by the March 2011 Great East Japan Earthquake and tsunami.

The government is moving to have reactors restarted as early as summer, depending on the results of NRA safety screenings and support from local governments that host nuclear plants. In this regard, securing public sentiment is crucial.

Hosokawa was backed by popular former Prime Minister Junichiro Koizumi, who has become a scathing critic of Prime Minister Shinzo Abe's pro-nuclear energy policy.

Government leaders were concerned that Koizumi would become more confrontational if Hosokawa won or even made an impressing showing.

"If Hosokawa and Utsunomiya together receive more votes than Masuzoe, it could send a message that Tokyo residents support their call for zero nuclear plants," education minister Hakubun Shimomura, a close ally of Abe, said Feb. 6.

Abe campaigned for Masuzoe in Tokyo's Ginza district Feb. 2, along with New Komeito leader Natsuo Yamaguchi.

Many government officials believe that Hosokawa's crushing defeat will undermine moves seeking nuclear phase-out.

"Koizumi will not be able to pick himself up again," a veteran LDP lawmaker said. "The government will proceed with reactor restarts as if nothing had happened."

Koizumi, who was in power between 2001 and 2006 and groomed Abe under his wing, took up the anti-nuclear cudgels last year and has repeatedly called on the prime minister to immediately abolish nuclear energy.

Media reports in early January that Hosokawa may run with backing from Koizumi gave the government a fright. It feared that the nuclear energy issue could dominate the campaign agenda.
Government officials were also concerned that the election outcome could shake up the LDP as some lawmakers are sympathetic to calls to move away from nuclear energy.

Abe fired a warning shot against a campaign preoccupied with nuclear energy during his African tour Jan. 12, saying pressing issues need to be discussed in a balanced manner.

He cited accepting more children in day care, preparing to host Tokyo Olympics in 2020 and improving preparedness against a mega-earthquake as examples.

In mid-January, the government postponed Cabinet approval of a basic energy policy, which features continued use of nuclear energy, to minimize the impact on the election.

The government and the ruling coalition changed tack and went all out to back Masuzoe after opinion polls showed he was the front-runner. Previously, the campaigning was led by the LDP's Tokyo chapter.

LDP Secretary-General Shigeru Ishiba, for example, demanded party lawmakers each submit a list of 100 supporters in Tokyo for canvassing for votes.

"A hard slog"

February 10, 2014

Japan's nuclear restart bogged down in safety checks and paperwork
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402100011

REUTERS

Hundreds of technicians and engineers are camped out in Tokyo hotels trying to revive Japan's nuclear industry, shut down in the wake of the Fukushima disaster almost three years ago.

It's proving a hard slog. A new, more independent regulator is in place, asking difficult questions and seeking to impose tougher safety rules on powerful utilities that were largely their own masters for the past 50 years.

The Nuclear Regulation Authority (NRA) was created in 2012 and set new safety guidelines in July last year. It now has four teams vetting reactors at nine nuclear power stations on a list of those seeking to restart. A deadline to complete the checks has been missed as the NRA is still asking for reams of information. No one is able to predict when the first of 48 reactors will be turned back on.

The delays are biting the utilities which are having to spend billions of dollars to import fossil fuels to keep the power on, pushing Japan into a record trade deficit and risking undermining Prime Minister Shinzo Abe's polices to end years of stagnant growth.

"All the utilities are in a similar situation and, unless outstanding issues are resolved, we can't judge that they are in compliance with the standards," Tomoya Ichimura, an NRA director, told Reuters.

SLOW PROGRESS

The regulator and staff from the utilities and Mitsubishi Heavy Industries Ltd, a leading supplier of nuclear plant equipment, are ploughing through mountains of paperwork on the technical specifications of reactors and their vulnerability to natural disasters such as the earthquake and tsunami that knocked out the Fukushima No. 1 nuclear power plant in March 2011.

All lack experience in carrying out such detailed safety checks because of the lax regime that existed before Fukushima.

"Only the framework of the safety criteria was decided, not the details, so the dialogue between the NRA and power companies to work out the specifics is taking time," said Seiichi Nakata, Project Leader, Department of Policy, Communication and International Affairs at the Japan Atomic Industry Forum.

And once the checks are done, reactors must undergo planned inspections, which took as long as two months under the previous regime, as well as get the go-ahead from local authorities before they can be turned back on. The plants are being treated as if they have just been built and are seeking certification to start operating for the first time.

Interviews with utility and nuclear industry staff, regulators and government officials reveal a climate of uncertainty, frustration and long hours.

A taskforce of some 90 NRA inspectors dispatch orders and requests to hundreds of staff from regional utilities seconded to the capital and camped out for months in business hotels near the regulator's headquarters. As many as 2,800 staff at Mitsubishi Heavy are involved in dealing with utilities' requests on specifications and other data, the company said.

LONG HOURS

Kyushu Electric Power Co, Hokkaido Electric Power Co, Kansai Electric Power Co and Shikoku Electric Power Co say they have each stationed scores of employees in Tokyo to respond to queries from the regulator.

A typical working day for them lasts from 8 a.m. to 11 p.m. They stay in cheap business hotels within a quick commute of the NRA headquarters in a leafy district of central Tokyo. One of those, the Hotel Unizo in Shimbashi, a bustling district of bars and restaurants, charges 11,000 yen ($110) a night. To keep costs in check, some companies offer staff a daily allowance of as little as 1,500 yen for meals, and no laundry, said one person close to the safety review process.

Any downtime not spent returning home to visit families is used to prepare for more meetings with the regulator.

"Everyone involved in the safety reviews is irritated and it is mentally draining," said one staffer at a regional utility, who has been stationed in Tokyo since July and has missed key dates on his children's school calendar.

"I can't read books or watch TV. There's no time to relax," he said, adding he rarely has time even to wash his clothes. "I have 20 sets of underwear and socks bought from convenient stores rolled up like sushi in my office," he said.

PAPER ... AND MORE PAPER

The utilities also rent office space for staff to prepare paperwork for the regulator, said an official who oversees the process at a regional utility. Asked when he expected reactors to be restarted, he replied: "That's what we want to know."

Utilities must submit thousands of pages of documents outlining their compliance and readiness on a checklist of 27 main items required by the NRA, covering everything from quake protection to their

emergency responses. Kyushu Electric, which has applied to restart four reactors, has alone submitted more than 10,000 pages of documents to the regulator, said spokesman Hiroki Yamaguchi.

The regulator is still feeling its way and often changes the criteria for compliance, forcing utilities to submit more documentation, people in the industry said. The utilities then take their requests to Mitsubishi Heavy, which is struggling to meet deadlines.

"Mitsubishi Heavy basically handles safety assessments of the plants, and the utilities vie with each other to get help from them, creating a bottleneck," said the person involved in the checks at a regional utility.

Mitsubishi Heavy declined to comment on claims that it was the reason for some delays.
The cost to Japan's economy and the utilities' finances is heavy. Japan imported a record 87.5 million tons of LNG last year, at a cost of $69 billion, according to customs-cleared import data. Imports of thermal coal were also at record levels.

"There's a growing consensus from a purely economic perspective that Japan needs to restart as many reactors as it can in order to build out the diversification of its power sources and reduce fuel prices," said Tom O'Sullivan, founder of independent energy consultancy Mathyos Japan.

Forecasts that the first nuclear reactor would be back in operation by the middle of this year are misplaced, said Tetsuo Yuhara, a director at The Canon Institute of Global Studies, who previously spent 30 years at Mitsubishi Heavy.

"I have no forecast for restarts. It's the same situation as a year ago, as two years ago. Nothing has changed."

Boost of confidence for pro-nukes

February 10, 2014

Nuke foes' loss lets Abe push for restarts

by Miya Tanaka
http://www.japantimes.co.jp/news/2014/02/10/national/nuke-foes-loss-lets-abe-push-for-restarts/#.UvkM54XrV1t

Kyodo

The defeat of two anti-nuclear candidates, including former Prime Minister Morihiro Hosokawa, in Sunday's Tokyo gubernatorial election has given the central government a boost of confidence as it prepares to move forward with an energy policy supporting the use of atomic power.

"We plan to compile a feasible and balanced Basic Energy Plan (for medium- to long-term energy policy)," Prime Minister Shinzo Abe told a Diet committee Monday morning.

Nevertheless, Hosokawa's attempt to focus attention on nuclear policy — a politically sensitive issue since the Fukushima nuclear crisis started in 2011 — appears to have put more pressure on Abe's government to refrain from rushing toward endorsing a draft energy plan that has been criticized for its strong pro-nuclear tone.

Abe's administration initially wanted to approve the plan in January, after unveiling a draft the month before praising nuclear energy as an "important base-load power source." Base-load power refers to electricity sources that are cheap and stable and can be used continuously through the day.

The draft also said the government will push for restarting nuclear reactors that meet the country's new safety regulations introduced last July, while effectively leaving open the possibility of building new reactors.

In the drafting process, officials of the Ministry of Economy, Trade and Industry did not even seem to be shy about showing that METI remains a strong promoter of atomic power, despite the lingering anti-nuclear sentiment generated by the Fukushima meltdowns, which was termed a man-made disaster in part because of the industry's cozy ties with METI.

"We have no intention at all to give up the nuclear option. The most important issue is to deliver this message outside," Takayuki Ueda, head of the Natural Resources and Energy Agency, which is under METI, said in December when briefing lawmakers in the ruling Liberal Democratic Party on the contents of the draft.

But the government appeared to shift toward a more cautious stance amid criticism from some LDP members who felt the draft deviated from the party's campaign pledge for the 2012 general election. The LDP promised to strive for the establishment of social and economic structures independent of nuclear power.

Applying further brakes was the Tokyo gubernatorial election, in which Hosokawa, tying up with charismatic former Prime Minister Junichiro Koizumi, joined the race in a bid to turn the poll into a referendum on energy policy.
Abe's government was quick to avoid triggering a backlash over its energy policy stance.

A day after the official campaigning for the election kicked off on Jan. 23, METI Minister Toshimitsu Motegi said the government would consider revising the draft energy plan to avoid "misunderstandings" that Japan seeks to rely heavily on nuclear power.

"I do not intend to change the term 'base-load power,' but if it is perceived as an electric source used for an extremely large amount, or given a high priority, I will consider changing the context," Motegi told a press conference.

His remarks indicated the part of the plan that highlights the importance of nuclear power could be watered down.
Motegi also refrained from setting deadlines for establishing the new energy policy.

NRA to speed up restart

February 19, 2014

_No53 / News in Brief
Japan Regulator Plans To Speed Up Reactor Restarts
http://www.nucnet.org/all-the-news/2014/02/19/japan-regulator-plans-to-speed-up-reactor-restarts

Plant Operation
19 Feb (NucNet): Japan's Nuclear Regulation Authority is working to speed up the restart of some of the nation's offline nuclear reactors, officials said today.

The NRA, an independent body created in 2012 in response to the March 2011 accident at Fukushima-Daiichi, said it would create "a priority list" of nuclear power stations which meet the earthquake and tsunami criteria as soon as next month, which will help move some nuclear facilities forward in the restart process.

Regulatory officials will compile reports on a handful of prioritised plants, which will then be handed off for public comment for an additional four weeks, a statement said. The NRA will also hold town hall meetings in local communities where plants are based to field any scientific and technical questions.

Japan has 50 commercial nuclear reactors, but only two, Kansai Electric Power Company's Ohi-3 and Ohi-4, have been restarted since the Fukushima-Daiichi accident. They have since been taken offline for scheduled refuelling and maintenance

The NRA is in the process of reviewing reactors to confirm that they meet new nuclear safety standards, which came into force on 8 July 2013.

Figures released by the NRA in December 2013 showed that applications have been submitted for the restart of 16 nuclear power reactors in Japan.

According to those statistics, the NRA has received applications for the restart of the following reactor units: Tomari-1, -2 and –3; Onagawa-2; Kashiwazaki Kariwa-6 and -7; Takahama-3 and -4; Ohi-3 and -4; Shimane-2; Ikata-3; Genkai-3 and -4; and Sendai-1 and -2.

Some plants are more equal than others

February 20, 2014

NRA to designate nuclear plants for priority safety screenings

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402200032

THE ASAHI SHIMBUN

The Nuclear Regulation Authority said it will designate nuclear power plants for priority safety checks from among the six that are currently being screened to determine if their reactors comply with its tightened regulation standards.

The decision came during a regular meeting of the government's nuclear watchdog Feb. 19.

The plants are to be singled out as early as March, making them likely to be the first to be brought back online.

While operators have requested NRA safety screenings for 10 nuclear plants across Japan, such examinations are presently under way only for six of them--the Sendai plant in Kagoshima Prefecture, the Genkai plant in Saga Prefecture, the Ikata plant in Ehime Prefecture, the Takahama and Oi plants in Fukui Prefecture, and the Tomari plant in Hokkaido.

Requests for those plants were submitted last July when the new regulation standards went into effect.

The NRA is expected to work out draft screening reports on a plant-by-plant basis as it nears the end of the screening process, once the standard seismic ground motion and the standard tsunami heights have been established. The standard seismic ground motion and the standard tsunami height, or the largest expected values that should be considered, have yet to be designated at any of the nuclear plants.

After the NRA selects the plants to be prioritized, it plans to concentrate on hammering out its first draft screening reports.

The NRA also plans to call for opinions from a broad audience on the draft screening reports, because they will be the first under the new regulation standards. It plans to co-host public hearing sessions with local governments in and around areas hosting nuclear plants if such requests are made by those governments.

The opinions contributed during the public calls and hearing sessions could be incorporated into the screening reports, NRA officials said.

What nuclear-free Japan?

February 20, 2014

Energy policy revised but intent remains same: Restart nuke reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402200063

THE ASAHI SHIMBUN

The Abe administration's long-awaited basic energy policy, set to be approved in March, means that Japan will continue to rely on nuclear power to generate electricity in spite of the disaster three years ago.

It will pave the way for the restart of idle nuclear reactors as early as this summer, when electricity demand is at its peak.
The basic energy plan, which will define the country’s mid- and long-term energy policy, will use slightly different wording from the draft plan revealed by the economy ministry last December.

The draft plan said that nuclear power generation is an “important base electricity source that serves as a basis” for society. The revised plan will say that nuclear power generation is an “important base load electricity source.”

The “base” in the draft plan and the “base load” in the revised plan both imply that nuclear power continues to generate a certain amount of electricity irrespective of seasons or hours.

However, base load is a more technical term that laypeople might easily construe as putting less importance on nuclear power generation--when nothing could be further from the truth.

The phrase “that serves as a basis” in the draft plan will be also deleted in the revised plan. The decision to delete it reflects concern in the ruling parties over such strong wording in the face of public opposition to nuclear power generation in the aftermath of the Fukushima nuclear disaster in 2011.

Despite the changes to wording, the intent of the basic energy plan remains the same: to restart the nation's idle nuclear reactors as soon as possible.

“Even with the slight change in expressions, the direction in policy (toward the restart of idled nuclear reactors) is unchanged,” said a senior administration official.

By keeping the wording “nuclear power generation is an important electricity source,” the Abe administration seeks to proceed smoothly with the restarts of idle nuclear reactors.

The revised basic energy plan is set to be approved by the Cabinet in March. It must first be adopted in a meeting of ministers tasked with the issue, probably as early as Feb. 25.

Initially, the administration planned to approve the basic energy plan, based on the economy ministry’s draft plan, in mid-January. But those plans went awry after former Prime Minister Morihiro Hosokawa decided to contest the Feb. 9 election for governor of Tokyo on a platform of creating a nuclear-free society.

Fearing that signing off on the basic energy plan would give momentum to Hosokawa or other anti-nuclear candidates, the Abe administration postponed taking the matter to Cabinet level.

In the event, Hosokawa and the other anti-nuclear candidates lost to Yoichi Masuzoe, who favors a gradual phase-out of nuclear power and was backed by the ruling party headed by Abe. Masuzoe's victory removed a key obstacle in the Abe administration's plans to move forward on the issue.

The government plans to approve the restart of idle nuclear reactors as early as this summer if the facilities pass new stringent safety screenings imposed by the Nuclear Regulation Authority.

In a December meeting of the economy ministry's panel that compiled the draft basic energy plan, Fukui Governor Issei Nishikawa asked the government to clearly state its position on maintaining nuclear power to generate electricity.
By enunciating a strong pro-nuclear stance, the central government would find it easier to obtain consent for the restart of idle nuclear reactors from prefectures and municipalities that host nuclear power plants.

The basic energy plan also endorses the government's policy of promoting a nuclear fuel recycling program.

Studies at the prototype fast breeder reactor Monjuin Tsuruga, Fukui Prefecture, which is a key part of the program, will continue.

(Norihisa Hoshino, Tomoyoshi Otsu, Yuriko Suzuki and Mari Fujisaki contributed to this article.)

Restarting Kashiwazaki not so easy

February 26, 2014
Incoming TEPCO chairman says July restart of Kashiwazaki-Kariwa nuclear plant unlikely
http://mainichi.jp/english/english/newsselect/news/20140226p2a00m0na007000c.html

Fumio Sudo, who is set to become chairman of Tokyo Electric Power Co. (TEPCO) in April, said Feb. 25 it is unlikely the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture will be restarted in July.

In an interview with the Mainichi Shimbun, Sudo, an adviser to and former president of steelmaker JFE Holdings Inc., explained that screening by the Nuclear Regulation Authority (NRA) for earthquake faults, which has a bearing on the plant's future, is likely to take several months. "A July restart is looking difficult," he said.

Under a business turnaround plan that the government approved in January this year, TEPCO predicted that its pretax profits for fiscal 2014 would reach roughly 167 billion yen, assuming it could bring the Kashiwazaki-Kariwa plant back online in July. If the restart of the plant's idled reactors is significantly delayed, then this will hold back the utility's earnings, and the company could come under pressure to increase customers' electricity bills again, despite the hike in 2012.

Sudo, however, said it was premature to consider increasing electricity bills, and maintained that TEPCO would strive to cut costs.

"We'll reduce costs to the bone, and even if there's an increase, we want to do all we can to hold it down -- even by a single yen," he said.

Speaking from his experience as president of a steel company that felt the heat of international competition, Sudo said, "TEPCO, too, needs an awareness of international competition." He said that the lack of such awareness was one reason behind the increase in electricity prices.

"Japan's energy costs are roughly triple those of the United States. Unless we make and break alliances, we won't get anywhere," he said. He underscored his position that major restructuring was needed in the power company, just like in the steel industry.

Sudo declared that he will visit Fukushima Prefecture, host to the company's crippled Fukushima No. 1 nuclear plant, soon after he becomes chairman.

"TEPCO lost trust through the nuclear accident. For my first three years (as chairman), we'll start off by restoring confidence," he said. He indicated that he would place priority on restoring confidence by putting effort into providing compensation, handling the nuclear disaster and decommissioning reactors at the Fukushima plant.

Paving the way for restart

February 26, 2014

Draft of gov't energy plan paves way for reactivation of nuclear plants

http://mainichi.jp/english/english/perspectives/news/20140226p2a00m0na002000c.html

The draft of the government's basic plan on energy has paved the way for reactivation of idled nuclear power stations.

The draft, announced by the government on Feb. 25, clarifies that the government will give the green light for reactivation of nuclear reactors that meet the new standards set by the Nuclear Regulation Authority (NRA). Moreover, the draft states that a certain ratio of nuclear power to total electricity consumed across the country should be maintained.

Although the wording in the government's draft has been slightly watered down from the proposal made by an advisory panel to the Economy, Trade and Industry Ministry, its calls for restarting atomic power stations remain unchanged.

However, some legislators within the ruling coalition are critical of its content because it clarifies the government's policy of clearly departing from the "zero nuclear" policy adopted by the previous administration led by the Democratic Party of Japan (DPJ). As such, the coalition is poised to cautiously deliberate the plan.

Issei Nishikawa, governor of Fukui Prefecture that hosts 13 commercial nuclear reactors, appreciated the government's draft of the basic plan on energy that clearly calls for maintaining Japan's reliance on nuclear plants. "The government fulfilled its responsibility for showing the importance of atomic power," he said.

One of the main aims of the draft is to clarify the government's stance toward atomic power to prefectures and municipalities hosting nuclear reactors and gain consent from local bodies.

The proposal drawn up by the industry ministry's panel in December last year recognizes nuclear power as an "important foundational power source that constitutes the basis" for electricity supply.

The ministry considered how to water down the wording of atomic power's role in electricity supply as ruling coalition partner New Komeito has pledged to seek to eliminate atomic power in the long run and the issue was a key point of contention during the Feb. 9 Tokyo gubernatorial election.

Some officials within the ministry proposed to delete the word, "important." However, as the draft describes natural gas and oil as "important" power sources, deleting the word from the description of nuclear plants could have provoked protests from local bodies hosting atomic power stations.

As such, the ministry erased the phrase, "that constitutes the bases," and used a technical term, "base load power source," to make it unclear whether nuclear power is far superior or inferior to other power sources.

The government's draft more proactively calls for the introduction of renewable energy sources than the panel's proposal. "The introduction of renewable energy should be sped up to the maximum extent over the next three years, after which it should also be actively promoted." The proposal made by the advisory council only states that the introduction of renewable energy should be sped up to the maximum extent over the next three years.

Although the draft says Japan's reliance on atomic power should be reduced as much as possible, its shows no road map toward cutting back on nuclear power, such as numerical targets.

Even though the wording in the draft has been changed, some government officials believe "it won't make any change to policy measures that the government should implement," as a senior official of the industry ministry says.

The government's draft also states that Japan will continue its nuclear fuel cycle project in which plutonium extracted from spent nuclear fuel will be reused for nuclear reactors. However, there are no prospects that a reprocessing plant in Rokkasho, Aomori Prefecture, and the Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture -- the core facilities in the project -- will be placed into operation in the foreseeable future because of a series of technical problems and a failure to meet the new safety standards.

The specific goal of putting fast-breeder reactors to practical use in the future has been dropped from the government's draft. At the same time, the draft emphasizes that the Monju reactor will be used for research on reducing the amount and toxicity of high-level radioactive waste.

Still, it does not mean that the government has given up putting the fast-breed reactor into practical use, says a senior ministry official, noting that the draft only shows what should be done with the prototype reactor for now.

Japan already possesses 44 tons of plutonium which could be used to make thousands of nuclear weapons. The draft says plutonium intended for use in fast-breeder reactors will be mixed with uranium and burned in conventional nuclear reactors as long as Monju can be reactivated soon. However, it remains unclear whether it is feasible.

If Japan is to start reprocessing spent nuclear fuel to produce plutonium while the current situation remains unchanged, it would run counter to the principle of not possessing plutonium without clear purposes of using it.

The continuation of the nuclear fuel cycle project is based on the assumption that various nuclear facilities are in operation. Therefore, the project runs counter to the government's policy of "reducing Japan's reliance on atomic power as much as possible."

Furthermore, since pools holding spent nuclear fuel are becoming full at many nuclear power stations across the country, the handling of radioactive waste that has nowhere to go poses a serious challenge.

The draft proposes to increase the capacity of temporarily storing spent nuclear fuel both on and outside the premises of atomic power stations. However, the proposal falls short of showing any specific measure to achieve this, and it is difficult to win consent form local communities.

While the government's draft of the basic energy plan calls for continued reliance on nuclear power, it fails to answer questions about various challenges posed by such an energy source. Sendai (Kagoshima Pref.) reactors get priority

March 13, 2014
Nuclear watchdog puts two Kyushu reactors on shortlist for restart screening

http://ajw.asahi.com/article/behind_news/politics/AJ201403130014

REUTERS
The government's nuclear watchdog put two reactors on a shortlist for a final round of safety checks on March 13, moving a step closer to reviving the country's nuclear industry, three years after the Fukushima disaster that led to the shutdown of all plants.

Two days after the third anniversary of the meltdowns at the Fukushima No. 1 nuclear power plant, the Nuclear Regulation Authority placed two reactors operated by Kyushu Electric Power Co. on a list for priority screening at a meeting of officials reviewing restart applications.

No timing for a potential restart was decided at the meeting and the next stage of checks incorporates a period of public hearings, which may be a fraught process given widespread skepticism about a return to nuclear power.

Kyushu Electric's Sendai reactors in Satsuma-sendai, Kagoshima Prefecture, are located about 980 kilometers southwest of Tokyo.

The utility is one of the most reliant of Japan's regional electricity monopolies that provide nuclear power, supplying about a third of Japan's energy needs before the Fukushima disaster.

Prime Minister Shinzo Abe, a strong supporter of nuclear power, finalized a mid-term energy plan last month, which embraces nuclear energy and calls for the restart of reactors deemed safe by regulators, overturning the previous administration's plan to eventually mothball all reactors.

Tokyo Electric Power Co's Fukushima No. 1 plant suffered a triple meltdown after an earthquake and tsunami that left at least 15,000 dead, sending a massive radioactive plume into the air and ocean.

In the worst nuclear disaster since Chernobyl in 1986, thousands were forced to flee their homes and much of the area around the Fukushima plant, about 220 km north of Tokyo, remains a no-go zone due to high levels of radiation.

Cleaning up Fukushima is expected to take decades and cost at least 11 trillion yen ($108 billion).
The disaster led to the eventual shutdown of all reactors, forcing utilities to spend billions of dollars on expensive fossil fuels to generate electricity.

Sendai nuclear plant screening prioritized
http://www3.nhk.or.jp/nhkworld/english/news/20140313_18.html

Japan's Nuclear Regulation Authority says it will prioritize the safety screening process for the Sendai nuclear plant in Kagoshima Prefecture, southwestern Japan. The country's 48 commercial reactors, now off-line, have to pass the screening before they can be reactivated.

Thursday's announcement means that the Number 1 and 2 reactors at the plant will likely be the first in Japan to clear the screening and resume commercial operation. Kyushu Electric Power Company is the operator of the units.

The authority discussed whether procedures should be speeded up for any of the six plants in the advanced stages of the safety review. Ten nuclear plants in Japan are currently being screened.

Prioritization requires confirmation of the maximum levels of tremors and tsunami expected from possible earthquakes.

The chairman of the authority, Shunichi Tanaka, told a meeting on Wednesday that major safety issues have mostly been resolved.

Authority officials expressed satisfaction with the Sendai plant operator's efforts.

Authority chairman Tanaka declared that they will begin preparations to wrap up the screening process.

The authority will report on the results of the safety review process, and give permission for a restart after listening to experts' views and holding public hearings in the prefecture.

Kyushu Electric hopes to resume operation of the Sendai plant before demand for power surges in the summer.
But the utility will still have to clear on-site inspections and persuade local residents.
Mar. 13, 2014 - Updated 03:09 UTC

Sendai nuclear plant emerges as leading candidate to restart
http://mainichi.jp/english/english/newsselect/news/20140313p2g00m0dm032000c.html

TOKYO (Kyodo) -- Nuclear regulators on Thursday decided to prioritize the safety review of two reactors at Kyushu Electric Power Co.'s Sendai plant in southwestern Japan, making them potentially the closest to being allowed to restart among Japan's 48 offline commercial reactors.

Currently, a total of 17 reactors at 10 nuclear power plants are subject to inspections to determine whether they satisfy a set of new safety requirements introduced in the wake of the 2011 Fukushima Daiichi nuclear power plant disaster.

But the Nuclear Regulation Authority has decided to narrow down the number of reactors it will place priority on so that the organization can efficiently finish its first safety checkup process based on the new regulations.

During a meeting Thursday, commissioners agreed that the Nos. 1 and 2 reactors at the Sendai plant in Kagoshima Prefecture are qualified to move on to the final stage of the review process.

"I understand that the Nos. 1 and 2 units at the Sendai plant have cleared major agendas (in regard to the assessment of earthquake and tsunami that could affect the plant), while others have not yet," Chairman Shunichi Tanaka told the meeting.

Toyoshi Fuketa, a commissioner in charge of checking the safety of facilities and countermeasures against severe nuclear accidents, also said he is satisfied so far with Kyushu Electric Power's approach toward serious accidents.

Under procedures agreed earlier, the NRA staff is expected to start devoting efforts to crafting a draft assessment report of the basic policies on the reactors' design and accident response. The document will serve as a certificate showing the inspected reactors have cleared the screening.

After compiling the draft, the NRA plans to solicit public opinion from scientific and technical viewpoints over a period of about four weeks.

Kyushu Electric Power wants to restart the plant by summer, when electricity demand increases. But it is not clear when the reactors will actually restart, as the NRA will need time to fully finish the checkups, while the utility will have to secure local consent before actually moving to reactivate the reactors.

The two reactors at the Sendai plant were operating when a magnitude 9.0 earthquake and tsunami hit eastern Japan in March 2011, triggering the Fukushima crisis, but they have been shut down for mandatory regular checkups since September the same year.

Kyushu Electric Power applied for the NRA's safety checks of the two reactors in July 2013, saying the maximum possible seismic ground motion that could affect the plant's important facilities is 540 gals.

During the safety review process, however, the utility decided to raise the estimate to 620 gals. It also revised upward the size of tsunami that could hit the plant to about 5 meters above sea level.

None of Japan's 48 reactors are allowed to reactivate unless they satisfy the new regulations, which for the first time oblige utilities to put in place specific countermeasures against severe accidents like reactor core meltdowns, as well as against huge tsunami -- the direct cause of the Fukushima crisis.

Prime Minister Shinzo Abe has reiterated that his government will push for the restart of reactors that have satisfied what it calls the world's toughest nuclear regulations, but a majority of the public is believed to be against such moves.

Anything could happen with screening

March 13, 2014

NRA chief: Massive tasks for screening

http://www3.nhk.or.jp/nhkworld/english/news/20140313_42.html

Japan's nuclear regulator has brushed away speculation about the restart date of the Sendai nuclear plant, despite prioritizing it for safety screenings.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, was explaining its decision on Thursday to check the plant in Kagoshima Prefecture ahead of others.

Tanaka said with so many safety items still to be examined anything could happen, especially if officials take time over planned checkups.

He said the decision on whether to speed up procedures for checks at other plants depends on the efforts of operators.

He said the NRA may make such a decision if operators clear major safety problems. But he said the reality is that they have yet to resolve outstanding issues.

Tanaka said one reason why safety screening is taking time is because operators are struggling to adapt to new safety regulations, which are very different from previous ones.

Meeting standards not enough to preclude accidents

March 17, 2014

Editorial: Overcome challenges before restarting Sendai nuclear plant

http://mainichi.jp/english/english/perspectives/news/20140317p2a00m0na002000c.html

The government's Nuclear Regulation Authority (NRA) has decided to prioritize safety inspections on the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Kagoshima Prefecture among examinations on idled reactors that would pave the way for restarting them. As such, Sendai plant's No. 1 and No. 2 reactors are set to be the first nuclear reactors to be examined under the new regulatory standards.

The government intends to go ahead with reactivation of nuclear reactors that pass the NRA's safety inspections on the grounds that Japan's new safety standards for nuclear reactors are the strictest in the world. However, if the government is to restart idled reactors based solely on the results of the NRA's inspections, it would only revive the myth of nuclear reactors' infallible safety that collapsed following the March 2011 outbreak of the Fukushima nuclear crisis. The NRA is supposed to only check if nuclear reactors meet the new standards, but confirmation that nuclear reactors meet the standards does not mean that there are no risks of accidents.

One cannot help but wonder whether the operators of nuclear reactors are sufficiently prepared for accidents, as well as who would take responsibility for any accidents, why the government intends to go ahead with reactivation despite risks of accidents and how the government will win consent from local communities hosting nuclear plants. The government has obligations to clearly answer these questions while showing the specific procedures for restarting nuclear reactors.

The new regulatory standards for atomic power stations that came into force in July last year require the operators of nuclear plants to strengthen countermeasures against earthquakes and tsunami, and to be fully prepared for serious accidents and terrorist attacks. Eight power companies have so far filed applications with the NRA for safety inspections on 17 reactors at their 10 nuclear plants. Based on inspections that have been conducted so far, the NRA has concluded that Kyushu Electric Power Co.'s assumption of the scale of earthquakes and tsunami that could hit Sendai's No. 1 and 2 reactors is appropriate.

The NRA is poised to assign inspectors intensively to the Sendai nuclear plant, draft an evaluation based on their inspections and announce the results. The authority will then complete its inspection process after hearing opinions from members of the general public. The evaluation document will also be used as a model for safety inspections on other nuclear power stations.

Apart from electric power suppliers, some government officials are also increasingly frustrated at the fact that none of the idled nuclear reactors has passed NRA safety inspections although eight months have passed since the new regulatory standards were enforced. However, as the delay is attributable partly to power companies' insufficient preparations, the NRA should strictly inspect reactors under the standards. In doing so, it is essential for the authority to sufficiently explain its efforts in a way that can convince the public.

Even after safety inspections are completed, numerous challenges must be overcome before restarting idled reactors. The most important of all these challenges is evacuation plans in case of a nuclear accident.

Nine municipalities within a radius of 30 kilometers from the Sendai plant, with a total population of approximately 220,000, have compiled their own evacuation plans. Still, they have not conducted sufficient evacuation drills to confirm the effectiveness of their evacuation plans. Specific measures to respond to the elderly and others vulnerable to disasters, which have been incorporated in the plans, are far from sufficient. These problems are common to other local bodies hosting atomic power plants. It is necessary for a third-party body to evaluate municipalities' evacuation plans.

The government has pledged to "gain understanding and cooperation from officials of local bodies hosting nuclear power plants" in reactivating idled reactors. However, it goes without saying that the government must respect the opinions of not only municipalities hosting nuclear plants but also those within a 30-kilometer radius of such power stations that are obligated to map out evacuation plans.
If the government goes ahead with reactivation of nuclear reactors that pass safety inspections, the administration of Prime Minister Shinzo Abe cannot achieve its goal of "decreasing Japan's reliance on nuclear power as much as possible."

The government should clearly show its specific goal of cutting down the country's dependence on atomic power in restarting idled nuclear reactors.

March 17, 2014(Mainichi Japan)

Sendai only plant to undergo screening before summer

March 27, 2014
Sendai to be only nuke plant to undergo NRA screening before summer
http://mainichi.jp/english/english/newsselect/news/20140327p2a00m0na006000c.html

The Sendai Nuclear Power Plant in Kagoshima Prefecture is likely to be the only nuclear plant to undergo the safety inspections that are required before restarting this coming summer, as other power companies have failed to submit data necessary for screening.

The government's Nuclear Regulation Authority (NRA) is set to prioritize safety inspections of the No. 1 and No. 2 reactors at the idled Sendai nuclear plant, which is operated by Kyushu Electric Power Co. Other utilities, too, hope to restart their idled reactors, but they failed to submit documents on "basic earthquake ground motion" in time for a March 26 screening meeting. The data is used to calculate quake-resistance standards for reactor buildings and other key facilities.

So far, eight power companies have applied for the NRA to screen 17 reactors at 10 nuclear plants. Among them, it had been expected that priority would be put on either the No. 3 reactor at the Shikoku Electric

Power Co.'s Ikata nuclear plant in Ehime Prefecture, the No. 3 or No. 4 reactors at Kansai Electric Power Co.'s Oi nuclear plant in Fukui Prefecture, or the No. 3 or No. 4 reactor at the utility's Takahama nuclear plant in the prefecture, on top of the Sendai nuclear plant. The No. 3 and No. 4 reactors at Kyushu Electric Power Co.'s Genkai nuclear plant in Saga Prefecture were also on the potential priority list.

The NRA, which started safety screenings under the new regulatory standards in July last year, had expected six months or so would be enough to inspect each reactor. However, screenings have fallen behind significantly due to power companies' delays in submitting necessary documents.

On March 13, the NRA decided to prioritize screenings at the Sendai nuclear plant, whose operator had finished calculating basic earthquake ground motion figures for the facility, as a model case for other nuclear plants, thereby accelerating the entire screening processes. At the same time, the NRA announced that it would additionally prioritize screenings at other nuclear plants once their basic earthquake ground motion is determined.

Out of the seven meetings that the NRA has held for safety screenings since March 13, five focused on inspections at the Sendai nuclear plant. The NRA will draw up a draft screening report on the plant outlining safety measures by around mid-April, and will solicit public opinions. The plant could be restarted as soon as this summer if local and other consent is gained as planned.

As for the Ikata and Genkai nuclear plants, the NRA has rejected their operators' calculations of basic earthquake ground motion due to insufficient data, forcing the utilities to start over. The NRA also ordered the operator of the Oi and Takahama nuclear plants to reanalyze potential tremors that the reactor buildings and other facilities at the plants would be exposed to, after the operator revised the estimated focus depth from 4 kilometers to 3.3 kilometers. As a result, it will take "at least another two weeks" before the basic ground motion at other nuclear complexes will be determined, according to a senior NRA secretariat official. This raises the possibility that basic ground motion figures at other plants would not be determined before the NRA finishes drafting the screening report for the Sendai plant.

At a press conference on March 26, NRA Chairman Shunichi Tanaka said, "I hope to see one reactor after another ready for prioritized screenings." But he added, "I don't think preparations (for screenings) are progressing at other nuclear plants. Power companies should put in a bit more effort, spurring the NRA into action."

March 27, 2014(Mainichi Japan)

Decommission Shimane?

March 28, 2014

Decommissioning is 'an option' for Shimane reactor: utility chief

http://mainichi.jp/english/english/newsselect/news/20140328p2g00m0dm044000c.html

HIROSHIMA (Kyodo) -- Chugoku Electric Power Co. President Tomohide Karita said Thursday that retiring a 40-year-old reactor at the company's Shimane Nuclear Power Station is "an option," a rarely heard remark from a top utility official in Japan suggesting decommissioning of an aging reactor.

In June, Kanda had indicated that the utility would consider seeking approval to extend the operation period of the unit 1 reactor, one of two at its only nuclear power station. He said at that time that he had no plan to retire it.

Some local residents in Shimane Prefecture have been calling for taking the reactor out of service permanently. With many other local communities having expressed strong concerns about the safety of aging reactors, Karita's remark could impact the thinking of executives at other utility companies in the country.

"Continuing operation beyond 40 years would require investment to deal with a variety of equipment issues," Karita told a press conference, apparently bearing in mind tougher safety measures demanded under new regulatory standards introduced after the Fukushima crisis.

He suggested that costs for extending the reactor's life and other factors would come into play in determining whether to reboot it. "There is an option of decommissioning it," he said.

The unit 1 reactor with capacity for 460,000 kilowatts went online in 1974 and will reach 40 years of operations Saturday, an age at which reactors need extensive retooling. It has been kept offline since March 2010 after it was discovered numerous devices remained uninspected sufficiently in regular checkups.

The power station has another reactor, unit 2, capable of generating 820,000 kw -- operational since 1989 and currently placed offline for a scheduled checkup.

A third reactor with a 1.37 million kw capacity is under construction with no date set for starting commercial operation, according to the company's website.

Masataka Matsuura, mayor of Matsue city, which hosts the nuclear power plant, said at a press conference Wednesday, "After 40 years, it should be decommissioned in principle. Citizens are hoping it will be decommissioned."

Under its fiscal 2014 business plan, the utility aims to make 67 billion yen in efficiency gains, which would be one of the largest cost saving targets for the company, through deferring or canceling building projects and taking other measures.

Karita said his company should be able to generate a profit in the year even if the unit 2 reactor is not rebooted. The utility is seeking authorization to restart it from the government's Nuclear Regulation Authority.

Many reactors will never be restarted

April 2, 2014

Only a third of nuclear reactors may be restarted

http://www.japantimes.co.jp/news/2014/04/02/national/only-one-third-of-nations-nuclear-reactors-may-be-restarted-analysis/#.UzwihVfi91s

by Mari Saito, Aaron Sheldrick, and Kentaro Hamada
Reuters
TEPCO, CHIEF SPEAKS OUT: PAGE 3 – Three years after the Fukushima disaster prompted the closure of all of Japan's nuclear reactors, Prime Minister Shinzo Abe is moving to revive atomic power as a core part of the nation's energy mix, but many of those idled reactors will never come back online.

Fewer than one-third, and at most about two-thirds, of the reactors will pass today's more stringent safety checks and clear the other seismological, economic, logistical and political hurdles needed to restart, a Reuters analysis shows.
Hokkaido Electric Power Co., facing a third year of financial losses, is seeking a capital infusion from a state-owned lender, which would make it the second utility after Tokyo Electric Power Co., whose Fukushima No. 1 plant suffered three core meltdowns, to get a government bailout since the March 2011 disaster started.

Continuing indefinitely to burn more coal and gas also means Tokyo will find it much harder to meet targets for reducing greenhouse-gas emissions.

Japan had 54 nuclear reactors supplying about 30 percent of its electricity before the March 11, 2011, Great East Japan Earthquake hit and tsunami knocked out the Fukushima No. 1 nuclear plant.

Of the nation's remaining four dozen reactors, 14 will probably be restarted at some point, a further 17 are uncertain and 17 will probably never be switched back on, the analysis suggests. As a result, nuclear energy will eventually make up less than 10 percent of Japan's power supply.

The analysis is based on questionnaires and interviews with more than a dozen experts and input from the 10 nuclear plant operators. It takes into account such factors as the age of the plants, nearby seismic faults, additional work needed to address safety concerns, evacuation plans and local political opposition.

It's impossible to say how many reactors will eventually pass safety inspections and win local approval to restart, but the analysis constitutes "a very good guess," said Tatsujiro Suzuki, who stepped down this week as vice chairman of the government's Japan Atomic Energy Commission.

A number at the low end of the Reuters calculations could make it impossible for Japan toreinstate nuclear as a "base-load" power source — enough to feed a constant minimum supply to the grid — as specified in a draft national energy plan that the government may adopt as soon as this week.

The public has turned against nuclear power after watching Tepco struggle to deal with the Fukushima disaster. Recent polls put opposition to reactor restarts at about 2-to-1 over support.

Abe's government, which reversed the previous government's goal to phase out nuclear power by 2030, has set no timetable for restarting nuclear plants, saying the process is in the hands of a tough, more independent safety regulator set up after Fukushima.

Some utilities have business plans that assume restarts by this summer, but that looks highly unrealistic as the Nuclear Regulation Agency says the utilities aren't taking the process seriously enough.

Eight power firms have requested safety inspections to allow the restart of 17 reactors at 10 power stations. The NRA has fast-tracked two reactors at the Sendai plant in Kagoshima Prefecture after Kyushu

Electric Power Co. broke ranks with its peers and said it would provision for far greater seismic shocks to the plant.

Three reactors in southern Japan are considered next in line, among 11 pressurized-water reactors at five plants, run by Shikoku Electric, Kansai Electric and Hokkaido Electric, being actively vetted by the NRA.

"I think the government is incredibly clever by doing the restarts in the most modern, advanced places that have the most local support and are yet far from centers of political activity," said Jeff Kingston, director of Asian studies at Temple University's Japan campus. "Then you use that to create momentum for the agenda of restarting as many reactors as possible."

Even after the NRA says a reactor is safe to restart, the government will defer to local areas for the final decision. Some of the front-runners have local governments strongly behind nuclear power and the wealth it brings to communities through jobs and government subsidies.

Other communities may balk at disaster preparedness. A survey of 134 mayors of towns and villages near reactors by the Asahi newspaper found that 10 of the country's 16 nuclear plants do not have evacuation plans to cover a full 30 km radius — the size of the Fukushima exclusion zone.

Some reactors can essentially be ruled out, like Tepco's Fukushima No. 2 station, which is well within the No. 1 plant evacuation zone and faces near-universal opposition from a traumatized local population. Also highly unlikely to switch back on is Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture. It sits on an active fault, according to experts commissioned by the NRA.

Twelve reactors will reach or exceed the standard life expectancy of 40 years within the next five years, probably sealing their fate in the new, harsher regulatory climate. These include reactor 1 at Shikoku Electric's Ikata power station.

Safety screening at Sendai

April 3, 2014

No problem found with Sendai nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20140403_44.html

A commissioner of Japan's Nuclear Regulation Authority, or NRA, says that the Sendai nuclear plant in Kagoshima Prefecture has no major problems with its anti-disaster measures.

The plant is likely to be the first to clear government safety screening procedures and resume operation.

NRA Commissioner Kunihiko Shimazaki and his team inspected the Kyushu Electric Power Company plant on Thursday. They studied how prepared the facility is for earthquakes and tsunamis.

The team members inspected seismic faults running beneath the facility. They observed the construction of barriers designed to protect a seawater intake facility in the event of a tsunami.

Shimazaki said the team found no problems, and will not change an earlier assessment of the plant.

The nuclear regulator announced last month that it will prioritize the safety screening process for the two reactors at the Sendai plant. Government guidelines state that idle reactors must undergo that process before they can restart.

All of Japan's nuclear plants are now offline. Ten of them are undergoing the screening.

The local community must also give consent before the plant can come back online.
Apr. 3, 2014 - Updated 12:23 UTC

On-site survey begins at Sendai nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20140403_28.html

Japan's Nuclear Regulation Authority is conducting an on-site inspection of Kyushu Electric Power Company's Sendai nuclear power plant in the southwestern prefecture of Kagoshima.

NRA Commissioner Kunihiko Shimazaki and 14 staff members visited the complex on Thursday. The inspection is aimed at confirming the plant's preparedness for possible earthquakes and tsunami.

The Sendai plant is projected to be the first to clear government safety screening procedures and resume commercial operation. Currently 10 nuclear plants are undergoing the screening.

The new safety standards were set in the wake of the 2011 accident at the Fukushima Daiichi nuclear power plant.

They require nuclear plant operators to conduct stricter assessments of the maximum level of earthquakes and tsunami that could hit their facilities.

In the morning, the inspectors observed seismic faults running beneath the facility. They also checked the seawater intake to confirm whether enough water can be secured to cool nuclear fuel even if the sea level becomes lower after a tsunami.

The NRA will compile a report on the outcome of the screening and ask for technical opinions from a wide range of sources.

But it remains uncertain when the plant can be actually restarted as the utility has to clear further NRA safety inspections of the nuclear power plant and win consent from local communities.

Jeff Kingston: Japan should not restart reactors

April 5, 2014
Lessons of Fukushima: Reactor restarts are unwise
by Jeff Kingston
Special To The Japan Times
http://www.japantimes.co.jp/opinion/2014/04/05/commentary/lessons-of-fukushima-reactor-restarts-are-unwise/#.U0FlPFfi91s

Kyle Cleveland, my colleague at Temple University Japan, recently published a report in the online Asia-Pacific Journal, "Mobilizing Nuclear Bias: The Fukushima Nuclear Crisis and the Politics of Uncertainty" that has drawn widespread media attention. Based on numerous interviews with government officials, military officers and nuclear energy experts, along with documents obtained through Freedom of Information requests to U.S. government agencies, Cleveland has pieced together a critical, but nuanced picture of a crisis that was closer to careening out of control than is generally acknowledged. There was a great deal of confusion in the early weeks of the crisis as different actors had different information and made varied assessments about what the information indicated.

Cleveland elucidates the yawning chasm between the minimizing and downplaying efforts of Tokyo Electric Power Co. and the U.S. government's assessments of the nuclear crisis. Because the Japanese government was reliant on Tepco for information this also created a gulf of perceptions between the two governments.

The USS Ronald Reagan, a nuclear powered aircraft carrier, arrived off the tsunami stricken coast of Tohoku on March 13, 2011, to provide rescue and relief assistance. Naval officers, according to Freedom of Information Act documents scrutinized by Cleveland, discovered the level of radiation was far worse than they anticipated. Radiation gauges on the ship measured levels of radiation at 100 nautical miles off the coast that were 30 times greater than normal. Aircrews that ventured closer to the stricken plant were found to have high levels of radiation on their shoes and clothing. Tepco's downplaying of the crisis and misleading information is at issue in a lawsuit filed by sailors from the U.S.S Reagan, who claim that they have had significant health problems due to exposure to radiation during their rescue efforts. Had Tepco acted responsibly by clarifying the scale of the crisis, the plaintiffs assert, they would not be suffering various cancers they attribute to exposure to high doses of radiation.

The higher than expected radiation readings created a delicate diplomatic situation as the U.S. did not want to embarrass or offend its ally, but it also wanted to ensure the safety of its military and government personnel, their dependents and American civilians. Cleveland finds that there was considerable disagreement between various U.S. agencies about the severity of the risk, but in the end the Defense Department ruled that there were no adverse health consequences from the reported radiation doses.

The international media has been lashed for exaggerating the risks to Tokyo, but Cleveland believes this 20/20 hindsight is misleading. Critics often cite Jeffrey Bader's 2012 article in Foreign Affairs, "Inside the White House During Fukushima" to assert that the U.S. government never considered the risk sufficient to justify evacuation of Tokyo. Bader served as the senior director for East Asian Affairs on the U.S. National Security Council from January 2009 until April 2011, but he would not be the first insider to put a gloss on what happened on his watch.

Bader explains that the U.S. decided to expand the exclusionary zone to 80 km, exceeding the Japanese government's 20-km evacuation zone, because the available data indicated that this is what the U.S. government would do in a similar situation at home. Washington also authorized a voluntary departure for dependents of U.S. personnel and issued a travel advisory recommending U.S. citizens consider leaving Japan. John Holdren, the president's science adviser, argued that U.S. Navy nuclear experts were overstating the risks, but as Cleveland explains, when science meets policy, politics prevails. Bader acknowledges that the withdrawal of U.S. forces from bases in Yokosuka, Kanagawa Prefecture, and Yokota in western Tokyo would have stoked panic among Japanese and gravely damaged the alliance.

Based on Holder's interpretation of worst-case scenarios developed by the Lawrence Livermore National Laboratory working with the NRC, Bader concludes that, "there was no plausible scenario in which Tokyo, Yokosuka, or Yokota could be subject to dangerous levels of airborne radiation." Cleveland's sources disagree. He suggests that Bader,"downplays the level of discord and debate among the radiation experts and privileges interpretations by State Department folks whose guiding concerns were the diplomatic impact of expanding evacuation/exclusionary zones, the implications of an actionable worst-case scenario and military departures. State essentially refereed the decision-making and pushed for less conservative measures to align more closely with the Japanese, with a close eye on implications for the American nuclear industry."

In Cleveland's view, the navy was, "more risk averse than either the NRC (Nuclear Regulatory Commission) or State, and from day one was ringing alarms that were not entirely understood, not completely validated and not well received by the NRC and State. The navy was pushing the other federal agencies to take more aggressive actions because their radiation measurements were indicating dose rates that were more significant than what was implied by the abstract modeling that guided the NRC and Holdren's views." Given that the U.S. government expanded the exclusionary zone in Fukushima to 80 km and developed contingency plans for a massive evacuation while shredding of documents continued for four days at the U.S. Embassy and military bases in Japan, somebody was obviously very worried.

Regarding accusations that The New York Times exaggerated the crisis, Cleveland argues, "The reporting of the NYT was warranted by the information known at the time. Their discussion of worst-case scenarios and their withering view of Tepco and the J-Gov were based on solid reporting.

. . . Their views were based on interviews with insiders who provided this information and so their coverage was not unduly alarmist. . . . If anything, the NYT was a mainstream, moderate voice in line with mainstream experts and the policy decisions being debated by elite-level insiders." Some of his insider sources tell him that the crisis was actually far worse than anyone acknowledged at the time and that information was withheld to prevent a panic.

Cleveland concludes that Japan's nuclear reactors should not be restarted. As one American nuclear expert told him, "Without a qualitatively different regulatory system, and in light of how Japan/Tepco responded to this crisis, Japan has not earned the right to have nuclear energy. No critically minded and informed person can evaluate this disaster and look at how Japan has responded in the aftermath and have any confidence that Japan will use nuclear energy safely. And in the most seismically active country in the world, even if Japan had a robust regulatory structure and thoroughly integrated crisis protocols, nature conspires against the best-laid-plans of human institutions. And what Japan has is certainly not the best plan by any measure."

Sendai likely to get clearance

April 10, 2014
Sendai nuclear power plant may get OK in June

http://www3.nhk.or.jp/nhkworld/english/news/20140410_28.html

The Sendai nuclear power plant in Kagoshima Prefecture, southwestern Japan, is likely to get government safety clearance as early as June, in the first step toward restarting its two reactors.

Officials from the operator of the plant told the Nuclear Regulation Authority, or the NRA, on Thursday that it will present a revised report outlining safety measures it will take for the plant, reflecting advice from the NRA. The operator, Kyushu Electric Power Company, says it will complete the report by the end of April.

The NRA officials said they will start compiling a safety assessment report for the plant, and plan to finish it by the end of May.

The NRA will then set up a 30-day public comment period to invite outsiders to post scientific opinions about whether the plant should be restarted.

If everything goes according to plan, the NRA could issue safety clearance for the Sendai plant in June. This would be the first such clearance under Japan's revised nuclear safety guidelines.

Kyushu Electric will have to clear some more hurdles before it can restart the plant. NRA officials will check safety equipment on site at the plant. The local community must give consent before the plant can come back online.

All of Japan's 48 reactors at 16 commercial nuclear power plants are currently offline.

The Sendai nuclear power plant is one of the 10 plants now undergoing screening by the Nuclear Regulation Authority.

Some people can't wait for restart

April 14, 2014
Yukio Nakano, 55, a nearby resident and conservationist, walks along the beach next to the Kyushu Electric Power Co.'s Sendai nuclear power plant in Satsumasendai, Kagoshima Prefecture, on April 5. | REUTERS

In test of post-Fukushima policy, town rallies for restart of reactors
http://www.japantimes.co.jp/news/2014/04/14/national/in-test-of-post-fukushima-policy-town-rallies-for-restart-of-reactors/#.U0wKD1fi91s

BY MARI SAITO
REUTERS

SATSUMASENDAI, KAGOSHIMA PREF. – On the main road leading from the Sendai nuclear plant in Kagoshima Prefecture, a construction crew is laying down asphalt to widen the evacuation route in the event of a future disaster.

For many living in the area, that's a hopeful sight. It means the authorities are edging closer to restarting two nuclear reactors that have been an economic engine for nearly three decades in a remote coastal town that has few other options.

Satsumasendai never felt the earthquake that triggered the Fukushima nuclear disaster some 1,600 km (almost 1,000 miles) to the north in March 2011. But residents saw their friends lose jobs and felt their future was threatened when the Sendai nuclear plant, run by Kyushu Electric Power, was idled along with the rest of the nation's reactors for a more stringent round of safety checks after Fukushima.

"I know it was a horrible accident, but right now I'm more concerned about the economy and my job," said Hiroya Komatsu, 28. "We saw it on TV, but it could very well have been the Philippines. It didn't feel like it was Japan."

Like Komatsu, many living in Satsumasendai support a pronuclear mayor who remains hopeful that a now-shelved plan to build a third reactor may some day be revived.

The Sendai plant has been fast-tracked for a safety review by the Nuclear Regulation Authority and could come back online as early as August.

Proponents hope Satsumasendai will be a test case for a nationwide effort to bring other nuclear plants back onto the grid in coming months.

Prime Minister Shinzo Abe's government last week approved a long-delayed energy policy statement that describes nuclear power — which once generated 30 percent of the nation's power — as a key energy source.

All 48 of Japan's reactors are shut down. Analysts see a good chance to bring at least 14 back online in a review process that begins with Satsumasendai, a town with a population of about 100,000.

A quick restart there will be good news for Kyushu Electric, which is seeking a $1 billion capital infusion from the government-run Development Bank of Japan.

The shutdown has been costly. While the reactors have been idled, their operators, including Kyushu Electric, have had to spend around $87 billion to burn replacement fossil fuels. They had posted combined losses of close to $50 billion as of March and have seen $60 billion wiped off their market value.

Satsumasendai, meanwhile, has received more than $250 million in government subsidies since 1974 for hosting the plant.

Subsidies and tax income from the plant have paid to build community centers and parks and to repair roads, creating jobs in a prefecture where pay is around a fifth below the national average.

"We have the strictest regulatory standards in the world, and the fact that our plant is considered first in line to re-start means we have the most reliable power plant here," said Hideo Iwakiri, Satsumasendai's mayor.

Iwakiri won his second term in 2012 after promising to lobby for a quick restart.

For now, shutters remain drawn on many city shop windows, a legacy of the 1980s economic downturn. Once-bustling motels, filled with plant workers, stand empty.

"This whole town used to be booked up and you couldn't get a room even if you made reservations months ahead," says Daisaku Fukuyama, the owner of Hotel Otori. Fukuyama, who heads the local hotel union, said several local motels have closed since 2011.

The local chamber of commerce says the Sendai plant contributes up to $25 million a year to the local economy, mostly from twice-yearly maintenance checks that bring around 3,000 workers to stay for up to four months.

A nearby Kyocera Corp. plant also supports 4,000 workers and a paper pulp processing plant on the Sendai River employs a few hundred more. But for construction, hotels, restaurants and other service industries, the shutdown of the Sendai plant has meant a significant drop in business.

The winding road leading to the Sendai plant is surrounded by empty fields and sloping hills. A sign a few kilometers from the plant reads, "No Nukes!" Closer to the plant, another sign says, "Developing Towns With Nuclear Power."

The mayor and his supporters say those against nuclear power are outside agitators. Opponents say many are intimidated against speaking out. Local media have reported that in the past Kyushu Electric packed a government-sponsored town hall meeting, and some managers were found to have encouraged employees to send in fake emails of approval to restart one of its nuclear plants in 2011.

Katsuhiro Inoue is a rare local dissenter.

As one of two local city council members opposed to the Sendai restart, Inoue holds a placard outside a darkened Kyushu Electric building on the city's busiest road, protesting with a handful of other activists.

Inoue says many residents are worried about how the town will evacuate in the event of a Fukushima-style crisis, but many are afraid to speak up because of the town's economic dependence on the plant.

"I have a cousin who works for a subcontractor and we never talk about the re-starts," he said. "Every family knows someone who benefits from the plant and people are afraid to speak out against it."

Abe has said Japan will defer to the prefecture and host city for the final decision on any reactor restart. The governor of Kagoshima Prefecture says it will hold a few town hall meetings in Satsumasendai and cities that are closest to the plant.

Around 100 protesters gathered last week on a windy beach near the Sendai plant where activists released colored balloons in a demonstration intended to show how far radioactive fallout could travel when carried by the wind.

Yukio Nakano, 55, a nearby resident and a conservationist, says he knows the plant will eventually restart. He lives alone in the mountains overlooking the plant.

"Even if you're personally opposed, everyone has brothers, parents, friends who are in industries that benefit," says Nakano, who walks the beach behind the plant every day to pick up trash and protect turtle eggs from predators.

"I can't imagine not being able to go home like those people in Fukushima. The people in my village have lived on this land for 70, 80 years. I want to die here."

No shortage of power this summer

April 17, 2014

Utilities expected to secure sufficient power supplies this summer

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201404170087

By MARI FUJISAKI/ Staff Writer

Even if their nuclear reactors remain offline, all power companies across Japan should be able to secure stable electricity supplies this summer with help from other utilities, an industry ministry subcommittee said.

The subcommittee's announcement April 17 is based on supply-demand projections by the nine major power companies in Japan.

The average reserve rate--the margin by which supply exceeds demand--of the nine utilities is 4.6 percent, even if their nuclear power plants do not return to service, according to the subcommittee. Okinawa Electric Power Co., which does not operate nuclear power plants, was excluded from the figure.

A reserve rate of 3 percent is considered the minimum level necessary for achieving a stable supply. That means the government for the second straight summer will likely not ask the public to take electricity-saving measures.

Kansai Electric Power Co. and Kyushu Electric Power Co., which provide electricity in western Japan and had been heavily dependent on nuclear power generation, have said their electricity supply this summer will be tighter than last year.

In fact, the reserve rate for Kansai Electric, which ran two reactors at its Oi nuclear power plant in Fukui Prefecture last year, will drop from 3.0 percent last year to 1.8 percent this summer now that those reactors have been shut down.

However, Kansai Electric will be able to reach the 3.0-percent level by receiving nearly 400,000 kilowatts of electricity from Tokyo Electric Power Co. for the first time and increasing its thermal power generation, according to the subcommittee.

The average reserve rate for Kyushu Electric, whose Sendai nuclear plant in Kagoshima Prefecture is not expected to resume operations this summer, will sink from 3.0 percent to 1.3 percent.

The company will raise the rate to 3.0 percent by receiving 200,000 kilowatts of electricity from other utilities.

Due to the different power frequencies used in eastern and western Japan, power companies are basically required to secure the minimum reserve rate of 3 percent without receiving electricity from utilities serving other regions.

"Costly" safety reviews

April 25, 2014
Costs keep mounting for idled reactors
Consequences of turn from nuclear begin to hit home

http://www.japantimes.co.jp/news/2014/04/25/national/costs-keep-mounting-for-idled-reactors/#.U1qP_lfi91t

by Aaron Sheldrick **and** Osamu Tsukimori

Reuters

Since March 2011, the government has focused on the cost of cleaning up after Fukushima, the worst nuclear disaster since Chernobyl. Now, the bill is coming due for another unbudgeted consequence of that calamity — shutting down the nation's 48 remaining nuclear reactors for costly safety reviews that could see many of them mothballed.

While their reactors have been idled, nuclear plant operators have had to spend around $87 billion to burn replacement fossil fuels. This, in part, explains the utilities' estimated combined losses of around $47 billion as of March, and the $60 billion wiped off their market value.

That pain is beginning to tell.

In early April, Kyushu Electric Power Co. was confirmed to be seeking an almost $1 billion bailout in the form of equity financing from the government-affiliated Development Bank of Japan because of the cost of idling its reactors. Hokkaido Electric Power Co. has also asked the bank for financial backing.

Even as Prime Minister Shinzo Abe's government has hammered out the final terms of a delayed energy policy, the bill for a reduced role for nuclear power in the world's third-largest economy is becoming clearer. One way or another, taxpayers are going to be saddled with the cost of throttling back on nuclear power through taxes and higher electricity bills, analysts say, just as the government has had to provide funding for those who lost their homes and livelihoods due to the Fukushima disaster.

The government took a controlling stake in Fukushima No. 1 operator Tokyo Electric Power Co. in 2012 to keep it from insolvency, and Tepco, as it is known, still relies on government credits to pay compensation to those affected by the disaster, which forced 160,000 people from their homes.

The expanded government role in helping utilities pivot from nuclear power — from providing around 30 percent of Japan's electricity to less than 10 percent — has echoes of the public bank bailouts from the 1990s, said Tom O'Sullivan, founder of energy consultancy Mathyos Japan and a former investment banker. "The banks were forced to consolidate after those losses, so the outcome might be similar in this case," he said.

Regional power companies also face the prospect of tougher competition under planned electricity reforms that may ultimately see them broken into transmission and generation companies by around 2020.

All of the nation's 48 nuclear reactors have been shut down since last year, forcing utilities to import extra fossil fuels, driving their costs higher. To ease the strain, the companies have raised electricity charges, but the industry minister has warned that further increases must be avoided.

The nine publicly traded nuclear plant operators together have lost the equivalent of about $31 billion in the two business years since Fukushima, and five of them also expect to be loss-making in the year that ended in March. Those results are due early next month. Japanese banking practices make it difficult for private lenders to extend credit, including the refinancing of existing loans, to companies that post three straight years of losses.

Many creditors face the possibility of a double whammy in if any of the utilities collapse because they also hold shares. A unit of Mitsubishi UFJ Financial Group is the biggest shareholder of Hokkaido Electric, and at least one of the big three banks is listed in the top 10 shareholders of all the utilities except one, Shikoku Electric Power Co.

Hokkaido Electric's equity ratio — a measure of how much of its assets are financed by shareholders rather than creditors — has dropped to 8.9 percent from 24.2 percent before March 2011. Kyushu Electric's ratio has more than halved to 11.5 percent. The average ratio of Japan's top companies is 43 percent, Finance Ministry data show.
Hokkaido Electric, Kyushu Electric, Kansai Electric Power Co. — the second-biggest utility after Tepco — and Shikoku were the most reliant on nuclear power before the Fukushima disaster.

All of them forecast a third year of losses for the 12 months to March 31.

The two reactors at Kyushu Electric's Sendai nuclear plant are on the fast track for restarting, and are likely to be the first to come back online.

The utilities are also likely to have large, but still uncertain, decommissioning costs as many idled reactors are unlikely to pass strict new standards, a Reuters analysis has shown. Of the 48 reactors, 17 are unlikely to be restarted, and as many as 34 may have to be mothballed.

Utilities are required to set aside reserves for future decommissioning costs, but have an industrywide shortfall of about $11 billion if all the reactors remain offline, according to trade ministry estimates.

"Given Japan's government finances are mainly paid for by debt, bailing out the utilities means they're passing on the cost to future generations, which are declining in numbers," said Gerhard Fasol, the founder of Eurotechnology Japan, a Tokyo-based consultancy on energy and technology issues.

"Speeding up the pace of liberalization might help by reducing costs. But this is unlikely to happen, given the pace of change in the electricity industry is generally slow."

Kagoshima - More info needed for restart

May 2, 2014
Regulators need more info for Kyushu nuclear plant safety checks
http://mainichi.jp/english/english/newsselect/news/20140502p2g00m0dm068000c.html

TOKYO (Kyodo) -- Regulators said Friday that Kyushu Electric Power Co. has not included enough information in a key document outlining the safety measures for two nuclear reactors the utility is seeking to restart.

The document was submitted to the Nuclear Regulation Authority on Wednesday so that the NRA can confirm that the reactors at the Sendai plant have satisfied a set of new safety requirements introduced in the wake of the 2011 Fukushima nuclear crisis.

The Nos. 1 and 2 reactors at the Sendai plant in Kagoshima Prefecture, southwestern Japan, are seen as the closest to being allowed to restart among Japan's 48 offline commercial reactors, as the NRA has decided to prioritize the safety checkup process for the two units.

None of the 48 reactors are allowed to reactivate unless they satisfy the new regulations, which for the first time oblige utilities to put in place specific countermeasures against severe accidents like reactor core meltdowns, as well as against huge tsunami -- the direct cause of the Fukushima crisis.

But during a meeting of the NRA commissioners on Friday, an official reported that "some information needed for the assessment appears to be lacking" from the 7,200-page document submitted by Kyushu Electric.

For example, the document should include measures to be taken against forest fires and fires triggered by an airplane crash, but Kyushu Electric only referred to the case of forest fires, the official said. It also lacked some descriptions regarding studies on how far equipment can withstand heat following fires.

Another NRA official told reporters that he cannot currently foresee whether the latest development will lead to a delay in the assessment process.

"We are still examining the document in detail...prospects will also be affected by the utility's response," he said.

The NRA said it plans to hold a safety assessment meeting next Thursday to discuss the issue with Kyushu Electric.

Kyushu Electric filed for the NRA's safety assessment of the two reactors in July last year. The document submitted Wednesday reflected the discussions that had taken place between the utility and regulators thereafter.

Kagoshima plant in final stage of safety screening

http://www3.nhk.or.jp/nhkworld/english/news/20140501_15.html

A nuclear power plant in Kagoshima Prefecture, southwestern Japan, has entered the final stage of the nuclear regulator's safety screening process for restarting its 2 reactors. But the timing of the restart is still not clear.

Japan's Nuclear Regulation Authority decided in March to prioritize the safety screening process for the No.1 and No.2 reactors at the Sendai nuclear plant.

The reactors are likely to be the first in Japan to resume commercial operation.

The plant's operator, Kyushu Electric Power Company, submitted a revised report on Wednesday outlining the safety measures to be put in place, based on advice from the NRA. The safety screening has now entered its final phase.

The revisions include higher maximum levels of tremors and tsunami expected from possible earthquakes.

Kyushu Electric has raised the estimate for tremors from the original 540 gals to 620. Gals are units of acceleration. It has also raised the estimated height of tsunami from about 3.5 meters to about 5 meters.

The NRA plans to compile a safety assessment report for the plant by the end of this month, and may issue a safety clearance at the end of June.

Kyushu Electric hopes to restart the reactors before demand for power surges in the summer.

But the utility is still continuing work to reinforce the plant against tsunami. It will also have to clear on-site inspections by the NRA and obtain consent from the local governments.
All 48 reactors at Japan's 16 commercial nuclear power plants are currently offline. The Sendai nuclear plant is one of the 10 plants undergoing screening by the NRA. May 1, 2014 - Updated 03:18 UTC

Revision of safety report (Kagoshima) needed

May 2, 2014
NRA asks for revision of plant safety report

http://www3.nhk.or.jp/nhkworld/english/news/20140502_34.html

Japan's Nuclear Regulation Authority has asked Kyushu Electric Power Company to revise a safety report the utility compiled as a first step toward restarting a nuclear plant.

NRA Commissioner Satoshi Fuketa made the request on Friday for the report on the Number 1 and 2 reactors at the Sendai plant in Kagoshima Prefecture, southwestern Japan.

At an NRA meeting on Friday, an official said the report submitted 2 days ago lacks data on how the plant's operator would respond to a fire if an aircraft crashed in the plant's compound. The report also does not mention fireproof levels for pumps and other equipment.

Regulators are to hold a screening session next Thursday.

In March, the authority decided to fast-track screening for the 2 reactors.

Regulators were expected to give safety clearance for the reactors as early as late June after drawing up a safety assessment by the end of May.

But the request for a revision indicates that the screening may take longer than planned. The utility must also get consent from the communities hosting the plant.

Kyushu Electric may not be able to put the reactors back online before summer.
May 2, 2014 - Updated 08:29 UTC

Needs revision

May 8, 2014
NRA: Plant report needs revisions on 42 items

http://www3.nhk.or.jp/nhkworld/english/news/20140508_29.html

Japan's nuclear regulator has asked Kyushu Electric Power Company to revise a report on a nuclear power plant. The key document is needed for safety screening that will decide if the idle plant can be restarted.

The Nuclear Regulation Authority screened the utility's report on its Sendai plant in southwestern Japan on Thursday. It identified 42 cases of insufficient data.

The utility applied last July for the screening of the plant's 2 reactors. The firm resubmitted the 7,200-page document late last month in response to NRA instructions.

In Thursday's session, NRA officials noted that the report fails to mention how the plant's operator would prevent a fire from an airplane crash.

The officials also said the report must specify ways to estimate hydrogen density in order to prevent an explosion. It must also detail procedures to cope with certain emergencies.

The NRA is expected to draw up a safety assessment by the end of May, and could complete the screening by the end of June.

But the request for revisions could delay the process, depending on how the utility responds.

Kyushu Electric may not be able to put the plant back online before summer, as it also must also undergo inspections of its facilities and operations.

Court rejects suit to suspend restart of Oi reactors

May 9, 2014
High court turns down suit seeking suspension of Oi reactors
http://mainichi.jp/english/english/newsselect/news/20140509p2g00m0dm071000c.html

OSAKA (Kyodo) -- The Osaka High Court on Friday turned down a lawsuit seeking to suspend the planned resumption of two reactors at the Oi nuclear power plant operated by Kansai Electric Power Co., upholding a lower court decision.

The suit was filed by a group of residents in western Japan.

The Nos. 3 and 4 reactors at the Oi plant in Fukui Prefecture on the Sea of Japan coast have been suspended since last September for regular checkups, and are now under examination by the Nuclear Regulation Authority to determine whether they can resume operations under Japan's new safety standards introduced last July.

The plaintiffs argued there are three faults near the Oi plant and that a major temblor caused by these faults could lead to a serious nuclear disaster.

In April last year, the Osaka District Court rejected the suit, determining such a temblor would not cause specific risks.

Oi reactors may not restart so soon

May 10, 2014

New Oi plant quake estimate expected to delay any restart of reactors

http://www.japantimes.co.jp/news/2014/05/10/national/new-oi-plant-quake-estimate-expected-to-delay-any-restart-of-reactors/#.U24ERlfi91v

JIJI

Kansai Electric Power Co. said Friday it plans to raise its earthquake force estimate for its Oi nuclear power plant in Fukui Prefecture — a move that is expected to delay the refiring of the plant's reactors.

The company said the plant's No. 3 and 4 reactors may be hit by a quake with a peak ground acceleration of up to 856 gals, against its initial estimate of 700 gals.

The company unveiled the new estimate at a meeting of the Nuclear Regulation Authority held to examine the safety of the reactors.

It will take some time for reinforcement work as a result of the changes, an official at Kansai Electric said. This is expected to cause a significant delay in the reactors' possible restart.

The initial estimate was provided in July when the company, in an effort to restart the stalled reactors, applied for the NRA's safety screenings.

The company will make the changes to reflects pinions by the NRA.

Geological survey on Shimokita Peninsula (Aomori)

May 12, 2014

NRA conducts geological survey in Aomori

http://www3.nhk.or.jp/nhkworld/english/news/20140512_33.html

Japan's nuclear regulator is conducting a geological survey of a northeastern area where many nuclear facilities are located.

The Nuclear Regulation Authority began examining underground structures on the Shimokita Peninsula and its surrounding areas on May 2nd. A sea bottom fault stretches 84 kilometers east of the peninsula and a 55-kilometer inland fissure runs from east to west toward the Bay of Mutsu.

On Monday, NRA Commissioner Kunihiko Shimazaki began an inspection of the survey.

Media people were invited to observe his visit to a ship anchored at a port, where he examined sonic equipment used to locate undersea faults.
The NRA will also assess underground areas about 10 kilometers deep using devices that can create artificial tremors.

The survey will last until early June.

Nuclear facilities on the Shimokita Peninsula include a power station, a spent nuclear fuel reprocessing plant, and a temporary storage site for high-level nuclear waste.

The Japanese government regards the reprocessing plant as a pillar of the country's spent nuclear fuel cycling policy. The plant is undergoing safety screening by the Nuclear Regulation Authority. Its operator plans to complete work to boost protective measures against earthquakes in October before starting full operations.

May 12, 2014 - Updated 11:03 UTC

Restart necessary to cut fuel costs, says Aso

May 13, 2014
Aso urges nuclear plant restarts to cut fuel costs
http://www3.nhk.or.jp/nhkworld/english/news/20140513_36.html

Japan's Finance Minister says the country's nuclear power plants need to be restarted once their safety is confirmed.

Taro Aso told reporters on Tuesday the step is necessary to slash the huge fuel import costs that cut deep into the nation's current account surplus in fiscal 2013.

He expressed concern about the impact of higher electricity rates on businesses and households.

Aso said nuclear power is the cheapest source of energy for the time being. He noted higher utility costs could raise prices and dampen consumer spending.

All nuclear reactors in Japan are now offline.

Aso also said Japan needs a growth strategy that will allow businesses to earn foreign currency not only through exports but also through overseas investments.

He said such a strategy is needed to stop the current account surplus from shrinking further.

Japan's surplus in the year ended March was the smallest since comparable data became available in 1985.
May 13, 2014 - Updated 08:42 UTC

Tokai no2. will apply for restart

May 19, 2014
Tokai No.2 nuclear plant to apply for safety check

http://www3.nhk.or.jp/nhkworld/english/news/20140519_21.html

The operator of the Tokai No. 2 nuclear power plant north of Tokyo in Ibaraki Prefecture will apply on Tuesday for safety checks to restart the plant's reactor.

Japan Atomic Power Company decided to ask the Nuclear Regulation Authority for the check after getting the go-ahead from 11 surrounding municipalities, including Tokai village. The communities agreed after the company held public briefings about safety concerns. The prefectural government has also agreed.

The plant has been idle because of damage to a turbine and pump caused by the March 2011 earthquake and tsunami.

But prospects for resuming operations are still poor due to a number of safety issues.
The reactor dates to 1978 and is older than 17 reactors now under screening. Cables in use at the plant are more flammable than those at newer plants.

The municipalities around the Tokai plant also insist that applying for safety checks and restarting operations are separate matters.

Nearly one million people live within 30 kilometers of the plant, more than at any other nuclear plant in Japan. The surrounding communities have yet to adopt appropriate evacuation plans in the event of a nuclear accident.
May 19, 2014 - Updated 06:52 UTC

JAPC applies for restart of Tokai 2

May 20, 2014

Japan Atomic Power applies for safety checks on Tokai No. 2 power plant

http://mainichi.jp/english/english/newsselect/news/20140520p2a00m0na016000c.html

The Japan Atomic Power Co. (JAPC) applied for safety checks on the Tokai No. 2 Power Station in the village of Tokai, Ibaraki Prefecture, on May 20 in a bid to restart the 35-year-old reactor there.

The reactor at the Tokai No. 2 Power Station is the oldest among those reactors being under safety screening by the Nuclear Regulation Authority (NRA). Attention, therefore, will be focused on the NRA's decision after screening as the revised Nuclear Reactor Regulation Law limits the life of a reactor to 40 years in principle.

The reactor at the Tokai No. 2 Power Station is a light water reactor of the boiling water type -- the same type of reactors at the troubled Fukushima No. 1 Nuclear Power Plant. The JAPC has been preparing to build a breakwater which is over 18 meters above sea level and install venting equipment with filters as it seeks to restart the reactor. The company plans to finish work to put measures against severe accidents in place by 2016.

Eleven municipalities around the nuclear plant, including Tokai, endorsed the JAPC's decision to apply for safety checks on May 15. This was after the company showed its stance to hold talks with other municipalities, besides Tokai, on signing nuclear safety pacts and released the outline of its application for safety checks to local residents, among other steps. Ibaraki Gov. Masaru Hashimoto had already agreed to the JAPC's application.

Meanwhile, there are 14 municipalities, including the cities of Mito and Hitachi, within a radius of 30 kilometers from the Tokai No. 2 Power Station, where a total of about 980,000 people live -- the biggest number of people living near a nuclear power plant in the country. But none of the municipalities has drawn up an evacuation plan in the event of a severe accident partly because it is difficult to secure places of refuge.

Mito Mayor Yasushi Takahashi said something to the effect that the issue of whether to reactivate the reactor should be handled separately from the JAPC's application for safety checks. "As long as evacuation plans are not drawn up, there can never be discussion on whether to reactivate the reactor," he said.

May 20, 2014(Mainichi Japan)

Tokai No.2 nuclear plant applies for safety check

http://www3.nhk.or.jp/nhkworld/english/news/20140520_81.html

The operator of the Tokai No.2 nuclear power plant in Ibaraki Prefecture north of Tokyo has applied for a government safety check to restart the plant's reactor.

Japan Atomic Power Company's Executive Vice President Hiroshi Masuda submitted application papers to the Nuclear Regulation Authority on Tuesday.

The operator is upgrading safety measures at the plant to withstand an earthquake that's 1.5 times stronger than previously assumed.

It is also building an embankment that's over 18 meters high to withstand potential tsunami of up to 14.3 meters.

However, the operator faces many obstacles to gaining approval and resuming operations.
The plant began commercial operation in 1978 and its reactor is now the oldest of the 18 across Japan that have applied for screening. Attention is focused on how the nuclear regulator will judge the safety of old, flammable cables.

Another factor is the lack of progress by nearby municipalities in drawing up evacuation plans for residents. Nearly one-million people live within 30 kilometers of the plant. That's the largest number among all the nuclear plants in Japan.

The plant's host municipality, Tokai village, and 10 other local governments gave approval for the application last week, but they say applying for screening and resuming operations are separate issues.

Masuda said his firm has submitted the application with confidence that the plant will be able to clear the new standards.
Tokai village mayor Osamu Yamada says he has confirmed that the safety check will not lead directly to a resumption of operations. He says he expects the nuclear regulator to carry out a strict inspection.

Yamada added that he wants the plant operator to actively provide information, including updates on the progress of the screening. He said the operator should hold public meetings to provide explanations to the residents.

May 19, 2014
Tokai No.2 nuclear plant to apply for safety check

http://www3.nhk.or.jp/nhkworld/english/news/20140519_21.html

The operator of the Tokai No. 2 nuclear power plant north of Tokyo in Ibaraki Prefecture will apply on Tuesday for safety checks to restart the plant's reactor.

Japan Atomic Power Company decided to ask the Nuclear Regulation Authority for the check after getting the go-ahead from 11 surrounding municipalities, including Tokai village. The communities agreed after the company held public briefings about safety concerns. The prefectural government has also agreed.

The plant has been idle because of damage to a turbine and pump caused by the March 2011 earthquake and tsunami.

But prospects for resuming operations are still poor due to a number of safety issues.
The reactor dates to 1978 and is older than 17 reactors now under screening. Cables in use at the plant are more flammable than those at newer plants.

The municipalities around the Tokai plant also insist that applying for safety checks and restarting operations are separate matters.

Nearly one million people live within 30 kilometers of the plant, more than at any other nuclear plant in Japan. The surrounding communities have yet to adopt appropriate evacuation plans in the event of a nuclear accident.

Court orders not to restart Ohi reactors

May 21, 2014
Court rules against restarting Ohi reactors

http://www3.nhk.or.jp/nhkworld/english/news/20140521_28.html

A Japanese court has ordered the operator of the Ohi nuclear plant in Fukui Prefecture, central Japan, not to restart 2 of its reactors, citing inadequate safety measures.

The plant's No. 3 and 4 reactors were halted for regular inspections last September.

Local residents filed a lawsuit asking that the reactors be kept offline. They said an estimate of possible tremors is too small, and that the reactors lack backup cooling systems.

The operator, Kansai Electric Power Company, has insisted that no safety problems exist.

On Wednesday, presiding judge Hideaki Higuchi of the Fukui District Court upheld the residents' claim.

The ruling is the first against resuming operations at a nuclear plant since the accident at Fukushima Daiichi in March 2011.

The decision could affect screening procedures by Japan's Nuclear Regulation Authority to determine whether the country's nuclear plants can be restarted.

Court orders power supplier not to operate Oi nuke plant
http://mainichi.jp/english/english/newsselect/news/20140521p2g00m0dm087000c.html

FUKUI, Japan (Kyodo) -- The Fukui District Court on Wednesday ordered Kansai Electric Power Co. not to operate its Oi nuclear plant in Fukui Prefecture, western Japan, as demanded by a total of nearly 200 people around the country.

In the lawsuit, a group of 189 people from Tokyo, the plant's host prefecture of Fukui and 20 other prefectures contended that the power supplier resumed operation of two of the four reactors at the plant in August 2012 even though their safety has yet to be guaranteed.

Reactions to court ruling

May 21, 2014

Kansai Electric to appeal ruling

http://www3.nhk.or.jp/nhkworld/english/news/20140521_35.html

Kansai Electric says it will promptly take procedures to appeal the ruling.

The firm issued a statement on Wednesday expressing regret that the court failed to take up its claim.

The utility said it will study details of the ruling and underscore the plant's safety in a higher court.
May 21, 2014 - Updated 08:03 UTC

Nuclear Regulation Authority on ruling

http://www3.nhk.or.jp/nhkworld/english/news/20140521_32.html

Japan's Nuclear Regulation Authority has been conducting safety screening at Ohi and other plants to determine whether they can be restarted.

NRA Chairman Shunichi Tanaka says he has no comment on court rulings.

He said the authority will continue its safety screening of the Ohi plant in accordance with its policy.
May 21, 2014 - Updated 08:17 UTC

Court rules against restarting Ohi reactors
http://www3.nhk.or.jp/nhkworld/english/news/20140521_80.html

A Japanese court has ordered the operator of the Ohi nuclear power plant not to restart 2 of its reactors, citing insufficient safety measures.

The facility is located in Fukui Prefecture, central Japan. Its no. 3 and 4 reactors were shut down for regular inspections last September.

Local residents filed a lawsuit to keep the reactors offline. They said the plant operator's estimate of possible earthquakes is too small, and the reactors lack sufficient cooling systems.

Operator Kansai Electric Power Company has insisted that no safety problems exist.

On Wednesday, presiding judge Hideaki Higuchi of the Fukui District court said the operator's earthquake estimate at the plant is too optimistic and not reliable.

He cited the fact that during the past 10 years there have been 5 cases in Japan where actual tremors exceeded prior estimates set by the operators.

The judge also referred to problems at the plant including the emergency cooling function in the event of an earthquake.

The court also said during the Fukushima nuclear crisis, authorities considered evacuating people living within 250 kilometers of the plant. Therefore, it upheld the claims of the plaintiffs living within that distance.

The court ruling is the first since the accident, against resuming operations at a nuclear plant.

All 48 of Japan's commercial reactors are currently off-line.

Kansai Electric says it will promptly take procedures to appeal the ruling. The firm issued a statement on Wednesday expressing regret that the court failed to take up its claim.

The utility said it will study details of the ruling and underscore the plant's safety in a higher court.

Oi court ruling: What impact on next safety trials?

May 22, 2014
ANALYSIS: Court ban on restart of Oi plant puts nuclear safety screening on trial
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405220051

THE ASAHI SHIMBUN

A court ruling ordering Kansai Electric Power Co. not to restart the No. 3 and No. 4 reactors of the Oi nuclear power plant in Fukui Prefecture has called into question the legitimacy of ongoing safety screenings of nuclear plants across Japan.

While the Nuclear Regulation Authority is currently inspecting 18 reactors that operators aim to reactivate at 11 nuclear plants, the Fukui District Court decided that no safety measures could ever be sufficient, as it is impossible for modern science to predict the biggest possible earthquake that could strike.

In handing down the ruling May 21, Presiding Judge Hideaki Higuchi said that the people's safety must not be dealt with on the same basis as cost efficiency.

"People's right to life is the very foundation of personal rights, which are protected by the Constitution. It must be regarded with the highest respect in the field of law," the judge said.

"While Kansai Electric says the operation of the plant will secure a stable supply of electricity, comparing the fundamental rights of so many people to survive and the utility prices on equal grounds is not a legitimate argument for this legal authority to consider," he added.

The ruling was the first handed down by a court in Japan in response to a lawsuit seeking the suspension of operations of nuclear reactors in the wake of the March 2011 accident at the Fukushima No. 1 nuclear power plant.

Kansai Electric appealed the ruling on May 22.

Until the ruling is finalized, the utility can still restart the Oi plant if the NRA finds that the two reactors meet new safety standards. But if Kansai Electric ignores the ruling and resumes plant operations, it will face immense opposition from local residents and others.

The focal point of the trial was whether the Oi plant's quake-resistant capability, which Kansai Electric says can withstand tremors with a maximum ground acceleration of 1,260 gals, is sufficient in securing its safety.

According to the utility, the maximum limit is 1.8 times stronger than the predictable strongest tremors of 700 gals that can hit the plant compound.

The ruling, however, said, "It is essentially impossible to eliminate the possibility of an earthquake stronger than 1,260 based on hard scientific evidence," citing the 2008 Iwate-Miyagi Nairiku Earthquake, which registered a maximum ground acceleration of 4,022 gals.

It also noted the fact that four nuclear power plants have experienced tremors stronger than their maximum standard since 2005.

Presiding Judge Higuchi added that the Fukushima nuclear disaster has clearly shown "the fundamental danger of nuclear power generation technologies" and the extensive damage an accident can cause.

The decision is likely to have a major impact on other trials concerning nuclear plants across Japan that are now being heard.

The NRA's new safety standard requires utility companies to map out safety measures at nuclear plants, based on calculations of the strongest potential earthquake at the sites, taking into account active faults running in the areas, ground conditions and other factors.

Kansai Electric used the same method in drawing up safety standards for the Oi plant, but the ruling challenged the capability of calculating maximum strongest earthquake at nuclear plants, citing the limitations of scientific knowledge.

The ruling added that centers of seismic activity are often located deep underground and it is impossible to predict the scale of future earthquakes without relying on hypothesis and presumptions. Data from the past earthquakes is also very limited, it said.

"The ruling is right in pointing out the limitation of the precision of earthquake prediction today," said Kazuki Koketsu, a professor of seismology at the University of Tokyo, who was involved in the NRA's safety screenings. "It is apparent that the ruling flatly denies the ways the NRA is screening the safety of each plant."

GOVERNMENT REMAINS STEADFAST

Even if the NRA's methods are questioned by the court, Prime Minister Shinzo Abe's government has made it clear that it will push for the resumption of nuclear plants if they pass the NRA's safety screening.

On May 21, industry minister Toshimitsu Motegi said the ruling will not have an impact on the NRA's safety regulation standards and its ongoing safety screening of nuclear plants, including the Sendai nuclear plant in Kagoshima Prefecture.

The government has a reason to be optimistic. In past lawsuits related to nuclear power plants, there have been two court rulings in favor of residents, but higher courts overturned them and those rulings became finalized.

One was a 2003 order handed down by the Kanazawa branch of the Nagoya High Court, which nullified the government's approval of the installation of the Monju prototype fast-breeder reactor in Tsuruga, also in Fukui Prefecture.

Another was the 2006 Kanazawa District Court's ruling that ordered a halt to operations of the Shika nuclear power plant in Shika, Ishikawa Prefecture.

"Everything depends on how the high court will rule on the case, although higher courts have tendency to judge more in line with the government's intentions," said Taro Kono, deputy secretary-general of the ruling Liberal Democratic Party. Kono is known for his anti-nuclear stance.

During a news conference May 21, the NRA's chairman, Shunichi Tanaka, confirmed the nuclear watchdog's stance that the ruling has no impact on its safety screening of nuclear plants.

"I have nothing to say about the judicial judgment. We have our own concepts and will proceed with the safety screening based on our scientific knowledge," Tanaka said.

Kansai Electric appeals

May 23, 2014

Kansai Electric appeals court ruling on Ohi plant
http://www3.nhk.or.jp/nhkworld/english/news/20140522_29.html

The operator of the Ohi nuclear power plant in central Japan has appealed a district court ruling against the restart of its 2 reactors.

Kansai Electric Power Company filed the appeal on Thursday with the Kanazawa branch of the Nagoya high court.

The appeal comes one day after the Fukui District Court ordered the utility not to restart the number 3 and 4 reactors at the plant in Fukui Prefecture. The 2 reactors were shut down for regular inspections last September. Local residents filed a suit to keep the reactors offline.

The ruling said nuclear plants require extremely high levels of safety and reliability.

It said the operator's estimate of possible earthquakes was too optimistic and the plant's cooling systems are faulty.

Kansai Electric argued in the trial that there were no safety problems.

Tetsuen Nakajima, who heads the plaintiffs' group, said he thinks it will be difficult to overturn the ruling that fully approved their arguments. But he said Kansai Electric must be aware of the challenge it faces so his group must fight resolutely again. He said he is appalled that Kansai Electric is trying to restart its reactors after the epoch-making ruling.

No point whatsoever in restarting Tokai 2

May 26, 2014
Editorial: From economic, safety view, no case for restarting Tokai No. 2 nuke reactor

http://mainichi.jp/english/english/perspectives/news/20140526p2a00m0na007000c.html

Japan Atomic Power Co. has applied to the Nuclear Regulation Authority (NRA) for a safety inspection of the Tokai No. 2 nuclear plant in Ibaraki Prefecture. Once it gets the agreement of local residents, the firm is looking to restart the plant's single reactor in fiscal 2016 or shortly thereafter.

From both a safety and an economic standpoint, however, putting the Tokai No. 2 plant back on-line is simply not realistic.

The application for safety screenings looks like a desperate, all-out attempt to prolong the life of Japan Atomic Power itself. In that case, however, what the firm needs to do first and foremost is reassess its corporate structure, based on the assumption that it will not be able to restart the Tokai No. 2 plant.

The Tokai No. 2 Power Station in the village of Tokai has been in commercial operation for more than 35 years, and has the oldest reactor of any of the 18 at 11 power plants currently applying for NRA screenings. Japan Atomic Power is set to spend some 78 billion yen on safety improvements at the No. 2 plant, including building a new breakwater to defend it against tsunami. Meanwhile, the NRA inspection will pay especially strong attention to fire prevention measures, including proofing electrical cables against blazes.

New basic nuclear plant safety regulations demand flame retardant cables. The cables at the Tokai No. 2 station, however, are flammable, and replacing them would be an enormous cost in time and money. Japan Atomic power has said it will paint the cables and take other steps to make sure they are just as fire-proof as newer flame-retardant versions.

Is this valid fire prevention? What if the flame-resistant paint deteriorates? This is but one of the serious issues that need addressing, and it's impossible to predict whether the plant will pass the NRA check.

Meanwhile, the 30-kilometer radius zone around the Tokai No. 2 plant has the highest local population of any nuclear station in Japan, at about 980,000 people. Despite this, the municipalities within the 30-

kilometer zone have not set evacuation plans in case of an accident at the plant. There have been numerous barriers in drawing up these plans, including finding places for evacuees to go.

Even if Japan Atomic Power overcomes all these problems and gets the restart of the Tokai No. 2 plant approved, the aging reactor has very little time left before it has to be decommissioned. Under the revised nuclear reactor regulation law, reactors have a maximum operating life of 40 years.

Ibaraki Gov. Masaru Hashimoto told the Mainichi Shimbun in a recent interview, "Considering the balance between operational life and running costs, it doesn't seem to me that restarting the reactor would be all that economical." He's exactly right.

The Tokai No. 2 station is not Japan Atomic Power's last ray of hope. The company also has two reactors at its Tsuruga Nuclear Power Station in Fukui Prefecture. However, all three reactors have been off-line since June 2011, and it looks like restarting the Tsuruga reactors will -- due to age and nearby active fault lines -- be quite difficult as well.

Japan Atomic Power is a nuclear energy wholesaler. Even though it is selling zero electricity right now, it still managed to stay in the black for the fiscal year ending March this year -- a feat managed only because of approximately 125 billion yen in "basic charges" paid by its clients, the big five electrical utilities, for equipment maintenance and other costs. Japan Atomic Power more or less has to show it's trying to get the Tokai No. 2 plant back on-line, otherwise the logic for the "basic charge" would evaporate. Meanwhile, the Big Five simply pass on these charges to consumers through their electricity bills.

Even as Japan Atomic Power jumps through hoops to keep its creaking business model intact, the firm is proceeding with the decommissioning of the Tokai Power Station -- home to the oldest commercial reactor in the country. Japan Atomic Power should use that experience to transform itself from a nuclear power supplier into a specialist in reactor decommissioning. The Japan Atomic Power case also calls into question the system of supports from other power companies.

There are some electrical utilities that have announced they're considering decommissioning aging reactors. What system will be created to handle what may become a long string of decommissionings? The government must hammer out a clear plan on this issue.

Koizumi calls court ruling "common sense"

May 24, 2014
Koizumi: Court ruling blocking Oi reactor restarts is 'common sense'
http://ajw.asahi.com/article/behind_news/politics/AJ201405240041

The ASAHI SHIMBUN

Former Prime Minister Junichiro Koizumi lauded a recent court ruling ordering an electric power company not to restart its reactors, saying the decision is in line with the “common sense” of the people.

The still-popular retired politician made the remark after he attended a meeting May 23 of the Japan Assembly for Nuclear Free Renewable Energy, an organization he set up with Morihiro Hosokawa, another former prime minister.

Koizumi reportedly said at the meeting that Hosokawa’s failed bid in February’s Tokyo gubernatorial election, in which they campaigned for the abolishment of nuclear power, possibly influenced the court’s decision.

Kansai Electric Power Co. was seeking to restart two reactors at its Oi nuclear power plant. But the Fukui District Court on May 21 sided with residents living near the plant and ordered the utility to keep the reactors offline.

The landmark ruling calls into question the legitimacy of current safety screenings of nuclear plants across Japan. It judged that no safety measures could ever be sufficient because it is impossible for modern science to predict the scale of possible earthquakes.

Hosokawa’s campaign “created an environment in which one cannot criticize a court by labeling it as leftist, even when it hands down an order to suspend (the operation of a nuclear plant),” Koizumi reportedly said at the meeting.

Residents file injunction against restart

May 30, 2014
Court order sought to stop reactor restart

http://www3.nhk.or.jp/nhkworld/english/news/20140530_24.html

Residents near a nuclear plant in Kagoshima Prefecture, southwestern Japan, have filed a temporary injunction with a local court to keep the facility from going online.

The Sendai nuclear plant's 2 reactors are the top priority of regulators carrying out safety checks required for restarting nuclear power plants in Japan.

23 people filed for the provisional order with the Kagoshima District Court on Friday. They demand that the plant's operator, Kyushu Electric Power Company, not restart the facility.

They say the plant drastically lacks earthquake resistance, and that a massive quake could cause radioactivity leaks.

The plaintiffs are among more than 2,200 people across the country who had already filed an injunction suit against restarting the plant after the Fukushima Daiichi nuclear crisis in 2011.

The 23 plaintiffs say they filed for the order as the regulators are prioritizing the check of the Sendai plant, and that restarting the facility could threaten the lives of nearby residents.

Kyushu Electric says it will study the content of the filing and decide what to do. The operator has been insisting that the plant is safe. It says it implemented a sufficient investigation and other measures after checking nearby underground faults.

This month, a court in Fukui, central Japan, ordered the operator of the Ohi nuclear plant not to restart 2 of its reactors, citing inadequate safety measures. The operator has appealed the ruling.

Trying to restart Higashidori

June 10, 2014
Tohoku Electric seeks screening of nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20140610_20.html

The operator of the Higashidori nuclear power plant in northern Japan has applied for a government safety screening with an eye to restarting the plant's reactor.

Shigeru Inoue, vice president of Tohoku Electric Power Company, filed papers with the Nuclear Regulation Authority on Tuesday.

The utility wants the NRA to examine whether the plant in Aomori Prefecture conforms to stricter regulations introduced after the 2011 Fukushima nuclear accident.

Tohoku Electric says it has increased the estimated strength of an earthquake that could hit the

Higashidori plant from 450 to 600 gals. Gal is a unit of acceleration.

The utility says it is reinforcing pipes and taking other steps to improve the structure's quake-resistance. Officials also plan to build a facility to serve as a command center in the event of an emergency.

Tohoku Electric aims to complete such work and restart the plant in March 2016.

However, experts advising the NRA have warned that geological faults under the facility are at high risk of shifting in the future.

NRA officials have suggested they will not begin full-scale screening of the plant until the experts come to a conclusion about the fault risks.

Inoue told reporters the utility believes the faults are not active, and wants the regulator to start the screening in parallel to its studies on the faults.

The NRA has now received safety screening applications for 19 reactors at 12 nuclear plants. Japan has 48 reactors at 16 plants across the country. All of the reactors are now offline.
Jun. 10, 2014 - Updated 04:02 UTC

Lack of detailed data and analyses

Utilities slammed for lack of preparation for reactor safety review
http://mainichi.jp/english/english/newsselect/news/20140617p2g00m0dm078000c.html

TOKYO (Kyodo) -- Japan's nuclear regulators slammed two plant operators Tuesday for their lack of detailed data and analyses in a safety review that would allow them to resume operations.

The Nuclear Regulation Authority, which held the first assessment meetings for reactors at the Tokai Daini plant, located some 130 kilometers north of Tokyo, and the Higashidori plant in northeastern Japan, urged the operators to provide more data so it can proceed with the review.

"It just won't do" that plant operators apply for the assessment with "quick-fix" documents to feel out whether their measures are sufficient to pass the review, NRA Commissioner Toyoshi Fuketa told utility officials.

Not one of the 48 commercial nuclear reactors in Japan has passed the NRA's safety assessment, based on new safety standards introduced in the wake of the 2011 Fukushima Daiichi nuclear accident, and they all remain offline, despite 19 safety review applications being made.

Shigeru Inoue, vice president of Tohoku Electric Power Co. -- the operator of the Higashidori plant -- told reporters he believes "the utility is ready" for the screening and the company wants the NRA to confirm the reactor's safety as soon as possible.

The nuclear watchdog, however, is not planning to begin a full-fledged assessment, as the plant has not finished investigating faults under the complex that the NRA says are active.

Regulatory officials also raised questions about fire protection measures Japan Atomic Power Co. plans to implement at the Tokai plant, which started commercial operation in 1978.

The operator said it plans to apply fire-retardant coatings on electric cables at the complex, instead of replacing them with flame-resistant cables. But NRA officials questioned the feasibility of the plan.

Restart or not restart? (1)

June 18, 2014
Reactor safety screening to follow fault study
http://www3.nhk.or.jp/nhkworld/english/news/20140618_26.html

Japan's nuclear regulatory body says it will not begin safety checks at a reactor in northern Japan until it judges the safety of geological faults under the facility.

Tohoku Electric Power Company, which operates the Higashidori nuclear plant in Aomori Prefecture, applied last week for a review of the plant's No.1 reactor. The utility hopes to restart it in March 2016.

But in February last year, an expert panel of the Nuclear Regulation Authority compiled a draft report warning that faults under the facility are at high risk of shifting.

Tohoku Electric insists the faults are not active.

On Wednesday, the authority decided not to launch a full-scale screening until its members can issue a unified opinion of the faults.

But the authority did agree to let Tohoku Electric join discussions with other power companies on filtered vents and other safety measures at reactors already being screened.
Jun. 18, 2014 - Updated 08:09 UTC

Restart or not restart ? (2)

June 18, 2014
Nuclear regulator to begin safety review on Higashidori plant
http://mainichi.jp/english/english/newsselect/news/20140618p2g00m0dm067000c.html

TOKYO (Kyodo) -- Japan's nuclear regulator decided Wednesday to start a safety assessment on a reactor at the Higashidori nuclear plant in northern Japan, although experts have yet to conclude an investigation of faults running under the complex.

The Nuclear Regulation Authority -- which initially said it would not launch a full-fledged review of the No.1 reactor until the investigation of the faults is done -- will begin the safety assessment on issues common with other boiling water reactors.

The decision "will not affect" the ongoing research on the faults, NRA Commissioner Kunihiko Shimazaki told a regular meeting of the nuclear watchdog.

A panel under the NRA said last year in a draft report that the faults under the Higashidori site are active, though Tohoku Electric Power Co. denies this.

According to the NRA, issues peculiar to the complex will not be included in the upcoming assessment.

Instead it will check items such as the performance of a filtered venting system, which releases radioactive substances to the outside to prevent damage to the reactor's primary containment vessel in the event of a severe accident.

Tohoku Electric applied for the safety review earlier this month, asking the regulatory body to proceed with the safety assessment in parallel with the investigation of the faults.

None of Japan's 48 commercial reactors has passed the review needed to restart operations in the wake of the 2011 Fukushima Daiichi nuclear accident, and they all remain offline, despite 19 safety review applications being made.

June 17, 2014

NRA begins screening for 2 nuclear facilities

http://www3.nhk.or.jp/nhkworld/english/news/20140617_30.html

Japan's nuclear regulator has criticized the operators of 2 nuclear facilities for failing to fully prepare for safety assessments needed to restart them.

The facilities are the Tokai Number 2 nuclear power plant in Ibaraki Prefecture and the Number 1 reactor at Tohoku Electric Power Company's plant in Higashidori, Aomori Prefecture. They must meet stricter regulations introduced after the 2011 Fukushima nuclear accident to be restarted.

The Nuclear Regulation Authority on Tuesday held its first session to examine applications from the operators for the safety assessments.

Authority members took issue with old flammable cables at the Tokai plant, which began commercial operation more than 30 years ago. They asked why the operator plans to apply non-flammable coating to the cables rather than replace them with non-flammable ones.

They also criticized the operator for failing to have its application reflect discussions by the authority on the impact of earthquakes that may be caused by unknown geologic faults.

Regulators asked Tohoku Electric about its assumptions concerning quake levels, and said it did not provide specific figures on worker radiation exposure in case of serious accidents.

Japan Atomic Power Company Executive Vice President Hiroshi Masuda said his firm already has data to explain the issues raised by the regulators.

Tohoku Electric Vice President Shigeru Inoue expressed regret that his firm failed to provide detailed data. He said it is preparing fully and will present them in a future assessment.

No active fault under Hamaoka... says Chubu Electric

June 19, 2014
No active faults found under Hamaoka nuclear power plant: operator
http://mainichi.jp/english/english/newsselect/news/20140619p2g00m0dm041000c.html

TOKYO (Kyodo) -- The operator of the Hamaoka nuclear power plant in central Japan said Wednesday its investigation found no active geologic faults under or around the site, which was forced to shut down in 2011 after operation of the plant was deemed risky.

Chubu Electric Power Co. plans to submit the results of the probe to the Nuclear Regulation Authority after it applied for the nuclear watchdog's reactor safety review in February, seeking to resume its operation.

Located on the Pacific coast, about 190 kilometers southwest of Tokyo, the Hamaoka complex in Shizuoka Prefecture is believed to be situated at the potential epicenter of a massive earthquake.
"Everyone in the prefecture knows that the Hamaoka plant is right above the source zone (of the possible quake)," said a Shizuoka Prefecture official, urging the utility to expand the scope of the faults investigation.

In quake-prone Japan, nuclear plant operators are not allowed to build reactors above active faults, which are defined as those that have moved in the last 120,000 to 130,000 years.

Chubu Electric concluded that the faults on the premises of and around the plant "have not moved at least in 130,000 years" and they will not trigger earthquakes.

Following the 2011 Fukushima nuclear accident triggered by the massive earthquake and tsunami, the previous government led by the Democratic Party of Japan asked Chubu Electric to halt the operation of the Nos. 4 and 5 reactors at the Hamaoka site, while not permitting reactivating the No. 3 reactor that was under checkups at that time, citing a lack of measures against quake and tsunami hazards.

Two of the five reactors at Hamaoka were retired in 2009.

None of Japan's 48 commercial reactors has passed the NRA's safety assessment based on new regulations introduced in the wake of the nuclear crisis, despite a total of 19 applications being made.
June 19, 2014(Mainichi Japan)

Revised safety report submitted for Sendai plant

June 24, 2014
Utility submits safety report to restart plant
http://www3.nhk.or.jp/nhkworld/english/news/20140624_31.html

The operator of the Sendai nuclear plant in Kagoshima Prefecture, southwestern Japan, has submitted a revised safety report to nuclear regulators to restart 2 reactors.

Kyushu Electric Power Company submitted an 8,600-page report to the Nuclear Regulation Authority on Tuesday that outlines safety measures for the Number 1 and 2 reactors.

The utility revised the report it submitted in April after the regulator said it lacked details on safety measures.

The regulators plan to compile a draft safety assessment by July 9th.

They are expected to complete the assessment report in August, after hearing public opinions on the draft for about a month.

Before restarting the plant, the utility will also need to obtain the approval of local municipalities, and complete inspections of equipment and other procedures.

The firm hopes to be able to restart the 2 reactors in September at the earliest.

Kyushu Electric's Managing Executive Officer Akira Nakamura said he doesn't know when the plant can be restarted, as the safety screening is continuing.

The Sendai plant is likely to be the first to resume operation under stricter safety standards.

But all Japan's commercial reactors are likely to remain idle in the summer when electricity demand peaks.
Jun. 24, 2014 - Updated 10:05 UTC

Kyushu Electric submits documents for reactor safety checks
http://mainichi.jp/english/english/newsselect/news/20140624p2g00m0dm064000c.html

TOKYO (Kyodo) -- Kyushu Electric Power Co. said Tuesday it submitted to nuclear regulators additional documents required for safety reviews of two reactors at its nuclear power plant in southwestern Japan that are considered the closest to being allowed to restart among the country's 48 offline commercial reactors.

The Nuclear Regulation Authority will draw up a draft report on the results of the safety reviews of the Nos. 1 and 2 reactors at the Sendai plant in Satsumasendai, Kagoshima Prefecture, based on the documents from the utility.

The operator of the two-reactor plant originally filed in July last year for reactor safety assessments by the regulators, and this April submitted to the regulators additional documents outlining safety measures. But the regulators asked the company to resubmit the documents after some flaws were found.

All of the commercial reactors in Japan currently remain halted as the Fukushima nuclear crisis, triggered by a massive earthquake and tsunami, has made it difficult for utilities to restart reactors shut down for routine checks. They need to satisfy a set of new regulations introduced after the accident to be allowed to go back online.

The nuclear agency has given priority to proceeding with the safety checks of the reactors at the Sendai plant because the units have cleared major hurdles regarding the assessment of future earthquakes and tsunami that could affect the plant.

Kyushu Electric had sought to restart the reactors by this summer when power demand is highest. But resumption is not expected before fall given the need for the utility to obtain permission from local municipalities and to pass equipment checkups for the reactors, among other procedures.

Kyushu Electric and eight other utilities have so far applied for safety review for a total of 19 reactors.

Emergency measures not so urgent after all

July 7, 2014

Sendai nuclear plant set to restart without off-site emergency center
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407070029

THE ASAHI SHIMBUN

The Sendai nuclear power plant in Kagoshima Prefecture could restart two reactors in autumn without a crucial emergency facility in place to deal with a possible nuclear accident and evacuations of host communities.

The Sendai plant, operated by Kyushu Electric Power Co., is expected to be the first to resume operations among all plants that have applied for safety screenings by the Nuclear Regulation Authority.

The Cabinet Office in September 2012 instructed all prefectures hosting nuclear power plants to ensure that off-site emergency centers be equipped with ventilation and other systems to prevent radiation contamination and be located between 5 and 30 kilometers from the nuclear plant.

It also mandated host prefectures to designate multiple backup facilities in case the functions of the off-site centers are crippled by a disaster, which is what occurred during the Fukushima nuclear disaster that started in March 2011.

The deadline for completion of the emergency off-site centers is September 2015.

Kagoshima prefectural government officials said construction of the off-site emergency center for the Sendai plant has lagged behind schedule due to delays in discussions with the central government.

“We know it is an issue to be resolved, and we plan to construct the facility at an early date,” an official said.

The prefecture plans to complete the installation of an anti-radiation ventilation system and an emergency power generator for the off-site center of the Sendai nuclear plant by **mid-March 2015.** One of backup facilities for the off-site center will be constructed by mid-October.

However, the Nuclear Regulation Authority is set to compile a draft of the safety screening results for the Sendai plant in Satsuma-Sendai as early as July 9. If the plant clears the NRA’s safety screening process, its two reactors will be restarted in autumn at the earliest.

Off-site emergency centers are supposed to function as the bases of operations for officials from the central government, local governments and utilities to combat a nuclear crisis and coordinate evacuations of residents.

An official of the Cabinet Office said the Sendai plant already has a backup off-site center and is thus capable of countering a nuclear accident.

The NRA's safety screening focuses on conditions of a nuclear power plant, not its off-site centers.

The Great East Japan Earthquake and tsunami in March 2011 led to radiation contamination and damaged communications equipment at the off-site center of the Fukushima No. 1 nuclear power plant, rendering the emergency facility unusable.

Its functions were relocated to the Fukushima prefectural office about 60 km from the plant, leading to confusion in communications and counter-accident measures, including ways to prevent residents from being exposed to radiation.

The government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations has called for the prompt construction of off-site emergency centers.

But renovations and relocations of the emergency facilities are also behind schedule around Japan.

In addition to the Fukushima plant, off-site centers need to be relocated from the 5-km radius of four other nuclear power plants, including Shikoku Electric Power Co.'s Ikata nuclear plant in Ehime Prefecture.

An official of Ehime Prefecture said if an accident at the Ikata plant cripples the existing off-site center before September 2015, the front-line headquarters will be "relocated to a safe location like in the Fukushima crisis" in a stop-gap measure.

Further evaluation needed

July 7, 2014

Japanese nuclear regulators to delay interim report on restart of Kyushu plant

Kyodo

The Nuclear Regulation Authority will delay unveiling an interim report on restarting two reactors at a plant in Kagoshima Prefecture, sources matter said Monday.

The NRA had planned to present the draft to its decision-making panel Wednesday, but regulators judged that further evaluation was needed for measures to deal with severe accidents proposed by the plant's operator, Kyushu Electric Power Co., the sources said.

Once finalized, the report is expected to give the green light to restart the two-reactor Sendai plant, which is the closest to meeting the new safety standards introduced after the 2011 Fukushima nuclear crisis.

All of Japan's 48 commercial reactors remain offline in the wake of the March 2011 debacle at Tokyo Electric Power Co.'s Fukushima No. 1 complex.

After compiling the draft, the agency will solicit comments from the public for a month. The final version will be completed when the comments are collated.

July 4, 2014

2 Kyushu reactors expected to go back online this fall

http://mainichi.jp/english/english/newsselect/news/20140704p2a00m0na001000c.html

The Nuclear Regulation Authority (NRA) will give a stamp of safety approval as early as July 9 to two idled reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture, paving the way for Kyushu Electric Power Co. to restart the reactors this autumn, the Mainichi Shimbun has learned.

Sources say the NRA will present a report on its safety review of the No. 1 and 2 reactors of the power plant in Satsumasendai, Kagoshima Prefecture, as early as July 9 -- a move tantamount to giving the utility the go-ahead to restart the two reactors. The two reactors are likely to resume operations after public opinions are solicited and procedures for local consent are completed.

New nuclear power standards featuring tougher measures against earthquakes, tsunami and severe accidents went into effect in July last year in the aftermath of the crisis at the Fukushima No. 1 Nuclear Power Plant triggered by the 2011 Great East Japan Earthquake and tsunami. At present, 19 reactors at 12

nuclear power plants in Japan are undergoing safety reviews. The two reactors at the Sendai power plant in southwestern Japan are expected to be the first among the 19 reactors to meet the new standards.

The NRA had initially projected that a safety review of each reactor would last about six months, but many electric power companies were slow in complying with the tougher standards, delaying safety reviews. Kyushu Electric raised its estimated figure for peak ground acceleration in the event of an earthquake from 540 gals to 620 gals, leading the NRA to preferentially conduct its safety reviews of the two reactors.

Kyushu Electric submitted revised documents for applying to change the reactor facilities with new safety measures at the end of April but the documents contained 42 flaws, delaying the NRA's safety screening by about one month.

Sendai to clear initial safety hurdle

July 14, 2014

Sendai nuclear plant to clear safety hurdle Wednesday, regulator says

Reuters
http://www.japantimes.co.jp/news/2014/07/14/national/sendai-nuclear-plant-to-clear-safety-hurdle-wednesday-regulator-says/#.U8Qd1LHi91s

The Sendai nuclear plant in Kagoshima Prefecture is to clear an initial safety hurdle Wednesday, a key step in what is likely to be the gradual restart of an industry idled by the 2011 Fukushima disaster.

As Japan swelters through its first summer without any nuclear power in 40 years, Prime Minister Shinzo Abe's administration is keen to start bringing the nation's 48 reactors back online as the prolonged shutdown forces reliance on expensive fossil fuel imports.

All reactors have been shut for safety overhauls since the 2011 disaster.

The Nuclear Regulation Authority said Monday it will approve the upgraded design and safety features of the Kyushu Electric Power plant at a Wednesday meeting.

After this initial approval, the NRA will seek public comments for a month. Further on-site operational checks will be required, followed by the approval of local communities.

Experts largely expect the two-reactor plant to come online by the end of the year. The plant was fast-tracked for safety approval by the NRA in March.

The likely restart will be a key boost to the nuclear industry and to Abe, who despite widespread public opposition to nuclear power calls for the restart of reactors deemed safe by regulators. He reversed the previous administration's plan to eventually mothball all units.

The NRA, an independent nuclear regulator set up after the Fukushima disaster, has been vetting restart applications from regional electric utilities for more than a year. Nine companies have applied to restart 19 reactors.

The blackout of nuclear plants, which supplied about one-third of Japan's electricity before Fukushima, has pushed several utilities to post three straight years of losses and has contributed to a record string of 23 months of trade deficits.

Kyushu Electric was forced to seek a ¥100 billion bailout from the government-backed Development Bank of Japan this year to shore up its battered finances.

Even after the Sendai plant's restart, at most about two-thirds of Japan's 48 reactors will eventually pass the regulator's stringent safety checks and clear the other hurdles needed to restart, a Reuters analysis in April showed.

NRA approves Sendai restart

Japan nuclear plant clears safety hurdle toward restarting

http://mainichi.jp/english/english/newsselect/news/20140716p2g00m0dm035000c.html

TOKYO (Kyodo) -- Regulators said Wednesday a nuclear plant in southwestern Japan cleared an initial safety hurdle, in what is seen as a major step for it to become the first nuclear facility to restart among the country's 48 offline commercial reactors since the 2011 Fukushima nuclear crisis.

The Nuclear Regulation Authority's decision-making panel approved a draft report required to resume the operations of two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture.

The 420-page report -- which concluded that the plant's proposed countermeasures against earthquakes, tsunami and other possible risks meet the standards -- will be finalized after a monthlong public consultation period through Aug. 15. The new standards were introduced in July last year.

But the regional utility is not expected to reactivate the plant before this fall as it still needs to secure local consent and complete some other procedures.

With Japan experiencing its first summer without nuclear power in nearly half a century and utilities' fuel costs for thermal power generation surging, the government of Prime Minister Shinzo Abe is keen to restart reactors after their safety is ensured.

At a press conference Wednesday morning, Chief Cabinet Secretary Yoshihide Suga reconfirmed the government's stance on promoting nuclear power generation, which supplied some 30 percent of the country's electricity before the Fukushima crisis.

More than half of respondents in a Kyodo News survey conducted last month, however, said they oppose the reactivation of nuclear plants.

Currently, all 48 commercial reactors in Japan remain offline, as the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi complex, the worst since the 1986 Chernobyl disaster, has made it difficult for utilities to resume their operation after mandatory regular checks.

To be restarted, reactors need to pass the regulatory body's safety assessments based on the new standards.

Kyushu Electric was among the first utilities to apply for the agency's safety screening when the new regulations took effect. The Sendai plant emerged as the leading candidate for resumption after clearing key hurdles for earthquake and tsunami hazards that could affect the coastal complex.

The new regulations require plant operators to implement measures in light of the lessons learned from the Fukushima nuclear disaster, triggered by a massive earthquake and tsunami on March 11, 2011.

Under what the government calls the world's toughest nuclear regulations, utilities are obliged to put in place countermeasures against possible severe accidents such as reactor core meltdowns and huge tsunami, as well as terrorist attacks.

While some experts have argued that Kyushu Electric is underestimating possible volcanic eruptions that could affect the plant, the agency supported the utility's claim that such risks are "small enough."

Kyushu Electric and eight other utilities have applied for safety screenings for a total of 19 reactors so far.

July 16, 2014(Mainichi Japan)

Regulators approve draft nuclear assessment
http://www3.nhk.or.jp/nhkworld/english/news/20140716_80.html

Japan's Nuclear Regulation Authority has approved a draft safety plan for restarting reactors at the Sendai nuclear plant in Kagoshima Prefecture.

The facility in southern Japan is operated by Kyushu Electric Power Company. It could be the first nuclear plant in the country to get the go-ahead to resume operation.

NRA officials unanimously approved the draft plan on Wednesday. They said the utility has satisfied their stricter safety requirements for nuclear facilities.

The NRA will issue their final assessment of the plan after 30 days of public hearings, starting on Thursday.

The focus will then shift to whether the government and the utility can convince local residents and municipalities to agree.

Kyushu Electric must also clear procedures for restarting the reactors. These include inspections, and getting the NRA to approve the design of equipment at the plant.

Observers say the reactors are unlikely to be back online until October at the earliest.

Japan introduced new safety guidelines for nuclear reactors last year after the meltdowns at the Fukushima Daiichi plant in March 2011.

The guidelines require nuclear plants to come up with stricter measures against natural disasters including earthquakes and tsunami.

Utilities must also come up with a plan of action against serious nuclear accidents at their plants. The

action plan had been voluntary in the past.

All 48 nuclear reactors across Japan are currently offline. They must be screened by the Nuclear Regulation Authority before being restarted.

A total of 19 reactors at 12 plants, including the Sendai Plant, have been undergoing screening since last July.

The nuclear regulator set up two teams. One is in charge of estimating the scale of possible natural disasters for the reactor in question, and the other checks the facility's safety measures. The teams have conducted screening meetings open to the public.

So far, screening for pressurized water reactors at 6 nuclear plants is preceding other applications.

Regulators approve draft nuclear assessment

Japan's Nuclear Regulation Authority has approved a draft safety plan for restarting reactors at the Sendai nuclear plant in Kagoshima Prefecture.

The facility in southern Japan is operated by Kyushu Electric Power Company. It could be the first nuclear plant in the country to get the go-ahead to resume operation.

NRA officials unanimously approved the draft plan on Wednesday. They said the utility has satisfied their stricter safety requirements for nuclear facilities.

The new standards were introduced last year in response to the nuclear disaster in Fukushima 3 years ago.

The NRA will issue their final assessment of the plan after 30 days of public hearings, starting on Thursday.

The focus will then shift to whether the government and the utility can convince local residents and municipalities to agree.

Kyushu Electric must also clear procedures for restarting the reactors. These include inspections, and getting the NRA to approve the design of equipment at the plant.

Observers say the reactors are unlikely to be back online until October at the earliest.
Jul. 16, 2014 - Updated 04:04 UTC

Nuclear regulators present draft safety assessment

http://www3.nhk.or.jp/nhkworld/english/news/20140716_15.html

Japan's Nuclear Regulation Authority has compiled a draft safety assessment that paves the way for Kyushu Electric Power Company to restart 2 of its nuclear reactors.

Regulators on Wednesday presented the draft assessment, which effectively approves safety measures carried out by the utility to restart the No.1 and No.2 reactors at its Sendai nuclear power plant in Kagoshima Prefecture.

Regulators say the measures meet the stricter safety standards introduced in response to the nuclear crisis in Fukushima in 2011. They noted that the utility has raised the estimated strength of an earthquake that could hit the plant and has put in place adequate measures to deal with serious accidents.

The regulators are expected to approve the draft later on Wednesday.

Before issuing a final assessment, they will hear comments from the public. The Sendai plant would be the first in Japan to satisfy the revised safety requirements.

The focus will then shift to whether the government and the utility can convince local residents and municipalities that the reactors are necessary and safe.

Kyushu Electric must also clear other procedures, which include obtaining approval from the NRA on the design of equipment at the plant. Observers say the earliest the reactors are likely to go back online is in October.

Happy about the restart (some are)

July 16, 2014
Abe, residents near Sendai Plant comment

http://www3.nhk.or.jp/nhkworld/english/news/20140716_23.html

Prime Minister Shinzo Abe says regulatory approval of a draft safety plan to restart nuclear reactors at the Sendai power plant is one step forward.

Abe said regulators have more work to do to finalize their assessment that the plant is safe. He said if the plant clears what are now the world's toughest safety standards, the government will work to restart it with the consent of local residents.

Opinions are varied among people living near the country's nuclear plants about restarting reactors.

A 70-year-old woman in the city hosting the Sendai plant said she hopes the reactors are never restarted.

She said she sees no benefit to restarting the plant in her city when the population is shrinking.

But a 52-year-old resident welcomed the possibility of the plant restarting. She said it benefits some people and is indispensable to the community.

Another woman of the same age complained that residents had not been adequately briefed on the issue.

A 37-year-old man said if the government wants to restart the plant, it should show it has a clear vision about energy resources and how to decommission nuclear plants.
Jul. 16, 2014 - Updated 07:15 UTC

Operator, Suga comment on approval
http://www3.nhk.or.jp/nhkworld/english/news/20140716_22.html

Kyushu Electric Power Company says it will respond carefully and sincerely to regulators' assessments of its nuclear facilities.

The company said in a statement it will also work continuously to boost the safety and credibility of the Sendai plant.

Chief Cabinet Secretary Yoshihide Suga says the Nuclear Regulation Authority is working hard to assess the safety of the plant. He said their analysis is based on safety guidelines considered among the toughest in the world.

Asked whether the government takes final responsibility for the safety of the plant, Suga said judgments about safety must be objective and exclude political concerns.

He said the government will rely on the judgment of the Nuclear Regulation Authority.
Jul. 16, 2014 - Updated 05:35 UTC

Restarting Kyushu reactors

July 16, 2014
Kyushu plant reactors certain to be first to restart since Fukushima accident
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407160060

By TOSHIO KAWADA/ Staff Writer

The Nuclear Regulation Authority announced on July 16 that the Sendai nuclear power plant No. 1 and No. 2 reactors meet its new tougher safety standards, allowing them to be the first to be restarted in Japan since the Fukushima No. 1 nuclear plant disaster.

Because local residents and officials have expressed support for restarts of the two reactors at the Kyushu Electric Power Co. plant, located in Satsuma-Sendai, Kagoshima Prefecture, operations are expected to be resumed as early as this fall.

The Abe administration had declared that it will allow now-idle reactors to resume operations if they are assessed as meeting stricter criteria introduced by the NRA after the March 2011 Great East Japan Earthquake and tsunami triggered the Fukushima nuclear accident.

The new standards demand nuclear operators develop countermeasures against severe accidents as well as impose more rigorous criteria to assess safety measures designed to prevent an earthquake and tsunami from critically damaging reactors. Effectiveness of resident evacuation plans and other factors are not taken into account in the screening process.

Only facilities that are deemed safe based on the new standards will be allowed to resume operations. Kyushu Electric submitted applications for restarts of the reactors immediately after the new regulations took effect in July last year.

Since March, the NRA has given priority to examining the Sendai reactors, which quickly passed screenings on major safety points, such as countermeasures against a massive earthquake and tsunami. The NRA has received applications to restart an additional 17 reactors at 11 nuclear plants, but the Sendai plant is the first to receive its blessing.

The nuclear watchdog intends to make the Sendai plant a model case for approving restarts of the country's reactors, all 48 of which remain offline in the aftermath of the Fukushima crisis.
The NRA will invite public opinions on technical issues for 30 days from July 17, and later finalize the decision to allow Kyushu Electric to resume operations at its Sendai plant.

At the same time, the nuclear watchdog will examine the utility's construction plans that include detailed designs of equipment and the company's new safety regulations detailing operation procedures and accident responses.

Based on those screening results, Kyushu Electric will discuss reactor restarts with local governments in a campaign to win their consent.

Although some planned safety features were set to be installed in the latest stages of the screening process, the utility is looking to complete construction of all anti-disaster equipment by the end of July. Completed facilities are expected to be screened by the NRA before Kyushu Electric restarts the reactors.

The NRA has been concentrating on examining the reactors at the Sendai plant, but it will shortly resume full-scale screenings of the other reactors at nuclear plants across the nation that have applied for restarts.

Restarting Kyushu reactors (2)

July 16, 2014

NRA poised to greenlight restart of two Kagoshima reactors

AFP-JIJI

The Nuclear Regulation Authority was expected Wednesday to approve the restart of two atomic reactors, in a move likely to ignite fresh protests over returning to the technology more than three years after the Fukushima meltdown crisis started.

NRA officials were to make public their safety review of the Sendai nuclear plant in Kagoshima Prefecture, which would technically give Kyushu Electric Power Co. the green light to switch on the reactors — the first since Japan ushered in stricter safety guidelines last year.

But Tokyo has agreed to a month-long public consultation period and winning agreement from local officials before giving a final nod, so an actual restart is unlikely before the autumn.

The review comes as Prime Minister Shinzo Abe tries to persuade a wary public that Japan needs to return to an energy source that once supplied more than a quarter of its power, a push backed by business groups.

The country's reactors were switched off after the March 2011 quake-tsunami disaster triggered three meltdowns at Tokyo Electric Power CO.'s Fukushima No. 1 nuclear power plant, the worst atomic accident since Chernobyl.

Abe has seen regular protests in front of his office over plans to restart reactors deemed safe by the nuclear agency.

The regulator's clearance for the Sendai plant comes after at least one local assembly adopted a resolution for the site to be decommissioned, and just days after the election of an anti-nuclear politician underscored opposition to the plans.

Former parliamentarian Taizo Mikazuki, 43, squeaked out a Sunday election win to become governor of Shiga Prefecture, beating out a candidate backed by Abe's ruling Liberal Democratic Party.

The prefecture borders on Fukui Prefecture, host to 13 idled reactors, and where the battle over nuclear could see its biggest fight.

Mikazuki has demanded that the central government get his approval before any reactor restarts over the border in Fukui.

Worries about whether Japan's nuclear plants could withstand another disaster came into focus at the weekend as an earthquake struck near the crippled Fukushima nuclear site.

No major damage was reported, but seismologists said the quake was an aftershock of the temblor that sparked 2011's deadly tsunami, and **warned of more to come.**

A 9.0-magnitude earthquake in March 2011 saw monster tsunami slam into the Pacific coastline, leaving about 18,000 dead or still missing.

The huge waves swamped the Fukushima plant, sending reactors into meltdown and spewing radioactivity across the adjacent farming region.

No one died as a direct result of the atomic disaster, but experts warn that decommissioning of the plant could take decades and many evacuated residents may never be able to return to their homes in the shadow of the plant.

Restart procedures for Sendai

July 16, 2014

Procedures for restarting Sendai plant

http://www3.nhk.or.jp/nhkworld/english/news/20140717_02.html

Kyushu Electric Power Company in southern Japan still has many steps to clear before becoming the first utility in the country to restart a nuclear power plant.

The Nuclear Regulation Authority will hold 30 days of public hearings starting on Thursday on the draft safety assessment for the Sendai nuclear plant.

The NRA will then finalize the assessment and give permission for the utility to replace its current equipment. Meeting new stricter safety standards is required for resuming operations.

Kyushu Electric will then seek agreement for a restart from Kagoshima Prefecture and the hosting municipality of Satsuma Sendai.

The prefectural government plans to hold town meetings in the city and 4 other municipalities within 30 kilometers from the plant to hear explanations from NRA officials on the assessment.

Then the governor of the prefecture is to confirm the views of Satsuma Sendai city and prefectural assembly members, and decide whether to agree to the restart.

Kyushu Electric will also be required to submit quake-resistance data for its equipment and safety devices to the NRA for its approval.

The utility must also present arrangements to deal with serious accidents, including personnel training programs to ready them for such contingencies.

The company will need to have newly installed equipment checked before ultimately resuming operations at the plant.

But some local residents have already voiced criticism, saying that local municipalities have not yet set up sufficient measures to counter nuclear contingencies.

They point out that facilities for evacuation have been designated in locations which are likely to be downwind from the plant. They also demand feasible evacuation plans for hospitals and nursing-care facilities for the elderly.

They say that in the US, reactor operation needs federal government approval of evacuation plans submitted by local municipalities. They call for a similar system in Japan.

NHK video Nuclear Watch

http://www3.nhk.or.jp/nhkworld/newsline/201407161805.html

Nuclear Plant Closer to Restart

Aired on Jul. 16

There are still safety concerns to be addressed. How earthquake-resistant can the plants be?

Demonstrators outside the NRA's office claim the screening of Sendai plant was "fast and sloppy". The NRA's decision is not final: A month is left to collect opinions.

No restart for Ikata

July 25, 2014

Poor quake resistance to keep Ikata plant offline

http://www3.nhk.or.jp/nhkworld/english/news/20140725_29.html

The restart of a nuclear power plant in western Japan has been put off until at least early next year after its emergency control room failed to pass a more rigorous quake resistance review.

Shikoku Electric Power Company made the announcement about its Ikata nuclear power plant in Ehime Prefecture on Friday.

The room failed the review when the utility raised the estimated peak ground acceleration from a potential earthquake at the plant to 620 gals.

The review was part of the ongoing safety screening of the No. 3 reactor being undertaken by the Nuclear Regulation Authority.

The reactor must pass the screening before it can be restarted.

Officials say they will build a new operations control center inside the compound. Construction will start in September and take up to 6 months to complete.

Kazutaka Kakinoki, the head of Shikoku Electric's nuclear power division, says it's the company's responsibility to take every step necessary to ensure the plant is safe.

He also says officials will do everything they can to win the authority's approval to get the reactor back online.

Jul. 25, 2014 - Updated 08:14 UTC

59% against Sendai restart

July 28, 2014
ASAHI POLL: 59% oppose planned restart of Kyushu reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407280043

THE ASAHI SHIMBUN

Nearly 60 percent of citizens are opposed to the planned restart of reactors at the Sendai nuclear power plant in Kagoshima Prefecture, the first such restart under tougher standards introduced after the Fukushima crisis, according to an Asahi Shimbun survey.

The Nuclear Regulation Authority on July 16 concluded that reactors at the Kyushu Electric Power Co. plant meet the safety standards introduced after the March 2011 Great East Japan Earthquake and tsunami triggered the nuclear crisis at the Fukushima No. 1 nuclear power plant.

It is the first time since the Fukushima nuclear disaster began that a nuclear plant has passed the NRA's stricter inspections.

The Sendai plant is expected to be allowed to resume operations as early as October, after Kyushu Electric obtains the consent of local residents and officials.

According to survey results, 59 percent of respondents said they are opposed to the restart of the nuclear facility, while 23 percent said they agree with the resumption of operations there.

The nationwide telephone survey, conducted between July 26 and 27, received 1,590 valid responses, or 45 percent of those contacted.

Asked whether the Japanese economy will be negatively affected by keeping the nation's suspended reactors offline, 42 percent said they think so. Those who said reactor suspension will not have a negative impact on the economy accounted for 43 percent.

Twenty-five percent of respondents said they believe it is possible to ensure the safety of nuclear reactors if appropriate techniques and management mechanisms are introduced, while 63 percent said nuclear technology poses risks that are beyond the control of humans.

Although the Abe administration is currently moving toward restarts of suspended reactors across Japan, 61 percent said the government has not sufficiently applied lessons learned from the Fukushima crisis. Only 19 percent said the Abe administration's nuclear policy has taken into account lessons from the disaster.

Meanwhile, the latest support rate for the Abe Cabinet was 42 percent, the lowest since Prime Minister Shinzo Abe returned to power in December 2012. The nonsupport rate, at 36 percent, marked a record high as well.

The Abe Cabinet has long enjoyed high public approval ratings. As recently as May, the support rate for the Cabinet was 49 percent.

But in June, when full-fledged discussions about lifting the long-standing self-imposed ban on the exercise of the right to collective self-defense started, the support rate hit a record low of 43 percent. In a special poll carried out July 4-5, the Cabinet approval rate was 44 percent.

The nonsupport rate reached a previous record high of 34 percent in December last year, immediately after the controversial state secrets protection law passed the Diet. In surveys conducted in June and early July, the rate was 33 percent.

No restart for Ikata (2)

July 26, 2014
Restarts of reactors in Ehime delayed due to insufficient safety standards
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201407260039

THE ASAHI SHIMBUN
Restarts of reactors at the Ikata nuclear power plant in Ehime Prefecture will be delayed until at least next year because the site does not meet safety standards.

Its operator, Shikoku Electric Power Co., is being forced to construct a new emergency headquarters building at the facility as the current one, which was completed after the March 2011 Fukushima nuclear disaster, fails to meet the new criteria.

The new building is scheduled to be completed in January 2015 at the earliest. Given that procedures for safety screening take time, the utility said it was doubtful the reactors could be reactivated this fiscal year, which ends in March 2015.

Shikoku Electric is not the only electric power company that has been obliged to construct new emergency headquarters buildings in their nuclear power plants.

Such facilities are expected to serve as command centers in the event of a nuclear accident. Thus, the buildings are required to withstand strong earthquakes and serve as a shield against radiation under stringent safety standards imposed by the Nuclear Regulation Authority (NRA) in July 2013.

Before the introduction of the more vigorous standards, some electric power companies built quake-resistant emergency headquarters buildings based on lessons from the offshore Niigata Chuetsu-oki earthquake in 2007.

The earthquake rendered one of the rooms for emergencies in Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture temporarily unusable.

Shikoku Electric, based in Takamatsu, constructed its emergency headquarters building at a cost of some 4 billion yen ($40 million).

The quake-proof building accommodates the emergency headquarters in the Ikata nuclear power plant and has a total floor space of about 600 square meters. It became operational in December 2011.

In the NRA's screening to decide whether the Ikata plant is safe to resume operations, the assumed intensity of a future earthquake is likely to be raised. That will require strengthening parts of concrete pillars in the foundations of the emergency headquarters building.

Shikoku Electric decided it would be better to construct a new structure, one that will be one-story high and made of reinforced concrete. It will have a total floor space of about 200 square meters.

Construction is set to start in September and take five to six months to complete.

A number of other nuclear power plants are faced with a similar problem.

For example, the emergency headquarters building of Tohoku Electric Power Co.'s Onagawa nuclear power plant in Miyagi Prefecture was deemed to be insufficient to shield people from radiation under the new safety standards. The building was completed in October 2011.

The same problem applied to the building at Japan Atomic Power Co.'s Tokai No. 2 nuclear power plant in Ibaraki Prefecture, which was completed in March 2011.

The emergency headquarters building at Chubu Electric Power Co.'s Hamaoka nuclear power plant in Shizuoka Prefecture, which was completed in August 2010, was also deemed to be unable to withstand major earthquakes or shield workers from radiation.

Electric power companies that did not construct emergency headquarters buildings after the Niigata Chuetsu-oki earthquake were spared the expense of having to construct emergency headquarters buildings.

Those utilities include Kyushu Electric Power Co. and Kansai Electric Power Co. They are currently constructing emergency headquarters buildings under the new safety standards.

Restart of Sendai plant won't be immediate

August 6, 2014
Paperwork forces Kyushu Electric to delay reactor restarts
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201408060038

By RYUTA KOIKE/ Staff Writer

Kyushu Electric Power Co.'s failure to submit paperwork will postpone the resumption of operations at its Sendai nuclear plant, despite the reactors having cleared tougher safety standards last month.

The utility announced the delay at an examination board meeting with the Nuclear Regulation Authority on Aug. 5.

The Sendai plant reactors in Satsuma-Sendai, Kagoshima Prefecture, in July became the first to meet the NRA's new safety standards designed to prevent critical damage from earthquakes and tsunami. The company was expected to restart the two reactors in autumn.

However, the restarts are unlikely to happen this year because the NRA needs time to review the paperwork and inspect the plant's equipment.

Kyushu Electric has yet to submit to the NRA documentation on the "construction plans" that recalculate the plant's structural strength.

That report is expected to be tens of thousands of pages long, covering precise details of the nuclear plant's design.

"There is much more to do than we originally expected, and it's taking a lot of time," said Akira Nakamura, a managing executive officer of the power company.

In April, Kyushu Electric expressed its intentions to have the paperwork ready by the end of May. The company later pushed back the date to sometime after July, and delayed it once again. The documentation is now expected to be submitted in late September at the earliest.

The NRA came up with the stricter standards after the meltdowns at the Fukushima No. 1 nuclear plant caused by the Great East Japan Earthquake and tsunami in March 2011. All reactors, including the ones at the Sendai plant, were shut down following the disaster. Currently, no reactors are operating in Japan.

Kyushu nuclear plant may not be restarted before winter

TOKYO (Kyodo) -- The operator of a nuclear power plant on the main island of Kyushu said Tuesday that documents required to be filed before obtaining final safety clearance for the facility's restart will not be ready before late September, possibly delaying the planned restart at least until winter.

Two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture were expected to go back online around this fall, after the units last month became the first in the country to clear a safety hurdle based on new regulations introduced following the 2011 Fukushima nuclear disaster.

The utility, which serves the Kyushu region, still needs to submit to the Nuclear Regulation Authority additional documents detailing plant equipment and construction work that are needed to enhance the plant's safety measures against future earthquakes and tsunami, but preparations are taking more time than expected, it said.

The submission of the documents could even be pushed back to October, Managing Executive Officer Akira Nakamura told reporters after attending a meeting of the Nuclear Regulation Authority in Tokyo in which he said the documents will not be ready for submission before September.

Kyushu Electric had planned to file the documents with the regulators at the end of May.

The Nuclear Regulation Authority is seeking technical comments from the public on its July 16 draft report, which effectively acknowledged the Sendai plant is safe enough in light of the new standards. The report is expected to be finalized after the month-long public consultation period through mid-August.

Before restarting the reactors, however, Kyushu Electric also needs to obtain consent from local communities and undergo on-site operational checks.

The Nos. 1 and 2 reactors at the seaside plant in Satsumasendai, Kagoshima, were suspended for routine checks after the March 2011 disaster at Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant, and they remain offline.

August 06, 2014(Mainichi Japan)

No need to rush restart

August 9, 2014

As I See It: Don't rush decision to put Sendai nuclear plant back online

http://mainichi.jp/english/english/perspectives/news/20140810p2a00m0na004000c.html

The Nuclear Regulation Authority (NRA) on July 16 approved the upgraded safety features of Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Kagoshima Prefecture as meeting the agency's new standards. The focus will now fall on whether local governments will approve of restarting the plant. Because Kagoshima Gov. Yuichiro Ito has shown enthusiasm to push ahead, it appears almost certain that the Sendai plant will be the first nuclear plant to be put back online since the new NRA regulations were put in place.

However, a myriad of problems -- including questions about the efficiency of evacuation plans and the sufficiency of measures against volcanic eruptions -- surrounding the Sendai nuclear plant have been brought up. As such, approval of reactivation under current circumstances would undoubtedly be criticized as **a snap decision.**

In response to the NRA's approval of Kyushu Electric's upgraded safety features, Ito said at a regularly scheduled press conference on Aug. 1, "I believe it means that safety has been guaranteed from the perspective of the general public." While he did not directly discuss whether he would approve of restarting the plant, his pro-reactivation stance is evident from his remarks referring to "the existence of environmental and energy issues, as well as the government's current-account balance." **The willingness to go forward with reactivation based on the NRA's initial safety approval is a revival of the safety myth of nuclear power.**

Nine municipalities within a 30-kilometer radius of Sendai Nuclear Power Plant have designed evacuation plans for residents based on the guidelines for measures against nuclear disaster that were revised after the onset of the Fukushima No. 1 Nuclear Power Plant disaster. According to calculations made by the prefectural government based on these plans, it will take 28 hours and 45 minutes for the approximately 215,000 residents within 30 kilometers of the plant to leave that area by car.

The estimates operate on the premise that residents within five kilometers from the plant will evacuate first, followed by those living within five to 30 kilometers. But a staff member of the Namie Municipal Government in Fukushima Prefecture who experienced the Fukushima disaster first hand says that such a proposal is unlikely to be carried out as planned. It's hard to imagine that those living in areas over five kilometers from the plant will remain put until those closer to the plant are finished evacuating**; people will likely try to evacuate at once,** including those living more than 30 kilometers from the plant. **Moreover, the possibility that main roads and bridges may be out of commission has not been considered in the calculations**, leading experts to criticize the estimates as being much too rosy.

Evacuation plans for people in medical and nursing care facilities who require extra assistance have not been completed. Plans for 17 facilities (826 people) within a 10-kilometer radius were drawn up in July. Ito has said he believes that laying down plans for the 10-kilometer radius is sufficient, and that devising plans for all facilities within 30 kilometers of the plant is unrealistic.

Indeed, securing evacuation sites for the approximately 10,000 people at all 244 facilities within 30 kilometers of the plant is not an easy task. There hasn't been sufficient planning for the evacuation of those who live at home and require extra assistance, either. That's precisely why we shouldn't rush to restart the Sendai nuclear plant.

Evacuation plans are not subject to the NRA's safety assessment, so their effectiveness goes unchecked. The governor, too, has said that evacuation plans are not part of the criteria that must be met to restart the plant. But implementing effective evacuation plans should be a prerequisite for plant reactivation if one looks at the situation from the perspective of protecting residents.

The NRA's acceptance of Kyushu Electric's conclusion that "it is sufficiently unlikely that a massive volcanic eruption will take place while the Sendai plant is in operation" is also questionable. The Sendai

plant is surrounded by multiple volcanoes, and is said to have the highest risk of being affected by a massive eruption among the country's nuclear plants. The NRA says it's possible to detect the warning signs of volcanic eruptions through close monitoring, but many volcanologists point out that it is incredibly difficult to predict massive eruptions.

Despite the many problems that remain, the governor maintains that only the consent of the prefectural government and the Satsuma-Sendai Municipal Government, where the Sendai plant is located, is required for the plant's reactivation. However, **the Fukushima crisis has shown that damage caused by a nuclear disaster can span far beyond the boundaries of a nuclear plant's host municipality.** The national government has not stipulated the parties that must provide consent for reactivation, but according to a Mainichi Shimbun poll taken of municipalities within 30 kilometers of the 16 nuclear power plants nationwide, 48 said that municipalities within 30 kilometers of a plant should have to provide consent before plant reactivation, as opposed to 18 municipalities, which said only the host municipality should have to provide consent.

In the Kagoshima Prefecture city of Ichikikushikino, located next to Satsuma-Sendai, a petition with the signatures of over half the city's population of 30,000 was submitted in protest of reactivating the Sendai plant.

"The voices of residents, who will suffer the most damage in the case of an accident, should be heard," says Koji Ueno, 61, who signed the petition and lives within 10 kilometers of the plant. But as of now, Ichikikushikino does not have any rights regarding the Sendai plant. **It's unclear how the governor expects to reflect the will of the prefecture's residents in his final decision.**

Hideyuki Hirakawa, a professor of science and technology studies at Osaka University, says there is a need to take more deliberate steps before making a decision on plant reactivation.

"It is important to carry out a careful process of gathering residents' opinions and wishes," he says. "There should be a forum in which experts who argue that the plant is safe and those who are critical of those claims can exchange their views, and assist residents in their decision making."

I agree. **There is absolutely no reason to rush to a conclusion. It will take time, but the governor must present diverging views on the issue and provide a forum where debate can be carried out. And once that's done, there should be a referendum or other method for residents to express their will**. That, I'm convinced, is the shortest route to extricating ourselves from the safety myth. (By Kenta Somatani, Kagoshima Bureau)

Shika applies for screening

August 13, 2014

Hokuriku Electric submits documents for reactor safety checks

http://mainichi.jp/english/english/newsselect/news/20140813p2g00m0dm045000c.html

KANAZAWA, Japan (Kyodo) -- Hokuriku Electric Power Co. submitted documents to nuclear regulators Tuesday required for safety reviews of a reactor at its nuclear power plant in Shika, Ishikawa Prefecture.

Among Japan's 10 entities which own nuclear power plants, Hokuriku Electric is the last to file such documents on the No. 2 reactor at the plant, the 20th reactor at 13 plants across the country subject to safety reviews under new safety standards introduced following the 2011 Fukushima nuclear crisis.

The utility aims to complete seismic strengthening work for the reactor building by the end of next March but it is undecided over when it plans to restart the reactor.
The Shika plant has two reactors -- a 540,000-kilowatt boiling-water reactor and a 1,358,000-kw advanced boiling-water reactor. The utility submitted documents for safety checks on the advanced reactor which started commercial operations in 2006.
The utility has decided to postpone safety reviews for another reactor in consideration of discussions over the "S-1 fault" lying under the reactor building.
The Nuclear Regulation Authority conducted an on-site survey over the fault and called for more information to make a decision on it. The utility briefed the NRA about its additional research on the fault in July, reiterating its denial of any activity in the fault.
In July, the NRA approved a draft report required to resume the operations of two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture, in a major step for the plant to become the first nuclear facility to restart under the new safety standards.
August 12, 2014

Shika nuclear plant operator applies for screening

http://www3.nhk.or.jp/nhkworld/english/news/20140812_26.html
Aug. 12, 2014 - Updated 09:07 UTC+2
The operator of the Shika nuclear power plant in central Japan has applied for a government safety screening as a step toward restarting its No.2 reactor.

Managing Director Akizumi Nishino of Hokuriku Electric Power Company submitted the papers to Japan's Nuclear Regulation Authority on Tuesday.

The utility has increased the estimated strength of an earthquake that could hit the Shika plant from 600 to 1,000 gals, and the possible height of a tsunami from 5 to 7.1 meters. Accordingly, it has been reinforcing the plant's piping system and has built a 15-meter-high seawall.

Experts are still debating the possibility of faults running through the plant's compound moving in the future, including one directly beneath the No.1 reactor.
Government safety rules ban the installation of reactors and other key facilities above faults that are at risk of shifting.

The nuclear regulatory body will therefore postpone the screening of the No.2 reactor until the experts reach a conclusion.

Hokuriku Electric Power is the 10th and last Japanese utility with nuclear power plants to formally seek to restart its reactors.

Thousands of commentson restart

August 17, 2014

Thousands of opinions on nuclear restart put

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Nuclear regulators say they have received thousands of comments from the public over their draft assessment on restarting a nuclear power plant in southwestern Japan.

The Nuclear Regulation Authority said on Friday it has now stopped accepting comments on the Sendai nuclear plant, operated by Kyushu Electric Power Company.

Regulators say the Sendai station is the first since the Fukushima Daiichi accident to meet enhanced government regulations.

By early August, the regulators had counted more than 4,000 comments from the public - a number they say is likely to have grown by Friday.

The comments have not been disclosed but a civic group says some call for stricter accident measures, including raising the maximum strength of earthquakes that might hit the plant.

They say other comments demand the NRA take charge of local disaster prevention measures including evacuation programs - not included in its current remit.

The regulators are being watched carefully to see how they respond to these opinions since the Sendai plant would be the first to restart based on the new regulations.

The operator needs to submit additional documents to the regulators, as well as approval from local municipalities. The restart is likely to be in December at the earliest.

Sendai restart plan attracts lots of comments

August 20, 2014

Sendai nuclear plant safety approval attracts 17,000 public comments

JIJI
http://www.japantimes.co.jp/news/2014/08/20/national/sendai-nuclear-plant-safety-approval-attracts-17000-public-comments/#.U_ScT2Onq1s
The Nuclear Regulation Authority said Tuesday it has received some 17,000 comments from the public on a draft paper that claims two reactors at Kyushu Electric Power Co.'s Sendai nuclear power station satisfy new safety standards.
Public comments must be included in the final paper on the outcome of the NRA's safety screening of the Nos. 1 and 2 reactors at the power station in Kyushu. The final version is due out as early as September.
The NRA announced its draft report on July 16 and accepted public comments for 30 days through Friday.
The report covers a basic plan about changes to the reactors that would bring them in line with the new safety standards, which are designed to prevent crises like the March 2011 triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power station.
The two reactors at the Sendai plant will clear NRA examinations if the regulator approves Kyushu Electric's construction and engineering plans for implementing the changes to the reactors and revision of its safety procedures in the event of a severe accident.

But approval is unlikely to come anytime soon, because the power company cannot submit revised construction and engineering plans earlier than the end of Septem

August 19, 2014

NRA receives 17,000 comments about plant restart

Aug. 19, 2014 - Updated 12:44 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20140819_30.html

Japan's nuclear regulator has received about 17,000 comments from the public on restarting a nuclear plant in southwestern Japan.

Last month, the Nuclear Regulation Authority approved a draft safety plan for restarting the reactors at the Sendai plant in Kagoshima Prefecture. The NRA said the assessment prepared by Kyushu Electric Power Company satisfied its stricter safety requirements for nuclear facilities.

The NRA invited the public to send comments on the draft for 30 days until last Friday. NRA officials said some people complained that the regulator's measures for dealing with earthquakes and volcanic eruptions are inadequate.

They said some people also commented that the NRA should look into evacuation plans for residents although these are not included in its current remit.

Officials are studying the opinions to reflect them in the final report. But a senior official at the NRA's secretariat said on Tuesday that he can't predict when they will finish the work as there were so many responses.

The plant is unlikely to be restarted before December due to Kyushu Electric's delay in submitting some of the necessary documents. The operator must also obtain the approval of local municipalities to restart the reactors.

Dont' bank on it

August 24, 2014

Don’t bank on nuclear restarts

http://www.japantimes.co.jp/opinion/2014/08/24/editorials/dont-bank-nuclear-restarts/#.U_oQyGOnrIU

Power companies are moving again to raise their electricity rates to get out of dire financial straits caused by the increased cost of importing fuel to run more thermal power plants while their nuclear power reactors remain idled. Hokkaido Electric Power Co. is the first among the nation’s regional utilities to apply for government approval of a plan to raise its rates for the second time since the shutdown of nuclear power plants following the March 2011 triple meltdowns at Tokyo Electric Power Co.’s Fukushima No. 1 plant.

Other utilities including Kansai Electric Power Co. and Tepco may follow suit in the coming months. Electricity charges are estimated to have already increased by roughly 20 percent for households and nearly 30 percent for businesses compared with 2010 levels.

Additional hikes could weigh heavily on households and businesses alike, and for that reason many are calling for a quick restart of the idled nuclear reactors — to remove an obstacle to Japan's economic growth. That, however, does not warrant a return to business as usual for nuclear power in Japan.

While minimizing the inevitable rate hikes by introducing more streamlining and efficiency in their operations, the utility firms should begin an effort to change their cost structure and reduce their reliance on nuclear power by taking a more realistic view of the situation since the Fukushima disaster.

The Abe administration also needs to set down more specific goals in Japan's energy policy that will incorporate efforts to reduce "as much as possible" the nation's dependence on nuclear power — as it says in the government's latest basic energy plan — to set a clear direction for the utility industry.

Hokkaido Electric applied to the Ministry of Economy, Trade and Industry in late July for a bid to raise household rates by an average of 17 percent. It also plans to hike rates for corporate users by 22.6 percent, which does not require the government's nod. These plans come on the heels of a 7.7 percent and 11 percent hike in household and business rates, respectively, introduced just last September. The latest hikes could take effect in November at the earliest.

Since 2011, seven power companies have introduced hefty rate hikes to reflect rising imported fuel costs. The government estimates that Japan's reliance on fossil fuels for its electricity generation hit 88 percent in 2013, topping the 80 percent at the time of the first oil crisis in 1973.

With import costs also driven up by the yen's fall since 2012, fuel imports amounted to ¥27 trillion in 2013, ¥10 trillion higher than in 2010 according to the government's white paper on energy.

Six power firms reported losses for the business year to March, with Hokkaido Electric's consolidated pretax loss hitting ¥95.3 billion — its third straight year of being in the red. When it raised its rates 11 months ago, Hokkaido Electric assumed that its Tomari Nuclear Power Plant would resume operations by June this year.

When Kansai Electric raised its electricity charges in the spring of 2013, it similarly calculated that its Oi and Takahama nuclear plants in Fukui Prefecture would be up and running.

In its reconstruction plans approved by the government last December, Tepco also assumed that it would start reactivating reactors at its Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture by July this year — adding that it might need to raise its rates again by up to 10 percent if the restart of the plant was delayed.

All of these forecasts by utilities have proven too optimistic. Of the 20 reactors at 13 nuclear power plants under safety review by the Nuclear Regulation Authority since July last year, the two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture have effectively cleared the NRA screening, but their actual restart is not likely before the end of this year due to pending procedures.

It is not known how soon the NRA screening — based on tightened standards for plant resistance to natural disasters and severe accidents, and on more rigorous checks of on-site earthquake risks — will proceed.

In rushing to get the NRA's nod to restart their reactors, the power companies appear oblivious to citizens' strong safety concerns over nuclear power since the Tepco plant disaster disrupted the lives of tens of thousands of Fukushima residents. More than three years afterward, opinion surveys still show that many people remain concerned about the restart of idled nuclear power plants.

The entire process for restarting the nuclear plants, including the necessary approvals from host municipalities and prefectures, is going to be tough and will take a long time. At present, only 20 of the nation's 48 reactors are under NRA review.

There will be limitations on what the power companies can do in their efforts to further trim costs and streamline operations, such as more fuel-efficient power generation.

Additional hikes in electricity charges may be unavoidable to some extent. But as long as the power companies keep drawing up business plans based on the hope of once again being be able to operate nuclear power plants as they did before 2011, consumers and businesses can bet on the certainty of more hikes in the future.

Tsuruga: Restart or scrap?

September 4, 2014

NRA's final ruling on fault to force scrapping of Tsuruga reactor

http://www.japantimes.co.jp/news/2014/09/04/national/nras-final-ruling-on-fault-to-force-scrapping-of-tsuruga-reactor/#.VAizfGOnq1s
Kyodo
A panel convened by the Nuclear Regulation Authority said Thursday its opinion that a fault beneath a reactor at the Tsuruga nuclear power plant is active has not been swayed by the additional data provided by its manager.
The move leaves Japan Atomic Power Co. no choice but to scrap the No. 2 reactor at the two-unit Tsuruga complex, which sits on the Sea of Japan coastline of Fukui Prefecture.
The NRA acknowledged last year that the fault is active, but Japan Atomic later submitted additional data to overturn the regulator's judgment, which the panel rejected at its meeting on Thursday.
Taiki Ichimura, vice president of Japan Atomic Power, called for more discussions on the issue, but NRA Commissioner Kunihiko Shimazaki brushed it off, saying that its ruling was final.
"Enough scientific debates have been held," he said.
The nuclear regulator might compile an amended version of its report as early as in October to reflect changes in details.
September 4, 2014

Utility defends safety of Tsuruga power plant

http://www3.nhk.or.jp/nhkworld/english/news/20140904_32.html
Sep. 4, 2014 - Updated 12:13 UTC+2
The operator of the Tsuruga nuclear power plant in Fukui Prefecture has presented new data to challenge the finding by Japan's Nuclear Regulation Authority that a fault beneath the plant could move in the future.

The authority determined in May of last year that the fault beneath the plant's No.2 reactor has the potential to shift in the future. The finding has prevented the restart of the reactor and may lead to its decommissioning.

Utility officials explained at a meeting with experts from the authority on Thursday that a new analysis of deposits in a geological formation in the compound shows that the fault has not shifted over the past 120,000 years or so.

The utility also explained there is no possibility that the fault under the reactor will shift together with another fault located some distance away within the plant compound.

Many experts at the meeting said the utility has yet to produce enough objective data to support its

claims.

Kunihiko Shimazu of the Regulation Authority has said it will start drawing up conclusions as to whether to allow the restart of the reactor at the next meeting.

Local Govts not so happy about restart

September 8, 2014

Local govts wary of nuclear plant restart

http://www3.nhk.or.jp/nhkworld/english/news/20140908_28.html
Sep. 8, 2014 - Updated 12:14 UTC+2
An NHK survey shows that more than 60 percent of local governments that host or surround a nuclear power plant are cautious about restarting idled reactors even if they meet new safety guidelines.

Last month, NHK polled 146 prefectures and municipalities within a 30-kilometer radius of a nuclear power plant.

The survey asked whether they will approve restarting plants nearby if authorities find they satisfy new safety requirements.

About 12 percent said they will approve or hope to approve in the future, while 8 percent said they will not approve or will never approve. About 67 percent said they were undecided for now.

Of the respondents, 44 percent of the municipalities that host a plant gave a positive answer. Only 8 percent of municipalities surrounding a plant did so.

Asked why they are against or cautious about restarting a plant, 30 percent replied that it's because inspections by Japan's nuclear regulating body have not yet finished. About 25 percent said the central government has not yet dealt with the issue. Another 23 percent said residents are wary of a restart.

There is currently no legal framework for the central government to obtain approval from local municipalities to restart reactors. When asked what they thought of this, 42 percent said local governments should be asked for approval, while 9 percent said it was not necessary.

University of Tokyo Graduate School Professor Hideaki Shiroyama says it is necessary to create a framework where the state comes to the forefront to explain the safety of nuclear plants, as well as measures to avoid accidents.

He also says that local governments must confirm residents' understanding and be able to refuse a restart unless they get a full explanation and support from the central government.

Sendai gets safety clearance

September 10, 2014

Kagoshima nuclear plant gets safety OK, moves closer to resumption

http://www.japantimes.co.jp/news/2014/09/10/national/kagoshima-nuclear-plant-gets-safety-ok-moves-closer-to-resumption/#.VA_vx2Onq1s

Kyodo, JIJI

A nuclear plant operated by Kyushu Electric Power Co. obtained a safety clearance from regulators Wednesday, becoming the first to meet new regulations imposed following the M ith the approval from the Nuclear Regulation Authority, the two reactors at the Sendai power plant in Kagoshima Prefecture moved a step closer to restarting. Currently all of the nation's 48 commercial reactors are offline.

The pro-nuclear government of Prime Minister Shinzo Abe is eager to bring reactors back online amid a surge in fossil fuel costs for thermal power generation, which has made up for the absence of atomic power.

A restart of the Sendai plant, however, is not likely to happen before December, as Kyushu Electric must still finish paperwork needed to complete the NRA screening process.

The regional utility must also obtain consent from local authorities and undergo on-site operational checks.

On Wednesday, the watchdog's decision-ma

ith the approval from the Nuclear Regulation Authority, the two reactors at the Sendai power plant in Kagoshima Prefecture moved a step closer to restarting. Currently all of the nation's 48 commercial reactors are offline.

The pro-nuclear government of Prime Minister Shinzo Abe is eager to bring reactors back online amid a surge in fossil fuel costs for thermal power generation, which has made up for the absence of atomic power.

A restart of the Sendai plant, however, is not likely to happen before December, as Kyushu Electric must still finish paperwork needed to complete the NRA screening process.

The regional utility must also obtain consent from local authorities and undergo on-site operational checks.

n Wednesday, the watchdog's decision-making panel approved the final version of its screening report, which included public comments.

The NRA said Aug. 19 that it had received some 17,000 comments from the public on the draft version of the report the panel completed on July 16.

The nation's 48 commercial reactors, including the two at the Sendai complex, have not been allowed to resume operating amid safety concerns after being shut down for mandatory regular checkups or other reasons.

The new, more stringent safety standards introduced in July last year set a higher hurdle for reactors to operate in the wake of the Fukushima disaster, which was triggered by a massive earthquake and tsunami.

The Sendai plant, located on the southwestern coast of the main island of Kyushu, emerged in March as the leading candidate for resumption after clearing key hurdles related to earthquake and tsunami hazards that could affect the plant.

So far, power companies have applied for regulator's safety screening of a total of 20 nuclear reactors at 10 nuclear power plants.

September 10, 2014

Nuclear regulator: Sendai plant meets safety plan

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Sep. 10, 2014 - Updated 07:55 UTC+2
Japan's nuclear regulator has officially approved an assessment that says safety measures for the Sendai power plant in southwestern Japan compiled by its operator meet government safety guidelines.

The plant is located in the city of Satsumasendai in Kagoshima Prefecture and is operated by Kyushu Electric Power Company. It became the first nuclear plant to meet the more stringent standards introduced after the 2011 Fukushima Daiichi power plant accident.

The Nuclear Regulation Authority unanimously approved the assessment on Wednesday.

The document was revised based on some of the more than 17,000 public comments the authority received since it released its draft assessment in July.
The draft assessment approved a plan by the operator to restart the No. 1 and No. 2 reactors at the Sendai plant.

Many members of the public urged Kyushu Electric to implement stricter measures against possible earthquakes, volcanoes and serious accidents. But the authority said such factors won't affect its conclusions.

The authority also said it will deal with opinions about the plant's disaster-preparedness measures that were not included in the instructions for public comments, separately from the current assessment.

Observers made comments such as "unconvincing" and "discuss countermeasures against volcanic eruptions" at the regulator's meeting on Wednesday.

Attention will now be focused on necessary procedures, such as approval by local municipalities, before the plant can restart.

Kyushu Electric hopes to obtain approval from the prefecture and Satsumasendai based on safety agreements voluntarily signed by the utility.

The plant also has to gain approval from the authority regarding detailed designs of related equipment and its operational system before it can go back online.

The plant is expected to resume operation in December at the earliest.

All of Japan's nuclear reactors are now offline.

Japan nuclear plant gets safety OK, moves closer to resumption
http://mainichi.jp/english/english/newsselect/news/20140910p2g00m0dm037000c.html
TOKYO (Kyodo) -- A nuclear plant operated by Kyushu Electric Power Co. obtained a safety clearance from regulators on Wednesday, becoming the first to meet new regulations imposed following the 2011 Fukushima nuclear disaster.

With Nuclear Regulation Authority approval, two reactors at the Sendai power plant in Kagoshima Prefecture, southwestern Japan, achieved the first step toward restarting the country's nuclear power industry.
The pro-nuclear government of Prime Minister Shinzo Abe is eager to bring reactors back online amid a surge in fuel costs for thermal power generation, which has made up for the absence of atomic power.
A restart of the Sendai plant, however, is not likely to happen before December, as Kyushu Electric still needs to get some paperwork done to complete the NRA screening process.
The regional utility also needs to obtain consent from local authorities and undergo on-site operational checks.
On Wednesday, the five-member decision-making panel of the nuclear safety regulator unanimously approved the final version of its screening report. Reflected in the document were some of more than 17,800 comments received from the public after the panel approved a draft version on July 16.
The comments included those criticizing the regulator's judgment that the chance of volcanic eruptions affecting the Sendai plant -- located in the region of active volcanic sites -- were small, while others conveyed technical concern that safety measures against a variety of possible hazards such as tsunami and cyberattacks are inadequate.
Major amendments, however, were not made to the report.
All 48 commercial reactors in Japan, including the two at the Sendai complex, currently remain offline as they have not been allowed to resume operating amid safety concerns after shutting down for mandatory regular checkups or other reasons.
The new, more stringent safety standards introduced in July last year set a higher hurdle for reactors to operate in the wake of the Fukushima disaster, which was triggered by a massive earthquake and tsunami.
The Sendai plant, located on the southwestern coast of the main island of Kyushu, emerged in March as the leading candidate for resumption after clearing key agendas related to earthquake and tsunami hazards that could affect the plant.
So far, power companies have applied for regulator's safety screening of a total of 20 nuclear reactors at 10 nuclear power plants.

Reactions to NRA's decision

September 10, 2014

NRA approves safety at Kagoshima nuclear plant; paperwork next step

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201409100050

By TOSHIO KAWADA/ Staff Writer
The Sendai nuclear plant in Kagoshima Prefecture formally passed tougher safety checks on Sept. 10, but the plant operator must submit a mountain of paperwork before it can restart its reactors.
The Nuclear Regulation Authority’s approval is the first since new safety standards were established following the Fukushima nuclear disaster in March 2011. That means safety checks have effectively been completed for a resumption of operations of the Sendai plant’s No. 1 and No. 2 reactors.

As the next step, Kyushu Electric Power Co., the operator of the Sendai plant, will have to submit to the NRA construction plans that include designs of equipment and the company's new safety regulations detailing operation procedures and accident responses.
The utility is expected to submit that paperwork after late September, or about four months later than initially planned.
After those documents are certified, another month or two will be needed to inspect the equipment.
The time needed to complete all those procedures means the resumption of reactor operations is not expected until early next year.
Kyushu Electric will also have to gain the consent of local governments. The Satsuma-Sendai municipal government and the Kagoshima prefectural government have both indicated a willingness to go along with resumption of operations.
However, concerns have been raised about the effectiveness of the prefectural and municipal government's evacuation plans in the event of an emergency at the plant. The Ministry of Economy, Trade and Industry plans to dispatch employees to the local governments to strengthen central government involvement in the process.
The NRA on July 16 announced that the Sendai nuclear plant's two reactors met the new tougher safety standards and gathered public opinions over the next 30 days.
On Sept. 10, the NRA released a summary of the 17,819 opinions submitted. Those opinions were the basis for a partial correction of wording in the safety document as well as adding items that were not initially included.
Kyushu Electric may have to address other potential problems.
The utility has said it would use the current observation system to detect signs of a major volcanic eruption in the vicinity of the Sendai plant. However, volcanologists have raised opposition to Kyushu Electric's policy.
The NRA has asked experts to consider the issue more thoroughly, and Kyushu Electric may be asked to take additional measures against possible eruptions.
Twelve other nuclear plants with a total of 18 reactors have submitted applications for safety checks to allow for a resumption of operations. The NRA intends to use the Sendai process as a model case in dealing with the other applications.

Reactions to NRA assessment of Sendai plant

http://www3.nhk.or.jp/nhkworld/english/news/20140910_30.html

Sep. 10, 2014 - Updated 10:11 UTC+2
Sendai nuclear plant operator Kyushu Electric Power Company has pledged to operate with dependability, saying it will aim to upgrade safety and transparency.

The utility said it will continue to respond truthfully to the Nuclear Regulation Authority's screening of its other applications.

Public reaction in the plant's host city of Satsumasendai was mixed.

A 78-year-old man said he does not know how to explain to future generations why the plant resumed

operation at a time when problems at the damaged Fukushima Daiichi nuclear plant remain unresolved.

He said he is against restarting the reactors because safe evacuation would be impossible in case of an accident.

A woman in her 20s said she has lived all her life in the city and has never felt unsafe. She said she's hoping for an early restart, because the plant has helped the local economy.

In Tokyo, some 80 people opposed to bringing the Sendai plant back online protested in front of the building where the NRA met on Wednesday.

They delivered to the NRA secretariat a petition signed by about 5,000 people urging the body to retract the assessment report.

They cited a lack of debate on the risk of a volcanic eruption as well as problems with resident evacuation plans.

The protesters agreed to urge Satsumasendai City and Kagoshima Prefecture not to approve the Sendai plant's restart. They also agreed to demand that plant resumptions require consent not only from the host municipality and prefecture but also neighboring municipalities and prefectures.

Restart likely in 2015

September 11, 2014

NRA approves Sendai nuke plant retrofit; restart likely in 2015

http://mainichi.jp/english/english/newsselect/news/20140911p2a00m0na006000c.html
The Nuclear Regulation Authority (NRA) approved design changes to the two reactors at Kyushu Electric Power Co.'s Sendai Nuclear Power Plant on Sept. 10, paving the way for a 2015 restart.
The Sendai plant in Satsumasendai, Kagoshima Prefecture, is the first to get a passing grade from the NRA under the new safety standards adopted in the wake of the March 2011 Fukushima No. 1 nuclear plant meltdowns. With NRA approval now official, Kagoshima Gov. Yuichiro Ito plans to open a series of information sessions for prefectural residents beginning on Oct. 9.
Kyushu Electric will now begin a serious push to get local approval for the reactor restarts. The utility, however, has been late in obtaining NRA approval for two more major steps in the Sendai plant's refit, including the construction schedule, meaning the plant likely will not go back into operation until sometime after the New Year.
"We have confirmed that (the Sendai plant) will maintain the level of safety demanded for reactor operations," NRA Chairman Shunichi Tanaka told reporters after the committee's Sept. 10 meeting. However, "This does not mean there is zero risk" with restarting the reactors, he added.
Chief Cabinet Secretary Yoshihide Suga told a news conference on the same day, "It's been confirmed that safety can be maintained. As the government, we will move forward with restarting the reactors based on our basic energy plan." He went on to say, "The governor of Kagoshima has requested that we provide him

with the government's plans (regarding the Sendai plant) in writing, so we will do so. The government will explain the situation carefully and clearly to gain the understanding and cooperation of local stakeholders."
Kyushu Electric Managing Executive Officer Akira Nakamura stated on the afternoon of Sept. 10, "We will do our best to explain the situation thoroughly to local residents to gain their understanding."
The NRA opened the Sendai plant restart issue to public comment before it made its decision, and received 17,819 messages. The majority of the comments were critical of any restart, including some stating that "it's impossible to predict major volcanic eruptions, so there is not enough information to make a decision on the reactors." Others pointed out that "emergency evacuation plans were not part of the (NRA) inspection process."
However, the NRA rejected most of the comments for various reasons, including that the mountains near the Sendai plant "are not currently in danger of a major eruption anytime in the near future."

Suga: Govt. to work to restart Sendai plant

http://www3.nhk.or.jp/nhkworld/english/news/20140910_37.html
Sep. 10, 2014 - Updated 12:40 UTC+2
Chief Cabinet Secretary Yoshihide Suga says the government will assist the operator of the Sendai nuclear power plant to restart it.

He told reporters that assistance will be given in line with the government's basic energy plan. The plan designates nuclear power as a key energy source.

He said the government will seek the understanding and cooperation of local governments.

He also said the government will help improve the regional disaster preparedness plan.

Suga said that the industry minister will present a document requested by the governor of Kagoshima prefecture clearly outlining the measures the government is taking.

Before starting again,"unpredicatable" should be turned into "predictable"

September 15, 2014

EDITORIAL: Plans to restart Sendai nuclear plant leave a multitude of unresolved questions

http://ajw.asahi.com/article/views/editorial/AJ201409150035
Last week, the government implemented several procedural steps toward restarting the Sendai nuclear plant's No. 1 and No. 2 reactors, operated by Kyushu Electric Power Co.
First, the Nuclear Regulation Authority officially adopted Kyushi Electric's assessment report which certifies that the reactors meet the new regulatory standards. The Nuclear Emergency Preparedness Council followed up by approving an evacuation plan for local residents in the event of an accident. Then Yuko Obuchi, the minister of economy, trade and industry, gave written notification to the governor of Kagoshima Prefecture and the mayor of Satsumasendai stating that the government will proceed with steps to restart the Sendai plant.
Are they being a bit too eager?

The NRA's Sendai assessment report ignores warnings made by volcanologists about the potential for a major eruption and the questions they posed on how and by which means signs of such an event will be detected. Nothing has been decided about how to observe those signs, nor has any decision been reached on where to move the fuel rods if and when signs of an eruption are detected.

Previously, evacuation plans were left up to local governments. Enhancing the involvement of the national government in the **evacuation plans**, including the emergency dispatch of Self-Defense Forces personnel, is to be expected. However, there is the question of just how applicable the new evacuation plan is. Under the current plan, the authorities intend to use buses for evacuation if high radiation levels are detected. But is it ethical to put evacuees and drivers in greater risk of radiation exposure?

Also last week, the government partially released the testimonies given to its investigative committee from those involved in the nuclear disaster at the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co.

With regard to the testimonies of the late plant manager Masao Yoshida, who died in July 2013, together with those of politicians, we realize there was poor communication between the people at the plant and those on the ground, TEPCO's headquarters in Tokyo and the prime minister's office. As Yoshida said, "No one came to help." We get a sense of the extraordinary efforts made by the workers at the plant, despite the feeling of isolation and despair.

Attempts to overcome the **problems of communication** were partly reflected in the new NRA guidelines, which call for better communication tools.

However, there is not enough improvement in areas where the NRA's regulatory authority does not reach, such as in fine-tuning the separate roles of the utilities and the government, and improving the collaboration between the SDF and the fire department. Now that the timeline for the reactors' restart is on the table, these glaring issues need to be dealt with as soon as possible.

Another major lesson to be learned from the testimonies is that **just making how-to documents, be it nuclear accident handbooks or evacuation plans, will be of little use in an actual crisis, unless we implement repeated training drills to make sure they will really work when the time comes**. This is an essential step before and after the restart of nuclear power plants.

The government plans to continue releasing the testimonies gathered by its investigative committee. It should explain what it learned from the testimonies and how those findings were reflected in the detailed handbook dealing with future accidents.

There is still much to be done in order to turn the "unpredictable" into the "predictable" before the Sendai plant restarts its operations.

--The Asahi Shimbun, Sept. 14

Push ahead with restart despite volcanoes

September 29, 2014

Japan vows to push ahead with reactor restarts after volcanic eruption highlights risks

http://ajw.asahi.com/article/behind_news/politics/AJ201409290089

REUTERS

Japan's government said the sudden deadly eruption of a volcano in central Japan won't derail its push to restart two reactors located near active volcanoes, even though the public remains opposed to nuclear power after the Fukushima crisis.

The government on Sept. 29 said the latest eruption in one of the world's most volcanically active countries was hard to predict, but critics were quick to note that the same was said about the tsunami and earthquake that caused the Fukushima nuclear disaster in 2011.

Thousands of people gathered in Kagoshima on the island of Kyushu after the eruption of Mount Ontake, about 800 kilometers away, to protest against plans to restart two reactors at Kyushu Electric Power Co's nearby Sendai nuclear plant, according to one of the organizers.

The Sendai plant is located about 50 kilometers from Mount Sakurajima, an active volcano that erupts frequently. Five giant calderas, crater-like depressions formed by past eruptions, are also in the region, the closest one 40 km from the Sendai plant.

"No one knows when natural disasters, including earthquakes and tsunamis will strike. The fact that they could not predict the Mt. Ontake eruption highlights that," said Yoshitaka Mukohara, a candidate in the 2012 elections for the governorship of Kagoshima who helped organize the demonstration on Sept. 28.

"There were plumes above Sakurajima yesterday and today. We have no idea when something might happen," he said.

Japan lies on the "Ring of Fire"--a horseshoe-shaped band of fault lines and volcanoes around the edges of the Pacific Ocean--and is home to more than 100 active volcanoes.

Mount Ontake, located about 200 kilometers west of Tokyo, erupted on Sept. 27, with 10 confirmed dead and more presumed to have perished as hikers near the summit were caught by belching ash and steam.

"This was a steam-driven (eruption) and it has been said it was extremely difficult to predict," Chief Cabinet Secretary Yoshihide Suga told a news conference.

Asked whether the eruption would require careful assessment of the restart at Sendai, Suga said: "I don't think so."

Japan's nuclear regulator on Sept. 10 said the Sendai nuclear power station met its new safety standards, the first step to reopening an industry that was idled by the Fukushima disaster.

The plant still needs to pass operational safety checks as well as gain the approval of local authorities and may not restart till next year.

Before giving its initial green light in July, the Nuclear Regulation Authority (NRA) said the chance of a major volcanic activity during the lifespan of the Sendai nuclear plant was negligible.

Critics of the restarts, including some scientists consulted by the NRA, said regulators are turning a blind eye to the kind of unlikely but potentially devastating chain of events that led to three meltdowns at the Fukushima No. 1 nuclear power plant north of Tokyo after an earthquake and tsunami in March 2011.

The NRA has also formed another panel of experts to look further into mitigating the risk from volcanoes.

The issue of volcanoes was repeatedly raised by members of the public during a consultation phase after the NRA's initial assessment.

Most Japanese remain opposed to nuclear power more than three years after the Fukushima disaster even though the shutdown of the country's reactors has forced utilities to import expensive fossil fuels, pushing electricity bills higher.

More than 10,000 people gathered in Tokyo Sept. 23 to protest the plans to restart the Sendai reactors, according to local media.

Tokai reprocessing plant to be shut

September 29, 2014

Tokai reprocessing plant to be scrapped

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Sep. 29, 2014 - Updated 10:59 UTC+2
The Japan Atomic Energy Agency says it will scrap its Tokai nuclear fuel reprocessing plant north of Tokyo by April 2017 at earliest.

The decision to close the facility, announced on Monday, comes after stricter regulatory standards established following the 2011 Fukushima nuclear disaster.

The cost of revamping the Tokai plant to meet the new standards has been estimated at over 900 million dollars, masking it too expensive to maintain.

The plant extracts uranium and plutonium from spent nuclear fuel. It has processed about 1,140 tons of spent fuel since operations began in 1977.

Authorities say the transfer of the plant's functions to a reprocessing plant in Rokkasho Village, Aomori Prefecture, is almost complete.

The Tokai facility was expected to treat spent fuel from the Monju fast-breeder reactor in Fukui Prefecture, so its closure may negatively impact the government's policy to reuse spent nuclear fuel.

Tokai reprocessing plant to shut

29 September 2014
The Japan Atomic Energy Agency (JAEA) will shut its reprocessing plant in Tokai, reportedly due to the costs of modifications required under post-Fukushima safety regulations.
Following a meeting today of JAEA's reform commission, the agency announced that it will permanently shut down the Tokai facility in Ibaraki prefecture.
The Tokai plant is Japan's oldest reprocessing plant. Construction of the plant began in 1971, with trial operation starting in 1977. The plant entered full operation in 1981 but has stood idle since 2006 when a contract for reprocessing used fuel from commercial power reactors came to an end. The plant was mainly used for processing mixed-oxide (MOX) fuel from the Fugen experimental Advanced Thermal Reactor (ATR), which ceased operating in 2003.
The plant has reprocessed a total of some 1052 tonnes of used fuel comprising 88 tonnes of fuel from the Fugen ATR, 644 tonnes of boiling water reactor fuel, 376 tonnes of pressurized water reactor fuel and 9 tonnes of fuel from the Japan Power Demonstration Reactor (JPDR).
A JAEA spokesman told the Kyodo news agency that it had decided to shut the plant as it would cost too much to upgrade it to meet new safety rules. He said more than Y100 billion ($915 million) would be required to upgrade equipment and enhance safety for the Tokai plant to continue operating.

New safety rules for Japanese fuel cycle facilities came into force in late 2013. The requirements vary from facility to facility, but generally include reinforcement measures against natural threats such as earthquakes and tsunamis, and in some cases tornadoes, volcanoes and forest fires. At fuel fabrication plants, proper confinement of radioactive material is required, as are severe accident countermeasures for potential criticality accidents. Reprocessing plants need to demonstrate these as well as countermeasures specifically for terrorist attacks, hydrogen explosions, fires resulting from solvent leaks and vaporization of liquid waste.

JAEA said that the first part of the reprocessing process at Tokai, where used fuel is made into solution, will be shut soon. However, the second part, where these solutions are treated, will continue operating for about the next 20 years in order to treat used fuel solution currently stored at the facility.

Some 110 tonnes of unprocessed used fuel is also at the plant. The JAEA spokesman said that this fuel is likely to be sent overseas for reprocessing.

Tokai to close because for economic reasons

September 30, 2014

Tokai nuclear fuel processor to close due to cost of meeting new standards

http://mainichi.jp/english/english/newsselect/news/20140930p2a00m0na009000c.html

The Japan Atomic Energy Agency has announced that it will shut down a spent nuclear fuel processor in Tokai, Ibaraki Prefecture, as the cost to prepare the facility for new regulation standards established after the Fukushima nuclear plant crisis is predicted to top 100 billion yen.

The agency reported the decommission plan of the existing nuclear fuel processor at a meeting of its reform committee held on Sept. 29.

According to the agency, the nuclear fuel processing technology that has been under development at the Tokai facility has almost been completely moved to another processing station in Aomori Prefecture operated by Japan Nuclear Fuel Ltd.

The new regulation standards for running a nuclear fuel reprocessing facility require operators to take the same level of safety and anti-disaster measures against earthquakes and tsunami as nuclear power stations. The agency's executive director Shigeo Nomura told the meeting that continuing the spent fuel recycling project will not be approved by the public in terms of economic rationality.

The agency will include the decommission plan in its medium-term operational policy, which comes into effect in the next fiscal year, and file a decommission plan with the Nuclear Regulation Authority as early as fiscal 2017.

The Tokai plant came into full operation in 1981. Since 2006, it had reprocessed spent nuclear fuel from the now-decommissioned converter-type nuclear reactor Fugen in Fukui Prefecture.

There are some 110 metric tons of spent nuclear fuel left in the Tokai plant, and the agency plans to commission France to treat the remaining fuel.

September 30, 2014(Mainichi Japan)

Sendai may not restart straight away

October 1, 2014

Kagoshima reactor restarts unlikely before January

http://www.japantimes.co.jp/news/2014/10/01/national/restart-kagoshima-plant-reactors-unlikely-january/#.VCvi5Banp1s

Kyodo

The restart of reactors at the Sendai nuclear power plant in Kagoshima Prefecture appears unlikely before January, as the plant's operator only submitted the necessary documentation to regulators on Tuesday, months later than originally planned.

Kyushu Electric Power Co. submitted roughly 600 pages of documents concerning reactor 1 — one of two reactors at the complex that have obtained safety clearance by the Nuclear Regulation Authority — but that accounts for only a fraction of the operator's 20,000-page construction plan, which needs to be submitted for the plant to be restarted.

Kyushu Electric had originally planned to submit the documentation to the NRA in late May. It plans to submit the remaining documents, including those regarding reactor 2, later this month, company officials said.

Given the time required to screen the construction plan, which includes building and equipment specifications, and for obtaining local consent for the restart, the Sendai plant is unlikely to come back online before January.

Also on Tuesday, **the cities of Ichikikushikino and Hioki, which are located within a 30-km radius of the Sendai plant, demanded that the Kagoshima Prefectural Government seek their consent for the plant's restart.**

The move by the two localities comes as Kagoshima Gov. Yuichiro Ito has taken the position that approval by the prefectural government and the city of Satsumasendai, which hosts the nuclear power plant, would be sufficient to allow Kyushu Electric to restart the plant.

The municipal assembly of Ichikikushikino, which lies just 5 km from the facility, adopted a written statement by a majority vote urging the governor to also seek the city's approval, saying a number of residents had signed petitions against restarting the plant following the start of the 2011 Fukushima nuclear crisis.

The governor should "fully respect" the opinions of the residents, the statement said.

The municipal assembly of Hioki unanimously adopted a similar statement the same day, stating "It is unacceptable to restart (the plant) without the city assembly and the mayor" approving it, as the municipality could also be held responsible in the event of a severe nuclear accident.

At a press conference on Tuesday, industry minister Yuko Obuchi, who oversees the power industry, said "Obtaining consent from local communities is not a legal requisite for a restart."

Currently, all of Japan's 48 commercial reactors remain offline due to safety concerns following the triple meltdown in Fukushima. The two-reactor Sendai plant is the closest to resumption after the NRA in September said it meets new, tighter safety regulations adopted in the wake of the nuclear disaster.

With only some of the documentation submitted to regulators on Tuesday, Kyushu Electric has missed its end-of-September deadline, set after it failed to meet its original end-of-May deadline.

“In addition to a heavy workload, we’ve had countermeasures for severe accidents and other new items to deal with, so there really is no precedent we can look to for a guide,” a company official said about the delay.

Paperwork delays snarl restart of Sendai nuclear plant to next year

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201410010049

By TOSHIO KAWADA/ Staff Writer
Kyushu Electric Power Co. jumped through all hoops but one to get its Sendai nuclear power plant in Kagoshima Prefecture back online this year.
Its failure to submit all the necessary paperwork means the reactors are unlikely to be reactivated until 2015, even though the facility cleared tougher safety standards.
Kyushu Electric had planned to submit the paperwork to the Nuclear Regulation Authority by the end of September, but it did not get around to completing the procedures by Sept. 30.
The utility said it will take two to four weeks to prepare the remaining documents required for restarts of the plant’s two reactors in Satsuma-Sendai.
Even after the company obtains the green light from the NRA, the reactors must clear on-site inspections of equipment. That almost certainly will rule out restarts by the end of this year.
The nuclear watchdog on Sept. 10 formally cleared the reactors, the first such approval under stricter safety standards established after the disaster at the Fukushima No. 1 nuclear power plant in March 2011.
The NRA will continue examining whether the utility’s application documents meet the watchdog’s conditions. The screening and equipment inspections will each take a couple of months.
On Sept. 30, Kyushu Electric submitted only a portion of the documents to make corrections to its previous application for approval of construction plans that list safety measurements.
In addition to the remaining paperwork, the company is required to present documents to make corrections to its applications for approval of manuals stipulating safety measures while the reactors are in operation or in case of accidents.
The utility initially planned to submit all the necessary documents by the end of May. As the company installed new equipment and took steps to raise the plant's ability to withstand strong earthquakes, the documents have increased to more than 40,000 pages, causing a delay in its preparation.
Kyushu Electric officials expect to submit all relevant documents by the end of October.

September 30, 2014

Restart of Sendai plant may be delayed

http://www3.nhk.or.jp/nhkworld/english/news/20140930_37.html

Sep. 30, 2014 - Updated 12:23 UTC+2

A nuclear power plant in Japan's southwestern prefecture of Kagoshima may not be restarted before the end of the year.

This is due to a delay in procedures required for the restart.

The Nuclear Regulation Authority ruled earlier this month that 2 reactors at Kyushu Electric Power Company's Sendai plant meet the government's new requirements for restart. The plant became the first facility to meet the tougher standards introduced after the nuclear accident at Fukushima in 2011.

In order to bring the reactors online, the operator had intended to submit for NRA approval further details on the equipment and devices in use by the end of September.
On Tuesday, the operator submitted 600 pages of documents. These are part of about 40,000 pages involving the Number 1 reactor.

The utility says it will submit the remaining documents on the reactor within a week or two, and that it hopes to submit all the documents for the Number 2 reactor by the end of October.

The NRA will then assess the documents and check the new equipment and devices.

The utility also needs the consent of local communities in Kagoshima Prefecture for the restart.

Even if it obtains the local approval, the restart will not happen until December at the earliest, and probably not until early next year.

Restart of reactors not based on "scientific" jugement

October 6, 2014

Japan Political Pulse: Scientific uncertainty

http://mainichi.jp/english/english/perspectives/news/20141006p2a00m0na013000c.html

Distinguishing between a "scientific judgment" and an "unscientific judgment" can prove difficult at times. The recent eruption of Mount Ontake in central Japan has drawn attention to Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Satsumasendai, Kagoshima Prefecture. The reason is that the plant is located just 50 kilometers northwest of Mount Sakurajima, a prominent active volcano in Japan.
Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka, 69, told a news conference on Oct. 1 that it is "unscientific" to discuss Mount Ontake and Mount Sakurajima together. Volcanologists, meanwhile, say the logic behind countermeasures to protect the Sendai Nuclear Power Plant from volcanic eruptions is "unscientific." This gap is at the heart of discussions surrounding volcanic activity and reactivation of the Sendai plant.
Why does the government -- including the NRA -- view it as unscientific to link Mount Sakurajima with Mount Ontake? Confronting experts, we find the following explanation: While the eruption of Mount

Ontake resulted in many deaths, it was a phreatic eruption, involving the explosion of steam and rock. No magma was ejected. Meanwhile, the Sendai Nuclear Power Plant is made to withstand an eruption 10,000 times the size of the Mount Ontake eruption.

What's the basis for "10,000 times"? It's actually nothing complicated. The size of an eruption is measured by the amount of ejected matter, and the amount of ejected matter can be roughly determined based on the accumulation of ash and other ejecta.

In the Ontake eruption, the amount of ejected matter was estimated at 1 million tons, an amount comparable to that produced by Mount Sakurajima in a year. At the same time, the 1914 reaction of Sakurajima a century ago produced 100 times the ejecta normally seen in a year. Kyushu Electric Power Co., the operator of the Sendai Nuclear Power Plant, bases its guideline for safety countermeasures on the Sakurajima-Satsuma eruption held to have occurred in the Jomon period roughly 12,800 years ago. The scale of that eruption is believed to be about 100 times bigger than the 1914 eruption.

Multiplying 100 by 100, we get 10,000. If an eruption 10,000 times the size of the Ontake eruption occurred, the pyroclastic flow would not reach the nuclear plant. The amount of ash that would fall on the Sendai plant would reach an estimated 12.5 centimeters. Since it can withstand up to 15 centimeters, there is no problem.

That's what Kyushu Electric Power Co. has to say, and it's also the reason behind the government's judgment that the Sendai plant's countermeasures for a volcanic eruption are adequate.

We see, then, this is rational and scientific. But there is another point from the volcanologists who maintain this is "unscientific" that gives us cause for concern -- namely, the method of determining the possibility of a catastrophic eruption exceeding the scale of the Sakurajima-Satsuma eruption.

Government data based on Kyushu Electric Power Co.'s explanation says, "The space between periods of activity from catastrophic eruptions is about 90,000 years. The latest such eruption occurred about 30,000 years ago, so the possibility of one occurring while the Sendai Nuclear Power Plant is in operation is sufficiently low."

But doubts remain over this theory that a cycle lasts 90,000 years. The space between major eruptions should be evaluated on each caldera. However, Kyushu Electric Power Co.'s evaluation is based on a combination of the Aira caldera including Sakurajima and four other calderas in the area.

Ryusuke Imura, 50, an associate professor at Kagoshima University and an expert on volcanic geology, comments, "A hotchpotch of estimates cannot be called scientific. In terms of volcanology, it is a very rough discussion, on a level that couldn't pass the peer reviews of academic journals or specialist magazines abroad."

Of course, if there were ever to be a disaster on the scale that destroyed all of southern Kyushu, then it would not be a case of simply having to worry about a nuclear power plant. In the name of science, both the government and Kyushu Electric Power Co. share that clear stance.

But hold on -- we have witnessed one catastrophic eruption not just within the past few tens of thousands of years, but in the 19th century, in Indonesia.

From my various questions to people on the issue, **it does not seem that a scientific judgment will determine whether the nuclear power plant goes back into operation or not. In the end, it's a choice of values.** From Oct. 9 the NRA will start holding meetings to explain its screening results to residents living within 30 kilometers of the Sendai Nuclear Power Plant. (By Takao Yamada, Expert Senior Writer)

Do not restart until we have the answers

October 16, 2014

More answers about Fukushima disaster needed before reactor restarts, Niigata governor says

http://www.japantimes.co.jp/news/2014/10/16/national/niigata-governor-says-soon-reactor-restarts/#.VEC_xBanrIU

AP

Niigata Gov. Hirohiko Izumida said Japan should not restart any nuclear plants until the cause of the Fukushima meltdowns is fully understood and nearby communities have emergency plans that can effectively respond to another major disaster.

Izumida, whose prefecture is home to Tokyo Electric Power Co.'s seven-reactor Kashiwazaki-Kariwa plant, said on Wednesday that regulators look at equipment but don't evaluate local evacuation plans.

Prime Minister Shinzo Abe is pushing to restart two reactors in Kagoshima Prefecture that last month were the first to be approved under stricter safety requirements introduced after the Fukushima disaster started. Nuclear Regulation Authority Chairman Shunichi Tanaka has called the new standard one of the world's highest.

Abe has said he will restart all reactors deemed safe, reversing the previous government's policy of phasing out nuclear power.

Regulators are inspecting 18 other reactors, including two in Niigata operated by Tepco, which runs the Fukushima plant that experienced three meltdowns following the 2011 earthquake and tsunami. All 48 workable Japanese reactors are currently offline.
