The nuclear authority's approval of the two Sendai reactors in Kagoshima paves the way for their restart within few months, considered a big boost for Japan's nuclear industry.

Its ots operator, Kyushu Electric Power Co., however, still faces an on-site operational inspection and must obtain the consent of local authorities. Residents are mainly concerned about five cauldron volcanos in the region, though regulators rule out a catastrophic eruption before the end of the reactors' functional lifespan of 30 years. Kagoshima's governor and town officials have generally welcomed a Sendai restart.

Izumida declined to comment on another prefecture's decision, but he said Tepco was responsible for the Fukushima crisis and has no qualifications to resume operating a nuclear plant in his region without fully clarifying unanswered questions about the disaster.

Resuming operations at the Kashiwazaki-Kariwa plant is crucial to Tepco, which is indebted and nationalized due to the astronomical cost of cleaning up Fukushima and compensating affected residents. But the safety inspection has been delayed due to a prolonged investigation into active seismic faults inside the compound, which experts say may affect safety.

Ensuring protection of nearby residents from radiation exposure as part of a multilayer safety measure is an international standard, but still not compulsory to pass safety inspection in Japan. Towns as far as 30 km from the plant, an expansion from the 20 km before the crisis, are now required to compile evacuation plans, but many have not. In some prefectures, the drills exposed that evacuating all residents from the no-go zones would take days. Niigata compiled its evacuation plan in June and is set to test it next month.

"Protecting the residents' lives and safety is the most important task for me as governor," Izumida told reporters in Tokyo. "I don't even want to discuss a restart."

Takaham revised safety plans

October 20, 2014

KEPCO to submit revised Takahama safety plan

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Oct. 20, 2014 - Updated 22:44 UTC+2
The operator of a power plant on the Sea of Japan coast says it will submit revised safety measures to the country's nuclear regulator as early as next week.

Officials of Kansai Electric Power Company say they have completed recalculations of the potential maximum height of a tsunami that could hit the Takahama plant.

The Nuclear Regulation Authority, or NRA, had pointed out to the utility that it underestimated the height in its first assessment. The company was obliged to conduct tsunami simulations for 2 reactors at the plant.

The 2 reactor's structural resilience against major earthquakes and other safety measures have been cleared by tests that began in July of last year.

If NRA officials find no shortcomings in the revised measures, they will draft a preliminary regulation plan that will pave the way for resuming operations at the plant.

The plan will be made public by the end of this year.

Takahama will be the second plant to receive a preliminary regulation plan from the nuclear regulator, following the Sendai plant in Kagoshima Prefecture, southern Japan.

All of Japan's nuclear reactors are currently offline.

Opponents to restart protest

October 20, 2014

Opponents scuffle with officials

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Oct. 20, 2014 - Updated 13:11 UTC+2
People opposed to the restart of the Sendai nuclear power plant in southern Japan scuffled with city officials when they tried to enter a room where the city assembly's special panel was meeting.

After the panel adopted a petition calling for the restart of the plant, people gathered in front of the Satsumasendai city hall to protest the decision.

Residents are divided over whether the Sendai nuclear plant should resume operations.

A hotel worker says she wants the plant to return online soon because it is the pillar of the local economy.

A man says nuclear plants need to be restarted to ensure a steady energy supply. He says he recently visited the plant and was impressed by the safety measures that have been implemented.

An 82-year-old woman says the assembly seems intent on restarting the plant soon. She says officials should take more time to ensure that future generations are able to live without worries.

Another woman says the officials are acting too hastily in making their decision before the prefecture concludes its public briefings.

She says more discussions are needed, but that she is worried because officials seem to be rushing to restart the plant.

Senai plant restart approved by city assembly

October 20, 2014

City assembly approves Sendai plant restart

http://www3.nhk.or.jp/nhkworld/english/news/20141020_32.html
Oct. 20, 2014 - Updated 10:20 UTC+2
A special panel at a city assembly in southern Japan has approved a petition to allow a local nuclear power plant to resume operations.

The panel at the Satsuma Sendai city assembly in Kagoshima Prefecture discussed petitions both for and against the restart of the Sendai plant on Monday.

The plant is operated by Kyushu Electric Power Company. Last month it became the first to pass new regulations for nuclear plants introduced after the 2011 Fukushima accident.

Panel members in favor of the restart argued that the local economy has been sluggish since the plant went offline. But others opposing the restart said the screening by the government's Nuclear Regulation Authority does not guarantee the plant's safety.
The panel rejected 10 petitions against the restart, and adopted one calling for the plant to return online.

The city assembly is likely to approve the same petition because a majority of the assembly members are in favor of the restart.

The assembly may hold a session as early as October 28th to discuss the matter.

The plant operator says it hopes to win approval from Satsuma Sendai City and Kagoshima Prefecture.

The utility must also obtain approval from the Nuclear Regulation Authority. The plant will then undergo inspection of the newly installed equipment before going online.

The restart is likely to be early next year.

No great surprise

October 21, 2014

New industry minister vows to restart idled nuclear plants

http://mainichi.jp/english/english/newsselect/news/20141021p2g00m0dm064000c.html

TOKYO (Kyodo) -- Japan's newly appointed industry minister Yoichi Miyazawa said Tuesday he will promote the restart of the country's idled nuclear reactors that clear safety checks, adhering to the basic stance of the pro-nuclear government.

In charge of overseeing the energy sector, Miyazawa has one of the toughest jobs in the government -- persuading the public to accept the restart of nuclear plants that have remained offline amid safety concerns following the 2011 Fukushima meltdowns.

"There is no doubt that nuclear power is our nation's important base-load power source," Miyazawa, 64-year-old nephew of the late former Prime Minister Kiichi Miyazawa, said at a press conference.

Miyazawa took office the day after Yuko Obuchi -- who had the highest profile among five female ministers in Prime Minister Shinzo Abe's revamped Cabinet -- stepped down over a money scandal less than two months after she assumed the post.

In comparison to the popular Obuchi, daughter of former Prime Minister Keizo Obuchi, Miyazawa has a low profile among voters. The sudden replacement could cause a delay in Abe's plan to revive the country's nuclear industry, some observers say.

During the press conference, Miyazawa also pledged to work toward the introduction of more renewable energy and reduce Japan's reliance on nuclear power generation "as much as possible," as stated in the national energy policy adopted in April.

Regarding the restart of a nuclear plant operated by Kyushu Electric Power Co. -- which will likely be the first to go back online under post-Fukushima, tougher safety regulations -- Miyazawa said he intends to visit Kagoshima Prefecture, the host community of the facility, "at the earliest possible date," to explain the government's stance and obtain consent from the locals.

Calls for Obuchi to resign had been growing over allegations that her support groups shouldered expenses for trips for voters to a theater in Tokyo. She also came under fire over spending from her political fund at a design office and clothing shop run by her relatives.

In addition to Obuchi, Justice Minister Midori Matsushima -- another female member of the Cabinet -- resigned Monday over a separate scandal. Matsushima allegedly distributed paper fans to supporters, in a possible violation of the election law, which bans politicians from sending gifts of monetary value to constituents.

Sendai restart: Still not so simple

October 21, 2014

Sendai plant unlikely to be restarted by year-end

http://www3.nhk.or.jp/nhkworld/english/news/20141022_01.html

Oct. 21, 2014 - Updated 21:58 UTC+2
Japan's nuclear regulators are calling for more information about the measures for the first plant that has passed revised government requirements to prepare nuclear plants for disasters.

Officials from the Nuclear Regulation Authority on Tuesday met representatives of Kyushu Electric Power Company who want to restart the Sendai plant in Kagoshima Prefecture.

The utility must gain the authority's approval for detailed facility designs and management systems to put the plant back online.

The regulators said the utility has failed to provide sufficient explanations about the plant's quake resistance and other matters.

The operator plans to give additional explanations at a later date. This makes it likely that the authority will grant its approval in November at the earliest.

If the utility decides to revise documents submitted to the authority, the approval will be further delayed.

Even after the authority gives the go-ahead, the new facilities at the plant need to undergo inspections.

Taking these matters into account, it seems unlikely that the plant will be back online by the year-end even if local governments agree to the restart.

Extra briefing about Sendai plant

October 22, 2014

More public briefings on Sendai nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Oct. 22, 2014 - Updated 14:20 UTC+2
The local government hosting the Sendai nuclear power plant in southern Japan will hold an additional briefing for residents. It will **mainly be about evacuation plans in the event of a nuclear accident.**

Kagoshima Prefecture has already held sessions on safety measures by the plant operator, Kyushu Electric Power Company, in 5 municipalities around the nuclear plant, ending Monday.

Last month, Japan's nuclear regulators approved the measures, saying they met revised government requirements for restarting the nuclear plant.

The prefecture will hold an extra session on October 29th in Hioki City near the plant.

Government and prefectural officials will explain evacuation procedures and other emergency measures. Power company staff will describe its safety steps.

OK to restart Sendai

October 29, 2014

Local government gives OK to restart Sendai nuclear plant in Kagoshima Prefecture

http://www.japantimes.co.jp/news/2014/10/29/national/local-government-gives-ok-restart-sendai-nuclear-power-plant-kagoshima-prefecture/

Reuters, Kyodo

The municipal assembly in Satsumasendai, Kagoshima Prefecture, voted Tuesday to approve the restart of the local nuclear power station, another step forward in the fraught process of reviving an industry left idled by the 2011 Fukushima catastrophe.

The city of 100,000 that hosts the two-reactor Sendai plant operated by Kyushu Electric Power Co. has long relied on the facility for government subsidies and jobs.

In September, the plant became the first nuclear facility to meet beefed-up post-Fukushima safetyrequirements.

Nineteen of the 26 assembly members voted in favor of restarting the plant, while four members voted against and three abstained, an assembly member said.

Mayor Hideo Iwakiri also gave the green light, paving the way for the plant to be rebooted as early as the beginning of next year once Kyushu Electric finishes the necessary paperwork and on-site operational checks.

While expressing approval, the mayor said at a news conference that the central government should ultimately be held responsible for any accidents that occur at the plant.

He also stressed that Japan should make more efforts to develop new energy sources and reduce nuclear dependence.

Other municipalities around the complex have said that bringing the plant back online without their consent is unacceptable because many of their residents still have safety concerns.

But Kagoshima Gov. Yuichiro Ito has tamped down these concerns, saying that obtaining approval from the surrounding municipalities is not a legally required process since they do not host the plant.

In Ichikikushikino, a city less than 5 km from the Sendai plant, more than half of its 30,000 residents signed a petition opposing the restart earlier this year.

In the lead-up to the vote in Satsumasendai, officials held town hall meetings in neighboring towns to explain the restart. Some residents complained that the public meetings were restrictive and did not address concerns about evacuation plans.

The vote came as a fire broke out Tuesday at Kyushu Electric's other nuclear plant, the Genkai facility in Saga Prefecture. The blaze started in an auxiliary building of the idled power station and was extinguished by plant workers, local officials said. There were no injuries and no release of radioactive materials, they said.

All 48 of the country's nuclear reactors were gradually taken offline following the Fukushima disaster. Japan has been forced to import expensive fossil fuels to replace atomic power, which previously supplied around 30 percent of the country's electricity.

Prime Minister Shinzo Abe's government is pushing to restart the nation's reactors, but he has said he will defer to local authorities to approve a policy that is still unpopular with large swaths of the public.

October 28, 2014

City assembly set to approve Sendai plant restart

Nuclear & Energy
Oct. 28, 2014 - Updated 23:35 UTC+1
A city assembly in southern Japan is set to approve the restart of a nuclear power plant in its municipality.

Satsuma Sendai city convened an extraordinary session on Tuesday to discuss the resumption of operations at the facility.

Last month, the Sendai plant became the first across Japan to pass new government regulations introduced after the 2011 Fukushima accident.

The assembly members are expected to vote on 10 petitions opposing the move and one in favor of it.

The majority of the assembly supports the restart. It is likely to adopt the petition calling for the plant to go back online.
Mayor Hideo Iwakiri is expected to express his view and also agree to the restart.

Plant operator Kyushu Electric Power Company is also hoping to obtain approval from the Kagoshima prefectural assembly and Governor Yuichiro Ito.

Satsuma Sendai okays nuclear plant restart

http://www3.nhk.or.jp/nhkworld/english/news/20141028_27.html
Oct. 28, 2014 - Updated 07:47 UTC+1
Satsuma Sendai city in southern Japan has approved the restart of a nuclear power plant in its municipality.

The city assembly convened an extraordinary session on Tuesday, to discuss a petition requesting the restart of the facility.

One member said residents will remain opposed unless safety can be guaranteed.

The member said economic activity in the city declined after the plant was shut down, and must be restored.

The petition was adopted with the support of 19 legislators, while 4 voted against.

Following the assembly's decision, Mayor Hideo Iwakiri also expressed his approval to restart the plant. He said he understands the government policy based on its basic energy plan.

Iwakiri said it is a difficult decision when he thinks of the citizens who are cautious about the restart. But said he will do everything he can to ensure public safety.

Last month the Sendai plant became the first in Japan to pass new government regulations introduced following the 2011 Fukushima accident. Since then attention has been focused on the city's attitude toward a possible reactor restart.

Plant operator Kyushu Electric Power Company will next try to obtain approval from the Kagoshima prefectural assembly and Governor Yuichiro Ito.

Local city assembly OKs restart of nuclear plant
http://mainichi.jp/english/english/newsselect/news/20141028p2g00m0dm064000c.html
KAGOSHIMA, Japan (Kyodo) -- A local city assembly on Tuesday approved restarting a nuclear plant located in the southwestern Japan city, a step toward the first resumption of a nuclear facility in the country since new regulations were adopted following the Fukushima meltdowns.
The city assembly of Satsumasendai, Kagoshima Prefecture, adopted a petition in favor of restarting the two-reactor Sendai plant, which became the first nuclear facility in September to meet the stricter post-Fukushima safety requirements.
Satsumasendai Mayor Hideo Iwakiri also gave the green light, paving the way for the plant to go back online as early as the beginning of next year once its operator Kyushu Electric Power Co. finishes the necessary paperwork and on-site operational checks.
However, other municipalities around the Sendai complex have said it is not acceptable to bring the plant back online without their consent, citing safety concerns among locals.
Kagoshima Gov. Yuichiro Ito, however, has said it is not necessary to obtain approval from the municipalities that do not host the plant given it is not a legally required process.
All of Japan's 48 commercial reactors currently remain offline and need to pass the Nuclear Regulation Authority's safety screening to resume operations.

Kagoshima next?

October 28, 2014

Kagoshima nuclear plant 1st to be approved for restart after Fukushima crisis
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201410280087
REUTERS
A town in southwest Japan became the first to approve the restart of a nuclear power station on Oct. 28, a step forward in Japan's fraught process of reviving an industry left idled by the Fukushima nuclear crisis in 2011.
Kagoshima Prefecture's Satsuma-sendai, a town of 100,000 that hosts the two-reactor Kyushu Electric Power Co. plant, is 1,000 km (600 miles) southwest of Tokyo and has long relied on the Sendai nuclear power plant for government subsidies and jobs.

Nineteen of the city's 26 assembly members voted in favor of restarting the plant while four members voted against and three abstained, a city assembly member told Reuters.
The restart of Japan's first reactors to receive clearance to restart under new rules imposed following the Fukushima disaster is unlikely until next year as Kyushu Electric still needs to pass operational safety checks.
All 48 of the country's nuclear reactors were gradually taken offline after the nuclear disaster, the world's worst since Chernobyl in 1986.
An earthquake and tsunami struck the Fukushima No. 1 plant, 220 km (130 miles) northeast of Tokyo, sparking triple nuclear meltdowns, forcing more than 160,000 residents to flee from nearby towns and contaminating water, food and air.
Japan has been forced to import expensive fossil fuels to replace atomic power, which previously supplied around 30 percent of the country's electricity.
Prime Minister Shinzo Abe's government is pushing to restart nuclear reactors, but has said he will defer to local authorities to approve a policy that is still unpopular with large swaths of the public.
The restart divided communities nearest to the plant, pitting the host township that gets direct benefits from siting reactors against other communities that do not reap the benefits but say they will be equally exposed to radioactive releases in the event of a disaster.
In Ichikikushikino, a town less than five km (three miles) from the Sendai plant, more than half the 30,000 residents signed a petition opposing the restart earlier this year.
In the lead-up to the local vote, officials held town halls in neighboring towns to explain the restart, where some residents complained that the public meetings were restrictive and did not address concerns about evacuation plans.
A fire broke out at Kyushu Electric's other nuclear plant on Oct. 28, according to Japanese media. The fire started in an auxiliary building of the idled nuclear station and was extinguished by plant workers, the agency said. There were no injuries and no release of radioactive materials, it said.

NRAP accepts KEPCO's revised assessment

October 29, 2014

Regulator accepts nuclear plant quake projection

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Oct. 29, 2014 - Updated 12:56 UTC+1
The operator of the idled Ohi nuclear power plant in central Japan may be a step closer to its goal of restarting 2 reactors.

Japan's Nuclear Regulation Authority on Wednesday accepted its revised assessment of the strength of the biggest quake that could possibly strike the plant.

Kansai Electric Power Company had initially devised a scenario with a 700-gal maximum for the 2 Ohi reactors it wants to bring back online. The gal is used to measure ground acceleration in earthquakes. But the NRA rejected the figure as too optimistic.

On Wednesday, the NRA agreed to accept in principle the operator's revision to 856 gals. The revised figure assumes simultaneous movement along 3 fault lines near the plant as well as shallower quakes that could shake the ground even more vigorously.

Kansai Electric says the new earthquake projection would require large-scale reinforcement work at the plant that could take about a year to complete. The authority will next examine projections for tsunami and other eventualities at the Ohi power plant.

A district court in May backed area residents and ordered the operator not to restart 2 reactors at the Ohi plant. The utility has appealed the ruling.

The nuclear regulator has already approved under new regulations earthquake projections at 3 other nuclear plants.

Latest revised safety plan

October 31, 2014

KEPCO submits revised Takahama safety plan

http://www3.nhk.or.jp/nhkworld/english/news/20141031_31.html
Oct. 31, 2014 - Updated 11:27 UTC+1
The operator of the Takahama power plant on the Sea of Japan coast has submitted a report on revised safety measures to the country's nuclear regulator to restart 2 reactors.

Officials of Kansai Electric Power Company on Friday submitted to the Nuclear Regulation Authority a 7,700-page report for the plant's Number 3 and 4 reactors.

The utility revised the measures based on advice from the NRA concerning new safety regulations that took effect in July last year.

The revisions include **higher maximum levels of tremors and tsunamis resulting from possible earthquakes.**

Kansai Electric raised its estimate for tremors from 550 gals to 700, and that for tsunami height from 2.6 meters to 6.7.

The utility plans to install a large water pump and equipment for preventing hydrogen explosions.

The regulator is expected to draft a preliminary plan to pave the way for resuming the plant's operations. The plan is to be made public this year.

But before a restart, the utility must obtain approval by local municipalities and complete equipment inspections and other procedures. The process is expected to take at least until next spring.

Takahama would be the second plant to have a preliminary regulation plan drafted by the nuclear authority, following the Sendai plant in Kagoshima Prefecture, southern Japan.

Kagoshima Governor: All's well

November 3, 2014

Kagoshima governor positive after METI briefing on reactor restart

http://www.japantimes.co.jp/news/2014/11/03/national/kagoshima-governor-positive-meti-briefing-reactor-restart/#.VFe6Q8l5B1s

Kyodo

KAGOSHIMA – Kagoshima Gov. Yuichiro Ito has accepted the explanation offered by Minister of Economy, Trade and Industry Yoichi Miyazawa about the government's plan to restart the Sendai nuclear plant.

Miyazawa "clearly explained the need for the restart," Ito told reporters after the pair met Monday in the prefectural government building.

The governor will likely grant his approval for reactivating the plant if the Kagoshima Prefectural Assembly, as expected, votes in favor of the move this Friday.

"We hope for your understanding," Miyazawa told Ito during the meeting. The governor replied, "We will make a decision by comprehensively evaluating factors, after the prefectural assembly holds a vote on it shortly."

The assembly will be voting on whether to support the central government's plan to restart reactors 1 and 2 at the Kyushu Electric Power Co. plant in the city of Satsumasendai.

Earlier in the day, Miyazawa visited the Sendai plant, which is expected to be the first facility to be brought back online under safety regulations adopted after the March 2011 Fukushima No. 1 disaster.

The Nuclear Regulation Authority certified the Sendai nuclear plant as meeting the new safety regulations in September and the municipal assembly and mayor of Satsumasendai approved the restart last month. The restart is expected to take place early next year.

Restart: So many uncertainties and concerns still unadddressede

November 2, 2014

Too soon for a nuclear restart

http://www.japantimes.co.jp/opinion/2014/11/02/editorials/too-soon-for-a-nuclear-restart/#.VFYpdcl5B1s

The city assembly and the mayor of Satsumasendai, Kagoshima Prefecture, have given their nod to the restart of Kyushu Electric Power Co.'s Sendai nuclear power plant, whose Nos. 1 and 2 pressurized light-water reactors, each with a generation capacity of 890,000 kW, cleared the Nuclear Regulation Authority's screening in September under new safety standards that came into force after the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

The Kagoshima prefectural assembly and Gov. Yuichiro Ito are also expected to approve the plan as early as this week, setting the stage for the first restart of an idled nuclear power plant under the updated standards.

Still, the concerns of many of the local residents have been left unanswered, especially those over the evacuation plans that would come into effect during a major accident at the Sendai plant.

A detailed review of the evacuation plans drawn up by the local governments has not been carried out. It would be irresponsible of the central and the local governments concerned, as well as Kyushu Electric, to go ahead with the restart without addressing the concerns of the very people who could be most affected in case of a nuclear disaster.

The move to restart the Sendai plant has brought to the fore problems in administrative procedures needed to restart a nuclear power plant that had been put offline. There are no specific regulations stipulating whether the consent of local governments near a municipality hosting the plant — besides that of the host municipality itself — is needed for restart.

The Kagoshima governor has declared that the approval of only the prefecture and Satsumasendai would be necessary for the restart. But his decision ignores the concerns of people living in neighboring municipalities who would also be affected by a severe accident at the plant. Most of these municipalities either oppose the restart or are urging the national government to address accountability concerns about the restart. Some of the municipalities have demanded that their consent should be prerequisite for the restart.

Aside from Satsumasendai, the eight municipalities are located within 30 km of the plant. These cities and towns are legally required to work out evacuation plans for their residents in case of a severe accident at the Sendai plant. This requirement is a lesson learned from the 2011 Fukushima disaster — that not only municipalities adjacent to a nuclear power plant but also those located further away from it can be severely affected by radioactive fallout from a serious accident.

The NRA mainly examines whether a nuclear power plant can withstand a major earthquake and tsunami, and whether the plant is sufficiently prepared for an accident, including whether it is equipped with emergency generators and cooling systems to continue cooling reactors when the plant is damaged by a major quake or tsunami. To examine whether evacuation plans devised by local governments will actually work is outside the purview of the NRA.

It does not stand to reason that the central government would not fully involve itself in deciding whether particular evacuation plans are reliable.

The government dispatched several officials to the local municipalities in September to check the evacuation plans, but it is not clear how much they can be involved in making sure that the plans would actually work.

In view of various factors that must be taken into account in making the evacuation plans, local residents' fears are understandable. The two most important questions are whether means of transportation can be secured and which roads will be safe to travel after a quake or tsunami. Not all residents have cars, and it is not certain whether hospitals can secure enough buses to transport inpatients to safety.

The possibility cannot be ruled out that roads used by evacuees will be clogged and people will not be able to escape from danger quickly enough. If designated roads are destroyed by a quake or tsunami, substitute routes will need to be secured. It is not clear whether each municipality concerned and the prefectural government have clear ideas about what to do in such situations.

Whether the public facilities designated as places for accepting evacuees will be well-prepared with the necessary personnel and other resources is also a question.

Iodine pills are supposed to be given in advance to residents living within 5 km of the plant. At present, fewer than 70 percent of them have received the pills. It has not yet been decided what to do with visitors who happen to be in the area when a nuclear accident takes place, as well as new residents. The places and facilities for checking whether people's clothes have been contaminated with radioactive substances, and for decontaminating them, have not been designated yet.
The uncertainties with regard to emergency evacuation underscore all the more the case for the national government establishing a system to check and verify such plans — and stop the planned restart of a plant if necessary — as the U.S. Nuclear Regulatory Commission does.
Even after the NRA's safety screening of the Sendai plant, there is expert criticism that it fails to take into account all types of quakes that could hit the plant. To restart the Sendai plant while all of these concerns are still unaddressed risks ignoring the basic rights of local residents.

Kagoshima Governor says OK

November 4, 2014

Governor accepts minister's explanation about Kagoshima nuclear plant restart

http://mainichi.jp/english/english/newsselect/news/20141104p2g00m0dm035000c.html
KAGOSHIMA, Japan (Kyodo) -- Kagoshima Gov. Yuichiro Ito on Monday accepted the explanation offered by Economy, Trade and Industry Minister Yoichi Miyazawa about the government's plan to restart the Sendai nuclear power plant in the southwestern Japan prefecture.
Miyazawa "clearly explained the need for the restart," Ito told reporters after a meeting at the prefectural hall. It is believed the governor will give the green light for reactivating the plant after the Kagoshima prefectural assembly's anticipated approval Friday.
"We hope for your understanding," Miyazawa told the governor as he requested approval at the meeting.
The governor replied, "We will make a decision by comprehensively evaluating factors, after the prefectural assembly holds a vote on it shortly."
The Kagoshima prefectural assembly plans to hold the vote on Friday and a majority of assembly members are expected to support the central government's plan to restart the Nos. 1 and 2 reactors at the Kyushu Electric Power Co. plant in the city of Satsumasendai
Earlier in the day, Miyazawa visited the Sendai plant, which is expected to be the first facility to be brought back online under new safety regulations adopted after the March 2011 Fukushima Daiichi nuclear plant disaster.
The Nuclear Regulation Authority certified the Sendai nuclear plant as meeting the new safety regulations in September and the municipal assembly and mayor of Satsumasendai approved the restart last month.
The restart is expected to take place early next year.
November 04, 2014(Mainichi Japan)

Restart of Sendai given green light

Trade minister Yoichi Miyazawa, second from left, inspects the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, on Nov. 3. (Ryo Ikeda)

November 4, 2014

Kagoshima assembly to OK restarts of 2 Sendai nuke reactors

http://ajw.asahi.com/article/behind_news/politics/AJ201411040034

THE ASAHI SHIMBUN

KAGOSHIMA--The Kagoshima prefectural assembly is set to give the green light to restarting the reactors at the Sendai nuclear power plant, as a majority of assembly members indicated they will vote in favor of bringing the reactors back online.

The Asahi Shimbun has learned that a majority of the 51-member assembly will approve a petition supporting the resumption of operations of the No. 1 and No. 2 reactors at the Sendai nuclear plant in Satsuma-Sendai.

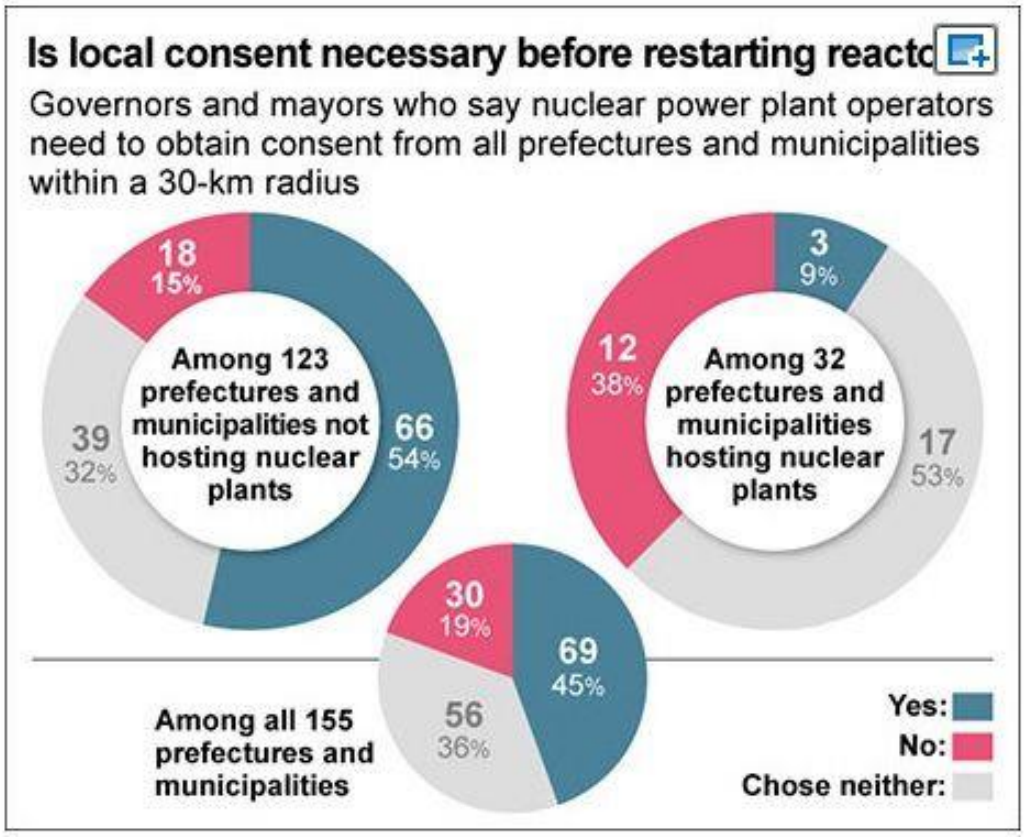
The assembly will deliberate on the petition during an extraordinary meeting of its 15-member special committee on nuclear safety and countermeasures on Nov. 5-7, culminating in a Nov. 7 plenary session.

On Nov. 3, trade minister Yoichi Miyazawa met Kagoshima Governor Yuichiro Ito and prefectural assembly chairman Kenichi Ikehata after visiting the Sendai plant and called for their support for restarting the reactors.

Hiroyuki Hosoda, secretary-general of the ruling Liberal Democratic Party, held a meeting with members of LDP's prefectural assembly caucus on the same day in Kagoshima and explained the party's intention to restart the Sendai plant.

The 35-member LDP caucus is the largest group in the assembly, and some from the three-member Komeito caucus and independents in the assembly are also expected to vote in favor of the petition.
During his meeting with Miyazawa, Ito said deliberations to restart the Sendai plant are in their final stages.
"The Satsuma-Sendai city assembly and mayor have already approved the resumption (of operations), and the prefectural assembly will soon make its decision on the issue," the governor told the trade minister. "Considering those decisions, I will make the final and comprehensive decision."

We want our say before restarting reactors



The Asahi Shimbun

November 4, 2014

Survey: Nearly half of local government leaders want a say in restarting nuclear reactors

http://ajw.asahi.com/article/behind_news/politics/AJ201411040025

THE ASAHI SHIMBUN

Nearly half of all heads of prefectures and municipalities near nuclear power plants say plant operators should be required to obtain their consent before restarting reactors, according to an Asahi Shimbun survey.

The figure reflects growing calls by local governments located within 30 kilometers of nuclear plants to have a greater say in whether such facilities are reactivated.

Among governors and mayors of the 155 prefectures and municipalities surveyed, 69, or 45 percent, said they believe plant operators must obtain consent not only from local governments hosting nuclear plants, but also prefectures and municipalities within a 30-km radius.
Among the 123 prefectures and municipalities that do not host nuclear power plants but are located within the radius, 66 governors and mayors, or 54 percent, said utilities should obtain such consent.
In contrast, among 32 leaders of prefectures and municipalities that host nuclear plants, only three, or 9 percent, said the operators should obtain consent from all municipalities within a 30-km radius. Twelve, or 38 percent, said utilities have to gain consent only from local governments hosting plants.
"Only local governments hosting nuclear power plants have effective rights to give consent to the restart of reactors, which is why they have been given generous financial incentives," said Atsushi Miyawaki, a professor of public administration at Hokkaido University.
"This has created a rift between these municipalities and their neighbors. However, the Fukushima nuclear crisis demonstrated that damage from a nuclear disaster may not be confined to municipalities hosting the plants," he said.
The survey covered governors of 21 prefectures and mayors of 134 municipalities located within the so-called Urgent Protective Action Planning Zone, a 30-km radius around 16 commercial nuclear plants across Japan, with the exception of the crippled Fukushima plant.
The respondents include leaders of 13 prefectures and 19 cities, towns and villages that host nuclear power plants. Leaders of all 155 local governments had answered the survey by the end of October.
On Oct. 28, authorities in Satsuma-Sendai, Kagoshima Prefecture, gave the green light to restarting the Sendai nuclear power plant, making it the first local government to approve the restart of a nuclear power station under new safety standards put in place following the 2011 nuclear disaster.
Kagoshima Governor Yuichiro Ito will now decide whether or not to allow the restart, based on the prefecture's view that the plant's operator, Kyushu Electric Power Co., only needs consent from the host prefecture and city.
Among the leaders of prefectures and municipalities that host nuclear plants, the Shizuoka governor, as well as mayors of Tomioka, Fukushima Prefecture, and Tokai, Ibaraki Prefecture, said utilities should obtain consent from all prefectures and municipalities within a 30-km radius.
In contrast, the governor of Fukui Prefecture, which hosts four nuclear plants, emphasized that “concerned local governments are prefectures, cities and towns that host nuclear plants.”
Meanwhile, the mayor of Niseko, Hokkaido, which is located within 30 km of the Tomari nuclear power plant in Tomari, said utilities should obtain consent from all municipalities that could be affected by a nuclear disaster.
The mayor of Izumo, Shimane Prefecture, agreed, saying the nearby Shimane nuclear plant poses the same risk to the city as it does to Matsue, which hosts the plant.
Among the leaders of all 155 surveyed prefectures and municipalities, 60, or 39 percent, called for the government to create a legally binding procedure that makes it mandatory for nuclear plant operators to gain consent from local governments to restart reactors.
Among the 12 prefectural and municipal leaders who said such a legal procedure is unnecessary, nine were from prefectures and municipalities that host nuclear plants.
The mayor of Takahama, Fukui Prefecture, which hosts the Takahama nuclear plant, said such legislation would add an “excessive political factor” to the country’s energy policy.

More debating about restart

November 5, 2014

Kagoshima Pref. assembly debates reactor restart

http://www3.nhk.or.jp/nhkworld/english/news/20141105_23.html
Nov. 5, 2014 - Updated 06:08 UTC+1
The prefectural assembly of Kagoshima, southwestern Japan, has begun debating whether to approve the restart of a local nuclear power plant.

Sendai Nuclear Power Plant is the first nuclear facility to pass new government regulations drawn up after the 2011 Fukushima Daiichi accident.

The assembly convened an extraordinary session on Wednesday to discuss the resumption of operations at the plant, which is owned by Kyushu Electric Power Company.

Speaking at the session, Kagoshima Governor Yuichiro Ito said he believes the safety of the plant has been guaranteed because it passed a strict review based on the new regulations.

He asked the assembly members to express their views, which he said will be the key factors in his decision about whether to restart the plant.

The assembly will vote on the restart on Friday, the final day of the 3-day session. The governor will make his decision after that.

About 50 protesters gathered in front of the prefectural government headquarters on Wednesday. They called on officials to consider the views of residents who oppose restarting the plant.

In October, the mayor and local assembly of Satsuma Sendai City, which hosts the plant, agreed to the restart after regulators determined that Kyushu Electric's safety measures meet the new requirements.

Safety screening for Oma plant

November 6, 2014

J-Power to apply for govt. screening of Oma plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Nov. 6, 2014 - Updated 07:57 UTC+1
A utility in Japan plans to apply to the nation's nuclear regulator for a safety screening of a power plant it is constructing in northern Japan as early as this month. The screening is a prerequisite for opening the plant.

But a nearby city concerned about the plant's safety is challenging its construction in court.

The Oma plant in Aomori Prefecture is being built by Electric Power Development Company, also known

as J-Power.

It is the first commercial plant in the world designed to run exclusively on a mixture of uranium and plutonium recycled from spent nuclear fuel, or MOX.

J-Power stopped construction work at the Oma plant after the 2011 Fukushima Daiichi nuclear disaster. The utility resumed work in late 2012, with an eye to meeting new government regulations.

The company says construction is nearing completion and it is close to satisfying the stricter rules.

The city of Hakodate filed for an injunction with the Tokyo District Court in April to halt the construction, saying it feared damage from a possible accident. The city lies less than 30 kilometers from the Oma plant across the Tsugaru Strait.

Next week J-Power President Masayoshi Kitamura will visit the Aomori prefectural government and the town hall of Oma to outline the utility's application and road map to the plant's completion.

The company also says it intends to brief the city of Hakodate on its plans.

Plant operators have filed applications with the government for screenings of 20 reactors at 13 nuclear power stations. The Oma application is the first for a facility under construction.

Matter of opinion

'Major Turning Point' For Japan As Governor Approves Sendai Restarts
http://www.nucnet.org/all-the-news/2014/11/07/major-turning-point-for-japan-as-governor-approves-sendai-restarts
Plant Operation
7 Nov (NucNet): The governor of Japan's Kagoshima Prefecture today approved the restart of the Sendai-1 and -2 nuclear reactor units after they became the first in the country to meet new safety standards imposed after the March 2011 Fukushima-Daiichi accident, the Japan Atomic Industrial Forum (Jaif) said. Yuichiro Ito's approval to restart the two pressurised water reactor units, owned and operated by Kyushu Electric Power Company, follows approvals announced last week from the mayor and the local assembly.

Various legal and technical procedures remain, with actual restarts expected at the beginning of 2015 at the earliest, Jaif said. "The decision nevertheless marks a major turning point."

In July 2014 Japan's Nuclear Regulation Authority (NRA) gave Kyushu Electric preliminary approval to restart the two units, pending local consultation and approvals.

The NRA said the station, in southwest Japan, met new safety standards designed to protect against everything from terrorist attacks to tsunamis like the one that led to meltdowns at Fukushima-Daiichi.

The new nuclear safety standards cover three main areas: design basis safety standards, severe accident measures and safety standards for earthquakes and tsunamis.

Operators of nuclear stations in Japan are obligated by law to take concrete steps to mitigate against the possibility of serious accidents. Until now, such action was voluntary.

All of Japan's 48 operational reactors are offline while they undergo inspections to make sure they comply with new safety standards.

Sendai-1 and Sendai-2 are both 846-megawatt PWRs. Sendai-1 began commercial operation in July 1984 and Sendai-2 in November 1985.

Restart given green light, but doubts linger

November 7, 2014

Kagoshima assembly, governor green-light restart of Sendai reactors

Staff Writer

OSAKA – Kyushu Electric Power Co. received approval from the Kagoshima Prefectural Assembly and governor on Friday to restart two nuclear reactors at the Sendai power plant.

Thee move clears the last major political hurdles to bring Japan's first two reactors back online, under new nuclear safety regulations introduced in July 2013.

However, some towns and villages that lie within 30 km of the plant have doubts about the restart and are demanding they, too, be consulted as part of promises by the central government and the utility to seek local consensus prior to restarting the units.

"I decided that the restart of the two reactors could not be avoided," Kagoshima Gov. Yuichiro Ito told a news conference Friday afternoon.

The assembly's vote to proceed with the reactivation had long been expected. It follows a judgment in September by the Nuclear Regulation Authority, the industry watchdog, that the two reactors had met the new safety regulations, and an overwhelming agreement less than two weeks ago by the mayor and city council of Satsumasendai, which hosts the plant, to restart the reactors.

Of the 49 members of the prefectural assembly, 35 are from the Liberal Democratic Party and three are from Komeito. Both parties agreed to the restart.

Satsumasendai Mayor Hideo Iwakiri and Gov. Ito had long made it clear they were in favor of the plan, despite opposition and concern among other municipalities within 30 km of the plant over the possibility of a nearby volcanic eruption, as well as criticism from anti-nuclear activists about the lack of detailed evacuation plans.

Ichikushikino, which has about 30,000 residents, lies within the 30-km radius and parts of the city are only 5.4 km from the plant. City officials were angry at Ito for his stance that as long as Satsumasendai consented to a restart, sufficient local approval had been obtained.

"Our city is a local government that sits right next to (the Sendai) nuclear power plant. As a city whose trust and deep understanding for the restart should be gained in the same way as the city hosting the reactors, and considering how close we are, you should take into account the voices of the people in

surrounding municipalities," Ichikikushikino Mayor Seiichi Tabata wrote in a three-page letter sent to the governor on Thursday.
Tabata called on Ito to consider the safety of the Sendai reactors as well as the inadequacy of current evacuation plans for nearby municipalities, expressing the fears of many area residents that in the event of an accident at the plant, especially one involving a natural disaster that blocked off access roads, escape would be impossible.
At his news conference, however, Ito said he had no problem with local evacuation plans. "The plans drawn up by the central government for evacuation are concrete and logical," he said.
That prompted a reply from the Ichikikushikino mayor Friday evening, who said Ito should try to dispel local concerns and pressure the central government and Kyushu Electric on safety measures.
For Satsumasendai, restarting the two units also means resuming the flow of state funding. Between 1974 and 2013, the city received over ¥27 billion in central government subsidies for hosting the plant.
The plant's No. 1 and 2 reactors, which have been offline since the March 11, 2011, quake and tsunami triggered the Fukushima meltdowns, generate 890 megawatts each. Reactor 1 went into operation in 1984, and reactor 2 the following year.
However, the units are unlikely to resume operation until sometime early next year, as the NRA has not completed its screening process.

Kagoshima Governor agrees to plant restart

http://www3.nhk.or.jp/nhkworld/english/news/20141107_26.html
Nov. 7, 2014 - Updated 07:10 UTC+1
Kagoshima Governor Yuichiro Ito has agreed to the restart of a local nuclear power plant.

The Sendai plant, operated by Kyushu Electric Power Company, is the first facility to obtain the agreement of the host prefecture and municipality for a resumption of operations since new government regulations were drawn up for nuclear plants. These were introduced after the 2011 accident at the Fukushima Daiichi plant.

In September, the Sendai plant became the first nuclear facility in Japan to meet the requirements.

The governor's agreement came after the Kagoshima prefectural assembly approved the restart of the plant earlier on Friday.

Last month, Satsuma Sendai City -- which hosts the plant -- also agreed to accept a resumption of the plant's operations.

Although Kyushu Electric will proceed with the restart, it is likely that the plant will not go back online until early next year because of other administrative procedures.

All of Japan's nuclear reactors are now offline.

Plant restart approved by Kagoshima assembly

http://www3.nhk.or.jp/nhkworld/english/news/20141107_22.html
Nov. 7, 2014 - Updated 05:02 UTC+1
The Kagoshima prefectural assembly in southwestern Japan has approved the restart of a local nuclear power plant. The Kagoshima governor is also likely to give his approval on Friday.

The Sendai plant is operated by Kyushu Electric Power Company. It was the first nuclear facility in the country to meet new government requirements in September. The regulations were drawn up after the 2011 accident at the Fukushima Daiichi plant.

The prefectural assembly voted on Friday on a citizens' petition requesting the restart of the plant. The supporters included members of the Liberal Democratic Party and Komeito.

Kagoshima Governor Yuichiro Ito has repeatedly said he will make up his mind after considering the decisions by Satsuma Sendai City, which hosts the plant, and the prefectural assembly.

Last month, Satsuma Sendai City agreed to restart the plant.

Kyushu Electric is expected to proceed with the restart when the governor gives his agreement. But it is highly likely that the plant will not resume operations until early next year because of other administrative procedures.

All of Japan's nuclear reactors are now offline.

But what is "local approval"?

November 7, 2014

2 reactors to restart in Japan after getting local go-ahead

http://mainichi.jp/english/english/newsselect/news/20141107p2g00m0dm055000c.html

KAGOSHIMA, Japan (Kyodo) -- Two nuclear reactors in southwestern Japan won local consent for their restarts Friday, making it certain that the two will become the first of the country's 48 offline commercial reactors to resume operation despite lingering concerns over evacuation planning and other safety issues.
In giving the green light for the restart of the Nos. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture, Kagoshima Gov. Yuichiro Ito said at a press conference the restart "is necessary" and emphasized that safety of the reactors has been ensured by nuclear regulators.
Local approval has been secured for the first time for reactors that have cleared a set of tougher safety requirements introduced in the wake of the 2011 Fukushima nuclear crisis. The actual resumption of the two reactors is expected next year, as regulators need to carry out further checks.
The nod by the governor effectively wraps up the process of winning local approval on the issue, as the prefectural assembly and the mayor of Satsumasendai city that hosts the plant have already expressed their approval.
As the Kagoshima prefectural assembly moved to adopt a petition in favor of restarting the reactors earlier Friday, nuclear opponents who came to listen to the discussions shouted, "You should protect the lives of the residents of the prefecture!" and "You should be ashamed!"

Even before the start of the plenary session, the chair had to call for silence because the protesters were shouting, "We are against nuclear restarts!"
Among residents of Satsumasendai, 64-year-old Masahiro Iwashita said he was disappointed that discussions have proceeded on the assumption the reactors will be restarted.
"There's been no occasion to properly garner opinions of residents of the prefecture...I won't give up efforts to stop the restart," he said.
But a taxi driver in the city expressed hope the reactors will be restarted swiftly and help boost the local economy.
"There aren't many jobs in this area and the number of customers has decreased," 66-year-old Michio Yamada said.
The central and prefectural governments appear to have been eager to finish the process quickly, although residents have voiced concerns about whether the Sendai plant, located in a region with active volcanic sites, will be safe if nearby volcanoes erupt and whether evacuation plans will sufficiently work.
The Nuclear Regulation Authority is mandated to evaluate safety measures for nuclear plants submitted by operators before allowing them to resume operations, but the evacuation plans, devised by local communities, are not subject to state screening.
However, Ito said at the press conference, "The plans have been confirmed by the state's nuclear disaster meeting that they are concrete and rational."
The scope of "local approval" has also been called into question, with no laws to determine the matter.
While Ito has said it means the approval of the prefecture and the host city, assemblies of some municipalities near the city have insisted they also have a say, as their residents could also be seriously affected by a nuclear accident.
Under Japan's new nuclear-disaster mitigation guidelines, revised after the Fukushima crisis, areas that need special preparations, such as evacuation plans, have been expanded to a 30-kilometer radius of a plant from the previous 10 km.
The local assemblies that have called for more say in the matter are located within the 30-km radius.
In the case of the Fukushima crisis, which saw three reactors suffer meltdowns after the plant was hit by a huge earthquake and tsunami, residents living within a 20-km radius of the plant and some areas beyond had to evacuate. More than 120,000 people still live as evacuees.
All of Japan's 48 commercial reactors have been offline since two reactors at Kansai Electric Power Co.'s Oi nuclear complex in Fukui Prefecture shut down for mandatory regular checkups in September last year.
As Japan revamped its nuclear regulations in July last year, reactors are now first required to clear the regulations before resuming operation.

Forget protests

November 7, 2014

Kagoshima governor approves restart of Sendai Nuclear Power Plant despite protests

http://mainichi.jp/english/english/newsselect/news/20141107p2a00m0na021000c.html
KAGOSHIMA -- Kagoshima Gov. Yuichiro Ito gave his consent on Nov. 7 to restarting the Sendai Nuclear Power Plant in the Kagoshima Prefecture city of Satsumasendai despite strong protests from locals and other demonstrators who arrived from areas as far away as Fukushima Prefecture.

Gov. Ito's move came after the Kagoshima Prefectural Assembly adopted a petition calling for reactivation of the plant. Some 400 people had gathered both inside and outside the prefectural assembly chamber, trying to prevent Kagoshima from becoming the first prefecture housing a nuclear plant to approve reactivation under new safety guidelines for nuclear power, but they failed to sway officials.
Police and workers from the prefectural government headquarters closely guarded the assembly building on Nov. 7. At about 9 a.m., a group opposed to restarting the plant's reactors gathered in front of the prefectural government building, protesting that officials were ignoring public opinion.
Among the demonstrators were 12 people from Fukushima Prefecture, which hosts the Fukushima No. 1 Nuclear Power Plant, the scene of the nation's worst-ever nuclear disaster.
"The disaster taught us that there's no such thing as a safe nuclear power plant, and that humans and nuclear power can't coexist," said 58-year-old Yoshiharu Saito, an executive from an organization in the city of Fukushima. "I came here to Kagoshima to convey the feelings of Fukushima Prefecture residents who went through the disaster."
Eiji Yanase, a 60-year-old member of an organization in Saga Prefecture, which is home to the Genkai Nuclear Power Plant, also took part in the protest.
"We are seeing one fait accompli after another. I don't want the children and grandchildren of the future to have to pay the price," he said.
Also protesting was 61-year-old Shigenobu Kawahara, from Isahaya, Nagasaki Prefecture. "To stop moves toward restarting the Sendai Nuclear Power Plant will lead to halting the reactivation of other nuclear power plants," he said.
A plenary session of the Kagoshima Prefectural Assembly commenced at 10 a.m. and the 150 public gallery seats were almost fully occupied. Outside, some reactivation opponents who were unable to enter the prefectural government building shouted that they be let in, resulting in a tussle with prefectural government workers.
Anger against the move to restart the reactors resounded within the chamber, when Makoto Nakamura, chairman of the prefectural assembly's special committee on nuclear power safety measures, reported on the committee's screening results from the previous day. When Nakamura used such expressions as "the world's safest standards," jeers erupted from the public gallery, with one protester yelling out, "Are you still saying things like that?"
November 07, 2014(Mainichi Japan)

"A hasty move without sufficient debate"

November 8, 2014

Editorial: Safety questions remain over Sendai nuclear plant

http://mainichi.jp/english/english/perspectives/news/20141108p2a00m0na014000c.html
A lesson learned from the Fukushima nuclear crisis is that a catastrophic accident endangering residents' health and lives can occur at any nuclear power plant. As such, **serious questions remain over the fact that a move toward restarting the Sendai Nuclear Power Plant in Kagoshima Prefecture is steadily progressing in ignorance of this lesson.**
The Kagoshima Prefectural Assembly has adopted a petition from local businesses calling for a resumption of operations at the atomic power station, and Gov. Yuichiro Ito has also endorsed the restart of the plant. Since the mayor and the municipal assembly of Satsumasendai that is home the power station

earlier approved the reactivation of the plant, its operator Kyushu Electric Power Co. has completed procedures for gaining consent from local communities. Although the latest moves mark a milestone since new regulatory standards for atomic power plants were enforced in July 2013, it can hardly be said that all the challenges to restarting the plant have been resolved.

The government's Nuclear Regulation Authority (NRA) has not completed its procedures for giving the green light to the reactivation of the power plant. Kyushu Electric Power Co. needs to gain approval of its plan on work to improve the plant based on the NRA's assessment and the utility's safety regulations. Such being the case, one cannot help but wonder why the prefectural and municipal governments needed to **hastily** express their consent to the restart of the plant. Critics say some political parties attempted to prevent the issue from being a point of contention during a prefectural assembly election next spring. Serious doubts remain as to whether the local governments thoroughly studied the safety of the nuclear plant and other issues before approving the plant's reactivation.

We have insisted that several conditions need to be met before the restart of idled nuclear plants is approved. The mayors and governors of the municipalities and prefectures have the responsibility to protect the lives and health of local residents should a catastrophic accident occur at atomic power stations they host. The planned response to those who need assistance and preparedness to accommodate evacuees in case of a serious nuclear accident, which are incorporated in local governments' evacuation plans, are not necessarily adequate. Moreover, the effectiveness of local governments' evacuation plans is not guaranteed because there is no system under which national governments screen such plans. As such, **great confusion might be inevitable if a catastrophic accident were to occur at a nuclear plant under the current circumstances.**

Local residents' consent is an important factor in restarting idled nuclear reactors. The Kagoshima Prefectural Government has held briefing sessions in five municipalities around the Sendai plant with the attendance of NRA officials. However, they failed to provide a sufficient explanation in response to questions raised by local residents about the need to restart the power station and the effectiveness of the evacuation plans. Supplementary briefing sessions that the prefectural government held subsequently failed to convince local residents of the plant's safety.

Surveys conducted after these sessions were superficial, merely asking the attendees to make overall comments on the sessions and what they did not understand. **A system should be created to sufficiently listen to local residents' opinions and convince them of the plant's safety**. However, the organizer of the briefing sessions obviously failed to sufficiently do so.

If a catastrophic accident were to occur at the Sendai nuclear plant, not only Satsumasendai but a**lso surrounding municipalities would be affected**. Therefore, many residents of municipalities around the power station are apparently dissatisfied with Kyushu Electric Power's intension to go ahead with the restart of the plant after gaining approval from only the Kagoshima governor and the municipality that hosts the plant.

Needless to say, the responsibility for restarting nuclear plants does not lie solely with local communities that host such facilities. The central government should judge whether to go ahead with the restart of individual nuclear plants after clearly showing a road map toward creating a society that will not rely on atomic power.

Going ahead with the procedure for restarting the Sendai nuclear plant before meeting these conditions should be criticized as a hasty move without sufficient debate.

November 08, 2014(Mainichi Japan)

Minamata group says safety takes back seat again

November 9, 2014

Minamata disease group opposes restart of Sendai nuclear plant

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201411090008

By YASUSHI SAITO/ Staff Writer

MINAMATA, Kumamoto Prefecture--Minamata disease victims and supporters have joined the protest against the restart of nuclear reactors in Kumamoto Prefecture, saying **safety again is taking a back seat in the drive for economic growth.**

"If they miss the danger of nuclear plants because of economic priorities, they have not learned the lessons from Minamata disease," said Koichiro Matsunaga, who heads the group "Stop restarting nuclear plants Minamata."

Formed in September by eight members, including three Minamata disease patients, the group plans to collaborate with local organizations to oppose the resumption of operations at the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture.

Kagoshima Governor Yuichiro Ito on Nov. 7 approved the plant's restart, the first such green light under stricter safety standards that were established following the Fukushima nuclear disaster in March 2011. The city of Minamata is about 40 kilometers from the plant at the shortest distance.

Minamata disease, a sometimes fatal neurological disorder that causes numbness and vision problems, was officially recognized as a health hazard 58 years ago. Caused by consumption of marine products contaminated by mercury discharged into the sea by a chemical factory, the disease remains a negative symbol of Japan's period of high economic growth.

Matsunaga said he sees similarities between the Sendai plant's restart and Minamata disease.

"While human lives should take priority, the priority has been placed on corporate profits," Matsunaga said. "(The government) has not learned lessons from Minamata and Fukushima.

Matsunaga, 51, visited Iitate in Fukushima Prefecture in February 2013. Many residents of the mountain village, whose center is about 40 km from the crippled Fukushima No. 1 nuclear power plant, remain in evacuation because of the high levels of radiation around their homes.

Matsunaga said that when he saw the Iitate village office, the vacant houses in the central area and temporary housing, he thought: "Residents cannot return home even if they wanted to.

"The Fukushima nuclear power plant has been tormenting people who were born and brought up in this village. There is no guarantee that Minamata can avoid the same fate."

He cited two problems with restarting the reactors at the Sendai plant: inadequate evacuation plans in the event of a disaster and a lack of trust in the government.

Matsunaga noted that the central government said it would take responsibility for the resumption of operations at the nuclear plant.

"But it did not take responsibility for Minamata disease, either," Matsunaga said.

The mayor of Satsuma-Sendai and the city assembly approved the reactor restarts earlier, on Oct. 28.

Matsunaga's group urged the Minamata assembly to adopt a written statement opposing the reactor restarts, but the assembly rejected it.

"Despite Minamata disease, a public hazard, economic priorities always come first," said Kenji Nagamoto, a 55-year-old Minamata disease patient. "I am disappointed we were not understood."

Minamata city plans to accept 6,645 evacuees from Izumi, Kagoshima Prefecture, if a serious accident occurs at the Sendai nuclear plant.
"With evacuation plans insufficient, to what extent can the central government assure the people's security?" Matsunaga asked.
Minamata Mayor Hiroshi Nishida on Nov. 8 also expressed concerns about the aftermath of a potential nuclear accident.
"We hope the central government will give a sufficient explanation to eliminate the anxieties of Minamata citizens who will accept evacuees, as well as resolve the problem responsibly and with sincerity," Nishida said in a statement.
Another Minamata-based group involved in possible evacuation procedures asked the Kagoshima governor in May to oppose the resumption of the plant. The group's view was not reflected in his decision.
"If a serious accident occurs, Minamata will also be subjected to evacuation," said Takafumi Nagano, head of the group. "I feel angry that Kagoshima Prefecture made the judgment (to resume operations) alone."
Nagano also said the central government's assurances cannot be trusted.
"Industry minister Yoichi Miyazawa said he will stand at the forefront to assume responsibility. But I cannot believe what he said when containment of the Fukushima plant accident is still not evident," Nagano said. "They only seem to be rushing to restart operations of the (Sendai) plant."

Sendai not a good model for restart

November 8, 2014

EDITORIAL: Sendai nuclear plant should not be model for reactor restarts

http://ajw.asahi.com/article/views/editorial/AJ201411080035

Kagoshima Governor Yuichiro Ito agreed on Nov. 7 to allow Kyushu Electric Power Co. to restart operations at its Sendai nuclear power plant. Ito said his decision was based on the opinions of the Kagoshima prefectural assembly, the mayor and the municipal assembly of Satsuma-Sendai, where the plant is located.
The mayors of the eight municipalities located within 30 kilometers of the nuclear plant did not raise objections to the governor's decision.
Local governments of areas hosting nuclear power plants have no legal power to approve or reject decisions on whether to bring reactors back online. However, the consent of the local communities is regarded as an essential procedure for a reactor restart.
The Kagoshima governor's decision has effectively ensured that the Sendai plant will resume operations. It will be the first nuclear power plant to start running again under stricter safety standards set in the aftermath of the disaster that struck the Fukushima No. 1 nuclear power plant in March 2011.
Currently, 18 reactors at 12 nuclear plants across the nation are undergoing safety assessments by the Nuclear Regulation Authority under the new standards.
The administration of Prime Minister Shinzo Abe has pledged to restart all reactors that have passed the nuclear watchdog's safety reviews. The Abe administration intends to use the case of the Sendai plant as the template for the restarts of other plants.

But the process leading to the reactivation of the idled reactors at the Sendai plant has raised serious doubts about the government's approach to the issue. The government is moving toward restarting the Sendai plant's reactors without making sufficient efforts to ensure the local communities are prepared for serious accidents.

SAFETY OF LOCAL RESIDENTS NOT ENSURED

First of all, the plan for emergency evacuations is grossly insufficient.

There is still no reliable plan for securing buses needed to evacuate local residents and dealing with expected traffic jams during emergencies, despite the fact that these issues have a direct bearing on the safety of local residents. The two problems were among the major factors that caused serious confusion in local communities during the Fukushima nuclear crisis, jeopardizing the safety of the residents.

The Fukushima meltdowns brought to the fore the fact that it is impossible to guarantee 100 percent safety of nuclear power generation, which entails risks that cannot be controlled.

If it is still necessary to operate nuclear reactors, authorities must take measures to minimize the risk for residents in host communities that would be affected by accidents and evaluate the sufficiency of those measures in ways that reassure the residents.

Six meetings were held since October to explain the reactor restart plan to local residents. But five of the meetings were focused exclusively on the technical and abstruse content of the safety assessment by the Nuclear Regulation Authority.

These meetings failed to ease the simple anxieties of residents about resuming operations at the Sendai plant. Nor were the meetings used to incorporate residents' proposals into safety measures.

In a survey of participants conducted immediately after the meetings, 47 percent of the respondents said the talks were not helpful. In addition, 60 percent of the respondents said there was at least one issue they did not understand despite the explanations given at the meetings.

In the end, the prefectural governor, the mayors of the municipalities and the local assemblies all said the central government is ultimately responsible for safety measures and evacuation plans.

Local governments, such as prefectures and municipalities, are involved in the process of restarting reactors because the safety of their residents is at stake.

The central government acted in a similarly inadequate way. In response to requests from the prefectural government, the Abe administration dispatched government employees and senior officials to the prefecture.

In local assembly sessions and on other occasions, these officials repeatedly stressed that "the central government takes the responsibility" for ensuring the safety of local communities.

On Nov. 3, Yoichi Miyazawa, the minister of economy, trade and industry, traveled to the prefecture in Kyushu and spoke about the need to restart the plant.

UNCLEAR MEANING OF 'TAKING RESPONSIBILITY'

What exactly does it mean that the government "takes the responsibility?" We know nothing specific about the government's promise.

The Fukushima nuclear disaster has created a raft of daunting challenges: rebuilding the livelihoods of victims; decommissioning the disabled reactors; dealing with a growing amount of radioactive water; decontaminating areas polluted with radiation; and disposing of radioactive waste. The government has not taken responsible actions in any of these formidable challenges.

Tokyo Electric Power Co. is directly responsible for the accident. Electricity consumers and taxpayers eventually have to pay the bills for compensation payments to victims and related government expenditures.

A severe accident at a nuclear power plant causes tremendous damage to the host communities, and the effects of the damage are felt for at least several decades. **The government is incapable of taking the responsibility to deal with all the consequences of a major nuclear accident.**

If the government says it will take the responsibility for the safety of local residents without paying attention to this reality, it is simply making an empty promise.

There is something else the government should do responsibly for the host communities: provide assistance to help end their financial dependence on nuclear power plants. The Abe administration has pledged to reduce the nation's dependence on nuclear energy.

ENDING RELIANCE ON NUCLEAR POWER

Many local governments in areas hosting nuclear plants are willing to approve plans to restart offline reactors. That's because they are generally underpopulated areas that cannot maintain their communities unless they accept nuclear plants to obtain related state subsidies and tax receipts.

To reduce their dependence on nuclear plants, it is vital to change the reality that forces them to accept such plants in the first place.

This is an immense challenge that the local governments cannot deal with on their own. That makes it all the more important to start taking steps to tackle this challenge now.

The government should take measures to promote recycling-oriented industries that make greater use of local resources and develop necessary human resources. It should also reorganize its energy policy budget, which has been focused on promoting nuclear power generation, and work out a new energy policy program featuring measures to reform the power supply system and promote the use of renewable energy sources. It is also the responsibility of the government to initiate debate on these issues involving areas that consume electricity.

In an Asahi Shimbun opinion poll conducted on Oct. 25 and 26, 55 percent of the respondents voiced opposition to the idea of resuming operations at nuclear plants. Similar polls carried out by other newspapers have also found a majority of the respondents cautious about the idea.

If the process of restarting the Sendai plant has become a model, the decision on whether to bring a reactor back online will be effectively left to the host communities. This will cause the will of the entire nation to become increasingly irrelevant. Would such a situation be acceptable?

There is a heap of problems concerning the nuclear power policy that could put the interests of the host communities at odds with those of the nation as a whole. They include, for example, how to store spent nuclear fuel and how to dispose of radioactive waste.

Debate on whether to start running the Sendai plant again has raised the question of how to harmonize the conflicting interests of the communities hosting nuclear plants and the nation as a whole.

--The Asahi Shimbun, Nov. 8

Sendai restart: A "dangerous precedent"

November 12 , 2014

Bad precedent for nuclear restarts

http://www.japantimes.co.jp/opinion/2014/11/12/editorials/bad-precedent-nuclear-restarts/#.VGWoq8l5B1s

Following the recent go-ahead given by Kagoshima Prefecture and the host city of Satsumasendai, Kyushu Electric Power Co.'s Sendai nuclear power plant is likely to be reactivated by early next year — the first under safety guidelines adopted in the wake of the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. But the move contains serious safety and procedural problems, and there is a risk that the Abe administration and power companies will use it as a precedent to rush the restart of more nuclear power plants without fully addressing the legitimate safety concerns of local residents.

the lessons from the Fukushima nuclear disaster, municipalities within 30 km of a nuclear power plant are required to work out evacuation plans for residents in the event of a serious accident. In the case of the Sendai plant, eight municipalities, in addition to Satsumasendai, were required to draw up evacuation plans.

In a September meeting of the national government's nuclear disaster management council, Prime Minister Shinzo Abe described the evacuation plans as "concrete and rational" despite the absence of a formal procedure for the central government to examine such plans. It is unclear how detailed an examination the government gave the plans and whether it checked their operability against worst-case scenarios. Many local residents who took part in a series of explanatory meetings expressed concerns about safety — which are understandable given the procedural setup.

Located in an area with a history of volcanic activity, the Sendai plant is viewed as being vulnerable to future possible eruptions. Kyushu Electric says that if an imminent eruption is predicted, it will take the nuclear fuel out of the plant's two reactors as a safety precaution. But it is difficult to predict volcanic eruptions and the company has yet to decide how to transport the fuel and where it can be safely stored.

The plant itself has problems. Filtered ventilation systems to reduce the amount of radioactive materials released from the reactor core in emergencies will not be installed for another two years. And the plant has not established a permanent off-site facility to serve as a command center in emergencies. A temporary facility will be used for the time being.

In a news conference held after giving his consent to the restart, Kagoshima Gov. Yuichiro Ito declared that there would be "no issue of life or death" for local residents in the event of an evacuation, citing the Nuclear Regulation Authority's assessment of possible radiation fallout from a severe accident at the Sendai plant. This statement ignores key lessons of the Fukushima crisis — that a severe nuclear accident can quickly spin out of control, and that even if radiation exposure does not claim any lives, the stress caused by evacuation and loss of property can cause grave and sometimes fatal health issues.

Because Ito decided that approval by the host city and Kagoshima Prefecture are sufficient to approve the restart, the exclusion of the eight other municipalities in the approval procedure for the Sendai plant may be used as a precedent by the Abe administration and other power firms as there are no legal regulations concerning which municipalities should be involved in such decisions. In short, the will of the people in nearby municipalities who may be directly affected by a severe nuclear accident can be completely ignored.

Trade and industry minister Yoichi Miyazawa said that if a nuclear accident occurs, the national government will be responsible for handling it. But the experience of the Fukushima disaster shows that such a promise means little in reality.

As the seemingly last key hurdle for the restart of the Sendai nuclear power plant is lifted, a dangerous precedent has been set and many fundamental questions remain unanswered.

NRA panel confirms assessment on Tsuruga fault

November 19, 2014

NRA panel: Fault under Tsuruga reactor could move

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Nov. 19, 2014 - Updated 13:04 UTC+1
Experts from Japan's nuclear regulator have determined that a fault running under a reactor at the Tsuruga nuclear plant in Fukui Prefecture, central Japan, could move in the future.

The Nuclear Regulation Authority concluded in May last year that the fault could be active. The plant's operator, Japan Atomic Power Company, then submitted new data disputing that assessment.

But after looking over that data, the NRA's panel of experts on Wednesday reaffirmed last year's conclusion that the fault could shift again.

In its draft assessment report, the panel cited a recently discovered fault north of the reactor that appears to extend from the fault under the reactor.

The panel said it couldn't rule out that the new fault had shifted in the past 120,000 to 130,000 years. Based on new regulations, the authority defines a fault that shifted within that period as potentially active. Reactor buildings and other key nuclear facilities are not allowed to be built atop such faults.

The report pointed out that the new fault could be connected to the fault beneath the reactor.

The panel will submit its assessment to the authority after hearing from other experts who did not participate in the discussions.

If the authority does not overturn the panel's assessment, the reactor cannot be restarted and may have to be decommissioned.

Japan Atomic Power Company Vice President Taiki Ichimura criticized what he described as a unilateral assumption, and expressed confidence it would be proved wrong.

He said the company welcomes the opportunity to challenge the panel's assessment.

Fault under Tsuruga IS active

November 20, 2014

Nuclear watchdog panel: Fault under Tsuruga reactor is active

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201411200043

THE ASAHI SHIMBUN

A fault line beneath the No. 2 reactor of the Tsuruga nuclear power plant is indeed active, an expert panel of the Nuclear Regulation Authority concluded Nov. 19, drawing criticism from the plant's operator.

Japan Atomic Power Co. vowed to challenge the panel's conclusion, which, if it stands, would force the company to decommission the reactor under new safety rules.

"It is a rash, one-sided judgment and just a presumption," Japan Atomic Power Vice President Taiki Ichimura told reporters after the Nov. 19 meeting of the NRA panel. "We are confident that we will be able to rebut and disprove the conclusion."

The NRA in May 2013 pointed out the possibility that the fault line beneath the No. 2 reactor building of the Tsuruga plant in Fukui Prefecture could move in conjunction with the nearby Urasoko active fault.

Japan Atomic Power, citing its own survey results, said the fault under the reactor was not connected to the Urasoko fault's branch and was not active.

After reassessing the conditions at the Tsuruga plant, the expert panel said in its draft report Nov. 19 that the fault under the reactor building "could move in the future," repeating the NRA's stance last year.

The NRA is expected to finalize the draft after it is examined by other experts.

Under stricter safety standards introduced after the Fukushima nuclear crisis triggered by the March 2011 Great East Japan Earthquake and tsunami, reactor buildings cannot be built directly above active faults. Japan Atomic Power will likely be unable to restart the No. 2 reactor unless the panel's draft report is dismissed.

The NRA's assessment of the fault last year came when Kunihiko Shimazaki, a seismologist known for his tough attitude toward power companies, was a deputy chairman of the watchdog. Utilities and ruling coalition officials criticized Shimazaki over his "hurried conclusion" on the Tsuruga plant.

Although Shimazaki's term ended in September and he was replaced, the NRA's position on the fault was not overturned.

The fault line survey at the Tsuruga plant was originally started at the request of the now-dissolved Nuclear and Industrial Safety Agency.

Fault inspections are a separate process from the safety screenings required to restart reactors, so Japan Atomic Power can still submit an application to resume operations at the reactor.

However, NRA Chairman Shunichi Tanaka has said he would respect the expert panel's conclusion when deciding whether to allow reactors to restart.

Experts retain Tsuruga reactor fault judgment in draft report

http://mainichi.jp/english/english/newsselect/news/20141120p2g00m0bu027000c.html

TOKYO (Kyodo) -- A panel of experts under Japan's nuclear regulator on Wednesday reaffirmed an earlier judgment that a reactor at the Tsuruga nuclear station is sitting right above an active fault, a move that could force the operator to permanently shut down the unit.

After the Nuclear Regulation Authority acknowledged last year that the fault in question is active, Japan Atomic Power Co. has submitted additional data in trying to have it overturned.

The experts, however, concluded that the new data offered no evidence to sway the judgment as it compiled a new draft report on the fault's assessment.

A zone of rock fragments called D-1, running directly beneath the No. 2 reactor at the plant, is a "fault that could move in the future," the draft report said.

Under the country's nuclear safety requirements, plant operators are not permitted to build reactors and other important safety facilities directly above active faults -- currently defined as those that have moved in the last 120,000 to 130,000 years.
The draft report will likely be finalized by an NRA decision-making panel after making amendments to details -- which will make it difficult for Japan Atomic Power to resume the unit's operation.
All of Japan's nuclear reactors are currently offline. To go back online, they must pass the regulator's safety screening process based on tougher regulations adopted in the wake of the 2011 Fukushima nuclear crisis.
Japan Atomic Power Vice President Taiki Ichimura said he believes the assessment is not based on specific evidence and it is a "one-sided assumption."
"I'm sure we can counter the judgment," he told reporters after the panel meeting, adding he will ask the NRA to create an occasion for more discussion.
If the company has to decommission the unit, its business would be negatively affected by scrapping costs and a loss in asset value.

Restart depends also on Government's stability

November 22, 2014

Poll loss might trigger meltdown in LDP's reactor restart campaign
http://www.japantimes.co.jp/news/2014/11/22/national/politics-diplomacy/poll-loss-might-trigger-meltdown-in-ldps-reactor-restart-campaign/#.VHCliMl5B1s
JIJI
Prime Minister Shinzo Abe may face difficulty restarting the nation's idled nuclear reactors if his Liberal Democratic Party fares poorly in the House of Representatives election on Dec. 14.
The Abe administration said it will reactivate any units confirmed safe by the new testing regime set up by the fledgling Nuclear Regulation Authority in July 2013. The NRA replaced the previous regulator, the Nuclear and Industrial Safety Agency, after the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 plant revealed watchdog was too cozy with the industry.
The government claims that Japan needs to restart the reactors to prevent electricity rates from rising further and hampering the economy. Depending on the election results, it might have a tough time gaining consent for restarts from municipalities that host reactors.
The Ministry of Economy, Trade and Industry estimates that the cost of procuring fuel for thermal power generation will climb ¥12.7 trillion between fiscal 2011 and fiscal 2014, which ends next March.
Although the price of oil has recently been sinking, the jump in fossil fuel costs since the Fukushima crisis, exacerbated by the Bank of Japan's weakening of the yen, have prompted several utilities to raise rates.

New METI chief Yoichi Miyazawa has said that reactors should be reactivated for the sake of the public if confirmed safe.
The No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai power plant in Kagoshima Prefecture are expected to be the first to go back online because they passed the new safety tests in September. In November, Miyazawa visited municipalities in Kagoshima in a bid to gain public consent for restarting the two units.
The No. 3 and No. 4 reactors as Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture are in the final stage of the NRA's screening process.
But a senior METI official said that political turbulence must be kept to a minimum first. "**Only a stable government can push ahead with the restart policy" because many people are now opposed to nuclear power,** the official said.

The 20-year extension

November 23, 2014

Kepco weights new lease of life for geriatric reactors

http://www.japantimes.co.jp/news/2014/11/23/national/kepco-weights-new-lease-life-geriatric-reactors/#.VHG-V8l5B1s

by Eric Johnston
Staff Writer
In a decision that will set a precedent for Japan's rapidly aging nuclear reactors, Kansai Electric Power Co. must soon choose whether to restart reactors 1 and 2 at its Takahama plant in Fukui Prefecture and operate them beyond the 40-year threshold, the first time a Japanese utility has faced such a dilemma.
The new government guidelines adopted in 2012, 40 years is the maximum limit, in principle, on how long the nation's reactors are allowed to operate.
After that, they are supposed to be decommissioned, a process that can take decades. However, if a utility decides to continue to use them, it can apply for a one-time-only extension of 20 years if it meets a series of additional safety tests the government describes as "stringent."
Currently, all of Japan's 48 commercial reactors are idled. To apply for a two-decade extension on those now at or close age 40, their operators have to apply for special government inspections by no later than next July. These checks will be more expensive than the inspections currently being carried out on younger reactors.
Of Fukui's 13 commercial reactors, 11 of which are operated by Kansai Electric, five are, or soon will be, at the 40-year limit. Another three are over 35 years old, and the utility will have to decide their fate in the next few years.
The two Takahama reactors went into operation in November 1974 and November 1975, with a capacity of 826,000 kilowatts each.

Earlier this month, Kansai Electric President Makoto Yagi said the utility would consider whether to decommission units based on whether they could still turn a profit if granted a 20-year extension. But Fukui politicians have cautioned the company to think about more than just the bottom line.

"What's important is to think about plant operation and decommissioning at the same time. Local governments, as well as utilities, have to check the decommissioning process and this will require funding," Fukui Gov. Issei Nishikawa said last month. "Where will midterm storage facilities be built? Where will a final storage facility for the spent fuel and nuclear waste be located? It's necessary for the central government to be deeply involved."

In September, Fukui Vice Gov. Tatsuji Sugimoto warned Kansai Electric Vice President Shigeki Iwane that "if you're going to discuss decommissioning, you won't get anywhere unless you treat finding a midterm storage facility for the spent fuel, the problem of disposing of nuclear contaminated materials, and how decommissioning will impact the local economy as **one set of issues**."

Decommissioning is of special concern to Fukui because it threatens the state subsidies that have been flowing into the prefecture for four decades. Between the 2007 and 2012 fiscal years, Fukui received at least ¥20 billion annually. From 1974 to 2012, prefectural data show Fukui received about ¥390 billion under three laws designed to reward local governments if they agreed to host nuclear plants.

Much of this has gone into roads, bridges, dams and other projects that keep the coffers of local construction companies full, provide employment for their workers as well as in local service industries, who then return the money via donations for local and national pro-nuclear lawmakers of the Liberal Democratic Party.

But while Kansai Electric, local governments in Fukui, the governor and major corporations in the region support both the restart of the prefecture's newer reactors and, if possible, extending the Takahama units for another 20 years, at least one survey shows the rest of Kansai appears to be generally fine without nuclear power.

The Institute of Nuclear Safety System Inc., established and owned by Kansai Electric in Mihama, Fukui Prefecture, conducted a multiple choice survey last fall on how people in six Kansai prefectures and the southern part of Fukui felt about power generation, especially nuclear energy.

The results showed that, despite pressure from the pro-nuclear lobby for reactor restarts and higher electricity bills, 46 percent of the respondents felt either that atomic power should not be used or that other sources of electricity should be tapped. Although another 45 percent believed the use of nuclear energy was "inevitable," only 8 percent replied it would be a "good" source of power.

In addition, the survey indicated that, despite Kansai Electric jacking up its power rates by 10 percent overall in spring 2013, not many of the respondents were overly concerned.

"The negative effects of the long-term suspension of nuclear power generation have not been recognized," said institute official Atsuko Kitada.

Then there is a question the survey did not address: to what extent should the rest of Kansai be involved in decisions to restart or extend the operational life of the Fukui reactors.

Since the March 2011 Fukushima meltdowns, relations between Fukui and other Kansai prefectures that rely on its nuclear power plants have often been tense. Leaders in neighboring Kyoto and Shiga whose towns lie within a 30-km radius of the Fukui reactors want more of a say in their future. Anti-nuclear groups add that talk of extensions is underway even as the nation has yet to end the crisis at the Fukushima No. 1 plant.

"It is particularly unconscionable for the Abe government to open the way for old reactors to operate when the Fukushima accident is ongoing," said Aileen Mioko Smith of Green Action, a Kyoto-based anti-nuclear lobby.

In October, Maizuru, a port city in Kyoto Prefecture that lies less than 10 km from the Takahama plant in Fukui, called for the **definition of "local government consent"** to be expanded to those municipalities within a 30-km radius of the facility since, by law, they have to draw up evacuation plans in case of a disaster. Around 144,000 people, including Maizuru's 88,600 residents, live within 30 km of Takahama. But Nishikawa rejects such calls.

"I recognize the definition of local consent as meaning Fukui Prefecture and the towns and villages that host the power plants," he told reporters last month. "Since it's been those areas closest to the nuclear plants that have borne the greatest risks over the past 40 or 50 years, there is a natural difference between them and other areas (outside Fukui)."

Kansai Perspective appears on the fourth Monday of each month, focusing on Kansai-area developments and events of national importance with a Kansai connection.

Restart Temperature Engineering Test Reactor (Oarai)?

November 26, 2014

JAEA eyes restart of next-generation nuclear reactor

JIJI

The Japan Atomic Energy Agency on Wednesday applied for a Nuclear Regulation Authority examination in an effort have a next-generation experimental nuclear reactor restarted.

Temperature Engineering Test Reactor in the town of Oarai, Ibaraki Prefecture has an output capacity of 30,000 kilowatts, according to the government-backed agency.

No active fault runs under the ground where the facility is located, the agency said. None of the reactor's important equipment would sustain major damage even if the reactor were hit by a big earthquake that causes ground motion of up to 700 gals, it said.

The facility stands 36.5 meters above sea level, against the maximum assumed tsunami height of 17 meters, the agency said.

In the basic energy policy plan adopted in April, the government stated that Japan will promote research and development of the next-generation reactor. An education and science ministry panel has also sought an early restart of the facility.

The reactor uses helium gas as the coolant. The country's commercial light-water reactors are cooled with water.

The next-generation reactor is said to be safer than light-water reactors. It is still uncertain when the new one will be put into practical use, however.

The test facility was halted for a checkup in February 2011, the month before a huge earthquake and tsunami hit Japan, triggering a nuclear disaster at Tokyo Electric Power Co.'s Fukushima No. 1 power station.

"Inconceivable" or "unlikely"?

November 27, 2014

Court rejects demand to prevent reactors' restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Nov. 27, 2014 - Updated 10:14 UTC+1
A court has rejected a petition by residents seeking not to allow the restart of nuclear reactors in Fukui Prefecture, central Japan.

About 180 residents in the nearby prefectures of Shiga and Kyoto and elsewhere had filed the petition about 4 reactors at the Ohi and Takahama nuclear power plants. They are run by Kansai Electric Power Company.

The residents argued that a powerful earthquake and tsunami could lead to a severe accident.

The Otsu District Court dismissed their demand on Thursday.

Presiding Judge Yoshihiko Yamamoto said even though the residents claimed that the restart is imminent, the Nuclear Regulation Authority is conducting screenings based on the premise of resumption.

Yamamoto said the reactors will never be brought back online, unless officials forge a coordinated accident preparedness plan among local municipalities and other parties, as well as evacuation plans for residents.

He said it is inconceivable that the NRA would allow the restart in a hasty manner.

He concluded that there is no need to order the operator not to restart the reactors.

The NRA is expected to make public a draft report by the end of the year that would say the 2 reactors at the Takahama plant have passed its screening.

Kansai Electric calls the court decision appropriate. The utility says it will take every possible measure to ensure safety, and seek the understanding of local residents.

A leader of the residents who petitioned, Yoshinori Tsuji, told reporters that the court said the restart is impossible without a coordination agreement or evacuation plans.

Tsuji said that despite that, the court has left the final judgment to the NRA. He said the court made an unjust decision.

Court nixes demand seeking suspension of Takahama, Oi reactor restart

http://mainichi.jp/english/english/newsselect/news/20141127p2g00m0dm073000c.html
OTSU, Japan (Kyodo) -- A Japanese court on Thursday rejected a demand by some western Japan residents seeking suspension of Kansai Electric Power Co.'s planned restart of nuclear reactors at its Takahama and Oi plants, now offline for a safety screening by the country's nuclear regulator.
The decision by the Otsu District Court in Shiga Prefecture contradicts a ruling by another district court in May not to allow the restart of two reactors at the Oi complex in Fukui Prefecture. Kansai Electric has appealed the May ruling.

In the latest case, residents in Shiga claimed there are many geological faults around the reactors and there is a strong likelihood that they will cause more serious earthquakes and tsunamis than currently anticipated. Shiga neighbors Fukui, which lies to the north.
Both four-unit plants' Nos. 3 and 4 reactors are currently undergoing the Nuclear Regulation Authority's screening based on tougher safety requirements imposed following the 2011 Fukushima meltdowns.
The Takahama site's two units are in the final phase of the assessment process which is necessary for any nuclear reactor in Japan before being allowed to go back online. Their operations could be resumed as early as next spring.
In the decision, however, Presiding Judge Yoshihiko Yamamoto said it is "**unlikely"** that the safety regulator will make a hasty decision to allow the reactors to restart, dismissing the residents' claim that resumption is looming and a severe accident could occur such as in the Fukushima crisis.
Kansai Electric, which had sought to have the residents' request rejected, said the court decision is "reasonable" and it will seek to restart the nuclear plants "as soon as possible" after safety is confirmed by the regulator.
In the wake of the Fukushima disaster that made it difficult for power companies to keep running their nuclear plants, judicial rulings on the plants' operation have been divided.
When the Fukui District Court ordered Kansai Electric Power to suspend the restart of the Oi units in May, the ruling admitted the importance of nuclear power plants for society, but pointed out that they are "merely a tool for generating electricity and thus inferior to people's fundamental rights (to life)."
In a similar case lodged in Osaka to seek suspension of the two Oi units, however, a district court rejected the demand in April 2013. A high court upheld the decision in May this year, saying that it is not appropriate for a court to decide on the matter before the government does.
Before the 2011 nuclear crisis was triggered by a massive earthquake-tsunami disaster, there were a few court judgments that denied the operation of nuclear facilities but all were later overturned by higher courts, including the Kanazawa District Court decision in 2006 to shut down a reactor operated by Hokuriku Electric Power Co.

Suit against Fukui reactor restarts fails

http://www.japantimes.co.jp/news/2014/11/27/national/suit-against-fukui-reactor-restarts-fails/#.VHdi-Ml5BLM
Kyodo
OTSU, SHIGA PREF. – The Otsu District Court on Thursday rejected a demand by Shiga residents to halt the restart of nuclear reactors at Kansai Electric Power Co.'s Takahama and Oi 's ruling, residents of Shiga argued that the many geological faults in the vicinity could cause stronger earthquakes and tsunami than currently anticipated.
Both nuclear plants have four reactors each. Two at each plant are being screened by the Nuclear Regulation Authority based on tougher safety requirements imposed following the triple core meltdown in Fukushima in March 2011.
The Takahama site's two units are in the final phase of the assessment process. They could be back in operation as early as next spring.
In Thursday's decision, presiding Judge Yoshihiko Yamamoto said it is unlikely the NRA will be overly hasty in allowing the reactors to resume operation, dismissing the residents' claim that resumption is looming and a severe accident could occur.

Kansai Electric said that the ruling was “reasonable” and that it will seek to restart the reactors “as soon as possible” after they are confirmed safe by the NRA.
Since the Fukushima disaster, judicial rulings on nuclear power plants have been divided. When the Fukui District Court ordered Kansai Electric to suspend the restart of the Oi reactors in May, the ruling affirmed their importance to society but pointed out they are “merely a tool for generating electricity and thus inferior to people’s fundamental rights.”
A similar case lodged in Osaka to halt the two Oi units was rejected by the district court in April 2013. A high court upheld the decision in May this year, saying it is not appropriate for a court to decide on the matter before the government does.
Before the Fukushima disaster, a few court judgments had sided against nuclear power plants, but all were later overturned by higher courts, including a Kanazawa District Court decision in 2006 that ordered the closure of a reactor run by Hokuriku Electric Power Co.

Sendai: Not before February

November 27, 2014

Restart of Sendai plant in February at earliest

http://www3.nhk.or.jp/nhkworld/english/news/20141127_27.html
Nov. 27, 2014 - Updated 09:26 UTC+1
Restarting of a nuclear power plant in Kagoshima Prefecture, southwestern Japan, will not take place before February, due to a document revision.

In September, the Sendai plant became the first in Japan to pass new government regulations introduced after the 2011 accident at the Fukushima Daiichi plant. The prefecture's governor and assembly have consented to a restart.

The plant's operator, Kyushu Electric Power, must now gain approval for a construction plan by explaining facility designs in detail and a set of maintenance rules on emergency responses.

The company on Thursday said at a regulators' meeting that it will present a revised construction plan for the plant's No.1 reactor in early December after improving its explanations about anti-earthquake measures.

The utility says it will also present revised versions of a construction plan for the No.2 reactor, and a set of emergency rules for both reactors this year.

Kyushu Electric wants to restart the No.1 reactor first.

But that would take at least until February, pending the regulatory agency's approval for the construction plan and inspections of new safety measures.

Kepco hoping to operate Takahama beyond the 40-year limit

December 1, 2014

Kepco inspects aging Takahama reactors for chance at 20-year extension

http://www.japantimes.co.jp/news/2014/12/01/national/kepco-inspects-aging-takahama-reactors-for-chance-at-20-year-extension/#.VHyv2Ml5Cos

Kyodo

The reactors are the No. 1 and No. 2 units at the Takahama nuclear plant.

Safety requirements adopted after the 2011 Fukushima nuclear crisis include a provision requiring operators to shut and dismantle reactors when they are 40 years old. But the nuclear regulator may grant a one-time extension of up to 20 years if utilities carry out thorough checks on their safety systems and the integrity of the containment vessel.

Seven of Japan's 48 nuclear reactors are either 40 years old or close to it. Kepco was the first utility to declare it would try to keep old reactors in action after the Fukushima meltdowns, while the government has sought to have old units shut.

Kepco has judged that keeping the two reactors going would help to repair a balance sheet saddled with costly fossil fuel imports, despite the hefty price tag for equipment upgrades and new investment in safety.

All of the nation's reactors remain offline pending safety checks.

Kepco, which serves Osaka and surrounding areas, will examine a range of factors such as the state of the welding of the reactor pressure vessels — which contain the nuclear fuel.

But the company will then need to apply for Nuclear Regulation Authority safety screening based on the new regulations and obtain approval before the units can come back online.

Kepco aims to have its checks complete and to ask for NRA screening as early as next spring.

Takahama's No. 1 unit turned 40 last month and the younger No. 2 unit is due to hit the barrier in November next year.

The pro-nuclear government of Prime Minister Shinzo Abe has urged utilities to decide quickly on whether to scrap their aging reactors, apparently in an attempt to ease concerns over the safety of nuclear power by promoting the shutdown of old facilities and bringing newer reactors back online.

KEPCO begins special checks seeking to keep old nuclear units

http://mainichi.jp/english/english/newsselect/news/20141201p2g00m0dm048000c.html

OSAKA (Kyodo) -- Kansai Electric Power Co. on Monday launched special checks on its two aging nuclear reactors at the Takahama plant, seeking to operate them beyond the limit of 40 years despite public concerns over the safety of old nuclear facilities in Japan.

Under tighter safety requirements adopted after the 2011 Fukushima nuclear crisis, reactors are not allowed to operate more than 40 years in principle to ensure safety. The nuclear regulator may grant a one-time extension of up to 20 years, but utilities seeking to extend the operational periods must conduct special checks that set a high hurdle to clear and require hefty costs.

Seven of Japan's 48 nuclear reactors, including the Takahama Nos. 1 and 2 units on the Sea of Japan coast in Fukui Prefecture, are around 40 years old. Kansai Electric was the first power company that announced its intention to keep old reactors in operation after the Fukushima meltdowns, while the government has sought to promote shutdowns of old facilities.

Kansai Electric has judged that keeping the two reactors would contribute to improving its earnings that have deteriorated due to a surge in fossil fuel costs in the absence of nuclear power, despite massive costs for upgrading equipment and enhancing the safety of the plant. Currently, all the reactors in Japan remain offline.

Under the special checks, which are expected to take up to four months, the utility serving Osaka and surrounding areas will scrutinize the state of reactor pressure vessels -- which contain the nuclear fuel -- and other key equipment.
But the company will then need to apply for the Nuclear Regulation Authority safety screening based on the new regulations and obtain approval to continue the units' operations, a process necessary for any reactor before being allowed to go back online.
Kansai Electric plans to finish the special checks and apply for the NRA screening as early as next spring.
The Takahama No. 1 unit became 40 years old in November, and the No. 2 unit will be 40 years old November next year.
The pro-nuclear government of Prime Minister Shinzo Abe has urged utilities to quickly decide on whether to scrap their aging reactors, apparently in an attempt to ease concerns over the safety of nuclear power by promoting the shutdown of old facilities and bring relatively new reactors back online.

After Sendai, Takahama

December 13, 2014

Takahama nuclear plant restart could come next spring

http://mainichi.jp/english/english/newsselect/news/20141213p2a00m0na012000c.html

The Nuclear Regulation Authority (NRA) secretariat will submit documents by year's end effectively approving reactor safety measures -- opening the way for the restart of those reactors -- at the Takahama Nuclear Power Plant in Fukui Prefecture, it was announced Dec. 12.
It will become the second time that nuclear reactors will have passed new, stricter safety regulations put in place after the Fukushima No. 1 nuclear plant meltdowns. The first approval was for the No. 1 and 2 reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture. Approval paves the way for reactivation of the reactors.
The draft report is expected to be presented at an NRA regular meeting on Dec. 17 or Dec. 24. If the authority grants its approval, the document will be subjected to public comment for a month, after which an official decision on whether to ratify it will be made.
Other remaining procedures include obtaining a construction permit and getting the agreement of locals to restart the reactors. The actual reactivation would not occur until spring 2015 at the earliest.
Based on its previous experience with the Sendai plant, the government believes that it can proceed with reactivation if it gets the agreement of the Fukui Prefectural Government and the government of the town of Takahama, where the plant is located. In the case of the Sendai reactors, however, the 30-kilometer emergency evacuation planning area around the plant was entirely within Kagoshima Prefecture. The 30-kilometer area around the Takahama plant stretches across three prefectures: Fukui, Kyoto and Shiga, raising the possibility of local opposition.
Takahama plant operator Kansai Electric Power Co. has boosted safety measures at the station to withstand a quake of 700 Gals (a unit of acceleration) from 550 Gals. It has improved tsunami countermeasures to withstand a wave 6.2 meters high, up from 5.7 meters. New protection measures, such as raising seawalls by two meters to make them eight meters tall, have cost 103 billion yen.

At the end of October, Kansai Electric reported these new measures in an addendum to a request for permission to alter its nuclear reactors. The NRA has been examining this addendum as it prepares the document giving a passing grade to the plant's safety measures.
December 13, 2014(Mainichi Japan)

Takahama next

December 15, 2014

Takahama plant set to pass new rules for restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 15, 2014 - Updated 11:32 UTC+1
Japan's nuclear regulator appears set to present a draft assessment that will effectively approve a restart of the Takahama nuclear power plant in Fukui Prefecture.

The Nuclear Regulation Authority will disclose the assessment at its meeting on Wednesday.

Authority experts have been evaluating whether the No.3 and No.4 reactors at the plant meet new government regulations introduced after the Fukushima Daiichi plant accident in March 2011.

If no problems are found in the draft at the meeting, the authority will then gather public opinion on it for 30 days before officially adopting the document.

Regulators have so far screened restart applications from power companies for a total of 20 reactors at 13 plants across the country.

Takahama will be the second plant to pass the new regulations, following the Sendai plant in Kagoshima Prefecture in September.

But it will take time until the plant can be restarted as operator Kansai Electric Power Company still needs permission for and inspections of its design, as well as local consent. The facility is unlikely to go online before spring at the earliest.

Abe keen to boost nuclear energy

December 15, 2014

With election over, Abe ready to boost reactor restarts

http://www.japantimes.co.jp/news/2014/12/15/national/abe-set-boost-efforts-revive-nuclear-power-election/#.VJBeWnt1Cic
Kyodo
With the Liberal Democratic Party's sweeping election victory Sunday, Prime Minister Shinzo Abe is expected to increase his efforts to revive nuclear power despite persistent public opposition.

Although polls show that most people are against restarting reactors idled following the 2011 Fukushima crisis, Abe has continued to promote nuclear as a key source of energy, arguing its use is necessary to maintain stable and cheap electricity in resource-poor Japan.
Abe hopes early next year to restart two reactors at Kyushu Electric Power Co.'s nuclear plant in Satsumasendai, Kagoshima Prefecture, which in September became the first to meet tighter, post-Fukushima safety regulations.
Another two reactors at Kansai Electric Power Co.'s Takahama power station in Fukui Prefecture, currently in the final phase of the Nuclear Regulation Authority's screening process, could also go back online within 2015.
However, as restarting nuclear plants did not take center stage in the election, partly because Abe avoided focusing on the contentious issue, critics say the LDP's victory cannot be taken as a vote of confidence regarding this issue.
In a rare mention during the campaign, Abe delivered a speech in Kagoshima Prefecture last Thursday arguing that nuclear power is necessary to protect jobs.
Local leaders in Kagoshima have already given the green light to restarting the power plant, but residents doubt that sufficient discussions have been held.
"I feel frustrated that there was no debate on the nuclear issue" during the election, a 44-year-old company employee who did not want to give his name said after voting.
With the election already in its rear view mirror, the LDP faces the task of deciding the nation's long-term energy policy, another issue Abe was reluctant to discuss during the campaign.
The process of deciding the country's energy mix, including the percentages of electricity to be generated by nuclear power and renewable sources, could be further delayed amid uncertainty over how many reactors will resume operations down the road, while Komeito, the coalition's junior member, has pledged to completely phase out nuclear power in the future.

Takahama open to media

December 16, 2014

Reactor special inspection shown to media

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 16, 2014 - Updated 11:32 UTC+1
Kansai Electric Power Company has shown to media special inspection procedures aimed at restarting 2 aging nuclear reactors at its plant in central Japan.

Last year, Japan's government limited the operational lifespan of nuclear reactors to 40 years in principle.

Operators must decide whether to decommission their aging reactors or apply for permission to extend their lifespans. Such permission requires special inspections to assess in detail the extent of reactor deterioration.

Kansai Electric has been conducting special inspections since December 1st on the No.1 and 2 reactors at the Takahama nuclear plant in Fukui Prefecture.

On Tuesday, journalists were allowed to watch workers remotely control an ultrasonic device in a reactor to examine the interior.

Workers are also checking the inner coating of the reactor containment vessel.

Kansai Electric plans to report the results of the inspection to the Nuclear Regulation Authority by July next year, the deadline for extension application.

In Japan, 7 nuclear reactors, including the 2 at the Takahama plant, have been in operation for about 40 years.

Virtual go-ahead for Takahama plant

December 17, 2014

Fukui nuclear reactors move big step toward restarts

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412170075
By TOSHIO KAWADA/ Staff Writer
TAKAHAMA, Fukui Prefecture--Kansai Electric Power Co.'s Takahama plant here became the second nuclear power facility to receive the virtual go-ahead to resume operations under tougher safety requirements introduced after the Fukushima nuclear disaster.
The Nuclear Regulation Authority on Dec. 17 said it concluded that the No. 3 and No. 4 reactors at the Takahama nuclear plant have met the safety standards required to prepare for natural disasters and severe accidents.
The NRA's decision will be finalized after it receives public opinions on the issue for 30 days starting Dec. 18.
However, Kansai Electric must first gain the consent of local officials and residents to restart the reactors.
In addition, the NRA still needs to check the detailed construction plans and blueprints for the Takahama plant, as well as safety guidelines on how Kansai Electric will operate the reactors and respond to an accident.
An additional one to two months will also be necessary for the NRA to conduct on-site inspections.
If no problems arise, Kansai Electric will likely be able to resume operations at the plant next spring at the earliest.
"There still remains screenings of the construction plans and safety rules to restart the reactors, so we will continue to sincerely respond to the NRA's examination," Kansai Electric President Makoto Yagi said at a news conference on Dec. 17.
Kansai Electric is also proceeding with a special safety inspection to extend the operating lives of the aging No. 1 and No. 2 reactors of the Takahama plant for two decades beyond the normal expiry date of 40 years.
Under the stricter safety standards, utilities must have quake-resistant buildings for emergency operations in the event of damage caused by a natural disaster.
Kansai Electric listed the buildings for the two aging reactors as emergency operation centers, but it is currently constructing separate buildings for emergency purposes at the Takahama plant site.

The NRA is requiring the company to keep those two reactors shut down for the time being. The nuclear watchdog could rescreen the No. 3 and No. 4 reactors if Kansai Electric hopes to restart the aging reactors at an early date.
The administration of Prime Minister Shinzo Abe is moving toward restarting now-idled reactors that are deemed safe by the NRA. Currently, no reactors are operating in Japan.
The first nuclear plant expected to resume operations is Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture. The No. 1 and No. 2 reactors there passed the NRA's safety screenings in line with the stricter regulations.
The results of the NRA's examination of the Sendai plant reactors were released in July.
The nuclear watchdog referred to its examination of the Sendai plant to work out its 433-page draft report that virtually allows Kansai Electric to resume operations at the Takahama plant.
Kansai Electric submitted its application to restart the Takahama No. 3 and No. 4 reactors when the new safety regulations took effect in July 2013.
It plans to use the reactors for plutonium-thermal power generation, in which mixed-oxide fuel consisting of plutonium and uranium is used.
The Takahama plant is located just 3.5 meters above sea level, much lower compared with the Sendai plant. Kansai Electric was required to raise the height of surrounding levees to block tsunami.
Kansai Electric initially projected a maximum tsunami height at the Takahama plant of 2.6 meters. It revised the estimate to 6.2 meters after the NRA ordered the company to recheck its calculations.
The utility was also advised to increase its projected earthquake scale from 550 gals to 700 gals and enhance the quake-resistance of plant equipment. A gal is a unit of acceleration that measures the extent of an earthquake's seismic waves.
The next step for Kansai Electric is to win the approval of Fukui Prefecture and Takahama town to restart the reactors.
"We will work to restart operations as early as possible by making efforts to obtain an agreement from people living in the surrounding areas," Yagi said.
Areas of Kyoto and Shiga prefectures located within a 30-kilometer radius of the Takahama plant have maintained a cautious stance toward resuming reactor operations there.
Areas within 30 km of the plant are designated as the Urgent Protective Action Planning Zone. Local administrations in the zone could demand that Kansai Electric keep the reactors offline until it also gains their approval, pointing to the possible dangers to their residents.

2 KEPCO reactors clear major safety hurdle toward resumption

http://mainichi.jp/english/english/newsselect/news/20141217p2g00m0dm041000c.html
TOKYO (Kyodo) -- Two idled nuclear reactors owned by Kansai Electric Power Co. on Wednesday cleared the initial safety hurdle to being brought back online, possibly next year, bolstering the government's plan to revive atomic power following the 2011 Fukushima crisis.
The Nos. 3 and 4 units at the Takahama nuclear plant, located on the Sea of Japan coast in Fukui Prefecture, western Japan, follow two reactors operated by Kyushu Electric Power Co. in passing the nuclear regulator's tighter safety requirements, introduced after the Fukushima accident.
Prime Minister Shinzo Abe's Liberal Democratic Party, which won a major victory in Sunday's lower house election, is set to speed up efforts to reactivate nuclear plants that have remained idled amid safety

concerns raised by the Fukushima meltdowns, even though the majority of people surveyed in Japan oppose resumption.
The Nuclear Regulation Authority decision-making panel approved Kansai Electric's enhanced safety measures against possible earthquake and tsunami hazards as well as other severe accidents that could affect the plant. The regulator will give a formal safety clearance to the utility after a monthlong public consultation period through Jan. 16.
NRA Chairman Shunichi Tanaka said the regulator has confirmed the plant's compatibility with the new regulatory standards, however, he urged Kansai Electric to make continued efforts to enhance safety.
Among Japan's 48 commercial reactors -- all of which currently remain offline -- only four, including the Takahama units, have met the more rigorous safety requirements. Passing the NRA's safety screening based on the regulations is the initial requirement for resumption, with no specific date set for the restart.
The Takahama units will not go back online before spring, as Kansai Electric still needs to obtain local approval and undergo more procedures including on-site operational checks.
Power companies are desperate to bring their idled nuclear reactors back online amid an increase in fossil-fuel costs for thermal power generation, which has covered the shortfall in the absence of atomic power.
On Wednesday, Kansai Electric said it will raise electricity bills from April, citing its deteriorating earnings. The utility last raised electricity rates in May last year.
"We face a severe financial condition and if this goes on it will endanger the company's existence," President Makoto Yagi said at a press conference in Osaka.
The utility, serving an area centering on Osaka, will likely post its fourth straight group net loss in the business year through next March. In addition to the Takahama units, it also hopes to restart two more reactors at its Oi complex in Fukui.
But the process of resumption may not go as smoothly as the utility hopes, partly because neighboring municipalities such as Shiga Prefecture demand more say in deciding whether to allow the resumption, saying they could also be severely affected in the event of a nuclear accident.
A pair of reactors at Kyushu Electric's Sendai complex, located in southwestern Japan, became the first units in September to meet the new regulations. Local municipalities have already given the green light to their resumption and they could go back online early next year.

Takahama nuclear plant's draft assessment approved

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 17, 2014 - Updated 04:15 UTC+1
Japan's nuclear regulator has compiled its draft assessment on safety measures for 2 of the 4 reactors at Takahama nuclear plant in Fukui Prefecture, central Japan.

The draft effectively approves the safety measures and clears the way for the restart of the plant located on the Japan Sea coast. A draft assessment of another plant in southern Japan has already been approved.

The Nuclear Regulation Authority unanimously approved the draft on Wednesday.

The draft assessment says the No. 3 and 4 reactors now meet government regulations introduced after the Fukushima Daiichi nuclear disaster in March 2011.

Kansai Electric Power Company's measures include raising the reactors' ability to withstand maximum projected jolts and tsunami heights from earthquakes. The operator also installed a higher embankment and cooling pumps to prepare for the possibility of a severe nuclear accident.

Authority commissioner Toyoshi Fuketa said the body confirmed the reactors are equipped with minimum measures to ensure safety, but the operator should continue efforts and investment for greater safety.

The authority will gather public opinion on the draft for 30 days before officially adopting the document.

The plant's operator still needs approval on details of equipment design as well as inspections. It also needs to gain local consent. The facility is unlikely to go online before spring.

Takahama will be the 2nd plant to pass the new regulations, following the Sendai plant in Kagoshima Prefecture, southern Japan, in September.

All of Japan's nuclear reactors are currently offline.

"Return to nuclear power"

December 18, 2014

Takahama reactors meet new safety standards, paving way to 'return to nuclear power'
http://mainichi.jp/english/english/perspectives/news/20141218p2a00m0na012000c.html
The Nuclear Regulation Authority (NRA) concluded on Dec. 17 that the No. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama Nuclear Power Plant have met its new safety requirements, clearing one of the hurdles to restarting the idled facilities.
The government, meanwhile, is poised to start discussing the reconstruction of aging nuclear power stations. Although the ruling parties won a solid majority in the Dec. 14 House of Representatives election, it cannot be said that they have secured a free hand over the country's nuclear energy policy, which was not fully debated during the election. The government of Prime Minister Shinzo Abe has made clear its stance toward "returning to nuclear power," but it remains to be seen whether the government will be able to secure public understanding for continued reliance on nuclear power by restarting idled reactors and rebuilding aging nuclear power plants.

Following the NRA's decision on the Takahama plant in Fukui Prefecture, a senior Kansai Electric official said, "If the Takahama reactors are reactivated, we'll be able to focus on measures to restart the No. 3 and 4 reactors at our Oi Nuclear Power Plant."

Safety requirements for nuclear reactors were tightened after the Fukushima disaster. Earlier, two reactors operated by Kyushu Electric Power Co. also passed the requirements. These developments are favorable for other major utilities because idled nuclear reactors in the country appear to be on track to being restarted.

Some Kansai region manufacturers have shifted their manufacturing bases elsewhere because of higher electricity prices and an unstable power supply during the summer, caused by the shutdown of nuclear power plants. The business community is now hopeful that those companies will bring their factories back to the Kansai region, because their power supply will become stable if nuclear reactors go back online

Fuel costs shouldered by power companies across Japan to operate their thermal power plants have increased about 3.6 trillion yen from pre-disaster levels. Financially strained, these companies have introduced full-scale price hikes. At the same time, increasing crude oil prices have pushed up electricity prices further, forcing businesses and households to shoulder the extra burden.

Those factors have played a part in the Abe government's move to promote nuclear power. If electricity prices remain high, they will get in the way of economic recovery, though the Abe administration has set forth corporate tax cuts as a key policy measure for economic growth in his economic policy mix, dubbed "Abenomics." The government is set to accelerate efforts to reactivate 21 reactors at 14 nuclear power stations across the country, but it will not stop there. It is also trying to shift its policy focus to the idea of continuing to rely on nuclear power by rebuilding aging nuclear power stations.

Under the Basic Energy Plan adopted by the Cabinet in April, the government set forth a plan to promote reactivation of idled nuclear reactors. At the same time, it said that it would "reduce (its reliance on nuclear power) as much as possible." The government, therefore, postponed its decision on the best possible composition of different energy sources, including nuclear, thermal and renewable energy.

If the government were to prohibit construction of additional nuclear plants and the rebuilding of existing nuclear facilities, and if it did not extend reactors' designated 40-year lifespan, Japan's nuclear generating capacity would be halved by 2030 and there would be no nuclear plants in the country by 2049. The government's discussions on the best possible composition of various energy sources will focus either on the "natural death" of nuclear plants, or continued reliance on nuclear power.

Nuclear power plants play a certain role in combating global warning. Considering the fact that it will take a long time to decommission nuclear power plants and process radioactive waste, it is necessary to nurture nuclear engineers. Local governments that host nuclear power plants are seeking new financial resources because they will not receive government subsidies and fixed property tax revenues if nuclear power plants are decommissioned. Based on these ideas, the government has opted for a policy of retaining nuclear power generation by rebuilding aging nuclear power stations.

Nonetheless, the costs of rebuilding and running nuclear power plants are expected to swell as a result of anti-disaster measures and extra expenses to improve safety. It costs several hundred billion yen to build a single nuclear power plant, and it takes time to recover the costs for such an investment. While deregulation of the electric power industry moves forward, a representative of one utility commented, "If we were to continue to run nuclear power plants, we would want a guarantee for stable electricity charges." However, it is difficult for utilities to secure public understanding for receiving special treatment for building and running nuclear power stations.

There was no in-depth debate on nuclear power during the Dec. 14 general election. If the government were to press forward and promote nuclear power with no debate, it would likely provoke a fierce public backlash. (By Masahiro Nakai and Shinya Hamanaka, Economic News Department)
December 18, 2014(Mainichi Japan)

Restart at Sendai delayed

December 24, 2014

Restart of nuclear plant in March at earliest

http://www3.nhk.or.jp/nhkworld/english/news/20141225_06.html

Dec. 24, 2014 - Updated 22:02 UTC+1
The restart of a nuclear power plant in Kagoshima Prefecture, southwestern Japan, is not likely before March, due to a document revision.

In September, the Sendai plant became the first in Japan to meet new government regulations introduced after the Fukushima accident in 2011.
The host city's mayor, the prefecture's governor, and local assemblies have all approved the restart plan.

The plant's operator, Kyushu Electric Power, must now obtain approval for 2 types of documents from the Nuclear Regulation Authority.

One is a construction plan that describes the facility's design in detail. The other is a set of rules for operation and emergency responses.

The company had planned to submit a revised construction plan for the plant's No.1 reactor in early December after improving its explanations of earthquake-resistance measures.

But the utility says it is taking more time than expected and it now plans to submit the document next year.

The delay pushes back the restart of the reactor at least until March, pending the regulatory agency's approval of the construction plan and inspections of new safety measures.

Local governments want their say

January 5, 2015
Almost the same article in the Japan Times on two runnning days:

Local governments want bigger say in restarting reactors

Kyodo

Only about 20 percent of 160 prefectural and municipal governments that host or are located near nuclear plants support how Kyushu Electric Power Co. went about getting the go-ahead for restarting its reactors in Kagoshima Prefecture.

Kyushu Electric won consent in November from the Kagoshima Prefectural Government and the city of Satsumasendai for the restart of two reactors at its Sendai plant. As a result, they will likely become the first of the country's 48 offline commercial reactors to resume operations.

In a survey by Kyodo News on 21 prefectures and 139 municipalities that are located within 30 km of a reactor, only 35 said the procedure adopted by Kyushu Electric — seeking the consent of just the host prefecture and host municipality — was appropriate.

While 55 municipalities, or about 30 percent, said the utility's methods were inappropriate, 70 avoided giving a clear-cut answer. None of these 55 municipalities directly host reactors.

Although the central government appears to back the way Kyushu Electric sought approval only from the host prefecture and municipality, the survey suggests that many municipalities near offline nuclear plants do not favor such a narrow approach.

Amid lingering safety concerns over nuclear power following the Fukushima No. 1 disaster in 2011, the number of cities calling for nearby municipalities to have a say in the decision-making process outnumbered those stating that only those directly hosting reactors should be involved.

The two reactors at the Sendai plant in Kagoshima Prefecture could be brought back online as early as this spring.

January 4, 2014

Poll shows local governments split on how to restart nuclear reactors

http://www.japantimes.co.jp/news/2015/01/04/national/poll-shows-local-governments-split-on-how-to-restart-nuclear-reactors/#.VKmxr3t1Cic

Kyodo

Only about 20 percent of 160 prefectural and municipal governments that host or are located near nuclear plants support how a utility company in Kagoshima Prefecture went about getting the go-ahead for restarting its nuclear reactors, a Kyodo News poll showed Sunday.

In November, Kyushu Electric Power Co. won consent from the Kagoshima Prefectural Government and the city of Satsumasendai for the restart of two nuclear reactors at its Sendai plant in the prefecture, which means the two reactors will become the first of the country's 48 offline commercial reactors to resume operation.

In a survey conducted on 21 prefectures and 139 municipalities that are located within a 30-km radius of nuclear reactors, only 35 said the procedure adopted by Kyushu Electric — seeking the consent only of the host prefecture and host municipality — was appropriate.

While 55 municipalities or about 30 percent said the method taken by Kyushu Electric at the Sendai plant was not appropriate, 70 avoided clear-cut answers, including those that said they do not know.

None of the 55 municipalities host nuclear reactors.
Although the central government appears to back the way Kyushu Electric limited seeking approval to only the host prefecture and municipality concerned, the survey suggests that many municipalities near offline nuclear plants do not necessarily favor such a narrow approach.
Amid lingering safety concerns over the restart of nuclear reactors following the Fukushima No. 1 disaster in 2011, the number of municipalities calling for those within a 30-km radius of nuclear reactors to participate in the decision-making process outnumbered those stating that only those hosting reactors should be entitled to give the green light to the resumption of operations.
The two nuclear reactors at the Sendai plant in Kagoshima Prefecture are expected to go back online this spring or later

NRA: Please focus on the job

January 5, 2015

NRA bracing itself for possible reactor restarts

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jan. 5, 2015 - Updated 05:14 UTC+1
The head of Japan's nuclear watchdog has asked its employees to work with greater responsibility this year. He said the task of regulatory authorities will take on greater importance if and when the country's reactors start going back online.

Nuclear Regulation Authority Chairman Shunichi Tanaka gave a New Year's address on Monday before 460 employees of the NRA's secretariat.

Tanaka said **if reactors are restarted, regulatory authorities will be required to carry out new kinds of work, such as inspections on the nuclear facilities.**
He said NRA officials must carry out their work with a greater focus than last year.

All of Japan's reactors are currently offline.

Utilities must pass new government regulations introduced after the 2011 Fukushima accident. They were set up as a precondition to restart their nuclear reactors.

The NRA is currently screening applications filed by utilities for 21 reactors at 14 plants.

In September, reactors at the Sendai nuclear plant in Kagoshima, southern Japan, became the first ones to clear the new regulations.

The Takahama nuclear plant in Fukui, on the Sea of Japan coast, is expected to have its safety measures approved by the end of this month at the earliest.

This year a number of pressurized water reactors may pass inspections and go back online.

Screenings of boiling water reactors, the same type as the reactors that suffered meltdowns at the Fukushima Daiichi plant, will also get underway.

The nuclear watchdog will be responsible for carrying out an appropriate assessment of the country's reactors as well as for explaining their decisions to the public.

Gov. Izumida remains adamant about restart

January 7, 2015

Niigata governor still at odds with Tepco chief over reactor restarts

http://www.japantimes.co.jp/news/2015/01/07/national/niigata-governor-still-odds-tepco-chief-reactor-restarts/

Kyodo
NIIGATA – Niigata Gov. Hirohiko Izumida remained at odds Tuesday with Tokyo Electric Power Co. President Naomi Hirose over the restart of reactors at Tepco's Kashiwazaki-Kariwa nuclear power plant in the prefecture, saying the utility has not done enough to probe the reasons behind the March 2011 meltdowns at the Fukushima No. 1 plant.
Izumida, who has said he will not approve the restart of the Niigata reactors unless all of the facts are discovered and made public on the Fukushima triple-core meltdowns, met Hirose for the first time in a year on Tuesday.
But the two remained far apart over the restart plan, as Tepco seeks to get the plant back online and has already scheduled meetings with local residents later this month.
The utility filed for the restart of reactors 6 and 7 at Kashiwazaki-Kariwa with the Nuclear Regulation Authority in September 2013.
"The (restart application) screening by the NRA is in full swing. We will start explaining to residents what safety measures we have put in place," Hirose told Izumida at the prefectural government office.
"The first thing we need is the full discovery of reasons behind the Fukushima accident," Izumida responded.
Izumida added that many Tepco officials have not agreed to the disclosure of documents that contain their interviews with the government investigation panel on Fukushima, calling this "backward-looking."
Hirose, however, said it is up to each Tepco official to decide whether to agree to disclose their interview transcripts.
Tepco said it will go ahead with plans to hold meetings with residents to explain its position in the city of Kashiwa on Jan. 22 and in the village of Kariwa on Jan. 23.

Niigata governor scolds TEPCO president, rejects reactor restarts

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201501070051

THE ASAHI SHIMBUN

NIIGATA--Niigata Governor Hirohiko Izumida on Jan. 6 remained adamantly opposed to restarting the Kashiwazaki-Kariwa nuclear plant and chided the president of the plant operator over the company's response to the Fukushima nuclear disaster.

Naomi Hirose, president of Tokyo Electric Power Co., was seeking Izumida's approval to bring two idle reactors at the plant back online, but he instead received criticism from the governor.

"(TEPCO) is taking a passive stance toward investigating the causes of the accident at its Fukushima No. 1 nuclear power plant," Izumida told Hirose.

TEPCO in autumn 2013 applied to the Nuclear Regulation Authority for safety screenings of the No. 6 and No. 7 reactors at the plant in Niigata Prefecture. The company not only has to win approval from the NRA, but it also needs the green light from host communities--and the prefectural governor--to resume operations.

During their talks, Hirose asked Izumida to inspect the Kashiwazaki-Kariwa nuclear power plant.

Izumida has repeatedly said he will not approve the reactor restarts unless TEPCO thoroughly examines the Fukushima nuclear accident, which unfolded after the Great East Japan Earthquake and tsunami in March 2011, and presents the results of its investigation.

He rejected Hirose's request for an inspection.

"There has not been a sufficient investigation into the causes of the (Fukushima) accident nor in-house disciplinary actions, so we cannot stand at the starting line of discussions on safety," the governor said.

TEPCO plans to upgrade its office in Niigata Prefecture to a local headquarters by July and increase the number of employees there from the current 20 or so.

The plan is designed to allow TEPCO to more effectively consult with local governments and residents in obtaining their consent for the reactor restarts.

TEPCO has forecast a net profit for the business year ending in March 2015, following widespread cost-cutting measures and reduced fuel costs.

TEPCO Chairman Fumio Sudo said in a news conference late last year that the company will forgo an additional electricity rate hike in 2015.

Sudo, however, also said the company could slip back into the red for the fiscal year ending in March 2016 if it cannot resume operations at the Kashiwazaki-Kariwa nuclear plant.

New subsidies to accelerate restarts

January 15, 2015

New subsidy system designed to expedite restarts of nuclear reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201501150078

The Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, is expected to resume operations this spring at the earliest. (Asahi Shimbun file photo)

THE ASAHI SHIMBUN

The Abe administration has earmarked 1.5 billion yen ($12.75 million) for a **new subsidy system designed to accelerate restarts of idled nuclear reactors and to convince residents that nuclear plants are safe.**

The figure was included in the draft budget for fiscal 2015, which was finalized on Jan. 14.

The fiscal 2015 draft budget also includes 91.2 billion yen for an existing annual grant system that targets regions hosting nuclear power facilities. These subsidies are provided to local governments based on power production at each nuclear plant they host.

Under the new system, prefectural governments that host nuclear reactors will receive grant money when the reactors resume operations or are later stopped so that the negative impact on local economies can be alleviated.

Although the local governments will be able to decide how to spend the funds, **the subsidies are expected to be used, for example, to conduct monitoring surveys to prevent the spread of groundless rumors about nuclear power. The central government also wants prefectural authorities to use the funds to hold explanatory sessions to convince residents of the safety of nuclear plants.**

All of the nation's reactors are currently offline in light of stricter safety standards introduced after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear crisis in March 2011. The administration decided on the figure for the existing subsidy system based on the assumption that all reactors are operating at 81 percent of capacity.

The Abe administration will revise the estimate for fiscal 2016 so that local governments that host restarted reactors will be able to receive larger amounts than other regions.

One way of discouraging plaintiffs

January 17, 2015

Some residents drop petition to halt restart of Sendai reactors in Kagoshima

http://www.japantimes.co.jp/news/2015/01/17/national/some-residents-drop-petition-to-halt-restart-of-sendai-reactors-in-kagoshima/#.VLqiGy51Cos

Kyodo

KAGOSHIMA – Some of the local residents seeking a court injunction to halt the restart of Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture have dropped their petitions, their lawyers said Saturday

Around 10 of the 23 residents who had sought the injunction last May have decided not to push ahead with their petition after learning that Kyushu Electric could seek massive damages from them, the lawyers said.

In addition to the residents' petition with the Kagoshima District Court, a larger group of plaintiffs filed in 2012 a lawsuit with the same court against Kyushu Electric and the state to prevent the restart of two reactors at the Sendai plant due to safety reasons.

The 23 residents are part of this larger group and reside in Kagoshima, Kumamoto and Miyazaki prefectures.

If the plaintiffs win the case, it would delay the utility's efforts to restart the reactors. But in the event they lose, Kyushu Electric could demand compensation from those who petitioned for the injunction because of the damages incurred due to the stoppage, according to the lawyers.

In one of the hearings, Kyushu Electric informed the court in writing that if the restart is delayed, it would mean losses worth ¥550 million per day.

The utility has also urged the court to order the plaintiffs to prepare cash collateral for possible compensation they might have to pay. The court has not yet issued such an order but some of the locals have decided to back out, the lawyers said, adding a ruling on the injunction is expected to be handed out in February at the earliest.

Last November, Kyushu Electric won consent from the Kagoshima Prefectural Government and the plant's host city of Satsumasendai for the restart of the two reactors at the Sendai plant, putting them in line to become the first of the country's 48 offline commercial atomic units to resume operation.

They are the first units to have cleared a set of tougher safety requirements introduced following the 2011 Fukushima nuclear crisis.

Sendai: Delayed till April

January 23, 2015

Sendai nuclear plant's restart delayed to April

http://www3.nhk.or.jp/nhkworld/english/news/20150123_27.html

Jan. 23, 2015 - Updated 08:19 UTC+1

The restart of the Sendai nuclear power plant in Kagoshima Prefecture, southwestern Japan, has been put off again due to a document revision.

The plant operator, Kyushu Electric Power Company, has been revising a construction plan for one of its two reactors. The document describes the facility's design in detail.

This is one of the documents needed to obtain approval from the Nuclear Regulation Authority for the restart. The other is a set of rules for operation and emergency responses.

Kyushu Electric says the plan could be submitted after the middle of next month. This is the second delay in the planned restart of the facility.

In September last year, the plant became the first in the country to meet the new government regulations introduced after the Fukushima accident in 2011.
The host city's mayor, the prefecture's governor and local assemblies have all approved the restart plan.

The latest delay pushes back the restart until April or later, pending the regulatory agency's approval of the plan and inspections.

All the commercial nuclear reactors in Japan are now offline.

Application for 3 more restarts

February 3, 2015

Kansai Electric to apply shortly to restart three more reactors

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201502030042
By KOJI NISHIMURA/ Staff Writer
OSAKA--Kansai Electric Power Co. will seek approval from the Nuclear Regulation Authority before the end of March to restart three reactors at its Mihama and Takahama power plants in Fukui Prefecture.
It also plans to ask the NRA to conduct safety assessments of the No. 1 and No. 2 reactors of the Oi nuclear power plant in Oi, Fukui Prefecture, as soon as the company deems they are ready to go back online.
With the utility having already requested NRA screening of the No. 3 and No. 4 reactors of both the Takahama and Oi nuclear power plants, the latest decision brings to nine the number of reactors Kansai Electric is preparing to restart.
The utility said Feb. 2 it intends to reactivate the No. 3 reactor in the Mihama facility in the town of Mihama and the No. 1 and No. 2 reactors at the Takahama plant in Takahama.

Kansai Electric will submit requests to the nuclear watchdog body for safety screening to ensure it is in compliance with tightened regulation standards.
The utility operates 11 nuclear reactors in total.
The remaining two are the No. 1 and No. 2 reactors at the Mihama nuclear power plant, which are due to be scrapped because of their age.
A final decision on decommissioning will be made by the end of March.
Kansai Electric decided to commission five more reactors based on its judgment that the restarts will bring profits despite the costs of revamping safety measures.
Reactors that are more than 40 years old are required to undergo a special inspection before the NRA will agree to extend their service.
To comply with these regulations, the No. 1 and No. 2 reactors at the Takahama nuclear power plant, which are 40 and 39 years old, respectively, are currently undergoing special inspections by Kansai Electric.
The No. 3 reactor at the Mihama nuclear power plant, which has been operating for 38 years, is next to follow.

NRA will approve safety measures for Takahama 3 and 4

February 3, 2015

NRA to approve Takahama safety measures

http://www3.nhk.or.jp/nhkworld/english/news/20150203_36.html

Feb. 3, 2015 - Updated 13:29 UTC+1

Japan's nuclear regulator is set to compile next week its final assessment on 2 reactors at the Takahama power plant in Fukui Prefecture, central Japan.

The final document will certify that the reactors have passed the regulator's scrutiny, which is a prerequisite for their restarts.

The final assessment follows the Nuclear Regulation Authority's approval of its draft in December. The draft said the safety measures at the numbers 3 and 4 reactors by the plant's operator have met new government requirements set after the Fukushima Daiichi disaster.

The regulator is examining about 3,600 opinions on the draft it received from the public in the 30 days after mid-December.

The NRA says the final document will come as early as Thursday of next week, after the public comments are gone through.

Kansai Electric Power Company will still need approval for equipment design details as well as the

consent of local governments. The reactors are unlikely to be brought online before summer. In a document submitted to the NRA, the utility reportedly plans to restart the reactors in November.

The Takahama plant has 4 reactors. The NRA says that if the utility files restart applications for the remaining numbers 1 and 2 reactors, it will reassess the measures for numbers 3 and 4.

The NRA says this is because the severe accident command center for the numbers 3 and 4 reactors in the current plan is too close to the other 2 reactor buildings.

Onagawa's faulty inspection reports

February 4, 2015

4000 errors in inspection records at Onagawa plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Feb. 4, 2015 - Updated 13:27 UTC+1

Tohoku Electric Power Company says it has found more than 4,000 improper entries in its inspection records about one of the reactors at its Onagawa nuclear power plant.

The initial inspection was held to check a wide range of facilities at the plant's No. 2 reactor after the great earthquake that hit northeastern Japan. The operator is hoping to restart the reactor about 100 kilometers north of the crippled Fukushima Daiichi plant.

But Japan's Nuclear Regulation Authority pointed out last year that Tohoku Electric's inspection was lax and the firm was re-examining the inspection records on the No. 2 reactor.

Company officials said at a news conference on Wednesday that the utility has scrutinized all the inspection records for the reactor since August 2011.

They said in some cases workers entered "no problem" for parts that didn't exist, citing the example of monitoring equipment for a valve which was not there.

In other cases, incorrect product types and serial numbers were left untouched. They say there were 4,188 errors in total.

Managing Director Takao Watanabe apologized to people in the region for causing concern, although he asserted the improper entries will not lead to any safety problems.

The company says it will also check the inspection records for the No.1 and No. 3 reactors.

Takahama restart

February 4, 2015

Two idled Kepco reactors to get safety OK next week

http://www.japantimes.co.jp/news/2015/02/04/national/two-idled-kepco-reactors-set-get-safety-ok-next-week/#.VNHONC51Cos

Kyodo
Two more idled nuclear reactors, in Fukui Prefecture, are set to obtain safety clearance from regulators, sources said Tuesday, giving another boost to Prime Minister Shinzo Abe's plan to revive atomic power following the 2011 triple meltdown at Tepco's Fukushima No. 1 plant.
Reactors 3 and 4 at Kansai Electric Power Co.'s Takahama nuclear plant will follow two reactors operated by Kyushu Electric Power Co. in meeting with the country's tighter safety requirements, which were imposed after the Fukushima meltdowns, moving a step closer to resuming operation.
According to the sources, the Nuclear Regulation Authority is set to approve on Feb. 12 a final report concluding that the two Takahama units comply with the new safety requirements, after Kansai Electric boosted safety measures against possible hazards at the plant.
But it will likely take at least a few more months before the reactors can go back online, given the operator still needs to obtain local approvals and undergo more procedures, including on-site operational checks.
All of Japan's 48 commercial reactors were gradually taken offline after the start of the Fukushima nuclear crisis, the worst such disaster since the 1986 Chernobyl disaster. Passing the NRA's safety screening is the initial requirement for resumption.
A pair of reactors at Kyushu Electric's Sendai plant in Kagoshima Prefecture became the first to meet the new regulations in September. Local municipalities have already given the green light to their resumption, but the units still remain offline as Kyushu Electric is behind schedule for finishing all necessary procedures.
In the case of the Takahama reactors, the process of resumption may not go as smoothly as the utility hopes, partly because some municipalities within the 30-km radius of the plant are demanding more say in deciding whether to allow the restart amid concerns they could also be severely affected in the event of a nuclear crisis.

Sendai restart delayed again

February 5, 2015

Nuclear plant restart delayed again

http://www3.nhk.or.jp/nhkworld/english/news/20150205_29.html

Feb. 5, 2015 - Updated 09:17 UTC+1

The restart of a nuclear power plant in southwestern Japan may not come until May at the earliest, due to a procedural reason.

In September, 2 reactors at the plant in Satsuma Sendai City in Kagoshima Prefecture became the first in Japan to meet new, tougher government regulations introduced after the 2011 nuclear disaster in Fukushima. Later, the governor of Kagoshima gave consent to Kyushu Electric Power Company to restart them.

The utility still needs approval from the Nuclear Regulation Authority for technical documents. It told the authority on Thursday that preparing them will take 2 or 3 months longer than expected because the authority says many revisions are needed.

One of the documents explains in detail facility designs for the plant's Number 1 reactor. The company originally planned to submit it in December. It now says it will take until the end of February, due to the need to provide more detailed data and explanations on earthquake resistance.

The utility says it will submit by the end of March a separate document describing designs for facilities that are shared with the Number 2 reactor.

The restart may not come until May or later, possibly the summer, pending the regulator's approval of the documents and onsite inspections.

All of Japan's commercial nuclear reactors remain offline.

Possible restart in June for Sendai

February 6, 2015

Sendai reactor faces June restart if inspection, election hurdles cleared

Reuters
http://www.japantimes.co.jp/news/2015/02/06/national/sendai-reactor-faces-june-restart-if-inspection-election-hurdles-cleared/#.VNXo3i51Cov
The Abe government is aiming to restart a nuclear reactor by around June, following a lengthy and politically sensitive approval process made difficult by the Fukushima disaster, sources familiar with the plans said.
The administration of Prime Minister Shinzo Abe has been pushing to bring some of the country's reactors back online after all 48 closed following the triple meltdown at Tepco's Fukushima No. 1 plant in March 2011, arguing they are key to economic growth.
A reboot would boost the nation's utilities, which have been hit by huge losses as they switch back to fossil fuels and race to upgrade nuclear plants, with two turning to the government for bailouts.
But the move would be controversial given that most citizens oppose nuclear power, with memories still fresh of the worst atomic crisis since Chernobyl in 1986.

"We urge the government to take into full consideration the tremendous suffering from the nuclear power plant accident and make sure that future policy ensures the safety and peace of mind of all citizens," Fukushima Gov. Masao Uchibori said, when asked about restarts.
Kyushu Electric Power Co. will be given the green light to restart two nuclear units in southwestern Japan, with June pencilled in for the first unit, according to three sources familiar with the government's thinking. They declined to be identified as they were not authorized to speak with media.
By June, the Nuclear Regulatory Authority is expected to have completed the final checks and appraisal of the reactors at Kyushu Electric's Sendai station, letting Abe give the final go-ahead after local authority approval late last year.
A June restart would also mean local elections scheduled for April would be out of the way, giving the government some leeway to take such a potentially unpopular step.
An industry ministry spokesman said no announcement had been made on Sendai's restart date.
A gradual return to nuclear power would not immediately end Japan's heavy reliance on fossil fuel imports, which has stoked a record trade deficit.
The use of fuel oil is likely the first to be curbed as it is the most expensive substitute and is being burned in older units that had been mothballed until being brought back online after Fukushima.
Demand for coal and liquefied natural gas, which has hit successive records as nuclear plants were shut down, will likely remain high, utilities and analysts have said.
Kyushu Electric's Sendai reactors, commissioned around 30 years ago, received initial safety clearance in September.
Two more rounds of checks are ongoing and, while there have been hitches, the June start date looks feasible for inspectors to finish their job, said another source.
However, **there is a chance restarts could be delayed as the units have been shut for more than three years and may need further maintenance.**

Takahama reactors clear safety checks

February 12, 2015

Takahama reactors clear NRA safety checks

http://www.japantimes.co.jp/news/2015/02/12/national/kepco-reactors-at-takahama-clear-key-safety-hurdle-toward-resumption/#.VNzcQC51Cos

by Eric Johnston
Staff Writer

Two nuclear reactors in Fukui Prefecture received a safety clearance from the Nuclear Regulation Authority on Thursday, marking a major step in efforts by Kansai Electric Power Co. to commence restarts this year.
It is the second time the NRA has granted a green light to potential restarts under tough, new safety standards. It earlier cleared two reactors at the Sendai plant in Kagoshima.

Although the new regulator said the Takahama No. 3 and 4 reactors meet operational safety requirements, two prefectures nearby fear how they would be affected by an accident and are demanding a say in whether to bring the plant back to life.
Furthermore, anti-nuclear activists warn that neither Fukui nor the Kansai region have developed detailed evacuation plans in the case of an accident.
The Takahama reactors, which turn 30 years old this year, still need approval from the NRA for design upgrades. They must also complete pre-start operational checks and win approval from residents. Kepco has said it hopes to restart them later this year, possibly in November.
The NRA said its decision had been uninfluenced by public concerns, including allegations that Kepco may have underplayed the likelihood of a major earthquake in the vicinity and concerns about the reactors' vulnerability to terrorism.
At a news conference Thursday, NRA Chairman Shunichi Tanaka said the reactors meet the new safety standards but cautioned **the checks are only one element in assessing risk.**
"This doesn't mean there's zero risk of an accident. What I'm saying is that under the new regulations and standards, the safety level sought for operation of the reactors has been satisfied," Tanaka said.
Kepco now needs to not only address the remaining technical and engineering issues, but also placate neighboring Kyoto and Shiga prefectures with assurances about safety and evacuation steps.The Takahama plant is only a few kilometers from the Fukui-Kyoto border.
About 397,000 people live within 30 km of the plant, including almost 90,000 in Maizuru, Kyoto Prefecture, a port city with a Maritime Self-Defense Force base that would likely play a major role in any evacuation.
In addition, 52,000 people in Shiga Prefecture, home to Lake Biwa, a major source of drinking water in the region, live within 30 km of the reactors.
Kepco is in talks with Kyoto and Shiga prefectures about various forms of cooperation for a restart. But residents in both prefectures are demanding the practice of formally obtaining local cooperation on restarts should include not only the governments that host a nuclear power plant but all administrations within 30 km — the approximate exclusion zone surrounding the Fukushima No. 1 plant.
Fukui opposes expanding the definition of "local consent," and Kepco has said only that it will formally seek permission from the Fukui governor and the town of Takahama.
Prior to the 2011 Fukushima meltdowns, the Kansai region relied on nuclear power for approximately half of its electricity needs.

Kansai Electric gets NRA go-ahead to restart 2 reactors in Fukui

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201502120057

By CHIKAKO KAWAHARA/ Staff Writer
Japan's nuclear watchdog gave the green light Feb. 12 to restart two idled reactors at a plant in Fukui Prefecture, adding impetus to government efforts to bring nuclear facilities back online.
The Nuclear Regulation Authority approved enhanced safety measures submitted by Kansai Electric Power Co. for the No. 3 and No. 4 reactors at its Takahama plant, a key hurdle for their restart.
Of the 48 commercial reactors that went offline after the Fukushima nuclear crisis unfolded in March 2011, only two other reactors--at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture--have received safety clearance.

Kansai Electric will now work toward completing other procedures, such as obtaining final NRA go-ahead and the backing of local governments to restart the reactors.
The reactors at both the Takahama and Sendai plants are not expected to go back online before summer, as their operators still need to obtain approval of detailed construction plans, as well as operational and accident-response manuals.
Also, on-site operational checks that follow the final NRA approval take one to two months to complete.
Kansai Electric submitted its application to restart the No. 3 and No. 4 reactors at the Takahama facility after new safety regulations took effect in July 2013.
The NRA approved the draft permission for the plant's safety measures last December and solicited opinions from the public over 30 days. It examined 3,615 opinions and made some corrections to the draft before adopting a final version.
The nuclear watchdog also took into consideration Kansai Electric's plan to use the reactors for plutonium-thermal power generation, which uses mixed-oxide fuel comprising plutonium and uranium.
It also gave the approval on condition that the utility enhances the plant's tsunami resistance and designates part of the No. 1 and No. 2 reactor buildings as emergency headquarters in the event of a serious incident.
In satisfying the latter condition, Kansai Electric will need to resubmit safety measures for the No. 3 and No. 4 reactors if it seeks to restart the No. 1 and No. 2 reactors.
With the Abe administration pushing to bring reactors that pass the NRA's safety standards back online, Kansai Electric believes it will be able to restart the No. 3 and No. 4 reactors after obtaining consent from Fukui Prefecture and the city of Takahama, which host the plant.
Prefectural authorities will make their decision after the utility has satisfied other requirements.
However, the restart remains uncertain, as some neighboring prefectures within 30 kilometers of the plant--which are required to map out disaster-evacuation plans--have demanded a greater say in the move.
Kyoto and Shiga prefectures, parts of which are included in the zone, have negotiated with Kansai Electric to give them the right to be more involved in the decision-making process.
The NRA said it will provide explanatory briefings on its decision to approve the safety measures at the Takahama plant for local governments that ask.

2 more idled nuclear reactors in Japan get safety OKs

http://mainichi.jp/english/english/newsselect/news/20150212p2g00m0dm034000c.html

TOKYO (Kyodo) -- Two more of Japan's idled nuclear reactors obtained safety clearance from the regulator on Thursday, giving another boost to the government's planned resumption of atomic power generation following the 2011 Fukushima Daiichi meltdowns.
With the Nuclear Regulation Authority's approval of enhanced safety measures against possible earthquake and tsunami hazards as well as other severe accidents, the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama complex, located on the Sea of Japan coast in Fukui Prefecture, cleared a key hurdle toward resumption.

Although the majority of the public in Japan remains opposed to the restart, Prime Minister Shinzo Abe is looking to resume operation of reactors that clear the regulator's screening based on the country's new, tighter regulations, saying it is necessary for economic growth.
Among a total of 48 commercial reactors that were gradually taken offline after the Fukushima nuclear crisis, only two other reactors, owned by Kyushu Electric Power Co., have obtained safety clearance under the new regulations so far.
"The level of safety that we require for resumption has been secured (regarding the two Takahama reactors)," Shunichi Tanaka, chairman of the regulatory body, said at a press conference.
"But this does not mean that accidents will never occur or there are no risks," Tanaka said, calling for Kansai Electric's continued efforts to enhance safety of the plant.
The units, however, are not expected to go back online before summer, as the operator still needs to complete other procedures, such as submitting a construction plan, undergoing on-site operational checks and obtaining local approval.
The restart also remains uncertain because some neighboring municipalities within a 30-kilometer radius of the plant have demanded a greater say in deciding whether to allow it, claiming they could also be greatly affected in the event of a severe accident.
A Kansai Electric spokesman said the company hopes to restart the two Takahama units by November.
The company seeks to resume operations at nine of the 11 reactors it owns, the exceptions being two aging reactors.
In September, a pair of reactors at Kyushu Electric's Sendai plant in southwestern Japan became the first to meet the stricter safety requirements introduced following the Fukushima nuclear crisis, the worst since the 1986 Chernobyl disaster.
But the Sendai plant, seen as the closest to resumption, still remains offline as the operator is behind schedule in completing necessary procedures.
Power companies are desperate to bring their idled nuclear reactors back online amid an increase in fossil-fuel costs for thermal power generation, which has covered the output shortfall in the absence of atomic power.
Kansai Electric, which was one of the most nuclear-reliant utilities in Japan before the Fukushima accident, is expected to post a fourth straight year of losses in the current business year through March.
The utility sought government permission last year for raising its electricity bills from April, after it last raised household bills in May 2013.
February 12, 2015(Mainichi Japan)

NRA: Takahama reactors clear screening

http://www3.nhk.or.jp/nhkworld/english/news/20150212_19.html

Feb. 12, 2015 - Updated 03:55 UTC+1
Japan's nuclear regulator says 2 reactors at Takahama nuclear plant in Fukui Prefecture have cleared screening for restart.

The Nuclear Regulation Authority unanimously decided on Thursday that safety measures on the No.3 and No.4 reactors meet new government requirements set after the Fukushima Daiichi disaster.

About 3,600 ordinary people gave their views on the NRA assessment via a public comment system.

Some comments said the authority underestimated the size of tremors from an earthquake. Others criticized the inadequacy of measures to deal with a severe accident or terrorist attack.

The Takahama plant in central Japan is the second to be cleared for restart, following the green light for the Sendai plant in Kagoshima Prefecture, in the southwest.

Operator Kansai Electric Power Company aims to bring the reactors back online in November, after its equipment designs are authorized and it wins the approval of local governments.

The company plans to seek the consent of Fukui Prefecture and Takahama town, which host the plant.

But some local governments demand approval from all municipalities within the plant's 30-kilometer zone. The municipalities are obliged to draw up disaster preparedness plans.

Municipalities in Fukui's neighboring prefectures of Kyoto and Shiga, which fall in that zone, are seeking a new accord with Kansai Electric.

Screening process: No major development

February 12, 2015

Screenings of nuclear fuel facilities in Japan not moving forward

http://mainichi.jp/english/english/newsselect/news/20150212p2a00m0na019000c.html

December last year marked one year since the implementation of new safety standards applying to nuclear fuel facilities, which play a significant role in the nation's nuclear fuel cycle. The Nuclear Regulation Authority (NRA) is performing safety checks of such facilities alongside inspections of nuclear power plants, but so far there have been no major developments.
NRA member Akira Ishiwatari visited a reprocessing facility for spent nuclear fuel in Aomori Prefecture in December last year. It was the first full-scale, on-site inspection to be conducted since the facility's operator, Japan Nuclear Fuel Ltd., applied for a safety check in January 2014 with an eye to start operations. The focus of the inspection was whether an active fault lay beneath the plant. If a fault existed, the main structures would need further reinforcement against earthquakes.
After examining 10 spots including geological formations in trenches that were dug, Ishiwatari told reporters that he wanted the data for drilling that was underway, indicating that it would take quite some time to reach a decision on the facility.

Applications for safety screening of 15 nuclear fuel facilities have been submitted to the NRA. Among them are four major Japan Nuclear Fuel facilities, including a reprocessing facility and a MOX fuel facility, together with a reactor for university research. The reprocessing and MOX fuel facilities form the core of Japan's nuclear fuel cycle.

The MOX fuel that is processed at the reprocessing facility in Aomori Prefecture is used at nuclear power plants in so-called "pluthermal" systems. The reactor at the Oma Nuclear Power Plant in the prefecture, to be operated by J-Power (Electric Power Development Co.), would be the first commercial reactor in the world to use 100 percent MOX fuel. A safety screening application for this plant has already been filed.

The Monju fast-breeder reactor in Fukui Prefecture, which was designed to generate more nuclear fuel than it consumes, also plays a pivotal role in the nuclear fuel cycle. A total of 99.3 percent of the uranium used as fuel at nuclear power plants consists of Uranium-238, which is not fissile. Monju has been touted as a "dream reactor" as it can break this down into fissile plutonium, increasing the amount of nuclear fuel.

However, the outlook for each of these facilities is unknown. NRA Chairman Shunichi Tanaka has said the Oma reactor will be evaluated carefully, as there are no other cases of 100 percent MOX fuel operation.

As for the Monju reactor, it was learned in November 2012 that a massive number of checks had not been performed properly, which effectively resulted in it being ordered to a halt. The operator, Japan Atomic Energy Agency, has sought to revise its administration system, but there are no immediate prospects of the order being lifted.

Similarly, in the screening of the reprocessing facility, the NRA and Japan Nuclear Fuel have not seen eye to eye. Five screening meetings were held in January, but one NRA official said all that happened was that people gathered for the meetings. Kazuhiro Matsumura, senior executive vice president of Japan Nuclear Fuel, stressed, "We are putting full effort into explaining the issues" However, a critical NRA official commented, "The grounds for their explanations in the screening process are lacking. They're just trying to get it over and done with simply and take the easiest route."

In screenings for nuclear power plants, the No. 1 and 2 reactors at the Sendai Nuclear Power Plant operated by Kyushu Electric Power Co. have been granted safety clearance. Permission was similarly granted to the idled No. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama Nuclear Power Plant on Feb. 12. To date, when power companies have failed to respond clearly to NRA requests during nuclear power plant screening, the screening process has tended to remain at a standstill. As such, the stance of Japan Nuclear Fuel is likely to be tested.

More eyes needed

February 14, 2015

EDITORIAL: Bring more parties aboard in reactor restart process

http://ajw.asahi.com/article/views/editorial/AJ201502140047

Citizens protest restarting of reactors at the Takahama nuclear power plant at a rally in Kyoto on Feb. 12. (The Asahi Shimbun)

The Nuclear Regulation Authority has formally approved an application by Kansai Electric Power Co. to restart the No. 3 and No. 4 reactors at its Takahama nuclear power plant in Fukui Prefecture.

The decision means that the two offline reactors meet its safety standards.

This is the second time the NRA has endorsed the safety of reactors under tighter standards introduced after the outbreak of the Fukushima nuclear crisis in March 2011. Two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture have also been granted the safety clearance.

The focus will now be on whether local governments in the vicinity give their consent. However, there is no law stating which prefectures and municipalities should be involved in the process.

With regard to the Sendai plant, Kagoshima Governor Yuichiro Ito decreed that only Kagoshima prefectural authorities and the facility's host city of Satsuma-Sendai should have any say.

The Abe administration decided to use the Sendai plant as a template for its push to bring idled reactors back online. In line with this policy, Kansai Electric and Fukui Governor Issei Nishikawa intend to seek the consent of only the prefecture and the town of Takahama for the restart.

The Fukushima nuclear disaster brutally underscored the reality that a severe accident can affect vast areas.

Allowing reactors to be restarted under the regulatory framework in place before the outbreak of the crisis is simply unacceptable.

The current approach for local government consent covers only the prefecture and the host municipality. Instead of treating this as an established system, the government should redefine the scope of local governments concerned before reactors are brought back online.

For instance, the city of Maizuru, Kyoto Prefecture, is within five kilometers of the Takahama plant. This means residents of the city would have to be evacuated immediately if there was a major accident at the plant.

Eight municipalities in Kyoto and Shiga prefectures lie within 30 km of the facility. These local governments are required by the state to compile evacuation plans for nuclear emergencies. The total population of the eight municipalities exceeds 120,000. This compares with 50,000 or so people living in the Fukui Prefecture area of the 30-km zone.

The NRA is also assessing the safety of the Oi plant in Fukui Prefecture, the Genkai plant in Saga Prefecture, the Ikata plant in Ehime Prefecture, the Shimane plant in Shimane Prefecture and the Shika plant in Ishikawa Prefecture. All of these facilities lie close to neighboring prefectures.

A key indicator of the government's stance toward this issue will be the scope of the local governments involved in the process of restarting the two reactors at the Takahama plant.

MORE 'EYES' NEEDED

The requisite consent from local governments hosting nuclear plants for operating reactors is based on safety agreements between these governments and the plant operators.

As many nuclear power plants were constructed in the 1970s onward, the number of problems with the facilities has increased. Yet, crucial information about these problems was tightly controlled by the plant operators and the central government, with local governments concerned often left out of the loop.

This prompted host governments to strike deals with the operators of nuclear plants to demand relevant information so that they can closely monitor safety aspects from the standpoint of local residents.

For instance, agreements between Fukui Prefecture and operators of nuclear plants in the prefecture include a provision that allows local governments to demand the suspension of a reactor under certain circumstances, as well as a clause requiring advance discussions before restarting reactors after a serious incident.

The prefectures acquired these rights through persistent negotiations with the operators following every incident and glitch along the way.

Since the Fukushima disaster, which has made residents of municipalities around nuclear plants uneasy about the safety of the facilities, many local governments across the nation have started calling for similar agreements with plant operators.

Kansai Electric, however, has been reluctant to respond to these calls.

The utility is currently in talks with Kyoto Prefecture for a new agreement, but refuses to accede to the prefecture's call for the right to consent.

Fukui Governor Nishikawa supports this stance, stressing that host governments have been assuming related “responsibilities and risks.”

Host governments are probably wary about giving a say to local governments that are not as deeply involved in nuclear plant-related matters.

However, the participation of surrounding governments in the process of deciding whether to restart reactors would lead to a broader scope of safety monitoring through a greater number of eyes.

Host governments have acquired the right to look into the safety of the nuclear plants on their own and, should they decide, refuse to approve plans to restart reactors if there are safety concerns. They should share this privilege with surrounding local governments to widen the scope of local communities that have a say in the matter.

CONSENT OF 30-KM ZONE

The three prefectures of Fukui, Kyoto and Shiga, as well as municipalities concerned, have worked out evacuation plans for broad areas in accordance with the central government's nuclear disaster-response guidelines. However, work has barely started on coordinating details to ensure the evacuations will be carried out properly.

If a serious nuclear incident occurs in Fukui Prefecture, more than 100,000 people in the three prefectures may have to be evacuated, mainly to the Kansai region.

Such a scenario conjures up images of major traffic snarls and serious confusion. Many issues need to be sorted out, including how to secure buses for evacuations.

In January, the Union of Kansai Governments, which groups seven prefectures and four designated cities, called on the central government to get actively involved in efforts to ensure the effectiveness of wide-area evacuation plans.

Until the central government commits itself to this task, the union warned, there is little likelihood that calls to restart the Takahama reactors will be accepted.

Operators of nuclear plants planning to restart reactors should be required to gain prior consent from all local governments responsible for the safety of residents during nuclear emergencies.

For the time being, the local government consent program should cover all areas within 30 km of nuclear plants, in line with the emergency evacuation zones defined by the government’s nuclear disaster-response guidelines.

It may also be advisable to consider providing a legal basis in the future for the requirement of local consent, which is currently based only on agreements between plant operators and local governments. This step would help remind nuclear plant operators that this is a process of great gravity.

REUNITING LOCAL TIES

When two reactors at the Oi plant were restarted in 2012, local government heads in the Kansai region, which uses electricity produced at the plant, temporarily expressed their opposition to the move. As a result, Fukui Prefecture became isolated.

The one-sided push against the restart of the reactors caused Fukui Prefecture to develop deep-rooted distrust of local governments in areas that consume electricity generated by the facility.

It is essential to make fresh efforts to overcome the conflict of interests and reunite the relationships among the broader range of local communities concerned.

We suggest the central government take the lead by coordinating talks among the governors of Fukui and Kansai prefectures, along with the mayors of municipalities within 30 km of the plant, to build consensus on the scope and rights of local governments involved.

There is a raft of problems that need to be resolved through cooperation between areas where nuclear plants are located and those that consume the electricity the sites produce. These include, for instance, where to store spent nuclear fuel rods piled up in storage pools at nuclear plants and how to support local communities that would lose their main revenue source when aged nuclear plants are decommissioned.

This process will undoubtedly require a great deal of time and effort. But sufficient time should be spent on tackling the challenges presented by the harrowing incident at the Fukushima plant.

The future of nuclear power generation is a question that should be answered through national debate.

We are eager to see Fukui and Kansai take a first step in this direction together.

--The Asahi Shimbun, Feb. 14

Takahama reactors

February 16, 2015
http://www3.nhk.or.jp/nhkworld/english/news/nuclearwatch/20150216.html

Nuclear Watch : Takahama Reactors Clear Screening

Kurando Tago, NHK WORLD
The operator of a nuclear power plant in central Japan is a step closer to restarting two reactors after government regulators approved the plan. The facility is the second to meet the new regulations introduced after the 2011 Fukushima accident, but not everyone agrees with the decision.
Officials with the Nuclear Regulation Authority were unanimous in giving approval for the restart. They say the No. 3 and No. 4 reactors of the Takahama nuclear plant meet the new requirements for withstanding potential earthquakes and tsunami. "We've confirmed the plant's operator will guarantee the level of safety that the authority is demanding," says Shunichi Tanaka, the authority's chairman.
The operator, Kansai Electric Power Company, is hoping to bring the reactors back online in November. But it still needs to win the approval of local governments, while some people are raising concerns about safety.
Dozens of people rallied in front of the NRA's office to protest the authority's decision. Operators are looking for consent from Fukui Prefecture as well as Takahama town, which host the plant.
But authorities with other local governments want their voices heard as well. They want Kansai Electric to get approval from all municipalities within the plant's 30-kilometer zone. Officials in those areas are obliged to draw up disaster-readiness plans, and some residents are voicing anxiety. "The plant's existence is desirable in terms of employment as many people work there," says one resident. "But when it comes to the plant's safety risks, it's a different story."
"Our community is in close proximity to the nuclear plant. We want a framework that makes sure our voices will be heard," says Kyoto Prefecture Governor Keiji Yamada, adding he has notified Kansai Electric of the concerns.
People around the world saw how the Fukushima disaster affected the lives of nearby residents. Now residents near the Takahama plant say Kansai Electric must come face-to-face with their concerns.

(Public) approval not guaranteed

February 17, 2015

Local approval is no given for Takahama nuclear restarts

http://www.japantimes.co.jp/news/2015/02/17/national/local-approval-given-takahama-nuclear-restarts/#.VOMDyy51Cot

JIJI
FUKUI – Kansai Electric Power Co. wants to fire up its Takahama nuclear plant as soon as possible, but it has cleared only one hurdle in securing a green light from regulators. The next could be difficult: obtaining the consent of local officials.

The plant must have evacuation plans for all residents. Although the plant is located in Fukui Prefecture, the evacuation zone sweeps into Kyoto and Shiga prefectures, and they fear for a repeat of a crisis like the Fukushima meltdowns.
The Nuclear Regulation Authority declared last week that the No. 3 and No. 4 reactors of the Takahama plant meet safety standards.
But Yutaka Nose, mayor of Takahama, called on the NRA to explain what that green light means. He suggested that it record a video for town residents to watch via a local cable television network.
Nose said he himself will only decide whether to approve the restarts after consulting residents.
Fukui Gov. Issei Nishikawa plans to decide in line with the recommendations of a panel of experts conducting an independent assessment at the prefectural government's behest. He will also, he said, consider sentiment in the town and the prefectural assembly.
Along with the NRA's safety certificate, **Kansai Electric needs to win approval for the systems and facilities it would deploy in the event of an accident**.
Nishikawa said he will take everything into account in deciding what to do.
It is unlikely that there will be much progress before **April's gubernatorial election**.
If the Sendai nuclear plant in Kagoshima Prefecture is anything to go by, approval could be months away at least. Approval is still pending for a resumption of life at that plant's No. 1 and No. 2 reactors, even though the NRA gave a thumbs-up in September.
The safety standards the NRA now holds reactors to were introduced after the crisis at the Fukushima No. 1 plant in March 2011.
A total of 21 reactors at 14 power plants are currently slated to get NRA screening, and some of them are already undergoing inspections. For now, all reactors remain offline.
In the event of a serious accident, residents within 5 km would be evacuated immediately. For those further away in the 30-km zone there need only be evacuation plans in place.
About 70 residents of Maizuru, Kyoto Prefecture, live within 5 km of the Takahama plant. The 30-km area includes 128,000 people in seven cities and towns in Kyoto, and 55,000 in four municipalities in Fukui.
Kyoto Gov. Keiji Yamada has not been drawn on whether he favors restarts. He has demanded "clear-cut accounts" from the central government, the NRA and Kansai Electric.
However, he seems satisfied with a draft safety agreement between his prefecture and the utility.
Taizo Mikazuki, governor of Shiga Prefecture, part of which also falls within the 30-km radius, maintains that he will not endorse the restart of the reactors unless the Takahama plant introduces an "effective" safety system.
Mikazuki was elected last July on a pledge of seeking to phase out nuclear power.
He has warned that in the event of an accident, the fallout won't respect prefectural boundaries. He believes reactivating nuclear plants should be a matter for other prefectures, not just the one that hosts the plant.
But Nishikawa said the decision should be for Fukui Prefecture and the town of Takahama alone because they host the plant and will assume the risk.
Nishikawa recognizes that there is concern in the Kyoto and Shiga prefectural governments, and therefore he has called on the central government to explain why the reactors need to be restarted.

Documents submitted to NRA for restart of Kagoshima plant

February 27, 2015

Utility submits papers to restart nuclear plant

Feb. 27, 2015 - Updated 11:18 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/20150227_45.html

The operator of a nuclear power plant in southwestern Japan has submitted revised technical documents to regulators. They hope to gain approval to restart the plant.

In September last year, 2 reactors at the Sendai facility in Satsuma Sendai City in Kagoshima Prefecture became the first in Japan to meet new, tougher, government regulations. The new rules were introduced after the 2011 nuclear disaster in Fukushima.

Later, Kyushu Electric Power Company, which operates the plant, obtained the governor of Kagoshima's consent to restart the reactors.

But the company still needs 2 approvals from the Nuclear Regulation Authority before it can put the reactors back online.

On Friday, the utility submitted a revised construction plan that includes detailed designs of the facilities as well as some other information about the Number One reactor.

Company's officials say that it has taken 2 months longer than expected. They needed to conduct experiments to verify earthquake resistance. They also say they were required to give more detailed explanations.

The utility plans to submit by the end of March documents describing the central control room and other facilities. They will also provide technical data about the Number Two reactor.

If a restart happens it may not come until May or later, possibly the summer. It depends on the regulator's approval of the documents and onsite inspections.
An executive from the utility, Akira Nakamura, said the company was required to thoroughly verify the facilities' quake resistance and it took longer than expected.

All of Japan's commercial nuclear reactors are currently offline.

Takahama assembly to vote on restart

February 27, 2015

Takahama assembly to vote on restarting nuclear reactors

http://www.japantimes.co.jp/news/2015/02/27/national/takahama-assembly-to-vote-on-restarting-nuclear-reactors/#.VPF7Ni51Cos

by Eric Johnston
Staff Writer

The town assembly of Takahama, Fukui Prefecture, which hosts Kansai Electric Power Co.'s Takahama nuclear power plant, will decide by March 20 whether to approve the restart of the plant's No. 3 and 4 reactors, which recently cleared central government inspections.

The decision by the assembly, which is generally seen as pro-nuclear, will be based on whether five basic conditions the prefecture requested of the central government in mid-February are met to their satisfaction. These include central government explanations to local residents on the importance of the reactors, the safety measures being taken, and a plan for dealing with midterm storage of the spent nuclear fuel they produce.

The prefectural government also wants to know how big nuclear's role in the overall energy mix will be, how the lessons of the Fukushima meltdowns will be applied to Takahama, and what kind of assistance other local governments hosting nuclear power plants will receive for employment and economic issues when plants are decommissioned.

In addition to the above, the Takahama assembly will canvass residents on whether they want the plant to be restarted. While not legally required, obtaining local permission for restarts is a long-established practice. Fukui Gov. Issei Nishikawa, who is also generally seen to be pro-nuclear, will have the final say, which is expected to come after the nationwide round of local elections in April.

One condition that neither the municipal nor the prefectural government sought was specific language demanding that neighboring cities and towns in Kyoto and Shiga prefectures that are within 30 km of Takahama also give formal permission for the restart. Under new guidelines adopted after 3/11, all local governments lying fully or partially within a 30-km radius of a nuclear power plant have to draft evacuation plans.

On Friday, a general safety agreement including Kepco, the Kyoto Prefectural Government, and the heads of seven towns and villages within 30 km of Takahama, was signed at prefectural headquarters following weeks of discussions.

Under the agreement, which is the first of its kind, the Kyoto localities will establish a joint committee to work together with Kepco, which will provide them with information about the reactors. As parts of Maizuru, a city in Kyoto with a population of nearly 89,000, lie within five km of the Takahama plant, Kepco has agreed to consult its officials about safety measures and respond to their opinions.

Kepco has also promised to provide Kyoto officials with an explanation of why it needs to build more reactors, should the utility decide to do so, and to provide prior notice if either spent nuclear fuel or radioactive waste is transported through the prefecture.

A survey by anti-nuclear citizens in Kyoto and Shiga conducted between Jan. 16 and Feb. 25 on 97 local assembly members in the seven Kyoto and two Shiga localities within 30 km of Takahama showed that 77 percent said they thought it was necessary to obtain their permission for a restart.

About 127,500 people in seven Kyoto prefectural cities, towns, and villages with a total population of 277,500 live within 30 km of the Takahama plant. Part of Takashima, Shiga Prefecture, which has a population of about 52,500, also lies within that zone.

Municipalities want right to express themselves on restart

March 2, 2015

Municipalities near nuclear plants want more say on reactivation: survey

http://mainichi.jp/english/english/newsselect/news/20150302p2a00m0na014000c.html

The mayors of over half of the municipalities near those hosting nuclear power plants have told the Mainichi Shimbun in a survey that they oppose reactivation of nuclear power plants based on agreements with the host city and prefecture alone.

The governments of municipalities surrounding those hosting nuclear power plants aren't given the right to express their opinions on reactivation, and there is no means to have their residents' opinions heard in the procedures leading up to reactivation.

In the case of the Sendai Nuclear Power Plant in Kagoshima Prefecture, procedures to obtain local consent only involved the prefecture and the city of Satsumasendai, hosts of the plant. With regards to this method, 11 of the 22 mayors of municipalities hosting nuclear power plants said that they thought it was correct to seek only the host prefecture and municipality's agreement. Only one village mayor said this was wrong. By contrast, the mayors of 60 of the 117 surrounding municipalities within 30 kilometers of the plants said the scope of consent sought was inappropriate. Just 14 said it was right to leave the decision up to the host prefecture and municipality alone.

"The residents of surrounding municipalities have a deep interest in the matter of plant reactivation, and reactivation can no longer be decided based on the opinions of the host municipalities alone," responded the mayor of Fujieda, Shizuoka Prefecture.

The survey also asked the 22 hosting municipalities' mayors whether it was acceptable to restart power plants that meet new safety regulations adopted after the Fukushima No. 1 Nuclear Power Plant disaster. Nine agreed with this stance while five opposed it. Meanwhile, 39 of the mayors of the 117 surrounding municipalities said it was not acceptable to restart the plants, while 23 said it was acceptable, showing a difference in attitude between the mayors of municipalities hosting nuclear power plants and those of the surrounding municipalities.

Fifty-two of the mayors of the surrounding municipalities said that municipalities' opinions were not being reflected in the national government's nuclear power policy, while 34 said they were. Twenty-nine of the 52 mayors who said the municipalities' opinions were not being reflected were also mayors who opposed reactivation.

"There is no opportunity to directly deal with the government," answered the mayor of Kucchan, Hokkaido.

"The understanding of residents is of the utmost importance in nuclear power policy, but the opinions of municipalities are not being represented," wrote the mayor of Fukuroi, Shizuoka Prefecture.

The mayor of Mito wrote, "There is no chance or method to express the voices of municipalities to the national government."
The survey was conducted from late January on the mayors of 135 municipalities specified by the government as "Urgent Protective Action Planning Zones" (UPZs), plus the mayors of four municipalities within 30 kilometers of Electric Power Development Co. (J-Power)'s Oma Nuclear Power Plant, currently undergoing safety inspections ahead of possible activation.
A similar survey was conducted on the mayors of 21 governors of prefectures within UPZs. Two of them, the governors of Fukui and Kagoshima prefectures, both nuclear power plant hosts, said that they thought it was correct to seek only the agreement of hosting municipalities for plant reactivation. The governors of two other nuclear power plant hosts, Ibaraki and Shizuoka prefectures, said they thought it was incorrect, as did the governors of Shiga, Kyoto, Tottori and Nagasaki prefectures, which are located around nuclear power plant hosts.
There is no clear legal basis for the scope of municipalities included when seeking agreement for reactivation of nuclear plants. For the Sendai Nuclear Power Plant, a safety agreement between Kagoshima Prefecture, the city of Satsumasendai and Kyushu Electric Power Co. was used as the basis for defining the municipalities whose agreement was necessary. Agreement on the plant's reactivation was expressed first by the Satsumasendai Municipal Assembly, then the mayor, followed by the prefectural assembly, then the governor.
The dissatisfaction of municipalities near nuclear plants with their inability to be a part of the process for deciding on plant reactivation is likely to affect the upcoming spring unified local elections.
March 02, 2015(Mainichi Japan)

Judges can stop nukes

March 5, 2015
Court battles are sole remaining obstacle to nuclear restarts

http://www.japantimes.co.jp/news/2015/03/05/national/court-battles-are-sole-remaining-obstacle-to-nuclear-restarts/#.VPgauS51Cos

by Mari Saito and Kentaro Hamada
Reuters
The fight over restarting the nuclear industry is moving to the courts, where power companies face the risk of further delays in firing up idled reactors if judges side with local residents worried about nuclear safety.
Four reactors owned by two utilities cleared regulatory safety checks in recent months, opening up the possibility of ending more than a year without atomic power in Japan, the first such spell in the four decades it has been using nuclear energy.
And while ruling politicians and Japan’s bureaucracy are pushing for restarts, the judiciary — which typically sided with power companies before the 2011 Fukushima nuclear disaster — may be shifting its attitude.

Judges are now considering injunctions that could halt the restarts and indefinitely extend the countrywide shutdown of Japan's 48 reactors that followed Fukushima, posing a threat to power companies already surviving on government support.

"Japan's courts have always been hesitant to properly check the state and its legislative process," but the shift in public opinion against nuclear power may have turned some judges in favor of residents, said Hiroshi Segi, a former judge turned critic of Japan's judicial system.

The court decisions, which might come this month — four years after the earthquake and tsunami that knocked out the Fukushima reactors — could mean months, even years of delays and hundreds of millions of dollars in losses for Kansai Electric Power Co. and Kyushu Electric Power Co.

Many citizens were shocked when Tokyo Electric Power Co. repeatedly mishandled and misreported on the Fukushima meltdowns and explosions, which led to a decontamination and decommissioning process that will take up to 30 years and cost billions of dollars. National opposition to restarts remains about two-to-one over support, polls have consistently shown.

"Now that we are drawing closer to restarts, there is no other entity but the judiciary to realistically stop it," said Yuichi Kaido, a lawyer involved in cases to stop restarts at the Sendai and Takahama nuclear plants and who has been battling utilities in court for three decades.

The plaintiffs contend the utilities are underestimating the earthquake risks at Sendai, in Kagoshima Prefecture, and Takahama, in Fukui, and are not meeting tougher post-Fukushima standards. Residents also say the government has not drafted credible evacuation plans for use in case of another nuclear event.

Kaido's team of anti-nuclear lawyers is planning to seek injunctions on every plant that wins regulatory approval.

"Judges must know that their decision could stop the next nuclear accident," Kaido said.

Ten utilities have so far submitted reactors at 13 nuclear facilities nationwide for restart. Electric Power Development Co., or J-Power, is also seeking approval for its Ohma plant, which is still under construction.

The costs of halting the restarts are high. Every day the Sendai reactors sit idle costs Kyushu Electric more than $4.6 million, the operator estimates.

Kansai and Kyushu Electric, the utilities most reliant on nuclear power before Fukushima, have amassed more than $10 billion in combined losses over the past four years.

Both are also on track for their fourth straight year of losses, Kyushu Electric after receiving a government bailout in 2014. Kansai Electric said last year that its corporate survival was at risk.

Halting restarts would also further complicate Prime Minister Shinzo Abe's plan to reduce imports of more expensive thermal fuels by reinstating nuclear power, which previously supplied nearly a third of Japan's energy.

Abe's government wants the first restarts, of Kyushu Electric's Sendai reactors in Kyushu, by around June, people familiar with the matter said last month. The industry had initially hoped the first reactors would be back online by last summer.

With judges appearing more sympathetic to anti-nuclear activists, though, the utilities face tougher prospects before the judiciary.

The lead judge in the Takahama case, Hideaki Higuchi, ruled against restarting Kansai Electric's Ohi plant in May last year, a rare victory for activists.

"I think residents could win the (Takahama) shutdown in Fukui District Court," said Akihiro Sawa, a former official with the Ministry of Economy Trade and Industry, which oversees electric power companies.

Sawa, now a research director at the 21st Century Public Policy Institute, affiliated with the nation's biggest business lobby, said he has been warning utility executives to take the lawsuits seriously.
A Kansai Electric representative said the company will continue telling the court its plant is safe. Still, "Kansai Electric believes there is a significant possibility that they will lose," said a person familiar with the utility's thinking.
Kyushu Electric has asked the court to dismiss the injunction request against its restart at Sendai, saying it has taken additional safety precautions after Fukushima and that there is no danger of an accident that would release large amounts of radiation.
In the Ohi decision last May, the Fukui court judge said protecting residents' health from a potential nuclear accident was more important than any financial gains the country may get from restarting stalled plants.
"I am hopeful that the Sendai judge will feel the same," Kaido said.

21 applications for restart

March 11 , 2015

Utilities apply to restart 21 reactors

Mar. 11, 2015 - Updated 11:02 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/20150311_22.html

Japanese utilities have applied to restart more than 40 percent of the country's reactors, which remain offline 4 years after the Fukushima Daiichi disaster.

Regulators had received applications to screen 21 reactors at 14 plants as of Wednesday. All 48 of Japan's commercial reactors are offline.

Regulators must determine whether operators' safety measures are meeting new, stricter government requirements for earthquakes, tsunami and severe accidents. The measures against severe accidents were put in place after the 2011 nuclear crisis.

The Nuclear Regulation Authority has so far given the green light to 4 reactors at 2 plants.

2 of the reactors are at the Sendai plant in Kagoshima Prefecture, southern Japan, while the others are at the Takahama plant in Fukui Prefecture, central Japan.

No restart dates have been set yet. The city hosting the Sendai reactors has given its approval, but equipment at the plant must still be given a thorough inspection. The reactors might be restarted as early as May, but summer or later are also possibilities.

The Takahama reactors have yet to gain local approval. They must also still pass inspection by the

regulator and others.

Regulators are screening 5 other reactors that appear to have met requirements for withstanding earthquakes and tsunamis.

Utilities may scrap some old reactors rather than apply for restarts. Seven reactors will be at least 40 years old by July 2016. Utilities could decide to decommission 5 of them.

The government allows reactors to run for 40 years in principle, with a one-time extension of up to 20 years.
The operator of 2 reactors is inspecting them with an eye to applying for extensions.

Sendai: Not before June

March 13, 2015

Earliest Sendai plant restart would be June

http://www3.nhk.or.jp/nhkworld/english/news/20150313_29.html

Mar. 13, 2015 - Updated 11:38 UTC+1
Japanese nuclear regulators next week plan to certify the equipment design paperwork for a nuclear reactor in southwestern Japan. Operators aim to restart the Sendai nuclear plant in June, at the earliest.

Officials at the Nuclear Regulation Authority, or NRA, are set to approve next Wednesday the equipment design documents for the No.1 reactor at the plant. They've decided that the Kyushu Electric Power Company has appropriately assessed the quake resistance of the facilities and equipment.

Last September, the plant's No.1 and No.2 reactors became the first in Japan to clear new, tougher regulations introduced after the 2011 Fukushima nuclear accident. Satsuma Sendai City and Kagoshima Prefecture, where the plant is located, also approved the restart.

Kyushu Electric's next step is to apply for NRA inspections for the No.1 reactor's facilities and equipment.

It also needs to submit the designs of an emergency power generator and other equipment shared with the No.2 reactor. The operator will likely present the documents in April.

Since the NRA's inspections are expected to last more than 2 months, it is unlikely the restart could happen before June.

All of Japan's nuclear reactors are currently offline.

Satsumai Sendai applies for inspection

March 18, 2015

A reactor to be inspected under new regulations

Mar. 18, 2015 - Updated 05:11 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/20150318_19.html

The operator of a nuclear power plant in Satsuma Sendai, southwestern Japan, may be able to restart one of its reactors as early as June.

On Wednesday, Kyushu Electric Power Company obtained approval from the Nuclear Regulation Authority of its equipment design documents for the Number 1 reactor. The documents involve an assessment of the earthquake resistance of the facilities and equipment.

As a result, the utility is expected to apply for an onsite NRA inspection as soon as Thursday.

Referring to the inspection, NRA Chairman Shunichi Tanaka said there is still important work to be done before the reactor can resume operation.
He suggested that both the regulators and the utility be well prepared, as the inspection will cover many new facilities and require detailed checks.

The inspection is expected to take around 2 months, including preparation. It may take longer, since the reactor has been idle for a long time.

Last September, the plant's Number 1 and 2 reactors became the first in Japan to clear the new, tougher regulations introduced after the 2011 Fukushima nuclear accident.

Kyushu Electric has yet to submit documents on the designs of an emergency power generator and equipment shared with the Number 2 reactor. The operator will likely present the documents in April.

All of Japan's nuclear reactors are currently offline.

Sendai to restart in June

March 20, 2015

Kyushu Electric plans to restart Sendai plant reactor in June

http://mainichi.jp/english/english/newsselect/news/20150320p2g00m0dm026000c.html

TOKYO (Kyodo) -- Kyushu Electric Power Co. has submitted a plan to the Nuclear Regulation Authority to restart the No. 1 reactor at its Sendai power plant in Kagoshima Prefecture in June, sources close to the matter said Thursday.
A schedule for restarting a rector was disclosed for the first time after a set of tougher nuclear safety requirements were introduced in the wake of the 2011 Fukushima nuclear disaster.
As the utility will have to arrange a schedule with the authority for a pre-operation test of instruments and equipment at the plant, the schedule for restarting the reactor may change.
According to the report submitted to the regulatory authority, the utility plans to begin the pre-operation test in late March, restart the reactor in June and complete the test in August to begin commercial operations.
Japan's 48 commercial reactors were all gradually taken offline after the Fukushima nuclear crisis.

March 19, 2015

Utility applies for reactor check for July restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Mar. 19, 2015 - Updated 13:30 UTC+1
A utility has applied for onsite inspection of a reactor at a power plant in southwestern Japan for a possible restart in July.

Kyushu Electric Power Company filed the application with the Nuclear Regulation Authority on Thursday.

The step came one day after the regulator approved the utility's equipment design documents for the No.1 reactor at the Sendai plant in Satsuma-Sendai city.

Last September, the reactor, along with another at the same plant, became the first to clear new, tougher regulations introduced after the 2011 Fukushima nuclear crisis.

The inspection involves performance checks of new equipment installed under the regulations.

Inspectors are to check whether coolant pumps and other new facilities are built as designed and whether they function as planned.

Kyushu Electric's plan calls for the inspection to start on March 30th. Officials hope to start loading nuclear fuel into the reactor in early June.

More checks are expected to follow, including ones to see if newly equipped water-level gauges in the reactor are functioning properly.

The officials say they hope to pull out control rods to put the reactor back online in early July.

They plan to start generating electricity about one week later after the reactor reaches criticality, or a

self-sustaining nuclear chain reaction.

The utility hopes to start commercial operation in late August after final, comprehensive examinations.

But experts say the inspection may take longer because the reactor has remained off-line for a long time and it will be the first to undergo on-site inspection under the new rules.

The utility says restart of the No.2 reactor is not expected until August at the earliest because of a delay in presenting equipment design documents.

Kyushu Electric aims to restart Sendai plant reactor in June

http://www.japantimes.co.jp/news/2015/03/19/national/kyushu-electric-aims-to-restart-sendai-plant-reactor-in-june/#.VQwWhOF1Cos

Kyodo
Kyushu Electric Power Co. has submitted a plan to the Nuclear Regulation Authority to restart the No. 1 reactor at its Sendai power plant in Kagoshima Prefecture in June, sources close to the matter said Thursday.
It's the first time a schedule for restarting a reactor has been disclosed since a set of tougher nuclear safety requirements were introduced in the wake of the 2011 nuclear disaster at Tepco's wrecked Fukushima No. 1 plant.
As the utility will have to arrange a schedule with the authority for a pre-operation test of instruments and equipment at the plant, the schedule for restarting the reactor may change.
According to the report submitted to the regulatory authority, the utility plans to begin the pre-operation test in late March, restart the reactor in June and complete the test in August to begin commercial operations.
Japan's 48 commercial reactors were all gradually taken offline following the triple meltdown at Tepco's Fukushima No. 1 power plant, which was crippled by the March 2011 earthquake and tsunami.

Takahama restart approved by Assembly

March 20, 2015

Takahama Municipal Assembly approves restart of local nuclear plant

http://mainichi.jp/english/english/newsselect/news/20150320p2a00m0na014000c.html

TAKAHAMA, Fukui -- The municipal assembly here agreed on March 20 to approve the restart of two idled reactors at the Takahama Nuclear Power Plant.
The Takahama Municipal Assembly reported its decision to Mayor Yutaka Nose later in the day. "We'd like to keep in mind the assembly's move as an important factor in deciding on the issue," Mayor Nose said.
The mayor will notify the Fukui Prefectural Government of the town's position on the issue after the April 12 Fukui gubernatorial and prefectural assembly elections.
After deliberations on the issue at the prefectural assembly, Gov. Issei Nishikawa will make a final decision on whether to endorse resumption of operations at the No. 3 and 4 units at the Takahama plant.
Kansai Electric Power Co. (KEPCO), operator of the atomic power station, expects that it will reactivate the plant in November this year.
Assembly Speaker Teruo Matoba proposed in a meeting held behind closed doors on March 20 that the 14-seat assembly approve KEPCO's plan to restart the plant. A majority of its members were in favor of the speaker's proposal.
On March 4, the assembly adopted two petitions calling for restarting the nuclear plant while rejecting three others against reactivation. The assembly has also voted to urge the central government to approve early resumption of operations at the plant's two reactors.
The national government's Nuclear Regulation Authority is still screening KEPCO's plan to modify the plant based on its safety measures and changes to safety regulations on the operation and management of the plant.

Preventive measures still not implemented at Monju reactor

March 23, 2015

JAEA declares prototype fast-breeder reactor safety measures sufficiently improved

http://mainichi.jp/english/english/newsselect/news/20150323p2a00m0na003000c.html

The Japan Atomic Energy Agency (JAEA) reported to the government on March 23 that it has sufficiently improved safety measures on its troubled Monju fast-breeder nuclear reactor, which remains shut down on Nuclear Regulation Authority (NRA) orders.
"All countermeasures have been implemented and positive results have been produced," says the report on the maintenance and management of the prototype reactor in Fukui Prefecture, submitted by JAEA President Shojiro Matsuura to Education, Culture, Sports, Science and Technology Minister Hakubun Shimomura.
However, the report failed to convince Shimomura.
"It's necessary for the JAEA to make further efforts to raise employee awareness of maintenance and management and to improve their skills," the science minister said. "The agency's efforts are still not enough to win public understanding."
Matsuura, whose current term as JAEA president ends on March 31, acknowledged that its efforts remained insufficient.

"I think the maintenance and management system has been established, but more efforts are needed to make sure that the system takes root at the plant."
The NRA effectively banned the JAEA from operating the Monju reactor in May 2013 after it came to light that maintenance workers failed to check numerous inspection items at the plant.
The JAEA had aimed to have the ban lifted by the end of March. However, the NRA pointed out earlier this month that the agency had still failed to fully implement preventive measures, and the lifting of the ban will likely be delayed.

NRA to inspect Sendai plant

March 29, 2015

Nuclear regulators to inspect reactor for restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Mar. 29, 2015 - Updated 19:16 UTC+2
Nuclear regulators will begin examining a reactor at a power plant in southwestern Japan on Monday to determine whether its operations can be restarted.

Officials with the Secretariat of the Nuclear Regulation Authority will oversee inspections of facilities at the No.1 reactor at the Sendai plant in Satsuma-Sendai city.

All commercial reactors in the country are currently offline. Last September, two reactors at the plant became the first to clear new, tougher regulations introduced after the 2011 Fukushima nuclear accident.

The NRA will determine whether the new facilities and equipment have been installed as planned and can function properly.

The new regulations require about 500 items to withstand severe nuclear accidents.

Inspectors will also check for any deterioration of conventional equipment as the No.1 reactor has been offline for nearly 4 years.

Kyushu Electric Power Company is the plant's operator. It wants to start loading nuclear fuel into the reactor in early June for a restart in early July.

But the schedule depends on the pre-start inspections.

Screening Takahama and Mihama reactors

April 2, 2015

Screening starts for 3 aging reactors

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Apr. 2, 2015 - Updated 10:52 UTC+2

Japan's nuclear regulators have begun screening for restarts of 3 aging reactors on the Sea of Japan coast in Fukui Prefecture, central Japan.

The reactors at the Takahama and Mihama plants are the first to undergo the screening as they approach a new 40-year age limit for operation.

Members of the Nuclear Regulation Authority and other officials met on Thursday to start screening the No.1 and 2 reactors at Takahama and No.3 reactor at Mihama.

Both plants are operated by Kansai Electric Power Company.

To bring reactors back online, their operators must meet government requirements introduced after the 2011 Fukushima nuclear crisis to prepare them for disasters.

Under the regulations, reactors can operate for 40 years in principle. Extensions of up to 20 years are allowed only when they clear both the screening for restarts and special inspections for possible deterioration.

Kansai Electric officials explained at the meeting what safety steps they take.

One major challenge with old reactors is preventing electric cable fires. The officials say they plan to replace hundreds of kilometers of cables per reactor with those made of flame-retardant materials or apply to them fire-resistant coatings.

The officials also say they will build a new emergency operation facility for the Takahama plant.

The firm originally planned to use the No.1 and 2 reactor buildings in case of emergencies at the No.3 and 4 reactors, which have already cleared screening.

The regulators asked the utility for further details on ways to confirm that the cables are fireproof and responses to simultaneous accidents at Takahama's 4 reactors.

The plant has until July next year and the Mihama plant until November next year to clear the screening.

If the 3 reactors fail to meet the many requirements by then, the utility is to be required to decommission them.

Life-span extension reviews begins for three aging Kepco reactors

http://www.japantimes.co.jp/news/2015/04/02/national/three-aging-nuclear-reactors-begin-getting-lifespan-extension-reviews/#.VR1qkuHwmos

Kyodo

The nuclear regulator on Thursday began screening three Kansai Electric Power Co. reactors which the utility wants to bring back online and keep in service beyond their mandated 40-year life span. All three are now nearing that limit.

A regulation brought in after the March 2011 nuclear disaster forbids the operation of nuclear reactors for more than 40 years, although operators can secure a 20-year extension if the reactors are refitted and obtain safety clearance from the Nuclear Regulation Authority.

Before the nuclear crisis, Kansai Electric was heavily reliant on atomic power. It hopes to restart the No. 3 unit at its Mihama plant and Nos. 1 and 2 units at the Takahama plant, all located on the Sea of Japan coast in Fukui Prefecture.

But Kansai Electric faces the daunting task of upgrading old equipment and clearing regulator screening within certain time limits.

For example, the new regulations require utilities to install power cables made from fire-retardant materials. Kepco hopes to clear the NRA checks by coating existing cables with non-flammable paint.

The company has decided to scrap its Nos. 1 and 2 reactors at the Mihama plant, which are both over 40 years old, believing that it was not economical to invest in costly refits, given the reactors' comparatively small output.

Ikata restart

April 14, 2015

Restart plan for Ikata nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20150414_15.html

Apr. 14, 2015 - Updated 05:37 UTC+2

Japan's nuclear regulator is set to draft an approval paper for the restart of a plant in western Japan.

The move comes as the operators of the Ikata nuclear power facility in Ehime Prefecture submit a revised safety plan.

Commissioners at the Nuclear Regulation Authority have been discussing safety measures for the Ikata reactor for more than 20 months.

They have been examining the magnitudes of possible earthquakes and tsunamis that could hit - as well as the operator's severe accident plan.

The regulator asked operator Shikoku Electric Power Company to raise its maximum magnitude of a possible earthquake, and to install a command center in the event of a severe accident.

The operator is expected to submit its revised safety plan on Tuesday.

If it is satisfied with the plan, the NRA will begin an assessment in one of several steps needed to restart the reactor.

Ikata could be the third plant in the country on course for restart following the Sendai plant in Kagoshima, southwestern Japan, and the Takahama plant in Fukui on the Japan Sea coast.

But it is widely believed that the Ikata reactor will not be online until winter at the earliest as more time is needed for the regulator to finish its assessment.

The operator must also go through the NRA's detailed on-site checks of equipment and machines, and the utility needs to gain local consent.

Screening

April 14, 2015

Reactors being screened for restart

http://www3.nhk.or.jp/nhkworld/english/news/20150414_32.html

Apr. 14, 2015 - Updated 12:11 UTC+2
All 48 reactors at 16 nuclear plants in Japan have been put offline since the accident at the Fukushima Daiichi power station in March 2011.

Plant operators had applied for screening by the Nuclear Regulation Authority for 24 of the reactors at 15 plants as of Tuesday, to see whether they comply with new requirements introduced after the accident.

2 reactors at the Sendai plant in Kagoshima Prefecture, southwestern Japan, and 2 more at the Takahama plant in Fukui Prefecture have passed the screening.

Kyushu Electric Power Company aims to restart the Sendai reactors in July, as it has already obtained approval from the prefecture and the host city.

Kansai Electric plans to put the Takahama reactors back online in November, but must undergo an equipment inspection and persuade local governments to agree to a restart.

Detailed discussion of the screening is almost complete for one reactor at the Ikata plant in Ehime Prefecture, Shikoku. 2 at the Genkai plant in Saga Prefecture, Kyushu; and 2 at the Ohi plant in Fukui Prefecture are in the final stages of the screening. Most others are still in the early stages.

Fukui Court rejects restart

April 14, 2015

Court rejects restart of Takahama nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20150414p2g00m0dm057000c.html

FUKUI, Japan (Kyodo) -- A court issued an injunction on Tuesday ordering Kansai Electric Power Co. not to restart two reactors at its Takahama nuclear power plant on the Sea of Japan coast that have cleared safety screening by the nation's nuclear safety regulator.
The Fukui District Court's decision -- the first such injunction in Japan forbidding nuclear reactors from resuming operations -- concerns the Nos. 3 and 4 reactors at the four-unit complex in Fukui Prefecture, located in an area along Wakasa Bay dotted with several nuclear power plants.
The court said it cannot see credible evidence in the utility's assumptions regarding earthquake risk.
The injunction is effective immediately. The utility serving Osaka and its surrounding region is expected to appeal the decision, but will not be able to restart the reactors unless its arguments are accepted.
The court decision is likely to affect not only the utility's resumption plans but also the government's energy policy, which places nuclear power as a key electricity source despite the crisis at the Fukushima Daiichi nuclear plant.
Kansai Electric hoped to restart the two reactors in November after they cleared a Nuclear Regulation Authority screening in February based on what the Japanese government calls "the world's toughest safety standards" introduced after the 2011 Fukushima meltdowns.
Presiding Judge Hideaki Higuchi at the district court also presided over a May 2014 ruling by the same court that ordered the regional utility not to restart two reactors at another nuclear power plant in the same prefecture.
In the latest case filed by residents in Fukui and elsewhere in December, they claimed that an unexpected earthquake could cause a severe nuclear accident and spread radioactive materials. Kansai Electric argued that the company has taken sufficient safety measures.
All of Japan's 48 commercial reactors had gone offline by the end of September 2013 and remain inactive as none has yet completed all procedures required for a restart. Amid persistent safety concerns, the majority of Japanese remain opposed to restarting nuclear reactors.
Power companies are desperate to restart their nuclear plants amid an increase in imported fuel costs for thermal power generation in the absence of nuclear power. Kansai Electric relied heavily on nuclear power for its power generation before the Fukushima crisis triggered by a huge earthquake and tsunami.
Only two other nuclear reactors, owned by Kyushu Electric Power Co., have obtained the regulator's safety clearance so far.

Fukui court forbids Takahama nuclear plant restart

http://www.japantimes.co.jp/news/2015/04/14/national/crime-legal/critical-case-fukui-court-rule-takahama-nuclear-plant-restart/#.VS187ZPwlLM
by Eric Johnston
Staff Writer

Plans to bring Kansai Electric Power Co.'s Takahama No. 3 and 4 nuclear reactors back online were dealt a severe setback Tuesday when the Fukui District Court approved an injunction against restarting them, citing safety concerns.

It marks the first time in Japan's nearly half-century of commercial atomic power operations that a court has ordered an injunction against firing up reactors.

The decision comes despite the Nuclear Regulation Authority appraising the reactors against technical and safety criteria and clearing them for restart last November.

The injunction, which took effect immediately, is expected to push back Kepco's schedule — it originally envisaged restarting the reactors this November — but the longer term impact is unclear.

For Prime Minister Shinzo Abe, resuming nuclear power is key to domestic revitalization, particularly the success of his "Abenomics" policy mix.

In its ruling, the court challenged Kepco's assertion that the reactors were safe. Presiding Judge Hideaki Higuchi, who in a regular lawsuit last year ruled that the Oi No. 3 and 4 units not be restarted, said Kepco had not shown evidence its earthquake simulation data, which were used to conduct the safety evaluation, could be relied upon.

"This ruling is a giant step for efforts to abolish nuclear power, and, in practice, stops the restart of the reactors," said lawyers representing nine people seeking the injunction.

"I was not that surprised, as we had indications that the court would rule in our favor," said Atsuko Nishimura, one of the nine.

Part of the reason for the lack of complete surprise was that Nishimura and those seeking the injunctions felt that Higuchi, at least, might be on their side. So did Kepco, which undertook legal efforts to remove him. Those attempts failed last week when a high court rejected an appeal to overturn a lower court's dismissal of a move to unseat them.

In a statement, Kepco expressed regret over the decision but said it remained determined to restart the Takahama reactors.

"We're preparing to file the necessary papers to get the injunction lifted at the earliest possible date and will make efforts to stress the safety of the reactors," the utility said.

Pro-nuclear Fukui Gov. Issei Nishikawa, who was elected to a fourth term on Sunday, had no comment on the ruling and only addressed the safety issue in a written statement.

"The government is pursuing the restart of those reactors whose safety has been confirmed by the NRA. Fukui will respond to the ruling by sufficiently confirming the central government's and Kepco's response, and by making safety the top priority," Nishikawa said.

Kyoto-based anti-nuclear activist Aileen Mioko Smith said the ruling would likely have a huge political impact on restart plans elsewhere. But she added that she hoped the injunction will also influence nuclear safety policy at the NRA.

"The (injunction) ruling is a preventative measure. Seismologists have warned this area could see another big earthquake. To have an injunction will, hopefully, prevent another nuclear disaster like Fukushima, or worse," she said.

Fukui court blocks reactor restart

http://www3.nhk.or.jp/nhkworld/english/news/20150414_37.html

Apr. 14, 2015 - Updated 09:13 UTC+2

A court in Fukui Prefecture, central Japan, has issued a provisional injunction blocking the restart of 2 reactors at the Takahama nuclear plant.

A group of 9 citizens had filed for the injunction to keep the plant's No.3 and 4 reactors offline, citing safety problems.

Officials of the plant's operator, Kansai Electric Power Company, said they had taken thorough anti-quake measures based on lessons learned from the accident at the Fukushima Daiichi nuclear plant in 2011.

At the Fukui District Court on Tuesday, presiding judge Hideaki Higuchi said Kansai Electric is too optimistic in assuming that no major earthquake would hit Takahama, as 5 unexpectedly large quakes have hit nuclear plants across Japan in less than a decade.

The judge also said the Nuclear Regulation Authority's new requirements should be as tough as possible to eliminate any risk of disaster, but are too lax to ensure the safety of nuclear reactors.

Tuesday's injunction takes effect immediately, so Kansai Electric will not be able to restart the reactors unless the court decision is overturned.

Lawyers for the utility said they will consider lodging an objection.

Ruling on Takahama reactors' restart

http://www3.nhk.or.jp/nhkworld/english/news/20150414_12.html

Apr. 14, 2015 - Updated 03:17 UTC+2

People in Fukui Prefecture in central Japan are awaiting a court decision on whether a local nuclear plant should be allowed to go back online.

The Fukui District Court is set to deliver its decision on Tuesday on the Takahama nuclear power plant. A group of 9 citizens has filed for a provisional injunction to block the restart of the plant's No.3 and No.4 reactors.

The citizens say plant operator Kansai Electric is underestimating the maximum strength of an earthquake that could hit Takahama. They also claim there are safety problems with equipment, and warn

of the risk of a serious accident.

Kansai Electric officials say they have taken thorough anti-quake measures based on the lessons learned from the accident at the Fukushima Daiichi nuclear plant in 2011. They deny that the plant's equipment is unsafe.

In February, the Nuclear Regulation Authority found the 2 Takahama reactors in compliance with new requirements introduced after the Fukushima accident.

With procedures for a restart already underway, the Fukui District Court has judged that it needs to promptly deliver its decision. If it issues an injunction, the measure could take effect immediately.

Govt. still wants restart

April 14, 2015

Govt. to continue seeking restart

Apr. 14, 2015 - Updated 11:06 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150414_40.html

Japan's government has vowed to continue seeking to restart the country's nuclear reactors, despite a provisional injunction issued by the Fukui District Court.

Chief Cabinet Secretary Yoshihide Suga told reporters on Tuesday that the government respects the independent Nuclear Regulation Authority's decision that the reactors comply with what are called the toughest requirements in the world. He said the decision came after a lengthy review.

Suga stressed that the government is not a party to the lawsuit, and that the injunction is provisional. He said the government will closely watch what the plant's operator does.

Suga added that he does not think the court decision will affect the government's energy policy or plans to restart other reactors.

The secretary general of the main opposition Democratic Party, Yukio Edano, said the decision by the judiciary must be taken seriously.

Edano described the decision as clear proof that the public does not believe nuclear plants are as safe as the government claims.

He said the Democrats will urge the government and nuclear regulators to keep this in mind and act cautiously.

Meaning of Fukui Court's injunction

April 14, 2015

Effects of injunction on restarting reactors

Apr. 14, 2015 - Updated 12:11 UTC+2

The Takahama nuclear power plant cannot restart operations unless the injunction is overturned. Kansai Electric Power Company says it intends to lodge an objection with the court as soon as possible.

The utility says it will in the meantime continue with screenings and inspections by Japan's nuclear regulator. It will also seek the consent of Fukui Prefecture.

The Nuclear Regulation Authority says the injunction will not affect administrative procedures such as screenings and inspections.

Work toward restarting operations will continue as planned, and attention will be on whether the court's decision can be overturned by the time the reactors are ready.

Observers say the court's decision could affect future debate on nuclear safety in Japan.

Earlier, the Nuclear Regulation Authority announced that it had found the 2 reactors at the Takahama plant in compliance with new government requirements introduced after the 2011 Fukushima accident.

The observers say the court's decision is likely to cast doubt on not only restarting the reactors but on the regulator's current requirements as well.

NRA not pleased with Fukui injunction

Dossier 8

April 15, 2015

Nuclear watchdog hits out at injunction against restart of Takahama reactors

http://www.japantimes.co.jp/news/2015/04/15/national/nuclear-watchdog-hits-out-at-injunction-against-restart-of-takahama-reactors/#.VS6AG5PwlLM

AFP-JIJI

The head of the nation's nuclear watchdog said Wednesday a landmark court provisional injunction banning the restart of two atomic reactors was based on a judicial "misunderstanding" of basic facts.

Although I haven't studied it in detail, many things that are based on misunderstandings are written in the verdict," Shunichi Tanaka told reporters, when asked about the court injunction that was issued on Tuesday.

"It is internationally recognized that our new regulatory regime is one of the strictest . . . but that was apparently not understood (by the judge)," the Chairman of the Nuclear RegulationAuthority (NRA) told reporters.

Tanaka's damning comments came a day after a district court in Fukui Prefecture granted a temporary stop order in response to a bid by local residents to halt the restart of the No. 3 and No. 4 reactors at the Takahama nuclear power plant.

That came after the NRA said last December that Takahama's reactors met tougher safety standards introduced after a powerful earthquake and tsunami triggered a triple meltdown at Tepco's Fukushima No. 1 plant in 2011.

Pro-nuclear Prime Minister Shinzo Abe has backed an industry push to return to get the country's reactors back online — which once supplied more than a quarter of Japan's electricity — as companies squeal over the high cost of electricity produced from dollar-denominated fossil fuels.

But there has been a groundswell of public opposition to nuclear power since the Fukushima crisis — the worst atomic disaster since Chernobyl in 1986 — began.

Japn's entire stable of reactors was gradually switched off following the disaster, and tens of thousands of people remain displaced from areas around Fukushima because of elevated levels of radioactivity.

The NRA was sold to the public as a watchdog with teeth after criticism that the last nuclear regulator was spineless and had facilitated a cozy relationship between power companies and the government.

But criticism of the body has grown in recent months, with claims that outspoken critics have been removed from its ranks.

Anti-nuclear campaigners saw the legal challenge as something of a Hail Mary that was unlikely to succeed in Japan's usually meek courts.

But Tuesday's verdict was a shot across the NRA's bows, saying the body's safety guidelines are "too loose" and "lacking in rationality".

Presiding judge Hideaki Higuchi said the method of predicting the maximum size of future earthquakes that could hit the nuclear reactors "has lost credibility," pointing out there have been five quakes in Japan that exceeded such predictions since 2005.

Tanaka said in greenlighting Takahama's reactors, the NRA had taken into consideration past experience, including that at Fukushima.

"We have demanded utilities meet very strict guidelines . . . and take measures to prevent severe accidents even if an earthquake bigger than expected hits," he said.

But he added that it was unreasonable to expect guarantees.

"There is no absolute safety in the world . . . a plane can fall and a train can overturn," he said.

KEPCO appeals court decision

April 18, 2015

Kansai Electric appeals reactor restart injunction, cites economic impact

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201504180031

Kansai Electric Power Co. filed an objection on April 17 seeking revocation of a court ruling that banned the restart of two reactors at its Takahama nuclear power plant in Fukui Prefecture.
The utility also requested that the Fukui District Court suspend the temporary injunction it issued on April 14, saying the order could cause “major economic loss” to the company.
The injunction, which residents in the prefecture and elsewhere had sought over safety concerns, legally bans Kansai Electric from bringing the No. 3 and 4 reactors at the plant back online.
Even if the two reactors pass the remaining safety screenings by the Nuclear Regulation Authority and the utility obtains permission from local governments to restart, it cannot do so unless the injunction is suspended or reversed.
If the district court upholds the decision, the utility plans to appeal it to the Kanazawa branch of Nagoya High Court.
Kansai Electric President Makoto Yagi said at a news conference in Tokyo on April 17 that the company will seek revocation of the injunction as early as possible while making every effort to prove the plant is safe.
Given the stoppage in nuclear power generation across the nation and the increase in imported fuel costs for thermal power plants, Kansai Electric has applied for a second time to the industry ministry for approval to raise household electricity rates.
The price increase was calculated on the premise that the two reactors at the Takahama plant will be brought back online in November.
(This article was written by Hideki Muroya and Koji Nishimura.)

Kansai Electric appeals court decision to ban nuclear restart

http://mainichi.jp/english/english/newsselect/news/20150418p2g00m0dm011000c.html

FUKUI, Japan (Kyodo) -- Kansai Electric Power Co. filed an objection Friday seeking revocation of a recent court decision that banned the utility from restarting two nuclear reactors at its Takahama nuclear plant in western Japan.
The utility serving Osaka and neighboring areas is not allowed to switch the reactors back online unless the Fukui District Court undoes the temporary injunction it issued Tuesday as sought by a group of residents in Fukui Prefecture and elsewhere.
The court decision dealt a blow to the government's plan to revive nuclear power generation, suspended following the 2011 Fukushima meltdowns. Kansai Electric hoped to restart the two units in November after it obtained safety clearance from the regulator in February based on post-Fukushima regulations.

The court said the safety of the Takahama plant is not secured despite the Nuclear Regulation Authority safety approval, saying the new regulations -- which the government has touted as "the world's toughest" -- are "too loose" and "lacking rationality."
Kansai Electric President Makoto Yagi said at a press conference Friday he believes there are "factual errors" in the content of the court decision.
Aiming to restart its reactors as soon as possible, the utility has spent a massive amount of money to boost their safety as required by the regulations.
Amid an increase in imported fuel costs for thermal power generation in the absence of atomic power, Kansai Electric expects a fourth straight yearly loss in the business year that ended in March.

Kepco appeals injunction blocking restart of Takahama reactors

AFP-JIJI, JIJI
FUKUI – The operator of a Japanese nuclear plant whose restart was blocked this week by a court injunction said Friday it would appeal the ruling.

Kansai Electric Power has submitted “a motion of complaint to Fukui district court” over Tuesday’s injunction banning the refiring of the Takahama nuclear plant’s No. 3 and 4 reactors, a company spokesman said.
In its ruling, the court said the safety of the reactors at Takahama had not been proved, despite a green light from the Nuclear Regulation Authority, whose guidelines, the court said, were “too loose” and “lacking in rationality.”
“We genuinely regret that the court did not understand our argument,” the spokesman said, adding that the temporary court order “includes significant factual errors.”
Kepco also warned of huge economic damage if the reactors are not restarted.
The utility had been aiming to begin operating the facilities as early as November, but it cannot restart them unless the ban is removed or suspended.
The nuclear issue is a highly sensitive one in Japan, which remains deeply scarred by the triple meltdown disaster at the Fukushima No. 1 atomic plant in 2011.
The worst atomic accident in a generation forced tens of thousands of people from their homes, with some still displaced and scientists warning that tracts of land might be uninhabitable for decades.
The nation’s entire stable of reactors — which once provided more than a quarter of the country’s electricity — was gradually switched off following the disaster.
Activists are also seeking an injunction to prevent the restart of reactors at the Sendai plant in Satsumasendai, Kagoshima Prefecture, with a court expected to rule that issue April 22.
But pro-nuclear power Prime Minister Shinzo Abe has backed an industry push to return to fire up the stalled reactors, with the country’s manufacturers complaining over the high cost of electricity produced from dollar-denominated fossil fuels.

Court refuses to block restart

April 22, 2015

Court refuses injunction seeking to stop restart of Kagoshima reactors

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201504220075

THE ASAHI SHIMBUN

KAGOSHIMA--A court here on April 22 rejected a request by local residents to halt the restarts of two reactors at the Sendai nuclear power plant, saying new, stricter safety standards are "not unreasonable."

Twelve plaintiffs plan to immediately appeal the Kagoshima District Court's ruling to the Fukuoka High Court. Kyushu Electric Power Co. is seeking to resume operation of its No. 1 and No. 2 reactors at the facility in Satsuma-Sendai, Kagoshima Prefecture.

Twenty-three residents from Kagoshima, Kumamoto and Miyazaki prefectures originally filed the suit, 11 of whom later left the group.

The rejection follows an injunction issued April 14 by the Fukui District Court in a separate case that put on hold Kansai Electric Power Co.'s plans to restart reactors at its Takahama nuclear plant in Fukui Prefecture. The court there called the new safety requirements inadequate.

The updated safety measures were introduced after the March 2011 Great East Japan Earthquake and tsunami triggered a triple meltdown at the Fukushima No. 1 nuclear power plant.

The key issue argued by the plaintiffs was whether the largest possible seismic movement generated by an earthquake planned for the Sendai plant in a worst-case scenario is sufficient.

The suit noted that five earthquakes have exceeded the maximum expected levels at four nuclear power plants since 2005. It claimed that Kyushu Electric, which set the maximum quake level at 620 gals, has underestimated the size of tremors that could strike the Sendai plant, endangering the lives of people living near the facility.

A gal is a unit of acceleration used to measure the extent of seismic waves produced by earthquakes.

However, Presiding Judge Ikumasa Maeda said the new restrictions were created after taking into account "regional differences," and rejected the request for an injunction.

The plaintiffs argued there is also a danger that a pyroclastic flow of ejecta and gas generated by a catastrophic volcanic eruption in Kyushu could reach the Sendai plant. They said there is no way to rule out the possibility because there is no technology in place to predict such an event.

Maeda dismissed the idea, noting that most volcanologists have not said risks have increased for such large-scale eruptions.

Last September, the Nuclear Regulation Authority ruled that the Sendai facility complied with its updated requirements, the first such decision in the country since the March 2011 disaster.

Kyushu Electric, which has since won consent from local governments and assemblies for the restart, plans to resume operations at the plant's No. 1 reactor in early July.

Kagoshima court rejects injunction against Sendai reactor restarts

http://www.japantimes.co.jp/news/2015/04/22/national/crime-legal/looming-ruling-sendai-reactor-restart-injunction-embolden-nuclear-foes/#.VTeCiZPwmot

Kyodo, Reuters

KAGOSHIMA – The Kagoshima District Court on Wednesday dismissed an injunction to block the restart of two more nuclear reactors in the prefecture, brushing aside the concerns of local residents worried about the safety of the plant.
The decision clears another hurdle for reactors at the Sendai Nuclear Power Plant to begin starting up as early as June, as the government pushes to revive Japan's idled nuclear industry four years after the disaster in Fukushima began.

The ruling stands in sharp contrast to last week's decision by the Fukui District Court to block the restart of reactors at the Takahama plant in Fukui Prefecture over safety concerns.
The Kagoshima District Court found no "irrationalities" in new safety standards adopted after the 2011 Fukushima meltdowns, ruling in favor of the plant operator.
The Kyushu Electric Power Co. plans to fire up one of the reactors in July, a watershed moment for the nation as it would be the first reactor restart under the revised rules.
The court's decision could inject momentum into the government's policy to restart nuclear power plants that have passed the safety standards, although the public remains divided on the matter.
Plaintiffs, including residents near the Sendai plant, are expected to appeal the ruling, their lawyers said.
Chief Cabinet Secretary Yoshihide Suga, the top government spokesman, said there will be no change in the government's policy of bringing the Sendai nuclear power plant back online. All 48 of Japan's commercial reactors remain offline amid heightened public concerns about safety following the triple meltdown at Tokyo Electric Power Co.'s Fukushima No.1 plant.
Four years after a quake and tsunami wrecked that facility, prompting mass evacuations, the Sendai reactors operated by Kyushu Electric have cleared most of the regulatory hurdles and could begin starting up as early as June.
The focus of the court case was on whether the operator of the Sendai plant has adequate measures in place to guard against earthquakes and whether it had weighed the chance of a volcano erupting nearby. The effectiveness of existing evacuation plans for local residents was also called into question.
Presiding Judge Ikumasa Maeda ruled that the new safety standards were crafted based on consultations among experts.
"There are no irrationalities," he said.
The judge also said the operator calculated the biggest possible earthquake motion after taking into account "uncertainties" over natural phenomena, and thus the decision to restart the power plant was legitimate.
Prime Minister Shinzo Abe wants to reboot reactors to help reduce high energy costs, but opponents are using the courts to block the revival of nuclear power, which is widely unpopular, especially in areas where they can't get local governors or mayors to prevent a restart.
Kansai Electric has four of its 11 reactors under injunction and recently announced plans to decommission two units.
Tepco, which is dealing with the Fukushima No. 1 debacle, is tussling with local authorities to get another power station up and running — Kashiwazaki Kariwa, the world's biggest. It sits on the Sea of Japan coast in Niigata Prefecture.
Chubu Electric Power Co.was forced to shut its Hamaoka plant in Shizuoka Prefecture because of its proximity to offshore tectonic plates and is facing legal action.

Court refuses to block restart of Sendai reactors

http://www3.nhk.or.jp/nhkworld/english/news/20150422_19.html

Apr. 22, 2015 - Updated 05:55 UTC+2
A Japanese court has dismissed a request to block the restart of 2 nuclear reactors in southwestern Japan.

A group of citizens had sought an injunction to keep the Number 1 and 2 reactors at a nuclear plant in Satsuma-Sendai City in Kagoshima Prefecture offline.

The 12 citizens from Kagoshima and 2 neighboring prefectures argued that earthquakes and large volcano eruptions could cause serious damage to the reactors.

The plant's operator, Kyushu Electric Power Company, argued that the 2 reactors are strong enough to withstand earthquakes. The utility also said chances of a huge volcano eruption are slim.

The utility is aiming to restart the 2 reactors in July as it has already obtained approval from the governments of Kagoshima and Satsuma-Sendai City. They would be the first to restart among the 48 reactors that are offline in Japan. The reactors cleared screenings by the Nuclear Regulation Authority in September, becoming the first under the country's new, strict requirements.

In a ruling on Wednesday, presiding judge Ikumasa Maeda at the Kagoshima District Court said that in light of up-to-date scientific knowledge, there is nothing irrational found in the new requirements that should keep the reactors offline. He said the same about the regulators' judgment to restart the reactors.

Last week, the Fukui District Court issued an injunction blocking the restart of 2 reactors at the nuclear plant in Takahama, calling the regulator's new requirements “too lax to ensure safety".
After Wednesday's ruling, a lawyer for the citizens accused the court of accepting Kyushu Electric's argument and called the ruling unfair. He said they will continue efforts to stop the restart of the reactors.

Mid-July start for Sendai plant, says Kepco

April 23, 2015

Utility plans mid-July restart of Sendai reactor

http://www3.nhk.or.jp/nhkworld/english/news/20150423_20.html

Apr. 23, 2015 - Updated 06:50 UTC+2
Kyushu Electric Power Company says it will push back the planned restart of a reactor at its Sendai nuclear plant due to a delay in onsite inspections.

This move follows the dismissal by a district court on Wednesday of a request by local residents to block

the restart of 2 reactors at the plant.

At a meeting with the Nuclear Regulation Authority on Thursday, the utility submitted a plan to restart the No.1 reactor at the plant in Kagoshima Prefecture in mid-July. It had been aiming for early July.

Nuclear regulators are currently conducting inspections at the plant in southwestern Japan.

Kyushu Electric officials told the regulators that they do not have all the necessary documentation ready and that has delayed the inspections.

Under the revised plan, the utility will start loading nuclear fuel into the reactor by mid-June. It plans to pull out control rods in mid-July to put the reactor back online.

But nuclear regulators said Kyushu electric's schedule seems unrealistic. The utility said it will reconsider the plan, which may result in a further delay of the restart.

Reactors 1 and 2 at the plant became the first in Japan to clear new regulations introduced after the 2011 Fukushima accident.

NRA will proceed with screenings

April 23, 2015

NRA meeting on Takahama after injunction

http://www3.nhk.or.jp/nhkworld/english/news/20150423_25.html

Apr. 23, 2015 - Updated 09:43 UTC+2
Japan's nuclear regulators continue to take steps to restart reactors at a plant in central Japan. They say their work is not affected by a recent court decision blocking such a restart.

Nuclear Regulation Agency officials met on Thursday to review progress at the No. 3 and 4 reactors at Kansai Electric's Takahama plant in Fukui Prefecture.

The meeting is the first on the reactors since the Fukui District Court issued a provisional injunction on April 14th. The operator cannot restart the reactors unless the court decision is overturned.

In February, inspectors confirmed that the reactors met new regulations introduced after the 2011 Fukushima accident.
Nuclear regulators say the injunction will not affect administrative procedures regarding the reactors.

Kansai Electric officials told the regulators at the meeting that the firm will later explain details of new facilities. They include a quake-resistant seawall and a facility to serve as a base for recovery efforts in the

event of an accident. They are necessary for restarting the reactors.

The regulators accepted the utility's explanation.

NRA officials said they will proceed with what screenings and inspections they can while the injunction is in effect.

Mid-July restart just "wishful thinking"

April 23, 2015

Sendai reactor restart 'unrealistic,' regulator says

http://www.japantimes.co.jp/news/2015/04/23/national/sendai-reactor-restart-unrealistic-regulator-says/#.VTkTU5Pwmos

JIJI, Staff Report
Kyushu Electric Power Co. has been forced to review restart plans for the No. 1 reactor at its Sendai Nuclear Power Plant a day after a court ruling paved the way for the move.
The plant, in Kagoshima Prefecture, was set to be restarted in mid-July, but on Thursday the Nuclear Regulation Authority criticized the company's planning.
The NRA found the plan, which was presented at a meeting between Kyushu Electric and the NRA, to be too optimistic following some work delays in ongoing final checks on the No. 1 reactor.
"We don't think the plan is realistic," Toyoshi Fuketa, commissioner of the NRA, said at the meeting. "It just looks like wishful thinking."
He added that: "As the checks are important, we want to spend time where we need to."
Under its existing timetable Kyushu Electric planned to insert nuclear fuel into the reactor in June, reactivate it mid-July and begin commercial operations mid-August.
Japan's commercial reactors remain offline amid heightened public safety concerns following the triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 plant in 2011.
The Sendai No. 1 reactor was on track to be the first to be restarted.
"We will reconsider the timetable," Kyushu Electric Managing Executive Officer Akira Nakamura told reporters after the NRA meeting.
On Wednesday, Kagoshima District Court dismissed a provisional injunction to block the restart of two reactors at the Sendai plant.
It stood in sharp contrast to a decision by the Fukui District Court last week to block the restart of reactors at the Takahama plant in Fukui Prefecture over safety concerns.
Prime Minister Shinzo Abe wants to reboot reactors to help reduce high energy costs, but opponents are using the courts to block the revival of nuclear power, which is widely unpopular, especially in areas where residents cannot get local governors or mayors to prevent a restart.

Needed: Clear roadmap to phasing out nukes

April 23, 2015

Editorial: Thorough debate on restarting nuclear reactors needed

http://mainichi.jp/english/english/perspectives/news/20150423p2a00m0na007000c.html

Courts were split over whether the green light should be given to restarting nuclear reactors at two power stations that are deemed to meet new regulatory standards set by the government's Nuclear Regulation Authority (NRA).

On April 22, the Kagoshima District Court dismissed a petition filed by residents around the Sendai Nuclear Power Plant in Kagoshima Prefecture for a provisional injunction to ban resumption of operations at the power station's No. 1 and 2 reactors.

Less than 10 days earlier -- on April 14 -- the Fukui District Court had issued a provisional injunction banning reactivation of the No. 3 and 4 reactors at the Takahama Nuclear Power Plant in Fukui Prefecture.

Behind the split in the courts' decisions are differences in basic ideas on how to evaluate the risks of serious accidents like the one at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant in 2011 and the possible impact of such disasters. The two court decisions also highlight difficulties evaluating the country's nuclear power policy. As such, the government should help deepen discussions on its nuclear energy policy to win the understanding of the general public.

The main point of contention in the two court cases was whether the biggest possible earthquake motion that the two plant operators calculated based on the new safety standards is appropriate. The quake resistance of each nuclear plant is determined based on the biggest possible quake motion estimated to hit such plants.

In their petition, residents around the Sendai plant contended that the biggest possible earthquake motion that could hit the power station is well underestimated because the figure was calculated based on the average scale of limited earthquakes that occurred in the area hosting the plant. In response, the Kagoshima District Court deemed that there are "no irrationalities" in the NRA's new regulatory standards even in light of scientific knowledge that reflects the experiences of the Fukushima nuclear disaster. The court also upheld the NRA's approval of the estimation of the biggest possible earthquake motion that could hit the power plant on the grounds that the plant operator is taking into account uncertainties involving predictions of natural phenomena in the future.

In sharp contrast, the Fukui District Court required that regulatory standards be stricter to completely prevent any serious nuclear accident and ruled that the estimation of the biggest possible earthquake motion that could hit the Takahama plant has lost credibility.

In other words, the Kagoshima District Court believes that if a nuclear reactor meets the new regulatory standards, the risks of serious accidents can be reduced to permissible levels, while the Fukui District Court is of the view that restarting any nuclear reactor is impermissible if there is any minor risk of accidents. The difference corresponds with that between members of the public over whether idled nuclear plants should be reactivated.

The presiding judge at the Fukui court who dealt with the petition for a ban on restarting the Takahama plant had also issued a similar decision in May last year to ban resumption of operations at the No. 3 and 4 reactors of the Oi Nuclear Power Plant in Fukui Prefecture.
However, the judge's decisions should not be dismissed as an extreme argument. In November last year, the Otsu District Court deemed that restarting the Takahama and Oi plants is "impossible" unless local municipalities around these plants work out evacuation plans, while stopping short of banning the resumption of operations at the power stations. Judicial rulings on the safety of nuclear plants appear to have become stricter since the March 11, 2011 outbreak of the Fukushima nuclear crisis.
The rate of an accident occurring at nuclear plants cannot be lowered to zero even if the regulatory standards are stiffened to the maximum extent. Requiring an absolute zero risk is unrealistic.
The government has reiterated that it will go ahead with reactivating nuclear reactors that are deemed to meet the new regulatory standards, but such a stance will never win understanding from the general public. If the government wants to restart idled nuclear plants, it should show a clear road map toward phasing out atomic power.

Legal fallout

Court cases frustrate efforts to restart Japan's nuclear plants

http://www.economist.com/news/asia/21649557-court-cases-frustrate-efforts-restart-japans-nuclear-plants-legal-fallout

Economist.com

THE world's biggest nuclear power plant runs along nearly 4 kilometres (2½ miles) of the coast of the Sea of Japan. At full pelt it generates enough electricity to supply 2.7m households. But the seven reactors at the Kashiwazaki-Kariwa complex sit idle, along with the rest of Japan's nuclear-power facilities. Four years after meltdown at the Fukushima Dai-ichi power plant, all Japan's 48 usable reactors are the focus of safety concerns. An industry that once produced nearly a third of Japan's electricity remains paralysed. The government badly wants some of the idle reactors put back to work to cut a huge bill for imported fuel. On April 22nd it got a shot in the arm when a court on Kyushu, the third-largest of Japan's four main islands, rejected an attempt to block the restart of two reactors at the Sendai plant. It said the reactors were safe to operate, despite active earthquake faults and a volcano in the area. Kyushu Electric, the plant's owner, believes it could be generating power again by July.

Yet the ruling contrasted with another one handed down a week earlier by a court in Fukui prefecture, down the coast from the Kashiwazaki-Kariwa plant. That decision blocked Kansai Electric Power from restarting two reactors at its Takahama site. It said stricter government-induced regulations after the

Fukushima disaster were no guarantee that another disaster could be prevented. The court warned of "imminent danger" to local citizens if the reactors were restarted.
The decision surprised the government. It is formulating a new energy plan that calls for nuclear power to meet up to 20% of Japan's electricity needs by 2030. The Fukui ruling will not derail that, the chief cabinet secretary, Yoshihide Suga, insists. He says the new regulations are among the world's strictest.
Such confidence in restarting the reactors may be misplaced. Every one of them is the subject of a lawsuit by locals trying to stop them from being fired up again. The government and the energy utilities will continue to argue that although they cannot completely rule out another accident, they have made nuclear power as safe as possible. By rejecting that argument, the Fukui court has set a precedent other courts may follow, says Mutsuyoshi Nishimura, a former climate-change negotiator.
Kansai Electric has challenged the Fukui ruling. Experts say the company will very likely get a higher court to overturn it. But the longer legal tussles drag on, the older the reactors become, putting their eventual operation in doubt. The Nuclear Regulation Authority (NRA), Japan's new watchdog, is reviewing about 20 reactors for compliance with its regulations. Luc Oursel, the late chief executive of Areva, a French nuclear giant, predicted in 2013 that two-thirds of Japan's plants would eventually restart. Few believe that now.
For Tokyo Electric Power (TEPCO), the operator of the ruined Fukushima plant, these issues are a matter of life and death. Kashiwazaki-Kariwa is its only remaining viable nuclear facility. The company says it loses ¥100 billion ($835m) per reactor every year that the reactors are down. The plant's chief, Tadayuki Yokomura, says that TEPCO has poured $2 billion into reinforcing the facility against earthquakes and tsunamis. There is, he insists, no reason why all seven reactors cannot be restarted. The problem is that he has yet to convince the public of that.

Extending for 20 years, KEPCO

May 1, 2015

Kepco applies to extend operating life of two aging reactors in Fukui by 20 years

http://www.japantimes.co.jp/news/2015/05/01/national/kepco-applies-extend-operating-life-two-aging-reactors-fukui-20-years/#.VUMqo5Pwmos

JIJI

Kansai Electric Power Co. on Thursday applied for regulatory approval for extending by 20 years the operational periods of two aging reactors at its Takahama nuclear power plant in Fukui Prefecture because it found no problems with them in its special safety checks.
The application for the reactors 1 and 2, which are now offline, at the Takahama plant was submitted to the Nuclear Regulation Authority.
This is the first time an application for extending an operational period of a reactor aged 40 years or older has been filed.

The revised law on nuclear power plant regulations sets basic operation periods of nuclear reactors at 40 years. Operational periods can be extended only once by up to 20 years if certain conditions are met.
At the Takahama plant, reactor 1 is already over 40 years old, and reactor 2 will reach 40 years in November.
The moratorium period set under the law will expire in July 2016.
The two reactors are the oldest among the 43 reactors in Japan, excluding those that have been decommissioned.
Kepco started its special checks in December to investigate the condition of the two reactors.
After checking the pressure and containment vessels of the reactors with ultrasonic tests and visual examinations, the company concluded they can operate beyond 40 years.
According to Kansai Electric, safety screening for operational period extension will cover pressure and containment vessels as well as pipes, reactor buildings and emergency power generators for a total of about 3,100 items for reactor 1 and some 3,000 items for reactor 2.
The NRA will examine whether Kansai Electric's special safety checks are satisfactory.
In March, Kansai Electric separately applied for NRA screening that is necessary for restarting the two reactors under the new safety standards introduced in July 2013.
If the extensions are approved, Kansai Electric expects the two reactors to resume operations in November 2019 at the earliest, as they require further safety measures before their restart.
Also on Thursday, Kansai Electric told the prefectural government of Fukui that it will launch special checks as early as in mid-May for reactor 3, which is also offline, at its Mihama plant. The reactor will be 40 years old in December next year.

April 30, 2015

Kansai Electric files to extend use of reactors

http://www3.nhk.or.jp/nhkworld/english/news/20150430_40.html

Apr. 30, 2015 - Updated 19:07 UTC+2
Kansai Electric Power Company has applied to extend the operational lifespan of 2 of its nuclear reactors by 20 years.

The company filed the application with the Nuclear Regulation Authority on Thursday. The extension covers the No.1 and No.2 reactors of the Takahama plant in Fukui Prefecture, central Japan.

After the accident at the Fukushima Daiichi nuclear plant in 2011, the government introduced regulations that limit the operational lifespan of reactors to 40 years in principle.

Operation of the 2 Takahama reactors started about 40 years ago.

Power companies that seek to extend the limit must inspect reactors and other equipment for possible deterioration.

This is the first time a power company has applied for an extension under the new system.

Kansai Electric officials say they have concluded that there are no safety problems after inspecting the reactors and containment vessels starting last December.

For the extension to be granted, the reactors must pass screening based on the new requirements to go back online. The application must also be approved by July of next year.

Observers say the screening may take time because of measures required for the aging reactors. Such measures include preventing electric cables from catching fire and lowering radiation leakage in the event of an accident.

The industry ministry envisions nuclear power contributing 20 to 22 percent of the country's total energy mix in fiscal 2030. The ministry stated the percentages in its draft plan for the optimal energy mix.

The draft assumes that multiple nuclear reactors will be granted extensions beyond 40 years.

38-year old Mihama reactor to be inspected shortly

April 30, 2015

Inspection of aging Mihama reactor to start in May

http://www3.nhk.or.jp/nhkworld/english/news/20150430_31.html

Apr. 30, 2015 - Updated 10:15 UTC+2

Kansai Electric Power Company plans to start a special inspection of one of its aging nuclear reactors in mid-May to operate it beyond a new 40-year age limit.

The No. 3 reactor at the plant in Mihama Town, Fukui Prefecture, started operating 38 years ago.

Officials of the utility informed the prefecture and the town of its plan on Thursday.

The government set the age limit for the nation's reactors after the 2011 Fukushima nuclear crisis.

In special inspections, utilities must carry out ultrasonic tests on entire reactors. The checks were previously limited to reactors' welded parts.

The inspections include thorough checks of the strength of containment vessels and analysis of concrete samples.

Utilities must report their findings to the government.

The Mihama reactor would be the third to undergo a special inspection. Kansai Electric carried out such checks for the No. 1 and 2 reactors at its Takahama plant, also in Fukui Prefecture.

Kagoshima residents appeal

May 6, 2015

Kagoshima residents appeal court's go-ahead to restart Sendai reactors

http://www.japantimes.co.jp/news/2015/05/06/national/crime-legal/kagoshima-residents-appeal-courts-go-ahead-to-restart-sendai-reactors/#.VUpu-JPwmic

Kyodo
KAGOSHIMA – Local residents on Wednesday appealed a court decision last month dismissing calls to stop the restart of two reactors at the Sendai nuclear power plant in southwestern Japan's Kagoshima Prefecture.
The appeal, filed with the Fukuoka High Court's Miyazaki branch, disputes the Kagoshima District Court's rejection of a local call for an injunction to stop the restart of the Nos. 1 and 2 reactors at the Kyushu Electric Power Co. plant.
While the government of Prime Minister Shinzo Abe is pushing to restart reactors taken offline after the 2011 Fukushima meltdowns, many in the country remain opposed to such moves due to lingering safety concerns.
On April 22, the district court ruled that there were no "irrationalities" in Japan's new safety standards adopted in the wake of the Fukushima crisis, and that, having cleared those standards, the Sendai plant is fit for operation.
Speaking at a press conference, lawyers representing the residents said many parts of the district court's decision were logically unsound and that the plaintiffs hope for a new ruling before the reactors come back online.
Kyushu Electric hopes to resume operation at the plant by summer.

Experts: Miyama faults unlikely to become active

May 8, 2015

Experts: Faults at Mihama reactor unlikely to move

May 8, 2015 - Updated 09:47 UTC+2
http://www3.nhk.or.jp/nhkworld/english/news/nuclear.htm
A group of experts says faults under a nuclear reactor compound in Fukui Prefecture are unlikely to become active.

At a meeting of the Nuclear Regulation Authority on Friday, the group presented a draft report on the No. 3 reactor at the Mihama power plant. The draft says the group found no proof that the faults were active in the past 130,000 years.

The group plans to ask for opinions from other experts before submitting the report to the authority.

The NRA is to make a final assessment on the faults and the reactor's quake resistance during its screening, which is a prerequisite to restarting the reactor.

The plant's operator, Kansai Electric Power Company, aims to extend the lifespan of the 38-year-old reactor.

To restart the reactor, the firm must pass a screening under regulations introduced after the Fukushima nuclear accident and another screening for extending the lifespan by November 2016.

The firm has decided to decommission 2 other reactors at the plant that are over 40 years old.

Delay in inspections will postpone restart

May 12, 2015

Sendai reactor restart unlikely until late July

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

May 12, 2015 - Updated 04:51 UTC+2

The planned restart of a reactor at the Sendai nuclear plant will be pushed back until late July or later due to a delay in onsite inspections.

The reactor is one of the 2 facilities at the plant that cleared the country's tighter regulations introduced after the 2011 Fukushima Daiichi nuclear disaster.

Kyushu Electric Power Company submitted a revised plan over the ongoing onsite inspections to the country's nuclear regulators on Monday. It extends the inspection process for the No.1 reactor by around one week.

The utility's earlier inspection plan assumed loading nuclear fuel in early June to restart the reactor in mid-July. But the regulators said the schedule was too tight.

Kyushu Electric has not specified the timing for a restart, but it now appears unlikely until late July at the earliest.

The onsite inspections began more than one month ago. But as of last week, only 7 of the roughly 180 items were checked. The utility has assigned more than 200 additional personnel to speed up the process.

Faults under Shika plants may be active

May 14, 2015

Panel says faults under Shika nuke plant may be active

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201505140050

By TOSHIO KAWADA/ Staff Writer

The nation's nuclear watchdog concluded that fault lines running underneath the Shika nuclear power plant in Ishikawa Prefecture may well be active, throwing the prospect of restarting the facility's reactors into doubt.

An expert panel of the Nuclear Regulation Authority, comprising NRA Commissioner Akira Ishiwatari and four external specialists, said May 13 the possibility of the Shika plant standing directly above active faults was very real.

But Yutaka Kanai, vice president of Hokuriku Electric Power Co., the plant operator, said: “We take issue with that conclusion.”

Kanai said the utility will present its “arguments at meetings on screening for restarts.”

The NRA panel plans to release a draft report of its conclusions at its next meeting. If the draft is approved, it will be the second time the nuclear watchdog has reported that fault lines directly beneath a nuclear reactor could be active, following the No. 2 reactor of Japan Atomic Power Co.’s Tsuruga plant in Fukui Prefecture.

Although the Shika plant has been taken offline after the 2011 earthquake and tsunami disaster set off the nuclear crisis in Fukushima, Hokuriku Electric has applied to the NRA for screening to restart its No. 2 reactor. The power company is also seeking to resume operations at the No. 1 reactor.

The company insists there are no active faults beneath the reactors and other key facilities on the plant site, but the expert panel said the S-1 fault line, which runs directly beneath the No. 1 reactor, as well as the S-2 and S-6 faults under cooling pipes connected to the No. 1 and No. 2 turbine buildings, may be active.

Stricter safety standards for nuclear power facilities were established after the Fukushima disaster, which ban plant operators from locating reactors and other key equipment directly atop active fault lines.

If Hokuriku Electric is unable to overturn the decision by the NRA panel, the No. 1 reactor will have to be decommissioned. Because piping is considered among key equipment under the new safety standards, the No. 2 reactor may also have to be decommissioned unless the utility relocates the pipes.

May 13, 2015

Experts say faults under Japan nuclear plant may be active

http://mainichi.jp/english/english/newsselect/news/20150513p2g00m0dm092000c.html

TOKYO (Kyodo) -- Geological experts on a panel under the Nuclear Regulation Authority said Wednesday that faults running beneath a nuclear plant in central Japan may be active, clouding the prospects for resumption of its operations.

Four outside experts of the five-member panel told a meeting it is possible the fault running right under the No. 1 reactor at Hokuriku Electric Power Co.'s two-unit plant in Shika, Ishikawa Prefecture, is active. If the regulator finalizes the judgment based on the panel's opinion, the utility would have no option but permanently shutting down that unit.

The experts also pointed out that two other faults running beneath the plant's emergency equipment could be active.

A regulatory official said the No. 2 unit could avoid a permanent shutdown, but that complex construction work would be required to greatly enhance the facility's safety before restarting it.

In quake-prone Japan, building nuclear reactors or other important facilities directly above active faults is prohibited. The issue came into the spotlight after the 2011 Fukushima meltdowns that resulted in all the country's commercial reactors coming offline by September 2013.

Panel members have "largely agreed" on the evaluation of the faults, said Akira Ishiwatari, the regulator's commissioner who heads the panel, adding he will compile a draft report and present it at the next meeting.

Hokuriku Electric maintains that the faults are not active. "We had it checked by experts when we built the No. 1 unit. I don't think there was a major oversight," Executive Vice President Yutaka Kanai told reporters.

To restart nuclear reactors, operators must pass the regulator's safety screening based on a set of new regulations adopted after the Fukushima Daiichi disaster. Hokuriku Electric has already applied for screening of the No. 2 reactor.

Amid an increase in imported fuel costs for thermal power plants in the absence of nuclear power, utilities are desperate to restart their nuclear reactors. However, many hurdles including the issue of active faults stand in the way.

A reactor at Japan Atomic Power Co.'s Tsuruga nuclear plant on the Sea of Japan coast is likely to be scrapped after a different panel concluded in March that at least one of the faults running under it could move in the future.

At least two key geological faults under Tohoku Electric Power Co.'s Higashidori plant in northeastern Japan are also believed to be active.

The situation could affect the government's plan to continue to use nuclear power even after the Fukushima crisis. It plans to cover around 20 percent of the total electricity supply with nuclear power in 2030, compared with 28.6 percent in fiscal 2010 when the Fukushima accident occurred.

Prime Minister Shinzo Abe seeks to restart nuclear reactors that have met the regulator's requirements as soon as possible, but a majority of the public remains opposed to resumption.

May 13, 2015(Mainichi Japan)

Shika nuclear plant may be sitting on active seismic fault: NRA panel

http://www.japantimes.co.jp/news/2015/05/14/national/science-health/faults-under-shika-nuclear-plant-may-be-active-experts-warn/#.VVRYDZPwmic

Kyodo
May 14, 2015

The news that a nuclear plant on the Sea of Japan coast may have been built on at least one active seismic fault line has cast doubt on whether the plant in Shika, Ishikawa Prefecture, will ever be restarted.

Four outside experts on the five-member panel from the Nuclear Regulation Authority revealed at a meeting Wednesday that it is possible the fault running beneath the No. 1 reactor of the two-unit plant run by Hokuriku Electric Power Co. is active.

If the regulator issues a judgment reflecting that opinion, the utility would have no option but to shut down the unit permanently.

Furthermore, the panel said two other faults running beneath the plant's emergency equipment could be active, too.

A regulatory official said the No. 2 unit could avoid decommissioning but that complex construction work would be required to bolster its safety before a restart.

In quake-prone Japan, it is prohibited to build nuclear reactors or other important facilities directly on active fault lines. The issue was thrust into the public spotlight after the triple core meltdown at the Fukushima No. 1 power plant in March 2011 that caused all of the nation's commercial reactors to be taken offline by September 2013.

Panel members have "largely agreed" on the evaluation of the faults, said NRA Commissioner Akira Ishiwatari, who heads the panel. Ishiwatari said he will compile a report on the matter and present it at the next meeting.

Hokuriku Electric maintains that the faults are not active.

"We had it checked by experts when we built the No. 1 unit. I don't think there was a major oversight," Executive Vice President Yutaka Kanai told reporters.

To restart a nuclear reactor, the utility that owns it must pass a safety screening based on new regulations adopted by the NRA, which was set up after the Fukushima crisis began. Hokuriku Electric has already requested a safety screening for the No. 2 reactor.

Amid an increase in imported fuel costs for thermal power plants in the absence of nuclear power, utilities are desperate to restart their nuclear reactors. However, many hurdles stand in the way.

A reactor at Japan Atomic Power Co.'s Tsuruga nuclear plant on the Sea of Japan coast is likely to be scrapped after a different panel concluded in March that at least one of the faults running under it could move in the future.

At least two key geological faults under Tohoku Electric Power Co.'s Higashidori plant in Tohoku are also believed to be active.

The situation could affect the government's plan to continue to use atomic power after the Fukushima crisis. It aims for reactors to account for around 20 percent of the nation's total power by 2030, compared with 28.6 percent in fiscal 2010 — when the Fukushima No. 1 disaster struck.

Prime Minister Shinzo Abe intends to restart nuclear reactors that pass the NRA's safety tests as soon as possible, but the majority of the public remains opposed.

Ikata likely to clear screening

May 15, 2015

Ikata reactor to effectively clear NRA screening

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

May 15, 2015 - Updated 15:36 UTC+2
Japan's nuclear regulator is expected to compile a draft assessment on safety measures for a reactor at the Ikata plant in western Japan.

Completing the assessment is regarded as a major step forward in the reactor's restart.

The Nuclear Regulation Authority is to present the draft on the plant's No.3 reactor in Ehime Prefecture at its meeting on May 20th.

The NRA has been discussing for nearly 2 years whether Shikoku Electric Power's safety measures meet new government requirements set after the Fukushima Daiichi nuclear crisis.

If the commissioners find no problem with the assessment, the NRA will hear public comments for 30 days and formally approve the assessment.

The NRA is screening, or has screened, 24 reactors at 15 power plants. Ikata is the 3rd plant to make it to the assessment stage after the Sendai plant in Kagoshima Prefecture and the Takahama plant in Fukui Prefecture.

Observers say Ikata's restart could be late this year at the earliest. It needs to get approval for equipment designs and pass onsite inspections as well as get local consent.

NRA approves restart of Ikata

May 20, 2015

NRA approves restart for third nuclear plant

http://www.japantimes.co.jp/news/2015/05/20/national/japan-approves-third-nuclear-plant-restart/#.VVw8wEbwmic

Reuters, Kyodo, Bloomberg, AFP-JIJI

Japan's nuclear regulator signed off on the basic safety of a reactor at a third nuclear plant on Wednesday, as the country inches toward rebooting its atomic industry more than four years after the crisis began at Tepco's Fukushima No.1 facility.

The decision will be a boost for operator Shikoku Electric Power Co., which relied on its sole Ikata nuclear power station in southwestern Japan for about 40 percent of its electricity output before the meltdowns at Fukushima led to the shutdown of all the country's reactors.

But the reactor is not expected to go back online before winter, as Shikoku Electric has yet to obtain local approval and finish other necessary procedures.

For the government of Prime Minister Shinzo Abe, resuming nuclear power, which provided about a third of the electricity supply before the triple meltdown in Fukushima, is key to lifting the economy out of two decades of anaemic growth.

Japan has switched to fossil fuels to compensate for the closure of reactors, pushing imports of liquefied natural gas to a record-high ¥7.78 trillion ($65 billion) in the financial year ended March 31.

The safety approval is still only one of three needed before the Nuclear Regulatory Authority (NRA) gives its final sign off. The consent of local authorities, which is seen as a formality, is also required, along with operational checks.

At a meeting on Wednesday, the NRA's commissioners signed off on a provisional assessment that says the Ikata reactor meets new design standards introduced in the wake of Fukushima. The decision will be open to public comment for about a month before being formalized.

Located about 700 km (660 miles) west-southwest of Tokyo on Shikoku Island, the Ikata No. 3 reactor started operations in 1994 and has a capacity of 890 megawatts.
The future of the Ikata plant's two other reactors, each with capacity of 566 megawatts, is unclear. One is almost 40 years old, which is the lifetime limit for reactors in Japan without a special extension that will be costly to achieve.
Shikoku Electric hasn't applied for restarts of that reactor or the No. 2 unit, which began operations in 1982.
Two other nuclear plants operated by Kansai Electric Power and Kyushu Electric Power have passed the first stage of regulatory checks.
Operators also have to overcome legal hurdles. Anti-nuclear activists have stepped up petitioning the judiciary to block restarts, with a majority of the public opposed to atomic power.
Residents near the Ikata plant filed a lawsuit in December 2011 to mothball the station, but a decision has yet to be made.
In a related move, the Fukui District Court has rejected Kansai Electric Power Co.'s appeal of a ruling that prevents the utility from restarting two reactors at its Takahama plant in Fukui Prefecture, according to Tadashi Matsuda, a representative for the plaintiffs who won the case.
The court dismissal was decided Monday but not announced to the media. A court official declined to comment when contacted Tuesday. Kansai Electric representatives couldn't be reached for comment.
The Fukui District Court issued an injunction in April preventing the utility from moving ahead with plans to restart the reactors.
The court said at the time that new safety regulations introduced following the Fukushima disaster of 2011 are still too lax to ensure the safety of the two reactors at the Takahama station.
Kansai Electric, the utility most dependent on nuclear power in Japan, had called the ruling unacceptable.
The rejected appeal throws yet another roadblock in the utility's path to resuming operations at its nuclear plants.
The meltdowns at Tepco's wrecked Fukushima No. 1 plant forced the country's entire fleet of reactors offline in the months that followed, amid deepening public distrust of atomic energy.
The central government says the economy needs nuclear power — a technology that once supplied more than a quarter of Japan's electricity — to meet its energy demand.

NRA approves draft assessment on Ikata

http://www3.nhk.or.jp/nhkworld/english/news/20150520_22.html

May 20, 2015 - Updated 05:33 UTC+2
Japan's nuclear regulator has taken steps toward restarting the Ikata plant in Ehime Prefecture, western Japan.

The Nuclear Regulation Authority unanimously approved its draft assessment on safety measures for the plant's No. 3 reactor on Wednesday.

The draft assessment effectively approves safety measures set forth by the plant's operator, Shikoku

Electric Power Company, and clears the way for restarting the reactor.

The NRA says the utility's measures meet new government requirements introduced after the Fukushima Daiichi nuclear accident in March 2011.

Regulators say the measures, which include raising the maximum magnitude of a possible earthquake and installing a command center capable of withstanding emergencies, are reasonable.

They also note that the utility has addressed the issue of using mixed-oxide fuel, which includes plutonium extracted from spent nuclear fuel.

They say effective plans are in place to prevent meltdowns in severe accidents.

The assessment was based on the premise that the utility will not restart the No.1 and No.2 reactors. Putting them back online would require more screenings envisioning simultaneous accidents of multiple reactors, including No.3 reactor.

Nuclear Regulation Authority Chairman Shunichi Tanaka says regulators will continue a thorough assessment in the next stage which includes approving the details of equipment designs.

Ikata is the third plant to reach the assessment stage after the Sendai plant in Kagoshima Prefecture and the Takahama plant in Fukui Prefecture.

The NRA will now hear public comments for 30 days before formally approving the assessment.

But quake-proofing work is scheduled to take until autumn of this year and Shikoku Electric must receive approval for equipment designs, pass inspections and obtain local consent before restarting the reactor.

Observers say a restart before winter is unlikely.

May 19, 2015

Ikata reactor expected to clear NRA screening

http://www3.nhk.or.jp/nhkworld/english/news/20150520_05.html

May 19, 2015 - Updated 21:47 UTC+2

Japan's nuclear regulator is to submit a draft assessment on the safety measures for a reactor at the Ikata plant in western Japan.

The Nuclear Regulation Authority will present the draft assessment for the No.3 reactor at the plant in Ehime Prefecture at a meeting on Wednesday.

The NRA has been discussing for nearly 2 years whether the safety measures of the operator, Shikoku Electric Power, meet the new government requirements that were introduced after the Fukushima Daiichi nuclear crisis.

The regulator asked Shikoku Electric Power Company to raise the maximum magnitude of a possible earthquake, and to install a command center that would be used to deal with a severe accident.
The operator decided to take additional measures such as improving quake resistance and installing pumps for pouring water into reactors or containment vessels in the event of severe accidents.

If the commissioners find no problems with the draft, the NRA will hear public comments for 30 days and formally approve the assessment.

Ikata is the 3rd plant to reach the assessment stage after the Sendai plant in Kagoshima Prefecture and the Takahama plant in Fukui Prefecture.

Observers say the Ikata reactor could be restarted later this year after equipment designs are approved and onsite inspections are passed. Local consent must also be obtained.

Fukui court rejects Kepco's appeal

May 19, 2015

Fukui court rejects Kansai Electric appeal of reactor ruling

http://www.japantimes.co.jp/news/2015/05/19/national/crime-legal/fukui-court-rejects-kansai-electric-appeal-of-reactor-ruling/#.VVw_S0bwmic

Bloomberg, AFP-JIJI
The Fukui District Court has rejected Kansai Electric Power Co.'s appeal of a ruling that prevents the utility from restarting two reactors at its Takahama plant in Fukui Prefecture, according to Tadashi Matsuda, a representative for the plaintiffs who won the case.
The court dismissal was decided Monday but not announced to the media. A court official declined to comment when contacted Tuesday. Kansai Electric representatives couldn't be reached for comment.
The Fukui District Court issued an injunction in April preventing the utility from moving ahead with plans to restart the reactors.
The court said at the time that new safety regulations introduced following the Fukushima disaster of 2011 are still too lax to ensure the safety of the two reactors at the Takahama station.
Kansai Electric, the utility most dependent on nuclear power in Japan, had termed the ruling unacceptable.
The rejected appeal throws yet another roadblock in the utility's path to resuming operations at its nuclear plants more than four years after the meltdowns at Fukushima No. 1.
The accident forced Japan's entire fleet of reactors offline over the following months amid deepening public suspicion over the technology.

The central government says the economy needs nuclear power — a technology that once supplied more than a quarter of Japan's electricity — to meet its energy demand.
Prime Minister Shinzo Abe has backed an industry push to return to nuclear power, with manufacturers complaining about the high cost of electricity produced from dollar-denominated fossil fuels.

Ikata No.3 gets OK from NRA

Ehime reactor effectively clears NRA screening

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505200072
May 20, 2015
By TOSHIO KAWADA/ Staff Writer
The nation's nuclear watchdog effectively gave the green light May 20 to restart a reactor at a third nuclear power plant.
The decision applies to the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture operated by Shikoku Electric Power Co.
The Nuclear Regulation Authority introduced stricter safety standards after the triple meltdown at the Fukushima No. 1 power plant triggered by the earthquake and tsunami disaster in March 2011.
All nuclear power plants in Japan have been shut down due to the disaster.
It has already assessed that the No. 1 and No. 2 reactors at the Sendai plant in Kagoshima Prefecture, as well as the No. 3 and No. 4 reactors of the Takahama plant in Fukui Prefecture, comply with the new regulations.
The latest decision, presented in a 427-page draft report the NRA drew up on its safety screening, will be finalized as early as July after it invites public opinion on technical issues. The public will have 30 days from May 21 to offer input.
Shikoku Electric will not likely be able to resume operations at the plant this year because the NRA still needs to inspect equipment, a process that is expected to take at least three months.
In addition, work to upgrade the facility will also likely continue until the fall.
Thus, the earliest the reactor can reasonably be expected to restart is this winter, assuming that the plant operator smoothly completes the necessary administrative procedures to gain formal final approval and wins consent from Ehime Prefecture and Ikata town.
Shikoku Electric plans to restart the reactor using plutonium-thermal power generation, in which mixed-oxide fuel consisting of plutonium and uranium is used.
The NRA began its screening process in response to Shikoku Electric's application submitted in July 2013, and concluded the utility's preparations for earthquakes and tsunami, as well as other measures to guard against severe accidents, meet the new safety regulations.

Sendai: One step closer to restart

Sendai nuclear plant to move closer to restart

http://www3.nhk.or.jp/nhkworld/english/news/20150522_03.html

Nuclear & Energy
May 21, 2015 - Updated 22:41 UTC+2

The Sendai nuclear power plant in southwestern Japan is likely to move one step closer to restart.

Japan's nuclear regulator will approve the designs of all the newly installed facilities for its No.1 reactor as early as on Friday.

Operator Kyushu Electric Power Company has been slow in submitting some of the design documents to regulators. They include the designs of the facilities shared with the No.2 reactor, such as the control room's air conditioning.

The regulator says it has finally confirmed the quake-resistance for these designs and that all the designs for safety purposes will be approved.

The next step is an in-person inspection by officials that leads to the reactor's restart. The regulator has been conducting inspections since March. But it has completed less than 10 percent of more than 200 inspection items as of Sunday.

This will set the restart date of the No.1 reactor to late July at the earliest. The operator says it plans to restart the plant's No.2 reactor in August or shortly afterward.

Sendai restart

May 22, 2015

Regulator OKs Sendai plant facilities' designs

http://www3.nhk.or.jp/nhkworld/english/news/20150522_30.html

May 22, 2015 - Updated 10:10 UTC+2
Japan's nuclear regulator has approved the designs of all the newly installed facilities for the No.1 and No.2 reactors at the Sendai nuclear power plant.

The approval moves the Sendai nuclear power plant in southwestern Japan one step closer to restart.

Operator Kyushu Electric Power Company had been slow in submitting some of the design documents to

the regulator. They include the designs of shared facilities, such as the control room's air conditioning.

On Friday, officials of the regulator said they finally confirmed the quake-resistance for these designs and that all the designs for safety purposes were approved.

The next step is an in-person inspection by officials that leads to the No.1 reactor's restart. The regulator has been inspecting the newly installed facilities for the reactor since March. But it has completed less than 10 percent of about 200 inspection items as of Sunday.

This will set the restart date of the No.1 reactor to late July at the earliest.

Regarding the No.2 reactor, the operator says it plans to restart it in August or shortly afterward. The power company next week plans to submit to the regulator documents asking for an in-person inspection of the reactor.

Sendai No.2 to restart late September ?

May 25, 2015

Utility sets September reactor restart date

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

May 25, 2015 - Updated 11:20 UTC+2

Kyushu Electric Power Company says it hopes to restart one of its reactors at the Sendai nuclear plant in southern Japan in late September, giving a more concrete target date than previously announced.

The utility revealed this on Monday in a plan submitted to the Nuclear Regulation Authority for on-site inspections of the No.2 reactor at the plant in Kagoshima Prefecture.

The inspections by the regulators are the final step for putting the reactor back online. Under the plan, the inspections will start on June 10th.

Kyushu Electric hopes to load nuclear fuel into the reactor in late August and pull out the control rods about a month later to reactivate the reactor.

The utility says it aims to check the overall functions of the reactor and connect it to the power grid in late October.

The firm used to say that it was planning to restart the reactor after August.

The regulators have already begun their inspections of the No.1 reactor at the same plant. The operator

aims to restart this reactor in late July. But the regulators have completed less than 20 percent of the roughly 200 items on the checklist.

With the inspections of the No.2 reactor about to start, the process could take longer than planned.

The 2 reactors are the first to clear the tighter regulations introduced after the Fukushima nuclear accident.

Sendai clears final screening

May 27, 2015

NRA approves emergency plans for Sendai plant

http://www3.nhk.or.jp/nhkworld/english/news/20150527_26.html

May 27, 2015 - Updated 06:43 UTC+2
Japan's nuclear regulator has endorsed a plan submitted by the operator of the Sendai nuclear power plant in southwestern Japan. It's for dealing with emergencies.

The Nuclear Regulation Authority, or the NRA, approved the plans for the No.1 and 2 reactors at the power station in Kagoshima Prefecture on Wednesday.

The operator, the Kyushu Electric Power Company, has now obtained all of the regulator's necessary approvals for restarting the reactors at the plant.

The latest screening will allow the power company to load nuclear fuel after the NRA finishes necessary inspections, and receive checks on its emergency drills.

NRA Chairman Shunichi Tanaka said that education and drills for workers to prepare in case of serious accidents are very important, and that he hopes these matters will be checked without fail.

The regulators have cleared all the necessary documents for the Sendai plant. It's the first time this has happened since tougher rules were introduced after the 2011 nuclear accident.

Only on-site pre-operational inspections by the NRA are left for the utility before it is allowed to restart the reactors.

Kyushu Electric hopes to restart the No. 1 reactor in late July after loading nuclear fuel into the reactor next month. It also plans to reactivate the No.2 reactor in late September. But the pre-operational checks since late March are falling behind schedule, and the delay may affect the utility's restarting plan.

Sendai nuclear reactors clear final screening

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505270067

By TOSHIO KAWADA/ Staff Writer

Kyushu Electric Power Co. cleared the final screening hurdle for a resumption of operations at its Sendai nuclear power plant in Kagoshima Prefecture.

The Nuclear Regulation Authority on May 27 approved the operational and accident-response manuals submitted by Kyushu Electric Power.

The utility will now conduct checks of the equipment at the nuclear power plant before reactivating the reactors. The No. 1 reactor could restart as early as late July. The utility expects to resume operations at the No. 2 reactor by late September.

It submitted the paperwork for three separate screenings in July 2013.

In September 2014, the NRA approved the basic direction of safety measures at the Sendai plant that were required under new standards implemented after the 2011 accident at the Fukushima No. 1 nuclear power plant.

The utility also submitted construction plans to change reactor design in line with its safety measures. The NRA approved the construction plan for the No. 1 reactor in March 2015 and for the No. 2 reactor on May 22.

The manuals that received approval on May 27 contained procedures for dealing with major accidents, such as a huge volcanic eruption.

The guidelines call for constant monitoring of volcanic activity and if a major eruption appears imminent, the president of Kyushu Electric Power is to issue instructions to stop operations at the Sendai reactors and remove the nuclear fuel.

Kyushu nuclear plant clears regulator's safety screening

http://mainichi.jp/english/english/newsselect/news/20150527p2g00m0dm060000c.html

The Sendai Nuclear Power Plant is pictured in Satsumasendai, Kagoshima Prefecture, in this Nov. 7, 2014 file photo. (Mainichi)

TOKYO (Kyodo) -- A nuclear plant owned by Kyushu Electric Power Co. cleared all of the regulator's safety screening Wednesday, with only on-site pre-operational checks left for the utility before it is allowed to restart the Sendai complex in southwestern Japan.

The Nuclear Regulation Authority approved the same day Kyushu Electric's safety management rules required for restarting the plant. The company now plans to reactivate in late July the No. 1 unit at its Sendai plant in Kagoshima Prefecture after completing the ongoing pre-operational checks of the plant's equipment.

The two-unit Sendai complex is expected to become the first nuclear facility in Japan to go back online under a set of new, tighter regulations imposed following the 2011 Fukushima meltdowns. Kyushu Electric plans to restart the No. 2 unit in late September.

But the pre-operational checks are already falling behind schedule, which may affect the utility's restart plan.

The nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi complex, triggered by a huge earthquake and tsunami in March 2011, resulted in eventually shutting down all of Japan's commercial reactors over safety concerns.
Following the disaster, two nuclear reactors at Kansai Electric Power Co.'s Oi plant were temporarily brought back online in 2012 with the government citing concerns about power shortages. But no reactors have been restarted under the post-Fukushima regulations introduced in 2013.
The government of Prime Minister Shinzo Abe seeks to reboot reactors that have cleared the regulator's screening as soon as possible, saying that continued use of nuclear power is necessary for keeping electricity bills low and boosting economic growth.
However, polls have shown that the majority of Japan's public are opposed to restarting nuclear plants.

NRA criticises Kepco

May 28, 2015

Kansai Electric urged to revise restart documents

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
May 28, 2015 - Updated 10:16 UTC+2
Japan's nuclear regulatory agency has criticized Kansai Electric Power Company for a delay in submitting documents necessary to decide whether 2 of its older nuclear reactors can keep operating.

The Nuclear Regulation Authority made the criticism at a meeting on Thursday to examine the results of a special inspection that the utility conducted at the No.1 and 2 reactors of its Takahama plant in Fukui Prefecture.

This is part of a screening process following the utility's application in April to extend the operational lifespan of the reactors by 20 years, beyond a standard 40 years.

The government introduced the 40-year limit after the 2011 Fukushima accident. Utilities hoping to extend the limit for their reactors must put them under close scrutiny and prove that they have no safety problems.

Regulators said Kansai Electric has not yet submitted documents explaining in detail the designs of equipment at the reactors. They also said other documents attached to the April application include outdated data.

Officials of Kansai Electric said it is taking time to reflect in the documents a decision made last May to prepare for the possibility that the plant will be hit by an earthquake more powerful than previously assumed.

For Kansai Electric to win approval, the reactors must pass screening in a special inspection by July next year, as well as a new set of requirements introduced after the Fukushima accident.

NRA begins inspection of Sendai Plant

June 8, 2015

Nuclear regulators inspecting Sendai plant

Jun. 8, 2015 - Updated 09:42 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Japanese nuclear regulators have begun inspecting a nuclear power plant in southwestern Japan to see if its operator is complying with new safety management rules. These include emergency responses.

Inspectors from the Secretariat of the Nuclear Regulation Authority on Monday began the 3-week probe at the Sendai plant in Kagoshima Prefecture.

Last month, the NRA approved the safety management rules for the No.1 and No. 2 reactors drawn up by operator Kyushu Electric Power Company.

The rules were the first to win approval based on tougher regulations that were introduced after the 2011 accident at the Fukushima Daiichi plant.

The inspectors will check if the utility has prepared detailed manuals in line with its new rules.

If they find any serious violations, Kyushu Electric may not be allowed to restart reactors at the plant until it takes measures to address them.

The utility hopes to restart the No.1 reactor in mid-August. But equipment inspections are falling behind schedule.

Checking Sendai plant

June 10, 2015

Check of Sendai reactor starts

Jun. 10, 2015 - Updated 09:13 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Nuclear regulators have begun checking a reactor at a power plant in southwestern Japan ahead of a possible restart.

The No.1 and 2 reactors at the Sendai plant in Kagoshima Prefecture last year were the first to clear tougher regulations introduced after the 2011 Fukushima accident.

Since the end of March, Japan's Nuclear Regulation Authority has checked new safety equipment for the plant's No.1 reactor to see whether it was installed as planned and works properly.

The regulators began checking the No. 2 reactor on Wednesday. They examined documents and held hearings of officials from the plant's operator, Kyushu Electric Power Company.

The checks covered about 100 facilities and equipment that are used by both reactors. The authority says it wants to finish checking them so it can restart the No.1 reactor first.

Kyushu Electric hopes to restart the No.1 reactor in mid-August and the No. 2 in late September.

All of Japan's commercial nuclear reactors are offline.

Setback for Sendai

10.06.2015_No119 / News

Setback For Sendai After Discovery Of 'Incomplete Documents'

http://www.nucnet.org/all-the-news/2015/06/10/setback-for-sendai-after-discovery-of-incomplete-documents
Security & Safety
10 Jun (NucNet): Japan's Nuclear Regulation Authority (NRA) has begun redoing parts of pre-service inspections it had already completed at the Sendai-1 nuclear power plant after the discovery of "numerous incomplete documents and erroneous written entries", the Japan Atomic Industrial Forum (Jaif) said today.
Pre-service inspections are the final stage before a nuclear power plant can be restarted. Kyushu Electric Power Company, the owner and operator of the 846-megawatt pressurised water reactor unit in Kagoshima prefecture, southern Japan, has now postponed the scheduled restart of the unit from early July to mid-August 2015.

Jaif warned today that because of the number of errors that need to be corrected, a restart this summer is unlikely.

The NRA said the omissions and errors were "not mere entry mistakes", but mistakes of a nature that require "the confirmation of facts". The NRA intends to carry out further inspections in the area of quality control, Jaif said.

Jaif said errors included discrepancies between data that Kyushu Electric Power Company had provided on fuel lines to emergency power facilities and the data on those fuel lines contained in original records provided by the manufacturer at the time of installation.

Pre-service inspections to confirm the performance of equipment and facilities at Sendai-1 began at the end of March 2015, Jaif said.

According to Kyushu Electric Power Company, around 420 personnel were engaged in inspections, but this has not been enough to keep to its schedule.

Pre-service inspections began at Sendai-2 on 10 June 2015. Jaif did not say if those inspections had been stopped or if they needed to be carried out again.

Units 1 and 2 at Sendai both cleared the NRA's safety examinations in September 2014, which meant they met new regulatory standards imposed after the March 2011 Fukushima-Daiichi accident. They were the first reactors approved for restart under the new standards.

All of Japan's 48 commercial reactor units were shut down for safety checks and upgrades following Fukushima-Daiichi.

Restart Hamaoka no.3 reactor?

June 16, 2015

Chubu Electric pushes Hamaoka reactor toward restart; residents divided

http://www.japantimes.co.jp/news/2015/06/16/national/chubu-electric-pushes-hamaoka-reactor-toward-restart-residents-divided/#.VYBo90bwmou

Kyodo
Chubu Electric Power Co. applied Tuesday for Nuclear Regulation Authority safety screening so it can restart the No. 3 reactor at its Hamaoka nuclear plant.
Located on the Pacific coast in Omaezaki, Shizuoka Prefecture, the facility is in a region that studies suggest could be devastated by a major earthquake.
Chubu Electric said it plans to take measures by September 2017 to enhance the safety of the No. 3 unit against risks from earthquakes and tsunami.
In February 2014, it applied for a safety assessment of the No. 4 unit. It and the No. 5 reactor were shut down in May 2011 after Prime Minister Naoto Kan of the Democratic Party of Japan requested that operations be suspended amid fears that a powerful earthquake predicted in the area could trigger another nuclear crisis. The Fukushima disaster was playing out at the time.
Residents in Shizuoka Prefecture expressed mixed reaction Tuesday.
"I can't trust the safety of a nuclear plant even if it passes the screening," said a woman in her 40s who operates a shop in Omaezaki.
A man in his 60s who owns a business in the city said the plant should not be restarted.
"Higher electricity bills are hitting my business hard, but that can't be traded for safety," he said.

Katsushi Hayashi, who belongs to a local citizens' group, said the application for restart "goes against the will of the people in Shizuoka."
However, some residents said the restart may be necessary for development of the local economy.
"It's true that many people have jobs thanks to the Hamaoka plant, although I support phasing out nuclear power," said a 43-year-old housewife who lives near the plant.
A man in his 30s who works at a local restaurant said, "We have no choice but to allow the restart if it would contribute to the local economy."
At the time of the Fukushima disaster, the No. 3 unit at the five-reactor Hamaoka plant was offline for scheduled maintenance and inspections. Reactors 1 and 2 ended commercial operation in 2009.
Chubu Electric wants to resume power generation at the complex as soon as possible to reduce its reliance on expensive fossil fuel imports.
Currently all of Japan's commercial reactors remain offline pending NRA safety reviews. Prior to the Fukushima disaster they provided nearly a third of the nation's power.
The NRA's current safety standards were adopted in the wake of the Fukushima disaster.

Chubu Electric applies for safety review of Hamaoka No. 3 nuclear unit

http://mainichi.jp/english/english/newsselect/news/20150616p2g00m0dm057000c.html
TOKYO (Kyodo) -- Chubu Electric Power Co. applied Tuesday for safety screening of the No. 3 reactor at its Hamaoka nuclear plant which is believed to be located at the potential epicenter of a future massive earthquake.
To resume operating, the Nuclear Regulation Authority must certify that a reactor satisfies more stringent safety standards adopted in the wake of the 2011 Fukushima nuclear plant disaster.
Chubu Electric said it plans to take measures by September 2017 to enhance the safety of the No. 3 unit against possible earthquake and tsunami hazards.
In February 2014, the utility applied for the nuclear regulator's safety assessment of the No. 4 unit at the plant on the Pacific coast in Shizuoka Prefecture.
Currently all of Japan's commercial nuclear reactors, which prior to the Fukushima disaster provided nearly a third of the electricity consumed in Japan, the world's third-largest economy, remain offline pending NRA safety reviews.
In May 2011, the No. 4 and No. 5 units at the Hamaoka station -- Chubu Electric's sole nuclear plant -- were shut down after then Prime Minister Naoto Kan of the now-opposition Democratic Party of Japan requested all operations at the plant be suspended due to concern that a powerful earthquake predicted in the area could trigger another nuclear crisis like the Fukushima triple-reactor meltdowns.
When the Fukushima disaster occurred in March 2011, the No. 3 unit at the five-reactor Hamaoka plant was offline for regular checkups. The No. 1 and No. 2 units ended commercial operation in 2009.
Chubu Electric wants to resume operating the complex as soon as possible amid increased imported fuel costs for fossil power in the absence of nuclear power.
But the outlook remains uncertain partly because Shizuoka Prefecture has been reluctant to give a green light to restarting the plant due to safety concerns.

June 16, 2015

Screening sought for another Hamaoka reactor

http://www3.nhk.or.jp/nhkworld/english/news/20150616_28.html

Jun. 16, 2015 - Updated 10:39 UTC+2

Chubu Electric Power Company has applied for screening of a second reactor at its Hamaoka nuclear plant in central Japan, to determine whether related safety measures meet new government requirements.

The plant on the Pacific coast of Shizuoka Prefecture is in an area where, scientists say, a major earthquake could occur in the near future.

Chubu Electric filed an application for the plant's No. 3 reactor with the Nuclear Regulation Authority on Tuesday. The screening is a prerequisite for restarting the reactor.

The utility last year applied for screening of the plant's No. 4 reactor, which is under the regulator's scrutiny.
The firm says that like safety measures taken for the No. 4 reactor, those for the No. 3 are based on a higher estimate of maximum acceleration during an earthquake.

The firm also built a 22-meter-high breakwater to protect the plant from tsunami after revising its estimate for tsunami height to about 21 meters.

The utility's senior official Hiromu Masuda said it's important to explain the safety measures in detail to not only the regulator but also local residents.

Following the Fukushima Daiichi nuclear accident, Chubu Electric halted 2 reactors at Hamaoka at the request of the government.

The No. 3 reactor was offline for regular checks and remains so.

Regulatory officials are discussing the possibility of earthquakes and tsunami in the area, leading to a delayed screening for the No. 4 reactor.

Local municipalities oppose restarting the plant.

Sendai: Fuel laoding delay

June 22, 2015

Fuel loading delay at nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jun. 22, 2015 - Updated 03:51 UTC+2

The operator of a nuclear power plant in southwestern Japan says there may be a short delay in fuel loading at a reactor scheduled for an August restart.

Kyushu Electric Power Company initially planned to start loading 157 units of nuclear fuel into the No. 1 reactor at Sendai, Kagoshima Prefecture, on July 4th.

Officials are now considering delaying the schedule to July 7th due to a reexamination of procedures.

The loading of the fuel units will likely take 4 days to complete.
The No.1 and 2 reactors at the Sendai plant in Kagoshima Prefecture are the first to clear tougher regulations introduced after the 2011 Fukushima accident.

Safety checks have been underway at the No.1 reactor since March, ahead of its planned restart. Once the fuel units have been installed, pipes and containment vessels will be examined.

Kyushu Electric Power Company officials are hoping to restart the reactor by mid-August.

Safety screening starts at Hamaoka plant

June 23, 2015

Regulators begin safety review of Hamaoka No. 3 nuclear reactor

http://mainichi.jp/english/english/newsselect/news/20150623p2g00m0dm115000c.html

TOKYO (Kyodo) -- Japan's nuclear regulators began safety screening Tuesday at the No. 3 reactor at Chubu Electric Power Co.'s Hamaoka nuclear plant which is believed to be sitting at the epicenter of a potential future earthquake.
During Tuesday's meeting, Nuclear Regulation Authority Commissioner Toyoshi Fuketa said the regulator will put a priority on assessing the safety of the No. 4 unit first -- signaling that the No. 3 unit would not go back online before the No. 4 reactor obtains a safety clearance.
Chubu Electric applied for the safety assessment of the No. 4 unit at the plant, located on the Pacific coast in central Japan, in February 2014.
To go back online, a reactor needs to pass the regulator's screening based on more stringent safety requirements adopted after the Fukushima Daiichi nuclear crisis triggered by a massive earthquake and tsunami in 2011. Chubu Electric is spending more than 300 billion yen to boost the Hamaoka plant's preparedness against possible earthquake and tsunami hazards.
However, assessment of the plant is expected to take a long time as the regulator is cautiously evaluating whether the safety measures are effective, and both the Nos. 3 and 4 reactors may remain offline for a while.

The outlook for restarting the plant is also unclear because Shizuoka Prefecture, which hosts the complex, remains wary about giving the green light. Shizuoka Gov. Heita Kawakatsu has said he wants to put the issue to a referendum.
In May 2011, the Hamaoka station -- Chubu Electric's sole nuclear plant -- was shut down after then Prime Minister Naoto Kan requested all operations at the facility be suspended, due to concerns that a powerful earthquake predicted in the area could trigger another nuclear crisis like the Fukushima meltdowns

Change quake preduction or not?

July 2, 2015

Nuclear watchdog threatens to abort screening of Mihama plant

http://mainichi.jp/english/english/newsselect/news/20150702p2a00m0na010000c.html

The Nuclear Regulation Authority (NRA) has threatened to terminate safety screenings for reactivating the Mihama nuclear power plant's No. 3 reactor if its operator, Kansai Electric Power Co. (KEPCO), fails to finalize a maximum seismic projection for the plant's premises by the end of August, it has been learned.
The nuclear watchdog announced the decision on July 1 over the plant's No. 3 reactor in Fukui Prefecture, whose operational life will reach the 40-year limit at the end of November next year. The move comes after KEPCO showed reluctance to raise the maximum earthquake ground motion for the plant site.
KEPCO is seeking to extend the operational life of the No. 3 reactor and filed for safety screenings in March. In order to bring about the extension, however, the utility will need to have inspections on the reactor completed by the end of November 2016, including anti-dilapidation measures.
At a regular meeting on July 1, the NRA estimated that it will take around 15 months from finalizing basic ground motion -- which serves as seismic design standards for reactors -- until screenings on other matters are completed at the plant, meaning that the utility must finalize the basic earthquake ground motion by the end of August.
Basic earthquake ground motion greatly varies depending on the predicted depths of an epicenter. KEPCO estimates that a quake whose epicenter's upper edge is four kilometers deep could hit the Mihama plant, while setting the figure at three kilometers deep for the nearby Takahama and Oi nuclear stations, respectively. The NRA has called on KEPCO to review the figure for the Mihama plant to make it on par with those for the other two plants.
If KEPCO reviews and finalizes basic ground motion for the Mihama facility, it will require additional seismic reinforcement work, possibly raising the costs for safety measures. If the utility sticks to the four-kilometer-deep epicenter scenario, however, it will not be able to finalize basic ground motion by the deadline, possibly leading to the decommissioning of the reactor.
During a July 1 press briefing, NRA Chairman Shunichi Tanaka said, "(If KEPCO fails to finalize basic ground motion by the end of August) we must consider measures including suspension of screenings. The operator (KEPCO) needs to be aware of that."
A senior KEPCO official told the Mainichi Shimbun, "We will consider whether to change our quake predictions before the next meeting for safety screenings is convened."
The upper limit of a reactor's operational life is set at 40 years, but it can be extended by up to 20 years only once.

Sendai (No.1) to start loading fuel on July 7

July 3, 2015

Sendai reactor fuel to be loaded from July 7

http://www3.nhk.or.jp/nhkworld/english/news/20150703_36.html

Jul. 3, 2015 - Updated 12:31 UTC+2

Officials at the Sendai nuclear power plant in southwestern Japan say they plan to start loading fuel into one of the reactors next Tuesday.

The Kyushu Electric Power Company reported the plan to the Nuclear Regulation Authority on Friday. Earlier the same day, pre-loading inspections were completed at the Number 1 reactor.

The utility expects it will take 4 days to insert 157 nuclear fuel assemblies into the reactor. Workers will use a crane to transfer the fuel rods one by one from a storage pool in an adjacent building.

Kyushu Electric will then check emergency equipment to inject coolant into the reactor and a device to insert control rods.

Workers will also undergo a drill to rehearse their response to a severe accident.

If all goes as planned, the utility will remove the control rods to activate the reactor in mid-August.

The Sendai plant's Number 1 and Number 2 reactors became the first to clear safety screenings last year.

The screenings were required under the country's new, stricter regulations introduced after the 2011 Fukushima nuclear accident.

The Number 1 reactor began undergoing equipment inspections in late March ahead of the Number 2 reactor.

All of Japan's 43 reactors are currently offline.

Sendai No.1 reactor to start earlier than planned

July 4, 2015

Kyushu Electric to load nuclear fuel into Sendai plant reactor ahead of restart

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507040027

HIGASHIYAMA/ Staff Writer
Kyushu Electric Power Co. will begin loading nuclear fuel into a reactor at the Sendai nuclear power plant in Kagoshima Prefecture on July 7 ahead of its planned restart in August.
The Nuclear Regulation Authority gave the plant operator the green light to start loading the fuel into the No. 1 reactor after the nuclear watchdog inspected the plant's equipment on July 3.
The reactor is planned to be restarted in mid-August after Kyushu Electric undergoes a month-long preparation.
The latest inspection was a part of the "pre-operation tests" to confirm that safety equipment is properly installed and can function at the plant to meet the NRA's new safety standard. The NRA determined July 3 that fuel can be properly loaded into the reactor in the light of the new regulation.
Before the reactor restart, the NRA will proceed with the remaining stages of pre-operation inspections to determine if the reactor can be actually restarted and conduct "security checks" on operational procedures.
During the fuel installation, Kyushu Electric workers will move bundles of nuclear fuel rods from a storage pool adjoining the reactor building into the reactor one by one. It will take about four days to load all 157 fuel rod bundles into the reactor, Kyushu Electric officials said.

Loading at Sendai soon to start - Protests

July 7, 2015

Operator to load nuclear fuel into reactor for planned 1st restart

Protesters demonstrate against reactivation of the Sendai nuclear power plant's No. 1 reactor in front of the plant's front gate in Satsumasendai, Kagoshima Prefecture, on July 7, 2015. (Mainichi)

http://mainichi.jp/english/english/newsselect/news/20150707p2g00m0dm018000c.html

FUKUOKA (Kyodo) -- Kyushu Electric Power Co. will start loading nuclear fuel into a reactor at its Sendai complex Tuesday ahead of its restart planned in mid-August under more rigorous safety requirements adopted after the 2011 Fukushima triple-reactor meltdowns.
The reboot of the reactor will mark the revival of Japan's nuclear power generation that has been idled amid safety concern following the world's worst nuclear disaster since the 1986 Chernobyl accident. None of Japan's commercial reactors have been online for nearly two years.
The government and utilities, faced with higher imported fuel costs, have sought to reactivate nuclear reactors that have met the new safety standards. The majority of the public, however, opposes the restart amid persistent safety concern and the ongoing work for decommissioning the radiation-leaking Fukushima Daiichi power plant.
According to a Kyushu Electric official, the operator will insert a total of 157 fuel rod assemblies into the Sendai No. 1 reactor, which will take about four days. Following the Nuclear Regulation Authority's screening of equipment, the utility plans to reactivate the unit and begin generating electricity in mid-August.
All of Japan's commercial nuclear reactors had been shut down by May 2012 due to heightened concern over the use of atomic power in the wake of the Fukushima disaster triggered by a huge earthquake and tsunami in March 2011.
Two reactors owned by Kansai Electric Power Co. were reactivated in July 2012 to address possible power shortages but they entered a period of mandatory routine checkups in September 2013, leaving Japan without nuclear power supply again.
In September 2014, the No. 1 unit at the Sendai plant, located in southwestern Japan, became the first nuclear facility to obtain a safety clearance from the regulator based on the post-Fukushima safety standards, a process necessary for any reactor before being allowed to go back online.
Kyushu Electric also plans to bring the Sendai No. 2 reactor back online in October. Two other reactors at Kansai Electric's Takahama plant have also obtained the regulator's safety clearance, but the outlook for their restart is uncertain due to a recent court decision to ban the utility from bringing them back online.
In its long-term energy policy, the government has pledged to continue utilizing nuclear power as a key source of electricity. It seeks to have nuclear power account for 20 percent to 22 percent of the total electricity supply in 2030, compared with around 30 percent before the nuclear crisis.
July 07, 2015 (Mainichi Japan)

July 6, 2015

Loading fuel at Sendai power plant soon to start

http://www3.nhk.or.jp/nhkworld/english/news/20150707_01.html

Jul. 6, 2015 - Updated 19:08 UTC+2
The operator of the Sendai nuclear power plant in southwestern Japan plans to start loading fuel into one of the reactors on Tuesday in preparation for restarting it.

The Kyushu Electric Power Company has scheduled 4 days for the work of placing 157 nuclear fuel assemblies into the Number 1 reactor. Workers will use a crane to transfer the fuel rods one by one from a

storage pool in an adjacent building.

The utility says it will rotate workers so it can conduct the work around the clock. It also says safety is the highest priority.

Kyushu Electric halted the operation of the Number 1 reactor 2 months after the 2011 disaster in northeastern Japan. All of its fuel was removed by the end of January 2013.

The company plans to restart the reactor in mid-August. In the meantime, emergency equipment that injects coolant into the reactor and other facilities crucial to safety will be checked.

Workers will also take part in a drill on how to respond to a severe accident.

Last year, the plant became the first to have safety measures approved under new regulations for nuclear plants introduced after the 2011 Fukushima accident.

Equipment at the plant's 2 reactors is now being checked ahead of the restart.

Sendai starts loading

July 7, 2015

Kyushu Electric starts transferring nuclear fuel into Sendai reactor

Protesters opposed to the resumption of operations at the Sendai nuclear power plant in Kagoshima Prefecture gather in front of the main gate on July 7. (Jun Kaneko)

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507070096

By JUNICHIRO NAGASAKI/ Staff Writer
Kyushu Electric Power Co. on July 7 began moving nuclear fuel into a reactor on expectations it will be the first in Japan to restart under tougher safety regulations implemented after the Fukushima disaster.
All 157 nuclear fuel rod bundles will be transferred to the No. 1 reactor at the Sendai nuclear plant in Satsuma-Sendai, Kagoshima Prefecture, over a four-day period.
Cranes were used to move each fuel rod bundle from a storage pool in an adjacent building, and work will continue around the clock to complete the process by July 10.
Kyushu Electric Power is seeking to restart the No. 1 reactor in mid-August after the Nuclear Regulation Authority completes the final phases of its safety screening.
NRA officials will continue with their equipment screening even after the nuclear fuel is moved into the reactor. The screening is expected to take another month or so and will include confirmation that water gauges in the reactor and equipment to inject coolant are functioning properly.
The NRA will also check Kyushu Electric Power's measures to deal with emergencies, including training exercises on how to respond to severe accidents.
If the screening process goes smoothly, Kyushu Electric Power could start up the No. 1 reactor by mid-August. Once the reactor resumes operations, NRA officials will conduct a final inspection before power generation can begin on a commercial basis by as early as mid-September.
The NRA approved the resumption of operations at the Sendai plant in September 2014, the first nuclear plant to receive such approval.
Kyushu Electric Power is also seeking to resume operations at the No. 2 reactor by mid-October at the earliest.

Fuel is loaded into Kagoshima reactor as first restart nears

http://www.japantimes.co.jp/news/2015/07/07/national/fuel-loaded-kagoshima-reactor-first-restart-nears/#.VZzvDvnwmid

by Eric Johnston
Staff Writer
OSAKA – Kyushu Electric Power Co. on Tuesday afternoon began loading fuel into the No. 1 reactor at its Sendai power station in preparation for a restart in mid-August, the first under safety standards adopted in response to the Fukushima crisis.

The 890,000-kilowatt unit in the city of Satsumasendai, on the west coast of Kagoshima Prefecture, will also be the first to be brought back on line since 2012.
But local concerns remain about the possibility of damage due to volcanic activity and how people living within 30 km of the two-reactor plant would be evacuated if a disaster hits.

A spokeswoman for Kyushu Electric said the fuel loading is a 24-hour operation and involves inserting into the reactor 157 fuel rod assemblies currently stored in an adjacent fuel pool. The first fuel was loaded early Tuesday afternoon, she said, and the last of the assemblies are expected to be inserted by Friday.
If there are no problems with loading the fuel and starting up the reactor, further safety checks of the electricity grid will be conducted. If given the all-clear, Kyushu Electric will begin selling nuclear-generated electricity by mid-September.
The Sendai No. 1 reactor passed the Nuclear Regulation Authority's safety standards last September, making it the first reactor since the March 11, 2011, quake and tsunami and three meltdowns at the Fukushima No. 1 plant to be cleared for restart under the new rules.
With the exception of Kansai Electric Power Co.'s Oi No. 3 and No. 4 reactors in Fukui Prefecture, which were online from July 2012 to September 2013, all of Japan's commercial reactors have been offline since the disaster.
The NRA has also cleared the Sendai No. 2 reactor, which Kyushu Electric hopes to restart by mid-October. Since the stricter requirements for restarts went into effect in July 2013, operators have applied for safety inspections on 25 reactors at 15 plants nationwide.
The loading of the fuel into the Sendai No. 1 reactor came the same day as the government announced revisions to the basic disaster response plan that, it says, will improve communications and coordination between Tokyo and local entities if a natural and nuclear disaster occur at the same time.
But Ryoko Torihara, a resident of Satsumasendai and a long-term anti-nuclear activist, said that the NRA, Kyushu Electric and local officials are rushing to a restart without a thorough analysis of the risk of volcanic damage and with questions remaining about evacuation plans.
"It's quite strange the NRA did not have any volcanic experts on its committee when it accepted the word of Kyushu Electric that the possibility of a gigantic volcanic eruption, called a caldera eruption, was extremely small," she said. In addition, evacuation plans for those within 30 km of the plant are vague. There are questions about how to assist the infirm, or even whether there would be enough bus drivers to help get people out, she said.

July 7, 2015

Nuclear fuel loading begins at Sendai plant

http://www3.nhk.or.jp/nhkworld/english/news/20150707_22.html

Jul. 7, 2015 - Updated 09:24 UTC+2
Work has begun to load nuclear fuel into a reactor at the Sendai nuclear power plant in Kagoshima prefecture. The procedure will prepare it to restart, after becoming the first to meet new Japanese government requirements following the 2011 Fukushima accident.

Kyushu Electric Power Company plans to load 157 nuclear fuel assemblies into the Number 1 reactor over 4 days starting from Tuesday.

Cranes and other equipment are being used to transfer them one by one from a storage pool in an adjacent building. The utility says it will rotate workers so the operation can continue around the clock.

Kyushu Electric halted the operation of the Number 1 reactor 2 months after the 2011 disaster. All of its fuel was removed by the end of January 2013.

Preparations to restart the Number 1 reactor are in the final stages. The operator plans to hold accident-response drills and inspect emergency facilities before restarting the reactor in mid-August.

Fuel loading completed

July 9, 2015

Nuclear fuel loaded into Sendai reactor

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jul. 9, 2015 - Updated 23:50 UTC+2
Workers at the Sendai nuclear power plant in western Japan have finished loading fuel into a reactor. Now the preparation work will enter the final stage for the operator to reactivate the reactor in mid-August.

Kyushu Electric Power Company said workers finished putting 157 nuclear fuel rod bundles into the Number 1 reactor of the plant in Kagoshima Prefecture shortly after midnight on Friday. The company started the work on Tuesday.

Company engineers will check whether the units are in proper position on Friday.

The operator plans to hold accident-response drills and inspect emergency facilities before restarting the reactor.

Kyushu Electric halted operation of the Number 1 reactor of the plant 2 months after the 2011 Fukushima Daiichi accident. All of its fuel was removed by the end of January 2013.

Last year, the plant cleared new regulations introduced following the 2011 disaster. It was the first nuclear facility in Japan to do so.

NRA will remain careful

July 9, 2015

Nuclear regulators to continue careful screening

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jul. 9, 2015 - Updated 03:27 UTC+2
The head of Japan's Nuclear Regulation Authority says regulators will continue to be careful in screening reactors for restart even though the process may be slow.

Shunichi Tanaka spoke at a news conference on Wednesday, the second anniversary of the implementation of new regulations for nuclear plants. The stricter rules were introduced after the 2011 Fukushima Daiichi accident.

Not a single reactor has been put back online in the past 2 years, including those at Sendai nuclear plant in southern Japan, which were the first to pass the screening.

Tanaka said the authority is looking at 25 reactors at 15 plants. He said the process is taking time, but that their job is not easy.

Tanaka said some people seem unable to wait, but rushing means ignoring safety and returning to the past.
He suggested the authority will remain careful, while improving its efficiency.

Some experts have pointed out there are no scientific grounds for limiting a nuclear plant's operation to 40 years in principle.

Tanaka defended the life-span limit, saying the United States and France also conduct very strict screening over whether to allow operation over 40 years. He said he does not have enough knowledge to say whether or not 40 years is scientifically valid and if a change to that rule is required.

Nuclear Watch: Loading for Restart

Loading for Nuclear Restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclearwatch/20150707.html

Moves are underway towards a restart at a nuclear power plant in southwest Japan. Workers at Kyushu Electric Power Company's Sendai plant have been loading fuel into one of its reactors. The plant will be the first to restart since the government introduced new regulations after the 2011 Fukushima disaster. Utility officials say workers are using cranes to transfer more than 150 fuel-rod units into the plant's Number 1 reactor, which has been without fuel for about 2 1 / 2 years. The fuel is being stored in a pool next to the building that houses the reactor.

Workers will spend four days transferring the individual units, on a shift rotation so the operation can continue around the clock. The fuel will be kept underwater to contain radiation.

Utility officials plan to restart the reactor following safety checks in about a month.

"The government plans to push forward with restarting nuclear plants that have satisfied the new guidelines in screenings by the Nuclear Regulation Authority. My feeling is that we've finally come this far toward the first restart under the new restrictions," says Japanese Industry Minister Yoichi Miyazawa.

The Sendai plant is the first to meet the government's new requirements. All of Japan's nuclear reactors are currently offline.

The developments at the Sendai plant have drawn opposition from residents and anti-nuclear activists. A group of protesters gathered outside the plant to voice opposition.

About 100 demonstrators took part in the rally. Some of them held signs that warned the fuel-loading is the first step toward an accident. One participant says what occurred in Fukushima could be repeated at the Sendai plant. "We can't just put aside the intense anger we feel. We urge the utility to stop the work immediately and give up on the restart," says anti-nuclear activist Ryoko Torihara.

The protesters criticized officials at Kyushu Electric for being callous. They accuse the utility of ignoring the public's desire for a nuclear-free society.

Almost half the fuel already loaded at Sendai No.1

July 9, 2015

Nuclear fuel loading process at Kyushu reactor nears halfway point

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201507090043

By JUNICHIRO NAGASAKI/ Staff Writer

SATSUMA-SENDAI, Kagoshima Prefecture--Workers at the Sendai nuclear power plant here have loaded nearly half of the nuclear fuel into a reactor that is expected to resume operations in mid-August.

The process to install 157 bundles of nuclear fuel rods into the plant's No. 1 reactor started at 1:39 p.m. on July 7. The plant operator, Kyushu Electric Power Co., said 61 bundles, or nearly 40 percent of total, had been loaded as of 4 p.m. on July 8.

"It is a focal step in our effort to restart the reactor, and we are determined to proceed gradually and carefully with the operation," said Satoru Kojo, director of the plant's general management office.

The utility plans to complete the operation by July 10. If the reactor passes final safety screenings, it will be the first to resume operations under stricter safety regulations that were introduced following the Fukushima nuclear disaster in March 2011.

About 50 workers are engaged in the round-the-clock operation.

Around 2:30 p.m. on July 8, workers using a crane meticulously inserted the 57th bundle of fuel rods into the reactor vessel. Media reporters were allowed to observe the process, which took place underwater to contain radiation from the rods.

The bundles are 4.1 meters tall, 21 centimeters wide on each side, and weigh 700 kilograms. They each hold 264 fuel rods.

Kyushu Electric also showed the operation to move the bundles one by one from a storage pool in a building adjoining to the No. 1 reactor building.

The fuel was hoisted by another crane, inserted in a rod-shaped container and transferred to the reactor building through a tube, which was also placed under water. The alignment of the bundles for the reactor is predetermined, so each batch is identified with letters based on their layout in the storage pool.

The distance between the storage pool and reactor is about 50 meters. It takes workers about 20 minutes to install a single batch.

The Nuclear Regulation Authority, the country's nuclear watchdog, is conducting the remaining stages of facility inspections to determine if the reactor can be actually restarted. The safety checks will continue even after all the fuel is installed in the reactor.

If the NRA gives the green light, Kyushu Electric will remove the control rods from the reactor in mid-August to restart the plant.

Safety clearance for Ikata no.3 reactor

July 15, 2015

Ikata No. 3 reactor clears another hurdle toward restart

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507150065

By MASANOBU HIGASHIYAMA/ Staff Writer

An idled reactor operated by Shikoku Electric Power Co. moved closer to restarting July 15 after the Nuclear Regulation Authority gave its blessing to safety measures implemented by the utility.
Although it has cleared a key hurdle in line with stricter safety standards introduced in the aftermath of the 2011 Fukushima nuclear disaster, Shikoku Electric Power will still have to pass equipment screening for its No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture and gain the consent of local government leaders.
Operations could resume as early as this coming winter.
This marks the third time the NRA has given its approval to new safety measures at nuclear plants. The other instances involved the No. 1 and No. 2 reactors at the Sendai nuclear power plant in Kagoshima Prefecture operated by Kyushu Electric Power Co. and the No. 3 and No. 4 reactors at the Takahama nuclear power plant in Fukui Prefecture operated by Kansai Electric Power Co.
The NRA compiled a draft report on its safety screening at the Ikata reactor in May and received 3,464 public comments that led to revisions in the wording of the report.
The No. 3 reactor uses plutonium-thermal power generation, in which mixed-oxide fuel consisting of plutonium and uranium is used.
One of the largest fault lines in Japan passes close by the plant site. The NRA called on Shikoku Electric Power to raise its estimated intensity of a possible earthquake striking the area during the safety screening because of the proximity of the fault line.
That led, in turn, to the need for a greater number of facilities on the plant site to deal with accidents as well as anti-quake measures for the piping used in the reactor.
The work to implement such measures is expected to take until this autumn.
The NRA will now screen the detailed design of equipment as well as operating procedures.
Neither Ehime Governor Tokihiro Nakamura nor Ikata Mayor Kazuhiko Yamashita have come out with a clear stance on a resumption of operations at the No. 3 reactor.

July 15, 2015

Ikata reactor in Ehime wins safety approval as nation's nuclear plants inch closer to restarts

http://www.japantimes.co.jp/news/2015/07/15/national/ikata-reactor-ehime-wins-safety-approval-nations-nuclear-plants-inch-closer-restarts/#.VaYSzPnwmid

Kyodo
A reactor at an idled nuclear plant owned by Shikoku Electric Power Co. in Ehime Prefecture obtained safety clearance from regulators Wednesday, moving it a step closer to restarting as the government seeks to revive atomic power plants halted in the wake of the 2011 Fukushima crisis.
With the Nuclear Regulation Authority approving Shikoku Electric's boosted safety measures against possible earthquake and tsunami hazards, the No. 3 unit at the Ikata power station has joined a total of

four reactors at two other plants in obtaining safety approval based on more rigorous rules adopted after the triple meltdown at the Fukushima No. 1 nuclear power plant.
However, it remains uncertain when the unit will be able to go back online as Shikoku Electric must still obtain the go-ahead from local municipalities and complete the remaining procedures for the NRA safety review before being allowed to resume operations.
Some residents near the plant have voiced concerns that an evacuation plan created by local authorities is not comprehensive enough. As the Ikata complex is located at the base of a very narrow Sada Misaki Peninsula, critics have warned that people living to the west of the plant may be left without an overland escape route in the event of a serious accident.
At the regulator's behest, Shikoku Electric set tougher quake-resistance safety criteria for the Ikata plant's facilities and invested heavily in enhancing safety measures, including the construction of a new, quake-proof emergency response facility.
The utility projects that its earnings will improve by around ¥5 billion per month if the 890-megawatt No. 3 unit is reactivated and fossil power generation is reduced.
Japan is preparing for restarting a reactor at Kyushu Electric Power Co.'s Sendai plant as early as mid-August, which will mark the first resumption of a nuclear facility under the more stringent regulations introduced after Fukushima, the world's worst nuclear disaster since Chernobyl in 1986. It has been nearly two years since any of the nation's commercial reactors were last online.
Last September, two reactors at the Sendai plant became the first to obtain safety approval from the regulator, followed by two more reactors at Kansai Electric Power Co.'s Takahama plant last February.
A total of 25 reactors at 15 plants await safety screening by the watchdog before the resumption of operations can be considered.

Nuclear plant in western Japan gets safety OK, edges nearer restart

TOKYO (Kyodo) -- An idled nuclear plant owned by Shikoku Electric Power Co. obtained safety clearance from regulators Wednesday, moving it a step closer to restarting as the government seeks to revive Japan's nuclear industry that has been at a standstill following the 2011 Fukushima crisis.
With the Nuclear Regulation Authority approving Shikoku Electric's enhanced safety measures against possible earthquake and tsunami hazards as well as other severe accidents, the No. 3 unit at the Ikata power station has joined a total of four reactors at two other plants in securing safety approval based on more rigorous regulations adopted after the Fukushima meltdowns.
Japan's Chief Cabinet Secretary Yoshihide Suga said at a regular press conference Wednesday the government will "proceed with the restart" of the Ikata reactor based on its basic energy policy that specifies atomic power as a key energy resource.
But it is uncertain when the unit, located in Ehime Prefecture in western Japan, will be able to go back online as Shikoku Electric still needs to obtain the go-ahead from local municipalities and complete remaining procedures for the NRA safety review before being allowed to resume operation.
Some residents living near the plant have voiced concerns that an evacuation plan compiled by local authorities is not comprehensive enough. As the Ikata complex is located at the base of a very narrow peninsula called Sadamisaki, critics have warned that people living to the west of the plant may be left without an overland escape route in the event of a serious accident.

Ehime Gov. Tokihiro Nakamura has not made clear his stance on restarting the plant.
Shikoku Electric projects that its earnings will improve by around 5 billion yen ($40.5 million) per month if the 890-megawatt No. 3 unit is reactivated and fossil fuel power generation is reduced. It hopes to restart the unit as soon as possible but industry observers say it may not happen this year.
At a meeting Wednesday morning, NRA Chairman Shunichi Tanaka instructed regulatory officials to continue their "rigorous review."
Shikoku Electric said in a statement it will "make utmost efforts" to ensure safety of the plant. The utility also plans to make house-to-house visits within a 20-kilometer radius of the nuclear complex to explain its safety measures to the residents.
At the regulator's behest, Shikoku Electric has set tougher quake-resistance safety criteria for the Ikata plant's facilities and invested heavily in enhancing safety measures, including the construction of a new, quake-proof emergency response facility.
Nevertheless, an antinuclear citizens' group based in Ehime criticized the move toward restarting, saying it plans to make an administrative appeal against the nuclear regulators' decision.
The regulators are "underestimating the scale of (possible) earthquakes" that could hit the plant, the group's member Tsukasa Wada said at a press conference in the city of Matsuyama.
Japan is preparing to restart a reactor at Kyushu Electric Power Co.'s Sendai plant as early as mid-August, which will mark the first resumption of a nuclear facility under the more stringent regulations introduced after Fukushima, the world's worst nuclear disaster since Chernobyl in 1986. It is nearly two years since any of Japan's commercial reactors were last online.
In September last year, two reactors at Kyushu Electric's Sendai plant became the first to obtain safety approval from the regulator, followed by two other reactors at Kansai Electric Power Co.'s Takahama plant in February.
A total of 25 reactors at 15 plants are awaiting safety screening by the regulator before resumption of operations can be considered.

Reactor restart in Ehime nearing approval

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jul. 15, 2015 - Updated 06:54 UTC+2
Japan's nuclear regulators have taken one step further in approving the restart of a nuclear reactor in Ehime Prefecture, western Japan.

They have accepted the plant operator's safety measures, saying they meet the government's new standards.

The Nuclear Regulation Authority unanimously accepted the measures at a regular meeting in Tokyo on Wednesday. This paves the way for Shikoku Electric Power Company to restart the No.3 reactor at its Ikata plant.

The NRA gave a preliminary assessment of the plant's safety in May, and then solicited public opinion.

Critics said the operator's assumption about the magnitude of a possible earthquake was too low, and that measures to prevent a hydrogen explosion were insufficient.

The regulators say they have confirmed that the utility has taken sufficient steps to manage these concerns.

NRA Chairman Shunichi Tanaka says stringent checks will remain in place before issuing final approval.

The No.3 reactor at the Ikata plant is one of 6 the NRA is assessing since the government tightened regulations two years ago.

The Ikata plant will be the third to gain approval to restart a reactor, following the Sendai plant in Kagoshima Prefecture and the Takahama plant in Fukui Prefecture.

Shikoku Electric must still win approval for the design of its equipment, and pass inspections. It also needs local government consent to restart the reactor.

Observers estimate a restart near the end of this year at the earliest.

Reservations about Ikata restart

July 16, 2015

Ehime governor and Ikata mayor cautious over restart of Ikata's No. 3 reactor

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201507160075

By MASANOBU HIGASHIYAMA/ Staff Writer

The governor of Ehime Prefecture and the mayor of Ikata remain cautious of the Nuclear Regulation Authority's decision on July 15 to approve newly installed safety measures at the No. 3 reactor at the nuclear plant here.

"We're only at the stage where a technical decision that says the plant meets the new standards was made," Ehime Governor Tokihiro Nakamura told reporters after the decision was announced. "We cannot yet debate the wisdom of restarting the plant when the central government hasn't even requested the resumption of operations."

For his part, Ikata Mayor Kazuhiko Yamashita issued a statement that said: "We understand the decision confirms the safety of the No. 3 reactor. We will make a judgment based on the opinions of the town assembly."

Neither of the leaders made specific statements regarding the local population's acceptance on reactivating the Ikata nuclear plant.

The stricter safety measures approved by the nuclear watchdog agency were implemented nationwide as a result of the 2011 nuclear disaster in Fukushima Prefecture.
The NRA has already determined the No. 1 and 2 reactors at the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, and the No. 3 and 4 reactors at the Takahama nuclear power plant in Takahama, Fukui Prefecture, are safe to restart.
Shikoku Electric Power Co., the operator of the Ikata nuclear power plant, originally submitted a request to restart the facility in July 2013.
A key safety concern at the plant is the Median Tectonic Line, one of the nation's most active faults, that passes near the facility. The new safety measures take into account the possibility that a more powerful earthquake could hit compared with previous calculations.
"We needed time, as we debated a range of fundamental issues, such as the assumption about earthquakes," said NRA chairman Shinichi Tanaka.
The nuclear watchdog will now review detailed construction plans for the plant and safety procedures that are to be carried out, including those to be implemented during emergencies.
The utility also plans to install quake-resistant pipes and make other adjustments to the plant by this fall.
It will likely take several months for the NRA to conduct its screening once the construction work is finished, which means the power plant would be ready to restart this winter, at the earliest.
Meanwhile, Ikata Genpatsu o Tomeru Kai (Association for putting a stop to the Ikata nuclear power plant) in Matsuyama, expressed strong concern in a news conference held the same day over the NRA's latest decision. The citizens group said it plans to file an objection based on the Administrative Appeal Law.
"Meeting the new standards does not guarantee the plant will be exempt from large-scale accidents," said an official with the group.

Shika plant and fault lines

July 18, 2015

NRA still antsy about fault lines under Shika nuclear plant

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507180040
By MASANOBU HIGASHIYAMA/ Staff Writer
An expert panel with the nation's nuclear watchdog remains unswerving in its assessment that fault lines running under the Shika nuclear power plant in Ishikawa Prefecture may well be active.
The position, stated in a draft report compiled July 17 that reflects an earlier finding, throws the prospect of restarting the facility's reactors into doubt.
The plant's operator, Hokuriku Electric Power Co., will have to decommission the No. 1 reactor at the plant if it is unable to overturn the finding by the expert panel of the Nuclear Regulation Authority.
The utility is set to dispute the veracity of the panel's analysis by citing "factual error" in the assessment.
Under new safety regulations for nuclear power plants introduced after the 2011 Fukushima nuclear disaster, no key facility or plant equipment--such as a reactor building or piping for cooling water--may be built on an active geological fault.
The report followed a tentative assessment the panel made in May. The panel comprises four outside specialists of geological faults and an NRA commissioner, Akira Ishiwatari.

The panel members will seek the advice of other experts before issuing an official report on the assessment of the fault at the Shika plant.
The fault in question, S-1, runs beneath the No. 1 reactor building.
The panel concluded it was impossible to rule out the possibility that the fault is active, citing evidence in the ground strata at the time of plant's construction.
Panel members also pointed out that other faults, S-2 and S-6, both of which run under the piping for cooling water used by the No. 1 and No. 2 reactors, may also be active.
However, they concluded that the impact of slippages of those faults on the equipment could be limited as the faults lie deep below the surface.
The NRA will also screen the No. 2 reactor, the other reactor at the Shika plant, to assess whether the facility can clear the new safety hurdles if Hokuriku Electric takes additional measures to reinforce the site.
A geological fault right beneath a key nuclear power facility could destroy the site simply because of slippage. A catastrophe would not necessarily be caused by the shaking of an earthquake.
Under the new regulations, an active fault is defined as one that has likely shifted during the past 120,000 to 130,000 years.
The Shika nuclear power plant is one of the nation's five commercial nuclear power plants that experts have looked into to assess if they have active faults.
The panel's conclusion marked the second time that an active fault has been suspected under a reactor building. **The same problem affects the Tsuruga nuclear power plant** operated by Japan Atomic Power Co.

Shika nuke plant reactor likely to be decommissioned due to possible active fault

http://mainichi.jp/english/english/newsselect/news/20150718p2a00m0na001000c.html
The No. 1 reactor at the Shika Nuclear Power Plant in Ishikawa Prefecture is likely to be decommissioned after a panel of experts concludes that a fault just below the unit may be active.
The panel, set up within the Nuclear Regulation Authority (NRA), is expected to compile a report on the No. 1 reactor after consulting with other experts before submitting it to the NRA.
At a news conference in Tokyo on July 17, Yutaka Kanai, president of Hokuriku Electric Power Co. that operates the nuclear plant, said, "We're confident that the fault isn't active."
In a draft of the report, the panel of experts states that the possibility cannot be ruled out that part of the 780-meter-long "S-1" fault, situated just below the No. 1 reactor building, moved 120,000 to 130,000 years ago or later. The conclusion is based on geological diagrams of the area's past strata as well as photos.
Hokuriku Electric insisted that the fault is not active based on volcanic ash in the stratum and other factors. However, the panel dismissed the utility's claim, saying it cannot be proven with the hard evidence available.
The panel has drawn a similar conclusion on a fault just beneath a key facility of the power station's No. 2 reactor. If large-scale reinforcement work needs to be done on the reactor, Hokuriku Electric's plan to reactivate the No. 2 unit will likely be severely delayed.

Could be August 10

July 25, 2015

Sendai nuclear plant to restart as early as Aug.10

Jul. 25, 2015 - Updated 09:35 UTC+2
http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The operator of the Sendai nuclear power plant in southern Japan submitted an application on Friday to the country's regulator to get final approval for putting one of its reactors online.

Kyushu Electric Power Company is hoping to turn on the reactor as early as August 10th.

The utility has completed the assembly of the reactor core after loading nearly 160 fuel rod assemblies into the plant's No.1 reactor in early July.

It has also finished checking a water level gauge system for the containment vessel and confirmed that it is working normally.

Kyushu Electric Power will also conduct a drill starting from Monday to train for a possible severe accident. The exercise is mandated by the government's new regulations to be performed before a reactor is restarted.

If no problems are found, the No. 1 reactor will go online as early as August 10th.

Last year the plant cleared the government's new regulations introduced after the accident at the Fukushima Daiichi plant. It was the first nuclear facility in Japan to do so.

August 10th

July 31, 2015

Utility hopes to reactivate reactor on August 10th

http://www3.nhk.or.jp/nhkworld/english/news/20150731_38.html
Jul. 31, 2015 - Updated 12:08 UTC+2
A nuclear power plant operator in southern Japan hopes to restart one of its reactors next month. It would be the first to operate under new regulations introduced after the Fukushima accident.

Kyushu Electric Power Company told the Nuclear Regulation Authority on Friday that it plans to reactivate the Number One reactor of the Sendai plant on August 10th at the earliest.

The company will carry out final checks on the reactor to make sure the containment vessel has no leaks and cooling equipment functions properly. Officials will also check procedures for reactivating the reactor.

The 2-reactor plant in Kagoshima Prefecture last year became the first nuclear power plant to meet the new regulations.

Kyushu Electric loaded fuel into the reactor earlier this month. Officials held an emergency drill this week, employing the scenario that a cooling system malfunction causes nuclear fuel to start melting down.

The government newly added this drill to a list of tests required to restart nuclear power plants.

The utility says when the reactor is once again operational, it will sustain a nuclear chain reaction in about 15 hours and start generating power in 3 days' time.

If everything goes as planned, the Sendai plant will become the first nuclear facility in the country to resume operations in almost 2 years.

40 tons of new spent fuel to store

August 3, 2015

Restart of Sendai reactors will result in 40 tons of spent fuel

http://www.japantimes.co.jp/news/2015/08/03/national/restart-of-sendai-reactors-will-result-in-40-tons-of-spent-fuel/#.Vb8ia_nwmos

JIJI
If the two idle reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture are reactivated as anticipated, the plant will have to store around 40 tons of new spent fuel.
gh the plant's storage capacity is unlikely to be filled in the near future, the amount will constantly increase until a final fuel disposal facility is built.
The Kagoshima Prefectural Government has nixed building the disposal facility in the prefecture.
To get back online, the two reactors need to each use 44 of their total 157 fuel assemblies, Kyushu Electric officials said.
Kyushu Electric Power hopes to restart one of the reactors, which have met the Nuclear Regulation Authority's new safety standards, by next Monday at the earliest, and the other in October.
According to the Natural Resources and Energy Agency, the plant's capacity for storing spent fuel is 1,290 tons. The restart of the reactors will push the amount in storage from 890 tons, or 69 percent of capacity, to 940 tons, or around 73 percent.
In related news Monday, Japan Nuclear Fuel Ltd. said radiation detectors have broken down at its spent fuel reprocessing plant in the village of Rokkasho, Aomori Prefecture.
According to JNFL and other sources, the two systems for detecting leaks of high-level radioactive liquid waste stopped after an alarm went off around 6:50 p.m. Sunday.
The plant, designed to extract uranium and plutonium from spent fuel, has yet to be completed. It is a key component of the national nuclear fuel cycle project.
Officials at JNFL, the operator of the plant, said they believe no leak has occurred because water levels of the liquid waste were unchanged.
The operator also found problems with pressure gauges at the plant around 8:30 p.m. Sunday.
JNFL is investigating the link between these troubles and lightning reported in nearby areas at that time.

The company aims to complete the plant next March. The facility is currently undergoing an NRA safety screening.

Sendai: Not all legal procedures completed

August 5, 2015

NRA approves long-term operating plan for Sendai nuclear plant

http://www.japantimes.co.jp/news/2015/08/05/national/nra-approves-long-term-operating-plan-sendai-nuclear-plant/#.VcH2OPnwmos

Kyodo
The Nuclear Regulation Authority on Wednesday approved Kyushu Electric Power Co.'s management plans, which are required to operate its reactor at the Sendai plant for more than 30 years.
The approval came days before the unit's planned restart under stricter safety requirements imposed following the 2011 Fukushima nuclear disaster.
The nuclear watchdog endorsed the steps even though Kyushu Electric has not completed all of the procedures, including evaluation of the quake-resistance of some aging instruments. That sparked criticism that the regulator rushed the approval before the reactor's resumption, which is expected as early as next Monday.
Japanese power companies that want to operate their nuclear plants for more than three decades are required to draw up long-term measures to ensure the safety of aging plant equipment. **The regulator decided to allow Kyushu Electric to put off completing the remaining steps for one year.**
The regulator said the long-term measures can be approved after the 31-year-old No. 1 unit at the plant goes back online. But anti-nuclear activists have intensified criticism of the planned resumption given that **not all of the procedures required by law have been completed.**
Last September, Kyushu Electric's Sendai plant became the first nuclear facility in Japan to meet new safety standards created in the wake of the Fukushima nuclear crisis, a process necessary before a reactor can go back online.
Safety reviews for the resumption of nuclear plants are conducted separately from those required for long-term operations.

Sendai restart delayed one day

August 5, 2015

Kyushu Electric delays scheduled nuclear reactor reactivation

http://mainichi.jp/english/english/newsselect/news/20150805p2a00m0na010000c.html

Kyushu Electric Power Co. has pushed back its scheduled reactivation of the Sendai Nuclear Power Plant's No. 1 reactor by one day to Aug. 11, as it prepares for pre-reactivation tests.
On Aug. 4, Kyushu Electric began raising the temperature and pressure in the reactor to close to its operational levels. On Aug. 10, it will measure the speed at which control rods enter the reactor. Depending on the results, reactivation could be further delayed.
About three days after restarting the reactor, the utility will begin producing and sending electricity from it, with an aim of resuming commercial operations in mid-September.
The utility will soon officially convey its decision to restart the reactor on Aug. 11 to the Nuclear Regulation Authority. The reactor hasn't been active for about four years. If it is restarted, it will become the first nuclear reactor in Japan to operate under new, post-Fukushima disaster regulations.
August 05, 2015 (Mainichi Japan)

Approved till 2024

August 5, 2015

NRA approves Sendai maintenance plan through 2024

http://www3.nhk.or.jp/nhkworld/english/news/20150805_32.html
Aug. 5, 2015 - Updated 20:26 UTC+2
Japan's nuclear regulators have approved a maintenance plan through 2024 for a reactor at the Sendai plant in Kagoshima Prefecture, southwestern Japan.

Sendai's No.1 reactor is set to be put back online this month. It has met new government requirements for nuclear plants introduced after the 2011 Fukushima disaster.

Japanese utilities are obliged to draw up long-term maintenance plans for reactors more than 30 years old. The maintenance plan is good until reactors reach 40, the government-set time limit for operation.

The Sendai No.1 reactor hit 31 in July.

The plant's operator, Kyushu Electric Power Company, has made a 9-year plan to evaluate and regularly check how the reactor and pump equipment are holding up. The utility says it will also increase number of items it will test.

The Nuclear Regulation Authority approved the plan on Wednesday.

The No.1 reactor is undergoing last-minute inspections for a restart as early as next week.

Kyushu Electric made a new list of items to be inspected at the Sendai plant after the regulators discovered some equipment was missing from the original check list.

Regulators discovered the omission during an inspection in June this year. They pointed out that this was a violation of maintenance rules. They reported on Wednesday the result of the June inspection.

But will Fukui court's injunction be respected?

August 6, 2015

Application filed for checking Takahama reactor

http://www3.nhk.or.jp/nhkworld/english/news/20150805_31.html
Aug. 5, 2015 - Updated 14:20 UTC+2
The operator of a nuclear power plant in central Japan has applied to have regulators conduct the final stage of checking of one of its reactors.

Kansai Electric Power Company hopes to restart the Number 3 reactor at the Takahama nuclear plant in Fukui Prefecture this year.

The utility's application on Wednesday came one day after the Nuclear Regulation Authority approved detailed plans of safety measures for the reactor's equipment.

The utility plans to place nuclear fuel in the reactor in mid-October to reactivate it early November. It also aims to resume power generation for commercial purposes in December.

The nuclear authority decided in February that the safety measures for the Number 3 and 4 reactors meet new government requirements for resuming operation.

But in April, a district court in Fukui issued a provisional injunction blocking the 2 reactors' restart.

Kansai Electric Power says it will arrange for the regulator to check the Number 3 reactor so that fuel can be placed inside it. **But it will not reactivate the reactor unless the injunction is repealed. If the injunction stays, the utility would also refrain from putting fuel into the reactor.**

The plant is the second in Japan to file such an application with the authority, following the Sendai plant in Kagoshima Prefecture, southwestern Japan.

Restart planned for Tuesday Aug. 11

August 8, 2015

Kyushu Electric eyes Tuesday restart for Sendai reactor

http://www.japantimes.co.jp/news/2015/08/08/national/kyushu-electric-eyes-tuesday-restart-sendai-reactor/#.VcXgu_nwmot
JIJI

Kyushu Electric Power Co. is planning to restart the No. 1 reactor at its Sendai nuclear plant in Kagoshima Prefecture as early as Tuesday, sources said Friday.
That would make it the first reactor to be brought back online since the country's new safety standards were introduced more than two years ago.
The last nuclear power reactor in operation in Japan was shuttered in September 2013. The new nuclear safety standards, introduced in July of that year, were compiled following the triple-meltdown crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant, which was damaged in the March 2011 earthquake and tsunami.
On Monday, Kyushu Electric will conduct a safety check of control rods that will be placed into the Sendai No. 1 reactor.
If no problems are found with the control rods, the utility, which serves Kyushu's southwestern region, will reactivate the reactor, the sources said.
The company had informed the Nuclear Regulation Authority it planned to restart the reactor on Monday or later.
The Sendai No. 1 reactor was shut down in May 2011, shortly after the quake and tsunami that devastated the Tohoku region.
Kyushu Electric filed for the NRA's safety screening of the reactor in July 2013 following the introduction of the new regulatory standards.
The No. 1 unit passed the screening in September 2014, becoming the first to receive the NRA's safety approval among reactors for which checks were sought.
Before the March 2011 disaster, nuclear energy accounted for 39 percent of all power generation at Kyushu Electric. The firm has two nuclear power plants — the Sendai plant and the Genkai plant in Saga Prefecture.
Following the suspension of the plants, Kyushu Electric, like other utilities, increased its thermal power generation.
But the company's fuel costs for thermal power generation ballooned, reaching ¥678.4 billion in fiscal 2014, which ended in March this year. That is up 2.4-fold from fiscal 2010's level. The huge costs have heavily weighed on its earnings.
The company is aiming to shore up its earnings by reactivating idled nuclear power reactors. Kyushu Electric expects that the restart of the Sendai No. 1 reactor will save the company about ¥7.5 billion a month.
August 7, 2015

Sendai reactor restart set for August 11th

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Aug. 7, 2015 - Updated 10:05 UTC+2
The operator of the Sendai nuclear power plant in southern Japan plans to restart one of its reactors next Tuesday. The facility would be the first to operate under regulations introduced after the Fukushima accident.

The plant's No.1 reactor is in the final stage of inspections by Japan's Nuclear Regulation Authority.

A final test of control rod movement is planned for Monday.

Kyushu Electric Power Company plans to restart the reactor the next day and achieve a sustained nuclear

chain reaction in about 12 hours. Power generation is expected to start in about 3 days.

The 2-reactor plant in Kagoshima Prefecture last year became the first nuclear power plant to meet the regulations.

The reactor was halted for regular inspections 2 months after the March 2011 nuclear accident.

The operator says it plans to exercise the utmost caution in restarting the reactor, as it has been offline for more than 4 years. The firm says it will watch for abnormalities in equipment used for the process.

The plant would be the first nuclear facility in Japan to resume operations in almost 2 years.

Level 2 problem at Sendai No.1

August 8, 2015

Cooling system pump at Sendai nuclear plant stopped due to faulty vibration meter

http://mainichi.jp/english/english/newsselect/news/20150808p2a00m0na007000c.html

SATSUMASENDAI, Kagoshima -- One of three cooling system water pumps at the Sendai Nuclear Power Plant's No. 1 reactor, now being prepared for reactivation, was halted after staff noticed an unusual vibration meter reading, Kyushu Electric Power Co. announced on Aug. 7.
According to Kyushu Electric, the pump is inside the No. 1 reactor's containment vessel, and the meter measures the vibration of the pump shaft. At 10:22 a.m. on Aug. 7, a worker in the central control room confirmed that the vibration meter was displaying a lower than usual value. At 6:30 p.m. workers stopped the pump, inspected it and found that the pump's vibration meter was defective. They replaced a part of the vibration meter.
The pump was started at full operation on Aug. 4, to raise the temperature and pressure of cooling water for the reactor. The utility says the incident will not affect its schedule for restarting the No. 1 reactor on Aug. 11.
Since July, Kyushu Electric is classifying problems that occur at the No. 1 reactor on a five-level scale from 0 to 4, and it has decided it will announce problems of level 2 or higher, which could impact the restart schedule. The pump trouble was the first such announcement, and was a level 2 problem.

Ready for restart?

August 10, 2015

Reactor in Kagoshima is readied for Tuesday restart

by Eric Johnston
Staff Writer

SATSUMASENDAI, Kagoshima Pref. – Kyushu Electric Power Co. said Monday it will restart the No. 1 reactor at its Sendai nuclear plant on Tuesday, marking the country's first long-term return to nuclear power since the Fukushima crisis.

The reactor, in Satsumasendai, Kagoshima Prefecture, will be the first to go live under new safety standards that were put in place in 2013. The standards were drawn up after the meltdowns at the Fukushima No. 1 power plant in March 2011.

The restart, strongly pushed by the pro-business administration of Prime Minister Shinzo Abe, will deal a tough blow to anti-nuclear activists and citizens who have been calling for abolition of all nuclear power plants.

Advocates of the restart include the prefectural government as well as residents of Satsumasendai who appreciate the impact of nuclear-power related subsidies on public works projects and the effect the plant has on local service industries.

Meanwhile, the Abe Cabinet risks losing popularity among voters. A poll by the Mainichi Shimbun on Saturday and Sunday found that 57 percent of people are opposed to reactivating the Sendai plant, while 30 percent support it. The survey polled 1,015 respondents nationwide.

Abe has maintained that utility companies, not the central government, should decide whether to restart reactors if the Nuclear Regulation Authority declares them safe under new inspection standards.

But at the same time his administration has been promoting the reactivation of suspended commercial reactors, citing the huge cost of importing fossil fuels for thermal power plants.

Tuesday's restart would come despite local worries that Kyushu Electric Power and local politicians and businesses have been pushing for it without addressing what would happen in the event of an emergency.

A protest rally in front of the plant Monday drew former Prime Minister Naoto Kan, who was in office at the time of the events of March 11, 2011.

With the exception of Kansai Electric Power Co.'s Oi No. 3 and 4 reactors in Fukui Prefecture, which were restarted in summer 2012 under the old safety measures and ran until early autumn 2013, all of Japan's 43 remaining operable nuclear reactors have been shut down since the Great East Japan Earthquake and tsunami, and subsequent meltdowns in Fukushima.

"Like Tepco and Fukushima at that time, Kyushu Electric will not take responsibility for evacuation in case of an emergency," Kan told the rally. "Under current laws, neither Tepco nor Kyushu Electric have responsibility to ensure the safety of residents."

Local governments hosting nuclear plants are required to draw up evacuation plans for those living within 30 km of the site.

But nuclear plants like Sendai are often located in isolated areas along a coast, where access roads are sometimes few and where many local residents are elderly and would require special care and assistance.

"The plans Kagoshima Prefecture has drawn up are unrealistic," said Katsuhiro Inoue, a member of the Satsumasendai Municipal Assembly from the Japan Communist Party.

"They assume the main access road closest to the plant will be usable in the event of accident, and they don't answer basic questions of how long it might take to move those who are elderly outside the 30-km radius of the plant, or what might happen to people who live more than 30 km away and try to evacuate," Inoue said.

In May 2014, the prefecture calculated how long it would take to evacuate the nearly 215,000 people who live in Satsumasendai and nine other towns within 30 km of the plant.
In the best case scenario, officials estimated it would take almost 10 hours to evacuate 90 percent of the population.
In the worst case, the prefecture concluded, it could take almost 29 hours.

Japan to restart 1st reactor under new rules since crisis

http://mainichi.jp/english/english/newsselect/news/20150810p2g00m0dm066000c.html

TOKYO (AP) -- A power plant operator said it will restart a reactor in southern Japan on Tuesday, the first restart under new safety requirements following the Fukushima disaster and a milestone for the nation's return to nuclear power.
Kyushu Electric Power Co. said Monday that it will restart the No. 1 reactor at its Sendai nuclear plant Tuesday morning.
The restart marks Japan's return to nuclear energy, breaking a four-and-half-year nuclear power impasse since the 2011 meltdowns at the Fukushima Dai-ichi nuclear power plant in northeastern Japan following the earthquake and tsunami.
The Nuclear Regulation Authority affirmed the safety of the reactor and another one at the Sendai plant in September under stricter safety rules imposed after the accident, the worst since the 1986 Chernobyl explosion. The plans call for the second reactor to be restarted in October.
The Sendai No. 1 reactor is scheduled to start generating power Friday and reach full capacity next month.
All of Japan's nearly 50 workable reactors have been offline for repairs or safety checks. Abe's government wants as many of them as possible to be put online to sustain the nation's economy, which now relies on imported energy.
"We believe it is important for our energy policy to push forward restarts of reactors that are deemed safe," Chief Cabinet Secretary Yoshihide Suga told reporters.
Under the basic energy plan adopted by the Cabinet last year to sustain nuclear power as a key energy supply for resource-poor Japan, the government earlier this year set a goal to have nuclear power meet more than 20 percent of the country's energy needs by 2030.
Despite the push by the government and utilities for nuclear restarts, a majority of Japanese are opposed to a return to nuclear energy. Residents near the Sendai plant are also wary of the restarts, citing potential dangers from active volcanos in the region.
On Monday, dozens of protesters rallied outside the Sendai plant in a last-ditch effort to stop the restart, shouting "We don't need nuclear plants."
Opponents of the restarts and nuclear experts are also concerned that evacuation plans, in case of a disaster, may not work well.
Experts also are concerned about possible glitches in a mothballed reactor that has not been used for more than four years.
With its nuclear fuel recycling program still stalled and plutonium stockpiles triggering international concerns, Japan is under pressure to use as much of the stockpiles as possible in its reactors.

U.S. Undersecretary of State for Arms Control and International Security Rose Gottemoeller told journalists in a teleconference that Japan should complete its pending fuel recycling program and burn plutonium as fuel called MOX at reactors.
"If there is going to be a plutonium program, reprocessing program, the flip side of it is that there has to be a very vigorous MOX program and that the MOX actually has to be burned in power plants," Gottemoeller said.
Japan has more than 40 tons of weapons-grade plutonium, enough to make 40 to 50 nuclear weapons. The question is whether Japan can restart as many as 18 reactors needed to burn enough plutonium, and whether the problem-plagued Rokkasho reprocessing plant in northern Japan starts up.

Sendai reactor to restart on Tuesday

http://www3.nhk.or.jp/nhkworld/english/news/20150810_80.html

Aug. 10, 2015 - Updated 10:13 UTC+2
The operator of the Sendai nuclear power plant in southwestern Japan will restart one of its reactors on Tuesday morning.

The 2-reactor plant in Kagoshima Prefecture would be the first to operate under new regulations introduced after the Fukushima Daiichi accident in 2011.

Kyushu Electric Power Company on Monday reported to Japan's Nuclear Regulation Authority that it plans to begin removing control rods at 10:30 AM on Tuesday to activate the No.1 reactor.

The utility says it will achieve a sustained nuclear chain reaction in about 12-and-a-half hours. Power generation is expected to start in about 3 days.
Kyushu Electric plans to gradually increase the output of the reactor and start commercial operation in early September.

The operator also says it will carefully watch for abnormalities in equipment used for the process, as the facility has been offline for more than 4 years.

The No.1 reactor has undergone inspections required for the resumption since March.

The Sendai plant would be the first nuclear facility in the country to resume operations in almost 2 years.

Kyushu Electric on Monday issued a statement saying the company will place the highest priority on safety. They will thoroughly comply with government inspections in order to take careful steps in the restarting process.

Civic group members have organized a protest rally in front of the Sendai nuclear plant due to restart on Tuesday.

The group says 350 people from across the country gathered near the facility in southern Japan on Monday.

The head of the group, Mukohara Yoshitaka, said they will not tolerate the plant's restart by Kyushu Electric Power Company. He called on protesters to make their opposition heard.

Locals together with a resident from Fukushima pointed out that there are still people evacuated from their homes in Fukushima where the Daiichi plant failed. They said the Sendai plant restart may result in the same tragedy.

Participants chanted their slogan, “Stop the restart".

A participant said she cannot allow the restart as the plant operator has not sufficiently discussed safety issues with residents.

The group says their members will meet in front of the plant again on Tuesday.

On nukes again: First time in almost 2 years

August 11, 2015

Sendai nuclear plant restarted

http://www3.nhk.or.jp/nhkworld/english/news/20150811_17.html

Aug. 11, 2015 - Updated 04:09 UTC+2
A nuclear reactor has been restarted in Japan for the first time in nearly 2 years.

The No.1 reactor at the Sendai nuclear plant in southwestern Japan is the first to go back online under new regulations introduced after the 2011 Fukushima nuclear accident.

On Tuesday morning, workers at the plant's central control room operated a lever to pull out the reactor's 32 control rods. Plant operator Kyushu Electric Power Company says there's been no trouble so far.

If all goes well, the reactor is due to achieve a sustained nuclear chain reaction in about 12-and-a-half hours and begin generating power on Friday. After gradually raising output, Kyushu Electric plans to begin commercial operations in early September.

The utility says it will watch carefully for any abnormalities in equipment operation, as the reactor has been kept offline for more than 4 years.

The 2-reactor Sendai plant in Kagoshima Prefecture last year cleared the new, rigorous regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant. It completed all necessary inspections on Monday.

The reactor is the first to go online since September 2013, when the Ohi nuclear plant in central Japan halted operations.

The Guardian on Sendai restart

Japan restarts first nuclear reactor since Fukushima disaster

Sendai nuclear plant in southern Japan is first to begin operation since 2011 Fukushima meltdowns, despite anti-nuclear protests
Justin McCurry in Tokyo
Tuesday 11 August 2015 09.40 BST Last modified on Tuesday 11 August 2015 11.44 BST
Kyushu Electric Power, the operator of the Sendai plant, said it had restarted one of the facility's two reactors on Tuesday morning, in defiance of strong local opposition.
The move marks the first time Japan has generated nuclear power since a post-Fukushima shutdown of all its 44 operable reactors two years ago.
While police scuffled with demonstrators outside the plant, public broadcaster NHK showed workers in the control room as the reactor whirred into action for the first time since it was mothballed in May 2011.
Kyushu Electric said the restart had gone without a hitch. The 30-year-old Sendai No 1 reactor is expected to reach full capacity next month. The second Sendai reactor is due to restart in October.
In an attempt to keep Japan's fledgling economic recovery on track, the prime minister, Shinzo Abe, has pushed for a return to nuclear power generation in spite of opinion polls showing that most voters oppose restarts.

Backed by business and industry lobby groups, Abe has warned that Japan cannot afford to continue importing huge quantities of oil and natural gas, while the growing reliance on thermal power generation has stalled Japan's efforts to reduce greenhouse gas emissions.
"There are very strong vested interests to reopen nuclear reactors. Accepting them as permanently closed would have financial implications that would be hard to manage," Tomas Kaberger, chairman of the Japan Renewable Energy Foundation, told Associated Press.
Japan's powerful pro-nuclear lobby is hoping a safe restart at Sendai, about 1,000km south of Tokyo, will help the public overcome the trauma caused by the Fukushima meltdown.
The March 2011 disaster, triggered by a powerful earthquake and tsunami, forced the evacuation of 160,000 people, many of whom might never return home.

“It is important to restart reactors one by one from the perspective of energy security, the economy and measures against global warming, but safety always comes first,” the industry minister, Yoichi Miyazawa, told reporters, adding that the government would “deal responsibly” should another accident occur.
Just ahead of the restart, Abe said Sendai’s reactors had passed “the world’s toughest safety screening”. He added: “I would like Kyushu Electric to put safety first and take utmost precautions for the restart.”
The Sendai plant, where more than £64m has been spent on new safety systems, was the first to meet strict new standards introduced after the Fukushima disaster.
Japan’s revamped Nuclear Regulation Authority (NRA) said the new safety checks meant there would be no repeat of the Fukushima catastrophe. “A disaster like that at … Fukushima Daiichi nuclear plant will not occur,” NRA chairman Shunichi Tanaka said in a recent interview with the Nikkei business paper. He conceded, though, that there was “no such thing as absolute safety”.
The government wants nuclear power to account for as much as 22% of Japan’s energy needs by 2030, despite continuing troubles at Fukushima Daiichi, where the removal of melted fuel from damaged reactors is not due to begin until 2022. Decommissioning the wrecked plant is expected to take 40 years.
Greenpeace said the restart “will not reverse the terminal decline” of Japan’s nuclear industry. “Even though one nuclear reactor has restarted, the nuclear industry is still fighting for its very survival in Japan,” said Mamoru Sekiguchi, energy campaigner at Greenpeace Japan.
Sekiguchi echoed local concerns that authorities in Sendai had not devised a comprehensive evacuation plan for more than 200,000 people living within a 30km radius.
Aside from the risk from earthquakes and tsunami, the Sendai plant is located in a volcanically vulnerable region, with Sakurajima, one of Japan’s most active volcanoes, just 50km away.
“The lengths to which safety issues have been ignored in the Nuclear Regulation Authority’s review process for the Sendai plant restart shows just how desperate the nuclear industry and their government allies are,” Sekiguchi said. “Rather than a nuclear renaissance, much of Japan’s ageing nuclear reactor fleet will never restart. Prime minister Abe and the nuclear regulator are risking Japan’s safety for an energy source that will likely fail to provide the electricity the nation will need in the years ahead.”
Greenpeace predicts nuclear will provide 2%-8% of Japan’s electricity generation by 2013, far lower than the government’s target.
Tobias Harris, a Japan analyst at Teneo Intelligence in Washington, said it was unlikely that Tuesday’s restart would herald a quick return to nuclear as a major source of energy.
“The Sendai restart is unlikely to trigger a cascade of restarts that significantly reduces Japan’s post-2011 dependence on imported fossil fuels,” he said. “Each nuclear power plant faces a unique set of technical, operational, legal, and political challenges, suggesting that the delays that have dogged the first restart will be seen at other locations.”
Japan’s nuclear operators have applied for approval to restart 25 reactors: so far regulators have cleared only five to go back online.

Protests haven't stopped restart

August 11, 2015

Amid protests, Kyushu Electric restarts Sendai nuclear plant in Kagoshima

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201508110066

THE ASAHI SHIMBUN

SATSUMA-SENDAI, Kagoshima Prefecture--Kyushu Electric Power Co. activated the No. 1 reactor of the Sendai nuclear power plant here on Aug. 11, the first to be restarted in Japan under new safety regulations instituted after the Fukushima nuclear disaster.

The reactor is the first of 43 across the nation to be brought back online, ending a period with no nuclear power, which lasted for a year and 11 months.

As anti-nuclear protesters rallied around the Sendai plant, located in Satsuma-Sendai city, work to restart the No. 1 reactor began in the central control room at 10:30 a.m. on Aug. 11.

Kyushu Electric workers pulled a lever to remove the control rods that had curbed nuclear fission in the reactor.

The 32 control rods began to withdraw, reactivating the reactor.

The reactor is expected to reach criticality, in which nuclear fission is self-sustaining, at around 11 p.m. on Aug. 11. Steam produced from the heat generated by the nuclear fission will drive a turbine to produce electricity.

The generation and transmission of electricity is expected to begin on Aug. 14. The output will be raised gradually, reaching full power generation in late August and shifting to a commercial operation in early September.

In a statement, Kyushu Electric Power President Michiaki Uriu said, “The activation of the nuclear reactor is one of the important steps in the process for restart. We will continue to deal sincerely with the government’s inspections and proceed with the subsequent process by putting a top priority on safety.”

In September 2014, the Sendai nuclear power plant passed the new safety regulations for the first time in the nation. In March this year, the Nuclear Regulation Authority started the inspection process that is required before a nuclear reactor can be reactivated. In July, nuclear fuel was brought into the reactor.

As operations of the reactor had been suspended for about four years, Kyushu Electric proceeded cautiously with the preparations.

All nuclear reactors in Japan were taken offline soon after the March 2011 Great East Japan Earthquake and tsunami triggered three meltdowns at the Fukushima No. 1 nuclear power plant. Though Kansai Electric Power Co. temporarily operated the No. 3 and No. 4 reactors of its Oi nuclear power plant in Fukui Prefecture to deal with an electricity shortage, it suspended operations again in September 2013.

The electric power industry is pushing for the restart of idled nuclear reactors. The Abe administration also regards nuclear power as vital to the nation's power needs.

Kyushu Electric plans to restart the No. 2 reactor at its Sendai nuclear power plant in mid-October.

Preparations for a restart are progressing at the No. 3 and the No. 4 reactors of Kansai Electric’s Takahama nuclear power plant in Fukui Prefecture and the No. 3 reactor of Shikoku Electric Power Co.’s Ikata nuclear power plant in Ehime Prefecture.

One stumbling block for the Takahama plant is a temporary injunction the Fukui District Court issued in April this year to prohibit the restart.

Meanwhile, anxieties remain among residents living near nuclear power plants over insufficient emergency measures in the event of a nuclear accident. For example, the formulation of evacuation plans has been delayed for some medical and welfare facilities that house many elderly people.

In the Kyushu region where the Sendai nuclear power plant is situated, volcanic activity poses a threat. Therefore, some opponents argue that it is necessary for nuclear power plants to take safety measures against major eruptions.
The spread of summer power-saving campaigns and solar power generation have reduced concerns over electricity shortages even when no nuclear reactors are operating. A stable electricity supply is continuing across the nation even amid a serious heat wave.
Opposition to the restart of nuclear plants remains strong among the public.

Who's next?

August 12, 2015

Next reactor to be reactivated following Sendai restart remains unknown

http://mainichi.jp/english/english/newsselect/news/20150812p2a00m0na011000c.html

After the No. 1 reactor at the Sendai Nuclear Power Plant in Kagoshima Prefecture was reactivated on Aug. 11, attention is being focused on which reactor will be brought back online next.
The No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama Nuclear Power Plant in Fukui Prefecture and the No. 3 reactor at Shikoku Electric Power Co.'s Ikata Nuclear Power Plant are deemed viable candidates for reactivation as they have already cleared safety screenings. But it is difficult to predict when they will be reactivated because the two nuclear plants face some challenges.
Of a total of 46 reactors at 17 nuclear plants in Japan, including three reactors that have been under construction, applications for the Nuclear Regulation Authority's safety screenings have been filed for 25 reactors at 15 nuclear plants. Of those reactors under application for safety screenings, 10 reactors at eight nuclear power plants are boiling water reactors (BWRs) -- the same type as that of the crippled reactors at the Fukushima No. 1 Nuclear Power Plant -- and 15 other reactors at seven nuclear plants are pressurized water reactors (PWRs) that are different from the Fukushima reactors.
The No. 3 and No. 4 reactors at the Takahama Nuclear Power Plant and the No. 3 reactor at the Ikata Nuclear Power Plant, all of which have passed the NRA's safety screenings, are PWRs -- the same type as that of the reactors at the Sendai Nuclear Power Plant. The reactors at the two nuclear plants are closest to reactivation, but the Takahama reactors cannot be reactivated for the time being because the Fukui District Court handed down a provisional injunction against their reactivation. The reactor at the Ikata nuclear plant looks difficult to be reactivated by the end of this year as Ehime Gov. Tokihiro Nakamura said he had not decided whether to give the green light for its reactivation.
PWRs are not required to be equipped with filtered vent systems -- which are designed to curb the discharge of radioactive substances in the event of a severe accident -- for now because their containment vessels are larger in capacity than those of BWRs so that pressure cannot build up easily in the vessels. On the other hand, it takes longer to conduct safety screenings on BWRs that are not free of such requirements. The NRA plans to carry out safety screenings intensively on the No. 6 and 7 reactors that are of a new type at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture as a model case to make the screening process efficient. But it remains unclear when the NRA

will do so. It is also difficult to reactivate Hokuriku Electric Power Co.'s Shika Nuclear Power Plant in Ishikawa Prefecture because the NRA's experts suggested the possibility of active fault lines running under the premises of the nuclear complex.
The NRA, meanwhile, has set the lifespan of a reactor at 40 years as a general rule after starting to operate. Therefore, the earlier a reactor started its operation, the more difficult it becomes to conduct a safety screening. One of the reasons is that new standards require measures to make electric cables flame-retardant. Seven reactors, including those at the Takahama Nuclear Power Plant, use electric cables made of flammable materials. Therefore, unless fire prevention measures are taken for an electric cable of several hundred kilometers at each reactor, it cannot pass a safety screening.
The government plans to give the green light for reactivation of nuclear reactors that have passed "new regulatory standards," but NRA Chairman Shunichi Tanaka has said, "The requirements under the new standards are considerably high. Utility firms are struggling over screenings, but we can't make them easy."

Ready for full operation

Utility says no abnormalities in reactor restart

Aug. 12, 2015 - Updated 08:59 UTC+2
http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The operator of the Sendai nuclear plant in southwestern Japan is clearing the steps to start supplying power on a commercial basis next month.

Officials with the Kyushu Electric Power Company say they have found no abnormalities since restarting one of the plant's nuclear reactors this week.

The No.1 reactor at the plant in Kagoshima Prefecture resumed operation on Tuesday. It is the first reactor to be back online under new regulations following the Fukushima Daiichi nuclear accident in 2011.

The reactor achieved a sustained nuclear fission chain reaction during the night.

Plant workers were checking on Wednesday whether the control rods could effectively halt the reactor within a safe margin.

The utility will also be checking a device to stop the power generation turbines in an emergency.

If no problems are found, the company plans to start generating power on a trial basis on Friday. It will gradually increase output while continuing the checks.

The utility plans to resume commercial operation in September after clearing a final government inspection.

Company officials say they will move cautiously toward full operation, as the No.1 reactor has been offline for more than 4 years.

August 11, 2015

Reactor at Sendai plant reaches criticality

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Aug. 11, 2015 - Updated 17:07 UTC+2
A nuclear reactor has been restarted in Japan for the first time in nearly 2 years.

The No.1 reactor at the Sendai nuclear plant in Kagoshima Prefecture, southwestern Japan, is the first to go back online under the new regulations introduced after the 2011 Fukushima nuclear accident.

On Tuesday morning, workers in the plant's central control room operated a lever to pull out the reactor's 32 control rods.

The plant's operator, Kyushu Electric Power Company, says the reactor achieved a sustained nuclear chain reaction later on Tuesday and there's been no trouble so far.

If all goes well, the reactor is due to begin generating power on Friday. After gradually raising its output, Kyushu Electric plans to begin commercial operations in early September.

The utility says it will watch carefully for any abnormalities in the operation of the equipment, as the reactor has been kept offline for more than 4 years.

Last year, the 2 reactors at the Sendai plant cleared the new, rigorous regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant. The necessary inspections were completed on Monday.

The reactor is the first to go online since September 2013, when the Ohi nuclear plant in central Japan halted operations.

Turbines started

August 13, 2015

Turbines started at Sendai nuclear plant

Aug. 13, 2015 - Updated 13:14 UTC+2
http://www3.nhk.or.jp/nhkworld/english/news/20150813_29.html

The operator of the Sendai nuclear power plant in southwestern Japan has started power generation turbines for one of its reactors.

The Kyushu Electric Power Company restarted the No. 1 reactor at the plant in Kagoshima Prefecture on Tuesday. The reactor achieved a sustained nuclear fission chain reaction that night.

The reactor is the first to be back online under regulations set after the Fukushima Daiichi nuclear accident in 2011.

The company says steam generated by heat from the reactor started the turbines on Thursday afternoon.

The utility says the speed of the turbines' rotations has gradually increased and is expected to reach 1,800 revolutions per minute -- the rate for normal power generation -- on Thursday night.

The firm plans to check whether a device designed to stop the turbines in case of emergency will work properly.

If no problems are found, the utility plans to start generating power by connecting the turbines to electricity generators on Friday and gradually increase output while continuing checks.

The firm says no problems have occurred so far. It plans to resume commercial operation of the plant in early September after clearing a final government inspection.

Company officials say they will move cautiously toward full operation, as the reactor has been offline for more than 4 years.

Sendai to start generating electricity on Friday 14

August 13, 2015

Sendai nuclear reactor to produce power on Friday

Aug. 13, 2015 - Updated 22:06 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150814_07.html

The operator of the Sendai nuclear power plant in Kagoshima, southwestern Japan, says it will start generating electricity at its No.1 reactor on Friday.

Kyushu Electric Power has been checking the performance of the reactor's control rods and turbines after

it activated the reactor on Tuesday.

The reactor has been maintaining a sustained nuclear fission chain reaction since late that night.

The firm says it has found no problems with the reactor's facilities. It now plans to begin electricity production and transmission at around 9 AM on Friday.

This will be Japan's first power generation at a nuclear station since the Ohi plant in Fukui Prefecture went offline in September 2013.

Kyushu Electric suspended the reactor's operation 4 years and 3 months ago. That was 2 months after the 2011 nuclear accident at the Fukushima Daiichi plant.

The utility replaced some parts of the reactor while it was offline. It will carefully watch for any abnormalities in the reactor and gradually boost output.

The company plans to attain full output about 10 days after the start of power generation. It will then undergo the government's comprehensive inspection of the facility.

If no problem is found, the firm will launch commercial operation early next month.

First time in two years

August 14, 2015

Sendai plant begins producing electricity after nearly 2 years of nuke-free nation

THE ASAHI SHIMBUN
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201508140058
SATSUMA-SENDAI, Kagoshima Prefecture--Marking the end of 23 months of a nuclear power-free Japan, the Sendai nuclear power plant began generating and transmitting electricity on Aug. 14.
Kyushu Electric Power Co. activated the No. 1 reactor at the Sendai plant on Aug. 11, to become the first nuclear reactor brought back online under new safety regulations instituted by the Nuclear Regulation Authority after the 2011 Fukushima nuclear disaster. The nation had been without nuclear power since September 2013.
At 9 a.m. on Aug. 14, utility workers connected an electrical generator with power cables from the plant's central control room. The workers applauded when it was confirmed that the reactor began power generation and transmission for the first time in more than four years.
In a statement released the same day, Yoichi Miyazawa, the minister of trade and industry, said the start of generating and transmitting power at the plant "represents an important step forward to achieving a well-balanced energy mix and a more stable supply of electricity."

The output from the reactor was expected to reach 30 percent of its full capacity of 890,000 kilowatts on Aug. 14, and will be raised gradually to reach full power generation in about 10 days.
The reactor is expected to begin commercial operations in early September unless the NRA detects safety problems during its final inspection.
Michiaki Uriu, Kyushu Electric Power president, said in a statement that the company will continue its efforts to improve safety at the plant with "determination to prevent an accident similar to the one at the Fukushima No. 1 nuclear power plant from occurring."
"We will gradually increase the output while closely monitoring the condition of the plant," he said.
Kyushu Electric officials said the utility will proceed cautiously with operation of the No. 1 reactor as its operations had been suspended for a periodic inspection in May 2011.
It will be the first time that electricity generated at a nuclear plant will be supplied to households and businesses since the No. 4 reactor at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture went offline in September 2013.
Kyushu Electric, which relied on nuclear energy for about 40 percent of its power supply before the Fukushima disaster unfurled, plans to restart the No. 2 reactor at the Sendai plant in mid-October.
It has also applied for NRA safety screening to resume operations of the No. 3 and No. 4 reactors at its Genkai plant in Saga Prefecture.
Preparations for restarts are progressing at the No. 3 and No. 4 reactors of Kansai Electric's Takahama nuclear power plant in Fukui Prefecture and the No. 3 reactor of Shikoku Electric Power Co.'s Ikata nuclear power plant in Ehime Prefecture.
The restart of the Sendai plant is likely to give momentum to efforts by the electric power industry and Prime Minister Shinzo Abe's government to restart idle nuclear reactors nationwide.
But municipalities located near nuclear power plants have yet to map out effective evacuation plans for people in local medical and welfare facilities in the event of nuclear accidents.
A shortage of buses and other transportation modes to evacuate residents remains unsolved, while it also is unclear if utility companies can effectively shut down reactors when a Fukushima-level accident takes place at a nuclear plant.
Opinion polls have shown that more Japanese are opposed to the reactor restarts than those who support them.
(This article was written by Junichiro Nagasaki and Masahiro Yuchi.)

August 14, 2015

Restarted Kagoshima reactor churning out power after two-year hiatus

http://www.japantimes.co.jp/news/2015/08/14/national/restarted-kagoshima-reactor-churning-power-two-year-hiatus/#.VdHy1pfwmov

Kyodo, JIJI
KAGOSHIMA – Japan resumed using electricity generated by nuclear power Friday after a two-year hiatus, following the reactivation earlier this week of a reactor upgraded under tough new safety regulations.
The No. 1 reactor at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture began generating and delivering electricity in the utility's service area, despite persistent public concern over the use of nuclear power following the Fukushima disaster triggered by a huge earthquake and tsunami in March 2011.

The reactor, which came back online Tuesday for the first time since May 2011, will gradually increase output and is expected to run at full capacity in late August, according to the utility. The No. 1 reactor, which reached criticality, a self-sustained nuclear fission chain reaction, late Tuesday night, has an output capacity of 890,000 kilowatts and can meet the electricity demand from some 300,000 average households.

The resumption of nuclear electricity generation is “an important step forward” in securing more stable power supply, Economy, Trade and Industry Minister Yoichi Miyazawa said in a statement.

The nuclear crisis, the worst since the 1986 Chernobyl catastrophe, eventually resulted in the shutdown of all of Japan’s commercial reactors by September 2013, cutting off the country’s nuclear power supply. All 43 reactors apart from the Sendai unit remain offline.

The government is seeking to restart the remaining idled nuclear plants that have met what it claims are “the world’s toughest safety standards,” citing the necessity of stable power supply and lower electricity bills that have surged since the Fukushima nuclear crisis began.

With the majority of people opposing nuclear power, however, critics question the government’s rush to restart. So far, power shortages have been avoided thanks to fossil fuel-based power generation and energy-saving efforts.

Still, Kyushu Electric said the Sendai reactor’s reactivation will enable the company to supply electricity without power procurement from other utilities.

The utility expects its business, which has been hurt by the high cost of importing fuel, to improve drastically with the reactivation and return its balance sheet to the black for the first time in five years in the fiscal year to March 2016.

Last September, the two-reactor Sendai complex became the first nuclear facility to pass the Nuclear Regulation Authority’s safety screening based on the new regulations, a prerequisite for being allowed back online.

Kyushu Electric plans to restart the Sendai plant’s No. 2 reactor as early as October.

Separately, three reactors at two plants have also obtained the regulator’s safety clearance.

A reactor at Shikoku Electric Power Co.’s Ikata plant could come back online this winter at the earliest after obtaining local approval.

The outlook is uncertain for two reactors at Kansai Electric Power Co.’s Takahama plant after a court in April banned the utility from restarting the units, citing safety concerns.

NRA begins checks at Takahama plant

August 17, 2015

Pre-restart check for Takahama reactor begins

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 17, 2015 - Updated 12:42 UTC+2

Inspectors from Japan's nuclear regulator have begun checking a reactor at a nuclear plant facing the Sea of Japan to determine whether it can be restarted.

The Nuclear Regulation Authority began the final stage of inspections on the Number 3 reactor at the plant in Takahama Town in Fukui Prefecture on Monday.

The inspections are in line with tougher regulations introduced after the March 2011 Fukushima nuclear accident. The final inspections cover 400 pieces of equipment installed to improve safety and based on the new requirements. The equipment includes emergency pumps and power-generation vehicles.

The final inspections come after the authority announced in February that safety measures for the Number 3 and 4 reactors at the plant meet the new requirements for resuming operation.

The plant operator, Kansai Electric Power Company, hopes to restart the Number 3 reactor in early November. But in April, a district court in Fukui issued a provisional injunction blocking the restart of both reactors. The operator says it will not reactivate the reactor unless the injunction is repealed.

The plant is the second in Japan to undergo final inspections based on the new requirements. A reactor at the plant in Satsumasendai City in Kagoshima Prefecture, southwestern Japan, became the first to have the inspections earlier this year. It was brought back online last week.

No surprise

August 17, 2015

Industrial Groups Welcome Japan Reactor Restart

http://www.nucnet.org/all-the-news/2015/08/17/industrial-groups-welcome-japan-reactor-restart

Security & Safety
17 Aug (NucNet): The chairmen of three industrial groups in Japan have welcomed the restart of the Sendai-1 nuclear reactor unit, saying it will help the country's economy, the Japan Atomic Industrial Forum (Jaif) said.
Chairman Sadayuki Sakakibara of the Japan Business Federation Keidanren (JBF), Chairman Akio Mimura of the Japan Chamber of Commerce and Industry (JCCI) and Chairman Yoshimitsu Kobayashi of the Japan Association of Corporate Executives (JACE) issued statements after the Sendai-1 nuclear unit restarted on 10 August 2015.

Mr Sakakibara said nuclear power is an important energy source for Japan, "not only from the viewpoints of energy security and economy, but also as a measure to combat global warming".

Mr Mimura said the restart of the reactor will be very helpful to Japan's economy as a whole because rising power costs have become a burden to small- and medium-sized enterprises, as well as to the recovery of local economies. Mr Mimura emphasized that a stable supply of energy at a reasonable price

must be realised throughout Japan by all means.

The expertise accumulated during the examination procedures at Sendai-1 should be shared among Japan's power companies and nuclear power station operators in order to speed up the process for restarting other nuclear units, Mr Mimura also said.

Mr Kobayashi said constant efforts have to be made to improve safety at all nuclear power stations, including such systematic aspects as the issuance of highly practical evacuation plans, and the disclosure of accurate information to the public nationwide.

The government should also formulate realistic measures concerning high-level radioactive waste treatment and disposal, as well as the nuclear fuel cycle, so that the country's nuclear power business can be sustainable, Mr Kobayashi also said.

In May 2015, Japan's government said it will "take the initiative" in identifying scientifically suitable or promising candidate sites for a high-level radioactive waste (HLW) repository, moving away from its previous approach of relying on applications from municipalities.

The Japan Times said around 17,000 tonnes of spent fuel from nuclear plants across the country are stored in pools at the plants themselves and in a storage facility at the reprocessing plant in Rokkasho, Aomori prefecture.

In April 2014, Jaif president Takuya Hattori said fossil fuel plants have had to fill the gap left by nuclear energy when the country's nuclear units were shut down after the March 2011 earthquake, tsunami and the Fukushima Daiichi accident. For utilities, this meant having to buy more oil, coal and natural gas adding a cost of about ¥3.7 trillion (about €28.5 billion) for 2014.

Since the shutdown of nuclear reactors in Japan, utilities have increased rates by about 20 percent for household consumers and about 30 percent for industrial consumers, according to Jaif. This has resulted in energy-intensive industries wanting to move out of Japan to countries like South Korea.

On 10 August 2015, Sendai-1 became the first nuclear unit to restart in Japan after all units had been shut down for safety checks and upgrades following the Fukushima-Daiichi accident. The Sendai-1 unit received approval to restart in May 2015, completing the NRA's three-part screening process and new safety requirements introduced for all nuclear plants in June 2013.

Earlier this year Japan's Institute of Energy Economics said 11 nuclear units could be back online by the end of March 2016.

Equipment trouble at Sendai plant

August 21, 2015

Sendai nuclear plant postpones output increase

Nuclear & Energy
Aug. 21, 2015 - Updated 04:47 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The operator of the Sendai nuclear power plant in southwestern Japan says work to increase output at its reactor will be postponed due to equipment trouble.
It's the nation's sole online nuclear facility.

Kyushu Electric Power Company restarted the No.1 reactor at its plant in Kagoshima Prefecture on August 11th. It was the first reactor to go back online under new regulations set after the accident in Fukushima in 2011.

The company said on Friday that it will postpone work to increase output planned for the day due to a glitch in equipment that turns steam used to generate power back into water.

The company says the glitch has not affected the other operations of the facility. It says the reactor is continuing to generate and transmit power.

The operator had planned to gradually increase output and resume commercial operation in early September.

Increase of output delayed

August 21, 2015
Kyushu delays increasing output at Sendai nuclear plant after cooling system problems detected

http://www.japantimes.co.jp/news/2015/08/21/national/kyushu-delays-increasing-output-sendai-nuclear-plant-cooling-system-problems-detected/#.VdcIWJfwlLP

JIJI, Kyodo

KAGOSHIMA – Kyushu Electric Power Co. said Friday it will delay planned increases in electrical output from the No. 1 reactor at its Sendai nuclear power plant in Kagoshima Prefecture as seawater is believed to have entered into a reactor cooling system.
The company planned to bring the recently reactivated reactor up to full capacity on Tuesday. But this will now be delayed as it will take about a week to fix the problem, officials from the utility said.

A small amount of seawater is believed to have flowed into one of the three condensers in the reactor's secondary cooling system, the officials said. Condensers turn steam into water by cooling it, after the steam runs power generation turbines.
But there should be no problem in continuing the reactor's operations as the salt can be removed with the aid of desalination equipment, the officials added.
The level of electric conductivity, which is monitored to check water conditions, rose Thursday afternoon at an outlet of a condensate pump used to circulate secondary coolant water.
Kyushu Electric checked the water quality and confirmed an increase in salt content.
Each condenser has some 26,000 tubes inside that are used to pipe seawater around for cooling. Kyushu Electric suspects that holes have opened on such tubes, causing seawater to enter into the condenser.
The company will seal any tubes found to have holes, the officials said.
In Japan, similar problems have occurred about 50 times in the past, but the latest case was the first at the Sendai power plant. In the past, Kyushu Electric experienced two cases at the No. 1 reactor at its Genkai plant in Saga Prefecture in 1997 and 1999.
The output at the Sendai plant's No. 1 reactor, restarted on Aug. 11, reached 50 percent of capacity last Sunday and 75 percent on Wednesday. The company had planned to raise output to 95 percent Friday.
The reactor is the first in Japan to run under strict new safety standards introduced in July 2013 following the meltdown accident at Tokyo Electric Power Co.'s Fukushima No. 1 plant, which was wrecked in the March 2011 earthquake and tsunami.
The reactor's restart also brought to an end the total absence of active reactors in Japan that had become a feature since September 2013, when Kansai Electric Power Co.'s Oi plant in Fukui Prefecture suspended operations for routine safety checks.
Some nuclear experts have said reactors could face severe safety problems because they have been mothballed for such a long period of time.

Japan's Sendai reactor power ramp-up halted due to pump problem

Reuters – 21-08-2015

TOKYO (Reuters) - Japan's Kyushu Electric Power has halted the ramp-up of power output from its Sendai No. 1 nuclear reactor due to a problem with a pump in the plant's secondary cooling system, a spokesman said on Friday.
Kyushu Electric last week began the restart of the Sendai plant, the first of Japan's reactors to begin operation under new safety standards introduced in the wake of the Fukushima disaster in 2011.
Engineers and regulators have warned that the utility may encounter equipment problems and failures as the Sendai No. 1 reactor has been idled for more than four years.
The utility suspects that seawater has entered one of the pumps in the secondary cooling system, where steam that turns the turbines to produce electricity is cooled, according to the spokesman.
Kyushu Electric had planned to raise output from the reactor to 95 percent by Friday, but delayed the process.

It had planned to achieve full power by Aug. 25 and begin commercial operation in early September after a final check from the atomic regulator.
Prime Minister Shinzo Abe, a strong proponent of nuclear power, is seeking to reassure a nervous public that the industry is now safe.
Abe and much of Japanese industry want reactors to be switched on again to cut fuel bills, but opinion polls show a majority of the public oppose the move after the nuclear crisis triggered by the earthquake and tsunami four years ago.

Sendai: Increase of output delayed (3)

August 21, 2015

Sendai nuclear plant halts output increase

http://www3.nhk.or.jp/nhkworld/english/news/20150821_28.html

Aug. 21, 2015 - Updated 09:59 UTC+2

The operator of Japan's only activated nuclear power plant says it will delay ramping up power output due to reactor equipment trouble.

Kyushu Electric Power Company says an alarm went off on Thursday afternoon indicating trouble with a condenser at the No. 1 reactor of the Sendai power plant in Kagoshima Prefecture. The condenser turns steam from the power turbine back into water. Neither the steam nor the water is radioactive.

The utility says water in one of the reactor's 3 condensers had higher than normal salt concentrations.

Kyushu Electric officials say a small amount of seawater that is used for cooling steam appears to have entered the condenser, possibly through holes in the intake pipes.
They say the salt is being removed while one system within the condenser is halted for inspections. A condenser has 2 systems.

Kyushu Electric says the other condensers are working normally, and that power generation and transmission will continue.

The utility was due to raise power output from 75 percent to 95 percent on Friday, before achieving full capacity on August 25th. It now expects a delay of about one week.

The operator restarted the reactor on August 11th at the Sendai nuclear power plant.

It was the first reactor to go back online under new regulations introduced after the Fukushima nuclear accident in 2011.

Kyushu Electric reactor problem halts plan to increase output

http://mainichi.jp/english/english/newsselect/news/20150821p2g00m0dm075000c.html

TOKYO (Kyodo) -- Kyushu Electric Power Co. said Friday a nuclear reactor at its Sendai station that came back online last week has experienced problems, promoting the utility to stop increasing its output.
The Sendai No. 1 reactor, located in southwestern Japan, became the first unit on Tuesday last week to be reactivated under upgraded safety regulations adopted in the wake of the 2011 Fukushima meltdowns.
Kyushu Electric will push back its plan to run the reactor at full capacity from next Tuesday after beginning generating and delivering electricity last Friday.
According to the utility, an alarm went off at the plant on Thursday afternoon signaling a problem near the water pumps. Shinjiro Yuge, a senior official at Kyushu Electric's Tokyo branch, said seawater may have entered inside condensate pumps -- which circulate cooling water -- through a hole in one or more of the pipes running through equipment called a condenser.
The company will not halt the operation of the reactor itself, but it will conduct equipment checkups for about a week, Yuge said.
The Sendai No. 1 reactor had been offline since May 2011, when the unit was halted for mandatory regular checkups.
Some nuclear experts have said reactors could face severe safety problems after they have been mothballed for a long time.

Seawater leak at Sendai plant

August 21, 2015

Restarted reactor at Sendai nuke plant suffers seawater leak

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201508210063

August 21, 2015
By KANAME KAKUTA/ Staff Writer
A minor glitch occurred at the newly restarted No. 1 reactor of the Sendai nuclear power plant in Kagoshima Prefecture, Kyushu Electric Power Co. said on Aug. 21.
The malfunction forced the postponement of work for raising the output of the reactor, the utility said.
According to the plant operator, a tiny amount of seawater leaked into a condenser in the secondary cooling system of the reactor, which has an output of 890 megawatts, it said.
The utility said at 2:19 p.m. on Aug. 20, an alarm sounded to warn of an abnormality in the water flowing in the condenser, a device that converts steam used in power generation to water by cooling it.

After checking the equipment, Kyushu Electric said an extremely small amount of seawater mixed into the water flowing in the condenser.
The seawater normally flows in a narrow titanium tube adjacent to the condenser to help cool steam in the condenser unit. The utility suspects that a tiny hole in the titanium tube caused the seawater to leak.
Kyushu Electric said the seawater was removed with a desalination device and operations at the No. 1 reactor were not hindered. The utility will continue to operate the reactor to generate and transmit electricity.
The output of the No. 1 reactor was scheduled to be raised from 75 percent to 95 percent on Aug. 21. However, the output will be maintained at 75 percent so the utility can investigate the cause of the seawater leak in detail. The work will take about a week.
Likewise, full operations of the reactor that were scheduled to be made on Aug. 25 are also likely to be pushed back, Kyushu Electric said.
The No. 1 reactor at the Sendai plant in Satsuma-Sendai is the first reactor in Japan to be brought back online under new safety regulations imposed by the Nuclear Regulation Authority.

Sendai nuclear plant halts output increase

http://www3.nhk.or.jp/nhkworld/english/news/20150821_28.html

Aug. 21, 2015 - Updated 09:59 UTC+2

The operator of Japan's only activated nuclear power plant says it will delay ramping up power output due to reactor equipment trouble.

Kyushu Electric Power Company says an alarm went off on Thursday afternoon indicating trouble with a condenser at the No. 1 reactor of the Sendai power plant in Kagoshima Prefecture. The condenser turns steam from the power turbine back into water. Neither the steam nor the water is radioactive.

The utility says water in one of the reactor's 3 condensers had higher than normal salt concentrations.

Kyushu Electric officials say a small amount of seawater that is used for cooling steam appears to have entered the condenser, possibly through holes in the intake pipes.
They say the salt is being removed while one system within the condenser is halted for inspections. A condenser has 2 systems.

Kyushu Electric says the other condensers are working normally, and that power generation and transmission will continue.

The utility was due to raise power output from 75 percent to 95 percent on Friday, before achieving full capacity on August 25th. It now expects a delay of about one week.

The operator restarted the reactor on August 11th at the Sendai nuclear power plant.

It was the first reactor to go back online under new regulations introduced after the Fukushima nuclear accident in 2011.

Cracked pipes in one condenser

August 24, 2015

Seawater leak found at Sendai nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 24, 2015 - Updated 13:55 UTC+2
The operator of the Sendai nuclear power plant in Kagoshima Prefecture, southwestern Japan, says it found seawater used to cool steam has leaked from some pipes.

The trouble occurred at a condenser for the plant's No.1 reactor last Thursday. Officials at Kyushu Electric Power Company found elevated salt levels in the machine.

The condenser uses seawater to turn the steam from the power turbine back into water. The reactor has 3 condensers, and each one is equipped with 26,000 thin pipes to carry seawater.

Utility officials have been checking these pipes. They say they found cracks in 5 pipes in one condenser and that seawater had leaked from them.

The officials stopped the flow of seawater by putting plugs in the 5 pipes. They are now checking the other tubes. The utility firm says they will keep running the reactor.

The trouble occurred 9 days after the operator restarted the reactor on August 11th. It was the first to go back online under new regulations introduced after the Fukushima nuclear accident in 2011.

The utility was due to raise the reactor's power output to 100 percent on Tuesday. But the problems are expected to delay the scheduled work by about one week.

Sendai: Problem solved?

August 25, 2015

Sendai plant to increase output from Thursday

Aug. 25, 2015 - Updated 14:57 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150825_40.html

The operator of Japan's only activated nuclear plant says it will begin increasing the power output on Thursday after solving a problem with reactor equipment.

Workers found seawater leaking into cooling water at the No.1 reactor of the Sendai nuclear plant in Kagoshima Prefecture last Thursday. The reactor had gone back online 9 days earlier.

Kyushu Electric Power Company had initially planned to increase the reactor's output to the maximum level, but delayed the work to identify the cause of the trouble.

Company officials said they found that 5 of about 26,000 narrow pipes carrying seawater in a condenser were damaged and 470 liters of seawater had been leaked.

The condenser is one of the 3 units that convert steam from the power turbines into water, using seawater to cool it down.

The utility said it suspects the 5 pipes were damaged by heat and high pressure in the condenser.

Officials say the damaged parts have not been checked since 2006. They say they will review the inspection procedures to carry out more frequent checks. But they stress that the problem does not affect the safety of the reactor.

The utility plans to plug the 5 damaged pipes as well as 64 surrounding ones to prevent seawater from leaking into the cooling water. The system will undergo inspection by the Nuclear Regulation Authority Secretariat. If approved, the operator will begin increasing the output on Thursday and raise it to 100 percent on Monday or later.

The reactor was the first to go back online under the new regulations introduced after the Fukushima nuclear accident in 2011.

Sendai: Problem solved? (2)

August 25, 2015

Sendai nuclear plant operator set to plug leaks in 5 cooling system pipes

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201508250046

THE ASAHI SHIMBUN
SATSUMA-SENDAI, Kagoshima Prefecture--The operator of the recently reactivated Sendai nuclear power plant here said it had pinpointed the sites of leaks that forced a postponement of full reactor operations.

Kyushu Electric Power Co. said it detected tiny cracks in five narrow pipes that carry seawater used to cool steam. The pipes are part of the steam condenser at the No. 1 reactor, which resumed operation on Aug. 11.
Output will be maintained at 75 percent of capacity, while the utility carries out checks for further holes.
Kyushu Electric was expected to release a final report on the glitch on Aug. 25. At the same time, it said fully restored reactor operations will be postponed from the scheduled date of Aug. 25.
The regional utility detected a tiny amount of seawater leaked into one of three condensers in the secondary cooling system of the reactor, which has an output of 890 megawatts, on Aug. 20.
The seawater was flowing in the condenser, a device that converts steam used in power generation to water by cooling it, and became mixed with the secondary cooling water that does not contain radioactive materials.
Kyushu Electric suspended operations of one of the two water circulation channels through the condenser at issue and inspected narrow pipes forming the system by passing an electric current through it.
Technicians found miniscule holes in five of 13,000 pipes they had inspected as of 10 a.m. on Aug. 24.
After inspecting all the pipes, the workers will repair the faulty bits.
Kyushu Electric said the seawater was removed with a desalination device and operations at the No. 1 reactor were not hindered.
The reactor was restarted earlier this month for the first time since it was shut down for a periodic inspection in May 2011. Opponents of the plant have voiced safety concerns.

Sendai reaches 95% of power capacity

August 27, 2015

Sendai nuclear plant resumes output increase

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 27, 2015 - Updated 13:53 UTC+2

The operator of Japan's only restarted nuclear power plant has resumed increasing power output one week after equipment trouble forced it to suspend the ramp-up.

Kyushu Electric Power Company suspended the output increase last Thursday after a problem was found with one of the No. 1 reactor's condensers at the Sendai plant in Kagoshima Prefecture in southwestern Japan.

The utility said seawater leaked from damaged intake pipes into the condenser. The company stopped increasing the output while it inspected the equipment and fixed the problem.

The utility had restarted the reactor just 9 days earlier, on August 11th. It was generating power at 75 percent of capacity at the time of the suspension.

The condenser turns steam that drives the turbine back into water. Neither the steam nor the water is

radioactive.

The utility said on Thursday that it had completed its inspections and fixed the problem by the previous day, and that nothing else amiss had been found. The company started increasing energy output again in the morning, and it had reached 95 percent by the evening.

However, the utility might miss its target to go back into commercial operation by early September.

The reactor was the first to go back online under the new regulations introduced after the Fukushima nuclear accident in 2011.

Sendai: 100% output

August 29, 2015

Sendai nuclear power plant achieves 100% output

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 29, 2015 - Updated 07:15 UTC+2
The operator of Japan's only online nuclear plant says it has raised turbine output to full capacity.

Kyushu Electric Power Company said on Saturday that engineers at the Sendai plant in Kagoshima Prefecture, southwestern Japan, had raised the turbine output to 100 percent of its capacity of 890,000 kilowatts.

The utility says that on Monday it will also increase the reactor output to full capacity.

The plant resumed work to ramp up output at its No. 1 reactor on Thursday after a 6-day suspension due to a problem with one of the reactor's condensers.

The company plans to restart commercial operations on September 10th as scheduled, if nuclear regulators find no problems in their final inspections on that day.

The plant is likely to become the first nuclear facility in commercial operation since the Ohi plant in Fukui Prefecture on the Sea of Japan coast halted operations in September 2013.

Kyushu Electric Power Company restarted the Sendai plant earlier this month. The plant's No. 1 reactor was the first in Japan to go back online under new regulations introduced after the Fukushima nuclear meltdowns in 2011.

The Nuclear Regulation Authority says it will conduct final inspections carefully.

Sendai to achieve full capacity

August 30, 2015

Sendai reactor output to achieve 100% capacity

http://www3.nhk.or.jp/nhkworld/english/news/20150831_05.html

Aug. 30, 2015 - Updated 21:53 UTC+2

The output of Japan's only online nuclear reactor is scheduled to be raised to full capacity on Monday.

Kyushu Electric Power Company, which operates the Sendai plant in southwestern Japan, says after 100-percent output capacity is achieved at the number-one reactor, it will undergo final inspections by the Nuclear Regulation Authority on September 10th.

The reactor was the first to be confirmed by the Authority to have met new safety guidelines that were introduced following the 2011 accident at the Fukushima Daiichi plant. The utility restarted the reactor on August 11th.

The company continued test operations while gradually increasing its output and checking whether the equipment was working properly.
The company was forced to temporarily stop increasing the output after a problem was found with one of the reactor's condensers. The work resumed last Thursday.

The nuclear authority will now check the water, temperatures and pressures in the reactor while it is in full operation.

The utility says if all goes well, it will resume full commercial operations. The reactor will become the first in the country to resume such operations since the Ohi plant in central Japan went offline in 2013.

The Nuclear Regulation Authority says it will carefully conduct final inspections of the Sendai reactor.

August 29, 2015

Sendai reactor to resume commercial operations Sept. 10

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201508290037

By JUNICHIRO NAGASAKI/ Staff Writer

SATSUMA-SENDAI, Kagoshima Prefecture--Kyushu Electric Power Co. said Aug. 28 it intends to resume full-scale commercial operations at the Sendai nuclear power plant's No. 1 reactor on Sept. 10.
The utility said the reactor, which has an output of 890 megawatts, will run at full capacity on Aug. 31 on a trial basis ahead of a final inspection by the Nuclear Regulation Authority, which introduced tougher safety standards in July 2013 in the aftermath of the Fukushima nuclear disaster two years earlier.
The planned start of commercial operations will herald the end of Kyushu Electric's two-year effort to resume operations at its Sendai plant.
The utility will begin full-capacity operations of the reactor's dynamo on Aug. 29, and then run the reactor at full capacity on Aug. 31 while ensuring that its thermal power remains constant.
Final pre-operation checks by the NRA are scheduled for Sept. 9 and 10.
The Sendai No. 1 reactor was brought online on a trial basis on Aug. 11, and began generating and transmitting electricity three days later.
Although Kyushu Electric initially planned to start full trial operations Aug. 25, the schedule was pushed back after it was revealed on Aug. 20 that a small amount of seawater had leaked into a condenser in the reactor's secondary cooling system.
Kyushu Electric quickly repaired the leak, putting it on track to begin business operations in early September as originally planned.
Kyushu Electric expects to resume operations at the Sendai No. 2 reactor by mid-October.

Sendai reaches full output capacity

August 31, 2015

Kyushu nuclear plant reaches full output capacity, commercial operations expected in Sept.

http://mainichi.jp/english/english/newsselect/news/20150831p2a00m0na013000c.html

Kyushu Electric Power Co. said that the No. 1 reactor at the Sendai Nuclear Power Plant in Kagoshima Prefecture has achieved its full capacity, in which the heat output generated in the reactor is maintained at its maximum level.
The Sendai plant's No. 1 reactor is expected to undergo a final inspection by the Nuclear Regulation Authority on Sept. 9 and 10. If passed, Kyushu Electric will resume commercial operations of the nuclear plant.
The utility decided to postpone raising power output on Aug. 21 following a problem at the reactor, where seawater entered into a condenser, but began boosting output power six days later after blocking holes in pipes.
Kyushu Electric resumed the No. 1 reactor's power generation and transmission on Aug. 14 after restarting the Sendai plant on Aug. 11 as the first nuclear station in Japan to restart its operation under new safety standards. The company has been careful in raising output power since the No. 1 reactor had

been off power for about four years and three months. Now that the reactor is maintaining its maximum output capacity, the utility expects less likelihood of problems in its operations.
The electric company plans to restart the No. 2 reactor at the Sendai plant in mid-October after inserting nuclear fuel in early September.

Sendai reactor output achieves 100% capacity

http://www3.nhk.or.jp/nhkworld/english/news/20150831_16.html

Aug. 31, 2015 - Updated 05:05 UTC+2

The output of Japan's only online nuclear reactor has been raised to full capacity.

Kyushu Electric Power Company, which operates the Sendai plant in southwestern Japan, said that the number-one reactor reached 100-percent output on Monday morning. It says that it will undergo final inspections by the Nuclear Regulation Authority on September 10th.

The reactor was the first to have met new safety guidelines that were introduced following the 2011 accident at the Fukushima Daiichi plant. The utility restarted the reactor on August 11th.

The company continued test operations while gradually increasing its output and checking whether the equipment was working properly.

The company was forced to temporarily stop increasing the output after a problem was found with one of the reactor's condensers. The work resumed last Thursday.

The nuclear authority will now check the water, temperatures and pressures in the reactor while it is in full operation.

The utility says if all goes well, it will resume full commercial operations. The reactor will become the first in the country to resume such operations since the Ohi plant in central Japan went offline in 2013.

The Nuclear Regulation Authority says it will carefully conduct final inspections of the reactor.

Ready for another restart?

September 4, 2015

Plant operator to reactivate another reactor

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Sep. 4, 2015 - Updated 11:24 UTC+2
The operator of Japan's only active nuclear power station plans to prepare to restart a second reactor at the plant.

Kyushu Electric Power Company on Friday told the Nuclear Regulation Authority, or NRA, of its plan to start putting fuel rods into the Number 2 reactor of the Sendai plant in the southwestern prefecture of Kagoshima on September 11th.

The company says loading the 157 units of fuel rods into the facility will take 4 days.

NRA officials are to then inspect emergency equipment and procedures for handling severe accidents. If no problems are found, the utility plans to reactivate the reactor in mid-October, aiming at starting commercial operations in mid-November.

The firm restarted the plant's Number 1 reactor on August 11th. The reactor is to undergo final checks by the NRA next Thursday and, if it passes them, become the first in Japan to supply electricity in 2 years.

The 2 reactors are the first to meet regulations introduced after the nuclear accident at the Fukushima Daiichi power plant in 2011.

Sendai set to resume commercial operation

September 10, 2015

Kyushu Electric reactor No. 1 set to resume full commercial operation

http://www.japantimes.co.jp/news/2015/09/10/national/kyushu-electric-reactor-no-1-set-resume-full-commercial-operation/#.VfEoJpfwmic

Kyodo
Kyushu Electric Power Co. is set to begin full-scale commercial operation of reactor No. 1 at its Sendai plant in Kagoshima Prefecture after the unit cleared a final inspection by the regulator on Thursday.
The plant's No. 1 reactor has been generating and feeding electricity to the grid on a trial basis since it went live on Aug. 11, becoming the nation's first reactor to resume operation under safety regulations adopted after the 2011 nuclear crisis.
Kyushu Electric Power plans to reactivate reactor No. 2 at the two-unit Sendai plant in mid-October.
The utility expects its earnings to improve by ¥15 billion a month when the two units are back online.
It projects posting a group net profit of ¥45 billion in the first half of the current business year through March, due to the restart of the No. 1 unit. It hopes to put its full-year earnings into the black for the first time in five years.

Before reactor No. 1 was reactivated in August, Japan had no nuclear power supply for nearly two years, as all commercial reactors were gradually taken offline in the wake of the Fukushima disaster.
Other power companies are also desperate to bring their reactors back online to reduce their fossil-fuel bills. However, analysts say the outlook remains uncertain as hurdles include the in-depth and lengthy safety screenings required by the regulator.

September 9, 2015

Sendai reactor set to resume commercial operation

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Sep. 9, 2015 - Updated 19:35 UTC+2
Japan's only online nuclear reactor is set to undergo final inspections by regulators on Thursday. If no problems are found, the No.1 reactor at the Sendai nuclear plant in southwestern Japan will resume commercial operation.

The reactor would be the country's first to resume commercial operation since the Ohi plant in central Japan went offline in 2013.

The operator, Kyushu Electric Power Company, restarted the Sendai reactor on August 11th. It became the first to be activated under new regulations introduced after the Fukushima Daiichi nuclear accident in 2011.

The operator gradually increased the reactor's output to 100 percent of its capacity by the end of August.

Inspectors from the Nuclear Regulation Authority plan to conduct final checks of the reactor and other equipment on Thursday morning.

If no abnormalities are found, the regulator will allow Kyushu Electric to resume commercial operation as soon as in the afternoon.

Mihama may not restart

September 9, 2015

Regulator warns Kansai Electric may not win approval for Mihama reactor restart

http://www.japantimes.co.jp/news/2015/09/09/national/regulator-warns-kansai-electric-may-not-win-approval-mihama-reactor-restart/#.VfAPv5fwmic

Kyodo

Nuclear regulators on Wednesday warned that Kansai Electric Power Co. may not be allowed to extend the life span of its aging nuclear reactor at the Mihama plant, saying the utility has been slow to submit information required for a safety review.

A regulation brought in after the 2011 nuclear disaster forbids, in principle, the operation of nuclear reactors for more than 40 years. However, they may be granted a 20-year life span extension if they obtain Nuclear Regulation Authority clearance.

"Under the current situation, it will be extremely difficult to give approval" for the resumption of the Mihama No. 3 reactor in Fukui Prefecture, the regulatory body's Commissioner, Toyoshi Fuketa, told a meeting.

Kansai Electric, which relied heavily on nuclear power before the nuclear crisis, hopes to restart a total of three aging reactors, including the Mihama unit.

The Mihama reactor would need to clear screenings by the regulator of general plant safety and the soundness of its aging equipment. It would need to secure a green light by the end of November next year — or else it will be scrapped.

The screening process made progress in August, when the regulators approved tougher quake-resistance criteria set by Kansai Electric. But there has been no progress since then, as the operator has yet to prepare required materials.

Sendai has resumed commercial operation

September 10, 2015

Sendai reactor resumes commercial operation

Sep. 10, 2015 - Updated 10:18 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150910_24.html

Japan's only active nuclear reactor has resumed commercial operations after approval from regulators.

The No. 1 reactor at the Sendai plant in Kagoshima Prefecture, southwestern Japan, became the country's first to supply electricity on Thursday after the Ohi plant in central Japan went offline 2 years ago.

Four experts from the Secretariat of the Nuclear Regulation Authority conducted final checks in the Sendai plant's central control room on Thursday morning, looking at temperatures of the reactor and

other equipment.

The NRA issued a certificate to the plant operator, Kyushu Electric Power Company, at 4 PM after no abnormalities were found in the final inspection.

The utility restarted the reactor on August 11th. It was the first to be activated under regulations introduced after the Fukushima Daiichi nuclear accident in 2011.

The reactor's output reached full capacity on August 31st.

The firm plans to start putting fuel rods into the plant's Number 2 reactor on Friday and restart it in mid-October if no problems are found in inspections.

First reactor in business again

September 11, 2015

Nuclear reactor resumes business, first in Japan in two years

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201509110047

Activists protest the start of commercial operations at the No. 1 reactor of the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, on Sept. 10. (Shoko Ishizuka)

THE ASAHI SHIMBUN

SATSUMA-SENDAI, Kagoshima Prefecture--For the first time in two years, a nuclear power plant in Japan is officially back in business.

The No. 1 reactor of the Sendai plant, which has an output of 890 megawatts, passed two-day final safety inspections conducted by the Nuclear Regulation Authority and resumed commercial operations on the afternoon of Sept. 10.

A safety screening pass certificate was handed over by Kunihisa Oba, a senior NRA inspector, to Nobuhiko Fujiwara, manager of the Sendai power plant, on Sept. 10.
Kyushu Electric Power Co., operator of the Sendai plant, reactivated the No. 1 reactor on a trial basis Aug. 11 after it became the first facility to pass the tougher safety standards introduced by the NRA after the Fukushima nuclear disaster.
Nuclear fuel was also supplied to the No. 2 reactor of the Sendai plant starting on Sept. 11.
Kyushu Electric plans to bring the second reactor back online in mid-October and resume its commercial operations in mid-November.
After the nuclear crisis at the Fukushima No. 1 power plant caused by the March 2011 Great East Japan Earthquake and tsunami, all reactors in Japan went offline.
Although the No. 3 and No. 4 reactors of Kansai Electric Power Co.'s Oi plant in Fukui Prefecture were temporarily restarted after the disaster due to a shortage of electricity, their operations were soon suspended.
The restart of the Sendai reactor marked the first time for a reactor in Japan to function commercially since the Oi No. 4 reactor was suspended in September 2013.
Kansai Electric is also working to restart the No. 3 and No. 4 reactors of its Takahama plant in Fukui Prefecture, while Shikoku Electric Power Co. is proceeding with its efforts to resume operations at the No. 3 reactor of the Ikata power plant in Ehime Prefecture.

Moving fuel rods into No.2

September 11, 2015

Fuel rods put into another Sendai reactor

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Sep. 11, 2015 - Updated 09:24 UTC+2
The operator of the Sendai nuclear power plant in Kagoshima Prefecture, southwestern Japan, has begun placing fuel rods into the plant's No.2 reactor.

Kyushu Electric Power Company plans to restart the reactor in the middle of next month.

The utility on Friday afternoon began the 4-day process of moving 157 fuel rod units into the reactor, using a crane and other machinery. It says it will conduct the work while placing top priority on ensuring safety.

The No.2 reactor went offline 6 months after the Fukushima Daiichi plant accident in March 2011. All the fuel rods were removed from the reactor by February 2013.
The reactor will be Japan's second to be restarted under new regulations introduced after the Fukushima Daiichi accident.

The No.1 reactor of the Sendai plant on Thursday became the nation's first to supply electricity since the Ohi nuclear plant in central Japan went offline in September 2013.

September 11, 2015

Kyushu Electric begins putting nuclear fuel in 2nd reactor for restart

http://mainichi.jp/english/english/newsselect/news/20150911p2g00m0dm004000c.html

TOKYO (Kyodo) -- Kyushu Electric Power Co. said Friday it began loading nuclear fuel into the second reactor at its Sendai station in southwestern Japan, moving a step closer to its restart planned for mid-October under upgraded safety regulations adopted following the 2011 Fukushima meltdowns.

The No. 2 reactor at the two-unit plant will become the second to be restarted in Japan since the post-Fukushima safety requirements came into force. Kyushu Electric reactivated the No. 1 unit at the complex on Aug. 11, which marked the revival of nuclear power generation in the country after a two-year hiatus.

On Friday, the utility launched operations to insert a total of 157 fuel rod assemblies into the No. 2 reactor. The work is expected to take about four days.

The government identifies nuclear power as a key electricity source and is promoting the restart of idled reactors even though antinuclear sentiment remains strong among the Japanese public.

However, the outlook for the resumption of other nuclear reactors remains uncertain due to prolonged safety screenings undertaken by the regulator and other hurdles.

Kyushu Electric expects its earnings to improve by 15 billion yen ($125 million) a month by bringing the two units back online, which may put its earnings into the black for the first time in five years in the current business year through next March.

Fuel rods inserted in No.2 reactor

September 14, 2015

Fuel rods placed into 2nd Sendai reactor

Sep. 14, 2015 - Updated 04:21 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150914_12.html

The operator of the Sendai nuclear power plant in southwestern Japan has finished placing fuel rods into the plant's No.2 reactor.

Kyushu Electric Power Company says workers completed the process of loading 157 fuel rod units into the reactor on Sunday night.

It plans to restart the reactor in the middle of next month.

The No.1 reactor at the plant resumed commercial operation on Thursday of last week.

It was the first reactor to be restarted under new regulations introduced after the Fukushima Daiichi accident in March of 2011.

The 2 reactors went offline after the accident. All the fuel rods were removed by February of 2013.

Kyushu Electric says no problems have been reported during the work to load the fuel rods. The operator will now check whether the units are properly positioned.

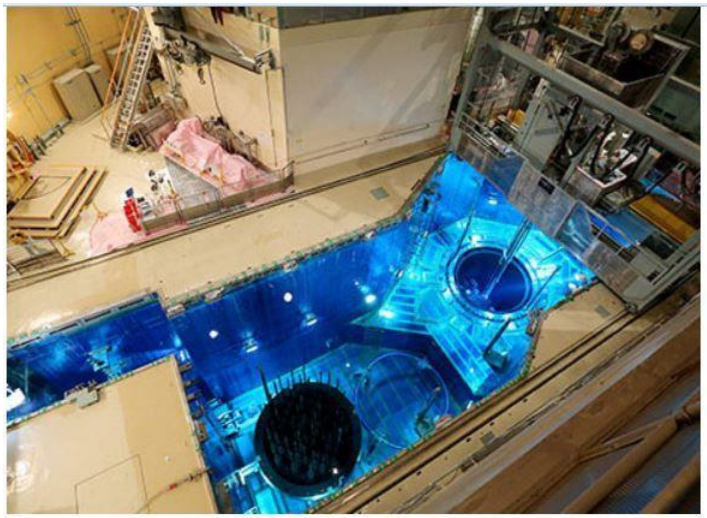
The operator plans to hold accident-response drills and inspect emergency facilities before restarting the No.2 reactor.

Fuel rods inserted in No.2 reactor (2)

September 15, 2015

Kyushu Electric finishes installation of fuel rods at second reactor

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201509150031



Nuclear fuel assemblies are transferred to the No. 2 reactor of the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, on Sept. 12. (Masaru Komiyaji)

By JUNICHIRO NAGASAKI/ Staff Writer

SATSUMA-SENDAI, Kagoshima Prefecture--Kyushu Electric Power Co. said it has finished installing nuclear fuel rods at the No. 2 reactor of its Sendai power plant in preparation for a resumption of commercial operations.

The fuel rods, bundled together in 157 assemblies, began being loaded in the No. 2 reactor during the afternoon of Sept. 11. The work was completed one day ahead of schedule on the evening of Sept. 13.
The 157 fuel assemblies were initially stored in a pool in a building adjacent to the reactor building, and then transferred to the reactor one by one around the clock.
The utility intends to reactivate the reactor in mid-October and start commercial operations in mid-November. The reactor has an output of 890 megawatts.
“We will continue to engage in government-led safety screenings with the utmost sincerity,” said a Kyushu Electric official in a statement.
The Nuclear Regulation Authority’s safety examination is still under way at the Sendai plant, and Kyushu Electric plans to shortly initiate training procedures in the event of an emergency in the presence of NRA officials.
The Sendai plant’s No. 1 reactor was brought back online on Aug. 11 and became the first to resume operations on Sept. 10 under new safety standards put in place after the 2011 Fukushima nuclear disaster.
However, equipment for the No. 1 reactor has experienced mechanical problems since its restart. The No. 2 reactor, like the No. 1 reactor, remained offline for four years.
Kyushu Electric said it will proceed carefully with work to resume operations at the second reactor to prevent a recurrence of problems.

Japan briefs IAEA

September 15, 2015

Japan briefs IAEA about reactor restart plans

http://www3.nhk.or.jp/nhkworld/english/news/20150915_12.html

Nuclear & Energy
Sep. 15, 2015 - Updated 02:47 UTC+2
Japan has laid out its case to the international community for its plan to restart the country's nuclear reactors.

The chairman of Japan's Atomic Energy Commission, Yoshiaki Oka, addressed the annual General Conference of the International Atomic Energy Agency in Vienna on Monday.

Oka told the attendees that Japan takes seriously the IAEA's findings in its final report on the 2011 nuclear accident at the Fukushima Daiichi plant.

The report says Japan was insufficiently prepared for a severe nuclear accident due to its assumption that nuclear plants were safe.

He said Japan will fully and forthrightly provide the international community with information about the

work to deal with contaminated water and to decommission the plant.

Oka briefed the conference about the restart of the Sendai nuclear power plant in southwestern Japan in August. The plant was reopened under tighter regulations introduced after the Fukushima accident.

He said it took more than 2 years of screenings before the Sendai reactor restart got the go-ahead. He added that new criteria for the screenings were based on experience gained and lessons learned from the accident.

Oka asked the participants to understand Japan's reasons for restarting other reactors in the days ahead.

Prior to the conference, the Japanese government hosted a meeting to showcase current conditions at the Fukushima plant. Participants were served sake and other Fukushima specialties to demonstrate how thoroughly the region has recovered.

A briefing on the IAEA's final report on the accident is scheduled for Wednesday. Conference participants wrap up their discussions on Friday.

Tomari plant not ready to restart by March

September 24, 2015

Hokkaido Electric abandons plan for reactor restart by March end

http://www.japantimes.co.jp/news/2015/09/24/national/hokkaido-electric-abandons-plan-reactor-restart-march-end/#.VgUKlpfwmic

JIJI
SAPPORO – Hokkaido Electric Power Co. President Akihiko Mayumi on Thursday signaled the company's plan to give up the restart of the three reactors at its Tomari nuclear power plant in Hokkaido by the end of March.
At a news conference, Mayumi said, "I have to say that realistically, it would be difficult to bring (any of) the reactors back into operation by the end of fiscal 2015."
The company initially planned to reactivate the No. 3 reactor at the Tomari plant in November this year and the No. 1 and No. 2 reactors between January and March 2016.
Mayumi stopped short of mentioning whether Hokkaido Electric will implement a third full-scale hike in its electricity rates following the expected postponement of the restart of the three reactors.
"We hope to reduce our rates as soon as possible," he added.
Mayumi indicated that a timeline for bringing the Tomari reactors back online is likely to be known by the end of March.
The three reactors have been undergoing safety checks by the Nuclear Regulation Authority under new criteria introduced in July 2013 in the wake of the March 2011 Fukushima nuclear disaster.

All reactors in Japan have to clear NRA checks under the new safety standards before being reactivated. The No. 1 unit at Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture was reactivated last month, becoming the first reactor in Japan to come online under the new standards and putting an end to the total absence of active nuclear reactors in the country that had lasted since September 2013.
The reactor went into commercial operations earlier this month.

Sendai: No.2 reactor ready for restart

October 03, 2015

Kyushu Electric eyes Oct. 15 restart of another reactor at Sendai plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201510030034

THE ASAHI SHIMBUN
Kyushu Electric Power Co. plans to restart another nuclear reactor in Kagoshima Prefecture on Oct. 15, which would make it the second reactor to go online in Japan under new safety regulations.
The utility on Oct. 2 notified the Nuclear Regulation Authority of its decision to conduct a test on Oct. 14 to confirm the proper functioning of control rods in the No. 2 reactor at its nuclear plant in Satsuma-Sendai.
The test involving the control rods, used to control nuclear fission, is one of the final checks required before a nuclear reactor restart.
Despite anti-nuclear protests, the No. 1 reactor at the same plant in August became the first to resume operations under the new safety regulations that went into force in July 2013.
The No. 1 and No. 2 reactors each have an output of 890 megawatts. The No. 2 reactor has been out of service for more than four years since all of Japan's nuclear power plants were ordered to shut down following the 2011 Fukushima nuclear disaster.
Japan has 43 commercial nuclear reactors.
Fukuoka-based Kyushu Electric on Oct. 1 began a four-day drill at the Sendai plant on dealing with a severe accident, such as the loss of power sources. The tsunami on March 11, 2011, knocked out all power at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, leading to the triple meltdown there.
NRA inspectors will oversee the drill to ensure the plant operator follows proper procedures.
If all goes well, the company will conduct a check of equipment in the reactor building from Oct. 9 by raising the temperature and pressure in the reactor to levels similar to those at the time of a restart.

October 2, 2015

Japan to restart 2nd nuclear reactor under post-Fukushima rules

http://mainichi.jp/english/english/newsselect/news/20151002p2g00m0dm062000c.html

TOKYO (Kyodo) -- Japan will restart a nuclear reactor in southwestern Japan as early as Oct. 14, making it the second to return to operation after the government introduced stricter safety regulations following the 2011 triple reactor meltdowns at a power plant in Fukushima.

Kyushu Electric Power Co. reported to the Nuclear Regulation Authority on Friday about its plan to reactivate the No. 2 reactor at its Sendai complex.

The No. 1 unit at the two-reactor plant resumed operations in August, becoming the first reactor to restart under what the government of Prime Minister Shinzo Abe calls "the world's toughest" safety rules implemented after the Fukushima disaster. The restart ended a nearly two-year hiatus in the country's nuclear power generation.

The government plans to have nuclear power account for 20 percent to 22 percent of Japan's total electricity supply in 2030, compared with roughly 30 percent before the disaster at the Fukushima Daiichi complex, despite the majority of the public opposing nuclear plant restarts. The government sees nuclear power as necessary for the country to reduce its greenhouse gas emissions in combating climate change.

Kyushu Electric finished inserting a total of 157 fuel rod assemblies into the No. 2 reactor last month and will begin final inspections from next Friday.

The huge earthquake and tsunami on March 11, 2011, that triggered the Fukushima nuclear crisis, led to the shutdown of all of the country's commercial reactors by May 2012. Two reactors were temporarily brought back online about two months later amid power shortage concerns, but they went offline for regular checks in September 2013, leaving Japan without nuclear power supply again.

Kyushu Electric Power Co. will restart one of its nuclear reactors on Oct. 15, making it the second to return to operation after the government introduced stricter safety regulations following the 2011 meltdowns in Fukushima Prefecture, a source familiar with the restart plan said. […]

Ikata next?

October 7, 2015

Ehime nuclear plant likely to restart soon after committee gives green light

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201510070038

THE ASAHI SHIMBUN

The Ikata nuclear power plant moved a step closer to restarting after a special committee of the Ehime prefectural assembly gave the go-ahead Oct. 6.

The panel approved a petition submitted by business and other organizations in the prefecture calling for the No. 3 reactor of the Ikata plant to be reactivated as early as possible.

The Liberal Democratic Party, which has a majority in the assembly, supports the push, so the petition is expected to be adopted at a plenary session Oct. 9.

The LDP also intends to urge the prefectural assembly to approve the planned restart of the reactor. That will likely receive approval, too.

As Shikoku Electric Power Co., operator of the Ikata plant, has concluded a safety agreement with Ehime Prefecture and the town of Ikata, the next step is to obtain consent from local authorities to restart the reactor.

The utility's operator will hammer out the finer details of resuming operations with Ehime Governor Tokihiro Nakamura and Ikata Mayor Kazuhiko Yamashita.

The latest move is in line with Prime Minister Shinzo Abe's efforts to promote nuclear energy.

"It is a grave duty for the government to protect the health, life and property of the nation's citizens, and we will responsibly handle situations with that in mind," said Abe while heading a government meeting on nuclear disaster management at the prime minister's office Oct. 6.

Nakamura, who attended the meeting as an observer, appeared satisfied with the prime minister's remarks.

"He has taken matters one step forward," Nakamura told reporters, indicating that he believed Abe's pledge of assistance provided strong support as the prefectural government worked on deciding whether to restart the reactor.

The Nuclear Regulation Authority gave the green light to Shikoku Electric's basic safety plans for the Ikata plant in July, saying the company's suggested measures met the new regulations introduced after the Fukushima nuclear crisis was set off by the March 2011 earthquake and tsunami disaster.

The NRA is now screening the safety plan before granting final approval.

October 6, 2015

Town assembly OKs plan to restart another nuclear plant in Japan

http://mainichi.jp/english/english/newsselect/news/20151006p2g00m0dm059000c.html

MATSUYAMA, Japan (Kyodo) -- The assembly of a small town in western Japan agreed Tuesday to the possible restart of a nuclear power plant it hosts, the latest such move despite public opposition in the wake of the 2011 Fukushima meltdowns.
The assembly of Ikata in Ehime Prefecture unanimously approved plans to request the restart of the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant.
The reactor could possibly come back online as early as next year after necessary checkups.
Also Tuesday, the central government approved evacuation plans in the event of severe accidents at the Ikata plant, another step toward its potential reactivation.
"Now we have all the criteria (to decide)," said Kazuhiko Yamashita, mayor of Ikata, following the approval by 15 assembly members.
Yamashita indicated he will decide whether to agree to restart the reactor after meeting with the industry minister on Wednesday or later.
A handful of protesters gathered outside the town office to express opposition to plans for the plant's reactivation.
The government aims to restart idled nuclear reactors in Japan that meet what it claims are "the world's toughest safety standards," citing the necessity of stable power supply and lower electricity bills that have surged since the Fukushima disaster.
The Ikata plant obtained safety clearance from the Nuclear Regulation Authority in July.
In a similar move, Kyushu Electric Power Co. restarted the No. 1 reactor of its Sendai plant in the southwestern prefecture of Kagoshima in August, becoming the nation's first utility to do so after the Fukushima disaster, which was triggered by the March 2011 earthquake and tsunami in northeastern Japan.
Kyushu Electric is also set to reactivate the plant's No. 2 reactor in mid-November.
October 06, 2015 (Mainichi Japan)

Ehime Gov. mulls restart of nuclear reactor

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Oct. 6, 2015 - Updated 07:14 UTC+2
The governor of Ehime Prefecture in western Japan says he is closer to getting the information he needs to decide whether to restart a nuclear reactor in his prefecture.

He says he will make a final decision after considering the views of local residents and other factors.

Tokihiro Nakamura spoke to reporters on Tuesday after attending a government's nuclear disaster prevention council meeting headed by Prime Minister Shinzo Abe.

The Prime Minister said during the meeting that it is the government's duty to protect peoples' lives and assets if a nuclear accident and ensuing disaster were to occur. He said the government would deal with the situation responsibly.

Abe's announcement had been requested by Governor Nakamura as a condition for restarting the No. 3

reactor at the Ikata plant. The plant had passed the regulator's requirements for a restart in July.

Despite Abe's statement, Nakamura said there are other factors which must be considered that are preventing him from agreeing to a restart.

He said he will make a decision after everything is in place. Nakamura indicated that he will also continue to request a visit by the industry minister.

In the meeting, the panel approved the prefecture's evacuation plan for the residents near the plant.

Ikata plant seems to be next

October 9, 2015

Ehime assembly agrees to restart another nuclear plant in Japan

http://mainichi.jp/english/english/newsselect/news/20151009p2g00m0dm056000c.html

MATSUYAMA, Japan (Kyodo) -- The Ehime prefectural assembly in western Japan gave its consent Friday to a plan to restart a nuclear power plant despite lingering safety concerns in the wake of the 2011 Fukushima meltdowns.

The acceptance of a petition for reactivating the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant and adoption of a resolution stating the necessity of doing so brought the plant a step closer to becoming the country's second nuclear facility to restart under stricter safety regulations. The first was Kyushu Electric Power Co.'s Sendai complex in southwestern Japan.

The move came after the assembly of Ikata town approved earlier this week a request for restarting the plant, which obtained safety clearance from the Nuclear Regulation Authority in July.

Ikata Mayor Kazuhiko Yamashita is set to meet with new industry minister Motoo Hayashi before conveying his support for the restart to Ehime Gov. Tokihiro Nakamura.

Nakamura is expected to separately meet with Hayashi and make the final decision on the restart. Even if the governor consents, the plant may not be reactivated until next year as further checkups will be required.

About 100 demonstrators gathered in front of the Ehime prefectural office in Matsuyama to protest against reactivation even before the assembly session began.

The government seeks to restart idled nuclear reactors in Japan that meet what it claims are "the world's toughest safety standards," citing the necessity of stable power supply and lower electricity bills that have surged since the Fukushima disaster.

Kyushu Electric restarted the No. 1 reactor at the Sendai plant in the southwestern prefecture of Kagoshima in August, becoming the nation's first utility to do so under the stricter safety regulations introduced after the Fukushima disaster triggered by the March 2011 earthquake and tsunami in northeastern Japan.

Kyushu Electric is also set to reactivate the plant's No. 2 reactor as early as next week.

Second reactor heads for restart after nod from Ehime assembly

http://www.japantimes.co.jp/news/2015/10/09/national/second-reactor-heads-for-restart-after-nod-from-ehime-assembly/#.VhfodSvwmos

Kyodo
MATSUYAMA – The Ehime Prefectural Assembly consented Friday to a plan to restart a nuclear power plant despite lingering safety concerns from the 2011 Fukushima core meltdowns.
The acceptance of a petition for reactivating the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant and the adoption of a resolution stating that is necessary brought the plant a step closer to becoming the country's second nuclear facility to restart under stricter safety regulations. The first was Kyushu Electric Power Co.'s Sendai complex.
The move came after the assembly of the town of Ikata approved earlier this week a request for restarting the plant, which was cleared by the Nuclear Regulation Authority in July.
Ikata Mayor Kazuhiko Yamashita is set to meet with new industry minister Motoo Hayashi before conveying his support for the restart to Ehime Gov. Tokihiro Nakamura.
Nakamura is expected to separately meet with Hayashi and make the final decision. Even if the governor consents, the plant may not be reactivated until next year, as further checkups will be required.
About 100 demonstrators gathered in front of the Ehime prefectural office in Matsuyama to protest the reactivation even before the assembly session began.
The government seeks to restart idled nuclear reactors around the country that meet what it claims are "the world's toughest safety standards," citing the necessity of a stable power supply and lower electricity bills that have surged since the Fukushima disaster.
Kyushu Electric restarted the No. 1 reactor at the Sendai plant in Kagoshima Prefecture in August, becoming the nation's first utility to do so under the stricter safety regulations introduced since the Fukushima crisis began.
Kyushu Electric is also set to reactivate the plant's No. 2 reactor as early as next week.

Takahama's injunction

October 9, 2015

Takahama reactors may not restart next month

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Oct. 8, 2015 - Updated 22:47 UTC+2

A district court in Japan has decided to hold another hearing on whether to repeal a provisional injunction banning the restart of reactors at a nuclear plant.

The injunction was issued in April following a request from 9 residents to block the reactivation of the No.3 and No.4 reactors at the Takahama plant in Fukui Prefecture, central Japan.

However, plant operator Kansai Electric Power Company asked for the nullification of the order, leading the court to open a series of hearings with a different presiding judge.

The court held its third hearing on the matter on Thursday. It decided to hold the fourth session as early as on November 13th to listen to more explanations from both sides.

The injunction remains in place at least until the court makes its decision on Kansai Electric's request.

Even if the court overturns its injunction, it will be difficult for the utility to put the reactors back online next month as it had hoped.

This is because the firm needs to gain consent from local governments and move nuclear fuel back into the reactors.

Sendai No.2 reactor to go back online...Oct.15

October 14, 2015

Sendai No.2 reactor to be restarted on Thursday

http://www3.nhk.or.jp/nhkworld/english/news/20151014_20.html

Oct. 14, 2015 - Updated 08:56 UTC+2

Kyushu Electric Power Company says the No.2 reactor at its Sendai nuclear plant in Kagoshima Prefecture, southwestern Japan, will be put back online on Thursday.

The Sendai plant was the first in Japan to clear the government's new regulations for nuclear plants introduced after the Fukushima disaster in March 2011.

The plant has 2 reactors. Its No.1 reactor resumed operation in August this year.

The No.2 reactor has been shut down since it underwent regular inspections 6 months after the nuclear disaster.

On Wednesday, Kyushu Electric announced that the reactor's control rods will be removed starting at 10:30 Thursday morning, Japan time.

The reactor is expected to reach criticality about 12 hours after going back online.

Its operator plans to start generating and transmitting power next Wednesday, and resume commercial operation in mid-November.

The Sendai No.2 reactor will be the second in Japan to be restarted under post-Fukushima requirements.

Second reactor back online

October 15, 2015

2nd reactor at Sendai plant brought back online

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201510150020

By JUNICHIRO NAGASAKI/ Staff Writer

Kyushu Electric Power Co. restarted a second reactor at its Sendai nuclear power plant in Kagoshima Prefecture on Oct. 15, overriding persistent safety concerns among local residents.

At 10:30 a.m., Kyushu Electric Power workers lowered a lever in the plant's central control room to remove control rods in the No. 2 reactor to start the process of nuclear fission.

Kagoshima Governor Yuichiro Ito exhorted the utility to pay utmost attention to ensuring safety at the plant after the No. 2 reactor was restarted.

"Japan's nuclear policy will end should local residents be forced to evacuate in a grave accident," Ito said. "I think the Nuclear Regulation Authority screened the facility, fully aware of such a scenario, and the utility should share the same recognition in proceeding with reactivation."

Utility officials said the reactor is expected to reach a state of criticality, at which nuclear fission is self-sustaining, around 11 p.m.

The No. 2 reactor became the second to come back online in Japan under more rigid safety regulations implemented after the Fukushima nuclear crisis triggered by the March 2011 earthquake and tsunami disaster.

Despite protests by opponents of nuclear energy, the No. 1 reactor at the plant in Satsuma-Sendai city became the first to resume operations in August under the new regulations.

The No. 2 reactor was shut down for a periodic inspection in September 2011 and had remained idle ever since.

“We will continue to cooperate with the central government’s inspection procedures and proceed with operational procedures at the plant by putting utmost priority on securing its safety,” said Kyushu Electric Power President Michiaki Uriu in a statement released on Oct. 15.

Steam produced from the heat generated by the nuclear fission will drive a turbine to produce electricity.

The generation and transmission of electricity is expected to begin on Oct. 21 after the utility completes an inspection of the turbine and other equipment.

The output will be raised gradually to start commercial operations in mid-November, the officials said.

The Sendai nuclear plant became the first nuclear facility in Japan in September last year to meet the new safety standards imposed by the NRA in July 2013.

Preparations for a restart are progressing at the No. 3 reactor of Shikoku Electric Power Co.'s Ikata nuclear power plant in Ehime Prefecture and at the No. 3 and No. 4 reactors of Kansai Electric Power Co.'s Takahama nuclear power plant in Fukui Prefecture.
Kyushu Electric Power is also seeking to reactivate the No. 3 and No. 4 reactors at its Genkai nuclear power plant in Saga Prefecture.

Sendai No.2 reactor is back online

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Oct. 15, 2015 - Updated 05:11 UTC+2
A nuclear reactor in Kagoshima Prefecture, southwestern Japan, has gone back online, the second such restart under tougher post-Fukushima regulations.

Kyushu Electric Power Company turned on the No.2 reactor at its Sendai plant on Thursday morning. Reactor 1 at the same plant went back online in August.

Plant workers began removing the reactor's 32 control rods at 10:30 AM. It is expected to take about 12 hours to achieve a sustained nuclear chain reaction.

The operator plans to start generating and transmitting electricity on Wednesday next week and resume commercial operation in mid-November.

The No.2 reactor has been offline for 4 years. It was shut down for regular inspections 6 months after the Fukushima nuclear accident in March 2011.

In September last year, the Sendai nuclear plant became the first plant in Japan to clear the government's stricter safety regulations, introduced after Fukushima.

Kyushu Electric President Michiaki Uriu said his company will place top priority on safety as it carefully proceeds with the restart.

He said it will also strive to improve the safety of nuclear power plants and actively disclose information with a strong determination never to repeat Fukushima.

Second reactor restarted in Kyushu under tighter Fukushima-inspired rules

http://www.japantimes.co.jp/news/2015/10/15/national/second-reactor-restarted-kyushu-tighter-fukushima-inspired-rules/#.Vh9emyvwmos

Kyodo

KAGOSHIMA – A nuclear reactor in Kagoshima Prefecture resumed operation Thursday, becoming the second unit to restart after the government tightened safety regulations following the 2011 triple reactor meltdowns at the Fukushima No. 1 complex.
Kyushu Electric Power Co. said it reactivated reactor 2 at its Sendai complex in Kagoshima, about two months after unit 1 at the two-reactor plant began operating under what Prime Minister Shinzo Abe's government calls "the world's toughest" safety rules implemented after the Fukushima disaster started.
The first restart in August ended a nearly two-year hiatus in the country's nuclear power generation, marking Japan's return to nuclear energy production.
The government plans to have nuclear power account for 20 to 22 percent of the country's total electricity supply in 2030, compared with roughly 30 percent before the disaster at the Fukushima complex, despite the majority of the public opposing the restart of nuclear plants.
The government sees nuclear power as necessary for the country to reduce its greenhouse gas emissions in an effort to reduce climate change and wants to benefit from the relatively low production costs of nuclear power.
Kyushu Electric finished inserting a total of 157 fuel rod assemblies into reactor 2 last month and had been working on final inspections since last Friday.
The huge earthquake and tsunami on March 11, 2011, triggered the worst nuclear crisis since the 1986 Chernobyl disaster and led to the eventual shutdown of all of Japan's commercial reactors by May 2012.
Two reactors were temporarily brought back online about two months later amid power shortage concerns, but they went offline for regular checks in September 2013, leaving Japan without nuclear power supply again.

Sendai No.2 achieves fission chain reaction

October 15, 2015

Sendai No.2 reactor achieves criticality

Nuclear & Energy
Oct. 15, 2015 - Updated 18:33 UTC+2

A second reactor at a nuclear power plant in southwestern Japan has achieved a sustained nuclear fission chain reaction.

Officials of the plant's operator, Kyushu Electric Power Company, made the announcement at 11 PM on Thursday, Japan time.

Workers at the Sendai plant in Kagoshima Prefecture began removing control rods to restart the No.2 reactor at 10:30 AM on the same day. They say they have detected no abnormalities so far.

This is the second reactor to come back online and reach criticality under the new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant. The first reactor to do so is the No.1 reactor at the same plant.
Kyushu Electric plans to start producing and supplying electricity from the No.2 reactor on Wednesday. But its officials say they may change the timing depending on work to adjust generation turbines.

The company plans to gradually increase the reactor's output and start its commercial operation in the middle of next month.

The firm had not operated the No.2 reactor since it suspended its operation for regular inspections 4 years and one month earlier.

Sendai No.2 achieves fission chain reaction (2)

Sendai No.2 reactor achieves criticality (2)

Nuclear & Energy
Oct. 15, 2015 - Updated 22:16 UTC+2
A second reactor at a nuclear power plant in southwestern Japan has achieved a sustained nuclear fission chain reaction.

Officials of the plant's operator, Kyushu Electric Power Company, made the announcement at 11 PM on Thursday, Japan time.

Workers at the Sendai plant in Kagoshima Prefecture began removing control rods to restart the No.2 reactor at 10:30 AM on the same day. They say they have detected no abnormalities so far.

This is the second reactor to come back online and reach criticality under the new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant. The first reactor to do so is the No.1 reactor at the same plant.
Kyushu Electric plans to start producing and supplying electricity from the No.2 reactor on Wednesday. But its officials say they may change the timing depending on work to adjust generation turbines.

The company plans to gradually increase the reactor's output and start its commercial operation in the middle of next month.

The firm had not operated the No.2 reactor since it suspended its operation for regular inspections 4

years and one month earlier.

Operators of nuclear power plants in Japan want to restart more suspended reactors now that the 2 reactors at the Sendai plant are back online. But things will not go as smoothly as they plan.

3 more reactors have already met new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant.

They are the No.3 and No.4 reactors at the Takahama plant in Fukui Prefecture and the No.3 reactor at the Ikata plant in Ehime Prefecture.

The Takahama plant's operator, Kansai Electric Power Company, hopes to resume operation of its No.3 reactor in late December and the No.4 reactor in mid-January.

However, the utility needs to coordinate with local governments in Fukui and neighboring Kyoto Prefecture to create an emergency evacuation plan for communities around the plant. The Cabinet Office is helping Kansai Electric to formulate the plan.

Also, the 2 reactors must remain offline unless a court injunction to block their restart is overturned.

Regarding the Ikata reactor, the local prefectural assembly passed a resolution to allow its restart. But its restart will only come next spring or later as the reactor is undergoing detailed equipment checks by experts from the Nuclear Regulation Authority.

Moreover, it remains unclear when regulatory screenings will end for 20 other reactors at 13 plants nationwide.

Opinion polls run by NHK this month show that 18 percent of respondents support reactor restarts while 43 percent are opposed. 33 percent remain undecided.

Observers say the central government and plant operators should provide sufficient explanation and enhance their safety and disaster preparedness measures.

Not so easy to restart

October 16, 2015

Reactor restarts face hurdles

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Oct. 16, 2015 - Updated 01:08 UTC+2

Operators of nuclear power plants in Japan want to restart more suspended reactors now that 2 reactors at the Sendai plant are back online. But things will not go as smoothly as they plan.

The No.1 and No.2 reactors at the Sendai plant in Kagoshima Prefecture came back online in August and on Thursday, respectively.

3 more reactors have already met new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant.

They are the No.3 and No.4 reactors at the Takahama plant in Fukui Prefecture and the No.3 reactor at the Ikata plant in Ehime Prefecture.

The Takahama plant's operator, Kansai Electric Power Company, hopes to resume operation of its No.3 reactor in late December and the No.4 reactor in mid-January.

However, the utility needs to coordinate with local governments in Fukui and neighboring Kyoto Prefecture to create an emergency evacuation plan for communities around the plant. The Cabinet Office is helping Kansai Electric to formulate the plan.

Also, the 2 reactors must remain offline unless a court injunction to block their restart is overturned.

Regarding the Ikata reactor, the local prefectural assembly passed a resolution to allow its restart. But its restart will only come next spring or later as the reactor is undergoing detailed equipment checks by experts from the Nuclear Regulation Authority.

Moreover, it remains unclear when regulatory screenings will end for 20 other reactors at 13 plants nationwide.

Opinion polls run by NHK this month show that 18 percent of respondents support reactor restarts while 43 percent are opposed. 33 percent remain undecided.

Observers say the central government and plant operators should provide sufficient explanation and enhance their safety and disaster preparedness measures.

Ikata ready to restart?

October 22, 2015

Town mayor gives nod to restarting reactor in western Japan

http://www.japantimes.co.jp/news/2015/10/22/national/town-mayor-gives-nod-restarting-reactor-western-japan/#.Vij3LSvwmov

Kyodo
MATSUYAMA, EHIME PREF. – A town mayor in western Japan gave approval Thursday to restart a nuclear reactor in the area, bringing closer the resumption of the third reactor in Japan under tougher safety rules introduced after the 2011 Fukushima disaster.
"I will accept the resumption," Ikata Mayor Kazuhiko Yamashita told Ehime Gov. Tokihiro Nakamura at the prefectural office building in Matsuyama, referring to the No. 3 unit at Shikoku Electric Power Co.'s Ikata plant that cleared the Nuclear Regulation Authority's safety screening process in July.
The process to secure local approval is expected to effectively wrap up with the decision of the local governor, possibly to be announced next week. The prefectural and Ikata town assemblies have already approved the restart.
"I want to think well, including through the weekend," Nakamura told reporters after meeting the town mayor.
The No. 3 reactor is the fifth reactor acknowledged by regulators as safe enough to restart in line with a set of tougher safety requirements introduced in the wake of Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant disaster.
Of the five, Kyushu Electric Power Co.'s No. 1 and No. 2 reactors at the Sendai complex in Kagoshima Prefecture resumed operations on Aug. 11 and Oct. 15, respectively.
While community concerns persist about the use of nuclear reactors, Japan ended a nearly two-year period without nuclear power in August by rebooting one of the Sendai reactors and is moving to revive its reliance on nuclear power under the government's energy policy.

Ikata: Evacuation plans remain insufficient

October 22, 2015

Editorial: Evacuation measures insufficient to approve restart of Ikata nuclear plant

http://mainichi.jp/english/english/perspectives/news/20151022p2a00m0na026000c.html

Economy, Trade and Industry Minister Motoo Hayashi recently toured the No. 3 reactor at Shikoku Electric Power Co.'s Ikata Nuclear Power Plant in Ehime Prefecture, which has passed safety screenings by the Nuclear Regulation Authority (NRA). The minister then met with Ehime Gov. Tokihiro Nakamura and Mayor Kazuhiko Yamashita of the town of Ikata, which hosts the nuclear plant, and sought their understanding on reactivation of the reactor. The mayor is expected to agree to the central government's plan at an early date and the governor is to make a final judgment on the matter.
The Ikata Municipal Assembly and Ehime Prefectural Assembly have already agreed to restart the reactor. If the governor gives the green light, procedures for gaining consensus on the resumption of nuclear power generation at the local level will come to a close.

Nevertheless, evacuation plans for a nuclear accident remain insufficient. There is growing concern among many local residents about safety measures, and many oppose restarting the reactor. In addition, the NRA's procedures for restarting the reactor are yet to be completed. The steps include approval of a construction plan based on safety inspection results. Given the lack of preparation, Gov. Nakamura should not agree to the reactivation plan.

Inadequacy in evacuation measures is a common challenge faced by Kyushu Electric Power Co.'s No. 1 and 2 reactors at the Sendai nuclear plant in Kagoshima Prefecture, which were reactivated recently.

The national government has failed to draw a road map to lower dependence on nuclear power despite promising to do all it can in this respect. Serious questions must be raised over the clear move by the government of Prime Minister Shinzo Abe to return to nuclear power by reactivating idled reactors when the safety of local residents has yet to be fully ensured.

The Ikata plant is located at the base of the Sadamisaki Peninsula, which stretches from the island of Shikoku toward Kyushu, and about 5,000 people live in the western part of the peninsula. According to the evacuation plan drawn up by the Ehime Prefectural Government and other entities, in the event of a nuclear accident at the Ikata plant, those who live on the west side of the peninsula would evacuate east of the plant before radioactive materials were discharged into the air. If evacuation routes over land could not be secured due to an earthquake or other disasters, the residents would instead flee to Oita Prefecture in Kyushu by sea. And if evacuation routes by land or air fail due to weather conditions such as a storm, the residents would be ordered to stay indoors.

The government's nuclear accident prevention committee approved of this evacuation plan earlier this month, stating that it is "concrete and reasonable." However, there are just four shelters for radiation protection in the area, and together they can accommodate only about 470 people. It is also questionable whether transportation by sea and other routes can be secured smoothly.

It's not just locals on the Sadamisaki Peninsula who are worried about evacuation plans in the event of a nuclear disaster. When the cities of Seiyo and Uwajima in Ehime Prefecture, both located within 30 kilometers of the Ikata plant, surveyed the heads of neighborhood associations and city assembly members who attended information sessions for local residents on the restart of the nuclear plant, a majority of respondents were against the plan to reactivate the plant's reactors.

Ehime Gov. Nakamura has repeatedly asked the national government to take final responsibility if a severe nuclear accident such as the one at the Fukushima No. 1 Nuclear Power Plant occurs. Nakamura appreciated comments made during a nuclear accident prevention panel meeting by Prime Minister Abe, who said that it is the national government's important duty to protect the lives of people and their properties in the event of a nuclear accident, and that the government will act responsibly to handle the situation in such a case.

It is only natural for the national government to be held accountable for a nuclear disaster, however, and a prime minister acknowledging such responsibility does not change the fact that the local governments hosting and surrounding nuclear stations would be the ones to stand at the forefront when an accident occurs.

The central government plans to hold a comprehensive nuclear disaster drill at the Ikata plant in November. The Yamaguchi and Oita prefectural governments will join the exercise since some parts of Yamaguchi Prefecture fall within the 30-kilometer zone around the plant, and Oita Prefecture will accommodate nuclear evacuees. Gov. Nakamura should take the outcome of the exercise into consideration when deciding to restart the reactor.

We shall never forget the lesson from the Fukushima meltdowns -- that a severe nuclear accident that puts local residents in danger could occur at any time.

Shikoku Electric satisfied

October 26, 2015

Shikoku Electric welcomes governor's consent

http://www3.nhk.or.jp/nhkworld/english/news/20151026_24.html

Oct. 26, 2015 - Updated 05:15 UTC+1

The president of Shikoku Electric Power Company has told reporters that the governor's agreement to the restart of the No. 3 reactor at the Ikata nuclear power plant was a big step forward.

Hayato Saeki said he will continue to make efforts to further improve the safety and reliability of the plant.

He said he will seek the restart of the reactor as early as possible.

But he refrained from commenting on the specific timing of the restart, saying that screening is still underway.

Ehime Governor approves restart

October 26, 2015

Ehime governor approves restart of Ikata nuclear plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201510260036

THE ASAHI SHIMBUN
MATSUYAMA--Ehime Governor Tokihiro Nakamura gave the go-ahead on Oct. 26 to resume operations at the Ikata nuclear power plant, becoming the second prefectural government to approve the restart of idle reactors under stricter safety guidelines.
"This is a decision made with an extremely large responsibility attached," Nakamura told Hayato Saeki, Shikoku Electric Power Co. president, at the Ehime prefectural government building. "I made the decision after comprehensively considering the thinking of the central government, the posture of Shikoku Electric in working toward resumption of operations and discussions at the local level."

The No. 1 and No. 2 reactors of the Sendai nuclear power plant in Kagoshima Prefecture were the first to go back online under the tighter safety regulations implemented by the Nuclear Regulation Authority following the 2011 accident at the Fukushima No. 1 nuclear power plant.
Shikoku Electric, the operator of the Ikata No. 3 reactor, could resume operations as early as this winter after it finalizes approval paperwork with the NRA and completes inspections before the resumption of operations.
The governor also presented to Saeki nine points on which he wants cooperation from Shikoku Electric, which include a thorough system of notification during emergencies; continued briefings to local residents; and support for disaster prevention measures to be taken by the prefectural and municipal governments.
Nakamura later held a news conference where he explained the reasoning behind his approval, as well as the measures he asked Shikoku Electric to take.
Ikata Mayor Kazuhiko Yamashita met with Nakamura on Oct. 22 and conveyed the town government's consent to resume operations at the Ikata plant. Nakamura was expected to meet with Motoo Hayashi, the economy minister, in Tokyo on Oct. 26 and pass on his approval for the resumption of operations.
No local government in Ehime Prefecture that lies within the 30-kilometer radius from the Ikata nuclear plant expressed opposition to the restart. The radius denotes the area for concentrated disaster prevention measures.
The approval from the Ehime prefectural and Ikata town governments comes about three months after the NRA approved in July the basic policy for safety measures laid out by Shikoku Electric.
The No. 3 reactor at the Ikata plant began commercial generation of electricity in December 1994. It is a pressurized-water type reactor, which is different from those at the Fukushima No. 1 plant. The two reactors that have resumed operations at the Sendai plant are also pressurized-water types, as are the No. 3 and No. 4 reactors at the Takahama nuclear plant in Fukui Prefecture, which is also pushing for the resumption of operations.
The Ikata reactor was converted in March 2010 to plutonium-thermal (pluthermal) power generation, which burns mixed oxide (MOX) fuel that contains plutonium extracted from spent nuclear fuel. Operations were halted in April 2011 for normal safety inspections.
Nakamura's consent is the first granted for a pluthermal power plant since the Fukushima nuclear accident.

Local gov. approves 3rd reactor restart under tougher rules

http://mainichi.jp/english/english/newsselect/news/20151026p2a00m0na014000c.html

MATSUYAMA, Japan (Kyodo) -- The governor of Ehime Prefecture in western Japan gave approval Monday for the restart of a nuclear reactor that will be the third in the country to resume operations under tougher safety rules introduced after the 2011 Fukushima disaster.
Ehime Gov. Tokihiro Nakamura conveyed his approval to restart the No. 3 unit at Shikoku Electric Power Co.'s Ikata plant in a meeting with the utility's President Hayato Saeki at the prefectural office building.
"It would be better not to have (a nuclear plant). Still, we have no choice but to implement the most advanced safety measures and live with it until we find alternative energy to nuclear power," Nakamura said at a press conference after the meeting.

The No. 3 unit at Ikata is one of five reactors acknowledged by regulators as safe enough to restart in line with a set of tougher safety requirements introduced in the wake of the disaster at Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant.
Japan ended a nearly two-year period without nuclear power in August when one of the Sendai reactors run by Kyushu Electric Power Co.in southwestern Japan was brought back online amid continuing public concerns about nuclear energy.
The Japanese government welcomed the decision by the Ehime governor, as it looks to generate about a fifth of the nation's overall electricity with nuclear power plants in 2030, compared with roughly 30 percent before the Fukushima disaster, in an effort to cut greenhouse gas emissions and lower fuel costs.
"There is no change in the government's policy of proceeding with the restart of reactors that meet the Nuclear Regulation Authority's stringent regulations by gaining local understanding" of restarts, Chief Cabinet Secretary Yoshihide Suga said at a regular press conference.
About 30 protesters gathered in front of the prefectural office building, demanding the utility stop the resumption.
"This is an important issue that affects the lives of (local) residents but the governor is not considering it seriously," said Tsukasa Wada, 63, a member of a local group aiming to prevent the restart of the reactor.
The reactor had cleared the Nuclear Regulation Authority's safety screening process in July. But the timing of the restart is expected to be January or later because some necessary procedures remain, including obtaining the authority's approval for detailed designs of equipment at the facility.
The governor's nod came as the final step in the process of securing local approval. The mayor of Ikata town as well as the prefectural and Ikata assemblies have already given their consent.
Kyushu Electric's Nos. 1 and 2 reactors at the Sendai complex in Kagoshima Prefecture resumed operations on Aug. 11 and Oct. 15, respectively, becoming the first two reactors to return to operation among 26 reactors for which Japanese utilities have applied for regulatory safety reviews to restart.
October 26, 2015 (Mainichi Japan)

Ehime governor agrees to restart nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20151026_14.html

Oct. 26, 2015 - Updated 02:18 UTC+1
The governor of Ehime Prefecture in western Japan has decided to approve the restart of a nuclear reactor in his prefecture.

In a meeting on Monday, Tokihiro Nakamura informed the president of Shikoku Electric Power Company that he agrees to the restart of the No. 3 reactor at the Ikata nuclear power plant.

The plant is the 2nd to obtain approval for a restart from the local prefecture and municipality under new regulations introduced after the 2011 accident in Fukushima. The town of Ikata has already agreed to restart the reactor.

The reactor passed a screening by the Nuclear Regulation Authority in July. But the regulators have yet to

approve its restart and inspect new equipment.

Shikoku Electric is expected to restart the reactor next spring or later.

Explanations...

October 26, 2015

Governor explains approval of restart

http://www3.nhk.or.jp/nhkworld/english/news/20151026_22.html

Oct. 26, 2015 - Updated 04:43 UTC+1
The governor of Ehime Prefecture says he decided to approve the restart of a reactor at the Ikata nuclear power plant only after thorough study.

Tokihiro Nakamura was speaking to reporters after informing Shikoku Electric Power Company that he approves of the restart of the No. 3 reactor at the plant.

He said the matter has been a very sensitive one for the prefecture in the wake of the accident at the Fukushima Daiichi nuclear power plant in 2011.

The governor said he concluded that even if a tsunami hit the area, the Ikata plant would not be seriously affected like the Fukushima Daiichi plant was.

Nakamura said there is currently no alternative energy source that meets the 3 requirements -- power output, cost, and stable supply. He said that for now nuclear power generation should be accepted with appropriate safety measures.

The governor explained his prefecture's requests to the central government and the power plant operator regarding safety measures against earthquakes and accidents.

He said the prefectural government has received satisfactory responses over the past 4 years. The governor said he decided to approve the restart based on the government's policy, the attitude of the power company, and the consent of the town of Ikata.

Priority on safety?

October 26, 2015

Suga: Safety important in restart of plant

http://www3.nhk.or.jp/nhkworld/english/news/20151026_26.html
Oct. 26, 2015 - Updated 05:33 UTC+1
Chief Cabinet Secretary Yoshihide Suga says it is significant that the Governor of Ehime Prefecture has agreed to the restart of the No. 3 reactor at the Ikata nuclear power plant in his prefecture.

Suga said it is very important that the operator of the plant, Shikoku Electric Power Company, place top priority on safety in accordance with legal procedures such as the government's approval and inspections.

He added the government expects the Nuclear Regulation Authority will carry out its procedures rigorously and smoothly.

Sendai No.2 reaches full capacity

Sendai No.2 reactor reaches 100% capacity

Nov. 1, 2015 - Updated 08:08 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The operator of the Sendai nuclear plant in southwestern Japan has raised the output of its second reactor to full capacity.

Officials with the Nuclear Regulation Authority will conduct final inspections of the No.2 reactor in mid-November. If it passes, it will resume full commercial operations.

The Sendai nuclear plant became the first in Japan to meet the new regulations introduced after the 2011 accident at the Fukushima Daiichi plant.

The No.1 reactor restarted in August, and the No.2 reactor on October 15th.

The operator, Kyushu Electric Power Company, continued test operations at the No.2 reactor while gradually increasing its output and checking whether the equipment functioned properly.

The reactor achieved 100-percent output on Sunday morning. Checks will now be conducted on the water quality, temperatures and pressures in the reactor.

If there are no problems, the reactor will undergo final inspections by the nuclear authority.

It stands to become the second reactor to resume commercial operations under the new regulations following the No.1 reactor at the plant.

Tsuruga: Safe to restart?

November 5, 2015

Japan Atomic Power pushes for Tsuruga reactor restart despite fault warning

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201511050054

THE ASAHI SHIMBUN

Japan Atomic Power Co. on Nov. 5 applied for a screening of whether its Tsuruga plant reactor meets safety regulations put in place after the Fukushima nuclear disaster.

But getting the green light from the Nuclear Regulation Authority will prove a difficult process.

The company must present evidence to the NRA that will invalidate the findings of two panels of experts. Their separate reports concluded that a seismic fault line running beneath the power station's No. 2 reactor building in Fukui Prefecture is probably active.

Japan Atomic Power has pledged to provide evidence to the contrary during the screening process.

The NRA has said that it will pay attention to the panels' reports as "significant findings" when it examines the condition of the reactor.

The regulations, which came into force in 2013, prohibit key facilities such as reactor buildings from being located directly above an active fault line.

But current arrangements allow electric power companies to apply for an NRA screening regardless of the panels' assessments.

Japan Atomic Power was established in 1957 to lead the nuclear power development in Japan, with regional electric utilities forming the bulk of its shareholders.

The No. 2 reactor, with an output of 1.16 gigawatts, began commercial operations in 1987.

Of Japan's fleet of 43 reactors, two at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture have gone back online after clearing the new regulation.

Tsuruga screening

November 5, 2015

Tsuruga reactor to undergo screening

http://www3.nhk.or.jp/nhkworld/english/news/20151105_30.html

Nuclear & Energy

Nov. 5, 2015 - Updated 10:46 UTC+1

The operator of the Tsuruga nuclear power plant in central Japan has applied for a safety screening of its reactor. But some experts say an active fault lies beneath the unit.

The Japan Atomic Power Company submitted the request to nuclear regulators on Thursday. The power company wants to restart the No. 2 reactor at the plant in Fukui Prefecture on the Sea of Japan coast.

The screening is a prerequisite for bringing reactors back online under stricter safety regulations

introduced after the 2011 nuclear accident in Fukushima.

The new regulations ban the construction of reactor buildings and other key structures above a fault that could move in the future.

An expert panel from the Nuclear Regulation Authority assessed the Tsuruga plant in May 2013 and in March of this year. It concluded that the No. 2 reactor stands directly above a fault that could shift in the future.

But the Japan Atomic Power Company is challenging the panel's conclusions. The company maintains that there are no faults that could move within the premises of the plant.

The company compiled reports on its new findings from fresh drilling surveys and other on-site studies it has carried out over the past year. And the utilities submitted them to the nuclear regulator.

Nobutaka Wachi, a managing director at the company, said he believes its argument will prove to be correct.

He also said the company wants the regulator to confirm the safety of the reactor and allow it to restart.

Attention is focused on whether the regulator will overturn the expert panel's conclusion.

Tsuraga 2

09.11.2015_No221 / News in Brief

JAPC Files Application For Examination Of Tsuruga-2

http://www.nucnet.org/all-the-news/2015/11/09/japc-files-application-for-examination-of-tsuruga-2

9 Nov (NucNet): Japan Atomic Power Company (JAPC) has filed an application with the Nuclear Regulation Authority (NRA) for an examination of the compatibility with new regulatory standards of its Tsuruga-2 nuclear reactor unit in Fukui Prefecture, southwest Japan. Earlier, the NRA approved an evaluation report by its expert panel concluding that a fault zone beneath the Tsuruga-2 unit was active. The Japan Atomic Industrial Forum said given that JAPC will have to convince the NRA to overturn the evaluation if the unit is to pass the compatibility examination, an early restart of the 1,108-megawatt pressurised water reactor is unlikely. Applications have been filed by various power companies to restart 26 units, of which five have already cleared examinations to show they comply with the new standards, introduced following the March 2011 Fukushima-Daiichi accident.

Sendai No.1 rector resumes commercial operations

November 17, 2015

Second reactor brought back fully online in Japan

Nov. 17, 2015 - Updated 12:53 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

The number 2 reactor at Kyushu Electric Power Company's Sendai nuclear plant in southwestern Japan has resumed commercial operations.

It is the second one in the country to restart under new regulations that took effect following the 2011 Fukushima Daiichi nuclear crisis. The first reactor to go online was the number 1 unit at the same plant.

On Tuesday, inspectors from the nuclear regulator's secretariat conducted final pre-service checkups in the plant's control room. They looked at the reactor's temperatures, as well as the condition of a steam generator and other equipment.

The officials later issued a certificate to prove the completion of the inspection saying no abnormalities had been found.

The reactor returned to commercial operation at 4 PM after more than 4 years.

It had been offline following a routine inspection 6 months after the Fukushima nuclear disaster. It was turned on last month, and was undergoing a check by the regulator.

Second reactor in Japan brought back fully online after Fukushima nuclear crisis

http://www.japantimes.co.jp/news/2015/11/17/national/second-reactor-japan-brought-back-fully-online-fukushima-nuclear-crisis/#.VktFWb8R-ot

Kyodo
FUKUOKA – Kyushu Electric Power Co. began full-scale commercial operations Tuesday of the second reactor at its two-unit nuclear plant in Kagoshima Prefecture after clearing final inspections by the Nuclear Regulation Authority.
The No. 1 unit at the Sendai plant returned to commercial service Sept. 10, the first under safety regulations adopted in the wake of the 2011 Fukushima disaster. Reactor 2 at the plant is the second.
The NRA's final inspection lasted two days. The No. 2 reactor was restarted Oct. 15 and began power generation and transmission Oct. 21. Output was raised gradually until the reactor reached full capacity Nov. 1.
Before the two units were reactivated, no electricity was generated in Japan with nuclear power for nearly two years as all commercial reactors were gradually taken offline amid safety concerns in the wake of the March 2011 Fukushima meltdowns.

The Abe administration is pushing nuclear power as a key electricity source and is promoting the restart of idled reactors across the country even though public sentiment remains strongly negative.
Besides the two-unit Sendai plant, two reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture and one reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture have obtained the necessary safety clearance.
The reactor at the Ikata plant is expected to be reactivated next year after local authorities agreed last month to the restart.
Stricter safety regulations for nuclear reactors were adopted after they were brought to a standstill in the wake of the catastrophe at Tokyo Electric Power Co.'s Fukushima No. 1 plant in 2011.

Takahama: One court injunction to overturn and public opinion to consider

November 25, 2015

Takahama reactors unlikely to restart this year

http://www3.nhk.or.jp/nhkworld/english/news/20151125_34.html
Nov. 25, 2015 - Updated 11:23 UTC+1
Japan's Kansai Electric Power Company, or KEPCO, says it will delay the restart of 2 nuclear reactors in central Japan.

The company was aiming to reactivate the Number 3 reactor at the Takahama nuclear plant in Fukui Prefecture in late December and the Number 4 reactor in mid-January.

On Wednesday the company submitted to regulators a new schedule, restarting Number 3 in late January and Number 4 in late February.

The utility also plans to move nuclear fuel back into Number 3 in late December and Number 4 in late January.

In February, the 2 reactors cleared new regulations introduced after the March 2011 Fukushima nuclear accident. In August, nuclear regulators began the final stage of inspections, but the process has fallen behind schedule.

The new schedule could also see delays. In April, a district court in Fukui issued a provisional injunction blocking restarting the reactors. They cannot operate until the court overturns the injunction.

Fukui Governor Issei Nishikawa has also said local consent is necessary to restart the reactors.

Takahama mayor OK with restart (despite injunction)

December 2, 2015

Takahama mayor to approve nuclear plant restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 2, 2015 - Updated 03:34 UTC+1
The mayor of Takahama Town in Fukui Prefecture on the Sea of Japan coast has decided to agree to the restarts of 2 nuclear reactors at a power plant in his town.

In February, the numbers 3 and 4 reactors at the Takahama nuclear plant met the requirements introduced by the Nuclear Regulation Authority after the 2011 Fukushima Daiichi accident.

The operator, Kansai Electric Power Company, has sought agreements from the host municipality and prefecture for the restarts. The company hopes to have the reactors back online early next year.

Takahama Mayor Yutaka Nose is expected to officially announce his decision on Thursday. He said that what he believes to be the conditions for the restarts have now been met.

One of the conditions is the securing of public understanding of the need for nuclear power plants. He said he confirmed at a meeting with the industry minister last month that the government will take responsibility for this.

Mayor Nose referred to how to effectively evacuate residents beyond administrative boundaries in the case of a nuclear accident. He said the evacuation issue will also be taken up at a meeting hosted by the Cabinet Office.

The Takahama town assembly has already agreed to the restarts, but the Fukui prefectural assembly and the Fukui governor have yet to reveal their intentions.

Meanwhile, the reactors cannot be restarted until a provisional court injunction is lifted. The Fukui District Court issued the injunction in April.

Takahama: What about evacuation?

December 4, 2015

Mayor OKs reactor restarts at Takahama nuke plant; questions remain on evacuation plan

http://mainichi.jp/english/english/newsselect/news/20151204p2a00m0na014000c.html

TAKAHAMA, Fukui -- The mayor of this coastal town gave consent to reactivating the No. 3 and No. 4 reactors at the Takahama nuclear plant on Dec. 3, in defiance of a landmark district court decision that

barred the reactors from being restarted as well as lingering skepticism over the town's nuclear accident evacuation plan.

Mayor Yutaka Nose gave the green-light during a town assembly meeting, with the aim of reinvigorating the local economy, which depends heavily on the nuclear complex.

"After the Fukushima nuclear disaster, measures required (for nuclear facilities) changed drastically," Nose remarked at the outset of the meeting, adding, "We will respond to the matter from a comprehensive perspective while placing top priority on safety."

The town is home to the No. 3 and No. 4 reactors of Kansai Electric Power Co.'s Takahama nuclear plant. In April this year, the Fukui District Court issued a provisional injunction ordering the reactors remain suspended, and legal judgment on the case has yet to be finalized. The town's resident evacuation plan in the event of a nuclear accident is also called into question in terms of its viability.

After the town assembly meeting on Dec. 3, Nose told reporters, "The judicial branch made its decision based on the law, while I made my decision as an administrator in consideration of residents' safety and disaster prevention schemes."

All 14 town assembly members were present at the meeting, while only 15 people occupied the gallery seats. The mayor's declaration to approve the reactor restarts caused a mixed reaction among the observers, with anti-reactivation residents sighing audibly, while a pro-restart resident questioning why it took so long for the mayor to give the go-ahead.

It's been almost three years and nine months since all four reactors at the Takahama plant were suspended.

"I haven't heard of any cases of local businesses going under due to the suspension of the plant, but its repercussions vary depending on the type of business," said a town official.

The town has financially benefited from the nuclear complex, hosting some 1,000 workers during regular inspections of the facility -- a far greater figure than usual. A man in his 80s in the construction business said, "We have a lot of civil engineering work to do thanks to the implementation of new regulatory standards (for nuclear reactors), but stores and inns that had anticipated demand from regular inspections are having a tough time."

In the meantime, anti-nuclear disaster measures are not fully in place yet. Under the town's evacuation plan, residents are supposed to flee in family cars or buses prepared by the municipal and prefectural governments to the Fukui Prefecture city of Tsuruga -- some 50 kilometers east of Takahama -- or to the Hyogo Prefecture city of Takarazuka, among other areas. Residents will be screened for radioactive materials en route to their evacuation destinations. If necessary, residents will undergo a decontamination process.

According to an estimate by the Fukui Prefectural Government, most of the approximately 55,000 residents within a 30-kilometer radius of the Takahama plant will be able to get outside that radius within 11 hours of an evacuation order. However, the escape routes include the two-lane Maizuru-Wakasa Expressway and National Route 27.

"If the news of a nuclear accident breaks, residents would panic," said Yukihiro Higashiyama, 69, head of the citizens group "Furusato o mamoru Takahama Oi no kai" (Association of Takahama and Oi for protecting our hometowns). "Because there are many narrow roads, car accidents may also happen. The evacuation plan is an armchair theory only."

Kaoru Takamura on restarts

December 5, 2015

INTERVIEW/ Kaoru Takamura: No one willing to take responsibility for restarting nuclear reactors

http://ajw.asahi.com/article/views/opinion/AJ201512050005

By SATOSHI DAIGUJI/ Staff Writer

OSAKA--An author who wrote a novel themed on a terrorist attack on a nuclear plant 20 years before the Fukushima disaster unfolded criticized the government for seeking to restart idled reactors as if on cruise control.

"In Japan, there is no stopping something once it has been set in motion," Kaoru Takamura, the 62-year-old author of "Kami no Hi" (Divine fire), told The Asahi Shimbun in a recent interview. "They just go on for no particular reason (continuing policies of the past). This is true not just of nuclear power policy, but of everything.

The Naoki Prize-winning author said only a minimal number of reactors should be allowed to be brought back online to maintain the necessary nuclear technology for decommissioning others and that all other reactors should be scrapped.

Kyushu Electric Power Co. restarted the No. 1 reactor of the Sendai nuclear power plant in Kagoshima Prefecture in August, the first among the nation's 43 reactors to be brought back online under new safety regulations introduced after the Fukushima disaster.

The reactivation put an end to a period without nuclear power, which lasted for a year and 11 months. The utility restarted the No. 2 reactor of the Sendai plant in October.

The Abe administration has said the government will seek to restart nuclear reactors once they meet the new safety standards.

Excerpts from the interview follow:

* * *

Question: The No. 3 and No. 4 reactors of the Takahama nuclear power plant in Fukui Prefecture, operated by Kansai Electric Power Co., are being prepared for restarts, whereas the governor of Ehime Prefecture has given his approval to restarting the No. 3 reactor of Shikoku Electric Power Co.'s Ikata nuclear power plant. How do you assess the situation?

Takamura: I don't see why the utilities are moving to reactivate their nuclear reactors. Oil prices have fallen, and I don't think thermal power generation is as expensive as it once was. I would say there is no rational reason for rushing to restart reactors, much less at the cost of drawing public criticism.

Q: Kansai Electric and all other regional utilities have returned to the black by the April-September 2015 fiscal period. What is your response to that?

A: That is another reason I don't understand why they are moving to reactivate their reactors. It will be impossible, at any rate, to construct new reactors, and you will have to decide to significantly cut the number of nuclear reactors somewhere along the way at a time when more and more reactors reach a 40-year statutory limit of operations.

After all, nobody in the central government probably wants its pro-nuclear policy to be modified. Japan has relied on the peaceful use of nuclear power as a pillar of its economic policy, and nobody wants to have that course changed.

Q: Japan's nuclear power policy could have been altered, given the 2011 triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. What do you think?

A: In Japan, there is no stopping something once it has been set in motion. I think everything boils down to that. They just go on for no particular reason. This is true not just of nuclear power policy, but of everything. Nobody takes responsibility. Nobody makes a decision. Nobody thinks about the future.

The way the Fukushima nuclear disaster was dealt with has left an enormous problem. I think TEPCO should have been made to take the responsibility through and through.

Q: Do you think Japanese society is not able to clearly assign responsibility to a party accountable before going on to the next step?

A: No, it isn't. And that was also the case with the war (World War II). Now, the Fukushima nuclear disaster is being left to fade into oblivion without anyone taking responsibility for the catastrophe. But nothing has ever been settled--such as the issue of radioactive water and the ways to remove debris (melted nuclear fuel).

I visited areas seriously affected by the nuclear disaster on March 11 last year (the third anniversary of the Great East Japan Earthquake and tsunami, which triggered the nuclear accident). I wonder if politicians are seeing what things are like on the ground there. Once you have seen that, I don't believe you will ever want to bring nuclear reactors back online. The areas were deserted and dosimeters kept beeping.

Q: What motivated you to write "Kami no Hi," a work of fiction, in 1991?

A: It's very simple. The Persian Gulf War was going on at the time, and a bunker-busting bomb of the United States was destroying an underground facility built beneath the desert. And the facility had a concrete barrier that was 5 meters thick. I saw that on the news, and I said to myself, "Oh, my God."

The concrete barrier that shields a nuclear reactor containment vessel is only about 1 meter thick at its thinnest. That could be penetrated by a single bomb. I thought something terrible could happen if a contingency were to take place on the Korean Peninsula. In addition, no proper security was in place at nuclear power plants in Japan, so terrorists could easily infiltrate them and blow up a control room. That's so scary, I said to myself, though the possibility of an earthquake like the one in 2011 hitting a nuclear plant never crossed my mind at the time.

Q: Do you feel nuclear plants also pose a risk in the Kansai region?

A: All of western Japan would be destroyed if a major disaster were to hit the Ikata nuclear plant. The same can be said of the Takahama nuclear plant. The Kansai region would become uninhabitable if the waters of Lake Biwako were to be contaminated. I suppose management people in Kansai Electric and Shikoku Electric are probably thinking hopefully that no disaster will occur in their own lifetime, or something like that.

The Kansai region has long had nuclear reactors sited nearby, beginning with the Mihama plant's No. 1 reactor (which began operations in 1970). They were already there when you realized it. Like many in the region, I would go, in my childhood, to Fukui Prefecture to swim in the sea, while sighting nuclear reactors. Kansai residents are half-resigned to the prospect that everything would be finished if a nuclear disaster were to hit.

Q: There is a deep-rooted view that Japan, with its scarce natural resources, has to rely on nuclear power. What do you say to that?

A: I am of the generation of people who believed, around the time nuclear fuel was "lit" for the first time in Japan (in 1957) in Tokai, Ibaraki Prefecture, that science and technology will open up the future. So we don't feel put off by the use of nuclear power as one of the leading-edge technologies. But there are other factors--wars, earthquakes and humans. Humans always commit errors. I have concluded that, because of various circumstances outside the scope of science and technology, we should not be using nuclear power in the world today.
Q: So do you believe that no nuclear reactor should be restarted?
A: Well, I wouldn't say we should go nuclear-free no matter what because you cannot just let nuclear technology die out at a time when the decommissioning of reactors will absolutely be unavoidable in the years to come. We need to define a clear-cut policy, whereby we pick out a clutch of nuclear reactors and bring them back online for the specific purpose of decommissioning others, and scrap all the other reactors.
If utilities are to incur any major losses by writing off impairment from the formal decommissioning of their nuclear reactors, we should help redress their account books somehow, such as by ensuring the central government will temporarily cover those losses. I suppose such a measure would prompt utilities to take steps toward scrapping their reactors.
I think the costs for decommissioning the reactors will be much cheaper than the expenses for dealing with the aftermath of the Fukushima nuclear disaster. I would say that's what rationality is all about. If we were to proceed pointlessly with restarting reactors and if another disaster were to occur elsewhere, we could no longer afford to spend as much money as we did for the Fukushima accident.
* * *
Born in Osaka, Kaoru Takamura, who debuted as a writer with her novel "Ogon wo Daite Tobe" (Fly with the gold) in 1990, won the Naoki Prize, a prestigious literary award, for "Makusu no Yama" (MARKS) in 1993. Her latest work is "Kukai," which partly touches on areas of Fukushima Prefecture that were affected by the nuclear disaster.

Miyazu: "We can in no way accept it"

December 10, 2015

Miyazu mayor in Kyoto Pref. opposes restart of Takahama nuclear reactors

http://mainichi.jp/english/articles/20151210/p2a/00m/0na/016000c
KYOTO -- Miyazu Mayor Shoji Inoue in Kyoto Prefecture has voiced his opposition to the planned reactivation of the No. 3 and 4 reactors at the Takahama Nuclear Power Plant in the Fukui Prefecture town of Takahama.
"In the present circumstances, we can in no way accept it," Inoue told the city assembly on Dec. 8. Miyazu city is not granted the right to say "yes" or "no" to any plan to restart the Takahama nuclear plant although it is located within 30 kilometers from the atomic complex. It is the first time for a local chief executive of such a municipality to declare their opposition to reactivating the reactors.
Asked by a city assembly member about his view on the planned reactivation of the Takahama reactors during a question-and-answer session, Inoue said, "In light of the intentions of the city assembly and citizens, we can in no way accept it."

There are three prefectures and 12 municipalities that are located within 30 kilometers from the Takahama plant, and most of Miyazu city falls within the 30-kilometer zone. **Plant operator Kansai Electric Power Co., however, singled out the Fukui Prefecture town of Tahakama that hosts the nuclear plant and Fukui Prefecture as the only local bodies that can agree or disagree to reactivation of the Takahama reactors.**

Fukui Pref. approves restart of Nos. 3 and 4

December 17, 2015
Fukui prefecture approves restart of 2 reactors
http://www3.nhk.or.jp/nhkworld/english/news/20151217_35.html

Dec. 17, 2015 - Updated 13:52 UTC+1

The Fukui Prefectural Assembly has approved the restart of two reactors at the Takahama nuclear power plant on the Sea of Japan coast.

The No. 3 and No. 4 reactors obtained safety clearance in February from Japan's nuclear watchdog, under stricter regulations introduced after the 2011 nuclear accident in Fukushima.

The plant's operator, Kansai Electric Power Company, has been seeking the permission of the host town and the prefecture to restart the reactors.

A draft resolution supporting of the move was submitted on Thursday to the plenary session of the prefectural assembly.

It met opposition from some members who said it's too early to make a decision on the matter. They said the local nuclear disaster evacuation plan has defects that need to be addressed first.

But the resolution was adopted by a majority vote.

Attention is now focused on Fukui Governor Issei Nishikawa. He said he'll make a decision on the restarts after hearing from experts and learning more about the central government's policies.

Nishikawa said Fukui is facing all kinds of nuclear power issues, including whether to decommission old reactors or extend their 40-year operational limit.

He said the central government needs to explain how it's going to address those problems.

The 2 reactors can't go back online until a provisional injunction issued in April by a local court is lifted. A decision is expected on the injunction next Thursday.

Takahama evacuation plan approved

December 18, 2015

Government OKs evacuation plan in key step for Takahama nuclear plant restart

http://www.japantimes.co.jp/news/2015/12/18/national/government-oks-evacuation-plan-key-step-takahama-nuclear-plant-restart/#.VnPTfr8R-if

Kyodo

The central government approved an evacuation plan Friday for residents near an idled nuclear power plant on the Sea of Japan coast, as it steps up efforts to bring more reactors back online following the 2011 Fukushima nuclear crisis.

A government commission gave the nod to an emergency plan for 180,000 people living within 30 kilometers of Kansai Electric Power Co.'s Takahama nuclear plant in Fukui Prefecture in the event of a serious accident.

The plan was presented to the Nuclear Emergency Preparedness Commission, chaired by Prime Minister Shinzo Abe, after it was finalized earlier in the week by the Cabinet Office as well as Fukui and neighboring Kyoto and Shiga prefectures.

"Should an accident occur, the government will take authority in responding to it," Abe said at a commission meeting.

The approved evacuation plan — the first covering neighboring prefectures — includes evacuation routes and facilities to be used as shelters, as well as rescue measures for people who may be left without an overland escape route. The Takahama plant, about 380 km west of Tokyo, is located at the base of the Otomi Peninsula.

The approval is an important step forward for the power company to resume operations at the plant after its No. 3 and No. 4 reactors cleared stricter safety regulations introduced after the Fukushima disaster.

The restart of the reactors would come after two units at Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture went back online this year in the first nuclear power generated under the tighter safety rules.

However, a court injunction in April has banned Kansai Electric from reactivating the Takahama units over safety concerns. The Fukui District Court will make a decision next week on the utility's appeal against the decision.

Despite strong public opposition to the restarts, the government is aiming for at least 20 percent of the nation's electricity to come from nuclear power by 2030.

On Thursday, the Fukui Prefectural Assembly gave its consent to the restart of the two reactors at the Takahama plant.

Industry minister Motoo Hayashi, who in charge of the country's energy policy, will likely meet with Fukui Gov. Issei Nishikawa on Sunday, with the governor expected to later express approval for the restarts, according to a source familiar with the matter.

"We will continue to make efforts to seek (public) understanding in a cautious manner," Hayashi said at a news conference.

Govt. OKs evacuation plan for Takahama plant

http://www3.nhk.or.jp/nhkworld/english/news/20151218_21.html

Dec. 18, 2015 - Updated 06:35 UTC+1

The Japanese government has decided on an evacuation plan for residents around the Takahama nuclear power plant in Fukui Prefecture, on the Sea of Japan.

The plan, which was approved on Friday at a meeting of the government task force on nuclear disaster preparedness, was drawn up by the central government as well as local authorities including Fukui Prefecture.

How to evacuate residents in the event of an accident poses a grave challenge to the authorities, as around 180,000 people live in the 30-kilometer zone that covers the 3 prefectures of Fukui, Kyoto and Shiga.

The plan includes securing accommodations for evacuees should they have to flee beyond prefectural boundaries.

At the meeting, Prime Minister Shinzo Abe said safety is the top priority. But he added that nuclear power is indispensable if resource-poor Japan is to secure a stable energy supply.

Fukui Governor Issei Nishikawa says he will judge whether to approve plans to restart 2 reactors at the Takahama plant after considering a final report of a prefectural panel of experts as well as the views of the central government.

Meanwhile, a court injunction has been in place since April barring the reactors from being brought online.

The Fukui District Court is expected to issue a decision on Thursday of next week on an objection filed by Kansai Electric Power Company, the operator of the Takahama plant.

Waiting for Fukui Governor's answer

December 20, 2015

Minister meets Fukui governor over plant's restart

http://www3.nhk.or.jp/nhkworld/english/news/20151220_21.html

Dec. 20, 2015 - Updated 16:23 UTC+1

Japan's industry minister has sought understanding from the governor of Fukui Prefecture for restarting a local nuclear power plant.

Motoo Hayashi met Governor Issei Nishikawa after inspecting the Takahama plant on Sunday.

Hayashi said the government would take charge of dealing with a possible nuclear accident. He also said the government plans to hold briefings across Japan to convince the public that the country needs nuclear power.

Nishikawa replied that he appreciates the government's policy.

The operator of the Takahama plant, Kansai Electric Power Company, is undergoing the final screening for restarting the No.3 and No.4 reactors.

The mayor of Takahama Town and the Fukui prefectural assembly have given their consent for the restart.

Nishikawa is expected to make a decision on the issue.

The Fukui District Court issued a provisional injunction in April blocking the restart of the 2 reactors. The plant's operator has filed an objection.

The court is scheduled to give a judgment on the matter on Thursday.

Fukui Governor OKs restart

December 22, 2015

Governor approves Takahama plant restart

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 22, 2015 - Updated 04:46 UTC+1

The governor of Fukui Prefecture has approved the restart of 2 reactors at the Takahama nuclear power plant.

Governor Issei Nishikawa announced his decision on Tuesday morning. The approval follows that of the mayor of Takahama, the town hosting the plant.

It is the third plant that has been approved for a restart by the hosting prefecture and municipality after the introduction of new government regulations following the March 2011 Fukushima Daiichi accident.

The operator of the Takahama plant, Kansai Electric Power Company, is undergoing final inspection for

the restart.

It plans to place fuel rods into the No. 3 reactor later this month and into the No.4 reactor in late January. It aims to restart each reactor a month after the procedure.

But the restart may not go according to plan. A district court issued a provisional injunction banning the move in April.

Kansai Electric has filed an objection to the injunction. The court will rule on the objection on Thursday.

Fukui Governor OKs restart (2)

December 22, 2015

Fukui gov. OKs restart of Kansai Electric nuclear reactors

http://mainichi.jp/english/articles/20151222/p2g/00m/0dm/056000c

FUKUI, Japan (Kyodo) -- As Japan seeks to push ahead with the resumption of nuclear power generation following the 2011 Fukushima nuclear crisis, the Fukui governor announced Tuesday he has approved the restart of two nuclear reactors in the prefecture.

Gov. Issei Nishikawa gave the go-ahead for Kansai Electric Power Co. to reactivate the Nos. 3 and 4 reactors at its Takahama plant on the Sea of Japan coast. The utility is looking to restart the No. 3 unit in late January and the No. 4 unit in late February.

However, a court injunction issued in April bans Kansai Electric from reactivating the Takahama units due to safety concerns. The Fukui District Court will make a decision Thursday on an objection filed by the utility against the injunction.

The governor's announcement came after industry minister Motoo Hayashi and Kansai Electric President Makoto Yagi met with him Sunday and Monday, respectively, to secure his consent for the restart.

"I gave comprehensive consideration to the country's and the operator's policy and reached a conclusion" on the restart, the governor said.

Kansai Electric's Yagi said in a release that his company will make best efforts for thorough safety management to prevent an accident like the Fukushima disaster from happening again.

Japan ended a nearly two-year period without nuclear power when two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture were brought back online earlier this year.

The governor of Ehime Prefecture gave approval for the reactivation of a reactor at Shikoku Electric Power Co.'s Ikata plant in October.

The Fukui governor also cited approval by the local prefectural assembly and the mayor of Takahama as well as safety checks conducted by the prefecture as key factors for his decision, on top of safety clearance by the Nuclear Regulation Authority.

Nishikawa said earlier supporting the local economy, creating new jobs and gaining public understanding would be necessary conditions for deciding in favor of restarting the reactors.

The reactivation should "stabilize employment and boost the economy" in the region, Yasutaka Tanaka, a 59-year-old local gas station owner, said.
Tadashi Matsuda, one of those who filed for the injunction, said the governor had acted prematurely as a court decision has yet to be issued.

Fukui Governor OKs restart (3)

December 22, 2015

Despite injunction, Fukui governor gives green light to restart nuclear reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201512220073
By KEIBU HORIKAWA/ Staff Writer
FUKUI--The Fukui governor on Dec. 22 approved the restarts of two reactors at the Takahama nuclear plant, despite a court injunction that forbids such operations because of the dangers posed by earthquakes.
Kansai Electric Power Co., operator of the plant, has filed an objection to the injunction issued in April by the Fukui District Court. The district court is expected to announce a decision on the matter on Dec. 24.
The injunction was sought by residents living in an area 50 to 100 kilometers from the nuclear plant.
Asked why he did not wait to announce his approval until after the court's decision, Governor Issei Nishikawa said at a Dec. 22 news conference: "There is no particular reason. The timing should not be the issue."
Fukui became the third prefectural government to give the nod to restarting reactors, following Kagoshima and Ehime prefectures, under new nuclear safety regulations that took effect in 2013 after the 2011 Fukushima nuclear disaster.
Of Japan's 43 active reactors, only two at the Sendai plant in Kagoshima Prefecture are currently operating.
Although the court injunction remains in place, Nishikawa's approval to restart the Takahama No. 3 and No. 4 reactors represents another step forward in Kansai Electric's long desire to bring its nuclear reactors back online.
If the utility's objection is granted, Kansai Electric plans to restart the No. 3 reactor in late January and the No. 4 reactor in late February.
The Nuclear Regulation Authority in February said the Takahama No. 3 and No. 4 reactors have met the more stringent safety standards.
The municipal assembly of Takahama, which hosts the nuclear complex, endorsed the proposed reactor restarts in March, followed by Takahama Mayor Yutaka Nose's approval on Dec. 3, and the prefectural assembly's green light on Dec. 17.
Nishikawa's decision came after Prime Minister Shinzo Abe pledged at a Dec. 18 meeting of the central government's nuclear disaster prevention council to hold briefings across the nation to gain the public's support for resuming nuclear plant operations.
Concerns about the nuclear safety persist among the public, given the continuing battle over the triple meltdown at the Fukushima No. 1 nuclear power plant, and the fact that Japan is one of the most quake-prone nations in the world.

Abe also promised that the central government will responsibly come up with comprehensive measures to address nuclear-related issues in Fukui Prefecture, such as extending the operating licenses of reactors beyond the 40-year limit, decommissioning aged reactors, and deciding the fate of the Monju prototype fast-breeder reactor, the problem-plagued centerpiece of Japan's nuclear fuel recycling project.
Nishikawa has said that promoting public understanding of the safety of nuclear complexes was the most important precondition toward a restart. With the prime minister's pledge, Nishikawa apparently decided that all of his requirements toward a restart had been met.
But no plans have been set to secure the safety of residents within a 30-km radius of the Takahama plant in the event of a serious accident. About 180,000 people live in this 30-km zone, which also covers parts of Kyoto and Shiga prefectures.
In light of the Fukushima triple meltdown, local governments hosting nuclear facilities have been required to come up with evacuation plans to prepare for a disaster.
But localities in the Takahama zone have yet to secure vehicles, build roads for a possible exodus or compile measures to ease traffic congestion and eliminate other hurdles for a workable nuclear evacuation plan.
The No. 3 and No. 4 reactors, each with a capacity of 870 megawatts, began commercial operations in 1985. The Takahama plant is one of three nuclear complexes operated by Kansai Electric in Fukui Prefecture.

Fukui's court decision expected on Dec.24

December 23, 2015

Ruling on Takahama nuclear plant to come Thursday [24 Dec.]
http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 23, 2015 - Updated 02:42 UTC+1
A court in Fukui Prefecture, central Japan, will issue a ruling on Thursday on an objection filed by the operator of the Takahama nuclear power plant to a provisional injunction blocking the restart of 2 reactors.

If the restart is approved, Kansai Electric Power Company says it will start loading fuel into one of the reactors as early as Friday.

The court issued the injunction in April to keep the plant's No.3 and No.4 reactors offline. Japan's nuclear regulators decided in February that the reactors satisfied revised government requirements to prepare nuclear plants for disasters.

The governor of Fukui Prefecture and the mayor of Takahama Town separately approved their restart earlier this month.
The No.3 reactor had undergone inspections of new equipment that had been installed to prepare for disasters, and was ready to load fuel.

If the court approves the restart, Kansai Electric is ready to begin inserting 157 fuel assemblies into the No.3 reactor as early as Friday.

If the restart is rejected, the utility is likely to postpone the start of the procedure.

Fukui court lifts injunction

December 24, 2015

Fukui court allows nuclear restarts

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html
Dec. 24, 2015 - Updated 06:23 UTC+1
A Japanese court has issued a decision that paves the way for the restart of 2 nuclear reactors at a plant in central Japan.

The court reversed an earlier injunction won by residents to keep the reactors at the Takahama nuclear plant offline.

The Fukui District Court issued the injunction in April to keep the plant's No.3 and No.4 reactors offline, citing safety concerns.

The operator of the plant, Kansai Electric Power Company, had filed an objection.

Japan's nuclear regulators decided in February that the reactors at Takahama satisfy new, stricter requirements introduced after the 2011 Fukushima nuclear disaster.

On Thursday, the court said it found nothing irrational in the judgment by the Nuclear Regulation Authority.

The local governor and mayor had already consented to the restart.

With the latest decision, Kansai Electric hopes to restart the No.3 reactor as early as next month.

The court also announced its decision in a separate case. It dismissed a request by citizens to block the restart of 2 reactors at the Ohi nuclear plant, also in central Japan.

Fukui District Court rules in favor of nuclear reactor restart

http://mainichi.jp/english/articles/20151224/p2a/00m/0na/012000c

December 24, 2015 (Mainichi Japan)

The Fukui District Court on Dec. 24 lifted a temporary injunction that had prevented the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama Nuclear Power Plant in Fukui Prefecture from being restarted.
Mayor Yutaka Nose had given consent to reactivating the No. 3 and No. 4 reactors at the Takahama nuclear plant on Dec. 3, in defiance of the temporary injunction.
In April this year, the Fukui District Court issued a provisional injunction ordering that the reactors remain suspended.

Japan court lifts injunction on restart of Takahama nuclear plant

http://www.japantimes.co.jp/news/2015/12/24/national/japan-court-lifts-injunction-restart-takahama-nuclear-plant/#.VnujoVIR-id

Kyodo
The Fukui District Court on Thursday lifted an injunction against the restart of the Takahama nuclear power plant in Fukui Prefecture.

On Tuesday, Fukui Gov. Issei Nishikawa gave his go-ahead for Kansai Electric Power Co. to restart the No. 3 and No. 4 reactors at the facility.
The utility is looking to restart No. 3 in late January and No. 4 in late February.
The court injunction was brought in April. Kepco challenged it.

Unjust and unacceptable

December 24, 2015

Residents' lawyer: Court decision unjust

http://www3.nhk.or.jp/nhkworld/english/news/20151224_27.html

Dec. 24, 2015 - Updated 10:07 UTC+1
A lawyer for residents who sought an injunction to block the restart of 2 reactors at the Takahama plant has denounced Thursday's court decision as unjust.

Lawyer Hiroyuki Kawai said the Fukui District Court's decision to reverse an earlier injunction was extremely unjust and unacceptable.

He said the court refused to learn from the lessons of the 2011 Fukushima nuclear accident. He also said the court seems to have a foregone conclusion as it apparently considered the plant operator's schedule for restart.

Kawai expressed intent to immediately file an appeal of the case with a high court.

One of the residents who filed the case, Harumi Kondaiji, said she felt indignant that the judge gave up being the guardian of the law and trampled on basic human rights.

Kondaiji said she will turn her indignation to energy to further their fight against the restart.

Kansai Electric happy

Kansai Electric welcomes decisions

http://www3.nhk.or.jp/nhkworld/english/news/20151224_26.html
Dec. 24, 2015 - Updated 09:31 UTC+1

Kansai Electric Power Company has welcomed a district court's 2 decisions on Thursday regarding reactors at 2 of the firm's nuclear plants in central Japan.

Kansai Electric said both decisions support its belief that safety at its Takahama and Ohi plants has been secured.

It said it intends to keep making constant efforts to improve safety at all of its plants.

The company says it will ensure that the facilities meet new, stricter requirements set by Japan's nuclear regulator so that their operation will have support from local communities and society at large.

The utility says it will aim to restart plants that have cleared safety checks as soon as possible.

Takahama: Fuel loading to begin straight away

December 24, 2015

Nuclear fuel to be put into reactor

http://www3.nhk.or.jp/nhkworld/english/news/20151225_02.html
Dec. 24, 2015 - Updated 20:28 UTC+1
The operator of a nuclear power plant in central Japan will begin work on Friday to load fuel into a reactor. A court decision previously allowed the restart of 2 reactors at the Takahama plant.

The Fukui District Court delivered the judgment on Thursday, reversing an injunction it issued in April to keep the plant's No.3 and No.4 reactors offline.

The plant's operator, Kansai Electric Power Company, had filed an objection to the injunction. Different judges presided over the 2 trials.

The governments of the plant's host town, Takahama, and Fukui Prefecture approved the restart earlier this month.

Kansai Electric plans to maneuver a crane and other equipment to finish moving 157 fuel assemblies to the No.3 reactor from a pool in an adjacent building by Tuesday of next week. They will include 24 units of MOX fuel, a mixture of plutonium extracted from spent fuel and uranium.

It will be the first time in about 3 years and 9 months for fuel to be inserted into the reactor. Kansai Electric says it will carefully perform the loading work.

When the fuel transfer is complete, preparations to restart the reactor will enter into the final stages. The utility plans to resume the reactor's operation late next month after checks of key safety facilities.

The reactor is expected to be the third to be restarted under new, stricter requirements introduced after the 2011 nuclear accident at the Fukushima Daiichi plant.

Two reactors at the Sendai plant in the southwestern prefecture of Kagoshima came back online earlier this year.

Kansai Electric says **it intends to restart the No.4 reactor at the Takahama plant in late February.**

Takahama: Fuel loading begins

December 25, 2015

Kansai Electric to begin fuel loading for Fukui nuclear restart

Kyodo
http://www.japantimes.co.jp/news/2015/12/25/national/kansai-electric-to-begin-fuel-loading-for-fukui-nuclear-restart/

TSURUGA, FUKUI PREF. – Kansai Electric Power Co. said Friday it has started loading nuclear fuel into a reactor on the Sea of Japan following a court decision to lift an injunction against the move, paving the way for its restart in late January, which would be the country's third reactor to go online.
After the restart earlier this year of two reactors in southwestern Japan, while others remain offline in the aftermath of the 2011 Fukushima nuclear disaster, the No. 3 reactor at the utility's Takahama plant in Fukui Prefecture would be the first to run on uranium-plutonium mixed oxide, or MOX fuel, if it begins operations as scheduled.
The utility is scheduled to insert a total of 157 fuel rod assemblies by the next Tuesday, including 24 made from MOX fuel, according to Kepco.
The reactor along with the No. 4 unit at the same plant was allowed to resume operation by the Fukui District Court on Thursday.

The power company envisions reactivating the No. 3 unit sometime between Jan. 28 and 30 and having it start power generation and transmission around Feb. 1, followed by the restart of the No. 4 unit in late February.
"We will put top priority on the safety of the work" for the restart, Kansai Electric President Makoto Yagi said at a news conference Friday.
Japan returned to nuclear power generation when Kyushu Electric Power Co. brought two reactors at its Sendai plant in Kagoshima Prefecture back online earlier this year.
The government seeks to make up at least 20 percent of the country's electricity using nuclear power plants by 2030.
The restart of Takahama's two reactors will be "a step forward" toward the goal, Motoo Hayashi, the industry minister in charge of the energy policy, said at a news conference Friday.
Prior to the court decision, both reactors gained approval for resumption from the state's Nuclear Regulation Authority in February.
The injunction issued by the court in April, however, banned the utility from restarting the units until it was lifted on Thursday.
Fukui Gov. Issei Nishikawa on Tuesday gave the go-ahead for the company to restart the two units following approval by the local prefectural assembly and the mayor of Takahama.
The court's presiding Judge Jun Hayashi said in Thursday's decision that he recognizes the rationality of the post-Fukushima safety regulations set by the nuclear regulator.
Hideaki Higuchi, the presiding judge when the same court issued the injunction in April, said then the court could not see any credible evidence in the utility's assumptions regarding earthquake risk and restarting the two reactors posed "imminent danger" to residents around the plant, which is about 380 km west of Tokyo.

Fuel loading starts at Takahama reactor

http://www3.nhk.or.jp/nhkworld/english/news/20151225_27.html

Dec. 25, 2015 - Updated 09:29 UTC+1
The operator of the Takahama nuclear power plant in Fukui Prefecture, central Japan, has begun loading fuel into a reactor to bring it back online.

One day earlier, a court in Fukui lifted an injunction that was blocking restart of the plant's No.3 and No.4

reactors.

Kansai Electric Power Company on Friday started the loading process at the No.3 reactor. Its containment vessel has been empty of fuel since March 2012.

157 fuel units will be moved to the vessel from a storage pool using cranes through Tuesday. 24 units are MOX fuel, a mixture of plutonium from spent fuel, and uranium.

Kansai Electric plans to restart the reactor in late January after an inspection of critical equipment.

It would be the 3rd reactor to be reactivated under new stricter requirements introduced after the 2011 nuclear accident in Fukushima. 2 reactors at the Sendai plant in Kagoshima Prefecture were restarted earlier this year.

The use of MOX fuel would be the first in about 3 years and 11 months.

Kansai Electric plans to restart the No.4 reactor in late February.

Takahama restart: No guarantee of safety

December 25, 2015

Editorial: No guarantee of safety with end to Takahama reactor restart injunction

http://mainichi.jp/english/articles/20151225/p2a/00m/0na/019000c

The Fukui District Court on Dec. 24 revoked a provisional injunction banning the restart of the No. 3 and 4 reactors at the Takahama Nuclear Power Plant in Fukui Prefecture. Since Kansai Electric Power Co. (KEPCO), the operator of the power station, has gained consent from the local community to restart the reactors, the utility is set to begin preparations to resume operations. The move would follow the reactivation of the No. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai plant.

The court made the decision in response to an appeal that KEPCO filed against the provisional injunction -- which had been issued by another presiding judge at the same court in April this year. The point of contention during hearings was whether the green light that the Nuclear Regulation Authority (NRA) issued to the planned reactivation -- based on its inspection on the reactors under the new regulatory standards -- is rational.

The court determined that the inspection the NRA conducted on the reactors was legitimate, noting that the NRA's evaluation of the quake-resistance of the nuclear complex reflects the latest scientific and technological knowledge and that the authority has advanced expertise and is fully independent. The

court thus upheld KEPCO's assertions and concluded that no problem involving the plant's safety can be found.
In contrast, the provisional injunction had stated that the new regulatory standards must be strict enough to ensure that a serious nuclear accident never occurs based on the notion that nuclear plants must not be operated if there is even a small risk of an accident.
The latest decision overturned this idea. Courts remain divided over levels of safety that nuclear plants need following the outbreak of the Fukushima nuclear crisis in March 2011.
Courts had been reluctant to evaluate of the safety of nuclear plants. A ruling that the Supreme Court handed down on a lawsuit on Shikoku Electric Power Co.'s Ikata nuclear plant in 1992 expressed its view that the evaluation of the safety of atomic power stations "requires the latest scientific, technological and comprehensive judgment, and is left to the discretion of rational judgment by the administrative branch." This framework had been maintained until the outbreak of the nuclear disaster.
However, **the accident at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant operated by Tokyo Electric Power Co. demonstrated that an accident could occur at a nuclear plant even if it passes an inspection by the national government. Courts now need to more strictly examine safety evaluations of nuclear plants by the executive branch.**
The presiding judge who issued the provisional injunction banning the restart of the No. 3 and 4 reactors at the Takahama plant also handed down a ruling in May last year prohibiting KEPCO from reactivating the No. 3 and 4 reactors at its Oi plant.
In his ruling on the lawsuit regarding the Oi plant, the presiding judge prioritized local residents' personal rights to protect their lives and stated that operations at nuclear plants "can be banned as long as there are specific risks, even if the risks are low."
While dismissing a petition for a provisional injunction to ban operations at the Oi and Takahama plants, the Otsu District Court warned in November last year against attempts to hastily restart idled nuclear reactors. "It's impossible to restart reactors as long as no progress is made on the compilation of **evacuation plans."**
Meanwhile, the Kagoshima District Court ruled in April this year in dismissing a petition for a ban on the restart of the Sendai nuclear plant that there is no irrationality in the new safety standards and that an inspection the NRA conducted on the plant was appropriate. The latest Fukui District Court decision also endorses the NRA's broad discretionary power. As such, courts are tending to go back to their passive attitude toward safety evaluations of nuclear plants.
Following the court's decision, KEPCO inserted nuclear fuel into the No. 3 reactor at the Takahama plant with an aim of restarting it in late January 2016. The Fukui District Court cautioned in its latest decision that the green light given by the NRA to the restart of the Takahama reactors "does not rule out the possibility that a serious accident will occur" at the power station. The court thus urged the national government and power companies to implement countermeasures against such disasters, including the compilation of evacuation plans for local residents. Without taking such steps, utilities should not be allowed to restart their idled nuclear reactors.

Takahama: Fuel injection completed

December 29, 2015

Takahama reactor 3 fuel injection completed, including MOX assemblies

http://www.japantimes.co.jp/news/2015/12/29/national/takahama-reactor-3-fuel-injection-completed-including-mox-assemblies/#.VoKnqVIR-id

JIJI
OSAKA – Kansai Electric Power Co. said Monday that it has finished work to inject fuel into reactor 3 at its Takahama nuclear power station in Fukui Prefecture.
The company installed a total of 157 fuel assemblies in the reactor. Among them are 24 units of mixed oxide, or MOX, fuel, a blend of uranium and plutonium extracted from spent nuclear fuel.
The fuel-loading work finished around 6 p.m. Monday (9 a.m. GMT), ahead of schedule, after being launched Friday afternoon.
The work was suspended temporarily after some of the fuel assemblies hit a container on Friday. There were no other problems.
The Takahama unit 3 would be the third reactor to be brought back online under Japan's new nuclear safety standards introduced in July 2013, after the triple reactor meltdown at Tokyo Electric Power Co.'s disaster-stricken Fukushima No. 1 nuclear plant in March 2011.
The other two other reactors are units 3 and 4 at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture. The two, reactivated earlier this year, are currently the only active reactors in Japan.
The fuel injection into the Takahama unit 3 came after the Fukui District Court on Thursday reversed its earlier decision against the restart of the reactor and unit 4 at the same plant, dismissing local residents' opposition due to safety risks.
The Fukui Prefectural Government and the municipal government of Takahama, host to the plant, have already given their consent to the restart.
Following the completion of the fuel injection, Kepco will check the containment vessel and ductwork for reactor 3. The company aims to put the reactor back online between Jan. 28 and 30.

December 29, 2015

Takahama reactor likely to be reactivated in Jan.

http://www3.nhk.or.jp/nhkworld/english/news/20151229_21.html

Dec. 29, 2015 - Updated 15:42 UTC+1

The operator of the Takahama nuclear power plant in Fukui Prefecture, central Japan, plans to reactivate one of its reactors in late January.

Kansai Electric Power Company started loading fuel into the plant's No.3 reactor last Thursday. That's one day after a court in Fukui lifted an injunction that was blocking the restart of the plant's No.3 and No.4 reactors.

Utility officials say the crane loading work was suspended for over 6 hours after an alarm went off on

Friday night while moving fuel from a storage pool into the containment vessel.

The officials say the operation went well after that and that they finished putting 157 fuel units into the reactor on Monday evening.

Kansai Electric plans to restart the No.3 reactor next month after inspecting critical equipment.

It would be the 3rd reactor to be reactivated under new stricter requirements introduced after the 2011 nuclear accident in Fukushima. Two reactors at the Sendai plant in Kagoshima Prefecture were restarted earlier this year.

Kansai Electric also plans to start loading fuel into the No.4 reactor in late January and restart it in late February.

IAEA on NRA

25.01.2016_No8 / News

Japan's Regulator Needs To Prepare For Restarts, Says IAEA

http://www.nucnet.org/all-the-news/2016/01/25/japan-s-regulator-needs-to-prepare-for-restarts-says-iaea

25 Jan (NucNet): Japan's regulatory body for nuclear and radiation safety has demonstrated independence and transparency since it was set up in 2012, but needs to further strengthen its technical competence in light of the planned restart of nuclear reactors following the March 2011 Fukushima-Daiichi accident, an International Atomic Energy Agency (IAEA) team of experts said.
The Integrated Regulatory Review Service (IRRS) team on Friday concluded a 12-day mission to assess Japan's regulatory framework for nuclear and radiation safety, which was modified following the Fukushima-Daiichi accident. The modifications included the establishment of the Nuclear Regulation Authority (NRA) in September 2012.

The IAEA team – made up of 19 experts from 17 countries and five IAEA staff – warned of "significant challenges" ahead and called on the NRA to work to attract competent and experienced staff, and improve staff skills.

The team said Japanese authorities should amend legislation to allow the NRA to perform more effective inspections of nuclear and radiation facilities.

The NRA and all the organisations it regulates should continue to strengthen the promotion of safety culture, including by fostering "a questioning attitude", the team said.

The team praised Japan for swiftly establishing a legal and governmental framework that supports a new independent and transparent regulatory body with increased powers.

It also said the NRA had incorporated lessons learnt from Fukushima-Daiichi in the areas of natural hazards, severe accident management, emergency preparedness and safety upgrades of existing facilities, into Japan's new regulatory framework.

"In the few years since its establishment, the NRA has demonstrated its independence and transparency," said team leader Philippe Jamet, commissioner of the French Nuclear Safety Authority. "It has established new regulatory requirements for nuclear installations and reviewed the first restart applications by utilities. This intensive and impressive work must continue with equal commitment, as there are still significant challenges in the years to come."

The IAEA said IRRS missions are designed to strengthen the effectiveness of the national nuclear regulatory infrastructure, while recognising the responsibility of each state to ensure nuclear safety.

Before being halted following the Fukushima-Daiichi accident, Japan's nuclear power reactors produced about 30 percent of the country's electricity generation, the IAEA said. Two reactors were restarted in 2015 with NRA authorisation, and the NRA is reviewing other restart applications using the new requirements. The country also has fuel cycle facilities, research reactors and widely uses nuclear applications in other fields.

The IAEA team reviewed the responsibilities and functions of the government and the regulatory body for safety, the authorisation of nuclear and radiation facilities and activities, safety assessments, inspections of nuclear facilities, emergency preparedness and response, and several other areas in the field of nuclear and radiation safety.

The team met NRA staff, observed regulatory activities including inspections, and visited nuclear-related sites. They also met with other Japanese officials, the IAEA said.

Juan Carlos Lentijo, IAEA deputy director-general and head of the department for safety and security, said Japan has reformed its regulatory system with "impressive speed and effectiveness" following the Fukushima-Daiichi accident.

"Today, the system provides for clearer responsibilities and greater authority to the regulatory body," he said. "The NRA is on a good path to continue this crucial progress in the future. Its work must continue to ensure that the new regulatory system is applied fully to all facilities and activities."

All of Japan's 48 commercial reactor units were shut down for safety checks and upgrades following Fukushima-Daiichi. Five reactors have been earmarked for permanent shutdown, bringing the number of potentially operable commercial units in the country to 43.

In May 2015 Japan's government said it wanted to see a 20-22 percent nuclear share in the country's energy mix by 2030, down from about 30 percent before Fukushima-Daiichi.

Safety agreement for Shiga prefecture

January 25, 2016

Shiga Pref., Takahama nuclear plant operator sign safety accord

http://mainichi.jp/english/articles/20160125/p2g/00m/0dm/083000c

OTSU (Kyodo) -- The Shiga prefectural government on Monday signed an agreement with Kansai Electric Power Co. on safety issues concerning its Takahama nuclear power plant, located in adjacent Fukui Prefecture, ahead of its planned restart later in the week.

The plant in western Japan will be the second nuclear power station in the country to resume operations under a set of new safety regulations that have been introduced in the wake of the 2011 Fukushima Daiichi nuclear power plant disaster.

The safety accord requires Kansai Electric to immediately report emergency situations at the plant and compensate for damage caused by accidents. But it stopped short of giving Shiga Prefecture a say over the reactors' return to service -- the right usually awarded to host municipalities -- as requested by the prefectural government.

The Fukushima crisis has led the central government to expand the buffer areas around nuclear power plants that should prepare for evacuation from a 10-kilometer radius to 30 km, and local governments which do not host the plants but could be largely hit by accidents have called for a greater say on safety matters.

Shiga Prefecture, a small part of which falls within the 30 km zone, has sought to be part of the process of giving local consent to Kansai Electric on the restart of the four-reactor Takahama complex, but the utility did not agree to the request.

Only Fukui Prefecture and the town of Takahama that host the plant were involved in the process.

Shiga Gov. Taizo Mikazuki said Monday the signing of the accord marked "progress" in terms of fulfilling the prefecture's responsibility to ensure the safety of local people.

But Mikazuki later told reporters that he told Kansai Electric President Makoto Yagi, who attended the signing ceremony together with the governor, that he was reluctant to accept the resumption and asked that Shiga Prefecture be treated in the same way as host areas.

Under the accord, Kansai Electric will also report its plans to transport nuclear fuel and radioactive waste in advance, while cooperating on the prefecture's disaster mitigation measures.

The utility will also promise in a separate document to provide explanations in advance on important changes at the plant, such as the construction of new reactors.

Kansai Electric on Monday reported to the Nuclear Regulation Authority that it will reboot the plant's No. 3 reactor Friday evening.

It will be the first reactor running on uranium-plutonium mixed oxide fuel under the country's new safety regulations that were imposed in 2013. The No. 4 reactor is also scheduled to resume operation in late February, with its nuclear fuel to be loaded on Sunday.

January 25, 2015

Shiga, Kansai Electric sign safety accord ahead of Takahama reactor restart

Kyodo

OTSU, SHIGA PREF. – The Shiga Prefectural Government signed an agreement Monday with Kansai Electric Power Co. on safety issues concerning the Takahama nuclear plant in adjacent Fukui Prefecture, which is scheduled to be restarted Friday.

The plant will be the second nuclear power station in Japan to resume electricity generation under new safety regulations introduced after the 2011 Fukushima crisis.

The safety accord requires Kansai Electric to immediately report emergency situations at the plant and compensate for damage caused by accidents. But it stops short of acquiescing to Shiga Prefecture's demand for a say over the plant's reactivation — a right usually awarded to host municipalities.

The Fukushima disaster led the central government to expand the evacuation preparation areas around nuclear plants to a radius of 30 km instead of 10 km. Local governments that do not host nuclear plants but could be adversely affected by an accident have called for a greater say in safety.

Shiga, a small part of which falls within the Takahama plant's 30-km buffer zone, has sought a role in the local consent process for approving the restart of the four-reactor Takahama complex, only to be rebuffed by Kansai Electric.

Only Fukui Prefecture and the town of Takahama, which hosts the plant, were involved in the process.

Shiga Gov. Taizo Mikazuki said Monday the signing of the accord marked "progress" in terms of fulfilling the prefecture's responsibility to ensure public safety.

But Mikazuki later told reporters that he told Kansai Electric President Makoto Yagi, who attended the signing ceremony together with the governor, that he was reluctant to accept the plant's reactivation and asked that Shiga be treated the same way as the host areas.

Under the accord, Kansai Electric will also report its plans to transport nuclear fuel and radioactive waste in advance, while cooperating on the prefecture's disaster mitigation measures.

The utility will promise in a separate document to provide explanations in advance on important changes at the plant, such as the construction of new reactors.

Kansai Electric on Monday reported to the Nuclear Regulation Authority that it will reboot the plant's No. 3 reactor on Friday evening.

It will be the first reactor to run on uranium-plutonium mixed oxide fuel, or MOX, under new safety regulations imposed in 2013.

The No. 4 reactor is scheduled to resume operation in late February, with its fuel to be loaded Sunday.

Takahama No.3: Friday restart

January 25, 2016

Takahama No. 3 reactor to restart on Friday

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jan. 25, 2016 - Updated 08:24 UTC+1

Kansai Electric Power Company plans to restart on Friday one reactor at the Takahama nuclear power plant in Fukui Prefecture along the Sea of Japan coast.

The plant will be the 2nd one to resume operation since all nuclear stations in Japan went offline following the Fukushima Daiichi disaster in 2011.

The utility informed Japan's Nuclear Regulation Authority on Monday of the plan to restart Takahama No.3 reactor.

The No. 3 and No. 4 reactors at the plant last February cleared the government's stricter regulations introduced after the disaster. In December, the host town of Takahama and Fukui Prefecture agreed to the restarts.

The No. 3 reactor is loaded with 157 fuel assemblies and is now undergoing inspections. If nothing wrong is found, the utility will activate the reactor as early as Friday afternoon.

The fuel includes 24 units of MOX fuel, a mixture of plutonium extracted from spent fuel and uranium. MOX fuel is regarded as part of Japan's fuel recycling system. The No.3 reactor was using it before getting offline 3 years and 11 months ago.

Kansai Electric Power also plans to load fuel in the Takahama No. 4 reactor on Sunday to ready for its planned restart end of February.

A court in Fukui lifted an injunction that was blocking the restart of the plant's 2 reactors last December.

Takahama plant follows Sendai nuclear plant in the southwestern prefecture of Kagoshima that started commercial operation in September of last year.

Restart of MOX reactor in densely populated region

Residents and activists on Jan. 24 protest the planned resumption of operations at the Takahama nuclear power plant in Takahama, Fukui Prefecture. (Eijiro Morii)

Pluthermal reactor in Fukui Prefecture expected to restart on Jan. 29

January 26, 2016

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201601260034

By HIROKI ITO/ Staff Writer

For the first time since the Fukushima nuclear disaster unfolded, a plutonium-thermal (pluthermal) reactor is scheduled to restart on Jan. 29 **in a densely populated region with Japan's largest concentration of nuclear reactors.**

Kansai Electric Power Co. submitted its plans for the No. 3 reactor at its Takahama nuclear power plant in Takahama, Fukui Prefecture, to the Nuclear Regulation Authority on Jan. 25.

A restart of that reactor would be the third under the NRA's stricter safety regulations that were compiled after the triple meltdown at the Fukushima No. 1 nuclear plant in 2011.

The No. 3 pluthermal reactor at the Takahama plant uses mixed oxide (MOX) fuel, which contains plutonium extracted from spent nuclear fuel.

Pluthermal reactors are crucial components in the government's ambitious, expensive and problem-plagued nuclear fuel cycle project.

Twenty-four of the 157 fuel rods delivered to the No. 3 reactor last month consisted of MOX fuel.

The utility will test the control rods used to regulate the nuclear reaction of the fuel on the morning of Jan. 29. If the NRA deems everything is functioning properly after a final safety check, the operator will remove the control rods and boot up the reactor on the afternoon of that day at the earliest.
Kansai Electric hopes to start commercial operations of the reactor in late February.
The area around Wakasa Bay hosts 13 nuclear power plants, with the Takahama plant located at the west end of the chain.
About 180,000 people reside in 12 municipalities of Fukui, Kyoto and Shiga prefectures within a 30-kilometer radius of the plant.
The NRA in February last year cleared the No. 3 and 4 reactors at the Takahama plant for a resumption of operations.
However, residents around the plant sought a court injunction against the reactor restarts. In April 2015, the Fukui District Court ordered Kansai Electric to keep the two reactors offline.
A different judge of the same court lifted the injunction in December, allowing Kansai Electric to restart the plant for the first time in three years and 11 months, following a suspension of operations for a periodic checkup in February 2012.
The utility also plans to restart the No. 4 reactor at the Takahama plant.
Kansai Electric will start loading nuclear fuel to the No. 4 reactor on Jan. 31 at the earliest. It hopes to fire up the reactor by late February and restart commercial power generation in late March.
All nuclear power facilities were shut down after the Great East Japan Earthquake and tsunami set off the nuclear crisis in Fukushima Prefecture in March 2011.
The No. 1 and No. 2 reactors at the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, resumed operations last August after being cleared by the NRA.

Takahama No.3: Almost there

January 28, 2016

Takahama No.3 nuclear reactor to restart

http://www3.nhk.or.jp/nhkworld/english/news/20160129_01.html
Jan. 28, 2016 - Updated 18:20 UTC+1
The operator of a nuclear power plant in central Japan is to put one of its reactors back online on Friday. It will be the third restart under strict government regulations adopted after the 2011 Fukushima Daiichi accident.

Kansai Electric Power Company plans to reactivate the No.3 reactor at the Takahama plant in Fukui Prefecture if no problems are found with its control rods.

The utility expects the reactor to achieve a self-sustaining chain reaction on Saturday. It plans to start generating and transmitting electricity on Monday. It wants to start commercial operation late next month.

Kansai Electric will use what is known as MOX fuel, a mixture of plutonium extracted from spent nuclear fuel and uranium. The substance is part of Japan's fuel recycling system.

The use of MOX fuel would be the country's first in about 3 years and 11 months.

Last April, a court in Fukui issued an injunction to keep the No.3 and No.4 reactors at Takahama offline. But it reversed the decision last month after Kansai Electric filed an objection.

The utility plans to load fuel into the No.4 reactor on Sunday and restart it as early as late next month.

Two reactors at the Sendai nuclear plant in the southwestern prefecture of Kagoshima went back online last year.

Takahama achieves criticality

January 29, 2016

Takahama reactor achieves criticality

http://www3.nhk.or.jp/nhkworld/english/news/20160130_12.html

Jan. 29, 2016 - Updated 23:08 UTC+1
Kansai Electric Power Company says a reactor that's been restarted in central Japan achieved criticality, a self-sustained nuclear reaction on Saturday morning, which should allow it to start generating power.

The Takahama plant's No.3 reactor in Fukui Prefecture is the third to restart under tougher government regulations introduced after the 2011 Fukushima Daiichi nuclear crisis.

On Friday, the plant's engineers removed some of the control rods from the reactor, and then restarted the facility.

After extracting 3 fourths of the control rods they cautiously adjusted nuclear fission reaction by controlling the density of materials in cooling water.
The utility plans to have the reactor generate power on Monday, if no problems are found with the performance of the control rods and other equipment. The resumption of commercial operation is planned for late February.

The operator says it will closely monitor whether the reactor's equipment is functioning properly after being offline for almost 4 years.

Part of the fuel used is a MOX type, a mixture of plutonium extracted from spent nuclear fuel and uranium. It forms part of Japan's nuclear fuel recycling system.
The reactor would be the first to use MOX fuel under the new regulations.

Two reactors at the Sendai nuclear plant in the southwestern prefecture of Kagoshima resumed operations last year.

January 29, 2016

Japan restarts 2nd nuclear complex under tighter post-Fukushima rules

http://mainichi.jp/english/articles/20160129/p2g/00m/0dm/074000c

FUKUI, Japan (Kyodo) -- A reactor at a nuclear plant in western Japan resumed operation Friday, becoming the second complex to restart, and the first running on uranium-plutonium mixed oxide fuel, under stricter safety rules set after the 2011 Fukushima nuclear disaster.

Kansai Electric Power Co. said it reactivated the No. 3 reactor at its Takahama plant in Fukui Prefecture nearly a year after it gained approval for resumption from the Nuclear Regulation Authority.

It is the third reactor operating under post-Fukushima regulations, following two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture, which were restarted last August and October, respectively.

The government is pushing ahead with nuclear restarts after all of the country's 48 reactors were shut down for safety reviews following the Fukushima accident.

The state looks to generate at least 20 percent of Japan's overall electricity with nuclear power by 2030 despite public opposition to nuclear power remaining strong since the disaster at the Tokyo Electric Power Co. plant.

Last April, a district court banned Kansai Electric from restarting the Nos. 3 and 4 reactors of the Takahama plant, citing safety concerns.

The same court lifted the injunction last month, allowing the utility to resume the two units, both 870-megawatt pressurized water reactors that began commercial operations in 1985.

Ikata: "Considerable number of issues"

January 28, 2016

Reactor at Ikata nuclear plant unlikely to be restarted before April: utility president

http://mainichi.jp/english/articles/20160128/p2a/00m/0na/011000c

Shikoku Electric Power Co. President Hayato Saeki on Jan. 27 indicated that the No. 3 reactor at the company's Ikata Nuclear Power Plant will not be restarted this fiscal year.

"It would be considerably difficult with just two months left," Saeki said. "It will have to wait until next fiscal year," he said in a regular news conference. Saeki did not specify a target date for restarting the reactor.

In October last year, Ehime Gov. Tokihiro Nakamura gave approval to restart the reactor, ending a series of local procedures. The same month Shikoku Electric submitted an amended request for approval of

construction plans to the Nuclear Regulation Authority (NRA), completing all of the necessary paperwork for government screening.
The NRA, however, pointed out a "considerable number" of issues regarding the basis for figures that were presented, Saeki said. Responding to these issues, including new analysis, is said to be taking time.

Third reactor restarted

January 29, 2016

Takahama No.3 reactor restarted

http://www3.nhk.or.jp/nhkworld/english/news/20160129_28.html

Nuclear & Energy
Jan. 29, 2016 - Updated 09:56 UTC+1
A third nuclear reactor in Japan has been restarted under tougher government regulations introduced after the catastrophic 2011 Fukushima accident.

Kansai Electric Power Company on Friday evening reactivated the Number 3 reactor at the Takahama plant in Fukui Prefecture on the Japan Sea coast by removing control rods.

If everything goes according to plan, the reactor will achieve a self-sustaining chain reaction on Saturday morning and start generating electricity on Monday.

The operator says it will closely monitor whether the equipment is functioning properly because the reactor was offline for almost 4 years. It aims to resume commercial operations in late February.

The Number 3 and Number 4 reactors at the Takahama plant passed screenings by the Nuclear Regulation Authority under the new regulations in February last year.

The operator plans to use what is known as MOX fuel, a mixture of plutonium extracted from spent nuclear fuel and uranium. The reactor would be the first to use MOX fuel under the new regulations.

Two reactors at the Sendai nuclear plant in the southwestern prefecture of Kagoshima went back online last year.

Japan brings third nuclear reactor online

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201601290054
By HIROKI ITO/ Staff Writer

TAKAHAMA, Fukui Prefecture--Takahama nuclear power plant's No. 3 reactor here was restarted on Jan. 29, becoming the third reactor to go back online under stricter safety regulations following the Fukushima disaster in 2011.
At 5 p.m., workers at the plant's control room pulled a lever that removed control rods to reboot the reactor. It is expected to reach criticality by around 6 a.m. on Jan. 30.
The reactor at Kansai Electric Power Co.'s plant should begin commercial operations in late February following test operations planned to start on Feb. 1.
Located in a densely populated region with Japan's largest concentration of nuclear reactors, it is the first plutonium-thermal (pluthermal) reactor to be restarted under the new Nuclear Regulation Authority regulations.
It uses mixed oxide (MOX) fuel, which contains plutonium extracted from spent nuclear fuel, and its restart marks a step forward in the government's troubled nuclear fuel cycle project.
Shikoku Electric Power Co. also plans to use MOX fuel at the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture, which is currently in the final stage of the screening for restart.
The area around Wakasa Bay, where the Takahama plant is located, hosts 14 nuclear reactors, and about 180,000 people reside in 12 municipalities of Fukui, Kyoto and Shiga prefectures within a 30-kilometer radius of the plant.
Kansai Electric also plans to reboot the No. 4 reactor at the plant in late February to restart commercial power generation in late March at the earliest.
The first two reactor restarts under the NRA's stricter safety rules were the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture.
They resumed operations in August and October last year after being cleared by the NRA.

Two governors regret restart

January 29, 2016

Governors criticize reactor restart

http://www3.nhk.or.jp/nhkworld/english/news/20160130_08.html

Jan. 29, 2016 - Updated 22:24 UTC+1

The governors of two neighboring prefectures near the Takahama nuclear plant have expressed regret over Friday's reactor restart without their consent.

Kansai Electric Power Company restarted the plant in Fukui Prefecture. It was the third reactor in Japan to restart under new government regulations introduced after the 2011 Fukushima Daiichi nuclear accident.

Part of Shiga prefecture is within 30 kilometer radius of the plant. Governor Taizo Mikazuki said on Friday that he cannot approve the restart.

He said his prefecture has been insisting that an effective, in-depth protection plan for handling a nuclear crisis be established.

Mikazuki said his prefecture will strengthen its call for the government and the utility to implement more safety measures at the plant.

Kyoto Governor Keiji Yamada told reporters that part of his prefecture is located within a radius of 5 kilometers of the nuclear station. He said it's regrettable that his prefecture was excluded from the approval process for the plant's restart.

In the prefecture hosting the plant, Fukui Governor Issei Nishikawa urged the government to do more to explain to residents the importance and necessity of nuclear power generation.

Nishikawa said the operator needs to disclose more information, and that his prefecture will enhance monitoring of the plant to ensure the safety of its residents.

Takahama: From 5.3 to 18.5 tons of MOX

January 31, 2016

Restarts threaten to increase amount of deadly MOX at Takahama plant to 18.5 tons

http://www.japantimes.co.jp/news/2016/01/31/national/restarts-threaten-increase-amount-deadly-mox-takahama-plant-18-5-tons/#.Vq4jY1KDmot

JIJI

Restarting a second reactor at the Takahama nuclear power plant in Fukui Prefecture will raise the amount of highly toxic spent mixed-oxide (MOX) fuel present there to an estimated 18.5 tons, Jiji Press has learned.

The plant run by Kansai Electric Power Co. in the town of Takahama had 5.3 tons of MOX — a blend of uranium and plutonium extracted from spent nuclear fuel — there before Friday's restart of the No. 3 reactor.

But lingering problems threaten to ruin the government's long-laid plans for recycling nuclear fuel, leaving spent MOX in need of a home. This means it is likely to join the standard uranium fuel being kept in the nation's rapidly dwindling storage pools until a solution can be found.

The Takahama plant is set to hold the largest amount of spent MOX among domestic nuclear facilities that have engaged in so-called pluthermal power generation utilizing the blended fuel, which can contain weapons-grade plutonium.

Takahama No. 3 is slated to use 24 units of MOX, according to Kansai Electric. Reactor 4 will use four units. Each fuel unit weighs about 660 kg, according to statistics from the Finance Ministry and other data.

Kepco imported 12 French-made MOX units in June 2010 and an additional 20 in June 2013. The utility's Genkai plant in Saga Prefecture and Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture have about 10.7 tons of spent MOX each — more than any other commercial nuclear plants in japan.
Among noncommercial facilities, the Japan Atomic Energy Agency currently has 63.9 tons stored at Fugen, an advanced converter reactor in Fukui, 23.1 tons at its nuclear fuel reprocessing facility in Ibaraki Prefecture, and 6.1 tons at the experimental Monju fast-breeder reactor in Fukui.
Takahama No. 3 is the nation's third reactor to be rebooted under new safety standards compiled since the Fukushima nuclear disaster began in March 2011.
Kansai Electric plans to reactivate Takahama's No. 4 reactor later this month.

Takahama: Beginning of fuel rod insertion

February 1, 2016

KEPCO begins to insert nuclear fuel into No. 4 reactor at Takahama plant
http://mainichi.jp/english/articles/20160201/p2a/00m/0na/018000c

A fuel rod is transferred through water to the No. 4 reactor building at Takahama Nuclear Power Plant in Fukui Prefecture, on Jan. 31, 2016. (Pool photo)

Kansai Electric Power Co. (KEPCO) began on Jan. 31 to insert fuel rods into the No. 4 reactor at its Takahama Nuclear Power Plant in preparation to restart the unit, company officials said.
The move follows the resumption of operations at the plant's No. 3 reactor on Jan. 29.
The utility will insert 157 fuel rods, each measuring 21 centimeters by 21 centimeters and 4.1 meters long, into the reactor by Feb. 3 and plans to reactivate the unit in late February. Four of the 157 fuel rods are so-called mixed oxide (MOX) fuel containing plutonium extracted from spent nuclear fuel and mixed with uranium.
This is the first time that MOX fuel is being used in Takahama plant's No. 4 reactor. Such fuel is currently in use in its No. 3 reactor.
KEPCO showed the media the transfer of fuel rods from a fuel storage pool that is adjacent to the No. 4 reactor building to the reactor on Jan. 31. A special crane was used to lift up fuel rods one by one and was moved to the reactor building through water to block radiation and cool down the rods.
Takahama plant's No. 3 reactor that has already been reactivated will begin generating electric power shortly and will be in full operation in late February, according to company officials.

Takahama No.3 reactor

February 1, 2016

Kansai Electric's Takahama pluthermal reactor back in operation
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201602010028

The No. 3 reactor at Kansai Electric Power Co.'s Takahama nuclear power plant went back online Jan. 29. (Eijiro Morii)

THE ASAHI SHIMBUN

Kansai Electric Power Co. began generating nuclear power for the first time in two years and five months on Feb. 1 after a reactor at its Takahama plant here reached criticality over the weekend.

The No. 3 reactor was brought back online Jan. 29 and achieved self-sustained fission the following day.

The 870-megawatt reactor at the Takahama plant uses mixed-oxide (MOX) fuel consisting of plutonium and uranium.

It is the first facility in Japan to generate power with this mix of nuclear fuel under stricter safety standards imposed after the 2011 triple meltdown at a nuclear plant in Fukushima Prefecture.

Takahama: A "problematic" restart

February 10, 2016

Takahama's problematic restart

http://www.japantimes.co.jp/opinion/2016/02/10/editorials/takahamas-problematic-restart/#.VrtmGlKDmot

The No. 3 reactor of Kansai Electric Power Co.'s Takahama nuclear power plant in Fukui Prefecture, which was restarted in late January, is expected to start commercial operations in late February. Its No. 4 reactor is also set to be restarted around the same time. Although the Takahama Municipal Government and Fukui Prefecture gave their consent to the restart, there are serious concerns, including those expressed by nearby municipalities and their residents.

Following the restart of the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture, Takahama unit 3 is the third reactor to come back online under the safety regulations introduced by the Nuclear Regulation Authority following the shutdown of the nation's nuclear plants in the wake of the March 2011 disaster at Tokyo Electric Power Co.'s Fukushima No. 1 plant. But it is the first to run on mixed oxide (MOX) fuel, which contains not only uranium but also plutonium extracted from spent nuclear fuel. The No. 4 reactor at Takahama will also use MOX fuel.

Japan has accumulated 48 tons of plutonium — enough to make an estimated 6,000 nuclear bombs — as a result of the government's nuclear fuel cycle policy, which aims to reprocess spent fuel to extract uranium and plutonium to be used again as fuel. The Takahama restart may help the government show its resolve to cut its plutonium stockpile to address U.S. concerns over nuclear proliferation. But the restart will pose a problem in the not-too-distant future. The spent fuel storage facilities for reactors 3 and 4 are expected to become filled in seven or eight years after they are reactivated. Spent uranium fuel from nuclear power plants is to be sent to a fuel reprocessing facility in Rokkasho, Aomori Prefecture, still on a trial run, but the plant cannot reprocess used MOX fuel — meaning that there will be no place to store overflowing spent fuel from the Takahama reactors. Although Kansai Electric aims to choose a site for a medium-term storage facility outside Fukui by around 2020, no prefectures seem willing to host it.

In the wake of the 2011 Fukushima disaster, local governments within 30 km of a nuclear power plant are now required to devise plans to evacuate their residents in the event of a major accident. In the case of Takahama, nearly 180,000 residents in 12 municipalities in Fukui, Kyoto and Shiga prefectures live in the 30-km zone. Part of the city of Maizuru, Kyoto Prefecture, is within 5 km of the Takahama plant. Despite this, Kansai Electric stuck to the position that to restart the reactors it only needs consent from the host town of Takahama and Fukui Prefecture, and it ignored calls from Kyoto and Shiga prefectures and many other municipalities within the 30-km zone that it should also gain their consent. The same situation happened when Kyushu Electric Power Co. pushed to restart the Sendai reactors. The power companies should address the concerns harbored by municipalities and residents that do not host plants but lie close enough to be affected by a nuclear disaster.

Despite the requirement for compiling evacuation plans, no evacuation drills with local residents have been carried out in the municipalities around Takahama and many residents have received no instructions on where they should evacuate to in the event of a severe accident. Maizuru, for example, won't release a new evacuation plan for its residents until March. While there are plans to evacuate some Fukui residents to Hyogo, Kyoto and Tokushima prefectures, many municipalities are not ready to receive them. In addition, evacuations may not proceed as planned in extreme weather conditions such as heavy snow or when roads are congested. The Fukushima disaster also exposed the evacuation difficulties faced by inpatients at hospitals and elderly people in nursing care facilities. And as there are few access roads to the Takahama facility, the evacuation of plant workers and dispatch of emergency teams may be hindered. The Takahama facility is among 14 nuclear power plants concentrated by Wakasa Bay in Fukui Prefecture. If a major disaster hits the plants simultaneously, the area will be highly vulnerable.

In December, the Fukui District Court quashed an injunction issued by the same court in April against restarting the Takahama reactors, paving the way for Kansai Electric to put them back online. Although the ruling upheld the NRA's new safety standards for restarting reactors as rational and endorsed the

authority's decision that the Takahama reactors met the standards, both Kansai Electric and the NRA should not forget that the ruling also stated that the NRA's decision does not rule out the possibility of a severe accident and that high-level efforts for safety must be constantly maintained because there is no such thing as absolute safety. Since it is believed that controlling a reactor that burns MOX fuel is more difficult than one that uses uranium, Kansai Electric cannot be too cautious in operating the Takahama plant.

First screening not enough

February 19, 2016

40 year old Takahama reactors set to clear screening but other hurdles block restart OK

http://www.japantimes.co.jp/news/2016/02/19/national/two-40-year-old-takahama-reactors-set-clear-screening-hurdles-block-restart-ok/#.VsbXauaDmot

Kyodo
Two more reactors at the Takahama nuclear power plant in Fukui Prefecture are expected to clear safety screening by regulators in the near future, but hurdles remain for them to restart, sources said Thursday.
The Nuclear Regulation Authority almost concluded the safety screening Thursday, and reactors 1 and 2 of the plant operated by Kansai Electric Power Co. are expected to become **the first units over 40 years old to clear screening**, the sources said.
Under Japan's new safety rules, the operation of such old reactors is prohibited in principle, but they can be allowed to continue operating for up to 20 more years with safety clearances from the NRA.
Located on the Sea of Japan coast, reactor 1 of the Takahama complex marked 40 years of operation in November 2014 and reactor 2 did likewise last November.
The two reactors are expected to clear the regular safety screening. But they will also have to go through a **separate screening by July 7 to operate beyond 40 years.**
It is still unknown when the reactors can resume operation, as they also need to gain approval for some facility designs, as required by the new safety regulations, set after the 2011 Fukushima disaster started.
A total of five reactors at three plants have so far cleared screening under the stricter safety rules, including three that have resumed operations at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture as well as at the Takahama plant.

Radioactive leak at Takahama No.4

February 21, 2016

Water leakage from Takahama nuclear power plant

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Feb. 21, 2016 - Updated 00:19 UTC+1
The operator of Takahama nuclear plant in Fukui Prefecture has found radioactive water leaking at one of its buildings. The utility says the radiation level is lower than the safety standard and the leakage caused no harm to the environment. The authorities say assessing the situation may delay the planned restart of the reactor.

Kansai Electric Power Company says workers at the Takahama plant's No. 4 reactor were alerted on Saturday by the water leakage alarm at the building adjacent to the reactor.

They found that **8 liters of cooling water containing radioactive substances had leaked and spread on the floor. They also found radioactive water seeping into other equipment in the building. The total amount of leakage was 34 liter**s. All was removed.

The company says the water that spread on the floor contained 14,000 becquerels of radioactive substances, less than one-200th of what is required to report to the government. The utility also says no one was exposed to the radiation and no abnormally high readings of radiation levels were measured at monitoring posts.

Takahama's No.4 reactor is to restart later this month. The company officials say workers started running water in some of the plumbing right before the alarm went off. The leakage was found where a filter to remove impurities has been installed. But they have not figured out where and how exactly the leakage came about.

The utility will stop some of the preparatory works and start examining the problem with the Nuclear Regulation Authority on Sunday. Authority officials say they need to first assess the status. They added **the reactor restart schedule may be affected**.

Radioactive water leak near Takahama reactor puts planned restart in doubt
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201602210028

THE ASAHI SHIMBUN
Days before a reactor was to go back online at the Takahama nuclear plant in Fukui Prefecture, a pool of radioactive water was discovered in a building, possibly delaying the reactivation, the plant operator said Feb. 20.
Kansai Electric Power Co. said 34 liters of contaminated water were discovered in an auxiliary structure of the No. 4 reactor building but is not aware of any environmental impact outside the building as a result. However, the utility did not rule out the possibility of a delay in the resumption of the No. 4 reactor, planned as early as Feb. 26 if all the preparations went well.
“We cannot say anything about the effect of the leak on the restart definitively at this point since we are looking into the cause,” said a Kansai Electric public relations official.

The pool was found at the facility to treat water used to cool the reactor. Workers at the plant were alerted to the leak when an alarm sounded at 3:42 p.m. on Feb. 20 after they sent water through piping at the facility.
The utility, based in Osaka, reported the incident to the Nuclear Regulation Authority and the prefectural government at 4:55 p.m.
The company said radioactivity of the leaked water was estimated at 60,000 becquerels, below the level that requires operators of a nuclear plant to notify the central government.
After the leak was found, Kansai Electric suspended part of the work to prepare for the restart of the No. 4 reactor.
The company had planned to conduct a test on Feb. 21 to check the reactor's status by bringing it to a condition similar to actual operation.
Kansai Electric said it remained unknown whether it can proceed with the planned test on Feb. 21. The No. 4 reactor can produce 870 megawatts of power, using plutonium-uranium mixed-oxide (MOX) fuel. This year marks the 30th since it began operations.
The No. 3 reactor at the plant, which also uses MOX fuel, is expected to resume commercial operations on Feb. 26 after being restarted in late January.
The No. 3 reactor was the third brought back online under stricter safety regulations drawn up by the NRA after the Fukushima No. 1 nuclear plant disaster in March 2011.

Radioactive leak at Takahama No.4 (2)

February 21, 2016

Utility examines western Japan reactor after coolant leak

http://mainichi.jp/english/articles/20160221/p2g/00m/0dm/038000c

February 21, 2016 (Mainichi Japan)
FUKUI (Kyodo) -- Kansai Electric Power Co. on Sunday began looking into the cause of a radioactive coolant water leak at a reactor at the Takahama nuclear power plant in western Japan the previous day.
The utility has suspended preparation work for the restart of Takahama's No. 4 reactor, scheduled for late February, pending an assessment of the small leak. An official from the operator declined to say whether the accident may affect the resumption schedule.
Kansai Electric said Saturday an estimated 34 liters of coolant water leaked within a building attached to the No. 4 reactor, containing a radioactivity level below that which is needed to be reported to the state. The utility said the leak does not affect the environment.
The company has already finished loading nuclear fuels into the No. 4 reactor at the plant in Takahama, Fukui Prefecture, on the Sea of Japan coast.
The No. 3 reactor at the same plant resumed operation Jan. 29, becoming the third reactor to be reactivated under stricter safety rules set after the 2011 Fukushima nuclear disaster.
The government is pushing ahead with nuclear plant restarts after all of the country's 48 reactors were shut down for safety reviews following the Fukushima accident.

The state is looking to generate at least 20 percent of Japan's overall electricity via nuclear power by 2030, despite public opposition to nuclear power remaining strong since the disaster at the Tokyo Electric Power Co. plant.

Radioactive water leak found at Takahama No. 4 reactor, posing restart delay

http://www.japantimes.co.jp/news/2016/02/21/national/radioactive-water-leak-found-takahama-no-4-reactor-discovery-delay-restart/#.VsmIH-aDmov

JIJI, AFP-JIJI

FUKUI – Kansai Electric Power Co. has found a puddle of radioactive water inside an auxiliary building at the Takahama nuclear plant's No. 4 reactor — an announcement that could throw a wrench into plans to reboot the unit later this month.

The Fukui Prefectural Government's nuclear safety division said the leak, announced by the utility Saturday, did not affect the environment.

"Resumption procedures have been suspended in light of the incident because we are still investigating the cause," a Kepco spokesman said.

The suspension could affect the reactivation timetable.

According to the company, an alarm went off after the utility injected water into a pipe connected to the No. 4 reactor's first cooling system at around 3:40 p.m. Saturday. Water was found dripping from two valves on a coolant water filter in the auxiliary building, and the radioactivity of the resulting 8-liter puddle was 14,000 becquerels.

Judging from other traces on the floor, roughly 34 liters were leaked overall, amounting to about 60,000 becquerels.

The No. 4 reactor is 30 years old and has idle for more than 4½ years since being taken offline in July 2011 for a scheduled checkup. That's longer than the No. 3 reactor, which was reactivated in January, and reactor Nos. 1 and 2 at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture, which were rebooted last year.

All four reactors have cleared the stiffer safety requirements set up after the March 2011 triple core meltdown at Tokyo Electric Power Co.'s poorly protected Fukushima No. 1 plant, which is now defunct.

In December, the Fukui District Court overturned an injunction on restarting the two Takahama reactors that had been brought by residents who said their safety had not been proven, despite being greenlighted by the Nuclear Regulation Authority.

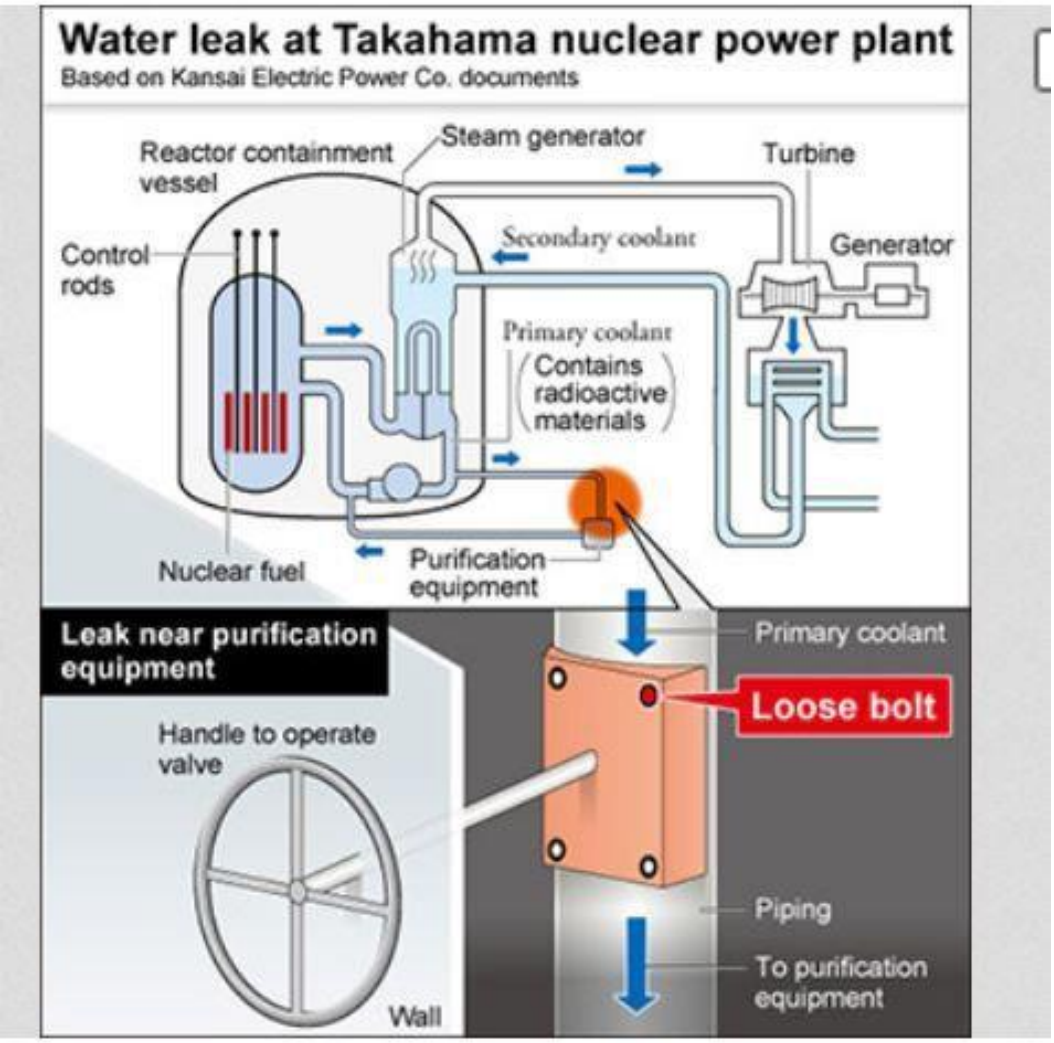
In Kagoshima, the two Sendai reactors were restarted in August and October 2015, ending a two-year hiatus.

No need to delay restart

February 23, 2016

No Takahama reactor restart delay after loose bolt found to be source of leak

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201602230044



THE ASAHI SHIMBUN

OSAKA--The radioactive water leak discovered recently at the Takahama nuclear power plant in Fukui Prefecture was caused by a loose bolt in the piping system and won't delay the planned restart of a reactor, its operator said Feb. 22.

The Kansai Electric Power Co. plant in the town of Takahama is currently undergoing procedures to restart its No. 4 reactor.

The discovery of the pool of contaminated water delayed the startup test at the reactor by a day, to the night of Feb. 22, but it is set to resume operations on Feb. 26 as scheduled.

Some 34 liters of radioactive water were found leaking near the purification equipment installed in the auxiliary structure of the No. 4 reactor building on Feb. 20 during a test to send water down the primary coolant pipe connected to the reactor.

When Kansai Electric examined the fault, they discovered that one of the four bolts attaching a valve to the pipe leading to the purification equipment was loose. The operator believes that water running through the pipe at a higher pressure than when the reactor is in operation had also contributed to the leak.
The bolt was tightened manually and although records stated that the procedure was completed in accordance with protocol, the operator said that it may not have been sufficiently tightened due to the limited space in the area.
Following the discovery of the leak, Kansai Electric examined all similar valves of the No. 4 reactor installed in about 80 locations and went on to conduct the startup test on Feb. 22.
Once the operator confirms that the control rods are functioning in the eight-day test, they will remove them and restart the reactor on Feb. 26.
The valves installed on the No. 3 reactor, which resumed operation on Jan. 29, were also checked for defects. The reactor will start commercial operation on the same day the No. 4 reactor restarts, if all goes according to plan.
Kansai Electric notified the Nuclear Regulation Authority and the Fukui prefectural government of the latest leak just one hour after the discovery, but took six hours to announce the matter publicly.

Beyond the 40-year limit for the first time

February 24, 2016

Nuclear watchdog gives nod on safety to two aging reactors for first time

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201602240072

By MASANOBU HIGASHIYAMA/ Staff Writer
For the first time, Japan's nuclear watchdog has disclosed that two aging nuclear reactors in operation for more than their basic lifespan of 40 years have passed the new safety standards set after the 2011 Fukushima disaster.
The No. 1 and No. 2 reactors of the Takahama nuclear power plant in Fukui Prefecture could now have their operations extended for a further 20 years as the Nuclear Regulation Authority made the announcement on Feb. 24.
To extend the operational lives of the two reactors, operator Kansai Electric Power Co. must receive NRA approval by July on three outstanding items--safety measures, detailed designs and extension of operations.
This is the fourth time the NRA has acknowledged that nuclear reactors are meeting the new safety standards, but the first time for those that are at least 40 years old.
The other three cases were the No. 1 and the No. 2 reactors at the Sendai nuclear power plant in Kagoshima Prefecture, operated by Kyushu Electric Power Co.; the No. 3 and the No. 4 reactors at the

Takahama plant; and the No. 3 rector at Ikata nuclear power plant in Ehime Prefecture, operated by Shikoku Electric Power Co.
After the triple meltdown at the Fukushima No. 1 nuclear power plant in March 2011, laws on nuclear safety were revised. As a result, it was stipulated that the operation period of nuclear reactors is a basic 40 years but that can be extended by up to 20 years--but just one time--with NRA approval.
Although the No. 1 and the No. 2 reactors at the Takahama plant have been operating for more than 40 years, it is a transitional measure until July as Kansai Electric Power has yet to obtain NRA approval for a 20-year extension.
In March 2015, the utility asked to be screened by the NRA to ensure it was meeting the new safety standards. In April 2015, it applied for an additional 20 years for each reactor.
The NRA has been conducting intensive screenings on the reactors because if Kansai Electric Power cannot obtain approval on safety measures, detailed designs and extension of operations by the July deadline, it will have to decommission the two reactors.
In the safety screenings, the main focus was on fire-prevention measures with regard to electric cables. The No. 1 and No. 2 reactors were using cables totaling 1,300 kilometers in length, but they were not fire-retardant.
The utility responded by replacing 60 percent of them with fire-retardant cables, and wrapping the remaining 40 percent with fire-retardant sheets. This met with NRA approval.
With regard to earthquake and tsunami resistance, the utility used the same levels as those for the No. 3 and the No. 4 reactors at Takahama plant, both of which had already been approved by the NRA as meeting the new safety standards.
The NRA devoted 389 pages of the screening paper to its opinion that the No. 1 and the No. 2 reactors at Takahama are meeting the new safety standards. The NRA will collect opinions from the public about its conclusions for 30 days from Feb. 25 and then formally decide whether the two reactors are meeting the new standards on safety measures.
At the same time, it will go ahead with screenings on the remaining two items--detailed designs and the extension of operations. The screening on the detailed designs will focus on quake-resistant capabilities of important facilities. The screening on the extension of operation will check on the deterioration of facilities.
Even if Kansai Electric Power obtains approval on all of the three items, it will take about three years for the utility to finish work on safety measures. Because of that, the operations of Takahama's No. 1 and No. 2 reactors are not expected to be restarted before autumn 2019.

First reactors in Japan get tentative approval to burn for longer than 40 years

http://www.japantimes.co.jp/news/2016/02/24/national/first-reactors-japan-get-tentative-approval-burn-longer-40-years/#.Vs26o-aDmot

Kyodo
Two aging nuclear reactors have come a step closer to being allowed to exceed their 40-year service lifetimes, in what would be the first such extensions under new safety guidelines.

On Wednesday, the Nuclear Regulation Authority reported that safety systems at the No. 1 and No. 2 reactors of Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture meet standards. The decision will be finalized after soliciting comments from the public.
However, the reactors must clear further hurdles before they can resume operation — in the form of further permission from the regulator.
The clock is ticking. They must secure this approval by July 7 or they will be scrapped.
Tougher safety rules were imposed in the wake of the Fukushima No. 1 meltdowns. They prohibit, in principle, the operation of nuclear reactors for longer than four decades, but extensions of 20 years are allowed if operators make safety upgrades and pass screening by the regulator.
The No. 1 reactor of the Takahama complex marked 40 years of operation in November 2014 and the No. 2 reactor last November.
A total of five reactors at three plants have so far obtained final approval for restarts under the stricter safety rules, including two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture and a reactor at the Takahama plant that have resumed operations.

Reactors given initial OK for restart beyond 40-yr limit for 1st time

http://mainichi.jp/english/articles/20160224/p2g/00m/0dm/067000c

The Takahama Nuclear Power Plant's No. 1 and 2 reactors (from left in the front row) and No. 3 and 4 reactors (from left in the back row) are pictured in this photo taken from a Mainichi helicopter in Takahama, Fukui Prefecture, on Feb. 23, 2016. (Mainichi)
TOKYO (Kyodo) -- Two aging nuclear reactors in western Japan gained initial approval Wednesday for their restart in the first such safety clearance for reactors running beyond the government-mandated 40-year service period under new rules set after the 2011 Fukushima disaster.
The Nuclear Regulation Authority approved safety measures taken for the Nos. 1 and 2 reactors of Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture as being in compliance with post-Fukushima regulations for their resumption. The decision will be finalized after soliciting technical comments from the public.
But it remains uncertain whether the reactors can actually resume operation, as they will also have to obtain further permissions from the regulator necessary to operate beyond the 40-year limit by July 7. Missing the deadline would mean an end to the reactors.
The new, tougher safety rules in principle prohibit the operation of nuclear reactors beyond four decades, but operation for an additional 20 years is allowed if operators make safety upgrades and pass the regulator's screening.
The No. 1 reactor of the Takahama complex marked 40 years of operation in November 2014 and the No. 2 reactor last November.
A total of five reactors at three plants have so far obtained final approval for restarts under the stricter safety rules, including two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture and a reactor at the Takahama plant that have resumed operations.

Takaham No.4 due to restart on Friday

February 25, 2016

Takahama No. 4 reactor to restart on Friday

http://www3.nhk.or.jp/nhkworld/en/news/20160225_35/

Kansai Electric Power Company says it will restart on Friday another reactor at the Takahama nuclear power plant in Fukui Prefecture, central Japan.

The plant in February last year cleared strict government regulations adopted after the 2011 Fukushima Daiichi accident. Its No. 3 reactor was restarted late last month.

Final preparations are underway at the No. 4 reactor.

The plant's engineers are expected to check control rods on Friday morning. If no problems are found, the utility plans to start removing 32 rods at 5 PM Friday.

Kansai Electric says the reactor will achieve a sustained nuclear chain reaction in about 13 hours.

The firm plans to start generating and transmitting power on Monday and resume commercial operation in late March.

Also on Thursday, inspectors from the Nuclear Regulation Authority are conducting final inspections of the No. 3 reactor.

If it passes and receives certification by the NRA, the reactor could start commercial operation as soon as Friday afternoon.

The No. 4 reactor would be the 4th to restart under the regulations, following the No. 3 and 2 more at the Sendai nuclear plant in the southwestern prefecture of Kagoshima.

Kansai Electric to restart another Takahama reactor under new rules

http://mainichi.jp/english/articles/20160225/p2g/00m/0dm/073000c

FUKUI, Japan (Kyodo) -- Kansai Electric Power Co. said Thursday that a reactor at its Takahama nuclear plant is slated to restart Friday, becoming the second unit to run on uranium-plutonium mixed oxide fuel under new rules set after the 2011 Fukushima nuclear disaster.
The No. 4 reactor at the plant in Fukui Prefecture, western Japan, will be brought back online as the fourth reactor in Japan to operate under post-Fukushima stricter regulations.
Kansai Electric rebooted the No. 3 unit at the same complex last month, also using mixed oxide fuel which is created by plutonium and uranium extracted from spent nuclear fuel. MOX fuel is a key component of the nuclear fuel cycle program pursued by the nuclear power industry and the government.

Last year, two reactors came back onstream at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture.
The latest restart comes as concern about the safety of the No. 4 unit grew recently after radioactive coolant water leaked last Saturday in a building attached to the reactor, containing a radioactivity level below that which is needed to be reported to the state.
The leak was caused by insufficient tension of a bolt used in a valve installed in a pipe and the utility has taken steps to prevent a recurrence.
The government is looking to reactivate more reactors to meet a goal of generating at least 20 percent of Japan's overall electricity with nuclear power generation in 2030.
A reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture is expected to follow suit with permission for resumption already given by regulators and the local government.
Kansai Electric is also seeking to resume operations of two more reactors at the Takahama plant, both of which are more than 40 years old.
The aging reactors gained initial approval from the nuclear regulation body Wednesday and could be the first reactors operating beyond the government-mandated 40 years service period under the new safety rules.
But it remains uncertain whether they can actually restart as further permissions obtained from the regulator are necessary to operate beyond the 40-year limit by the July 7 deadline.
The new safety rules prohibit the operation of nuclear reactors beyond four decades in principle, but they can be allowed to continue operation for up to 20 more years if operators make safety upgrades and pass the regulator's screening.
Kansai Electric said the Takahama No. 4 unit will begin operations for restart on Friday afternoon and is expected to reach criticality, or a state of sustained nuclear chain reaction, early Saturday.
The reactor will begin generating and sending electricity as early as next Monday.

Takahama: Surprise!

March 9, 2016

Court issues surprise injunction to halt Takahama nuclear reactors

http://www.japantimes.co.jp/news/2016/03/09/national/court-issues-surprise-injunction-halt-takahama-nuclear-reactors/#.Vt_h-ebbySo

Kyodo
OTSU, SHIGA PREF. – A court has issued a surprise injunction to halt operations at Kansai Electric Power Co.'s Takahama No. 3 and No. 4 nuclear reactors in Fukui Prefecture, **siding with residents** from neighboring Shiga Prefecture worried about the safety of the plant.
The order, by the Otsu District Court in Shiga, is likely to lead to an immediate halt of the No. 3 reactor, which was restarted in late January.
The judgment — the first of its kind affecting reactors that were fired up under beefed-up safety regulations following the March 2011 triple-meltdown at the Fukushima No. 1 nuclear plant — **is a blow**

to the government's renewed push for atomic power. The ruling could also cast doubt on the stringency of the new safety regulations.
Kansai Electric had also been working to restart Takahama's No. 4 reactor this month after an unplanned shutdown due to a technical problem last week.
The Takahama reactors, on the coast of Fukui Prefecture in western Japan, had cleared the new regulations last year.
The Takahama plant is one of two nuclear power stations that are currently online.
The injunction by the Otsu District Court forces the operator to shut down the No. 3 unit, which was restarted in late January, while also keeping the No. 4 reactor offline.
Residents of neighboring Shiga Prefecture, a portion of which is within a 30-km radius of the Takahama plant, had asked for the injunction citing insufficient safety measures and concerns that many residents could be exposed to radiation in the event of a severe accident.
While the central government has expanded evacuation preparation areas to a 30-km radius of a nuclear plant from a previous 10 km, safety concerns have persisted in Shiga. Those in favor of the injunction had cited the March 2011 disaster, where some people living outside the 30-km zone around the Fukushima plant were also forced to evacuate.
The Takahama complex was the nation's second nuclear power plant to be brought back online after clearing the new regulations, with its Nos. 3 and 4 reactors resuming operations on Jan. 29 and Feb. 26, respectively.
But the No. 4 reactor was hit by trouble shortly before and after its reactivation. Ahead of its reboot, radioactive coolant water leak was discovered. Then — just three days after it was rebooted — the unit shut down automatically for a reason yet to be conclusively specified.
In a separate case concerning the two reactors, the Fukui District Court issued an injunction last April banning Kansai Electric from restarting the units, citing safety concerns.
But the same court later lifted the injunction in December, allowing the utility to resume operations at both reactors. Plaintiffs appealed the court decision to the Kanazawa branch of the Nagoya High Court, where the case is pending.
Under the revamped safety regulations, which took effect in 2013, utilities are for the first time obliged to put in place specific countermeasures in the event of severe accidents like reactor core meltdowns and huge tsunami — the direct cause of the Fukushima crisis that began on March 11, 2011.

Takahama: Surprise (3)

March 9, 2016

Court orders Takahama reactor shut down, 2nd offline

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201603090064

THE ASSOCIATED PRESS
A court has issued an unprecedented order for a nuclear reactor in western Japan to stop operating and ordered a second one to stay offline.

The Otsu District Court in Shiga Prefecture, which issued the injunction, said the emergency response plans and equipment designs at the two reactors have not been sufficiently upgraded despite the 2011 Fukushima crisis.
Wednesday's order requires Kansai Electric Power Co. to shut down the No. 3 reactor immediately and keep the No. 4 offline at the Takahama plant in Fukui Prefecture, home to about a dozen reactors.
The two reactors restarted this year after a high court in December reversed an earlier injunction by another court.
The decision reflects Japan's divisive views on nuclear safety and leaves only two of the country's 43 reactors in operation.

Court Orders One of Japan's Two Operating Nuclear Plants to Shut Down

http://www.nytimes.com/2016/03/10/world/asia/japan-nuclear-plant.html?_r=0
By JONATHAN SOBLEMARCH 9, 2016
Photo
TOKYO — A court in Japan ordered one of only two nuclear power plants operating in the country to shut down on Wednesday, citing insufficient safety measures put in place after meltdowns at a facility in Fukushima five years ago.
The plant, Takahama Nuclear Power Plant, had been back online for only two months after an extended freeze on atomic power in Japan in the aftermath of the March 2011 Fukushima disaster.
Japan's government and its power companies have struggled to get the nuclear industry back on its feet. Despite new safety standards introduced in 2013, much of the public remains wary. Only a handful of the more than 40 operable reactors in the country have met the new rules, and lawsuits have made it difficult to restart them.
Prime Minister Shinzo Abe's government sees a revival of nuclear power as critical to supporting economic growth and slowing an exodus of Japanese manufacturing to lower-cost countries. Electricity prices have risen by 20 percent or more since the Fukushima disaster because of increased imports of fossil fuels, though the recent drop in oil prices has taken some of the pressure off.
The court ruling on Wednesday added a new twist to the legal battles over nuclear power.
Judges have enjoined idled plants from being put back into service, but the judgment against Takahama was the first in which a facility that had successfully been restarted was ordered to shut down.
Takahama's owner, Kansai Electric Power Company, brought one reactor at the facility back online in January and another last month.
The court, which is in Otsu, Shiga Prefecture, said neither restart should have happened. It was responding to a request for an injunction filed by residents, who said the plant's owner had underestimated the size of earthquakes that could strike the plant and had not made adequately detailed plans to evacuate people living nearby in case of an accident.
Government safety regulators say Takahama meets Japan's new safety guidelines, which address such issues. But the court ruled for the plaintiffs, saying there were "points of concern in accident prevention, emergency response plans and the formulation of earthquake models."
Kansai Electric said it would appeal. It has won previous appeals against injunctions issued against its plants, including Takahama. The company overcame a separate lawsuit to bring the plant online in January.
Takahama is in Fukui Prefecture, a stronghold for the atomic power industry that is home to 13 commercial reactors and that has earned the nickname Genpatsu Ginza, or Nuclear Alley. But the latest

lawsuit was filed by residents of the neighboring Shiga Prefecture, who said they would be affected by radiation from a serious accident at Takahama.
Radiation releases from the plant in Fukushima affected a wide swath of northeastern Japan. More than 100,000 residents were evacuated, and many are still unable or unwilling to return.
The restart of Takahama was already plagued by problems. About a week before the second reactor was returned to service in February, a puddle of radioactive water from a leaking pipe was found inside the building housing the unit. A few days after the restart, the reactor abruptly shut down automatically, for reasons that Kansai Electric has not been able to determine.

Takahama: Surprise! (2)

March 9, 2016

Court orders shutdown of Takahama reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160309_25/

A Japanese court has issued an injunction to suspend operations of 2 nuclear reactors at the Takahama plant in Fukui Prefecture, central Japan. It's the first such injunction for reactors currently in operation.

Twenty-nine residents of neighboring Shiga Prefecture sought an injunction in January last year demanding that the plant's operator, Kansai Electric Power Company, keep the No.3 and No.4 reactors offline. They claim the reactors are unsafe and at risk of major accidents.

The Takahama plant's No.3 reactor was restarted in January this year under new government regulations introduced after the 2011 Fukushima disaster. The No.4 reactor was put back online last month, but 3 days later it shut down automatically for reasons still under investigation.

On Wednesday, the Otsu District Court ruled in the residents' favor.

Kansai Electric Power will have to stop the No.3 reactor as soon as possible because the injunction takes effect immediately.

The company says it plans to lodge an objection to have the decision canceled.

Japan court rules against operating restarted Takahama reactors

http://mainichi.jp/english/articles/20160309/p2g/00m/0dm/078000c

OTSU, Japan (Kyodo) -- A Japanese district court on Wednesday ordered Kansai Electric Power Co. not to operate its two reactivated nuclear reactors, delivering a blow to the government's push for nuclear power under new safety requirements introduced after the 2011 Fukushima disaster.

- 【Related】Kansai Electric to restart another Takahama reactor under new rules
- 【Related】Analysis: Nuclear watchdog's green light for Takahama reactors a threat to '40-year rule'
- 【Related】KEPCO begins to insert nuclear fuel into No. 4 reactor at Takahama plant

In issuing the injunction on the Takahama plant, the first of its kind affecting reactors that resumed operations under the post-Fukushima rules, the Otsu District Court cited "problematic points" in planned emergency responses for major accidents and "questions" remaining on tsunami countermeasures and evacuation planning.

The Takahama plant in Fukui Prefecture is one of two nuclear power stations that are currently online.

The injunction will force the operator to shut down the No. 3 unit, which was restarted late January, and keep offline the No. 4 unit whose operation was recently suspended due to equipment trouble.

Kansai Electric said it will "swiftly start procedures to file an objection to the court's decision" after confirming the detailed content of the court decision and will "make all-out efforts to have it revoked at an early date."

Chief Cabinet Secretary Yoshihide Suga told a press conference that the government will continue to seek the resumption of reactors that have cleared what it calls the "world's toughest (safety) standards."

On whether the court judgment could affect the country's overall nuclear policy, the top government spokesman only said, "I have not heard the details. Anyway, I believe Kansai Electric will first appropriately deal with the issue."

The injunction had been sought by residents of neighboring Shiga Prefecture, a tiny part of which falls within a 30-kilometer radius of the Takahama plant. The plaintiffs living within 70 km of the complex argued that safety measures are insufficient and that many residents could be exposed to radiation if a severe accident occurs.

While the central government has expanded evacuation preparation areas to a 30-km radius of a nuclear power plant from the previous 10 km, safety concerns remain in Shiga Prefecture because in the March 2011 disaster some people living beyond the 30-km zone around the Fukushima Daiichi nuclear power plant also had to evacuate.

Under the revamped safety regulations, which took effect in 2013, utilities are for the first time obliged to put in place specific countermeasures against severe accidents like reactor core meltdowns and huge tsunami -- the direct cause of the Fukushima disaster that began on March 11, 2011.

But Presiding Judge Yoshihiko Yamamoto said there are problems even in the latest safety measures, such as in the designing of the quake-resistance standards. And he also criticized Kansai Electric for its failure to offer sufficient explanations regarding the safety of the Takahama plant.

Kansai Electric reactivated the Takahama Nos. 3 and 4 reactors on Jan. 29 and Feb. 26, respectively. But the process was plagued with problems, with the No. 4 unit shutting down automatically just three days after it was rebooted.

In a separate case concerning the two reactors, the Fukui District Court issued in April last year an injunction banning Kansai Electric from restarting the units, citing safety concerns.

But the same court lifted the injunction in December, allowing the utility to resume operations at both reactors. Plaintiffs appealed the court decision to the Kanazawa branch of the Nagoya High Court, where the case is pending.

Starting to halt Takahama plant after injunction

March 10, 2016

After injunction, work starts to halt reactor at Takahama plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201603100005

THE ASAHI SHIMBUN

Kansai Electric Power Co. started shutting down a nuclear reactor in Fukui Prefecture on March 10 after a court issued an unprecedented injunction and questioned the effectiveness of the world's "strictest" safety standards.

The Osaka-based utility plans to file an objection to the injunction or request a stay of execution of the order to suspend operations of the No. 3 and No. 4 reactors at its Takahama nuclear plant.

But the injunction issued by the Otsu District Court in neighboring Shiga Prefecture on March 9 took effect immediately, and the No. 3 reactor is expected to be brought to a complete halt around 8 p.m.

It was the first time a court in Japan has issued orders for an operating reactor to be taken offline.

"It is extremely regrettable," Kazuo Kijima, chief of Kansai Electric's atomic fuel cycle division, said at a news conference in Osaka on March 9. "It is totally unacceptable."

The two 870-megawatt reactors had passed the Nuclear Regulation Authority's new safety regulations that were imposed after the disaster unfolded at the Fukushima No. 1 nuclear power plant in 2011.

The No. 3 reactor, which was brought online on Jan. 29, had started commercial operations on Feb. 26.

But technical trouble caused the No. 4 reactor to automatically shut down only three days after it was restarted on Feb. 26. Previously, a leak of radioactive water was found in the No. 4 reactor building.

The Otsu District Court focused on the overall safety of the plant before issuing the injunction.

Presiding Judge Yoshihiko Yamamoto said the utility failed to provide a convincing argument that it is fully prepared for the most powerful quake and tsunami that could hit the nuclear plant.

Specifically, the court concluded that the Takahama plant lacked a sufficient safety cushion to withstand maximum shaking of such an earthquake emanating from an active geological fault.

It said Kansai Electric's assumption of the length of that fault was inaccurate.

To drive home the point that the utility was ill-prepared, the district court cited archives of a huge tsunami that struck the Wakasa region, where the plant is situated, following the Tensho earthquake in 1586.

The court also said Kansai Electric failed to offer an adequate explanation on how it would respond to a leak of coolant water from a quake-damaged storage pool for spent nuclear fuel at the plant.

The central government has been pushing for the restarts of reactors if they pass the NRA's safety standards.

Kansai Electric, which relied on nuclear power for half of its electricity output before the Fukushima disaster, the highest ratio among regional utilities, had high hopes that the two reactors would turn around the company's finances.

The two reactors at the Takahama plant were the third and fourth in the nation to go online under the NRA's new rules that went into force in 2013.

However, the district court said the NRA's regulations should be more comprehensive.
Judge Yamamoto noted that the specific causes of the disaster at the Fukushima No. 1 nuclear plant have yet to be identified even five years after three of its reactors melted down.
"If we squarely face the fact that a disaster whose scope went beyond expectations has occurred, the new regulations should have been set based on the philosophy that an accident caused by oversight should not result in a disastrous situation," Yamamoto said.
The court said it was "extremely concerned" that the NRA put in place its new regulations when efforts to unravel the full picture of what went wrong at the Fukushima plant were "only half-way through."
"We hesitate to conclude that they (new regulations) serve as a basis for public welfare," the court said.
NRA Chairman Shunichi Tanaka defended the regulations at a news conference on March 9.
"I do not believe that there are any flaws in them," he said. "New regulations always pursue safety by incorporating the latest findings."
Chief Cabinet Secretary Yoshihide Suga also appeared calm despite the court decision.
"Our policy to restart the reactors remains unchanged since they were judged to meet the world's strictest regulations," he said.
The court, however, stressed that the central government has a larger role to play to ensure the safety of people living near nuclear plants, such as taking the lead in drawing up evacuation plans in the event of a serious accident.
After the Fukushima disaster, new guidelines require local governments within a 30-km radius of a nuclear facility to prepare evacuation plans for an emergency.
"Broader regulations than the existing ones should be set, with an eye on such evacuation plans as well, and the central government is obliged to draw up them," the court said.
The 29 plaintiffs from Shiga Prefecture live in areas 30 to 70 kilometers from the Takahama plant in Fukui Prefecture, which is home to 13 reactors.
Citing the impact of the Fukushima nuclear disaster, the plaintiffs requested the court injunction over fears that damage from a severe accident at the Takahama plant could go well beyond the 30-km zone.
Residents of Shiga Prefecture are keen to protect Lake Biwako, which covers one-sixth of the prefecture's area.
The lake, the largest in Japan, supplies water for 14.5 million residents in the Kinki region, including Kyoto and Osaka prefectures.
Kenichi Ido, leader of a group of lawyers representing the plaintiffs, called the court decision "epoch making."
"The impact of the ruling on other courts across Japan is significant," said Ido, a former judge. "We could bring a halt to the operation of a nuclear plant even though Shiga Prefecture does not host one. The court made the decision because Japan experienced the Fukushima disaster."
The court's decision is the second to order Kansai Electric to suspend operations of the Takahama plant.
A similar injunction in April last year by the Fukui District Court was later rescinded by a different judge of the same court.

Takahama No.3 reactor halted on injunction

http://www3.nhk.or.jp/nhkworld/en/news/20160310_42/

Kansai Electric Power Company has shut down a reactor at its Takahama nuclear plant in Fukui Prefecture, central Japan, in accordance with a court injunction.

This is the first time in Japan that operating reactors have been stopped on a court decision.

Workers began placing control rods inside the No.3 reactor at 10 AM on Thursday to stop nuclear fission. Output was gradually reduced, and the reactor came to a halt at around 8 PM.

A district court issued an injunction on Wednesday ordering the plant's No.3 and No.4 reactors to be taken offline. The court decided that the operator has not offered an adequate explanation of how it would prevent or deal with accidents and other emergencies.

The No.3 reactor was restarted in January of this year.
Unit 4 went back online last month but shut down automatically 3 days later because of a glitch which is still under investigation.

The reactors must stay offline until the injunction is overturned.

The shutdown leaves just two reactors operating in Japan, both at the Sendai power station in Kagoshima Prefecture in the southwest.

Work begins to halt Takahama No.3 reactor

http://www3.nhk.or.jp/nhkworld/en/news/20160310_21/

The operator of the Takahama nuclear plant in Fukui Prefecture, central Japan, has begun shutting it down following a court injunction.

The Otsu District Court in neighboring Shiga Prefecture issued an injunction on Wednesday ordering the plant's No.3 and No.4 reactors taken offline.

The court said the operator, Kansai Electric Power Company, has not sufficiently explained the reactors' safety to local residents despite the high risks.

Kansai Electric began placing control rods inside the No.3 reactor at 10 AM on Thursday to stop nuclear fission. The operator suspended generating electricity at around 5 PM.

Output will gradually be reduced until it reaches zero at around 8 PM.

Takahama No.3 shut down

March 11, 2016

Takahama nuclear reactor shut down following court order

http://mainichi.jp/english/articles/20160310/p2g/00m/0dm/087000c

FUKUI (Kyodo) -- Kansai Electric Power Co. halted on Thursday a reactor at its Takahama nuclear power plant a day after a court ordered the utility to shut it down.

- 【Related】Court questions credibility of safety standards as it orders suspension of 2 reactors
- 【Related】Takahama reactor injunction torpedoes Kansai Electric's business strategy
- 【Related】Residents rejoice over court order to halt Takahama nuke plant reactors

The other reactor at Takahama subject to the court order, the No. 4 unit, was already offline.
The No. 3 unit, which was reactivated Jan. 29, is the first active reactor in Japan to be suspended under a court injunction. The utility cannot reactivate the two units unless the order is overturned.
The No. 4 unit was restarted Feb. 26 but automatically shut down three days later due to an equipment problem. It was brought into a state of cold shutdown to investigate the cause of the trouble.
On Wednesday, the Otsu District Court ordered that the two reactors be halted as requested by local residents, citing "problematic points" in planned responses for major accidents, and "questions" on tsunami countermeasures and evacuation planning.
The ruling was a blow to the government's push for nuclear power under stricter safety requirements introduced after the 2011 Fukushima disaster.
Prime Minister Shinzo Abe said that the government will continue to seek the restart of reactors that have cleared the new safety regulations to ensure stable power supply in resource-poor Japan.
"I hope Kansai Electric will provide further explanations about the safety (of the reactors), and the government will also give guidance," Abe said at a press conference on the eve of the fifth anniversary of the devastating March 11, 2011 earthquake and tsunami, which triggered the Fukushima nuclear plant disaster.
The order came as Japan was on course to become reliant on nuclear power again after two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture were brought back online last year, followed by another two at the Takahama plant in Fukui Prefecture earlier this year.
The government looks to derive 20 to 22 percent of the country's electricity from nuclear power in 2030 by bringing reactors back online after the Fukushima disaster led to a nationwide shutdown of nuclear plants.

The No. 3 and 4 units run on mixed oxide or MOX fuel, which is created using plutonium and uranium extracted from spent nuclear fuel. It is a key component of the nuclear fuel cycle pursued by the nuclear power industry and the government.

Screening suspended at Niigata plant

March 23, 2016

Screening of Kashiwazaki-kariwa plant to be halted

http://www3.nhk.or.jp/nhkworld/en/news/20160323_25/
Japan's nuclear regulator says it will suspend screening for restarts of 2 reactors at a nuclear power plant in central Japan.

The reactors are the Number 6 and 7 units of the plant at Kashiwazaki-kariwa in Niigata Prefecture.

The Nuclear Regulation Authority said on Wednesday that Tokyo Electric Power Company must supply more data for a new method of assessing quake resistance of facilities and buildings.

The screening has focused on measures to prevent serious accidents, as the regulator judged that the 2 reactors have a new design and pose fewer safety risks.

Niigata Governor Hirohiko Izumida says he wants the regulator to conduct thorough safety checks. He also suggests that finding the truth of the 2011 Fukushima nuclear accident is essential for ensuring the safety of nuclear plants.

The 2 reactors are boiling-water types, like those of the damaged Fukushima Daiichi plant.

The screening was in the final stage, with more progress than that for any similar reactors. The regulator says assessing the 2 reactors' quake resistance may take 6 more months. It adds that while the screening is suspended, it will resume that for other reactors of the same type.

Reactors must meet tougher government requirements introduced after the Fukushima accident before going back online.

Safety checks for Tepco's Kashiwazaki-Kariwa nuclear plant to be prolonged

http://www.japantimes.co.jp/news/2016/03/23/national/safety-checks-for-tepcos-kashiwazaki-kariwa-nuclear-plant-to-be-prolonged/#.VvKR53qDmov

JIJI
Safety screenings for the No. 6 and No. 7 reactors at Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant are set to be prolonged further, it was learned Wednesday.
It is nearly two years and six months since Tepco applied for safety checks for the reactors in Niigata Prefecture. Under new regulations put in place after the Fukushima nuclear disaster of 2011, a reactor must pass screenings by the Nuclear Regulation Authority before going back online.
The NRA's secretariat reported at a regular NRA meeting on Wednesday that Tepco is not yet ready to undergo an examination of the company's new method for assessing the degree of quake-resistance at the Kashiwazaki-Kariwa reactors.
Preparations for the examination, including completing documents, can take as long as six months, sources familiar with the matter said.
The reactors at the Kashiwazaki-Kariwa plant are boiling water reactors, the same type as those at Tepco's disaster-stricken Fukushima No. 1 nuclear plant.
The secretariat also said documents are largely ready for screening items other than those relating to quake-resistance and that these could serve as models for other boiling water reactors.
The NRA unveiled a plan to resume safety checks for the No. 2 reactor at Chugoku Electric Power Co.'s Shimane nuclear plant in Shimane Prefecture and the No. 2 reactor at Tohoku Electric Power Co.'s Onagawa plant in Miyagi Prefecture. Both are boiling water reactors.

Ikata No.3 almost ready to restart/ No.1 to be scrapped

March 25, 2016

Shikoku Electric's Ikata No. 1 nuclear reactor to be scrapped

http://mainichi.jp/english/articles/20160325/p2g/00m/0dm/043000c

OSAKA (Kyodo) -- Shikoku Electric Power Co. plans to give up restarting the No. 1 reactor of its Ikata nuclear complex in western Japan and scrap it because extending the aging unit's lifespan would be hugely expensive, company sources said Friday.

Shikoku Electric's plan could have an impact on other major utilities as they decide whether to seek to keep their aging reactors operable beyond the 40-year time limit, a rule imposed after the 2011 Fukushima Daiichi nuclear power plant disaster.
The regional utility serving the main island of Shikoku is expected to announce the plan as early as later in the morning.
Stricter government regulations set in 2013 following the Fukushima nuclear crisis prohibit the operation of nuclear reactors beyond 40 years in principle. But operation for an additional 20 years is possible if operators make safety upgrades and pass the regulator's screening.

Around the country, five reactors at four other nuclear power plants that are around 40 years old are already set to be scrapped.
The No. 1 reactor at the Ikata power complex in Ikata, Ehime Prefecture, reaches the 40-year time limit next year. If the utility wants to continue operating the reactor, it needs to apply for an extension to the Nuclear Regulation Authority in advance.
Shikoku Electric has determined that decommissioning the unit is better than seeking to extend its lifespan as it expects safety measures to keep the reactor in use would cost over 100 billion yen ($886 million), the sources said.
The utility, meanwhile, plans to restart the newer No. 3 reactor at the three-reactor plant in July.

March 23, 2016

Ikata plant to apply for restart in July

http://www3.nhk.or.jp/nhkworld/en/news/20160322_37/

The operator of the Ikata nuclear power plant in Ehime Prefecture, western Japan, is planning to apply to restart one of its reactors in July.

The No.3 reactor at Shikoku Electric Power Company's Ikata plant passed an initial inspection of its safety equipment last July. The Nuclear Regulation Authority's screening was based on new regulations introduced after the 2011 accident in Fukushima.

The regulators are now checking the detailed plans of the equipment for quake resistance and other functions.

They are expected to approve these plans as early as Wednesday.

NHK has learned that Shikoku Electric is set to apply for a final inspection and aims to win approval for its schedule for the restart.

The timetable is expected to call for putting nuclear fuel in the reactor in June, and restarting it the following month.

If it passes the final inspection, the No.3 reactor at the Ikata plant would be the 5th to be put back on line, following 2 reactors at the Sendai plant in Kagoshima Prefecture and another 2 at the Takahama plant in Fukui Prefecture.

But the operation of the 2 reactors at Takahama has been suspended due to mechanical problems and a court injunction.

Takahama Nos 1 & 2 meet new NRA regulations

April 20, 2016

2 older reactors meet new requirements

http://www3.nhk.or.jp/nhkworld/en/news/20160420_13/

Two nuclear reactors at the Takahama plant on the Sea of Japan coast have become the first reactors aiming to operate beyond 40 years to pass Japan's nuclear authority's new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant.

Under a system also introduced after the 2011 accident, the lifespan of reactors across Japan has been limited to 40 years in principle.

Reactors aged 40 years old or more need to meet the assessment regulations of the Nuclear Regulation Authority and other conditions as part of the process for gaining permission to extend operations.

On Wednesday, the authority officially decided to pass a screening document saying the Number 1 and 2 reactors at the Takahama plant in Fukui Prefecture have met the regulations. The reactors are currently offline.

Earlier in February, the nuclear regulator judged that fire prevention measures on electric cables -- a problem unique to older reactors -- and other revised measures met the regulations. They effectively approved the draft screening document at that time.

Wednesday's approval session came after a 30-day period of soliciting public opinions on the document, which is a necessary process in the assessment. It was reported at the session that some of the opinions said the draft underestimated the size of possible quakes and also criticized the fact that actual tests on improved electric cables had been put off.

The session unanimously approved the draft with some revisions, without changing its conclusion.

Attention is now focused on whether the reactors can clear remaining conditions and gain approval for the extension by the time limit of July 7th.

The remaining conditions include checks on deterioration at the facility and an assessment of detailed plans on quake resistance.

The operator, Kansai Electric Power Company, says putting the reactors back online will take more than 3 years, due to the need for more safety work.

Research reactors in Osak Pref. approved for restart

May 11, 2016

2 research nuclear reactors approved for restart

http://www3.nhk.or.jp/nhkworld/en/news/20160511_12/

Japan's nuclear regulator has given basic approval for restarting 2 research reactors in Osaka Prefecture.

The reactors are the first approved for research under government rules introduced after the 2011 Fukushima Daiichi nuclear accident.

The Nuclear Regulation Authority agreed on documents on Wednesday stating that safety measures in case of fire, tornados and other events meet requirements.

The reactors are at Kyoto University's laboratory in Kumatori Town and Kindai University in Higashiosaka City.

The regulator did not invite public input into the approval process as the reactors' outputs are far smaller than that of commercial reactors.

Kyoto University hopes to restart its reactor in July, and Kindai University in September, after onsite inspections and other checks.

Six more research reactors are on the waiting list for the regulator's approval.

Research institutions have limited funding and manpower. Their failure to apply earlier for approval has put students at a disadvantage.

Regulator Chairman Shunichi Tanaka instructed the secretariat to review the regulations for research reactors. He said the safety requirements for commercial reactors are too strict to apply to small output research reactors.

Not wanted

May 14, 2016

No municipalities near Hamaoka nuclear plant want restart: survey

http://mainichi.jp/english/articles/20160514/p2a/00m/0na/019000c

None of the 11 municipalities within the 30-kilometer-radius urgent protective action planning zone (UPZ) around the Hamaoka nuclear plant in Omaezaki, Shizuoka Prefecture, want the power station's idled reactors restarted, a Mainichi Shimbun survey has found.
The reactors at the Hamaoka plant, operated by Chubu Electric Power Co., were shut down on May 14, 2011 at the request of the central government, following the meltdowns at the Fukushima No. 1 nuclear

plant in March that year. The survey, sent to the mayors of each municipality as well as Shizuoka Gov. Heita Kawakatsu in April, was timed to coincide with the fifth anniversary of that shutdown.
Chubu Electric is aiming to restart the Hamaoka plant's No. 3 and 4 reactors, and has filed a request for a safety review by the Nuclear Regulation Authority (NRA). The Mainichi survey was undertaken to assess the pros and cons of restarting the plant, and has revealed persistent local concerns over plant safety.
Five response options were included in the questionnaire on whether or not the reactors should be restarted. Among these, three of the municipal leaders said that they were "against" the restart, five said that they were "unable to make a decision at the present time," and four answered "other."
None of the respondents said they "agree" with the restart, or even that they "agree subject to the meeting of specific requirements."
The three mayors who said they opposed a restart were Shigeki Nishihara from the Shizuoka prefectural city of Makinohara, Kinuyo Soneya from the city of Shimada, and Norihiko Tamura from the town of Yoshida.
Nishihara, whose city lies directly above the predicted focus of a Nankai Trough earthquake, noted that "a (nuclear) accident would endanger the very existence of the nation."
Meanwhile, Tamura commented that "(citizens') safety cannot be guaranteed," and Soneya noted, "There is no guaranteed evacuation plan accompanying (the proposed restart)."
Among those who said they were "unable to make a decision at the present time" or "other," four mayors stipulated specific stringent conditions for approving the restart. These were Kakegawa Mayor Saburo Matsui, Kikugawa Mayor Junichi Ota, Fukuroi Mayor Hideyuki Harada and Fujieda Mayor Shohei Kitamura.
Mayors Matsui and Ota listed the requirement of understanding from citizens, while Harada and Kitamura indicated conditions related to the accident at the Fukushima No. 1 nuclear plant.
"The investigation of the Fukushima accident's causes has been insufficient," commented Mayor Harada. "As long as safety cannot be completely guaranteed, I cannot approve the (reactor) restarts."
Mayor Kitamura noted, "The discussion regarding the plant restart should not begin until there has been a complete resolution to the problems associated with the Fukushima accident, and citizens are thoroughly at ease."
Meanwhile, Omaezaki Mayor Shigeo Yanagisawa noted that "safety checks are ongoing," and accordingly answered that he was "unable to make a decision" on the reactor restarts.
Gov. Kawakatsu similarly responded that he was "unable to make a decision," and added, "Unless safety can be guaranteed, there is no way (that the restart would be approved)."
Chubu Electric officials commented that they will "do everything possible to ensure safety."

Injunction sought against Ikata restart

June 2, 2016

Residents seek injunction against reactor restart

http://www3.nhk.or.jp/nhkworld/en/news/20160531_33/

A group of residents in Ehime Prefecture, western Japan, is seeking a court injunction to suspend the restart of a nuclear reactor, claiming earthquake safety concerns.

Twelve residents filed for the injunction at the Matsuyama District Court on Tuesday. They want to stop a plan by Shikoku Electric Power Company to resume operation of the No.3 reactor at the Ikata nuclear plant in late July.

The residents point out that the Ikata plant is located about 5 kilometers from Japan's longest fault system. They say the operator must assume the possibility of significant earthquakes in the near future, after the powerful quakes that struck Kumamoto Prefecture in April. Those tremors occurred along faults linked to the major fault system.

They say that the level of earthquake preparedness claimed by the operator is not sufficient.

Another group of residents in Ehime has already filed for a similar injunction.

And residents in Hiroshima Prefecture, on the other side of the Inland Sea, have also requested a court injunction to suspend the reactor's restart.

Residents file request to revoke restart permit (Sendai)

June 10, 2016

Residents file for revoking reactor restart permit

http://www3.nhk.or.jp/nhkworld/en/news/20160610_27/

A group of people has asked a court to cancel permits by Japan's nuclear regulator for operating 2 reactors at a plant in Kagoshima Prefecture, southwestern Japan.

The No.1 and 2 reactors at the Sendai plant are the country's only online reactors. The Nuclear Regulation Authority gave the permits in 2014.

More than 30 residents of Kagoshima and Fukuoka prefectures and elsewhere joined the suit filed on Friday with the Fukuoka District Court.

They said the permits should be revoked due to risks of a massive volcanic eruption, and that new government regulations to prepare nuclear plants for disasters are insufficient.
The plaintiffs say the requirements are not based on scientific knowledge about volcanic eruptions, and that the regulator does not fully examine the possibility of mega-eruptions in its screening.

A plaintiff from Kagoshima City says an accident at the plant could cause effects of radioactive substances for decades. She says she wants the court to properly decide whether the facility should be allowed to operate.

The authority has declined to comment on the lawsuit, saying it has not received relevant documentation.

In 2014, another group of residents filed a request to block a restart of the reactors, but a district court and a high court dismissed the petition.

Current screening procedures "very dangerous"

June 12, 2016

Former nuclear regulatory body official calls for review of safety screening method

http://www.japantimes.co.jp/news/2016/06/12/national/former-nuclear-regulatory-body-official-calls-for-review-of-safety-screening-method/#.V116mORddLP

JIJI
Japan needs to review its current method for screening nuclear plant safety, seismologist and former senior regulator Kunihiko Shimazaki said in a recent interview.
The current method risks underestimating the magnitude of possible earthquakes that may hit nuclear plants, Shimazaki, former acting chairman of the Nuclear Regulation Authority, said.
"A review is needed" for the method to calculate the design basis quakes that is currently adopted in the NRA's screening procedures, he said.
Shimazaki said that he has confirmed the need for such a review after examining data on powerful quakes that hit Kumamoto Prefecture and other areas in Kyushu in April.
"The NRA has to be aware that the current screening procedures have shortcomings," he said, adding it is "very dangerous to keep using the method."
Before leaving the NRA in September 2014, Shimazaki was in charge of assessing quake and tsunami impacts in its nuclear safety screening.
The current method risks underestimating design basis quakes when it is applied to vertical faults found mainly in western Japan, according to him.
The design basis quakes for Kansai Electric Power Co.'s Takahama and Oi nuclear plants, both in Fukui Prefecture, and Kyushu Electric Power Co.'s Genkai nuclear plant in Saga Prefecture, should be recalculated based on a different method, he said.
The NRA should draw up a revised method by taking into account new data, including on strong tremors such as the Kumamoto quakes, Shimazaki said.
The Nos. 3 and 4 reactors at the Takahama plant have passed the NRA's safety screening. The NRA is expected to approve Kansai Electric's request for extending operational periods at the plant's Nos. 1 and 2 reactors beyond 40 years, a basic lifetime for nuclear reactors in Japan.

Restart or not: What impact?

June 8, 2016

Residents near Sendai nuclear plant agonize over future power supplies

(Mainichi Japan)
http://mainichi.jp/english/articles/20160608/p2a/00m/0na/016000c
SATSUMASENDAI, Kagoshima -- Residents here are agonizing over whether they will be able to do away with nuclear power and shift to renewable energy.
The No. 1 and 2 reactors at the Sendai Nuclear Power Plant in this Kagoshima Prefecture city of Satsumasendai were put back online in the summer of 2015.
There had been a common view that the suspension of operations at the Sendai nuclear power complex in the wake of the Fukushima nuclear disaster was having a grave impact on the local economy. But there were unexpected responses to a questionnaire survey of local businesses conducted by the city's chamber of commerce and industry in 2014. **On a question about the impact of the suspension of nuclear reactors, 50.3 percent of the 358 companies that responded to the survey said that there was "no" impact, surpassing 48.9 percent of the companies that said "yes."**
Hiroshi Tanaka, 58-year-old president of local electronics parts manufacturer Okano Electronics Co., said, "There was no impact." At the request of the municipal government two years ago, he played a mediator role in ensuring cooperation among 18 local companies to put street lights using solar power to practical use. The city is currently making a strong effort to introduce renewable energy such as solar and wind power. The municipal government withheld approval of a plan to build a third reactor at the Sendai nuclear power station after the outbreak of the Fukushima nuclear crisis in 2011. The total output of renewable energy in the city stood at 250 kilowatts generated by only one windmill before the Fukushima nuclear disaster, but it rose to a total of 134,000 kilowatts as of the end of March 2016, enough to cover the needs of all 46,000 households in the city.
Satsumasendai Mayor Hideo Iwakiri has been saying, "The No. 1 and 2 reactors will eventually be decommissioned. We want to gear up for the next generation of energy." Tanaka also said, "We will take the next step while the reactors are running." Obviously, it is difficult for the renewable energy industry to create the same amount of jobs as the nuclear power industry. The city is planning to build a major conference hall by using government subsidies of 2.5 billion yen it is to receive for allowing the two reactors to resume operations. The city government, therefore, has been criticized for its policy focusing on the construction of public structures. But there are still calls within the construction industry to build another reactor at the Sendai nuclear power station.
Still, there are signs of the city becoming keen to fully break away from nuclear power. A 71-year-old former head of a neighborhood community association in the city's Takae district, about 6 kilometers from the Sendai Nuclear Power Plant, said, "We cannot relieve our anxiety because of the accident in Fukushima. We want the existing reactors to keep running until they are decommissioned, but we want new ones to be installed somewhere else. I think that's what everyone thinks."
The central government is planning to have nuclear power make up 20 to 22 percent of the nation's electric power needs in the future. The city is not able to do away with nuclear power so easily, so it is agonizing over the future of its energy program while putting up a two-front strategy -- nuclear power and renewable energy.
I got on a boat to visit an islander, hoping to hear his real opinion. The Koshikijima Islands, about 30 kilometers west of the Sendai nuclear plant, merged into the city of Satsumasendai in 2004. Single-seat

electric vehicles for tourists are lined up at a harbor on Kamikoshiki-jima island, the central part of islanders' activities. In the yard of an shutdown school, a private-public project was under way to conduct a demonstration experiment on a power storage system that combines solar panels and used batteries for electric vehicles.
Kyushu Electric Power Co. built the country's first commercial wind power plant on the island in 1989. After the outbreak of the Fukushima nuclear crisis, the city called the Koshikijima Islands "Eco Islands."
The man I went to see is Kenta Yamashita, 30, who runs a company called "Higashishinakai no Chiisanashima Burando" (Small Island Brand in East China Sea). He studied architecture at a Kyoto university and worked for a while after graduating from college. He returned to his home six years ago to start his own business. His company, which has 13 employees, is engaged in projects to show the attractive points of the island such as "minshuku" (private homes that provide lodgings for travelers) and tour guides.
The Fukushima nuclear accident occurred one year after he returned to the island. No matter how much he is proud of the island's beautiful nature, he can see the Sendai Nuclear Power Plant far away on a sunny day.
I sat face to face with him in his office that was converted from a house that was more than 100 years old, and asked him unashamedly about what he thinks of nuclear power. He lowered his eyes and thought for a while before saying with a stern face, "There is no electricity generated by nuclear power not even one kilowatt on this island. I don't care about whether the reactors are running or not."
Yamashita told me about a fishing port that has a breakwater, a stone wall built by islanders. So, I asked him to take me there. It was a place where fishermen sat on the stone wall and repaired fishing nets over small talk. Yamashita said, "This is an affluent island if you live idyllically. I think the distinct character of this island is the landscapes that cannot be measured by economics." He said that he had an incisive memory of the stone wall.
This was from around a time when Yamashita moved away from the island to go to high school on the Japanese mainland. When he came back to the island on holidays, his father, who was working for a construction company, was destroying part of the stone wall at the fishing port as part of work to widen a road. He thought, "Who needs such construction work? What is the point of construction work to destroy a place that everyone has been caring about?" On that night, he rebuked his father in anger. His father replied, "It was for the sake of you."
It requires money to go to school on the mainland. Yamashita was plagued by the irrational fact that he was able to live by having someone destroy the landscape that he had been familiar with since his infancy. He could not say anything to respond to what his father said.
"If you think about the economy alone, this is the worst island," Yamashita said. He went on to say, "I want to do my best to create work which I can proudly tell the generation of our children 'this is for the sake of you'. I believe that is the role for me to play."
Yamashita then told me, "It is true that there are many people who rely on the nuclear power plant for their living. I can't flatly say this and that." He feels that nuclear power is equal to a public works project to destroy the stone wall. "It is better not to have nuclear reactors. But once they start moving, they will move closer to decommissioning. I even think that it was good to restart the reactors."

Kepco submits revised application for Takahama restart

14.06.2016_No116 / News in Brief

Kepco Submits Revised Application In Bid To Extend Takahama-1 And -2 Operations

http://www.nucnet.org/all-the-news/2016/06/14/kepco-submits-revised-application-in-bid-to-extend-takahama-1-and-2-operations

Plant Operation
14 Jun (NucNet): Kansai Electric Power Company (Kepco) said yesterday it had submitted a revised application to the Nuclear Regulation Authority to extend operations at its Takahama-1 and -2 nuclear units in Fukui Prefecture, southwest Japan, beyond 40 years.

Kepco said in a statement the submission follows the NRA's approval last week of an engineering work plan for the extensions.

The revised application includes additional results of seismic safety evaluations with maximum acceleration increased from 550 centimetres per square second (gal) to 700 gal.

In April the reactors met new safety requirements introduced by the NRA following the March 2011 Fukushima-Daiichi accident.

However, anti-nuclear groups filed a lawsuit with Nagoya District Court claiming extended operation of the two units could be dangerous because the reactors have already operated commercially for more than 40 years.

According to laws regulating nuclear stations in Japan, reactors are generally limited to a 40-year operational lifetime.

This can be extended by 20 years if approved by the NRA. Kepco wants to extend the licences for both Takahama-1 and -2.

The two 780-MW pressurised water reactor units have been in commercial operation since November 1974 and November 1975 respectively.

On the same site, Takahama-3 and -4 have already passed safety checks and received restart approval from local authorities. But on 9 March Otsu District Court ordered Kepco not to operate the two 830-MW units, in a legal ruling in favour of a local anti-nuclear group who alleged extended operation of the units could pose a safety danger.

The group said there were doubts about the station's seismic standards and about the NRA's new regulatory standards.

The Japan Atomic Industrial Forum said the court's decision "pointed to problems in both reactors regarding such matters as design concepts, earthquake resistance, tsunami measures, and evacuation plans, based on the experience of… Fukushima-Daiichi".

The court said: “There is fear that the personal rights of residents are being violated, and that Kepco has not sufficiently explained that safety is secured.

Quake scale underestimated

June 17, 2016

Quake scale may be underestimated in calculations for nuclear plants: Ex-NRA official

http://mainichi.jp/english/articles/20160617/p2a/00m/0na/010000c

Nuclear Regulation Authority (NRA) former deputy chairman Kunihiko Shimazaki asked the nuclear power watchdog on June 16 to recalculate the maximum possible earthquake estimate -- known as the standard ground motion -- for some nuclear plants in western Japan using a different formula, since the current calculation may include underestimated figures.

- 【Related】Nuclear regulator sees no need to halt reactors despite quake concerns
- 【Related】Court decisions divided over risk evaluations of nuclear reactors

The NRA will hold a meeting on June 20 and discuss handling the matter to recalculate figures for Kansai Electric Power Co.'s Oi Nuclear Power Plant in Fukui Prefecture that is now under safety screening.t
After retiring from the NRA position in 2014, Shimazaki, professor emeritus at the University of Tokyo, examined one of the calculation formulas used to work out the standard ground motion for the Oi nuclear plant. The formula is known as the Irikura-Miyake recipe. As a result, Shimazaki claims that he has confirmed that in cases where an active fault at the estimated hypocenter is straight up-and-down or close to vertical, the scale of the calculated motion becomes smaller compared to the figures calculated with other formulas. The figures worked out with the Irikura-Miyake recipe for the recent Kumamoto Earthquake did not match data recorded in the actual tremor.
Shimazaki has submitted a statement to an ongoing appeal trial at the Nagoya High Court Kanazawa branch over the suspension of the No. 3 and No. 4 reactors at the Oi plant pointing out the problem with the calculation formula.
Shimazaki told NRA members, including Chairman Shunichi Tanaka, at the June 16 meeting that different formulas should be used and other measures should be considered such as re-evaluating the earthquake resistance of the plant if necessary.
According to the NRA, in addition to the Oi plant where the fault at the estimated hypocenter is either vertical or close to vertical, the Irikura-Miyake recipe is being used to calculate the standard ground motion at Kansai Electric's Takahama nuclear plant in Fukui Prefecture that has passed the NRA screening and Kyushu Electric Power Co.'s Genkai nuclear power station in Saga Prefecture that is now under safety screening.

After the meeting with NRA officials, Shimazaki told reporters that first and foremost figures for the Oi plant should be recalculated. While he suggested that recalculation should be considered for the Genkai plant, there will be little effect on the Takahama plant as it is located away from an active fault.
Kojiro Irikura, professor emeritus at Kyoto University who developed the formula in question, said the method has been scientifically proven to be effective in estimating the scale of an earthquake. He admits, however, when used to predict ground motion the formula may provide smaller figures for the scale of a tremor in cases where the angle of an active fault is close to vertical. He added, "The formula should be used with caution to avoid an underestimate."

Court maintains ban on restart

June 17, 2016 (Mainichi Japan)

http://www.japantimes.co.jp/news/2016/06/17/national/crime-legal/kepco-fails-suspend-injunction-takahama-nuclear-plant/#.V2fZQ6LiiSq

Kepco loses challenge to Takahama nuclear injunction

OTSU, SHIGA PREF. – The Otsu District Court on Friday rejected a bid by Kansai Electric Power Co. to lift an injunction against restarting reactors at a nearby plant, dealing yet another setback to attempts by the utility and the central government to return swiftly to nuclear power.
The move means the No. 3 and No. 4 reactors at the Takahama nuclear plant, in Fukui Prefecture, will remain idled.
In a statement, Kepco condemned the court's action.
In his decision, Judge Yoshihiko Yamamoto said Kepco failed to provide sufficient evidence to back up its claims that the two reactors were safe.
"The very first article of the law that established the Nuclear Regulation Authority says a fundamental point of Japan's nuclear power administration is clearly establishing the understanding that the maximum effort must be made at all times to prevent an accident involving the use of nuclear power," said Yamamoto. "But unless the operator shows that there is nothing lacking in regards to safety, it's presumed some safety points are lacking."
The decision was welcomed by citizens' groups fighting the restart of the two reactors, but it was also expected. Yamamoto was the same judge who had granted their initial request back in March that shut down the reactors, also citing a lack of convincing evidence on the part of Kepco that the plants were safe. The reactors were originally restarted at the beginning of the year.
"It was a just decision, very direct. We hope it will provide a spark to other legal efforts in other parts of Japan to stop nuclear power plants from being restarted," Yoshinori Tsuji said after the ruling. Tsuji was one of the plaintiffs who filed for an injunction in March.
Legal wrangling over the two reactors continues. Kepco has filed a separate legal challenge to the Otsu court's decision, and said Friday it hoped that when that ruling came, possibly in July or August, it will lead to restarts.

Shiga residents seeking to keep the reactors offline have said Friday's decision did not mean their court battles were over.
"If the Otsu court rules against Kepco, it could end up in the Osaka High Court, possibly next year," said Hidenori Sugihara, another one of the plaintiffs who sought the injunction.
The Otsu court case has demonstrated the difficulty of restarting nuclear power plants in a timely manner. Under laws drawn up by the NRA that went into effect in 2012, localities within a 30 kilometer radius of a nuclear power plant are supposed to establish evacuation plans in the event of an emergency.
But the expanded radius has greatly increased the number of local governments and residents who are concerned about a rush by the utilities to restart as many plants as possible.
In the Kansai region, where parts of Kyoto and Shiga prefectures lie within 30 kilometers of Fukui Prefecture's plants, lawsuits by residents like the one in Otsu have the potential to slow down, if not halt, Kepco's plans for restarts.
The original injunction was brought by Shiga residents who fear an accident at the plant would have a damaging impact on Lake Biwa, the nation's largest freshwater lake and the source of water for about 14 million residents in cities such as Kyoto and Osaka.

Japan court rejects appeal, keeps ban on restarting 2 nuclear reactors

http://mainichi.jp/english/articles/20160617/p2g/00m/0dm/039000c

OTSU, Japan (Kyodo) -- A Japanese court kept its ban on operation of two nuclear reactors at the Takahama power plant in Fukui Prefecture on Friday by rejecting the plant operator's request to suspend an injunction it had issued over the reactivated reactors.
The Otsu District Court's decision concerns the injunction issued in March over the Nos. 3 and 4 units at the Kansai Electric Power Co. plant that marked a major setback for the government's push to ramp up nuclear power generation. Local residents had filed for the injunction on safety concerns.
In Friday's decision, the court said it "cannot conclude that (the reactors) are safe, merely because they have met new regulatory standards on nuclear power plants." New, more stringent safety rules were introduced in 2013 in the wake of the meltdowns at the Fukushima Daiichi nuclear power plant in 2011.
"Kansai Electric should at least explain how the regulations on operation and designs of nuclear power plants were toughened and how it responded to them," the decision said.
The decision, issued under the same presiding judge, Yoshihiko Yamamoto, as the injunction in March, marks the final word on one process regarding the injunction because Kansai Electric cannot take further action on it.
The two reactors will remain offline as long as the injunction is not invalidated through a separate track examining an objection filed by Kansai Electric when the court issued the injunction. This track is also being presided over by the same judge.
The March 9 injunction was the first of its kind affecting operating reactors. One of the reactors was taken offline one day after the order. The other reactor was already offline.

The court said then there are "problematic points" in planned responses for major accidents and "questions" on tsunami countermeasures and evacuation planning, in light of the 2011 Fukushima disaster.
The Osaka-based utility subsequently sought to suspend the injunction, saying its safety measures are thoroughly proven and the court's decision was scientifically and technologically groundless. It also said the suspension of the reactors has cost the company 300 million yen ($2.88 million) in losses daily.
The Takahama plant had cleared the post-Fukushima safety regulations in February last year, allowing Kansai Electric to reactivate the Nos. 3 and 4 reactors on Jan. 29 and Feb. 26, respectively. But their operations were beset with problems, with the No. 4 unit shutting down automatically due to a trouble just three days after it was rebooted.
The residents of Shiga Prefecture living within 70 kilometers of the four-reactor plant had filed the injunction as they worried about their safety in the event of a nuclear accident or disaster.
The plaintiffs argued that safety measures are insufficient and feared residents' exposure to radiation in case of a severe accident.
A part of Shiga falls within a 30-kilometer radius of the plant, which is set by the central government as an evacuation preparedness zone.

Extending the 40-year limit

June 20, 2016

Regulator allows extended use of old reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160620_17/

Japan's nuclear regulator has for the first time given the green light to extending the use of two old nuclear reactors that have been in operation for 40 years.

Regulations introduced after the 2011 Fukushima Daiichi accident do not allow in principle the use of reactors beyond 40 years unless safety measures meet new criteria.

Officials at the Nuclear Regulation Authority met on Monday to discuss extending the operation of the Numbers 1 and 2 reactors at the Takahama plant in Fukui Prefecture on the Sea of Japan.

They assessed the deterioration rate of the facilities.

They unanimously accepted an extension of up to 20 years on the condition that operator Kansai Electric Power Company carry out reinforcement work on aging pipes that fail to meet earthquake safety standards.

In April, the regulator judged that fire prevention measures for electric cables -- a problem unique to older reactors -- and other revisions had met the new regulations.

In June, the regulator approved a plan describing the earthquake resistance of the facilities.

The operator has now gained all the approvals it needs for the extension by the July 7th deadline. Kansai Electric Power says it will need more than 3 years to complete the planned reinforcement work and restart the reactors.

NRA gives two-decade extension to 40-year-old Takahama reactors; residents' reactions mixed

http://www.japantimes.co.jp/news/2016/06/20/national/nra-looks-ok-2019-restart-aging-kepco-reactors-fukui-coast/#.V2jhg6Jdeot

The Nuclear Regulation Authority on Monday approved an additional 20 years of operation for two aging reactors on the Sea of Japan coast that will become the first such units to be rebooted under new rules introduced after the Fukushima disaster.
The atomic regulator green-lighted Kansai Electric Power Co.'s plan to restart its No. 1 and No. 2 reactors — both more than 40 years old — at the Takahama nuclear power plant in Fukui Prefecture.
But the reboot is unlikely to happen soon, with the company eyeing an October 2019 timetable for completing the final screening measures.
The rules, which were tightened after the 2011 triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 plant, in principle set the maximum operational life span for nuclear reactors at 40 years. However, the regulations also stipulated that operations can be extended by an additional 20 years if the NRA approves.
Meanwhile, Takahama's two other reactors — No. 3 and No. 4 — remain idle after the Otsu District Court rejected a bid Friday by Kepco to lift an injunction preventing their restart.
The utility has condemned the court's move.
Kepco had been closely monitoring the condition of the two aging reactors in a stricter manner than regular checkups since December 2014 as it sought to obtain approval for extending their life spans.
After confirming there were no abnormalities, the utility applied for an NRA screening in April last year.
The utility had been required to complete three procedures by July 7 to obtain permission for restarting units No. 1 and No. 2. While they had already passed a test for compatibility with the new rules and received approval for a construction plan detailing equipment design, the only remaining test had been of the reactors' anti-degradation measures.
In that screening, regulators asked that the utility address the potential for long electrical cables to catch fire and how it would cover the containment vessels with concrete in the event of a serious accident. NRA chief Shunichi Tanaka said he hopes the power company will conduct inspections more often than required to ensure the facilities are safe.
The utility will spend ¥200 billion ($1.9 billion) to improve the reactors' safety over the next 3½ years.
They are expected to be restarted sometime after fall 2019.
Reactors 1 and 2 will thus reach the end of service in November 2034 and 2035, respectively.
Residents had mixed reaction to the decision.
The town of Takahama "has lived with the nuclear power plant for a long time. I hope the (reactors') resumption will help revitalize the local economy," a woman in her 20s said, though admitting she is worried about their safety.

While Takahama Mayor Yutaka Nose welcomed the decision, he said he will ask the regulator and plant operator for detailed explanations of the safety steps to respond to residents' concerns.
Kansai Electric said in a press release that it believes permission for reactors to run beyond the 40-year limit heralds the restart of more of Japan's aging reactors.
The government is pushing to bring dozens of reactors back online after the Fukushima disaster prompted a nationwide shutdown, as it looks to atomic power to provide 20 to 22 percent of its electricity by 2030.
The government will need a dozen aging reactors running beyond the four-decade limit to meet its goal, experts say, given the difficulty of building new reactors now that Japan's long-held nuclear safety myth has been shattered by the triple meltdown in Fukushima.
The No. 1 reactor began operating in November 1974, while the No. 2 reactor did so in November the following year. Both reactors have been suspended since regular checkups in 2011

Fuel loading at Itaka No.3

June 24, 2016

Fuel loading begins at Ikata No.3 nuclear reactor

http://www3.nhk.or.jp/nhkworld/en/news/20160624_20/

Workers have begun loading nuclear fuel into a reactor at the Ikata power plant in western Japan. The operator plans to restart the reactor in late July.

They started removing units of fuel rods from a pool on Friday, and placed them into the No.3 reactor one at a time. Sixteen of the 157 units of fuel rods are the type of fuel called MOX, which is a mixture of plutonium extracted from spent fuel and uranium.

The operator, Shikoku Electric Power Company, plans to complete the procedure next Monday.

The utility hopes to put the reactor back online in late July, after conducting drills based on the scenario of a serious nuclear accident.

The reactor's operations were suspended in April 2011, following the Fukushima Daiichi nuclear accident the previous month.

But Japan's nuclear regulators decided last year that the No.3 reactor met the new government regulations that were introduced after the Fukushima accident.

Ikata will become the 3rd nuclear plant to be restarted under the new regulations, following the Sendai plant in southwestern Japan and the Takahama plant in central Japan.

But the 2 reactors at the Takahama plant are now offline under a court injunction.

Not safe to restart

June 24, 2016

Protesters hold rally at Ikata plant

http://www3.nhk.or.jp/nhkworld/en/news/20160624_21/

People opposing the restart of a reactor at Shikoku Electric Power Company's Ikata nuclear plant in Ehime Prefecture have held a rally in front of the complex.

Around 10 people, including members of an Ehime-based civic group, gathered near the plant's main entrance on Friday and chanted slogans against the restart.

They read out a statement protesting the insertion of nuclear fuel into the No.3 unit.

The statement said the system for transmitting electricity to the plant cannot withstand a powerful earthquake and the plant's safety cannot be guaranteed. A stable power supply is needed to maintain the cooling of the reactor.

One of the protesters said that in view of the powerful temblors that struck Kumamoto, the operator should not rush the process of inserting fuel into the reactor.

Ikata No.3 reactor: commercial operations to resume end of August

June 30, 2016

Ikata looks to fire up MOX-fueled Ehime reactor around Aug. 25

http://www.japantimes.co.jp/news/2016/06/30/national/ikata-looks-fire-mox-fueled-ehime-reactor-around-aug-25/#.V3TEHaJdeov

JIJI

MATSUYAMA, EHIMA PREF. – Shikoku Electric Power Co. is considering launching commercial operations of its reactor 3 at the Ikata nuclear power plant in Ehime Prefecture around Aug. 25, later than mid-August as initially planned, sources told Jiji Press on Wednesday.

The company reviewed the schedule to provide more time for a preuse inspection by regulators that is necessary for reactivating the reactor, the sources said.
At reactor 3, Shikoku Electric finished loading 157 fuel assemblies, including 16 units of mixed oxide, or MOX, fuel, a blend of uranium and plutonium extracted from spent nuclear fuel, on Monday.
The company plans to resume operations of the reactor as early as July 26 if no major troubles are found in safety checks.

Reactor 3 was shut down in April 2011 for a routine safety inspection.
Shikoku Electric expects the reactor to improve its earnings by some ¥25 billion annually after it begins commercial operations.

Imari mayor again Genkai restart

July 5, 2016

Local mayor vows not to approve restart of Genkai nuke plant

http://mainichi.jp/english/articles/20160705/p2a/00m/0na/004000c

IMARI, Saga -- Imari Mayor Yoshikazu Tsukabe said on July 4 that he had no intention of approving a plan to restart the Genkai Nuclear Power Plant in Saga Prefecture.

- 【Related】Shareholders urge utilities to end nuclear power generation
- 【Related】High court denies injunction against MOX fuel use at nuclear plant
- 【Related】Quake scale may be underestimated in calculations for nuclear plants: Ex-NRA official

The Saga Prefecture city of Imari falls within 30 kilometers from Kyushu Electric Power Co.'s Genkai nuclear power station. Imari Mayor Tsukabe said at a regular news conference, "I have no intention of giving consent to restarting (the nuclear plant)."
It is the first time for the head of a municipal government among eight municipalities in three prefectures of Saga, Fukuoka and Nagasaki that are within 30 kilometers from the Genkai nuclear plant to voice such opposition.
Tsukabe said, "If a nuclear accident occurs, we can't recover from it," adding, "I will state my opposition (if I am questioned by the prefectural government)."

Japan Elections: Antinuclear Candidate's Win Poses Risk to Plant Restarts

http://www.wsj.com/articles/japan-elections-antinuclear-candidates-win-poses-risk-to-plant-restarts-1468232103
Ex-journalist Satoshi Mitazono defeats incumbent Yuichiro Ito
By MAYUMI NEGISHI
Updated July 11, 2016 8:28 a.m. ET
TOKYO—The election Sunday of an antinuclear governor in the only Japanese prefecture with an operating nuclear power plant poses another risk to the government's efforts to restart idled nuclear plants.

Former journalist Satoshi Mitazono defeated incumbent Kagoshima Gov. Yuichiro Ito largely by pledging to suspend operations at Kyushu Electric Power Co.'s Sendai nuclear plant, which is located in the southern prefecture.

Mr. Mitazono's victory underscores the strength of antinuclear sentiment in the country, even as Japanese companies such as Toshiba Corp. and Hitachi Ltd. win orders to build plants abroad in countries searching for a reliable, emissions-free source of power.

Kyushu Electric shares tumbled 7.5% to a three-year low Monday.

The Japanese public remains skeptical about the safety of nuclear power after the 2011 triple meltdowns at the Fukushima Daiichi nuclear plant, with many parents still screening food for radiation. Communities hosting the plants are resisting plans to restart reactors.

The Japanese government aims to revive at least 32 of the 54 reactors it shut down following the Fukushima disaster, and plans for nuclear power to account for about a fifth of the nation's total electricity generation by 2030. It also hopes to double the contribution from renewable energy to meet a goal of cutting the nation's greenhouse gas emissions by about a quarter from 2013 levels.

Nuclear power is also seen by many analysts and policy makers as key to Japan's energy security. The country is forced to import nearly all of its fossil fuel.

"Relying on oil and gas is not sustainable, with huge costs to people's health and the economy, and serious consequences for the environment," said Hooman Peimani, research fellow at the Tokyo-based Asia Pacific Energy Research Centre.

Yet **the government's goals for nuclear look increasingly ambitious as local communities fight back**. In March, a district court in Fukui prefecture issued an injunction halting two reactors at Kansai Electric Power Co.'s Takahama nuclear plant just months after they had been restarted. The court said Kansai Electric had failed to show the public that the reactors were safe, despite having met stricter safety standards established after the Fukushima accident.

The only other nuclear plant now scheduled to be restarted is Shikoku Electric Power Co.'s plant in Ikata, in southern Ehime prefecture. The restart is slated for August.

"The people are worried," Mr. Mitazono said in a TV interview shortly after the election Sunday night. "We will not operate nuclear reactors when their safety cannot be guaranteed."

The fight against nuclear at home has Japanese plant operators seeking business overseas—particularly in China and India. Hitachi last week said it would work with plant operator Japan Atomic Power to build and run nuclear plants in the U.K.

Toshiba, through U.S. unit Westinghouse Electric, hopes to secure contracts to build 45 nuclear reactors by 2030. Westinghouse is already building four reactors each in the U.S. and China. Toshiba said last week that it is eyeing 12 more deals in India, three in the U.K., and a total of five in the U.S. and Turkey.

Having nuclear plants idled is costly for Japan's utilities, which are competing in a newly deregulated retail market. Restarting the Sendai plant has enabled Kyushu Electric to cut its imports and consumption of fossil fuels, which helped it log a profit in the year ended in March.

Mizuho Securities Co. analyst Norimasa Shinya said in a note to clients Monday that if the Sendai plant were to remain shut after planned maintenance checks later this year, Kyushu Electric's recurring profit would fall by nearly a third, or about 18 billion yen ($176 million), in the current business year.

Kyushu Electric declined to comment on the impact of a possible shutdown at Sendai. "We have not been told to halt operations, nor do we know when, if, or how such a request would be made," a spokesman said. "Voters voted on a wide array of issues, and not just on nuclear."

For the 3rd time court rules against Takahama restart

July 12, 2016

Court rules a third time against Takahama reators

http://www.japantimes.co.jp/news/2016/07/12/national/court-rules-third-time-takahama-reators/#.V4TRc6Jdeot
by Eric Johnston
Staff Writer

OTSU, SHIGA PREF. – The Otsu District Court ruled against Kansai Electric Power Co. for the third time in five months Tuesday, in a decision that will keep its Takahama No. 3 and 4 reactors in Fukui Prefecture shut down indefinitely.
Both sides are now gearing up for an appeal by Kepco to the Osaka High Court, where a decision could come next year, while the plaintiffs are expected to file further suits.
The utility had filed an objection to the Otsu court's March decision, which granted a temporary injunction on the Takahama reactors, forcing Kepco to shut them down about two months after they had been restarted.
The court reaffirmed its decision in June and again made the same ruling on Tuesday after Kepco fought the June decision.
"The utility was not arguing that both reactors were safe based on expert evidence and reasonable safety standards, but that they were safe due to detailed assertions directly related to their safety and prima facie evidence," said presiding Judge Yoshihiko Yamamoto, the same judge who has twice ruled against Kepco. "However, the new safety standards haven't drawn the limits of what dangers should be accepted by society."
Representatives for the plaintiffs welcomed the ruling.
"Once again, the Otsu court has ruled against the safety of restarting the reactors, especially with Lake Biwa nearby, even though Kepco has said it'll likely appeal to the (Osaka) High Court," said Yoshinori Tsuji, one of the chief plaintiffs.
The case boiled down to the basic question of what determines adequate safety for a nuclear power plant. It has raised questions about the way the Nuclear Regulation Authority is handling safety inspections for restarts.
Tuesday's verdict will fuel attempts elsewhere to block reactor restarts. The Otsu plaintiffs said they were preparing to file requests in other local courts for a temporary injunction on restarting the Ikata reactor in Ehime Prefecture, which is expected to take place in the coming weeks.

Court blocks restart of 2 Takahama reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160712_25/

A district court has issued a fresh injunction to block the restart of 2 reactors at the Takahama nuclear plant in central Japan. It points out that clearing new regulations does not necessarily guarantee the safety

of reactors.

The Otsu District Court in Shiga Prefecture issued the injunction on Tuesday for the No.3 and No.4 reactors at the Takahama plant in neighboring Fukui Prefecture.

In March, the court issued an injunction to suspend the operations of the 2 reactors. This was the first court order of its kind in Japan.

The operator, Kansai Electric Power Company, filed an objection to cancel the injunction.

The district court held hearings to consider the opinions of Kansai Electric and residents of Shiga Prefecture.

In Tuesday's ruling, presiding judge Yoshihiko Yamamoto said the utility had not given an adequate explanation of what caused the 2011 accident at the Fukushima Daiichi nuclear plant.

He said that the approval of the Nuclear Regulation Authority, based on the new regulations that were introduced after the Fukushima disaster, will not be sufficient to guarantee the reactors' safety.

Kansai Electric issued a statement saying that it is disappointed, and it plans to appeal to a higher court.
The utility also says it will begin removing nuclear fuel rods from the 2 reactors next month as there is a possibility they will be offline for a long time.

Court again nixes appeal to restart 2 Takahama nuclear reactors

July 12, 2016 (Mainichi Japan)

http://mainichi.jp/english/articles/20160712/p2g/00m/0dm/067000c

OTSU, Japan (Kyodo) -- A Japanese court again disallowed the operation of two nuclear reactors Tuesday, rejecting their operator's request to suspend an injunction the same court had issued over the once-reactivated units at the Takahama power plant in Fukui Prefecture, western Japan.
The Otsu District Court's decision, following the injunction issued in March over the Nos. 3 and 4 units at the Kansai Electric Power Co. plant, would continue to legally prevent the Osaka-based utility from restarting operation of the reactors on the Sea of Japan coast about 380 kilometers west of Tokyo.
Kansai Electric plans to appeal the decision to the Osaka High Court, company officials said.
In June, the district court also rejected the plant operator's appeal to temporarily void the effects of the injunction, with public concerns lingering over the restart of nuclear power plants in Japan in the wake of the 2011 Fukushima Daiichi disaster.
Tuesday's decision was issued under the same presiding judge, Yoshihiko Yamamoto, who made the judgments in March and June.
The March injunction was the first of its kind affecting operating reactors. One of the reactors was taken offline one day after the order. The other reactor was already offline.

The Takahama plant has cleared the post-Fukushima safety regulations, allowing Kansai Electric to reactivate the Nos. 3 and 4 reactors. But their operation was beset with problems.
Kansai Electric has announced it will remove fuels from the two nuclear power reactors in August, even though Prime Minister Shinzo Abe's government has expressed a desire to ramp up nuclear power generation at home.

Kagoshima Gov. wants Sendau halted for safety checks

July 14, 2016

Kagoshima's new governor vows to halt Sendai nuclear plant for safety checks

http://www.japantimes.co.jp/news/2016/07/14/national/kagoshimas-new-governor-wants-sendai-nuke-plant-halted-faults-evacuation-routes-checked/#.V4fS2qJdeot

Kyodo
KAGOSHIMA – Incoming Kagoshima Gov. Satoshi Mitazono says he plans to ask Kyushu Electric Power Co. to suspend operation of the Sendai nuclear power plant for safety checks.
In an interview on Wednesday, Mitazono said he will make the request to the utility at a yet to be decided date to examine the effects of powerful earthquakes that hit nearby Kumamoto and Oita prefectures in April.
The former TV commentator was elected Sunday as governor of the only prefecture in Japan with an operating nuclear power plant.
During campaigning, Mitazono pledged to halt its operation.
"I will require Kyushu Electric to temporarily suspend the operation" for a survey of nearby faults and a review of evacuation plans to ensure safety, he said.
"There are many citizens in this prefecture concerned about the nuclear power plant operating after the quakes in Kumamoto," he said.
Prefectural governors are not authorized to stop the operation of a nuclear reactor, but utilities require local consent to restart them.
Backed by an anti-nuclear camp, Mitazono defeated incumbent Yuichiro Ito, who allowed two reactors at the Sendai complex to be reactivated last year.

Mitazono to ask for halt of reactors

July 28, 2016

New Kagoshima gov. to request halt of reactors, possibly in Aug.

http://mainichi.jp/english/articles/20160728/p2g/00m/0dm/072000c

KAGOSHIMA, Japan (Kyodo) -- New Kagoshima Gov. Satoshi Mitazono, elected on an antinuclear platform, said Thursday he will request a temporary halt of reactivated nuclear reactors in the southwestern Japan prefecture, currently the only reactors operating in the country.
"There are concerns over nuclear power plants following the Kumamoto earthquakes (in April)," Mitazono said in a press conference held after his first appearance as governor, adding that Kyushu Electric Power Co.'s Sendai plant should be "halted once to conduct checks and reviews again."
The No. 1 reactor of the Sendai plant is scheduled to be taken offline for regular checkups on Oct. 6, but Mitazono may submit his request for the suspension as early as late August.
The Nos. 1 and 2 units at the plant resumed operation in August and October last year, respectively, becoming the first two reactors to be brought back online under stricter safety rules set after the 2011 Fukushima Daiichi nuclear power plant disaster.
No other reactors are currently online in Japan amid lingering safety concerns among the public, with some subject to court injunctions and others preparing to resume operation.
The governor is not authorized to stop the operation of reactors, but a safety accord reached between the prefectural government and the plant operator allows local government officials to enter the plant to confirm necessary safety steps are being taken.
Kyushu Electric Power is likely to make the case that the Sendai reactors are safe.
In the July 10 gubernatorial election, 58-year-old Mitazono, a former TV Asahi Corp. commentator, defeated previous governor Yuichiro Ito, 68, who was seeking his fourth four-year term with the support of the ruling Liberal Democratic Party and its junior coalition partner Komeito.

New Kagoshima governor to ask for halt to reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160728_22/

The new governor of Kagoshima Prefecture in southwestern Japan says he plans to request, possibly next month, for a temporary halt of the only nuclear plant in the country currently in operation.

Satoshi Mitazono took office as governor on Thursday following his election victory on July 10th. During his election campaign, he called for a halt of the Sendai nuclear power plant in the prefecture. The two reactors at the plant are currently online.

At a news conference, the new governor said people in Kagoshima are worried about the Sendai nuclear plant after the series of powerful earthquakes in neighboring Kumamoto in April.

Mitazono reminded reporters that in his campaign he called for halting the reactors for rechecks and reviews.

He said he wants to lodge a strong request with the operator, Kyushu Electric Power Company, as soon as possible. He suggested he plans to make the request in late August or early September.

Kyushu Electric plans to take the two reactors offline for regular checks, starting with Number One in October followed by Number Two in December.

Sitting in the governor's office, Mitazono said he's ready to work. He said he wants his office to be an open one, where anyone is welcome.

Restart 26 reactors by 2018?

27.07.2016_No147 / News in Brief

Japan Report Predicts 26 Reactor Restarts By March 2018

http://www.nucnet.org/all-the-news/2016/07/27/japan-report-predicts-26-reactor-restarts-by-march-2018

27 Jul (NucNet): Seven nuclear power reactors will be restarted in the current fiscal year, by the end of 31 March 2017, with another 19 in the following fiscal year to the end of March 2018, a report by Japan's Institute of Energy Economics says. However, the report points out numerous uncertainties surrounding nuclear reactors, including judicial judgments and local agreements. In addition to its standard scenario, the report outlines a low scenario in which 12 reactors would be restarted in the same period. The Japan Atomic Industrial Forum said four reactors have been restarted in Japan after clearing examinations under the new regulatory standards imposed by the Nuclear Regulation Authority. They are Sendai-1 and -2 and Takahama-3 and -4, although the Takahama units have since been taken offline after a court issued a temporary injunction following a protest lodged by anti-nuclear activists. Applications for 22 additional reactor restarts have been filed. All of Japan's 48 commercial reactor units were shut down for safety checks and upgrades following the Fukushima-Daiichi accident. Five reactors have been earmarked for permanent shutdown, bringing the number of potentially operable commercial units to 43.

Sendai shutdown: Mitazono ready for fight

July 29, 2016

New Kagoshima governor ready for Sendai plant shutdown fight

THE ASAHI SHIMBUN
http://www.asahi.com/ajw/articles/AJ201607290046.html

KAGOSHIMA--Satoshi Mitazono repeated his assertion that operations at Sendai nuclear power plant in the prefecture should be suspended at his first news conference as Kagoshima governor on July 28.
He said that he will make the request to Kyushu Electric Power Co., the operator of the plant, "between late August and early September."

"As long as residents in the prefecture are feeling anxious due to the Kumamoto earthquakes, I strongly urge Kyushu Electric to temporarily halt the operations of the reactors and conduct another inspection," Mitazono, a former TV journalist, said.
The new governor raised his voice as he made the remarks in response to a question about the suspension of the No. 1 and No. 2 reactors at the Sendai plant in Satsuma-Sendai, the only units in Japan currently in service.
Mitazono was elected as Kagoshima's governor on July 10. The suspension of the Sendai plant's operation for additional safety checks was one of his campaign pledges.
Although a governor has no legal authority to order a halt, Mitazono said, "Whether or not a governor has that authority and making a request to a utility are a separate issue."
Regarding the method for how he will make the request and its contents, Mitazono said, "I will sum up the ideas while exchanging opinions with various people."
Mitazono also referred to the possible decommissioning of the two reactors at the Sendai plants, which have been in operation for more than 30 years.
He plans to establish an expert panel to discuss nuclear plant-related issues in the near future including the decommissioning of the aging reactors.
The governor also expressed his view that "the construction of a new reactor would be difficult," in reference to the proposed No. 3 unit that Kyushu Electric is planning to add at the plant.
During the news conference, he also said that he plans to increase the number of radiation monitoring posts around the Sendai plant from 73 to about 100.
The devices measure radiation levels near the plant and serve as a barometer for issuing an evacuation order to residents at the time of a nuclear accident.
"I want to install many high-performance ones," Mitazono said.

How much will it cost to restart?

July 31, 2016

Extra safety precautions balloon costs to restart reactors

http://www.asahi.com/ajw/articles/AJ201607310028.html
THE ASAHI SHIMBUN
Eleven operators of nuclear power plants expect to spend more than 3 trillion yen ($32 billion) to safeguard their facilities, revealing the continuing skyrocketing costs, an Asahi Shimbun survey has found.
The overall costs will likely grow even further in the coming years as many of the plants applying for a restart did not include expenses to build centers to deal with a terrorist attack, required under the new regulations set after the 2011 Fukushima disaster.
The latest survey, conducted in June, found the combined spending on safety precautions totaled 3.32 trillion yen, up about 935 billion yen from a similar survey a year ago.
The estimate was partly updated to implement measures to continue to operate reactors past the 40 years of their lifespan.
Some companies had to bolster their plants to withstand an earthquake more powerful than the one previously forecast to hit the sites, in line with the Nuclear Regulation Authority's recommendation.

The survey covered 10 regional utilities operating nuclear power plants and Electric Power Development Co., known as J-Power, which is building a nuclear plant in Oma, Aomori Prefecture.
The first of the series of cost studies was conducted in January 2013, followed by one done annually.
The results of the studies showed that the cost to update safety precautions soared between 600 billion yen and 900 billion yen annually to meet the new regulations, which took effect in 2013.
Kansai Electric Power Co.' spending grew by 2.5-fold to 730 billion yen from last year's 285 billion yen, the most of all surveyed.
The surge resulted from the company's plan to operate three reactors at two of its nuclear plants beyond their 40-year lifespans.
As for the construction of anti-terrorism facilities, only five of 16 plants that have filed their applications to restart with the NRA include figures for such facilities in their estimate.
A terrorism response center is expected to cost tens of billions of yen per plant, likely pushing up the overall costs into the hundreds of billions of yen.
Although companies believe that they can recoup their investments once their plants go back online after the NRA's examination, it is unclear whether events will transpire as envisioned.
Kansai Electric has been ordered to suspend the operation of reactors at its Takahama plant in Fukui Prefecture following a court injunction in March.
Unforeseen problems could force operators to shut down their reactors for a prolonged period, experts say.
(This article was written by Takashi Sugimoto and Masanobu Higashiyama.)

Mihama No.3 OK for another 20 years

August 3, 2016

Aging Mihama reactor meets extension requirements

http://www3.nhk.or.jp/nhkworld/en/news/20160803_26/

Japan's nuclear regulator says another aging reactor in Fukui Prefecture has basically met its requirements for extending its operation.

Kansai Electric Power Company applied last year to allow the Mihama No.3 reactor to continue operating for another 20 years. The reactor is 40 years old this December, the age limit set by the government.

The Nuclear Regulation Authority on Wednesday unanimously agreed on a draft certification of the utility's safety measures. It said they meet the new requirements set after the 2011 Fukushima Daiichi nuclear accident.

The regulator will seek public input for one month, starting Thursday, before formally endorsing the documents of certification.

The reactor facilities must then be checked in detail for quake resistance design and degree of aging. The deadline for final permission is the end of November.

The regulator earlier this year approved an extension of up to 20 years for 2 aging reactors at the utility's Takahama nuclear plant in Fukui Prefecture.

Officials with the utility say actual restart of the reactors will take about 3 years, due to additional engineering needed to ensure safety.

Ikata No.3 to start again mid-August

August 8, 2016
08.08.2016_No155 / News in Brief

Japan's Ikata-3 To Resume Operation On 15 August, Shikoku Says

http://www.nucnet.org/all-the-news/2016/08/08/japan-s-ikata-3-to-resume-operation-on-15-august-shikoku-says

Plant Operation

8 Aug (NucNet): The Ikata-3 nuclear unit in Ehime Prefecture, southern Japan, will start generating electricity on 15 August 2016 after workers complete the replacement of parts on the 846-MW reactor, owner and operator Shikoku Electric Power Company said. The company said it expects to resume normal commercial operation in early September. The utility said it had originally planned to start commercial operation of the unit in late August. The delay is due to the need to replace the seals on three reactor coolant pumps, the company said. There are three units at the Ikata nuclear station. Shikoku Electric has already said it plans to decommission Ikata-1 because projected financial returns from operating the reactor will be "insufficient" to justify the high expected costs of necessary safety measures. The Japan Atomic Industrial Forum said four reactors have been restarted in Japan after clearing examinations under the new regulatory standards imposed by the Nuclear Regulation Authority following the March 2011 Fukushima-Daiichi accident. They are Sendai-1 and -2 and Takahama-3 and -4, although the Takahama units have since been taken offline after a court issued a temporary injunction following protests lodged by anti-nuclear activists. Applications for 22 additional reactor restarts have been filed. All of Japan's 48 commercial reactor units were shut after Fukushima-Daiichi. Five reactors have been earmarked for permanent shutdown, bringing the number of potentially operable commercial units to 43.

Ikata No.3 will restart in a few days

August 10, 2016

Ikata nuclear reactor to be restarted this week

http://www3.nhk.or.jp/nhkworld/en/news/20160810_23/

Workers at the Ikata nuclear power plant in western Japan are engaged in the final inspection of control rods ahead of a planned restart of a reactor there on Friday.

The Ikata plant will be the 3rd to come back online under new regulations adopted after the 2011 Fukushima Daiichi nuclear accident.

Inspectors from the Nuclear Regulation Authority are also participating in the final checkups on Wednesday at the plant's number 3 reactor, operated by Shikoku Electric Power Company.

The checks include confirming whether 16 control rods work properly in the reactor. They are designed to operate automatically during an earthquake and other emergencies.

If the inspection finds no problems, workers will restart the reactor on Friday by pulling out the control rods. The operator plans to start generating electricity and feeding it to the grid 3 days later.

The company initially planned the restart for late July. But trouble with a water cooling pump caused a delay.

Two reactors at the Sendai nuclear plant in Kagoshima Prefecture, southern Japan, have already resumed power generation.

The regulator also approved the restart of 2 reactors at the Takahama plant in Fukui Prefecture, central Japan. But a court injunction suspended their operation.

Ikata No.3 (MOX) reactor restarted

August 12, 2016

Shikoku Electric restarts reactor under post-Fukushima regulations

http://mainichi.jp/english/articles/20160812/p2g/00m/0dm/035000c

MATSUYAMA, Japan (Kyodo) -- Shikoku Electric Power Co. restarted a reactor at its Ikata power plant in western Japan on Friday, making it the fifth unit reactivated under tougher regulations set following the 2011 Fukushima nuclear disaster.

The No. 3 reactor at the plant in Ehime Prefecture is the only restarted unit in Japan that runs on uranium-plutonium mixed oxide, or MOX, fuel, as a court ordered Kansai Electric Power Co. in March to suspend two reactors at its Takahama plant after they resumed operations earlier this year, citing safety concerns.

MOX fuel, created from plutonium and uranium extracted from spent fuel, is a key component of the nuclear fuel recycle program pursued by the nuclear power industry and the government.

The government aims to bring reactors back online after the Fukushima crisis led to a nationwide halt of nuclear plants, as it plans to have nuclear power account for 20 to 22 percent of the country's total electricity supply in 2030 to cut greenhouse emissions and lower imported fuel costs.

The Ikata unit is expected to reach criticality, or a state of sustained nuclear chain reaction, on Saturday and begin generating and transmitting electricity on Monday before resuming commercial operation in early September for the first time since it was halted in April 2011 for regular inspection.

"We will take steps toward criticality and resumption of power generation with priority on ensuring safety," Shikoku Electric President Hayato Saeki said in a statement on Friday.

Meanwhile, around 70 residents and others opposing the reactor restart gathered around the seaside plant early Friday morning, chanting slogans such as "Don't contaminate the Seto Inland Sea," and "Stop the nuclear plant."

Junko Saima, a 72-year-old woman from Yawatahama, adjacent to the town hosting the plant, which is located on one side of a narrow peninsula, said, "I am nervous that some kind of accident may occur."

Opponents are concerned about the effectiveness of government-prepared evacuation plans in case of an accident and about potential major earthquakes that are not taken into account in the plans, while proponents are hailing the resumption as it could bring economic benefits.

The restart follows the reactivation of two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture last year and the brief run of the Nos. 3 and 4 units at Kansai Electric's Takahama complex in Fukui Prefecture.

The mayor of Ikata town and the governor of Ehime Prefecture have already given their consent to restart the No.3 reactor after regulators approved its restart in July last year.

In June, Shikoku Electric loaded nuclear fuel at the power plant eyeing to reboot it on July 26. However, reactivation was postponed due to problems with the reactor's cooling system.

A group of local residents filed a suit in May seeking an injunction to halt the restart arguing that a series of earthquakes that have hit nearby Kyushu Island in April could trigger quakes along the median tectonic line running close to the Ikata reactor.

The plant is about 170 kilometers east of Kumamoto Prefecture, the epicenter of the quakes.

Meanwhile, in Kagoshima, new Gov. Satoshi Mitazono is planning to ask Kyushu Electric to suspend the two reactivated reactors at the Sendai plant to double-check any safety impact on the units from the powerful earthquakes that hit neighboring Kumamoto in April.

Ikata reactor set for cautious restart

http://www3.nhk.or.jp/nhkworld/en/news/20160812_01/

The Ikata nuclear power plant in western Japan is set to restart on Friday. It will be the 3rd plant to go online under new regulations issued after the Fukushima Daiichi disaster.

Operator Shikoku Electric Power says it will restart the No.3 reactor very carefully. It has been idle for more than 5 years.

Inspectors from the Nuclear Regulation Authority have been joining workers at the Ikata plant in Ehime Prefecture in checking the control rod system. The rods, designed to contain nuclear fission reactions, are crucial in controlling the reactor.

The operator plans to remove the rods to resume operation of the reactor at around 9 AM as no problems have been found so far.

If the process goes as scheduled, the reactor is expected to achieve a self-sustaining nuclear chain reaction by Saturday morning.

The utility plans to begin electricity generation and transmission to the grid on Monday, and start commercial operation early next month.

The reactor has been offline since it underwent a regular inspection one month after the 2011 nuclear accident in Fukushima. It had been in operation for about a year at that time.

The utility says the plant's workforce includes personnel who have no experience of reactor operation, and that even veteran workers have not rebooted reactors for a long time.

The firm says it will spend more than 20 hours, 5 hours longer than the previous time, to proceed with each step in achieving criticality of the reactor.

Two reactors at the Sendai plant in Kagoshima Prefecture, southern Japan, have been operating since last year.

Two reactors at the Takahama plant in Fukui Prefecture, central Japan, were restarted earlier this year. But a court injunction has been suspending their operation.

Applications for restarting 21 other reactors at 14 nuclear plants across Japan are being checked at the Nuclear Regulation Authority.

Protestors rally at Itaka plant

August 12, 2016

Protest rally staged at Ikata

http://www3.nhk.or.jp/nhkworld/en/news/20160812_15/

People opposing the restart of a reactor at the Ikata nuclear power plant have staged a protest rally in front of the plant.

More than 100 protesters gathered early Friday morning at the entrance of the plant, operated by Shikoku Electric Power Company. They held flags and banners with anti-nuclear messages.

When the plant's No.3 reactor resumed operations at around 9 AM, they shouted "Stop the operations."

A woman in her 40s from Kagoshima Prefecture said she feels sad, just like she did a year ago when Kagoshima's Sendai nuclear power plant was brought back online.

She said she fears that powerful earthquakes like the ones that hit Kumamoto Prefecture, western Japan, earlier this year could occur around the Ikata plant.

A man in his 60s from Fukui Prefecture, central Japan, said the reactivation of the Ikata reactor is regrettable. He said he hopes the lawsuits filed with district courts will stop its operation.

Ikata reactor restarted despite lingering fears

August 13, 2016

EDITORIAL: Another nuclear plant restarted amid lingering safety concerns

http://www.asahi.com/ajw/articles/AJ201608130031.html

Ikata nuclear power plant, foreground, is located at the root of the Sadamisaki Peninsula. (The Asahi Shimbun)

The No. 3 reactor at Shikoku Electric Power Co.'s Ikata nuclear plant in Ehime Prefecture was restarted Aug. 12, becoming the fifth reactor to be brought online under the stricter safety standards introduced in the aftermath of the 2011 Fukushima nuclear disaster.

The move followed the restart of the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture and the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture. However, the two reactors at the Takahama plant have remained offline since March after the Otsu District Court ordered the operator to shut them down.

The No. 3 unit at the Ikata plant is now the only operating reactor in Japan that burns mixed oxide, or MOX, fuel, composed of plutonium blended with uranium.

1991

But this reactor shares many of the serious safety problems that have been pointed out for the reactors at the Sendai and Takahama plants. It is impossible for us to support the decision to resume operations of the Ikata plant reactor without resolving these problems.
What is particularly worrisome about the Ikata plant is the anticipated difficulty in securing the smooth evacuation of local residents in the event of a serious accident.
The facility is located at the root of the Sadamisaki Peninsula, a 40-kilometer-long spear of land that juts westward into the sea with a maximum width of 6 km or so.
This narrow strip of land west of the plant is home to about 5,000 people.
The only land route for the emergency evacuation of local residents is a national highway that passes near the nuclear plant into inland areas.
Under the evacuation plan crafted jointly by the local governments in the region and the central government, local residents are supposed to be evacuated mainly by ship from ports in the peninsula if the highway becomes impassable because of an accident at the plant.
But many of the communities in the peninsula are located on slopes in coastal areas. They could be cut off from the rest of the peninsula if a landslide occurs.
There are seven radiation protection facilities within the town of Ikata, but four of them are located in designated landslide-prone areas.
People aged 65 or older account for more than 40 percent of the town's population.
The municipal government has plans in place to support the evacuation of residents of each district. But residents say there is no way to secure evacuation of the entire town if multiple disasters occur.
People living in areas located between 5 and 30 kilometers from a nuclear power plant are supposed to take shelter in their own homes or public facilities, in principle, when a serious nuclear accident takes place.
But the series of earthquakes that rocked central Kyushu around Kumamoto Prefecture in April underscored anew the devastating effects of multiple disasters. The swarm of quakes included two registering a maximum intensity of 7 on the Japanese seismic scale, which caused severe damage to buildings across wide areas of Kumamoto Prefecture.
Ehime Prefecture is likely to be shaken violently if it is struck by the predicted massive Nankai Trough earthquake.
But the prefecture is ill-prepared for such a gigantic quake, with the ratio of public facilities that are quake-proof in the prefecture being the third lowest in Japan. These public facilities are supposed to play a key role in disaster response scenarios.
Evacuation plans are designed mainly to cope with situations in the wake of a single nuclear accident.
At the very least, however, the central and local governments should give serious consideration to the possibility of a nuclear accident being triggered or accompanied by other disasters like an earthquake and a landslide, and evaluate whether the lives of local residents will be protected in such situations.
Satoshi Mitazono, the new governor of Kagoshima Prefecture who took office last month, has indicated his intention to ask Kyushu Electric Power to halt the two reactors at its Sendai plant in response to local anxiety that has been aroused by the Kumamoto earthquakes.
Shikoku Electric Power's decision to bring the Ikata reactor back on stream despite the fresh safety concerns is deplorable.
Another sticky issue is how to dispose of spent nuclear fuel.
If the No. 2 reactor at the Ikata plant is also restarted following the No. 3 unit, the spent fuel pool will become full in six to seven years. But there is no prospect of building a new storage facility for spent fuel.
There is no practical way, either, to reprocess spent MOX fuel.

The utility, which covers the Shikoku Island, has apparently enough capacity to meet power demand during this summer too.
The company has estimated that restarting the reactor will boost its annual earnings by 25 billion yen ($247 million). But this offers no compelling case for bringing the reactor back online at this moment. Electric utilities, the central government and local governments in areas where nuclear power plants are located should all stop seeking to restart reactors until they have first dealt with the raft of safety issues.

August 12, 2016

Shikoku MOX plant restarts amid outcry over fresh quake fears

by Eric Johnston
http://www.japantimes.co.jp/news/2016/08/12/national/shikoku-electric-poised-fire-ehime-plant-mox-reactor-amid-protests/#.V6226aJdeos

Staff Writer

MATSUYAMA, EHIME PREF. – Shikoku Electric Power Co. restarted the Ikata No. 3 reactor Friday at its plant on the narrow Sadamisaki Peninsula in Ehime Prefecture as citizens groups sought injunctions in three different prefectures to turn it back off amid various safety concerns, including the viability of evacuations.
The reactor is the fifth to be switched back on since all of the nation's atomic reactors were closed due to the March 2011 triple core meltdown at the Fukushima No. 1 power plant following a mega-quake and tsunami.
However, a March decision by the Otsu District Court to place a temporary injunction on two Kansai Electric Power Co. reactors in Takahama, Fukui Prefecture, left only two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture in operation. They were restarted a year ago.
The Ikata No. 3 unit is also the only reactor burning the mixed uranium-plutonium oxide (MOX) fuel.
Shikoku Electric reported no problems with the restart Friday morning, saying it was expected to reach criticality by Saturday morning and begin generating and transmitting electricity by Monday. After a series of final checks, the utility plans to start selling reactor-generated electricity early next month.
But the reactor's restart has not gone unchallenged. The Otsu District Court decision, which shut down Kepco's Takahama No. 3 and 4 reactors less than two months after they were restarted, has energized residents who opposed the Ikata restart. In light of the quakes in Kyushu earlier this year, many now fear a natural disaster could also damage the reactor, and that official evacuation plans for the slender peninsula could prove unrealistic.
Petitions seeking a temporary injunction on the Ikata reactor have been filed in the district courts of Matsuyama in Ehime, as well as Hiroshima and Oita, by people living relatively close to the plant. Matsuyama is about 60 km from Ikata and Hiroshima is within 100 km. Oita's Saganoseki Peninsula is about 45 km away.
A temporary injunction from any one of the three courts would almost certainly mean Ikata No. 3 would have to shut down immediately. For this reason, anti-nuclear lawyers involved with the petitions remain hopeful the courts will do what politicians have not.

“The Otsu court decision to shut down the Takahama reactors sent a shock wave through the government and the utilities. Political measures including demonstrations are needed. But I’ve come to believe the best way to stop the restart of nuclear power plants is through legal means, such as filing lawsuits and requests for temporary injunctions,” Hiroyuki Kawai, a lawyer involved with the Matsuyama, Hiroshima and Oita petitions, said at a news conference in Matsuyama late last month.
The Otsu decision angered Kepco and senior corporate leaders in the Kansai region who fear it will spark a nationwide movement against nuclear power plants. Some are now pushing the government to establish a separate court presided over by judges with specialized knowledge, or to establish separate legal measures to review petitions by citizens’ groups targeting restarts in the hope of obtaining more favorable rulings.
“From the viewpoint of a stable energy supply, it’s necessary to reduce the legal risks as much as possible,” Kansai Economic Federation chairman and former Kepco Chairman Shosuke Mori said at his regular news conference last month.
Other pro-nuclear Kansai economic leaders support Mori’s call for legal changes.
“Why should the nation’s energy policy be impaired by a judge at a district court? I hope the law is quickly changed so this doesn’t happen,” said Kansai Economic Federation Vice Chairman and Hankyu Railways Chairman Kazuo Sumi after the initial Oita ruling in March.
In their request for a temporary injunction on the Ikata unit, citizens’ groups cite the fact that it lies about 5 km from the Median Tectonic Line, which runs from Kyushu to Honshu. They also say that evacuation plans in the event of a natural disaster that damages the plant could prove impossible if the roads along the narrow, landslide-prone peninsula hosting it collapse or are washed away by a tsunami.
Even officials who support the restart have stressed the need for better communication with the prefectural and central governments in the event of an accident that forces an evacuation.
“There are heightened concerns compared with the past, and we’ll strengthen the information collection system,” Ikata Vice Mayor Matabei Moriguchi said Friday after the restart.

Ikata No.3 reaches criticality

August 15, 2016

Ikata nuclear plant’s No. 3 reactor begins generating power

Kyodo

MATSUYAMA, EHIME PREF. – The Ikata nuclear plant began generating electricity Monday, ahead of its planned reconnection to the grid on Sept. 7, operator Shikoku Electric Power Co. said.
The plant in Ehime Prefecture is one of only two nuclear power stations currently operating in Japan, despite the government seeking to plug back into the energy source more than five years after the Fukushima crisis.
The plant’s No. 3 reactor was reactivated Friday after it cleared safety checks drafted in the wake of the catastrophe at the Fukushima No. 1 nuclear plant.

The reactor is the sole operating unit running on plutonium-uranium mixed oxide fuel, which contains plutonium extracted from reprocessing spent fuel.
MOX is a central component of Japan's fuel cycle and is also important as a way to reduce the nation's stockpile of weapons-grade plutonium.
But MOX fuel is more radioactive than ordinary uranium fuel, and this meant it was controversial even before the Fukushima crisis.
The 890-megawatt reactor will shift to commercial operation after final checks by the Nuclear Regulation Authority.
The unit was taken offline in April 2011 for scheduled maintenance and inspections and remained in that state until last week.

Ikata restart: Serious concerns remain

August 17, 2016

Editorial: Grave concerns remain over restart of Ikata nuclear plant

http://mainichi.jp/english/articles/20160817/p2a/00m/0na/012000c

Shikoku Electric Power Co. has restarted the No. 3 reactor at its Ikata Nuclear Power Plant in Ikata, Ehime Prefecture, and begun generating and transmitting electric power. It is the fifth reactor that has been reactivated after passing safety screenings by the Nuclear Regulation Authority (NRA) -- following the No. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture and the No. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture.

- 【Related】Ikata nuclear plant's No. 3 reactor begins generating power
- 【Related】Shikoku Electric restarts reactor under post-Fukushima regulations
- 【Related】4 radiation protection shelters near Ikata nuke plant located in landslide risk areas

Ehime Gov. Tokihiro Nakamura told a news conference, "The best possible safety measures have been taken at the plant. An accident similar to that in Fukushima will never happen." His remarks appear to signify that the myth of the infallible safety of atomic power stations, which had been prevalent in the electric power industry and the government until the outbreak of the Fukushima nuclear crisis in March 2011, have been revived.
In particular, serious concerns remain about the Ikata plant from the viewpoint of preventing a nuclear disaster.
The biggest problem is that the power station is situated at the base of the Sadamisaki Peninsula, which is 40 kilometers long from east to west and about 800 meters wide at its narrowest location. Approximately 4,700 people live in areas west of the nuclear plant, but should a nuclear accident occur at the station, the escape route for local residents could be blocked.
Moreover, the median tectonic line fault, one of Japan's largest active faults, is situated only about six to eight kilometers off the nuclear plant. A powerful Nankai Trough quake is feared to hit Shikoku Island where the power station is located. A complex disaster of a powerful earthquake and a nuclear accident could happen. The ground in some areas of the Sadamisaki Peninsula is fragile.

Under evacuation plans worked out by the prefectural and municipal governments, residents of areas west of the plant would escape from the peninsula in cars or boats if a nuclear accident were to occur. However, if a complex disaster were to hit the peninsula, there are fears that residents might not be able to flee by land or sea. In such a situation, residents would be required to stay indoors at home or in evacuation shelters to avoid being exposed to radiation.
However, if the area were to be hit twice by a temblor registering 7 on the 7-point Japanese intensity scale just like in the Kumamoto Earthquake, it would be difficult to continue staying indoors.
Public evacuation shelters are not absolutely safe. There are seven radiation proof facilities in the town of Ikata. However, four of them are located in landslide caution zones.
The Ikata plant is Japan's only nuclear plant using mixed oxide (MOX)-fuel consisting of plutonium and uranium since operations at the Takahama Nuclear Power Plant have been suspended in response to a court order. It has been pointed out that MOX-fuel makes control rods more ineffective than conventional nuclear fuel. Furthermore, specifically how to dispose of spent MOX-fuel has not yet been determined.
Local bodies hosting nuclear plants are obligated to work out evacuation plans for local residents in case of a nuclear accident. Even if such plans are inadequate, the NRA still approves reactivation of nuclear plants because such plans are neither subject to screening by the NRA nor a precondition for restarting atomic power stations. A system under which a third-party organization would check the efficacy of evacuation plans before restarting nuclear plants needs to be established.
Shikoku Electric Power estimates that the operation of Ikata plant's No. 3 reactor will increase the company's annual profits by some 25 billion yen. However, power companies across the country have leeway to supply electricity to households and businesses this summer. There is no need to make haste to restart idled nuclear plants from the viewpoint of ensuring a stable supply of electric power.
The government and power companies' attempts to rely on nuclear plants while indefinitely postponing countermeasures against a possible complex disaster are unacceptable.

TEPCO reactors to restart in central Japan?

August 24, 2016

Two Tepco Kashiwazaki-Kariwa reactors may pass geared-up safety checks by March

http://www.japantimes.co.jp/news/2016/08/24/national/two-tepco-kashiwazaki-kariwa-reactors-may-pass-geared-safety-checks-march/#.V71e46Jdeos

Kyodo
Nuclear regulators have decided to gear up the safety assessment of two reactors operated by Tokyo Electric Power Company Holdings Inc. in central Japan, raising the possibility of finishing the process by next March, sources said Tuesday.
Reactor Nos. 6 and 7 at the Kashiwazaki-Kariwa plant in Niigata Prefecture are boiling water reactors, the same type as the ones that suffered core meltdowns in 2011 at Tepco’s Fukushima No. 1 complex.

All reactors in Japan — either BWRs or pressurized water reactors — are required to meet tougher safety criteria imposed after the Fukushima crisis, but the BWR assessment has been delayed due to the need to install safety equipment that involves extensive work.
If reactors 6 and 7 clear the assessment, they will become the first BWRs technically qualified to resume operation under the post-Fukushima rules.
Facing massive decommissioning costs and compensation payments after the Fukushima disaster, Tepco applied for the safety assessment of the two reactors in September 2013, hoping that restarting the units will help turn around its business.
But it is unclear whether the development will lead to their swift restart because Niigata Gov. Hirohiko Izumida has said he will "not talk about restarting" the reactors unless a study on the Fukushima calamity is sufficiently carried out.
The Kashiwazaki-Kariwa complex on the Sea of Japan coast is one of the world's largest nuclear power plants in capacity if all of its seven reactors were in operation.
Allowing Tepco to reactivate its reactors can be controversial, as the utility is still struggling to scrap the crippled reactors at the Fukushima plant. Tens of thousands of people who lived nearby also remain displaced evacuees.
The Nuclear Regulation Authority decided last August to prioritize checking the two Kashiwazaki-Kariwa reactors, hoping to make them a model case of the BWR assessment process. But it retracted the decision in March after Tepco failed to offer sufficient explanation on questions raised by the regulators.
But Tepco has come up with the necessary documents and the NRA decided to reinstate the priority status of the Kashiwazaki-Kariwa reactors at least until mid-September. The NRA has conveyed its plan to other utilities whose BWRs are being checked, the sources said.
Under the new safety requirements, BWRs must be equipped with filtered venting systems so that radioactive substances will be reduced when gas and steam need to be released to prevent damage to containment vessels.
The venting facilities are not an immediate requirement for PWRs as they are housed in containers larger than those of BWRs, allowing more time until pressure rises inside the containers.
Currently, two reactors at Kyushu Electric Power Co.'s Sendai plant and another reactor at Shikoku Electric Power Co.'s Ikata plant are operating in Japan after passing the safety checks. They are all BWRs.

Operating of Oma plant postponed again (till 2024)

September 9, 2016

J-Power delays plan to begin operating Oma nuclear plant until 2024

http://www.japantimes.co.jp/news/2016/09/09/national/j-power-delays-plan-begin-operating-oma-nuclear-plant-2024/#.V9LN2jVdeos
Kyodo
AOMORI – Electric Power Development Co. said Friday that it has decided to **postpone its plan to start operating its Oma nuclear power plant by two years to fiscal 2024 due to longer-than-expected safety tests by the nuclear regulatory body.**
The company, known as J-Power, has delayed the schedule for the second time after it applied for the safety check of the plant, which will be **the world's first reactor to run solely on plutonium-uranium mixed oxide fue**l, in December 2014, with an initial plan aimed at starting operation in fiscal 2021.

But it put off the original schedule in September last year to around fiscal 2022 due to the prolonged screening process by the Nuclear Regulation Authority after the company was asked to provide further explanations of the plan to build the plant in Aomori Prefecture.
"We would like to continue responding appropriately to (requests from) the regulation authority for safety screening," said Shosaku Kusunose, executive managing officer in charge of the Oma plant project.
Nuclear power plant operators in Japan need to obtain safety clearance from the NRA under tougher regulations adopted after the Fukushima nuclear crisis in 2011, which led to a nationwide halt of nuclear power plants.
Following the 2011 Fukushima disaster, the city of Hakodate in neighboring Hokkaido sued the company and government in April 2014, demanding a halt to the plant's construction.

6.000 workers every day at Kashiwazaki-Kariwa plant

September 16, 2016

TEPCO keeps thousands on the clock at idled Kashiwazaki-Kariwa plant, hoping for restart

http://www.japantimes.co.jp/news/2016/09/16/national/tepco-keeps-thousands-clock-idled-kashiwazaki-kariwa-plant-hoping-restart/#.V9un-DVdeou

by Emi Urabe
Bloomberg
More than 6,000 workers cycle through the world's biggest nuclear plant every day to operate and maintain a facility that hasn't sold a kilowatt of electricity in more than four years.
The buzz at Tokyo Electric Power Co. Holdings Inc.'s Kashiwazaki-Kariwa plant plays out daily across Japan, where utilities employ thousands of workers and spend billions of dollars awaiting the green light to restart commercial operations. With only three of the country's 42 operable reactors running, they're betting a central government committed to nuclear power will win over local officials and a wary public who don't believe enough has been done to guarantee safety since the worst meltdown disaster since Chernobyl.
"Even though operating expenses of nongenerating reactors remain high, utilities would prefer to keep them open while there is any chance they can restart," said James Taverner, a Tokyo-based analyst at IHS Markit Ltd. "Utilities have already committed significant expenditure for plants to meet new safety standards, and decommissioning costs are considerable."
The nine biggest regional utilities spent more than ¥1.5 trillion ($14.6 billion) on their nuclear plants during the year to March, according to Bloomberg calculations based on the latest earnings reports. Over that same period, those plants accounted for just 1.1 percent of the nation's electricity.
Nuclear-related costs accounted for 9 percent of all operating expenses at the utilities in the previous fiscal year, according to the calculations. That includes personnel and maintenance, as well as waste disposal and contributions to the nation's nuclear damage compensation system.

The burden of paying for nuclear facilities producing little electricity has been softened by price declines in recent years for coal, natural gas and oil, which are also used as fuels for power generation. Tepco sees itself swinging to a net loss as fossil fuel prices recover, making the restart of Kashiwazaki-Kariwa key to profitability, Naomi Hirose, the company's president, said in an interview earlier this year.

Costs for operating the country's nuclear facilities were slightly higher before the March 2011 Fukushima disaster, at about ¥1.7 trillion a year, when atomic energy accounted for nearly 30 percent of Japan's electricity mix. Tokyo Electric estimates that restarting one of the newest reactors at Kashiwazaki-Kariwa — known as KK — would boost net income by as much as ¥10 billion a month.

Tepco's plant, the world's biggest with about 8.2 gigawatts of generating capacity, has seven reactors at a facility spread across more than 1,000 acres (400 hectares) in Niigata Prefecture.

Workers clad in jumpsuits and loaded down with manuals convene daily in a mock-up of the reactor control room, preparing for the restart of the plant under new safety guidelines imposed after the Fukushima meltdowns.

"Everyday, this room is full of workers, from fresh employees to old veterans, sharpening their skills," Noboyuki Suzuki, a deputy manager in the company's human resources development group, said at the KK plant last month. "Operators at this facility are required to go through training here on a regular schedule."

About three-fourths of the Tepco employees and contract workers at the plant are from the prefecture hosting the facility, making it one of the area's biggest economic drivers.

The plant is an economic windfall for the region, employing thousands of workers and supporting restaurants, shops and even taxi companies, according to Masayoshi Oota, an official from the village of Kariwa. "If the (reactors) were to disappear, then so would the economic benefit," he said.

The nuclear energy industry employs more than 80,000 engineers, construction workers and operators, according to a report published by the Ministry of Economy, Trade and Industry last year.

To boost confidence in the giant facility's safety, Tokyo-based Tepco has spent ¥470 billion on flood barriers, a 15-meter seawall and a reservoir the size of 30 Olympic-size swimming pools to supply water in the event a reactor pump fails.

KK's restart is far from assured. The plant was forced to shut for 21 months following a strong earthquake in July 2007. Though some units eventually restarted, all were shuttered again after the March 2011 Fukushima debacle started, for safety checks.

There is skepticism among the public. The restart of nuclear reactors is opposed by 53 percent of Japanese and supported by just 30 percent, according to a nationwide poll conducted earlier this year by the Mainichi newspaper.

Local courts and governments have been some of the biggest roadblocks to restarting more reactors, crimping Prime Minister Shinzo Abe's goal of deriving as much as 22 percent of the nation's energy needs from nuclear by 2030. Goldman Sachs Group Inc. lowered its price target on six Japanese power utilities this month on risk of delays in restarting operations or renewed shutdowns.

"While some reactors have been restarted, the method to shut them down again (is) evolving," Goldman analyst Hiroyuki Sakaida wrote in a report dated Sept. 14. "We think it will be difficult to fully price in nuclear restarts and restored dividends until fundamental solutions are found to resolve the economic uncertainty surrounding nuclear power operations."

Should the plant clear the necessary regulatory, legal and political hurdles and resume operations, Tepco plans to maintain the facility's workforce at current levels, a reflection of how many workers are needed even during a period called cold shutdown.

“Right now we are focused on the nation’s regulatory review of the plant,” said Chikashi Shitara, facility chief at KK. “Even though the plant isn’t running, there is still a lot we must do.”

Local agreement may be needed to restart Fukushima Daini plant

September 24, 2016

Japan mulls legislation requiring local government approval for restarting Fukushima No. 2 nuclear plant

http://www.japantimes.co.jp/news/2016/09/24/national/japan-mulls-legislation-requiring-local-government-approval-restarting-fukushima-no-2-nuclear-plant/#.V-YueTVdeos

JIJI
The Japanese government is considering legislation to oblige Tokyo Electric Power Company Holdings Inc. to obtain approval from local governments if it applies for restarting its Fukushima No. 2 nuclear power station, Jiji Press learned Friday.
The legislation is also expected to stipulate that the plant be decommissioned if Tepco fails to win such approval and is unable to submit an application for its restart within three years after the law takes effect, sources said.
It will be a special measure under the nuclear reactor regulation law, which does not require local government approval for restarting reactors.
The government aims to submit the legislation to the extraordinary session of the Diet that will be convened on Monday, the sources said.
All the No. 1 to No. 4 reactors at the Fukushima No. 2 plant have been offline since the March 2011 earthquake and tsunami led to a triple meltdown at the Fukushima No. 1 nuclear power station.
Although three of the four reactors at the No. 2 plant lost cooling functions temporarily in the 2011 disaster, they avoided severe accidents such as a core meltdown.
Tepco has not clarified what to do with the No. 2 plant. It is working on decommissioning the stricken No. 1 plant.
The Fukushima prefectural government and its assembly have been calling for scrapping the No. 2 plant.
The legislation could force Tepco to decommission the No. 2 plant because it raises further hurdles for resuming operations.
The government has yet to decide on details of the legislation, including the scope of local governments whose approval would be necessary for reactor restarts, the sources said.
The government allows the restart of nuclear reactors that pass the Nuclear Regulation Authority’s screening based on the stricter safety standards introduced after the accident at the Fukushima No. 1 plant.
But the government sees a need for taking special measures for the No. 2 plant because it is located near the No. 1 plant, which caused severe damage to Fukushima Prefecture, the sources said.

Mihama No.3 and the 40-year rule

October 5, 2016

Another aging reactor passes safety checks to operate beyond 40 yrs

http://mainichi.jp/english/articles/20161005/p2g/00m/0dm/074000c
TOKYO (Kyodo) -- Another aging nuclear reactor in Japan passed a key safety assessment Wednesday as a step toward going back on line, signaling a weakening of the force of a rule introduced after the 2011 Fukushima disaster to limit reactors' operations to 40 years in principle.

- 【Related】Editorial: Japan should phase out aging nuclear reactors
- 【Related】40-year rule for Japan's nuclear reactors sidelined as Mihama unit passes screening
- 【Related】NRA's Takahama reactor approval a blow to 40-year lifespan rule

The No. 3 unit at Kansai Electric Power Co.'s Mihama plant in Fukui Prefecture is the latest reactor seeking to continue in service beyond the 40-year limit to pass the screening, after two such units at the utility's Takahama complex, also in Fukui.
The No. 3 unit went offline in May 2011 for a regular checkup and has not been restarted since due to inspections to meet tougher safety requirements introduced after the Fukushima disaster.
But hurdles remain before the Mihama reactor can restart. It will have to obtain further permission from the Nuclear Regulation Authority on details of equipment design and other issues by the end of November, when it will reach 40 years since entering service.
Missing the deadline would require the utility to scrap the reactor.
Even if the deadline is not missed, resumption of the reactor is not expected before the spring of 2020 to allow time for the operator to finish preparing all the required safety measures, according to Kansai Electric.
Kansai Electric plans to spend about 165 billion yen ($1.6 billion) to upgrade the facilities to meet the new regulations, which reflect the lessons learned from the Fukushima Daiichi nuclear power plant disaster.
The 40-year operational limit has been included in the regulations with the aim of encouraging the retirement of aging reactors that could be prone to accidents.
Although operation for an additional 20 years is possible, nuclear regulators initially indicated that it would be extremely difficult to actually get approval for an extension.
Some utilities have decided to scrap their aging reactors due to expensive safety costs. Kansai Electric has also given up restarting the Nos. 1 and 2 reactors of the three-unit Mihama plant.
But the 40-year-old limit has come to look as if it lacks teeth because utilities are still seeking extensions where they see it as economically viable, with nuclear regulators acknowledging that technical issues could be overcome with sufficient investment.

Niigata governor's election threatens restart

October 17, 2016

Niigata election a setback for restarting Japan's biggest nuclear power plant

http://www.japantimes.co.jp/news/2016/10/17/national/politics-diplomacy/setback-operator-worlds-largest-atomic-plant-anti-nuclear-doctor-elected-niigata-governor/#.WAS1Ccldeot

Reuters, Kyodo, Bloomberg

NIIGATA – Sunday's victory by an anti-nuclear activist in the Niigata gubernatorial election is a setback for Prime Minister Shinzo Abe's energy policy.

Ryuichi Yoneyama, 49, defeated the candidate endorsed by Abe's Liberal Democratic Party. Former construction ministry bureaucrat Tamio Mori, 67, was expected until the last moment to cruise to victory. Yoneyama, a doctor and lawyer, has never held office.

The campaign was dominated by concerns over the future of the world's biggest nuclear power station, the seven-reactor Kashiwazaki-Kariwa complex in Niigata Prefecture.

Currently, only two reactors across Japan are operating in the wake of the 2011 Fukushima nuclear disaster, and Abe has pushed hard for restarts.

"Under current circumstances where we can't protect the lives and the way of life of citizens in the prefecture, I can't approve a restart," Yoneyama told reporters Monday.

Supported by the Japanese Communist Party and two other small parties, Yoneyama secured close to 530,000 votes. Mori trailed with 465,000.

The focus will now be how Yoneyama will be able to cooperate with municipalities and the central government in creating evacuation plans for nuclear disasters. These will be key before restarts can take place.

Abe, meanwhile, told a Diet committee that he will respect the choice of Niigata and that he will cooperate with the new governor.

Shares in Tokyo Electric Power Company Holdings Inc., which operates the Kashiwazaki-Kariwa reactors, fell 8 percent Monday.

The complex has a capacity of 8 gigawatts. Its revival is key to saving Tepco, which was brought low by the Fukushima crisis and then repeated admissions of cover-ups and safety lapses.

"Senior managers at Tepco have made it clear that restarting the Kashiwazaki reactors is fundamentally important to restoring their finances," Tom O'Sullivan, founder of Tokyo-based consultant Mathyos, said by email. "There now has to be significant uncertainty over restarting those reactors."

Yoneyama's victory came after Tepco President Naomi Hirose highlighted the utility's financial vulnerability this month. He said it may face insolvency if it were to recognize the cost of decommissioning the crippled Fukushima No. 1 plant.

Tepco has said that resuming operations for just one of the Kashiwazaki-Kariwa reactors would boost its profit by about ¥10 billion a month.

This was Yoneyama's fifth attempt at public office, and the first time he was successful.

During the campaign he promised to continue the policy of the outgoing governor, who had long thwarted the ambitions of Tepco to restart the plant. Tepco supplies about a third of Japan's electricity.

When the race tightened, the election became a litmus test for nuclear safety and put Abe's energy policy and Tepco's handling of Fukushima back under the spotlight.

"The talk was of Kashiwazaki-Kariwa, but I think the result will affect nuclear restarts across the country," said Shigeaki Koga, a former trade and industry ministry official who is a critic of nuclear restarts and the Abe administration.

Koga said it will be important for Yoneyama to join forces with another newly elected governor skeptical of nuclear restarts, Satoshi Mitazono of Kagoshima Prefecture.

“Without strong support from others, it won’t be easy to take on Tepco,” he said.
The government wants to restart nuclear plants that pass safety checks while also promoting renewables and burning more coal and natural gas.
All of Japan’s reactors were eventually taken offline after Fukushima, but the Niigata plant’s troubles go back further.
Several reactors at Kashiwazaki-Kariwa have been out of action since an earthquake in 2007 caused radiation leaks and fires in a disaster that prefigured the Fukushima calamity and Tepco’s bungled response.
Yoneyama, who has worked as a radiological researcher, said on the campaign trail that Tepco lacks the means to prevent Niigata children from getting thyroid cancer in a nuclear accident, as he said happened in Fukushima. He said the company did not have a solid evacuation plan.
The LDP’s Mori, meanwhile, was forced to tone down his support for restarting the plant as the race tightened, insisting safety was the top priority for Kashiwazaki-Kariwa, while promoting the use of natural gas and solar power in Niigata.
People affected by the Fukushima crisis welcomed the election result, while operators of nuclear power-related businesses expressed concern.
Some evacuees of the 2011 crisis, including a 57-year-old man living in temporary housing in the city of Fukushima, said they hope the voices of the anti-nuclear camp will be reflected in Yoneyama’s policies.
“I don’t want another nuclear plant accident ,” he said. “No nuclear plant should be restarted.”
Kotaro Nagai, 67, who operates a guest house in Kagoshima Prefecture, home to the Sendai nuclear plant, however, said the financial boon for hosting reactors is the key factor behind his support for restarts.
“There are many people who have benefited financially from nuclear power plants,” Nagai said. “A restart is a matter of life and death for us.”

Upset in Niigata pushing LDP to review nuclear energy policy

THE ASAHI SHIMBUN
October 17, 2016 at 14:45 JST

http://www.asahi.com/ajw/articles/AJ201610170029.html

An opposition-backed candidate’s victory in the Niigata gubernatorial election threw the Abe administration into a state of shock over the possible consequences to its nuclear energy policy and its standing on the national level.
Niigata Governor-elect Ryuichi Yoneyama has taken a cautious stance on restarting the Kashiwazaki-Kariwa nuclear plant in the prefecture, the key issue in the gubernatorial election north of Tokyo.
The ruling coalition parties of the Liberal Democratic Party and Komeito thought they had a sure winner in Tamio Mori, a former Nagaoka mayor, before the official campaign period started.
But the voters’ rejection of the coalition-backed candidate means the Abe administration will have to review its energy policy.
“Our side lost in an election in which the opposition parties took an anti-nuclear stance,” a senior government official said. “That will naturally have an effect on the central government’s energy policy.”
The defeat of Mori, however, could have repercussions beyond just energy policy.

“There will be an effect on national politics in general, above and beyond nuclear energy policy, because this will give the opposition parties additional momentum,” a high-ranking LDP official said on Oct. 16.
The ruling coalition and proponents of nuclear power saw a great opportunity when Hirohiko Izumida, who had long opposed restarting the Kashiwazaki-Kariwa plant, announced he would not run for re-election.
After Yoneyama entered the race and said he would continue the cautious stance taken by Izumida, LDP executives went to Niigata to campaign on behalf of Mori.
After such efforts by the ruling party failed, one pro-nuclear energy LDP official said about restarting the Kashiwazaki-Kariwa plant, “We will have to take a wait-and-see approach for the time being.”
Yoneyama’s victory also throws a monkey wrench into plans of the Ministry of Economy, Trade and Industry to help Tokyo Electric Power Co., the operator of the Kashiwazaki-Kariwa plant, to return to a more stable corporate footing.
TEPCO has been hampered by the huge costs associated with cleaning up after the 2011 disaster at its Fukushima No. 1 nuclear power plant.
Economy ministry officials had preconditioned their TEPCO rehabilitation plan on a resumption of operations at some of the seven reactors at the Kashiwazaki-Kariwa plant.
Although a prefectural governor does not have the legal authority to order utilities to start or suspend operations at a nuclear plant, the common practice until now has been for utilities to obtain the consent of the local government before resuming operations.
With Yoneyama having clearly stated his reluctance toward such a resumption, TEPCO faces a much higher hurdle in its attempt to reboot the Kashiwazaki-Kariwa plant.
“We will persistently try to gain the understanding of the new governor, but it might be difficult to resume operations over the next four years,” a high-ranking economy ministry official said.

Nuclear foe Ryuichi Yoneyama elected Niigata governor, threatening Tepco reactor restarts

http://www.japantimes.co.jp/news/2016/10/17/national/politics-diplomacy/anti-nuclear-candidate-yoneyama-leading-niigata-gubernatorial-election/#.WAS1Xcldeos

Kyodo, Reuters

NIIGATA – An anti-nuclear candidate was elected governor of Niigata on Sunday, dealing a potential blow to Tokyo Electric Power Co.’s attempts to restart the world’s biggest nuclear power station.
The winner, Ryuichi Yoneyama, 49, is a doctor and lawyer who has never held office and was backed mostly by left-wing parties.
The campaign was dominated by concerns over the future of the massive Kashiwazaki-Kariwa power station and nuclear safety more than five years after the Fukushima crisis.
Yoneyama defeated former Nagaoka Mayor Tamio Mori, 67, who was backed by the pro-nuclear Liberal Democratic Party.
Yoneyama gathered more than 528,000 votes, about 60,000 more than Mori. Voter turnout was 53.05 percent, up significantly from the 43.95 percent in the previous gubernatorial election in 2012.

"It's really regrettable. We will take the judgment of voters very seriously," said Keiji Furuya, a Lower House member who served as head of Mori's campaign office.
Yoneyama promised to continue the policy of the departing governor, who had long thwarted Tepco's ambitions to restart the plant.
Reviving the seven-reactor giant, with capacity of 8 gigawatts, is key to saving the utility, which was battered by the Fukushima catastrophe of March 2011 and then the repeated admissions of coverups and safety lapses.
Tepco is vital to Prime Minister Shinzo Abe's energy policy, which relies on rebooting more of the reactors that once provided about 30 percent of the nation's electricity needs.

Genkai 3 & 4 cleared for restart... despite opposition

Dossier 8
November 9, 2016

Japan regulator clears more reactors for restart amid opposition

http://www.japantimes.co.jp/news/2016/11/09/national/japan-regulator-clears-reactors-restart-amid-opposition/#.WCLUVcmDmos

Bloomberg
Japan's nuclear regulator cleared another pair of reactors on the southernmost island of Kyushu for restart despite a growing chorus of opponents who object to any resumption of nuclear operations.
The Nuclear Regulation Authority approved a preliminary report on Wednesday that says Kyushu Electric Power Co.'s Genkai Nos. 3 and 4 reactors in Saga Prefecture meet post-Fukushima safety rules, one of the biggest hurdles an operator must clear. A 30-day comment period must be held before any final approval.
Genkai's approval is another small step for Prime Minister Shinzo Abe, who has backed a policy of restarting the nation's reactors to lower electricity rates, shore up the economy and boost global competitiveness. However, the looming threat of legal action and local opposition has put the fate of the entire restart process in doubt. Japan aims to have nuclear power account for as much as 22 percent of its energy mix by 2030, compared with more than a quarter before Fukushima and a little more than 1 percent now.
"This news will provide a boost for Japan's nuclear industry, but progress to restart reactors still lags behind the initial hopes of incumbent utilities," James Taverner, an energy analyst at IHS Markit Ltd., said by email. "Japan's policymakers and regulators continue to have a challenge to carefully balance industry needs and public safety concerns."
Last year, Kyushu Electric restarted the Nos. 1 and 2 reactors at its Sendai station, becoming the first utility to bring a reactor back online since new safety rules were brought in following the Fukushima disaster.
Almost 51 percent of the citizens of Saga Prefecture, where the Genkai plant is located, oppose its restart, while 39.3 percent approve, according to a regional newspaper poll conducted between Sept. 30 and Oct.

2. The same poll last year showed that 45.3 percent of respondents were against the restart, while 46.8 percent approved.

Restarting both units would boost net income by ¥12 billion ($117 million) a month, Naoko Iguchi, Tokyo-based spokeswoman for the utility, said by phone. The Sendai Nos. 1 and 2 reactors provided a ¥33 billion boost to net income for the six months ended Sept. 30, Masakatsu Tanaka, an official in Kyushu Electric's Tokyo office, said last month.

The Genkai reactors, with a combined capacity of 2.36 gigawatts, are expected to restart in the fiscal year ending March 2018, the Nikkei reported last month, citing President Michiaki Uriu. The company would consider lowering power rates once four units are online, Tokyo-based Kenji Kawabata, the company's deputy regional director, said last year.

Almost all the country's reactors remain shut because of the new safety regulations and public opposition following the 2011 Fukushima disaster. Only two of Japan's 42 operable reactors are producing power commercially as of Oct. 6, when Kyushu Electric shut its Sendai No. 1 unit for maintenance.

Sendai's return to service may be delayed due to the recent election of a new governor in Kagoshima who strongly opposes its operation. Local government approval — including endorsement from the governor — is traditionally sought by Japanese utilities before returning plants to service.

Tokyo Electric Power Co. Holdings Inc. fell the most in almost four months on Oct. 17 after Ryuichi Yoneyama was elected governor of Niigata the previous day. Yoneyama opposes Tokyo Electric's plan to restart its Kashiwazaki-Kariwa nuclear facility located in his prefecture.

Genkai nuke plant's No. 3, 4 reactors pass screening for possible restart

http://mainichi.jp/english/articles/20161109/p2a/00m/0na/023000c

The Nuclear Regulation Authority (NRA) has given a de-facto green light to reactivation of the No. 3 and 4 reactors at the Genkai Nuclear Power Plant in Saga Prefecture, bringing the total number of reactors that have passed the nuclear watchdog's screenings to 10 across Japan.

At a regular meeting on Nov. 9, the NRA put together a draft document indicating that the Genkai plant's No. 3 and 4 reactors met the new safety criteria introduced in the wake of the Fukushima nuclear disaster. The document will be officially approved following a one-month public comment period.

In order for the two reactors to be restarted, plant operator Kyushu Electric Power Co. will need to clear two more screenings on specific facility designs and other elements, as well as a pre-operation inspection. Actual reactivation is expected to come sometime after fiscal 2017.

Kyushu Electric applied for the safety screenings of the two reactors in July 2013, around the same time it filed a similar application to reactivate the No. 1 and 2 reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture, which are now online.

However, the NRA prioritized the Sendai plant screening as a model case for accelerating the entire safety review processes, putting the Genkai reactor screening on the back burner. The fact that the utility had changed an emergency response base's structure from a seismic isolation design to a quake-resistant design also contributed to the prolonged screening on the Genkai complex.

There are few active faults in areas around the Genkai plant that could trigger major earthquakes, and the maximum projected seismic acceleration is 620 gal and the maximum tsunami height is projected at about 6 meters -- smaller than for other nuclear complexes.
Meanwhile, there are 17 remote islands within a 30-kilometer radius of the plant, with a total population of around 20,000. While a nuclear accident evacuation plan is required to be mapped out for sites within that area, challenges remain for the islands as it would be difficult for residents to evacuate in the event of multiple disasters, such as a nuclear plant accident coupled with tsunami. Furthermore, measures for radiation protection at evacuation shelters on those islands haven't been improved yet.
The nuclear plants that have heretofore passed NRA screenings are: the No. 1 and 2 reactors at the Sendai plant, the No. 1 through 4 reactors at Kansai Electric Power Co.'s Takahama nuclear plant in Fukui Prefecture, Kansai Electric's No. 3 reactor at the Mihama plant in the same prefecture, and Shikoku Electric Power Co.'s No. 3 reactor at the Ikata plant in Ehime Prefecture.
Of those, five reactors -- the No. 1 and 2 reactors at the Sendai plant, the No. 3 and 4 reactors at the Takahama plant and the No. 3 reactor at the Ikata plant -- have been reactivated. However, the No. 3 and 4 reactors at the Takahama complex and the No. 1 reactor at the Sendai plant have been suspended due to a provisional injunction handed down by the Otsu District Court and a regular inspection, respectively. As a result, only two of those reactors are currently online.

NRA takes steps to restart Genkai nuclear plant
http://www3.nhk.or.jp/nhkworld/en/news/20161109_20/

Japan's nuclear regulator has taken steps to restart the Genkai plant in Saga Prefecture, western Japan. The restart will happen next summer at the earliest.

The Nuclear Regulation Authority presented its draft assessment of safety measures for the plant's No.3 and No. 4 reactors at a meeting on Wednesday.

The draft effectively approves safety measures set forth by the plant's operator, Kyushu Electric Power Company. Genkai is the 5th commercial nuclear plant in Japan to reach this stage.

The agency says the utility's measures meet new government requirements introduced after the Fukushima Daiichi nuclear accident in March 2011.

The measures include raising the maximum magnitude of a possible earthquake and making emergency command centers quake-resistant.

The regulator also says effective plans are in place to prevent meltdowns and damage to containment vessels in case of severe accidents. The No. 3 reactor uses mixed-oxide fuel, which includes plutonium extracted from spent nuclear fuel.

The NRA will hear public comments for 30 days before formally approving the assessment.

Kyushu Electric must receive approval for equipment designs, pass inspections and obtain local consent before restarting the reactors.

Extending 40-year lifespan once again might set a trend

November 17, 2016

EDITORIAL: NRA decision on aging reactors is irresponsible and unnecessary

http://www.asahi.com/ajw/articles/AJ201611170033.html

The Nuclear Regulation Authority on Nov. 16 gave the green light to Kansai Electric Power Co.'s application to extend operations of the aging No. 3 reactor at its Mihama nuclear power plant for up to 20 years. The plant in Fukui Prefecture will reach its 40-year-lifespan at the end of the month.

The Mihama No. 3 unit is the third reactor to be granted a license renewal by the nuclear safety watchdog following the No. 1 and No. 2 reactors at the same utility's Takahama nuclear power plant, also in Fukui Prefecture.

In the aftermath of the disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in 2011, the law was revised to set 40 years, in principle, as the lifespan of nuclear reactors. The licenses for reactor operations can be renewed once for up to an additional 20 years, but license renewal is supposed to be highly exceptional.

We are deeply concerned that the NRA's decision to approve the extended operation of an aging reactor could set a trend, gradually eviscerating the principle. We feel obliged to express again our opposition to the decision.

There are reactors that have been in service for more than 40 years in the United States and Europe. But experts have warned about a possible significant decline in the level of safety due to such aging issues as deterioration of the reactor vessel, which cannot be replaced.

The No. 3 reactor at the Mihama nuclear plant had a serious accident in 2004 when 11 workers were killed or injured by high temperature steam blowing out of a worn-out pipe in a turbine facility.

One of the factors behind the deadly accident was inadequate inspection over many years.

Older nuclear power plants require more careful maintenance and safety checks.

The extended operation of the aging reactors will impose a heavy burden on Kansai Electric Power, which is responsible for securing their safety.

The utility has promised to raise its estimation of ground motion due to possible earthquakes that might strike areas around the plants and take appropriate measures to bolster the quake-resistance of the reactors by spring 2020. It will also have to take additional safety measures, including steps to make electric cables less flammable.

The company will have to spend more than 380 billion yen ($3.47 billion) to meet the requirements to extend the operation of the three reactors. This sum doesn't include the costs of building new facilities to respond to terrorist attacks required under the new stricter safety standards.

The amount of money involved could have covered the entire cost of building a 1,000-megawatt nuclear power plant before the Fukushima disaster.

Still, Kansai Electric Power claims the massive investment makes economic sense. It said it plans to also seek license renewal for the No. 1 and No. 2 reactors at its Oi nuclear power plant, which will reach the 40-year legal lifespan in three years.
Of the 11 reactors it owns, the utility has decided to decommission only the two oldest--the No. 1 and No. 2 reactors at the Mihama plant.
Before the 2011 accident, Kansai Electric Power promised local communities that it would replace the aging Mihama No. 3 reactor with a new one. This promise seems to have played a role in its decision to keep the Mihama No. 3 unit running.
The license renewals offer no respite from concerns about the situation in areas around Wakasa Bay in Fukui Prefecture, which are dotted with many aging reactors.
Instead of making decisions only from a business point of view, the utility should opt to decommission these reactors to lower the risk of nuclear accidents.
The NRA's stance toward the issue is also questionable.
The three reactors at the Takahama and Mihama plants faced decommissioning unless their licenses were renewed before the expiration of the 40-year term.
The NRA gave precedence to the inspections of these reactors for license renewal and allowed the utility to delay required earthquake-resistance tests for important equipment until after the completion of the planned work.
These actions indicate the nuclear regulator tried to complete the license renewal review process before the expiry dates kicked in.
The pools for storing spent nuclear fuel at the nuclear plants operated by Kansai Electric Power are close to reaching their capacity.
The utility says it will build an interim storage facility outside Fukui Prefecture. But there is no workable and specific plan to realize this idea.
The utility is acting in an irresponsible manner by deciding to extend the operation of these aging reactors without solving the key problem.
The catastrophic accident at the Fukushima plant has radically changed the Japanese public's perceptions of nuclear power generation.
It is hard to believe that continued use of old reactors will open up a new energy future for this nation.
Kansai Electric Power should stop to reconsider whether extending the operation of these reactors is really necessary.

November 16, 2016

Another operation approval of aging nuclear reactor contradicts 40-year rule

http://mainichi.jp/english/articles/20161116/p2a/00m/0na/019000c

The Nuclear Regulation Authority (NRA) has allowed Kansai Electric Power Co. to continue running the No. 3 reactor at its Mihama Nuclear Power Station in Fukui Prefecture beyond the 40-year limit.

- 【Related】Japan regulator OKs another nuclear reactor to run beyond 40-yr limit
- 【Related】Another aging reactor passes safety checks to operate beyond 40 yrs
- 【Fukushima & Nuclear Power】

This is the third nuclear reactor in the country that will have been allowed to continue to operate beyond the 40-year limit -- following the No. 1 and 2 reactors at the Takahama plant also in Fukui Prefecture.
The move contradicts rules stipulating that nuclear reactors should be decommissioned after being operated for 40 years, in principle.
It had been viewed as extremely difficult to extend the lifespan of Mihama's No. 3 reactor because of its old design and difficulties in improving the reactor's quake resistance as the plant operator is required to largely increase the estimate of the scale of the maximum earthquake that could hit the plant.
As such, the NRA once hinted that it would discontinue examinations of the reactor to see if it meets the new regulatory standards.
However, Kansai Electric Power spent 165 billion yen on measures to enhance the safety of the reactor.
The NRA increased its personnel to accelerate the examination of the plant, and managed to approve the continuation of its operation by the deadline.
Six aging nuclear reactors across the country are set to be shut down and decommissioned. Their operators voluntarily decided to decommission these reactors, whose outputs are small, considering the units' cost-benefit performance.
However, if power companies apply for permission to extend the lifespan of nuclear reactors, the NRA will almost certainly grant permission.
The rules limiting the operation of a nuclear reactor to 40 years, in principle, was established with the aim of reducing Japan's reliance on atomic power stations following the outbreak of the Fukushima nuclear crisis in March 2011. Both the NRA and power companies should go back to the fundamentals of the rules.

Niigata mayor vs governor?

November 21, 2016

New mayor in Niigata willing to restart nuclear plant

http://www.asahi.com/ajw/articles/AJ201611210053.html

THE ASAHI SHIMBUN
KASHIWAZAKI, Niigata Prefecture--An independent candidate who has called for a conditional restart of one of the world' largest nuclear plants was elected mayor of this coastal city in northwestern Japan on Nov. 20.
Masahiro Sakurai, 54, gained 30,220 votes, compared with 16,459 for Eiko Takeuchi, 47, who opposed a resumption of operations at the Kashiwazaki-Kariwa nuclear power plant.
Sakurai's victory could lead to a showdown with Niigata Governor Ryuichi Yoneyama over the nuclear power plant operated by Tokyo Electric Power Co. Yoneyama, who won the governor's election in October, has taken a tough stance against restarting the nuclear plant.
The plant's site covers part of Kashiwazaki and the neighboring village of Kariwa. All seven of the plant's reactors have remained idle over the past few years.
"I will gradually but surely reduce the number of reactors in the nuclear power plant," Sakurai told reporters after the election. "But I recognize the value of resuming operations."

Takeuchi, who was backed by the Japanese Communist Party and the Social Democratic Party, was against restarting reactors there.
Voter turnout for the mayoral election was 64.06 percent, a slight decrease from 64.93 percent in the previous election.
TEPCO, operator of the crippled Fukushima No. 1 nuclear plant, is eager to restart reactors at the Kashiwazaki-Kariwa plant.
During the election campaign, Sakurai said he would "approve a restart of the halted nuclear plant if safety is confirmed and certain conditions are fulfilled."
One condition is the construction of a road that residents can use for evacuation in case of an emergency at the nuclear plant. Sakurai also promised to start decommissioning older reactors at the plant.

Has Fukushima quake shaken restart plans?

November 22, 2016

Earthquakes rattle Japan's plan to restart more nuclear reactors

http://www.beyondnuclear.org/home/2016/11/22/earthquakes-rattle-japans-plan-to-restart-more-nuclear-react.html

The Shinzo Abe government's plan to restart nuclear power in Japan was shaken to its core with a 7.4 magnitude earthquake that struck on November 21, 2016 (the date here in the U.S.) just off the coast of the destroyed Fukushima Daiichi atomic reactors. Fukushima Daiichi is also the site of a huge radioactive waste tank farm that continues to expand from an on-again off-again radioactive cooling water treatment system for the three still unrecovered melted reactor cores. Little is presently known about how the hastily built tank farm has fared during the earthquake.
The four-unit Fukushima Daini nuclear power complex just seven miles south of Fukushima Daiichi temporarily lost cooling to Daini's Unit 3 spent fuel pool raising concerns for the overheating of high-level nuclear waste configured as 2400 used fuel rods being stored underwater. Fukushima Daini remains shutdown and barred from power operations along with 38 operable units in Japan following the March 11, 2011 8.9M earthquake and catastrophic tsunami. Only two of the nation's nuclear reactors have successfully returned to power operations amid intense public and political opposition that continues to grow.
Tuesday morning's 7.4M earthquake struck around 6 am (JST) 31 miles off the east coast. The large earthquake set off coastal tsunami warnings for several hours, eventually measuring up to a sea level rise of 55 inches. A second 5.5M earthquake struck shortly after with its epicenter on land just 7 miles from Fukushima Daini with another tsunami warning. Aftershocks continue to jolt the area with officials concerned that another major quake can be expected within the week.
During times of natural disaster and national security threats, nuclear power is more a dangerous societal liability than an asset. All of the reactors' safety systems and their nuclear waste cooling systems are 100% reliant upon offsite electrical grid power during normal operations. If the electric grid is disturbed by disaster or sabotage, nuclear power plants automatically shut down and emergency electrical power

systems kick in to service a subset of priority reactor safety and cooling systems. If those systems fail or are disabled, nuclear power stations typically have 4 to 8 hours of back-up battery power to prevent a meltdown. Cooling capability to thousands of tons of high-level nuclear waste (irradiated fuel rods) initially rely upon the same off-site electrical power. Since the 9/11 World Trade Center aircraft attacks and the 3/11 Fukushima nuclear disaster, reactor spent fuel pools with high-density storage of nuclear waste are being equipped with make-up water systems should a loss of power threaten to boil off the water filled pools. Each pool containing up to 700 to 1000 tons of thermally hot and highly radioactive nuclear waste can overheat, boil off and catch fire without cooling.
The Beyond Nuclear Facebook page posted live stream coverage broadcasted from Japan during the tsunami warning.

First meeting between TEPCO and Niigata Governor

November 24, 2016

Niigata Governor, Tepco execs to meet Tuesday

http://www.japantimes.co.jp/news/2016/11/24/business/niigata-governor-tepco-execs-meet-tuesday/#.WDgC032Dmos

JIJI
Tokyo Electric Power Company Holdings Inc. said Thursday that its first meeting with new Niigata Gov. Ryuichi Yoneyama will be held at the Niigata Prefectural Government's offices in Niigata next Tuesday.
The meeting, initially scheduled for last Tuesday, was canceled by the magnitude-7.4 earthquake that coincidentally struck off Fukushima Prefecture the very same day.
At the meeting with Tepco Chairman Fumio Sudo and President Naomi Hirose, Yoneyama plans to convey his cautious attitude toward restarting the Kashiwazaki-Kariwa nuclear power plant, informed sources said.
Yoneyama was elected governor last month. At a news conference Thursday, he said he will clarify his stance that "unless a thorough review of the (March 2011) accident at Tepco's Fukushima No. 1 nuclear plant is conducted, the talks on a restart (of Kashiwazaki-Kariwa) can't get started."
As for the review of the crisis by the prefectural government's technical panel, Yoneyama said: "We can't proceed with the review if Tepco doesn't give us information. We'd appreciate its cooperation."
The Tepco officials, for their part, want the governor's support to restart the giant plant, which straddles Kashiwazaki and the town of Kariwa, because it is critical to the utility's survival.
"We'll sincerely deal with the issue without shutting down discussion," Yoneyama told the prefectural assembly.

People worried about continuing to run old reactors

November 27, 2016

Fukushima aftershock renews public concern about restarting Kansai's aging nuclear reactors

http://www.japantimes.co.jp/news/2016/11/27/national/fukushima-aftershock-renews-public-concern-restarting-kansais-aging-nuclear-reactors/#.WDqAuX2Dmos

by Eric Johnston
Staff Writer

KYOTO – The magnitude-7.4 aftershock that rocked Fukushima Prefecture and its vicinity last week, more than five years after the mega-quake and tsunami of March 2011, triggered fresh nuclear concerns in the Kansai region, which hosts Kansai Electric Power Co.'s Mihama plant in Fukui Prefecture..

The aftershock came as the Nuclear Regulation Authority approved a two-decade extension for Mihama's No. 3 reactor on Nov. 16, allowing it and two others that have already been approved to run for as long as 60 years to provide electricity to the Kansai region.

Residents need to live with the fact that they are close to the Fukui reactors, which are at least 40 years old. Despite reassurances by Kepco, its operator, and the nuclear watchdog, worries remain over what would happen if an earthquake similar to the one in 2011, or even last week, hit the Kansai region.

Kyoto lies about 60 km and Osaka about 110 km from the old Fukui plants. Lake Biwa, which provides water to about 13 million people, is less than 60 km away.

In addition to Kepco's 40-year-old Mihama No. 3, reactors 1 and 2 at the Takahama nuclear power plant in Fukui are 42 and 41 years old, respectively.

In the event of an accident, evacuation procedures for about 253,000 residents of Fukui, Shiga, and Kyoto prefectures who are within 30 km of the plants would go into effect.

But how effective might they be?

The majority does not live in Fukui. Just over half, or 128,500, live in neighboring Kyoto, especially in and around the port city of Maizuru, home to a Self-Defense Forces base. Another 67,000 live in four towns in Fukui and about 58,000 live in northern Shiga Prefecture.

Plans call for Fukui and Kyoto prefecture residents to evacuate to 29 cities and 12 towns in Hyogo Prefecture and, if facilities there are overwhelmed, to Tokushima Prefecture in Shikoku. Those in Shiga are supposed to evacuate to cities and towns in Osaka Prefecture.

In a scenario put together by Kyoto Prefecture three years ago, it was predicted that tens of thousands of people would take to available roads in the event of an nuclear accident. A 100 percent evacuation of everyone within 30 km of a stricken Fukui plant was estimated to take between 15 and 29 hours, depending on how much damage there was to the transportation infrastructure.

But Kansai-based anti-nuclear activists have criticized local evacuation plans as being unrealistic for several reasons.

First, they note that the region around the plants gets a lot of snow in the winter, which could render roads, even if still intact after a quake or other disaster, much more difficult to navigate, slowing evacuations even further.

Second is the radiation screening process that has been announced in official local plans drawn up by Kyoto and Hyogo prefectures.

While automobiles would be stopped at various checkpoints along the roads leading out of Fukui and given radiation tests, those inside would not be tested if the vehicle itself has radiation levels below the standard.

If the radiation is above standard, one person, a "representative" of everyone in the car, would be checked and, if approved, the car would be allowed to continue on its way under the assumption that the others had also been exposed to levels below standard. This policy stands even if those levels might be more dangerous to children than adults.
Finally, there is the question of whether bus drivers would cooperate by going in and out of radioactive zones to help those who lack quick access to a car, especially senior citizens in need of assistance.
None of the concerns about the evacuation plans is new, and most have been pointed out by safety experts, medical professionals and anti-nuclear groups.
But with the NRA having approved restarts for three Kansai-area reactors that are over 40 years old, Kansai leaders are responding more cautiously to efforts to restart Mihama No. 3 in particular.
"It is absolutely crucial that local understanding for Mihama's restart be obtained," said pro-nuclear Fukui Gov. Issei Nishikawa in July, after a local newspaper survey showed that only about 37 percent of Fukui residents agree with the decision to restart old reactors.
Shiga Gov. Taizo Mikazuki, who is generally against nuclear power, was even more critical of the NRA's decision to restart Mihama.
"There are major doubts about the law that regulates the use of nuclear reactors more than 40 years old. The central government and Kepco need to explain safety countermeasures to residents who are uneasy. People are extremely uneasy about continuing to run old reactors," the governor said earlier this month.
Kansai Perspective appears on the fourth Monday of each month, focusing on Kansai-area developments and events of national importance with a Kansai connection.

Governor Mitazono: "A mere publicity stunt" before the election?

November 29, 2016

Governor under fire as Sendai nuclear reactor likely to restart

http://www.asahi.com/ajw/articles/AJ201611290066.html

THE ASAHI SHIMBUN

KAGOSHIMA—Anti-nuclear activists are castigating Governor Satoshi Mitazono, saying the politician has retreated from his campaign promises regarding the planned restart of a nuclear reactor in the prefecture.
Despite stressing that he would take a hard look at safety issues, Mitazono's actions on Nov. 28 indicate that Kyushu Electric Power Co. will be allowed to restart the No. 1 reactor at its Sendai plant on Dec. 8 as was expected.
"What he had done over the past months now appears to be a mere publicity stunt," said Yukio Taira, chief of a confederation of labor unions in Kagoshima Prefecture.
Taira withdrew his candidacy in the governor's race in July after he and Mitazono agreed on many policy measures toward a temporary halt of operations at the nuclear plant in Satsuma-Sendai.
Mitazono on Nov. 28 submitted to the prefectural assembly a budget proposal for establishing an expert panel on nuclear power generation--a centerpiece of his campaign pledges.

“I will make a comprehensive judgment on how to respond when the panel releases its findings of the utility’s reports on ‘special checks,’” Mitazono told the assembly session, referring to the reactor restart plan.
However, given that a governor does not have the legal authority to order a halt, the No. 1 reactor will probably already be running by the time those findings are released.
The assembly is expected to vote on the budget request for the panel on Dec. 16. Kyushu Electric is scheduled to release the outcome of its special checks in early January.
The utility agreed to carry out the additional checks in response to the new governor's concerns. These inspections, including checking bolts fastened on barrels containing nuclear waste, are nothing new and have been done in the past, according to Kyushu Electric.
Two reactors at the Sendai plant were the first in the nation to go online under new nuclear safety regulations set up after the 2011 nuclear disaster in Fukushima Prefecture.
The No. 1 reactor has been shut down for maintenance since October. The No. 2 reactor is scheduled to be taken offline in December for a routine inspection.
Mitazono, a former TV journalist, was elected on campaign promises to take a “strong response regarding a reactor restart if the envisaged committee deems the plant unsafe.”
Concerns over the safety of the nuclear complex arose when roads and other infrastructure were damaged in a series of powerful quakes that began rattling neighboring Kumamoto Prefecture in April.
After gaining support from anti-nuclear groups, Mitazono won the race against the incumbent, who was seen as friendlier toward nuclear power generation.
But after he took office, Mitazono appeared to back off from his campaign promises.
He did request an “immediate halt” of plant operations to Michiaki Uriu, president of Kyushu Electric, in late August and early September.
After the company refused the governor’s requests, Mitazono decided not to pursue the issue, saying a governor does not have the legal authority to demand a halt to operations.
He tried to assuage public concerns about the safety of the plant, citing the extra special checks the utility promised to conduct.
Taira said Mitazono has rejected repeated requests for a meeting with him and other anti-nuclear activists. They have asked Mitazono to quickly establish the expert panel for possible action to counter Kyushu Electric’s reactor restart plans. But the governor did not reply.
Mitazono also did not submit a budget request for the expert panel in the September session.
When asked by reporters, Mitazono merely kept saying he would establish the panel “as soon as possible.”
“He is breaking the campaign promise if he allows the resumption of the plant without obtaining the conclusion of the panel,” Taira said.
According to one source, the governor told an informal gathering of members of the Liberal Democratic Party, the largest group in the assembly, that he shares the LDP’s direction in nuclear power policy.

Sendai No.1 to restart before all checks are completed

December 7, 2016

Another reactor to return online in Japan
https://www3.nhk.or.jp/nhkworld/en/news/20161207_05/

A Japanese nuclear power plant operator plans to restart one of its reactors on Thursday after regular inspections.

Kyushu Electric Power Company says the Number One reactor at its Sendai plant in Kagoshima Prefecture will return online if no problem arises.

The reactor was taken offline in October for the checks.

The operator conducted additional inspections by request from Kagoshima Governor Satoshi Mitazono to see whether strong earthquakes that hit nearby Kumamoto Prefecture in April affected the reactor.

Before the inspections, Mitazono had asked the operator to halt the reactor immediately, citing growing concerns among residents.

The utility rejected the request, but decided to conduct the additional checks.

Inspections will continue after the restart, with all procedures to be completed by January 6th.

Mitazono has not expressed his views on the restart.

He also has not set up a panel of experts that will discuss the safety of the reactor. He says the panel will be launched after the prefectural assembly approves a budget on December 16th.

Some people are urging the governor to make his stance clear before the reactor returns online.

In August last year, the reactor became the first one to return online under new government guidelines introduced after the 2011 nuclear accident in Fukushima.

Sendai goes back online

December 8, 2016

Sendai reactor goes back online
https://www3.nhk.or.jp/nhkworld/en/news/20161208_30/

Operators have powered on a nuclear reactor at a plant in western Japan on Thursday night after 2 months of inspections.

Officials at Kyushu Electric Power Company say workers have begun pulling control rods out of the Number One reactor at their Sendai plant in Kagoshima Prefecture.

The reactor has been offline since October. Before that, it operated for 14 months as the first reactor in the country to go online under new regulations following the Fukushima Daiichi nuclear disaster.

The utility says it found no abnormalities during its regular and special inspections.

The special checks were added at the request of Kagoshima Governor Satoshi Mitazono, who took office in July. He asked the utility to see if strong earthquakes that occurred at nearby Kumamoto Prefecture in April had affected the plant.

Officials say they expect the reactor to reach criticality on Friday and begin transmitting electricity to the grid on Sunday. They also expect the plant to resume commercial operations in early January.

A group opposing the restart held a rally on Thursday outside the facility. Group leader Yoshitaka Mukohara said a proposed prefectural panel should first give a judgment before the reactor is brought online.

Governor Mitazono had promised to set up an expert panel to look into the reactor's safety, but it has yet to be launched. Mukohara urged the governor to stick to his position.

Kyushu Electric to reactivate Sendai reactor as governor OK'd

December 8, 2016 (Mainichi Japan)

FUKUOKA (Kyodo) -- Kyushu Electric Power Co. will reactivate a reactor Thursday in the southwestern Japanese prefecture of Kagoshima, the utility said Wednesday after the local antinuclear power governor gave a de facto green light last week.

The No. 1 reactor at the Sendai nuclear power complex is one of the five reactors that have been restarted under Japan's strict safety regulations set following the 2011 Fukushima meltdowns. After resumption in August 2015, it has been suspended for regular checkups since Oct. 6.

The company plans to pull rods to control nuclear fission for the No. 1 reactor from fuel at 9:30 p.m. Thursday, resume power generation on Sunday and return to commercial operation of the unit Jan. 6 after an inspection by the Nuclear Regulation Authority.

Kagoshima Gov. Satoshi Mitazono was elected in July on an antinuclear platform. But he told a prefectural assembly session Dec. 1, "I have no legal power (to decide) on the restart of the reactor," which is interpreted as permitting the restart.

In addition to the regular checks, 10 kinds of special checks are being conducted on the No. 1 reactor at the governor's request following the massive earthquakes in the adjacent prefecture of Kumamoto in April, according to the company.

The Sendai complex's No. 2 reactor is also scheduled to be suspended for regular checks from Dec. 16 to Feb. 27.

Sendai No.1 goes back online (2)

Kyushu Electric fires up Kagoshima reactor after governor gives OK

http://www.japantimes.co.jp/news/2016/12/09/national/kyushu-electric-fires-kagoshima-reactor-governor-gives-grudging-nod/#.WEqg832Dmos

Kyodo
FUKUOKA – Kyushu Electric Power Co. restarted a nuclear reactor in Kagoshima Prefecture on Thursday after the prefectural governor, who is opposed to nuclear power, effectively permitted the move last week.
Reactor No. 1 at the Sendai nuclear power complex is one of five reactors to have been reactivated under stricter safety regulations adopted in the wake of the 2011 Fukushima reactor meltdowns. Following resumption in August 2015, its operation had been suspended for a regular checkup since Oct. 6.
The utility pulled out control rods from the reactor at around 9:30 p.m. The reactor is expected to achieve criticality by Friday morning and to start power generation from Sunday. Commercial operation is set to resume from Jan. 6.
Kyushu Electric on Tuesday notified Kagoshima Gov. Satoshi Mitazono of the planned restart of the reactor and was not requested to suspend it this time, it said.
Mitazono, who was elected in July on an anti-nuclear platform, asked the utility in August and September to immediately suspend operation of the plant. Reactor No. 1 came to a halt in October for a regular checkup.
The Sendai complex's reactor No. 2 is scheduled to be suspended for regular checks from Dec. 16 to Feb. 27.
Mitazono had told the prefectural assembly earlier this month that he had no legal power to decide whether to restart the reactor, paving the way for the latest move.
On Thursday, however, Mitazono said that he will take "strong action, regardless of the reactor's operation," if an experts' committee, which he plans to set up to examine safety at the plant, finds any safety problems.
Some 30 local residents and anti-nuclear group members gathered in front of the Sendai plant Thursday morning to protest the reactivation.

December 9, 2016

Sendai nuclear reactor restarts as governor stays quiet

http://www.asahi.com/ajw/articles/AJ201612090049.html

THE ASAHI SHIMBUN
SATSUMA-SENDAI, Kagoshima Prefecture--Kyushu Electric Power Co. restarted a reactor at its nuclear plant here on Dec. 8, drawing protests from anti-nuclear activists and a look of resignation from the man they helped to elect governor.

The procedure to remove control rods to allow nuclear fission in the No. 1 reactor at the Sendai plant started at 9:30 p.m., and the plant is expected to generate electricity for commercial use in early January.
The No. 1 reactor had been shut down for maintenance since Oct. 6.
The reactor is the first to be restarted after undergoing a routine checkup based on tighter safety standards adopted in light of the 2011 disaster at the Fukushima No. 1 nuclear power plant.
Groups of protesters, including local residents, rallied against the restart and held placards in front of the Sendai plant Dec. 8.
The resumption of operations was particularly harsh for the anti-nuclear activists because they thought they had elected a leader who would shut down the plant.
But Kagoshima Governor Satoshi Mitazono kept his voice low and avoided giving any direct responses to media questions about the restart.
"The nuclear plant will remain here whether it is restarted or not," Mitazono said earlier on Dec. 8.
The governor also said the prefectural government will soon organize a third-party committee that will examine the safety of the Sendai plant.
During the governor's race in July, Mitazono indicated he would take a tough stance against the Sendai plant.
After he took office, he twice asked Kyushu Electric for an "immediate halt" to plant operations.
But Mitazono later toned down his words, repeatedly saying he has no legal authority to have the reactor restarted or not.
The No. 1 reactor was restarted as scheduled.

Niigata governor rejects restart

January 5, 2017

Niigata governor rejects restarts in 1st meet with TEPCO execs

http://www.asahi.com/ajw/articles/AJ201701050067.html

THE ASAHI SHIMBUN
NIIGATA--Niigata Governor Ryuichi Yoneyama met Jan. 5 with top executives of Tokyo Electric Power Co. (TEPCO) for the first time, reiterating his opposition to restarting the Kashiwazaki-Kariwa nuclear power plant.
"It will be difficult to approve the restart as long as (the causes of) the accident at the Fukushima No. 1 nuclear power plant are not verified. In the present circumstances, I cannot accept the restart," Yoneyama told Fumio Sudo, chairman of Tokyo Electric Power Co. Holdings Inc., and Naomi Hirose, president of the company.
It was the first time for Yoneyama to meet with TEPCO executives since he assumed the post of Niigata governor last October. The talks were held in the Niigata prefectural government office.
Yoneyama, noting that it will take several years for the Niigata prefectural government to verify the causes of the 2011 nuclear disaster, asked the TEPCO executives to provide more information and other forms of cooperation.
In response, Sudo said, "The priority is to hear voices of local residents."

This seemed to suggest that TEPCO will not restart the Kashiwazaki-Kariwa nuclear power plant as long as the Niigata governor continues to resist the move.
A council of experts of the Ministry of Economy, Trade and Industry announced late last year that the costs for dealing with the aftermath of the Fukushima nuclear disaster will almost double to 21.5 trillion yen ($185 billion) from 11 trillion yen initially estimated in 2013.
To help cover the amount, TEPCO planned to restart two reactors at the Kashiwazaki-Kariwa to generate 100 billion yen in annual profits. But that now looks difficult, given Yoneyama's firm stance on the issue of restarts.
(This article was written by Yoichi Yonetani and Yuko Matsuura.)

Gov., TEPCO execs discuss restart of nuclear plant
https://www3.nhk.or.jp/nhkworld/en/news/20170105_21/

The governor of Niigata Prefecture has met executives from Tokyo Electric Power Company over restarting a nuclear power plant in the prefecture.

Ryuichi Yoneyama, who took office last October, has taken a cautious stance on restarting the utility's Kashiwazaki-Kariwa plant.

Yoneyama has insisted that the plant should not be put back online until after an investigation into the cause of an accident in Fukushima and its effects on human health. He also said verification of the effectiveness of an evacuation plan for a possible nuclear accident must be completed before a resumption.

On Thursday, Yoneyama met TEPCO executives, including Chairman Fumio Sudo and President Naomi Hirose, for the first time after 2 postponements of their meetings.

Sudo said TEPCO is ready to sincerely respond to the governor's calls. He added that as opinions of local people are most important for the company, the harsher the opinions, the better for TEPCO.

Sudo also said the firm wants to reform its current management system.

The governor said he's not sure how long the verification process will take, but assumes it will probably be several years. He expressed determination to do all he can to accomplish the verification.

"Several years"

January 5, 2017

‘Several years’ needed to restart Kashiwazaki-Kariwa plant: Niigata governor

http://www.japantimes.co.jp/news/2017/01/05/national/governor-says-restart-nuclear-plant-niigata-take-several-years/#.WG-v432Dmos

Kyodo

Restarting the world’s largest nuclear power plant will likely take “several years,” the governor of Niigata Prefecture said Thursday, highlighting the difficulty of concluding the nuclear disaster reviews sparked by the triple core meltdown of March 2011.

Tokyo Electric Power Company Holdings Inc., better known as Tepco, has been trying to reactivate the Kashiwazaki-Kariwa nuclear plant, the world’s largest by generation capacity, to generate much-needed revenue to offset ballooning costs and redress claims stemming from the 2011 nuclear disaster.

“There can be no discussions about a restart without reviewing” factors including the cause of the Fukushima nuclear disaster and evacuation plans for residents, Niigata Gov. Ryuichi Yoneyama said in his first talks with Tepco executives since assuming office in October.

Restarting reactors remains a sensitive issue in Japan following the crisis at the Fukushima No. 1 nuclear plant, a triple meltdown triggered by the Great East Japan Earthquake and ensuing tsunami that wrecked the coast of the Tohoku region in March 2011. Stricter safety standards were introduced after the crisis.

“I expect it will take several years to review” all the factors, Yoneyama told Tepco President Naomi Hirose and Chairman Fumio Sudo at the Niigata Prefectural Government’s offices.

The prefectural government plans to set up independent panels to probe the Fukushima disaster and its health impact, as well as arrangements for evacuating residents in the event of another disaster.

Hirose remained confident, however, that both sides will find common ground, telling reporters after the meeting that he had the impression that Tepco and the prefectural government “can continue to have positive discussions.”

Yoneyama has expressed his intention to visit the plant, as well as the Fukushima No. 1 plant.

Sudo told the governor that the utility will “earnestly address” the concerns of the prefectural government and community. After the meeting, he told reporters that local consent must “take priority.”

“As an operator, we must be prepared,” he said, suggesting that it will take a long time before the plant is restarted.

With total costs related to the 2011 disaster, including for compensation and decommissioning, likely to reach around ¥22 trillion ($189 billion), Tepco is speeding up its turnaround efforts, aiming to reform its nuclear power and electricity transmission businesses.

Yoneyama’s meeting with the Tepco executives was initially scheduled for November but postponed following a strong earthquake off the coast of Fukushima and the detection of bird flu in Niigata.

Safety measures approved for Ohi plant

January 10, 2017

Nuclear watchdog approves safety measures for Ohi

https://www3.nhk.or.jp/nhkworld/en/news/20170110_25/

Japan's nuclear watchdog has basically approved new safety measures for the 2 reactors at the Ohi nuclear plant in Fukui Prefecture, central Japan.

The operator, Kansai Electric Power Company, drafted the measures under the guidelines that were introduced after the Fukushima Daiichi accident in 2011.

Officials of the Nuclear Regulation Authority will now examine the safety procedures. They are expected to complete their assessment by the end of March.

12 reactors at 6 nuclear plants in Japan will then have passed the screening by the nuclear agency.

Kansai Electric plans to finish the necessary work and equipment tests by the end of September for restarting the reactors. But it will also need to obtain local consent.

The assessment process for the 2 reactors was resumed in November last year. It had been suspended for 9 months because older reactors were given priority.

No.3 and No.4 Genkai reactors pass muster

January 18, 2017

Two nuclear reactors in Saga Prefecture pass safety checks

http://www.japantimes.co.jp/news/2017/01/18/national/two-nuclear-reactors-saga-prefecture-pass-safety-checks/#.WH9fS32Dmot

Kyodo, JIJI
Two nuclear reactors in Saga Prefecture passed a key state safety assessment Wednesday, but uncertainty remains over whether operator Kyushu Electric Power Co. will win local support to bring them back online amid lingering safety concerns.
The No. 3 and No. 4 units of the Genkai plant are among many reactors in limbo after the tougher safety requirements were introduced in the wake of the Fukushima No. 1 nuclear power plant disaster in 2011.
To restart the Genkai No. 3 and No. 4 units, Kyushu Electric needs approval from the Nuclear Regulation Authority for detailed designs of equipment and procedures for dealing with severe accidents. The reactors are expected to restart in April or later.
The government has been pushing for reactor restarts as nuclear power is regarded as a key energy source even after the Fukushima disaster. But the process has been slow, partly due to safety concerns.
As for the resumption of the Genkai reactors, the city of Imari, which sits within a 30-km radius of the plant, has expressed concerns over evacuation preparations.
The Fukushima disaster led the central government to expand the areas around nuclear plants that should prepare for evacuation to 30 km from 10 km.

The 30-km areas around the Kyushu Electric plant, which faces the Genkai Sea, includes municipalities in Saga Prefecture, neighboring Fukuoka and Nagasaki prefectures, and 17 islands where about 20,000 people live.
In an emergency, residents on the islands would evacuate by ship. But critics say measures for safe evacuation in bad weather must be established.
While there are more than 40 commercial reactors across the country, only two are now operating — the No. 1 reactor at Kyushu Electric's Sendai plant in Kagoshima Prefecture and the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture.
The Sendai plant's No. 2 unit is operable, but is currently undergoing regular checkups.
Two reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture were also restarted last year after clearing safety hurdles. But a court injunction in connection with safety issues shut them down with no clear timeline for a restart.

Genkai plant reactors' safety measures certified
https://www3.nhk.or.jp/nhkworld/en/news/20170118_15/

Japan's nuclear regulator has officially announced that safety measures for 2 reactors at the Genkai nuclear plant meet government requirements introduced after the 2011 Fukushima Daiichi accident.

The Nuclear Regulation Authority on Wednesday compiled an assessment approving restarts of the No.3 and 4 reactors at the plant in Saga Prefecture, western Japan. The facility is run by Kyushu Electric Power Company.

The regulator has been hearing from the public after compiling in November a draft assessment that had taken more than 3 years.

An NRA secretariat official at a meeting of the agency on Wednesday referred to strong earthquakes that took place last year in Kumamoto, near Saga Prefecture.

The official said some criticized the draft for failing to reflect the lessons of Kumamoto, but added that the government regulations require that the plant can function even during such quakes.

The official also said the operator checked the impact of the quakes and is taking necessary measures. The draft was approved on Wednesday with some of its wording revised.

The Genkai is to be the 2nd nuclear plant of Kyushu Electric to go back online, following the restarted Sendai plant. The Genkai facility is the 5th in the country whose safety measures have received NRA approval.

Detailed checks for quake resistance design and local consent are still needed. The reactors are expected to be back online this summer at the earliest.

Other issues are evacuation plans for elderly and challenged people as well as those living on 17 small islands near the plant in the event of a nuclear accident. Experts say the prefectural government and relevant municipalities must review their evacuation plans.

2 online - 10 have passed the "safety" tests

January 18, 2017
Operational status of Japan nuclear plants
https://www3.nhk.or.jp/nhkworld/en/news/20170118_19/

Japan's nuclear regulator has so far approved safety measures for 10 reactors at 5 plants. Two of these reactors are online as of January 18th.

There are a total of 42 reactors at 16 nuclear power plants across Japan. That number excludes reactors set to be scrapped.

Twenty-six reactors are now being checked for compliance with regulations introduced after the 2011 Fukushima Daiichi nuclear disaster.

The 10 reactors that have cleared checks include 2 at the Genkai nuclear power plant, which were approved on Wednesday.

The others are: the Sendai No.1 and 2 reactors in Kagoshima Prefecture; the No.3 reactor at the Ikata plant in Ehime Prefecture; and the Takahama No.3 and 4 reactors in Fukui Prefecture.

They also include 3 reactors allowed to operate beyond the basic operational limit of 40 years. They are the Takahama No.1 and 2 reactors and the No. 3 at Mihama nuclear plant in Fukui.

The reactors now online are the Sendai No.1 and the Ikata No.3.

Operation of the No. 3 and 4 reactors at the Takahama plant was suspended after residents of a nearby prefecture filed a lawsuit.

The 3 aging reactors need additional safety measures before restarts. Their operator estimates it will take around 3 years for those reactors to go back online.

Worrying review for Onawaga No.2

January 18, 2017

1,130 cracks, 70% rigidity lost at Onagawa reactor building

http://www.asahi.com/ajw/articles/AJ201701180054.html

THE ASAHI SHIMBUN

Plans to resume operations at the Onagawa nuclear power plant's No. 2 reactor have taken a hit, as the building sustained 1,130 cracks in the walls and lost an estimated 70 percent of structural rigidity in the massive 2011 earthquake.

Tohoku Electric Power Co. revealed the extent of the damage at a Nuclear Regulation Authority review meeting on Jan. 17 to investigate plans to bring the power station in Miyagi Prefecture back online.

Tohoku Electric plans to extensively reinforce the damaged No. 2 reactor building. It is seeking to bolster the quake-resistance of the reactor to pass the stricter safety regulations on nuclear plants instituted by the NRA in the aftermath of the Fukushima nuclear crisis, triggered by the disaster.

However, that may be a long way off, as the nuclear watchdog said that it must inspect the cracks and the plans before the utility can proceed with the reinforcement project.

As with all nuclear power stations in the nation, the facility, which straddles the town of Onagawa and Ishinomaki city, went offline after the Great East Japan Earthquake and tsunami sparked the nuclear disaster.

A tremor of 607 Gals was recorded at the No. 2 reactor building when the magnitude-9.0 earthquake struck, but the structure was only built to withstand jolts of up to 594 Gals, according to Tohoku Electric. (Gal is a unit of acceleration used to describe how violently something shakes.)

A later architectural investigation found a total of 1,130 cracks on its walls, with 734 of them found on the top third-floor section. There were more cracks in the upper levels of the building as that part swayed the most during the earthquake.

The difference in the ways the uppermost section rocked compared to the lower portion when hit by aftershocks suggested that the structural rigidity of the third floor was down to 30 percent of what it was when the reactor began operating in 1995, according to the utility.

The lower section of the building, which covers two above-ground floors and three basement levels, was estimated to have lost 25 percent of its structural rigidity.

Structural rigidity assesses a building's ability to withstand earthquakes and other stresses from outside without being distorted.

Kashiwazaki-Kariwa restart: More lies from TEPCO

February 15, 2017

TEPCO admits error in screening report

https://www3.nhk.or.jp/nhkworld/en/news/20170215_18/

Japan's Nuclear Regulation Authority is demanding an explanation from Tokyo Electric Power Company.

TEPCO has admitted to submitting inaccurate information from calculations 3 years ago on plans for restarting two of its nuclear reactors in Niigata Prefecture.

The regulator is in the final stages of screening the No.6 and 7 reactors at TEPCO's Kashiwazaki-Kariwa plant.

The reactors must meet new government requirements introduced after the 2011 Fukushima disaster.

Regulators gathered on Tuesday for discussions with TEPCO about buildings at the plant to be used as headquarters in an emergency.

TEPCO officials admitted one of the buildings lacked the necessary quake-resistance in all 7 of the company's tests.

They had earlier said that the building had failed 5 of the 7 tests. They said they would not use the building.

They blamed the discrepancy on a failure by the civil engineering department to convey test results to the equipment design department.

The regulators noted the lack of coordination between TEPCO departments on the impact of soil liquefaction on breakwaters.

They called the mistakes unacceptable, and they're demanding that TEPCO provide details and countermeasures.

Kashiwazaki-Kariwa restart: More lies from TEPCO (2)

February 15, 2017

TEPCO gave inaccurate explanations about seismic capacity of nuke plant

http://mainichi.jp/english/articles/20170215/p2a/00m/0na/014000c

Tokyo Electric Power Co. (TEPCO) has revealed that it had explained that the seismic capacity of a quake-absorbing structure called an "important anti-seismic building" at its Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture was higher than it actually was, now saying that it "cannot withstand all types of shaking."

TEPCO made the revelation at a Nuclear Regulation Authority (NRA) safety screening session on the plant's No. 6 and 7 reactors on Feb. 14. The "important anti-seismic building" is supposed to serve as a frontline base in the event of a nuclear accident. The NRA demanded TEPCO give detailed explanations about how and why it provided the wrong information, saying harshly, "We cannot overlook this."

According to the NRA and other sources, of the so-called "standard earthquake vibrations," the strongest seismic shaking the important anti-seismic building is assumed to withstand, TEPCO had said that the structure would not be able to withstand some types of seismic shaking. But the utility reversed its previous explanations at the latest meeting, saying, "It cannot withstand all types of shaking." TEPCO said that it had given the wrong explanation because the facts had not been conveyed from its section that analyzed the seismic capacity of the building in 2014 to the division in charge of attending safety screening session meetings.

A TEPCO official apologized at the meeting, saying, "We are sorry that our information sharing was insufficient."

Key Niigata nuclear plant building may not be quake-proof

http://www.asahi.com/ajw/articles/AJ201702150042.html

THE ASAHI SHIMBUN

Tokyo Electric Power Co. has revealed that a key building at its Kashiwazaki-Kariwa nuclear power plant may not be able to withstand even half of the assumed strongest seismic shaking, contrary to its earlier assurances.

TEPCO's disclosure came Feb. 14 during a screening by the Nuclear Regulation Authority (NRA) for the restart of the No. 6 and No. 7 reactors at the nuclear power plant in Niigata Prefecture, which is the world's largest.

The utility became aware of the possibility in 2014, but the information was not shared within the company. TEPCO reported to the NRA that the building can withstand temblors of 7, the highest category on the Japanese seismic intensity scale.

The building is designed to serve as an on-site emergency headquarters in the event of a severe accident, such as one caused by an earthquake.

An earthquake that occurred off the Chuetsu region of Niigata Prefecture in 2007 badly damaged the Kashiwazaki-Kariwa plant.

In response, TEPCO constructed the building in question in 2009. At that time, it said the structure could withstand the assed biggest earthquake motions that are 1.5 times stronger than those described in the Building Standards Law.

In 2014, the utility checked the building's anti-quake capabilities again. It found that it may not be able to withstand horizontal movements triggered by even half the anticipated strongest earthquake, and that it could collapse into the side of an adjacent building.

That information was not conveyed to the company's division in charge of the NRA's screening, and thus escaped notice from NRA inspections.

Takafumi Anegawa, managing executive officer of TEPCO, apologized, saying, "We did not conceal the possibility. The in-house liaison was insufficient."

An NRA official said, "Information is not shared in the company. Lessons from the accident at the Fukushima No. 1 nuclear power plant are not utilized."

Governor likely to OK Sendai restart

Governor likely to OK Sendai plant operation

https://www3.nhk.or.jp/nhkworld/en/news/20170222_33/

The governor of Kagoshima in western Japan is expected to approve the continued operation of a nuclear plant in the prefecture. Experts have found no irregularities at the facility following last year's strong

earthquakes.

Governor Satoshi Mitazono had called for the operation of the Sendai nuclear plant to be suspended after a series of earthquakes centered in nearby Kumamoto Prefecture.

He noted public concern and also asked for an inspection of the plant.

Kyushu Electric Power Company officials rejected his call to halt operations, but they carried out a special inspection. They say they found the quakes caused no abnormalities.

Last Thursday, an expert panel set up by the prefecture also reported that the quakes left no effects on the plant.

Mitazono said on Wednesday that there is currently no need for strong measures against the plant. He said he will remain vigilant if troubles arise.

There were mixed reactions to Mitazono's decision.

A man in his 70s says the governor may have found that he cannot prevail over the central government in his anti-nuclear battle. He says there was no other choice but to continue operating the plant.

A woman in her 30s says she wanted the governor to stick to the anti-nuclear policy he pledged in the campaign.

She says she wants him to ensure that Kagoshima is a place where children will be able to live safely, now and in the future.

Oi restart still need local consent

February 23, 2017

EDITORIAL: Local consent needed despite OK to restart Oi nuclear plant

http://www.asahi.com/ajw/articles/AJ201702230032.html

The Nuclear Regulation Authority on Feb. 22 published a draft safety inspection report saying measures taken at the Nos. 3 and 4 reactors of Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture meet the new stricter anti-disaster standards.
In 2014, however, the Fukui District Court ordered the operator to keep the two reactors offline, raising serious questions about their safety.

Some 160,000 people in Fukui, Kyoto and Shiga prefectures reside within 30 kilometers from the plant. It is also questionable whether local residents can be evacuated quickly and smoothly if a serious accident occurs at the plant.

In a recent Asahi Shimbun survey, 57 percent of the respondents expressed their opposition to the restart of offline nuclear reactors, nearly double the number of those who supported the idea.

Come next month, six years will have passed since the catastrophic accident broke out at the Fukushima No. 1 nuclear power plant. Many Japanese remain unconvinced of the safety of nuclear reactors.

Kansai Electric Power is hoping to bring the two reactors back on line as early as this summer. But we find it difficult to support the plan.

There are multiple faults around the Oi plant. The biggest worry cited in the district court ruling was the possibility that a stronger earthquake than assumed could seriously damage the reactors or the spent fuel pool.

The electric utility has since appealed the ruling. But the company has also raised the estimated maximum ground acceleration that could occur in an earthquake at the location.

The utility will spend 122 billion yen ($1.07 billion) on measures to enhance the safety of the plant.

But Kunihiko Shimazaki, a seismologist and former acting chairman of the NRA, has warned against the plan. Using observation data about the powerful earthquakes that hit areas around Kumamoto Prefecture in April last year, he has argued that the utility's calculation method may have underestimated the biggest potential shaking of a quake at the location.

After reviewing the data, the NRA dismissed Shimazaki's argument, with Chairman Shunichi Tanaka calling it "groundless."

But the scientist's warning has deepened anxiety among local residents.

The spent fuel pools at Kansai Electric Power's three nuclear power plants including Oi are almost filled to the brim.

The utility says it will build an interim storage facility outside Fukui Prefecture around 2030 so that used fuel rods can be removed from the pools.

But the company has yet to map out a specific and workable plan to build such a facility.

In January, a large crane toppled in strong winds at the utility's Takahama nuclear power plant, also in Fukui Prefecture, damaging the roofs of two buildings.

The accident occurred as the company failed to notify the contractor operating the crane of a storm warning, and the contractor failed to fold up the crane in advance.

The lesson of the Fukushima nuclear accident is that maximum possible safety measures should be taken to guard against the risks posed by natural phenomena. It came as a dire warning about underestimating such risks.

Even the Fukui prefectural government, which has been keen to support Kansai Electric's plan to bring reactors back online, has expressed skepticism about the utility's trustworthiness.

"It is difficult to place sufficient confidence in the company's operations of nuclear plants," the deputy Fukui governor has said.

The focus of the utility's efforts to restart the reactors will shift to gaining local support for the plan.

The company has stuck to the position that only the governments of Fukui Prefecture and the town of Oi, where the plant is located, have the de facto "right to consent" to its plan under a safety agreement between the operator and the local governments.

A severe accident, however, could cause damage in wide areas in the Kansai region, for example, by polluting Lake Biwa in Shiga Prefecture, the largest lake in Japan.

The utility should not proceed with the plan to restart the reactors without obtaining support from areas where local residents would have to be evacuated in the event of a major accident.
We demand again that the company gain consent to the plan at least from all local governments within 30 km from the plant, including those in Kyoto and Shiga prefectures.
--The Asahi Shimbun, Feb. 23

February 22, 2017
Ohi nuclear plant restart draft assessment ready
https://www3.nhk.or.jp/nhkworld/en/news/20170222_18/

Japan's nuclear regulator has taken a step further toward restarting the Ohi nuclear power plant in Fukui Prefecture, on the Sea of Japan coast. The restart will take place next autumn at the earliest.

At a meeting on Wednesday, the Nuclear Regulation Authority unanimously approved its draft assessment of the plant's No.3 and No.4 reactors.

The assessment says safety measures set forth by the plant's operator, Kansai Electric Power Company, meet new government requirements introduced after the Fukushima Daiichi nuclear accident in March 2011.

The NRA said the utility has raised its estimates of possible quakes and tsunami in response to the regulator's earlier request for improvements.

It also said the planned introduction of equipment designed to prevent hydrogen explosions is also appropriate.

The regulator plans to invite the public to express their opinions for a month starting on Thursday before it gives official approval.

The Ohi plant will be the 6th plant whose safety measures have received the regulator's approval.

Kansai Electric is planning to complete necessary work to fulfill the safety measures by May. It is also necessary to conduct equipment tests and obtain local consent before putting the reactors back online.

A lawsuit over whether to approve the plant's restart is under way. The utility has appealed a district court ruling in 2014 that rejected the restart.

Kashiwazaki-Kariwa: TEPCO must resubmit restart papers

March 1, 2017

TEPCO told it must re-submit papers to pass NRA screening

http://www.asahi.com/ajw/articles/AJ201703010074.html

THE ASAHI SHIMBUN

The nation's nuclear watchdog, incensed at more blundering by Tokyo Electric Power Co., ordered it to re-submit documents for the restart of two reactors at the Kashiwazaki-Kariwa nuclear power plant after checking them again for accuracy.

The Nuclear Regulation Authority also summoned TEPCO's president to its office and gave him a dressing-down for failing to reveal information that could have compromised safety at the plant.

The NRA's action Feb. 28 followed revelations in mid-February that a key building at the facility may not be able to withstand anything like the strong earthquake shaking it is supposed to. This fact came to light in 2014 but was not reported to the NRA until last month.

TEPCO said that the information was not shared within the company, and as a result, was not conveyed to its division in charge of NRA screenings.

It was the first time for the NRA to summon TEPCO President Naomi Hirose to its office as part of the screening process for the restart of reactors.

“TEPCO needs to learn from other electric power companies, but its stance is insufficient. As the company lost public trust due to the accident (at the Fukushima No. 1 nuclear power plant in March 2011), it needs to make much greater efforts than others. But it is not doing so,” said NRA chairman Shunichi Tanaka.

Hirose acknowledged that TEPCO needs to work harder to regain society's trust, saying, "We are taking that fact seriously.”

He said TEPCO had shown "insufficient humility and displayed arrogance."

Hirose stated that the company intends to learn its lesson and will re-submit documents so that the plant passes the screening process.

To get to that point, the top management of TEPCO will have to check several thousand pages of documents. As drastic changes may have to be made, it is inevitable that the NRA screenings will be prolonged.

In 2013, TEPCO applied to the NRA for screenings so it can restart the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

The screenings entered the final stage in 2016. But this coincided with big changes in policies over the designs of quake-resistant capabilities of buildings and measures for sea walls to deal with liquefaction.

Then, this year, it was learned that TEPCO failed to report to the NRA for three consecutive years that a key building, which is expected to serve as an on-site emergency headquarters in the event of a severe accident, may not be able to withstand even half of the assumed strongest seismic shaking.

The upshot of the series of problems meant that the NRA wasted time for discussions.

But the NRA is also miffed that TEPCO seems unable to decide its basic policies in a determined manner.

26 reactors have applied for restart

March 13, 2017

Applications For 26 Nuclear Plants Being Considered Related To Japan Restarts
http://www.nucnet.org/all-the-news/2017/03/13/applications-for-26-nuclear-plants-being-considered-related-to-japan-restarts

13 Mar (NucNet): Japan's Nuclear Regulation Authority (NRA) has accepted applications for 26 nuclear power plants at 16 sites in relation to the restart of reactors following the introduction of new safety and security standards after the March 2011 Fukushima-Daiichi accident, the Japan Atomic Industrial Forum (Jaif) said. The applications are at different stages such as public comment, volcanic issues, geographical features and various design-related safety issues. Tokyo Electric Power Company (Tepco), which owns and operates the Fukushima-Daiichi nuclear site, is planning to restart the seven boiling water reactor units at its Kashiwazaki Kariwa station in Niigita Prefecture, western Japan. Jaif said examinations at the facility are "generally in their final stages". There remain, however, a number of points of contention that need to be resolved including issues related to an emergency response area in the main anti-earthquake building and an emergency response area within the Unit-5 reactor building. Japan's Kyodo news agency said recently that Tepco, has been trying to reactivate the Kashiwazaki Kariwa plant, the world's largest by generation capacity, to generate "much-needed revenue" to offset rising costs and redress claims stemming from the 2011 accident.

First research reactor to restart soon

March 19, 2017
First research reactor to restart in April
https://www3.nhk.or.jp/nhkworld/en/news/20170318_10

A laboratory at a university in western Japan will restart its research nuclear reactor in April after meeting safety standards.

It will be the first research reactor in Japan to go back online under stringent regulations introduced by the government in the wake of the 2011 Fukushima Daiichi nuclear accident.

Kindai University in Higashi-Osaka said on Friday that the reactor has passed a series of checks by Japan's nuclear regulator.

The Nuclear Regulation Authority gave in-principle approval for the restart of the reactor in May last year. The university subsequently made further adjustments to protect against fire, tornados and other risks. The small reactor has a maximum output of just 1 watt, and is used exclusively for academic purposes.

The head of the university laboratory, Tetsuo Ito, said he will do his best to ensure students and researchers can use it as soon as possible.

High Court backs restart of Takahama

March 28, 2017
High court allows restart of Takahama reactors
https://www3.nhk.or.jp/nhkworld/en/news/20170328_24/

The Osaka High Court has nullified a lower court injunction that suspended operations of 2 nuclear reactors in central Japan.

The No.3 and No.4 reactors at the Takahama plant in Fukui Prefecture have been offline since the Otsu district court issued the order in March last year.

The Otsu court upheld claims filed by residents of Fukui's neighboring prefecture of Shiga that Kansai Electric Power Company had failed to fully explain the plant's safety.

Its injunction was the first to halt an online reactor.

Kansai Electric appealed to the Osaka High Court, claiming it has put in place tougher safety measures than required under new regulations introduced after the 2011 accident at the Fukushima Daiichi nuclear plant.

The high court decision on Tuesday allows the reactors to go back online.

Kansai Electric plans to begin procedures to restart the reactors, including the transfer of nuclear fuel, after explaining the situation to local governments in Fukui Prefecture.

It's expected to take more than a month for the reactors to resume operation.

https://www3.nhk.or.jp/nhkworld/nhknewsline/nuclearwatch/courtapprovesrestartoftakahamareactors/

Higher court backs restart of halted Takahama reactors

March 28, 2017 (Mainichi Japan)

http://mainichi.jp/english/articles/20170328/p2g/00m/0dm/063000c

OSAKA (Kyodo) -- A Japanese high court on Tuesday revoked a lower court order to halt two nuclear reactors at the Takahama plant in central Japan, accepting an appeal by Kansai Electric Power Co. against the first injunction ever issued in the country to shut operating reactors.
But it is unlikely that the operation of other nuclear reactors in Japan will be resumed soon due to pending legal matters, analysts say.
The decision, made by the Osaka High Court, legally allows Kansai Electric to resume operating the Nos. 3 and 4 reactors at the nuclear power plant on the Sea of Japan coast in Fukui Prefecture. The two reactors have been idled for around a year.

The higher court said that quake-resistance standards were not overestimated under tougher regulations set following the 2011 Fukushima nuclear disaster and that necessary measures have been taken to prevent significant damage of the reactor core.
The latest decision bodes well for Prime Minister Shinzo Abe's government, which has been promoting the restart of nuclear reactors in a bid to bolster the economy by cutting the cost of fossil fuels and exporting nuclear technology abroad.
Yoshihide Suga, the government's top spokesman, said at a press conference in Tokyo, "We want Kansai Electric to put top priority on safety and make every effort to obtain understanding from the local government and others involved."
Kansai Electric President Shigeki Iwane said at a news conference in Osaka that his company has yet to decide when to restart the operation of Takahama's Nos. 3 and 4 reactors, pledging to "make safety our top priority."
Iwane also expressed eagerness to push down electric charges as soon as possible after the resumption of the two reactors.
A group of residents in neighboring Shiga Prefecture who won the landmark injunction from the Otsu District Court in March last year are expected to consider countermeasures, including filing a special appeal with the Supreme Court.
Amid widespread concern about the safety of nuclear power following the 2011 Fukushima meltdowns, the residents in Shiga filed a request with the district court in January 2015, seeking an order halting the two reactors at the plant.
On March 9, 2016, the district court ordered operation of the two nuclear reactors to be halted, casting doubts about the utility's safety measures and Japan's post-Fukushima nuclear regulations set by the Nuclear Regulation Authority.
Last July, Kansai Electric filed an appeal against a district court decision rejecting its request to suspend the injunction order.
In Tuesday's decision, the Osaka High Court determined that the post-Fukushima safety measures were "not unreasonable" because they were devised on the basis of the "latest scientific and technical knowledge" that reflects lessons learned from the nuclear disaster.
The utility has criticized the injunction, claiming it was not an objective judgment based on scientific knowledge. It also says the injunction is costing the utility 200 million to 300 million yen ($1.8 million to $2.7 million) more per day to generate power from other fuel.
Kansai Electric removed nuclear fuel from the Takahama reactors between August and September last year given the prolonged court battle.
As of Tuesday, only three of Japan's 42 commercial reactors nationwide are now operating -- the Nos. 1 and 2 reactors at Kyushu Electric's Sendai plant in Kagoshima Prefecture, southwestern Japan, and the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture, western Japan, according to the Agency for Natural Resources and Energy.
On Thursday, the Hiroshima District Court is set to rule on an appeal filed to halt the operation of the No.3 reactor at the Ikata power plant, the first ruling since it resumed operations in August last year.

Court rejects injunction against Ehime reactor

March 30, 2017

Court refuses injunction against reactor
https://www3.nhk.or.jp/nhkworld/en/news/20170330_25/

A Japanese court has turned down a request by residents for a halt to operations of a nuclear reactor in western Japan.

The Hiroshima District Court ruled on Thursday that local residents are in no specific danger of suffering serious radiation damage from the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture.

4 people were asking for an injunction, saying the reactor is at risk of a serious accident from a major earthquake.

The reactor's operator, Shikoku Electric Power Company, rejected their concerns, saying it took safety measures based on the maximum size of a possible quake predicted for the area.
Presiding Judge Shigeyuki Yoshioka said the firm worked out its assessment based on a meticulous geological survey.

The judge ruled that there is nothing unreasonable about the Nuclear Regulation Authority's decision that the reactor meets its requirements.

The reactor was restarted last August after passing scrutiny by the agency based on stricter requirements introduced following the 2011 Fukushima Daiichi nuclear power plant accident.

One of the four residents, Kenta Tsunasaki, called the court's decision regrettable. He said he will keep speaking out against nuclear stations.

Shikoku Electric Power Company said in a statement that the court's decision is reasonable. The firm said it will keep working to ensure safety.

District court rejects request to temporarily halt Ikata nuke plant
http://www.asahi.com/ajw/articles/AJ201703300062.html

By YUKI KUBOTA/ Staff Writer
March 30, 2017 at 18:35 JST

HIROSHIMA--The district court here on March 30 rejected a request for a temporary injunction halting operations of the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture, upholding the operator's anti-seismic designs.
The main point of contention in the closed court sessions was if the basic earthquake ground motion figure used by Shikoku Electric Power Co., the plant operator, was appropriate as the basis for its anti-seismic design for the reactor.
The four plaintiffs, who are residents of Hiroshima and Matsuyama, argued that the Ikata plant is located in the region that is vulnerable to a potentially massive Nankai Trough earthquake. The plant also faces a second quake risk because it is located close to the Median Tectonic Line, the longest fault system in Japan.

Based on those circumstances, the plaintiffs argued that the maximum 650 gals, a measure of ground acceleration, used by Shikoku Electric as the basic earthquake ground motion, was an underestimation when compared to the figures used for safety inspections of other nuclear plants that have been made stricter following the 2011 accident at the Fukushima No. 1 nuclear power plant.
However, the Hiroshima District Court ruled that Shikoku Electric used reliable measures in calculating the basic earthquake ground motion. The court also ruled that there were no irrational points in the decision made by the NRA to approve the safety screening for the Ikata reactor based on the new standards.
The temporary injunction request, filed on March 11, 2016, the fifth anniversary of the Great East Japan Earthquake, was rejected because the court ruled that the rights of the plaintiffs were not likely to be violated by the safety measures.
The ruling follows a decision on March 28 by the Osaka High Court that overturned a ruling in March 2016 by the Otsu District Court that issued a temporary injunction against the No. 3 and No. 4 reactors at the Takahama nuclear plant in Fukui Prefecture.
Other residents have submitted requests for similar temporary injunctions against the Ikata plant in the Matsuyama and Oita district courts as well as the Iwakuni branch of the Yamaguchi District Court.
The plaintiffs in the Hiroshima case have also filed a separate lawsuit with the Hiroshima District Court seeking to halt operations of the No. 1 to No. 3 reactors at the Ikata plant. No ruling has yet been made on that lawsuit.

Japan court dismisses request to halt reactor in Ehime

http://mainichi.jp/english/articles/20170330/p2g/00m/0dm/072000c

March 30, 2017 (Mainichi Japan)
HIROSHIMA (Kyodo) -- A Japanese district court Thursday dismissed a request from local residents to order the halt of a nuclear reactor, which restarted last year, at the Ikata power plant in western Japan.
The decision by the Hiroshima District Court came two days after the Osaka High Court revoked a lower court order halting two reactors at the Takahama plant in Fukui Prefecture. In that case, the high court accepted an appeal by the plant's operator against the first injunction ever issued in Japan to stop an operating reactor.
The No. 3 reactor is one of only three of Japan's 42 commercial reactors nationwide now operating. The two others are the Nos. 1 and 2 reactors at Kyushu Electric's Sendai plant in Kagoshima Prefecture, southwestern Japan.
In response to Thursday's ruling, the plaintiffs plan to appeal the decision to the Hiroshima High Court, while Shikoku Electric Power Co. welcomed the ruling which supported its claim that it had ensured safe operation of the reactor on the opposite side of the Seto Inland Sea from Hiroshima.
Shikoku Electric has been operating the reactor since last August.
In the ruling, Presiding Judge Shigeyuki Yoshioka said there were "no irrationalities" in stricter safety regulations introduced after the 2011 Fukushima nuclear disaster.
The court said quake and tsunami estimates by Shikoku Electric were appropriately set based on the safety regulations.
The court said there is a need to prudently review the rationality of the quake estimate. But it said such highly technical matters should be examined by seismologists and officials of the Nuclear Regulation Authority, and not determined by courts.

The most contentious points in the case included whether the post-Fukushima nuclear regulations set by the regulatory body are appropriate, and whether the estimate of seismic ground motion, a key factor in a reactor's quake-resistance design, was credible.
During the court hearings, the plaintiffs argued that Shikoku Electric underestimated the potential magnitude of an earthquake that could hit the plant, which lies above the epicenter of the anticipated Nankai Trough mega-quake.
Amid widespread concern about the safety of nuclear power in the wake of the 2011 Fukushima meltdown, four residents of Matsuyama, Ehime Prefecture, and the city of Hiroshima, which lies about 100 kilometers from the plant, filed a request with the Hiroshima court in March last year, seeking an order to halt the No. 3 reactor.
If the Ikata plant were to be severely damaged like the Fukushima Daiichi nuclear plant was in 2011, nuclear substances could spread and contaminate the Seto Inland Sea, affecting Hiroshima on the other side of the sea, the plaintiffs asserted.
Supporters expressed their anger over the ruling, calling it "unjust" and saying that coming from the atomic-bombed city of Hiroshima, they will "not give up" the fight.
Similar lawsuits and other injunctions seeking suspension of the No. 3 reactor at the Ikata plant have been filed with other district courts in the nearby city of Matsuyama, Yamaguchi, which lies southwest of Hiroshima, and Oita, which lies to the west of Ikata.

Restart of Osaka University reactor

April 13, 2017

University in Osaka restarts research reactor

https://www3.nhk.or.jp/nhkworld/en/news/20170412_26/

A university in Osaka has restarted its nuclear reactor designed for research for the first time in 3 years. The restart will allow the school to recommence practical training.

It's the first research reactor in Japan to go back online under more stringent regulations introduced by the government after the 2011 Fukushima Daiichi accident. 21 other similar facilities remain offline.

The reactor at Kindai University's Atomic Energy Research Institute has a maximum output of 1 watt, the lowest in Japan.

Due to the stricter safety requirements, the university hasn't been able to use the reactor since it was taken offline in 2014 for scheduled inspections.

After implementing measures under the new regulations, the institute restarted the reactor on Wednesday afternoon. It achieved criticality in about 25 minutes.

Experts say education in nuclear power engineering is vital to keep reactors in Japan running and to

decommission them.

They say the offline state of Japan's research reactors has made it harder to encourage students to study nuclear engineering.

Apart from Kindai University's facility, only 2 other research reactors in Japan have so far passed government screening to be restarted.

Kaswahiwazaki-Kariwa: 2019

April 15, 2017
Tepco's latest plan for Kawashiwazaki-Kariwa plant envisions restart in 2019
http://www.japantimes.co.jp/news/2017/04/15/national/tepco-aims-restart-kawashiwazaki-kariwa-nuclear-plant-2019/#.WPIDWGekKos

JIJI
Tokyo Electric is now aiming to restart the Kawashiwazaki-Kariwa nuclear plant in Niigata Prefecture in April 2019, sources say.
The company plans to include the goal in its financial outlook under a reconstruction program, the sources said Friday.
Restarting the giant plant is considered important to Tokyo Electric Power Company Holdings Inc.'s ability to recover from the triple meltdown at the Fukushima No. 1 nuclear plant in March 2011.
But the prospects for rebooting the plant are dim because it is opposed by Niigata Gov. Ryuichi Yoneyama.
The reconstruction plan is also expected to include Tepco's commitment to pursuing integration with other companies in some areas.
Tepco is expected to draw up the new plan and file for government approval as early as this month.

Evacuee mums fight restart

April 23, 2017
Mothers who fled Fukushima fallout raise voices against Genkai plant restart in Saga
http://www.japantimes.co.jp/news/2017/04/23/national/mothers-who-fled-fukushima-fallout-raise-voices-against-genkai-plant-restart-in-saga/

Kyodo

SAGA – A group of mothers who evacuated from the Kanto region to Fukuoka Prefecture after the 2011 Fukushima nuclear crisis is ramping up protests against efforts to restart the Genkai nuclear plant in neighboring Saga.

After meeting with Minister of Economy, Trade and Industry Hiroshige Seko on Saturday, Saga Gov. Yoshinori Yamaguchi is expected to approve the restart of two reactors in the town of Genkai as early as Monday.

Earlier this month, four of the moms gathered for a meeting in Itoshima in Fukuoka and discussed plans to send the city a document and an inquiry conveying their opposition.

As they racked their brains to deliver effective expressions, the meeting lasted for around six hours until their children returned home from school.

Three of the moms moved to Itoshima after becoming worried their children would be adversely affected by exposure to the fallout spewed by the triple core meltdown at the Fukushima No. 1 plant in Fukushima Prefecture in March 2011. The plant is run by Tokyo Electric Power Company Holdings Inc.

"I wanted to go far away for the sake of my unborn child," said 39-year-old Fumiyo Endo, the leader of the group.

But the place she relocated to was within 30 km of the Genkai plant run by Kyushu Electric Power Co.

In March, she attended a meeting of residents to get explanations about the restart but was concerned whether safety would be ensured by sheltering indoors as instructed should an accident occur.

She also felt angry after hearing a utility official say that restarting the plant is necessary "for a stable supply of power." She said it sounded as if the utility did not care about human lives.

But she did not decide to leave Itoshima because she wanted to keep living there, to stay close to the sea and mountains.

Another member of the group said it was important to keep resisting.

"It is significant to protest against nuclear plants near the plant sites," said photographer Nonoko Kameyama, 40.

Kameyama, a mother of three, has published a photo book of mothers hoping to bring about a society without nuclear power plants.

A day after attending the residents' meeting, Endo and other members called the Saga Prefectural Government to urge it to reject the restart.

When asked by a prefectural official during the call what the name of their group was, they came up with an impromptu title: "Mothers Who Want to Save Children's Lives." Dozens of people have recently joined in response to its Facebook post.

The group has submitted petitions to Saga Gov. Yamaguchi and Itoshima Mayor Yuji Tsukigata.

"Resuming operations only makes residents feel unsettled and we cannot see a bright future," said Endo. "We want our leaders to understand such feelings."

Yamaguchi is expected to approve the Genkai restart as early as Monday, after meeting with METI chief Seko on Saturday.

"The central government has shown a strong determination to work on nuclear energy policy in a responsible manner," Yamaguchi said Saturday, adding he wants to convey his decision "as early as possible."

The government is pushing for reactor restarts despite the triple core meltdown at Fukushima No. 1, saying nuclear energy is Japan's key energy source.

In January, reactor Nos. 3 and 4 at the Genkai plant passed the tougher safety requirements introduced in the wake of the Fukushima crisis. On Feb. 24, a majority of the Genkai Municipal Assembly voted in favor of restarting the plant.

Genkai plant: Saga governor OKs restart

April 24, 2017

Saga governor agrees to Genkai reactor restart

https://www3.nhk.or.jp/nhkworld/en/news/20170424_23/

The governor of Saga Prefecture, southwestern Japan, has announced his approval of a plan to restart 2 nuclear reactors in the prefecture.

Governor Yoshinori Yamaguchi told reporters on Monday that the Number 3 and 4 reactors at the Genkai nuclear plant would be scheduled for restart. It is the fourth such approval granted by a prefectural government after meeting the country's new safety standards put into place after the March 2011 nuclear disaster.

Genkai Town, the power plant's host municipality, also gave its approval last month.

But the reactors will not be restarted until this fall at the earliest.

The Nuclear Regulation Authority must give its approval for the restart and carry out required inspections.

Governor agrees to Genkai reactor restart

https://www3.nhk.or.jp/nhkworld/en/news/20170424_25/

The governor of Saga Prefecture, southwestern Japan, has announced his approval for a plan to restart two nuclear reactors within the prefecture.

Governor Yoshinori Yamaguchi told reporters on Monday that the Number 3 and 4 reactors at the Genkai nuclear plant would be scheduled for restart. It is the fourth such approval granted by a prefectural government after meeting the country's new regulations. These were put into place after the March 2011 nuclear disaster.

Genkai Town, the host municipality of the power plant, had given its approval earlier, as well as the Saga prefectural assembly.

Yamaguchi said the restart decision required much consideration. He said he felt he had no choice but to approve the plan.

The reactors will not be restarted until this fall, at the earliest.

The Nuclear Regulation Authority must give its approval for the restart and carry out required inspections.

Saga governor green-lights restart of Genkai nuclear plant

https://mainichi.jp/english/articles/20170424/p2g/00m/0dm/067000c

Saga Gov. Yoshinori Yamaguchi on Monday consented to restart two nuclear reactors at the Genkai power plant in the southwestern Japan prefecture, a process expected to result in them coming back online as early as this summer.

The governor's decision for the Nos. 3 and 4 reactors at the Kyushu Electric Power Co. plant in the town of Genkai is likely to elicit strong reactions from municipalities and residents opposed to their reactivation amid widespread concerns about a major nuclear accident following the 2011 Fukushima nuclear crisis.

"After deeply thinking it over, as it was a grave decision to make, I have reached the conclusion that (the restart) is inevitable under the present circumstances," the governor said at a press conference. He also said dependence on nuclear power "cannot be helped to some extent" from the standpoint of securing energy supply.

The reactors in January passed tougher safety requirements that were introduced in the wake of the nuclear disaster. Monday's decision comes after the prefectural government consulted with the heads of municipalities within the prefecture and local residents over whether to approve the restart.

The town of Genkai, which hosts the power station, gave its consent last month. And on April 13, the prefectural assembly adopted a resolution approving the reactors' restart.

Of the eight municipalities within a 30-kilometer radius of the seaside plant, the city of Imari in Saga, and the cities of Iki, Matsuura and Hirado in neighboring Nagasaki Prefecture have opposed the restart.

In Tokyo, the central government's top spokesman said Monday that the government will continue to seek acceptance from local authorities in and around the site.

"We feel it is important that the governor's understanding has been gained regarding the restart of these reactors," Chief Cabinet Secretary Yoshihide Suga told a press conference.

Even though Japan was hit by the nuclear disaster following a massive earthquake and tsunami that devastated the country's northeast in March 2011, the government is pushing for reactors to be restarted as nuclear power is regarded as a key energy source.

All four reactors at the Genkai plant had stopped operating by December 2011 in the wake of the Fukushima accident. Kyushu Electric has decided to decommission the aging No. 1 reactor.

Other than gaining local approval, restarting a nuclear reactor requires getting a green light on safety provisions, and conducting an inspection before the restart.

Currently, out of 45 commercial reactors in the country, only three reactors -- the Nos. 1 and 2 reactors at Kyushu Electric's Sendai plant in Kagoshima Prefecture, and the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture, western Japan -- are in operation.

In 2009, the Genkai plant's No. 3 reactor began generating power using MOX fuel, which is created from plutonium and uranium extracted from spent fuel. In June 2016, the Fukuoka High Court upheld a ruling that the utility can continue with its plan to use MOX fuel at the reactor.

The use of the fuel had been controversial even before the 2011 nuclear crisis as it is more radioactive than uranium fuel, which is widely used at the nation's nuclear power plants.

Takahama: Nuclear fuel loaded

May 1, 2017
Nuclear fuel loaded into reactor at Takahama plant
https://www3.nhk.or.jp/nhkworld/en/news/20170501_15/

Workers have finished loading nuclear fuel into a reactor at the Takahama power plant in central Japan.

Kansai Electric Power Company says work to place all 157 units of nuclear fuel into the No. 4 reactor was completed on Monday morning with no problems. The fuel includes 4 units of MOX fuel, a mixture of plutonium extracted from spent nuclear fuel and uranium.

In March, the Osaka High Court scrapped an injunction issued by a lower court a year earlier that suspended operations of the No. 3 and No. 4 reactors at the plant in Fukui Prefecture.

Kansai Electric plans to restart the No. 4 reactor in mid-May if operations such as raising the temperature and pressure inside the reactor and conducting checks go without a hitch.

The utility says workers at the plant will use extra caution when performing the tasks.

In February of last year, radioactive cooling water leaked from the reactor during preparations for a restart. 3 days after being put back online, the reactor automatically shut down as workers were trying to generate power and send it to the grid.

The plant operator says it will begin putting nuclear fuel into the No. 3 reactor in mid-May and restart it in early June.

Protest at Takahama plant

May 8, 2017
About 200 people protest restarting of Fukui nuclear reactor outside plant
https://mainichi.jp/english/articles/20170508/p2a/00m/0na/006000c#cxrecs_s

TAKAHAMA, Fukui -- Approximately 200 people protested outside the gates of Kansai Electric Power Co. (KEPCO)'s Takahama Nuclear Power Plant here on May 7, to voice their opposition to the planned restarting of the plant's No. 4 reactor in mid-May.

- 【Related】Utility seeks to restart two reactors in Fukui from mid-May
- 【Related】High court backs restart of halted Takahama reactors

As police officers patrolled outside the gates from the morning onward, anti-nuclear protesters from groups based in Fukui Prefecture and the Kansai region turned up from cities such as Kyoto and Kobe, with some holding placards.
From about midday onward, the protesters began to shout out slogans such as "An earthquake-prone country like Japan does not need nuclear plants," and "We are against the restarting (of the reactor),"

while beating small drums. Also, a letter demanding a stop to the restarting of operations was handed over to a KEPCO employee.
Tetsuen Nakajima, former secretary-general of an anti-nuclear group based in the city of Obama in Fukui Prefecture, stated, "Please do not restart operations." In addition, participants also gathered in downtown Takahama, where they carried out a demonstration.
Further protests are also scheduled to take place between May 8 and 12 in other Fukui prefectural cities such as Obama, Tsuruga and Sabae, which will oppose the restarting of the reactor at the Takahama plant.
In addition to the No. 4 reactor, KEPCO also plans to restart the plant's No. 3 reactor, in early June.

Who wants to restart Hamaoka?

May 13, 2017
Mayors near Hamaoka nuclear plant say wider consensus needed for reactor restarts

https://mainichi.jp/english/articles/20170513/p2a/00m/0na/013000c

The Hamaoka Nuclear Power Plant, idled for five years and now guarded by a 22-meter-tall tsunami wall, is seen on May 12, 2016. Omaezaki, Shizuoka Prefecture, is seen in the background. (Mainichi)
Seven heads of 11 Shizuoka Prefecture municipalities located within a 30-kilometer radius of Chubu Electric Power Co.'s Hamaoka Nuclear Power Plant said in a recent Mainichi Shimbun survey that they believe restarting the currently idled nuclear reactors requires agreement from not only the host prefecture and host city but also other municipalities around the plant.
As May 14 marks the sixth year after the Hamaoka nuclear plant suspended operations upon a request from the then government of Prime Minister Naoto Kan, the Mainichi Shimbun surveyed the Shizuoka Prefecture governor and mayors of 11 prefectural municipalities in the "Urgent Protective Action Planning Zone" (UPZ) around the plant. UPZs cover areas within a radius of 30 kilometers of a nuclear plant.
While no legal framework has been set up regarding the scope of municipal consensus necessary to restart operations at a nuclear station, requests have been growing for a broader agreement among municipalities -- not just the host prefecture and host municipality -- in the wake of the Fukushima nuclear disaster.
Shizuoka Gov. Heita Kawakatsu, who is running for re-election in the gubernatorial race scheduled for June, has argued for the need to hold a referendum over the restart of the Hamaoka plant and has expressed a positive view of involving the 11 mayors in decisions regarding the matter. Consequently, the issue could become a key point in the upcoming gubernatorial election.
The Mainichi asked Gov. Kawakatsu and 11 municipal mayors in a multiple-choice form about the scope of local consensus over the Hamaoka plant restart. Five mayors said agreement from all 11 municipalities in the UPZ was necessary, one favored gaining consensus from four municipalities located within a 10-kilometer radius of the plant and another mayor wanted agreement from all municipalities in Shizuoka Prefecture. The mayor of Omaezaki, the host city of the Hamaoka plant, said restarting the idled nuclear plant only required the city's agreement.
Shigeki Nishihara, the mayor of Makinohara, neighboring Omaezaki, said consensus from municipalities in the UPZ was necessary. He commented that local governments (in that area) "have a responsibility to secure their residents' safety." Meanwhile, Yasuo Ota, the mayor of the town of Mori, who picked

"agreement from all municipalities in Shizuoka Prefecture" to restart the Hamaoka plant, told the Mainichi, "It is necessary to hear broad opinions when it comes to gaining consensus over nuclear power as a national energy policy."
While the remaining four mayors checked "other" in the survey, most of them expressed their view of involving the national government in deciding the scope of local consensus.
Gov. Kawakatsu stressed that it is not an appropriate time to make a decision over the scope of local consensus and repeated that a referendum over the issue of the Hamaoka plant is necessary from the standpoint of popular sovereignty.
No local government heads surveyed were actually in favor of restarting the Hamaoka nuclear plant, even under right conditions such as with approved safety measures. Three city mayors said they were against restarting the plant. Seven local government chiefs chose "other" in the question, while the remaining two said they "cannot judge at the moment."
The Nuclear Regulation Authority's screening process of the Hamaoka nuclear plant has been prolonged as the No. 3 and No. 4 reactors being screened are the same "boiling-water type" reactors as the ones at the devastated Fukushima No. 1 Nuclear Power Plant. Furthermore, the estimated maximum ground motion at the Hamaoka nuclear station is likely to be raised because it is located directly above the hypocenter of a potential Nankai Trough megaquake.

Takahama No.3 about to restart

May 14, 2017

Nuclear fuel being loaded into Takahama reactor
https://www3.nhk.or.jp/nhkworld/en/news/20170513_14/

Workers have begun loading nuclear fuel into a reactor at the Takahama power plant in Fukui Prefecture in central Japan.

Kansai Electric Power Company began loading on Saturday the 157 nuclear fuel units needed to restart the No. 3 reactor. The company says it will work around the clock through Tuesday to finish the work.

The fuel includes 24 units of MOX fuel, a mixture of plutonium and uranium.

In March, the Osaka High Court scrapped an injunction issued by a lower court that suspended operations of the No. 3 and No. 4 reactors at the Takahama plant.

Kansai Electric completed loading nuclear fuel into the No. 4 reactor earlier this month. It is preparing to restart the reactor on Wednesday.

The company plans to restart the No. 3 reactor in early June.

TEPCO's nuclear plans (2)

12.05.2017_No94 / News in Brief

Tepco Recovery Plan Includes Search For Partners, Restart Of Kashiwazaki Kariwa

http://www.nucnet.org/all-the-news/2017/05/12/tepco-recovery-plan-includes-search-for-partners-restart-of-kashiwazaki-kariwa

12 May (NucNet): Tokyo Electric Power Company (Tepco) said on 11 May 2017 that it will look for partners for its nuclear business as part of a recovery plan that could see it restart Units 6 and 7 at the Kashiwazaki Kariwa nuclear station in Niigata Prefecture, western Japan, by March 2020 at the earliest. The move would be the first step towards getting all seven boiling water reactor (BWR) units at the station back online by March 2026, the company said. Units 1, 6 and 7 at Kashiwazaki Kariwa have been shut since shortly after the March 2011 Fukushima-Daiichi accident, while units 2, 3 and 4 have been shut since an earthquake in Niigata Prefecture in July. The plan, which needs government approval, is part of an updated Tepco turnaround strategy aimed at generating operating profit of nearly 500 billion yen (€4bn, $4.4bn) in the fiscal year ending March 2026, a substantial increase from the 226 billion yen operating profit expected for the fiscal year that ends in March 2018. Tepco also needs to fund decommissioning and remediation costs at Fukushima-Daiichi. Those costs have been put by Tepco at around $770m a year, although various estimates have differed widely. Tepco said it aims to set up joint ventures for nuclear power and power grid operations to streamline its business and bolster earnings. Its search for an industrial partner includes plans to introduce “safe and low-cost” light-water reactors at the Higashi Dori nuclear station in Aomori Prefecture, northern Japan. Tepco plans to build two reactors at the site, where Tohoku Electric Power Company already owns a single 1,067-MW BWR. All reactors in Japan were ordered shut following the Fukushima-Daiichi accident. To restart, they must meet a series of regulatory requirements and receive local government consent. Of 42 operable reactors in the country, three are operating and another four are close to restarting.

Restart protest

May 17, 2017

Reactor restart protested

https://www3.nhk.or.jp/nhkworld/en/news/20170517_29/

Dozens of people have gathered in front of the Takahama nuclear power plant to protest the restart of its No.4 reactor.

About 70 local residents and others from nearby prefectures marched outside the complex, some carrying banners and placards.

They handed over a petition to an official from the operator, Kansai Electric Power Company, demanding that the restart be halted and the plant be decommissioned.

A resident says he opposes the restart as there is a possibility that a huge earthquake could occur near the plant.

A civic group chief says it may be impossible to halt the plant's operations immediately, but he hopes their continued campaign will help reduce accidents or trouble at the plant.

Takahama restarted

May 17, 2017
Takahama nuclear reactor restarted
https://www3.nhk.or.jp/nhkworld/en/news/20170517_28/

One of the reactors at Takahama nuclear plant in the central Japanese prefecture of Fukui has been restarted for the first time in 15 months.

Plant workers began pulling control rods out of the No.4 reactor at 5 PM on Wednesday.

It runs on MOX fuel, which is a mixture of plutonium extracted from spent nuclear fuel and uranium.

The reactor is to reach criticality, a self-sustained nuclear reaction, in about 13 hours by around 6 AM on Thursday. The operator, Kansai Electric Power Company, plans to start power generation and transmission to the grid on Monday next week.

The power utility plans to resume commercial operations with the reactor in mid-June.

Wednesday's restart brought the number of reactors operating in Japan to 4, including 2 reactors at Sendai plant in Kagoshima Prefecture and one at Ikata plant in Ehime Prefecture.

Takahama's No.4 reactor was reactivated in February of last year, but shut down automatically due to a glitch that occurred 3 days after the restart.

A district court later issued an injunction that suspended operations of the No.4 and No.3 reactors of the Takahama plant, but the Osaka High Court nullified the injunction in March this year.

Controversial Reactor Restarted

https://www3.nhk.or.jp/nhkworld/nhknewsline/nuclearwatch/controversialreactorrestarted/

A controversial nuclear reactor in central Japan has been restarted. A local court had previously banned its operation.
The Kansai Electric Power Company has put the No.4 reactor at its Takahama plant back online.
The facility passed stricter regulations, introduced after the 2011 Fukushima nuclear disaster.
The reactor runs on what's called MOX fuel. It's created by reprocessing spent fuel from nuclear reactors.
Last year, a district court ordered a suspension of operations. It said Kansai Electric hadn't given sufficient explanation of how it would deal with or prevent accidents.
But in March, a higher court overturned the decision. It said that the company had introduced the necessary measures against earthquakes and tsunamis.
The utility says it wants to resume commercial operations next month. At the moment Japan has 3 other reactors online.

May 17, 2017

Takahama reactor to restart on Wednesd
https://www3.nhk.or.jp/nhkworld/en/news/20170517_16/

The operator of the Takahama nuclear power plant in central Japan will soon restart its No.4 reactor for the first time in 15 months.

Kansai Electric Power Company says it will start removing the control rods from the reactor at around 5 PM on Wednesday, if no problems are found in the final inspection on the rods for containing nuclear fission.

The power utility began the process of restarting No.3 and No. 4 reactors at the plant in Fukui Prefecture after the Osaka High Court scrapped, in March, an injunction by a lower court that ordered their suspension.

The No. 4 reactor has been offline since February last year, when it shut down automatically due to a glitch.

If the process goes as scheduled, the No. 4 reactor is to reach criticality by Thursday morning, and start power generation and transmission to the grid on Monday next week.

Kansai Electric plans to resume commercial operations with the reactor in mid-June.

The reactor uses MOX fuel, which is a mixture of plutonium extracted from spent nuclear fuel and uranium.

It is the 4th reactor to go online, after 2 reactors at Sendai nuclear plant in Kagoshima Prefecture, and one at Ikata nuclear plant in Ehime Prefecture.

Kansai Electric also plans to restart the No.3 reactor in early June.
May 14, 2017

Two more: Safe enough to be restarted

May 24, 2017

Nuclear regulator adopts Ohi plant assessment

https://www3.nhk.or.jp/nhkworld/en/news/20170524_19/

Japan's nuclear regulator has paved the way for the restart of 2 nuclear reactors at the Ohi power plant on the Sea of Japan coast.

The Nuclear Regulation Authority has adopted a report stating that safety measures at the plant in Fukui Prefecture meet new requirements set after the 2011 Fukushima Daiichi nuclear crisis.

The NRA had been receiving public comment in February and March on the draft assessment of the plant's No.3 and No.4 reactors.

It says it has amended some expressions in the final document as a result.

The plant in Ohi Town is the 6th nuclear plant to gain regulatory approval for new safety measures.

Operator Kansai Electric Power Company says it will complete safety-related work by July. But the utility still needs regulatory approval for equipment design. It also needs local consent to restart.

Observers say a restart before winter is unlikely.

The Fukui District Court had ruled against restarting the Ohi plant reactors 3 years ago. The utility is appealing the ruling.

However, the town and prefectural governments could decide whether to agree to a restart before the matter is resolved in court.

A former regulator has told the appeal court that the utility could have underestimated the maximum potential size of an earthquake.

Kansai Electric rejected this statement, saying its examinations were detailed and its assessments conservative.

2 more nuclear reactors in Japan clear regulator's safety review

May 24, 2017 (Mainichi Japan)
https://mainichi.jp/english/articles/20170524/p2g/00m/0dm/072000c

TOKYO (Kyodo) -- The Nuclear Regulation Authority formally confirmed Wednesday that two reactors on the Sea of Japan have met the country's post-Fukushima safety standards, paving the way for their restart possibly this fall.
The authority gave its final approval to a screening report submitted by Kansai Electric Power Co. on the Nos. 3 and 4 reactors at Oi plant in Fukui Prefecture, bringing the number of reactors that have met the standards introduced after the 2011 nuclear accident at the Fukushima Daiichi plant to 12 at six power stations.
For the restart, Kansai Electric still has to pass on-site pre-operational checks by the authority and obtain approval from the Fukui prefectural government.
The utility said in a statement it will "make utmost effort for the early restart of nuclear plants whose safety has been confirmed by gaining the understanding of local residents."
Although the government of Prime Minister Shinzo Abe has been promoting the restart of nuclear reactors, most of them remain offline amid safety concerns among local residents following the Fukushima disaster triggered by a massive earthquake and tsunami.
The nuclear safety watchdog gave the green light to the restart of the reactors despite a pending lawsuit filed by local residents seeking to block the resumption of operations. Kansai Electric has appealed a Fukui District Court ruling in 2014 which banned it from running the two reactors due to safety concerns.
Seismologist Kunihiko Shimazaki, a former commissioner of the NRA, has warned that the authority may have underestimated quake hazards at the Oi plant.
Kansai Electric applied for the screening of the two reactors at the Oi plant in July 2013. With Wednesday's approval, all of its seven nuclear reactors at three power stations for which the utility has sought screening have cleared the safety standards.
Of the seven, the No. 4 reactor at Takahama plant in Fukui restarted operation on May 17, while the No. 3 reactor of the same plant is expected to get back online in early June.

Issue of local approval ignored

June 5, 2017
EDITORIAL: Support of areas within 30-km zone vital for reactor restarts
http://www.asahi.com/ajw/articles/AJ201706050017.html

Several more offline nuclear reactors are now on track to be restarted in the coming months despite lingering safety concerns among residents living in surrounding areas.
Kyushu Electric Power Co. plans to restart two reactors at its Genkai nuclear power plant in Saga Prefecture as the prefecture’s governor and the mayor of Genkai, the town where the plant is located, gave their consent to the utility’s plan this spring.
Kansai Electric Power Co. is going through the process of restarting two reactors at its Oi nuclear plant in Fukui Prefecture, which effectively passed the regulatory inspections by the Nuclear Regulation Authority in May. The company will now seek the approval of its plan by the Fukui governor and the mayor of Oi, the town hosting the plant.

Many local government chiefs and residents within 30 kilometers of these nuclear plants have voiced opposition to the planned reactor restarts. Local governments inside the 30-km zone are required to craft plans for the evacuation of local residents in the event of a serious nuclear accident.

But the electric utilities have turned a deaf ear to their voices. That's because the operators of nuclear plants only ask for the approval of the host municipalities and prefectures when they seek to bring offline reactors back on stream.

If reactors are brought back online through the same procedures as those used before the catastrophic accident that hit the Fukushima No. 1 nuclear power plant in 2011, it will be difficult for people living in areas around nuclear plants not to feel anxiety.

We strongly urge the operators of nuclear plants to widen the definition of the "local communities" involved in the approval process so that at least the entire 30-km zone is covered.

NO DIFFERENCE IN DAMAGE CAUSED BY NUCLEAR ACCIDENT

There is no legal basis for the rights of the host local governments to approve plans to operate nuclear power plants. They are mainly based on safety agreements between the local governments and the plant operators, which include a provision concerning "advance consent" by the local governments.

Last summer, Yoshikazu Tsukabe, mayor of Imari, a city of 55,000 located within 30 km of the Genkai plant, unequivocally expressed his opposition to Kyushu Electric Power's plan to bring the reactors back online.

When Tsukabe visited Minami-Soma, a city in Fukushima Prefecture within 30 km of the crippled Fukushima plant, in 2013, it hit home to him that there is no difference in the seriousness of damage that the host municipalities and areas around them would suffer when a major nuclear accident occurs.

Then, Tsukabe asked Kyushu Electric Power to conclude a safety agreement with Imari including an advance consent provision similar to the ones it has with the host municipalities. But the company refused his request.

"No matter how strongly we oppose (the utility's plan to restart the reactors), we are left out in the cold," Tsukabe says.

"But we are nevertheless forced to face the risk of a serious accident. That's too unfair," he adds indignantly.

The mayors of three cities in Nagasaki Prefecture, which are located near the Genkai plant, have also voiced their opposition to the utility's plan. But even the governor of the neighboring prefecture has no right to grant consent to such a plan.

Since 2015, reactors at the Sendai (Kagoshima Prefecture), Ikata (Ehime Prefecture) and Takahama (Fukui Prefecture) have been restarted only with the consent of the host municipalities and prefectures. Kyoto and Shiga prefectures, which are adjacent to Fukui Prefecture, have been demanding that they, too, be involved in the process of local approval.

The city of Hakodate, Hokkaido, has filed a lawsuit seeking a court injunction to stop the ongoing construction of the Oma nuclear power plant in Aomori Prefecture, which is located 23 km from the city across the sea. The suit effectively asks why an area near a nuclear power plant that could be damaged if an accident occurs at the plant is not regarded as a concerned "local community."

VIGILANT LOCAL COMMUNITIES FOR BETTER SAFETY

Asahi Shimbun editorials have called for widening the scope of the local communities that have the right to grant consent to plans to restart nuclear reactors. That's because we believe that the safety of nuclear reactors would improve if more local governments are involved in their safety checks as part of the consent process. That would also boost local residents' confidence in the safety of the reactors in their areas.

The administration of Prime Minister Shinzo Abe has argued that the Nuclear Regulation Authority's inspections are enough to confirm the safety of reactors. The administration claims the nuclear watchdog checks the safety of reactors according to the strictest nuclear regulatory standards in the world.
But Japan's new nuclear safety standards, introduced after the Fukushima disaster, cover only four of the five levels of "defense in depth" advocated by the International Atomic Energy Agency. The fifth level is mitigation of the radiological consequences of off-site releases of radioactive materials.
It is, so to speak, the last line of defense against a full-scale nuclear disaster in the event of failure of the four preceding levels of defense resulting in massive releases of radioactive materials into the environment. Specifically, it involves evacuating local residents to protect them from exposure to radiation.
Following the accident at the Fukushima plant, the central government made it mandatory for local governments inside the 30-km zone to develop plans for the emergency evacuation of local residents in such situations.
If so, the local governments should be given the right to call a stop to a plan to restart a reactor. They should be allowed to take the step when, instead of relying totally on the central government for confirming the safety of the reactor, decide that the safety of the reactor in question and the effectiveness of the evacuation plan are not sufficiently ensured.
Making such a decision requires expertise. It would help to set up a task force of experts as Niigata Prefecture has done. The prefectural government has been making its own efforts to investigate the Fukushima nuclear disaster with the help of experts.

DIET SHOULD DISCUSS THE ISSUE

Most local governments hosting nuclear power plants take a dim view of the proposal to widen the scope of the local approval program.
The host local governments have been receiving great fiscal and economic benefits from having nuclear plants, including state subsidies based on three laws related to power sources and job creation.
These prefectures and municipalities are concerned that an increase in the number of local governments with the right of consent would make it harder to operate reactors.
Toshiyuki Kanai, a professor at the University of Tokyo specializing in local government operations, argues that the original aims of safety agreements between utilities and local governments should be recalled.
In the 1960s, local governments hosting nuclear plants started seeking safety agreements with the plant operators to prevent them from concealing information about accidents and problems. In these moves, they tried to enhance local residents' safety and sense of security by ensuring their own right to get the operators to listen to what they have to say, if necessary.
"If there is a local government concerned about the safety of a reactor, a wide range of local communities around it should join together to have discussions on the source of the concern," says Kanai. "That would also help the host local government."
Kanai points to the need to establish a system that ensures there is no difference in the benefits host local governments receive whether the reactors are operating or not. This is necessary for allowing host local governments to make neutral judgments about the safety of reactors.
It is the duty of the central government to devise such a system.
The Abe administration has been staying away from the issue of local consent. Economy, Trade and Industry Minister Hiroshige Seko has said the scope of the local governments allowed to give their consent to reactor plans should not be uniformly determined by the central government.

But the administration should not continue neglecting the rift between the two sides--nuclear plant operators and the host local governments versus local governments in surrounding areas. It should not simply let utilities restart reactors without paying serious attention to objections from surrounding local governments.
There are possible ways to deal with the issue, including legally requiring utilities to obtain the consent of all local governments within the 30-km zone as a condition for restarting a reactor.
Six years after the Fukushima calamity, the Diet should start a serious debate on the issue as one of the important challenges concerning nuclear safety that has remained unaddressed.

And now five

June 6, 2017

Takahama No.3 reactor restarted
https://www3.nhk.or.jp/nhkworld/en/news/20170606_23/

Another reactor in Fukui Prefecture, central Japan, has been restarted, bringing to 5 the total number of Japanese reactors currently in operation.

The No.3 reactor at Takahama nuclear plant came online after Kansai Electric Power Company workers completed pulling out its control rods at 2 PM on Tuesday.

The reactor runs on MOX fuel, which is a mixture of plutonium extracted from spent nuclear fuel and uranium.

Takahama's No.3 and No.4 reactors were stopped following a court injunction issued in March last year.

But after a higher court decision this March to nullify the injunction, the No.4 reactor was restarted last month.

Kansai Electric says the No.3 reactor will reach criticality, a self-sustained nuclear reaction, early on Wednesday. It expects to start power generation and grid transmission on Friday.

The utility plans to notify the government of cuts in electric bills after resuming commercial operations with the reactor in early July.

Reactors currently in operation besides Takahama No.3 and No.4 are 2 at the Sendai plant in Kagoshima Prefecture and one at the Ikata plant in Ehime Prefecture.

Saga court dismisses residents request

June 13, 2017

Court dismisses request to halt restart of Saga reactors
http://www.japantimes.co.jp/news/2017/06/13/national/crime-legal/court-nixes-request-halt-restart-saga-reactors/#.WUA32NykJLM

Kyodo
SAGA – A district court on Tuesday dismissed a request from about 230 local residents for an injunction to stop the restart of two reactors at Kyushu Electric Power Co.'s Genkai nuclear power plant in Saga Prefecture over safety concerns.
The Saga District Court handed down the ruling concerning reactors 3 and 4 at the complex as the utility prepares for their restart this summer or later, having secured the necessary consent of the governor of Saga and the mayor of Genkai. The town hosts the four-reactor power station.
Reactors 3 and 4 have cleared Nuclear Regulation Authority screenings that were based on safety standards revamped after the Fukushima nuclear disaster triggered by the March 2011 earthquake and tsunami.
In Tuesday's decision, presiding Judge Takeshi Tachikawa said the new safety standards are "reasonable." The court has found no issues with earthquake resistance or steps taken against serious accidents and does not see any specific danger of radiation exposure at the plant, he added.
The focus of the lawsuit, filed by the residents in July 2011, was whether the operator has adequate measures in place against earthquakes. The plaintiffs argued that serious accidents could occur due to degradation in piping.
"The court is supposed to help the weak, but the ruling is based on economics and politics," said Hatsumi Ishimaru, 65, who leads the group of residents. "We will continue to fight until we stop the nuclear plant."
The plaintiffs said they will immediately appeal the decision to the Fukuoka High Court.
Kyushu Electric said in a statement it considers the latest decision "appropriate" and will continue to try to ensure safety at the plant.
The ruling may inject momentum into the government's policy to restart nuclear plants that have fulfilled the new safety standards.
While declining to comment on the court decision itself, Chief Cabinet Secretary Yoshihide Suga said the government respects the Nuclear Regulation Authority's judgment that the reactors meet the new safety standards.
Tuesday's ruling followed a series of court decisions rejecting similar suits seeking to halt the operations of nuclear power plants.
In March, the Osaka High Court overturned a lower court order to halt two nuclear reactors at the Takahama plant in Fukui Prefecture, while in the same month the Hiroshima District Court dismissed a request by local residents to order the halt of a nuclear reactor that was restarted last year at the Ikata plant in Ehime Prefecture.
Of the more than 40 commercial reactors nationwide, five are currently in operation. At the Genkai plant, the No. 1 unit is set to be decommissioned due to aging.

TEPCO's new board

June 23, 2017

New Tepco chief reaffirms Fukushima commitment, but underscored need for plant restarts
http://www.japantimes.co.jp/news/2017/06/23/business/corporate-business/new-tepco-chief-reaffirms-fukushima-commitment-underscored-need-plant-restarts/#.WU6G4FFpyos
by Shusuke Murai
Staff Writer
Dealing with the aftermath of nuclear disaster at Fukushima No.1 power plant remains the most important mission for Tokyo Electric Power Company Holdings Inc., Tomoaki Kobayakawa, Tepco's new president, said Friday, but he also stressed the need to restart nuclear plants for the sake of continuing the utility's business.
"To fulfill responsibilities over (disaster in) Fukushima is the fundamental (policy) for our company, and that will never change at all," Kobayakawa, the former chief of the Tepco's electricity retail arm, said at a news conference at the firm's headquarters in Tokyo.
Kobayakawa officially took the helm as head of the ailing power giant after the reshuffle of top management was approved at a shareholder's meeting earlier on Friday.
Struggling financially amid ballooning costs for dealing with the aftermath of the nuclear accident caused by the devastating earthquake and tsunami in 2011, Tepco is effectively under control of the state with the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp. holding the majority of its shares.
Ten of 13 board directors were replaced with new members, including honorary chairman of Hitachi Ltd. Takashi Kawamura. Kawamura was appointed the new chairman to back Kobayakawa.
Under the new board, Tepco will proceed with the new revitalization program it mapped out in May. The plan includes reactivating Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, so as to make up for the estimated ¥22 trillion cost of dealing with damage, including decommissioning of Fukushima No.1 and compensation for disaster-hit areas.
"I believe securing safety and gaining the understanding of local people are our utmost priorities" in order to reactivate the nuclear plant, Kobayakawa said.
In October 2016 in the Niigata gubernatorial election, voters elected doctor and lawyer Ryuichi Yoneyama, whose anti-nuclear stance is firmly against any restart of Kashiwazaki-Kariwa plant, over a pro-nuclear candidate from the Liberal Democratic Party.
At the shareholder's meeting in Tokyo's Shibuya Ward earlier Friday, which was attended by about 1,200 people, some expressed diverse opinions on the company's intention to restart nuclear power plants.
One suggested that restarting a nuclear power plant could be a "ray of hope" that stands as the symbol of recovery from the disaster, while another claimed Tepco's financial recovery will "never be possible" without reactivating ceased plants.
Others were concerned about the firm's plan to continue its nuclear power business.
One shareholder called the proposed restart of the Kashiwazaki-Kariwa plant as "a long-shot gamble" repeatedly saying that the Niigata plant is "good-for-nothing", and that it has only caused the utility to incur costs of ¥680 billion for safety measures.

Another shareholder urged the utility to abandon its plan to reactivate Fukushima No.2 and Kariyazaki-Kariwa, and open them for engineers worldwide to use as research centers for decommissioning technologies.
These proposals were turned down at the end of the three-hour meeting after facing opposition from board members.

Inspection starts at Kashiwazaki-Kariwa

July 27, 2017

Inspection starts at nuclear plant in Niigata
https://www3.nhk.or.jp/nhkworld/en/news/20170727_25/
Japan's Nuclear Regulation Authority has started an on-site inspection at a nuclear power plant in Niigata Prefecture regarding the restart of two of its reactors.

NRA chairman Shunichi Tanaka visited Tokyo Electric Power Company's Kashiwazaki-Kariwa plant on Thursday to interview officials there.

The regulator is in the final stages of screening the No.6 and 7 reactors at the plant. The reactors must meet new government requirements introduced after the 2011 Fukushima nuclear disaster.

Tanaka has been stressing that unless the regulator is convinced the reactors will be operated safely, it will not allow their restart.

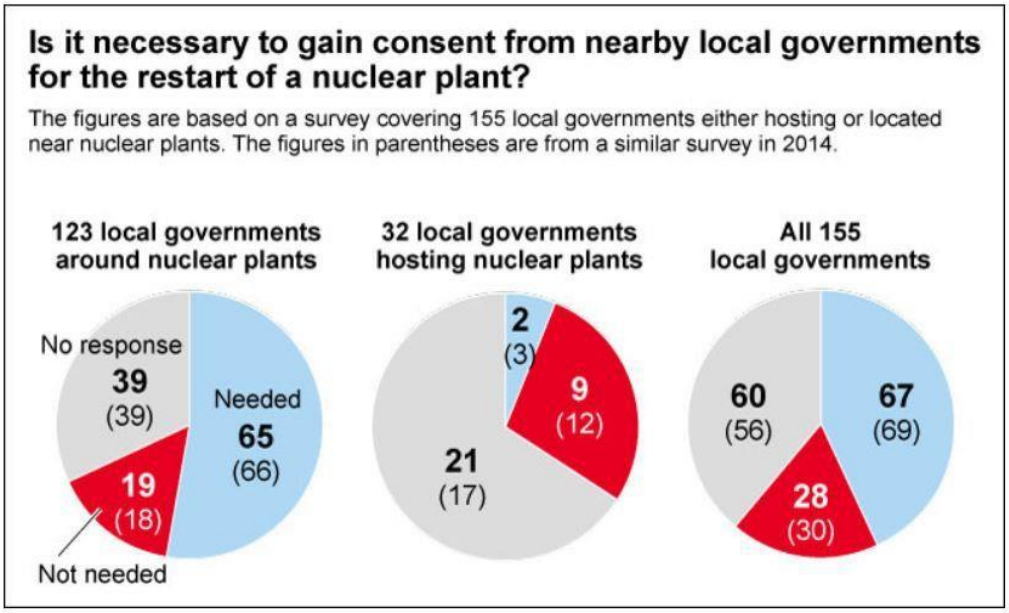
Tanaka told plant chief Chikashi Shitara that TEPCO is different from other operators in that it caused the accident.

He added that he may ask quite candid questions. He said before making a conclusion on the restart of Kashiwazaki-Kariwa plant, the regulator needs a different sense of conviction than when it screened other plants.

Shitara responded that he wants to explain how officials at the plant have been coping with the restart after the nuclear accident.

The regulator is to interview executives and workers at the plant through Friday.

Who should have a say about restarts?



The Asahi Shimbun

August 22, 2017

Municipalities near nuclear plants want say over restarts

THE ASAHI SHIMBUN

http://www.asahi.com/ajw/articles/AJ201708210035.html

More than half of municipalities within a 30-kilometer radius of nuclear power plants insist their approval must be sought for restarts, but only 6 percent of local governments that host such facilities agree.

The finding that 53 percent of municipalities require prior consultations came in a survey by The Asahi Shimbun undertaken two years after a reactor at the Sendai nuclear plant in Kagoshima Prefecture went back online in August 2015, the first to do so under new, more stringent nuclear regulations adopted in the aftermath of the 2011 Fukushima disaster.

The mayor of Hitachiomiya, Ibaraki Prefecture, said local governments beyond host communities "need" to have a say over restarts as the central government revised its nuclear emergency guidelines in 2012 to require municipalities within the 30-km radius to have evacuation plans in place in the event of a serious accident.

Before the Fukushima accident, only local governments within 8-10 km of a nuclear power plant had to do so.

The mayor of Misato, Miyagi Prefecture, said his town's approval should be sought for a restart because a "local government not receiving economic benefits can make a levelheaded judgment on the pros and cons of resumed operations."

Host communities receive grants and subsidies from the central government, in addition to taxes and other revenue sources related to power generation.

In the survey, The Asahi Shimbun contacted the heads of 155 local governments that either host or are situated within a 30-km radius of the 16 nuclear plants across the nation, excluding the crippled Fukushima No. 1 nuclear plant. The figure includes the prefectural government of Hokkaido and 20 other prefectural authorities that host plants.

As things stand, there are no legal steps that an operator of a nuclear facility must take, such as winning the consent of a host municipality or the prefectural government, before a plant's restart.

The Sendai nuclear plant went back online after operator Kyushu Electric Power Co. got the go-ahead only from Satsuma-Sendai, which hosts the plant, and Kagoshima Prefecture for a resumption of operations.
The survey found that Mihama, home to Kansai Electric Power Co.'s Mihama nuclear plant, was against the notion of asking nearby municipalities for their approval for a restart.
"Only a host community has a history of contributing to the safe operation of a nuclear plant," the mayor said.
Of all the local governments, 61 heads called for legal procedures to be adopted with respect to restarts. All these calls came from municipalities located in areas surrounding nuclear power plants, except for one.
"As long as nuclear energy has been promoted as a state program, the central government should take responsibility for setting the legal framework for a restart," said the mayor of Makinohara, Shizuoka Prefecture.
The mayor of Imari, Saga Prefecture, echoed a similar view.
"Things remain ambiguous because no legal procedures are in place," the mayor said. "The government is reluctant to enshrine the steps into law because that will make restarts harder. However, the central government should also listen to what people in municipalities beyond host communities have to say."
The survey also found that calls for plant operators to gain the consent of the municipalities within a 30-km radius of a proposed restart have somewhat abated among 35 local governments, where nuclear plants have resumed operations.
Ten heads sided with this view in the current survey, down from 13 in the previous survey in autumn 2014.
Another 10 leaders called for setting up legal procedures for restarts, compared with 14 in the last survey.
Apart from the Sendai nuclear plant, Ikata in Ehime Prefecture and Takahama in Fukui Prefecture are currently operating.
Municipalities situated close to facilities that are expected to go back online in the near future are now taking a more clear-cut stance on nuclear energy issues.
Representatives from cities around the Genkai nuclear plant in Genkai, Saga Prefecture, formed a group to present a united front against moves to resume its operations, which is expected this winter.
Although the mayors of Hirado and Matsuura, both in Nagasaki Prefecture, did not take a stance in the 2014 survey, they joined the municipalities against the restart in the latest poll, bringing municipalities opposed to the restart to four, or half of the eight local governments within a 30-km radius of the facility.
The Genkai town hall and the Saga prefectural government have already agreed to resuming plant operations.

NRA getting tougher on TEPCO?

August 30, 2017

NRA chair ties nuke plant restart to TEPCO taking lead on Fukushima decommissioning
https://mainichi.jp/english/articles/20170830/p2a/00m/0na/017000c
Tokyo Electric Power Co. (TEPCO) must take the lead on decommissioning reactors at the disaster-stricken Fukushima No. 1 nuclear plant if it wants reactors at another of its plants to pass safety

inspections, Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka told the Mainichi Shimbun in an Aug. 29 interview.

- 【Related】TEPCO begins extending ice wall to reduce tainted water in Fukushima
- 【Related】Highly radioactive water leak at Fukushima No. 1 nuke plant

"TEPCO must do things based more on its own judgment," and not depend so much on the government and other organizations, said Tanaka, whose term as NRA chairman comes to a close on Sept. 18 this year. Tanaka added that the No. 6 and 7 reactors at TEPCO's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture would only pass NRA safety screenings if the utility took the initiative in the Fukushima decommissioning. The reactors must pass the inspections before they can be restarted.
The NRA was to summon TEPCO Chairman Takashi Kawamura and President Tomoaki Kobayakawa on Aug. 30 to sound the executives out about the utility's intentions regarding the reactor decommissioning at the Fukushima No. 1 plant and ideas about safety, among other issues.
"We want to confirm whether the top people at TEPCO are aware of their responsibility for the Fukushima No. 1 plant accident, and if they are resolved to deal with it properly," Tanaka told the Mainichi. He had earlier expressed concerns that the utility has so far proven unable to process radioactive tritium-contaminated water, and that the water continues to collect at the plant.
"If TEPCO is unable to finalize the decommissioning of the Fukushima reactors, it is simply not qualified to restart the Kashiwazaki-Kariwa plant," Tanaka has said. TEPCO submitted a written response to Tanaka's position on Aug. 25, but the document did not include a concrete plan to deal with the contaminated water.
Tanaka pointed out during the Mainichi interview that there were people and industries such as the fishery sector that could be impacted by the water issue, saying, "TEPCO likely can't reveal anything because there are people on the receiving end of this. More than concrete plans, we are asking TEPCO management about their ideas on safety."

Restart TEPCO reactors?

September 6, 2017

Nuclear regulator prepares to OK TEPCO reactors
https://www3.nhk.or.jp/nhkworld/en/news/20170906_25/

Japan's nuclear regulators will decide next week whether to certify the safety of reactors at a nuclear plant in Niigata Prefecture. This would bring the plant, run by the Tokyo Electric Power Company, one step closer to restarting the reactors.

The Nuclear Regulation Authority has been interviewing TEPCO managers about safety measures for the No.6 and No.7 reactors at the Kashiwazaki-Kariwa plant.

One of the regulators at a meeting on Wednesday agreed with TEPCO that putting the plant back into regular operation is a way of taking responsibility for the 2011 nuclear accident in Fukushima.

Another asserted that the Fukushima accident had helped improve TEPCO's safety awareness.

But other members of the regulating authority were skeptical. One asked whether TEPCO's promise alone was sufficient for deciding that the plant is ready to restart.

The regulators meet again next Wednesday to decide whether to draft documents that would effectively certify that the reactors have cleared safety screening procedures.

They would be the first of TEPCO's reactors to get the go-ahead for a restart since the Fukushima meltdown. They would also be the first boiling water reactors -- the same as those in the crippled Fukushima plant -- to pass screening.

Niigata Governor Ryuichi Yoneyama has indicated he will not permit a restart of the reactors until the investigation into the Fukushima accident is completed.

Trust TEPCO again?

September 7, 2017

NRA doubts TEPCO's safety vow in Niigata, plans legal move
http://www.asahi.com/ajw/articles/AJ201709070026.html
By MASANOBU HIGASHIYAMA/ Staff Writer
The Nuclear Regulation Authority, skeptical of Tokyo Electric Power Co.'s promise to put safety ahead of profits, plans to gain legal assurances before allowing the embattled utility to start operating nuclear reactors again.
TEPCO has applied to restart two reactors at its Kashiwazaki-Kariwa plant in Niigata Prefecture, which would be the first run by the company since the disaster unfolded at its Fukushima No. 1 nuclear plant in March 2011.
Although NRA members agreed that the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa plant passed new regulations on technological aspects, they could not agree on whether the company has learned its lessons about safety management since the triple meltdown at the Fukushima plant.
To ensure TEPCO will put safety at the forefront of its operations, the NRA is considering holding the utility legally responsible for completing the entire decommissioning process of the Fukushima No. 1 nuclear plant.
The regulator expects to draft a checklist to verify the Kashiwazaki-Kariwa plant's safety and other steps before it makes a final decision on whether to allow TEPCO to restart the reactors. The next meeting is scheduled for Sept. 13.
The NRA had previously determined that 12 reactors at six nuclear plants met new nuclear reactor regulations shortly after completion of their technological examinations.
The NRA also finished its technological examinations of the No. 6 and No. 7 reactors, the newest ones at the Kashiwazaki-Kariwa plant.
The plant has seven reactors, making it one of the largest nuclear power stations in the world. The two reactors that TEPCO wants to put online each has a capacity of 1.36 gigawatts.
TEPCO has said the resumption of the reactors are needed to turn around its business fortunes.

But NRA commissioners are reluctant to allow TEPCO to bring the plant online based solely on the results of the technological screening.
After the chairman and president of the utility were replaced in June, the NRA summoned the new top executives in July.
The watchdog demanded that they give a written response to the regulator's position that TEPCO "is not qualified to operate the Kashiwazaki-Kariwa plant, given the seeming lack of determination and spotty track record to take the initiative in decommissioning (the Fukushima No. 1 plant)."
In August, the company submitted a paper to the NRA promising to "take the initiative in addressing the problem of victims of the nuclear disaster and to fulfill the task to decommission the plant."
The paper also said the company "has no intention whatsoever to place economic performance over safety at the (Kashiwazaki-Kariwa) plant."
Tomoaki Kobayakawa, the new president of TEPCO, called the paper a "promise to the public."
Although the NRA commissioners on Sept. 6 recognized TEPCO's commitment to safety to a certain degree, doubts remained.
Nobuhiko Ban, an NRA member who is a specialist on radiological protection, called for a system that would keep TEPCO committed to safety management in the future.
"Is it all right for us to take TEPCO's vow at face value?" he said.
The NRA then decided to consider legal ways to hold TEPCO accountable for safety issues.

TEPCO's Niigata nuclear plant set to clear screening to restart reactors
https://mainichi.jp/english/articles/20170906/p2a/00m/0na/016000c
September 6, 2017 (Mainichi Japan)
The Nuclear Regulation Authority (NRA) looks set to grant permission for Tokyo Electric Power Co. (TEPCO) to restart the No. 6 and No. 7 reactors at its Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture, it has been learned.

- 【Related】Mayor to link reactor decommissioning to restarting 2 others at same TEPCO plant

At a meeting on Sept. 6, the NRA discussed whether or not TEPCO is fit to restart the plant -- with none of the meeting attendees ruling out the firm's eligibility. The technical screening process has almost finished, and the nuclear watchdog is set to compile a report stating that TEPCO has met the new safety standards.
This is the first time that TEPCO, which was behind the accident at the Fukushima No. 1 Nuclear Power Plant in 2011, has been forecasted to clear the new standards for nuclear power plants. In addition, it is set to be the first time for boiling water reactors, like the ones at Fukushima, to meet the necessary criteria.
For TEPCO, the restarting of the Kashiwazaki-Kariwa plant is a key way to recover earnings. However, Niigata Gov. Ryuichi Yoneyama wants to put priority on verifying the cause of the Fukushima disaster first, before giving a green light to the restart of the Kashiwazaki-Kariwa plant. According to Yoneyama, the verification process will take "three to four years," and therefore, the utility cannot expect an early restart, even if the reactors clear the NRA screening process.
In September 2013, TEPCO applied to have No. 6 and No. 7 reactors at its Kashiwazaki-Kariwa plant screened under the new standards. Consequently, the NRA set about checking the application intensively -- recognizing this as the model for boiling water reactor screenings.
During the screening process, multiple changes were made to given conditions such as the possibility of ground liquefaction in costal levees at the plant. Furthermore, it emerged in February this year that TEPCO had submitted false reports to the NRA about a quake-proof building, which would be used as the

command and control hub in case of an accident, even though company officials knew that the building was insufficiently earthquake resistant. As a result, the NRA summoned then TEPCO President Naomi Hirose, and asked him to overhaul the screening application form. Hirose complied and TEPCO resubmitted the form in June.
While conducting the screening, the NRA focused on the fact that TEPCO had caused a major accident (in 2011), and demanded that TEPCO submit its thoughts regarding plant safety, as well as its approach toward decommissioning the Fukushima plant.
The NRA also interviewed senior TEPCO executives including President Tomoaki Kobayakawa, twice, in what can be regarded as a much more stringent screening process than for any other nuclear plant.

Why has NRA changed its mind?

September 7, 2017

Nuclear regulator does dizzying U-turn on TEPCO reactor restart plans
https://mainichi.jp/english/articles/20170907/p2a/00m/0na/019000c
Tokyo Electric Power Co. (TEPCO), the utility responsible for the Fukushima No. 1 nuclear plant and its March 2011 triple meltdown, is aiming to get the reactors at its other power plants back on line.

- 【Related】TEPCO's Niigata nuclear plant set to clear screening to restart reactors
- 【Related】Mayor to link reactor decommissioning to restarting 2 others at same TEPCO plant
- 【Related】NRA chair ties nuke plant restart to TEPCO taking lead on Fukushima decommissioning

The Nuclear Regulation Authority (NRA), which must approve any restarts, had been holding to a very strict line on TEPCO applications. However, on Sept. 6 the NRA abruptly changed track, taking a more sympathetic attitude and indicating that the No. 6 and 7 reactors at the utility's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture would likely pass their safety inspections -- a prerequisite for restart approval.
Despite the NRA's suddenly sunny attitude, the prefectural government has not budged from its more cautious position. And TEPCO, which has made the Kashiwazaki-Kariwa plant a chief pillar of its business recovery plans, cannot flip the reactors' "on" switch without the prefecture's imprimatur, meaning the plant still has no clear restart schedule.
When the NRA summoned TEPCO President Tomoaki Kobayakawa and other top managers on July 10 this year to testify on the utility's competence to keep running nuclear plants, authority chairman Shunichi Tanaka was unequivocal and unforgiving.
"If TEPCO is unwilling or unable to finalize the decommissioning of the Fukushima (No. 1 station) reactors, it is simply not qualified to restart the Kashiwazaki-Kariwa plant," Tanaka told the executives, adding, "I don't see TEPCO showing any independent initiative whatsoever."
The NRA chairman was referring to the longstanding problems with contaminated water and radioactive waste disposal plaguing TEPCO's Fukushima plant decommissioning efforts. The utility tends to focus too much on trying to read the government's mind on any and all Fukushima issues -- an attitude that has long drawn NRA criticism.

When the NRA inspected the Kashiwazaki-Kariwa plant's No. 6 and 7 reactors, it added a new evaluation category to the usual technological checklist, though it was not part of the new safety standards: "eligibility." That is, TEPCO's eligibility to run a nuclear power plant at all. After all, it was one of TEPCO's plants that had succumbed to the worst nuclear disaster since Chernobyl. "TEPCO is different from other (power) companies," Tanaka had said.

TEPCO President Kobayakawa and Chairman Takashi Kawamura are also a source of NRA concern. The two had no role in the utility's response to the 2011 meltdowns, and Kobayakawa replaced a much more experienced hand in Naomi Hirose, a TEPCO managing director when the disaster struck. After his NRA dressing-down in July, Kobayakawa apparently visited the Fukushima disaster zone seven times.

However, there has been an apparent U-turn in Tanaka's stance. A document submitted on Aug. 25 to the NRA under Kobayakawa's name was sewn with phrases like, "We will carry the (Fukushima) reactor decommissioning through to the end," and other terms suggesting a determined TEPCO attitude. At the same time, the document was bereft of details on specific preparedness measures or progress benchmarks for the decommissioning work.

Nevertheless, when Kobayakawa again appeared before the NRA on Aug. 30, the body indicated its acceptance of TEPCO's position. Taking the contaminated water problem "as one example," Tanaka stated that he recognized TEPCO's lack of concrete countermeasure planning couldn't be helped under the circumstances. One NRA executive revealed to the Mainichi Shimbun, "**We avoided demanding a detailed (disposal measures) plan because we don't legally have that authority, and doing so could pose legal risks."**

Pro-TEPCO sentiment was on conspicuous display when the NRA met again on Sept. 6, including acting Chairman Toyoshi Fuketa's declaration that he "felt TEPCO's drive to pass on the lessons of the (Fukushima nuclear) accident."

Committee member Nobuhiko Ban stated that while the document the utility had submitted in the summer was a "declaration of intent," he was "concerned over whether this alone can constitute eligibility" to run a nuclear plant. However, Tanaka wrapped up discussion by saying that "circumstances are not such that we can deny (TEPCO's) eligibility."

Tanaka will leave his NRA post on Sept. 18 after completing his five-year term in the chairmanship, and at a post-meeting news conference he was asked if he had wanted to bring the TEPCO issue to a close while in office.

"I can't say that I've never felt that way," Tanaka replied.

Start of Rokkasho plant postponed again

September 14, 2017

Work to be delayed for nuclear recycling plant

https://www3.nhk.or.jp/nhkworld/en/news/20170914_14/

The planned completion of a nuclear fuel reprocessing plant in Aomori Prefecture is expected to be difficult by the first half of fiscal 2018, because of problems involving inflow of rainwater.

The Nuclear Regulation Authority indicated on Wednesday that the plant in Rokkasho Village, northeastern Japan, which is supposed to reprocess spent nuclear fuel, will not pass screening until its

safety is ensured for the entire facility. Passing the screening is a precondition for full-scale operation of the plant, which is a pillar of the government's nuclear fuel recycling program.

The decision will force the operator Japan Nuclear Fuel Limited to delay its plan to complete the plant as planned.

Last month, workers at the plant found that rainwater has been flowing through underground pipes into a building where an emergency power generator is installed. It was also revealed that the underground tunnel for the piping has not been inspected for 14 years.

The operator says it will present an inspection plan by the end of the current fiscal year in March 2018.

But observers say the screening process will likely be significantly extended. They say it will also take a long time to gain approval for detailed plant designs and to pass inspection, making it difficult to complete the plant as scheduled.

TEPCO eligible to operate nuke plants again...under conditions

September 14, 2017

Conditional approval of TEPCO's eligibility
https://www3.nhk.or.jp/nhkworld/en/news/20170913_34/
Japan's nuclear regulators have affirmed that Tokyo Electric Power Company is eligible to operate nuclear reactors again, but they have imposed some conditions.

The members of the Nuclear Regulation Authority made the decision at a meeting on Wednesday.

They have been debating whether or not to give the utility a green light to restart 2 reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture, central Japan.

TEPCO is the operator of the crippled Fukushima Daiichi plant.

During the meeting, a plan was put forth. According to the plan, TEPCO must express in its safety regulations its determination to tackle the decommissioning of the Fukushima Daiichi plant and its determination to prioritize safety over economic efficiency. In return, the regulators will certify that the company is eligible to operate nuclear reactors.

The plan also requires the industry ministry to make its intention to supervise the company clear.

At the meeting on Wednesday, the regulators agreed to certify that TEPCO is eligible to operate reactors as long as the industry ministry and the president of TEPCO agree to the provisions in the plan.

The regulators will compile a report that will effectively certify that TEPCO has their approval to restart the 2 reactors in Niigata.

NRA "too hasty" in giving OK to TEPCO

September 14, 2017

EDITORIAL: NRA too hasty in giving green light to TEPCO to restart reactors

http://www.asahi.com/ajw/articles/AJ201709140030.html

Although the Nuclear Regulation Authority has decided to give the green light to Tokyo Electric Power Co. to restart nuclear reactors, we question the fitness of the utility, which is responsible for the accident at the Fukushima No. 1 nuclear power plant, to manage nuclear facilities.

The NRA has been screening TEPCO's application to resume operations of the No. 6 and No. 7 boiling-water reactors at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.

The NRA on Sept. 13 acknowledged with conditions that TEPCO is eligible for operating nuclear plants after examining the company's safety culture and other issues.

The nuclear safety watchdog said it will make TEPCO incorporate a written pledge by TEPCO President Tomoaki Kobayakawa to secure safe operations into its safety code. Kobayakawa promised to put higher priority on safety than on profitability. The NRA made clear it also has the power to order TEPCO to suspend its reactor operations or rescind the utility's license if a serious violation is found.

Establishing an effective system to monitor the company's nuclear power operations to ensure their safety is one thing. Assessing the utility's fitness to operate reactors is another.

Why is the NRA in such a rush to make the decision when it still harbors doubts about TEPCO's eligibility to operate nuclear reactors?

Was the move in any way driven by a desire on the part of Shunichi Tanaka, chairman of the NRA, to settle the issue by the end of his five-year term, which is due to expire soon?

It is hard to deny the impression that the NRA has unnecessarily rushed into the decision, as it is clearly premature.

A corporate safety culture usually deteriorates in a five-stage process--with each marked, respectively, by overconfidence, complacency, disregard, danger and collapse.

TEPCO's safety culture was already collapsed before the 2011 nuclear disaster at the Fukushima No. 1 nuclear power plant, as indicated by a series of scandals involving the company's attempts to cover up safety problems and falsify data.

That's how TEPCO itself summed up the root causes of the catastrophic accident in a report published in 2013.

In an attempt to fix its corporate culture, TEPCO established an oversight committee, which includes independent members and regularly receives reports from the management team.

The utility has also published a somewhat self-congratulatory report on the effectiveness of measures it has taken.

It was revealed only last year, however, that the company's president at the time of the Fukushima accident told employees not to use the term "core meltdown" in describing what was unfolding.

It has also been disclosed that TEPCO had failed to inform the regulator that the earthquake resistance of a key facility at the Kashiwazaki-Kariwa plant was insufficient.
Only last month, it emerged that TEPCO had seriously delayed announcing that falling levels of underground water being pumped up at the Fukushima plant set off an alarm. The NRA bitterly criticized the delay, saying the suspicion that TEPCO was still in the habit of "covering up inconvenient facts and deceiving people" could not be avoided.
Why then, has the NRA concluded there is "no reason" to proclaim that TEPCO is unfit to operate nuclear reactors?
In the aftermath of the Fukushima disaster, many critics, both at home and abroad, pointed out that both the operators and regulators of nuclear plants in Japan focus too much on hardware, such as facilities and equipment.
All operators of nuclear plants in Japan, not just TEPCO, face the challenge of reforming the way they manage their organizations as well as the mind-set among their employees in order to foster and firmly establish a safety culture.
Even the more stringent reactor regulations imposed by the NRA after the triple meltdown in 2011 are not effective enough in this respect.
Evaluating a utility's fitness to operate nuclear plants is a new task for the NRA.
A special task force set up by the body started working on the criteria and procedures for such evaluations in July. The team is expected to produce an interim report on its work by the end of the year.
Here's how the NRA should tackle this challenge. It should first establish effective guidelines for eligibility assessments. Then, it should apply the guidelines to the screening of specific plans to restart reactors to ensure that a solid safety culture underpins the operations of all nuclear reactors.
--The Asahi Shimbun, Sept. 14

Editorial: Can resolve alone qualify TEPCO to operate nuclear reactors?

https://mainichi.jp/english/articles/20170914/p2a/00m/0na/019000c

Japan's Nuclear Regulation Authority (NRA) has judged that Tokyo Electric Power Company Holdings Inc. (TEPCO) is qualified, under certain conditions, to operate nuclear reactors.

- 【Related】Nuclear regulator defers giving safety OK for idle TEPCO reactors
- 【Related】Nuclear regulator does dizzying U-turn on TEPCO reactor restart plans
- 【Related】TEPCO's Niigata nuclear plant set to clear screening to restart reactors

The judgment comes in line with the nuclear watchdog's safety screening of the idled No. 6 and 7 reactors at TEPCO's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.
Technical screening of the reactors has practically finished, and in the near future the NRA is expected to release a draft of screening documents indicating that the reactors have passed new safety standards implemented in the wake of the Fukushima nuclear disaster.
But when looking closely at the screening process, the foundation for the nuclear watchdog's decision appears flimsy, and we have to say that it lacks persuasiveness.
The NRA's decision to screen TEPCO on its qualifications to operate the reactors was an unusual step not clearly stipulated in the new safety standards. It stems from NRA Chairman Shunichi Tanaka's judgment that TEPCO, having caused the accident at the Fukushima No. 1 Nuclear Power Plant, is different from other power companies. It is understandable that an additional, high-level response is being sought from TEPCO.
In July this year, the NRA called in TEPCO officials including the utility's president Tomoaki Kobayakawa, and Tanaka put pressure on them, telling them, "If TEPCO is unwilling or unable to see through the

decommissioning of the Fukushima reactors, it is simply not qualified to operate a nuclear power plant." He requested that TEPCO take the initiative in tackling problems such as the accumulation of tainted water on the grounds of the Fukushima No. 1 nuclear plant.

In response, TEPCO last month submitted a document to the NRA in the name of the president. It stated that the company would "proactively face the parties involved and see through the decommissioning of the reactors," and that it would "deal with decommissioning at the Fukushima plant and safety improvements at the Kashiwazaki-Kariwa plant at the same time." Though the document displayed TEPCO's resolve, it contained no concrete measures on dealing with contaminated water or other such issues.

In spite of this, Tanaka and other officials at the NRA went straight ahead and accepted the document. They took the position that the effectiveness of TEPCO's resolve could be ensured by making the utility express it in nuclear plant safety stipulations, with which operators are obliged to comply.

However, there are no clear standards for evaluating the stance with which TEPCO is tackling decommissioning work and safety countermeasures. Even if the company states its subjective resolve in safety regulations, doubts remain about how much of a binding effect that will have on the utility's actual stance.

In screenings to date there have emerged several findings which cast doubt on TEPCO's fitness to operate reactors at the Kashiwazaki-Kariwa plant, including the discovery that the utility did not report to the NRA that the quake resistance of a seismic-isolated building that is supposed to serve as a base for handling accidents was not up to scratch.

Niigata Gov. Ryuichi Yoneyama has indicated that inspection of the disaster at the Fukushima No. 1 plant is a priority issue, and so even if the Kashiwazaki-Kariwa reactors pass screening, there are no immediate prospects of being able to restart them. So why is the NRA in such a hurry to reach a conclusion?

Tanaka's tenure as chairman of the NRA will expire this month. One might well think the NRA is rushing to clear reactivation of the reactors before he steps down. If things keep going the way they are, public trust in the NRA as a government nuclear watchdog will only decline.

What altered NRA's assessment of TEPCO?

September 18, 2017

NRA screening of Tepco's restart plan

https://www.japantimes.co.jp/opinion/2017/09/18/editorials/nra-screening-tepcos-restart-plan/#.Wb_OLMZpGos

The Nuclear Regulation Authority appears to be moving toward approving Tokyo Electric Power Company Holding Inc.'s bid to restart two of the idled reactors at its Kashiwazaki-Kariwa power plant in Niigata Prefecture — the same type of boiling water reactor (BWR) that suffered core meltdowns at its Fukushima No. 1 plant in 2011. Tepco sees the restart of reactors 6 and 7 at the Niigata plant as vital to its financial reconstruction. However, the way the NRA is wrapping up its safety screening of Tepco's plan seems less than convincing.

Even if the NRA gives it nod, it remains uncertain when the plant will be restarted given that Niigata Gov. Ryuichi Yoneyama says it will take "at least three to four more years" before making a judgment on whether to grant local consent to the restart, which he says will require a full review of the 2011 crisis. Instead of rushing to a decision, what's required of the NRA is a screening process that will be accountable to the public.

In a meeting last Wednesday, the NRA held off certifying the safety of the two Kashiwazaki-Kariwa reactors, as it had been widely expected to do, in the face of criticism that it has not sufficiently discussed whether Tepco, responsible for the 2011 disaster, is fit to operate a nuclear plant. It was believed that the NRA wanted to wrap up the screening while Chairman Shunichi Tanaka, who will leave the post this week, was still on board. Still, Tanaka told a news conference that the nuclear watchdog has reached a consensus that Tepco is qualified to run nuclear plants.

Just two months ago, Tanaka, in a meeting that was also attended by Tepco's top management, severely criticized the utility over the way it was approaching the task of cleaning up the mess of Fukushima No. 1, saying that a power company which "lacks the will to take the initiative" in decommissioning the crippled Fukushima plant "does not have the right to restart operations" of a nuclear power plant. While Tanaka urged the Tepco executives to submit a document detailing how the firm intends to dispose of radiation-contaminated water at Fukushima No. 1, the utility's reply delivered in August did not mention any concrete plans for disposing of the contaminated water that has built up there.

During a hearing in late August, however, the utility pledged its resolve to see the decommissioning process through to the end. This has reportedly gained the understanding of the NRA. The nuclear watchdog began wrapping up the screening of Tepco's bid at its meeting on Sept. 6 — in which participants reportedly gave positive comments about its plan, such as that the experience of the Fukushima catastrophe should serve as a plus for the company's operation of its other plants. Another participant was quoted as saying that Tepco's responsibility for the 2011 accident is one thing and its technological capacity to run nuclear plants is another.

At the last meeting, the NRA reportedly agreed that Tepco is fit to restart the reactors at Kashiwazaki-Kariwa — on condition that the utility state in its rules its determination to implement all new safety measures in running nuclear power plants. It's not clear how the doubts expressed so strongly in July about Tepco's qualifications as a nuclear plant operator have been dispelled by verbal pledges of its "determination" to follow safety rules and by writing them down in its safety rules.

More than six years after the meltdowns, the path to decommissioning Fukushima No. 1 still has a long way to go. Detailed conditions of the melted fuel debris inside the crippled reactors — the removal of which will pose the biggest hurdle to decommissioning the plant — remain unknown.

Just two years after the disaster broke out, Tepco filed for an NRA screening of its plan to reactivate the reactors at Kashiwazaki-Kariwa. Tepco is placing its hopes on resuming operation of the Niigata plant — the world's largest nuclear power station in terms of output capacity — as a key to restoring its financial bottom line, which has been battered by the massive costs of paying for the aftermath of the 2011 catastrophe.

At that time, Tepco said there was no problem with the earthquake resistance of an emergency response center at the Kashiwazaki-Kariwa plant. But even though it later learned that the emergency unit's quake resistance was insufficient, it failed to report this fact to the NRA for three years. It was only in June that the company submitted a revised application. **That alone brings into question Tepco's commitment to safety as a nuclear power plant operator. One wonders what altered the NRA's assessment of Tepco to determine that the utility is fit to run a nuclear plant.**

TEPCO to make legal safety pledge...

September 20, 2017

Tepco to make legal safety vow as it seeks restart of reactors at Kashiwazaki-Kariwa plant
https://www.japantimes.co.jp/news/2017/09/20/national/tepco-make-legal-safety-vow-seeks-restart-reactors-kashiwazaki-kariwa-plant/#.WcIzVcZpGos
Kyodo

The head of Tepco said Wednesday that the company will make a legal safety pledge — in response to a request by the nation's nuclear watchdog — as it seeks approval to restart reactors at its Kashiwazaki-Kariwa plant in Niigata Prefecture.
Tomoaki Kobayakawa, president of Tokyo Electric Power Company Holdings Inc., told the Nuclear Regulation Authority that the firm will work to build a culture of safety as it seeks the restart of undamaged but idled reactors 6 and 7 at the plant on the Sea of Japan coast.
The nuclear watchdog called for the pledge as part of the firm's legally binding reactor safety program because it operates the Fukushima No. 1 nuclear power plant, the site of a major nuclear disaster in the aftermath of the massive March 2011 earthquake and tsunami.
Tepco's promise will pave the way for the regulator's safety clearance for the two boiling-water reactors — the same type as the ones that suffered meltdowns in the 2011 disaster.
The regulator will soon compile a draft document for the two units which will serve as certification that the utility has satisfied new stricter safety requirements implemented since the nuclear disaster.
It will then consult the economy, trade and industry minister, who oversees the nuclear industry, to confirm that Tepco is fit to be an operator. It will also solicit comments from the public before formally giving clearance.
Even if the reactors clear the safety checks, local governments near the plant remain cautious. Niigata Gov. Ryuichi Yoneyama, for example, has said it will take "around three to four years" for the utility to win the required local consent for a restart.
The Nuclear Regulation Authority said last week that Tepco was qualified" as a nuclear plant operator, but that it wanted the utility to express its resolve to ensure safety in a legal document, not just in words.
Safety programs drawn up for reactors need to be approved by the regulator, which can demand a halt to nuclear power operations if it finds a grave violation.
"We intend to tackle the unending mission of improving the safety of nuclear power and to complete the decommissioning and compensation of the Fukushima No. 1 complex," Tepco's Kobayakawa said at the regulator's meeting on Wednesday. "We will also make efforts to maintain qualification" as an operator of nuclear reactors, he said.
Reactors 6 and 7 at the Kashiwazaki-Kariwa plant are the newest among the seven units at the plant. The complex is one of the world's largest nuclear power plants, with a combined output capacity of 8.2 million kilowatts.
For a reactor to be restarted, it first needs to clear the safety requirements introduced in the wake of the Fukushima nuclear crisis. Tepco filed for safety assessments of the two units in September 2013.
Tepco, which is facing massive compensation payments and other costs in the aftermath of one of the world's worst nuclear crises, has been desperate to resume operations of its idled reactors so it can reduce spending on costly fossil fuel imports for thermal power generation.

While some reactors run by other utilities have resumed operations by satisfying the new regulations, Tepco has been under close scrutiny by regulators over whether it is qualified to once again operate a nuclear power plant.

NRA approves safety mesures at Kashiwazaki-Kariwa Nos.6 and 7

October 4, 2017

NRA approves safety measures at TEPCO plant in Niigata
http://www.asahi.com/ajw/articles/AJ201710040031.html
By MASANOBU HIGASHIYAMA/ Staff Writer
Japan's nuclear watchdog on Oct. 4 approved Tokyo Electric Power Co.'s safety measures taken to restart two reactors in Niigata Prefecture, the first such approval for the company since the Fukushima nuclear disaster unfolded.
The Nuclear Regulation Authority confirmed the results of its screening on the technological aspects of the No. 6 and No. 7 reactors that TEPCO wants to bring online at its Kashiwazaki-Kariwa nuclear plant.
It was also the first time for the NRA to conclude that boiling-water reactors, the same type as those at TEPCO's crippled Fukushima No. 1 nuclear plant, met the new safety standards adopted after the meltdowns at the plant in 2011.
The NRA plans to hear opinions from the public about its judgment for 30 days before deciding on whether to make the approval official. It will also solicit the views of the minister of economy, trade and industry.
As one condition for official approval, the NRA is requiring the industry minister to oversee the utility's management policy concerning its initiative and responsibility for work to decommission the Fukushima No. 1 nuclear plant.
From now, the NRA will check equipment designs and security regulations, including how TEPCO will guarantee its promise that its priority is on safety, not economic benefits.
The NRA's screening process at the Kashiwazaki-Kariwa nuclear plant went beyond checking technological aspects of TEPCO's safety measures. Given TEPCO's history of mistakes and blunders, NRA members also discussed whether the utility was even eligible to operate nuclear power plants.
In response to the NRA's demands that TEPCO take full responsibility for decommissioning the Fukushima No. 1 plant, the utility in late August stressed that its stance of putting importance on safety is "a promise to the people."
The NRA then approved TEPCO's eligibility but attached some conditions.
In late September, however, it came to light that workers at the Fukushima No. 1 plant were erroneously setting water gauges to measure groundwater levels of wells around reactor buildings, which could cause leaks of highly contaminated water to the outside water.
Inspectors will face a formidable challenge in judging individual issues facing TEPCO based on security regulations.
However, even if TEPCO passes all of the screenings, it must win the consent of local governments to restart the reactors at the Kashiwazaki-Kariwa nuclear plant.
Niigata Governor Ryuichi Yoneyama has said that he will wait for three or four years to make decision on the restarts, until his prefectural government completes its own investigation into the cause of the 2011 nuclear disaster at the Fukushima No. 1 plant.

TEPCO reactors clear safety review for 1st time after Fukushima

https://mainichi.jp/english/articles/20171004/p2g/00m/0dm/054000c

TOKYO (Kyodo) -- Two reactors in Niigata Prefecture on the Sea of Japan coast run by the operator of the crippled Fukushima nuclear plant cleared government safety standards on Wednesday, becoming the first of the utility's idled units to pass tightened screening.

The Nuclear Regulation Authority endorsed at its meeting a draft document that serves as certification that Tokyo Electric Power Company Holdings Inc.'s Nos. 6 and 7 reactors at Kashiwazaki-Kariwa power station have met the new, stricter safety standards introduced after the Fukushima disaster.

The two reactors are the newest among the seven units at the Kashiwazaki-Kariwa plant. The complex is one of the world's largest nuclear power plants, with a combined output capacity of 8.2 million kilowatts.

Despite the effective approval by the nuclear regulator, the actual restart of the two reactors will likely be at least a few years away as Niigata Gov. Ryuichi Yoneyama says it will take "around three to four years" for the utility to win local consent for the resumption of operation.

Formal approval of the restart by the nuclear watchdog is expected after receiving public opinions and consulting with the economy, trade and industry minister to confirm that Tepco is fit to be an operator.

The clearance of the two units is likely to be a boost for the government of Prime Minister Shinzo Abe, which is keen to retain nuclear power generation despite Japan suffering the world's worst nuclear disaster since Chernobyl at the Fukushima Daiichi nuclear complex in March 2011, triggered by a massive earthquake and tsunami.

Tepco, facing huge compensation payments and other costs stemming from the Fukushima crisis, has been desperate to resume operation of its idled reactors so it can reduce spending on costly fossil fuel imports for non-nuclear thermal power generation.

It filed for safety assessments of the two idled reactors at Kashiwazaki-Kariwa plant in September 2013.

In addition to assessing technical requirements, the review focused on whether Tepco is qualified to once again operate a nuclear power plant as it struggles with work to scrap the Fukushima Daiichi complex, an effort expected to take until around 2051, and reduce contaminated water around the crippled plant where radiation levels remain high.

The two reactors are boiling-water reactors, the same as those that experienced meltdowns in the Fukushima crisis. No such types have previously cleared Japan's safety standards after the Fukushima disaster, partly as they are required to conduct major refurbishment to boost safety.

Under the new safety requirements, BWRs must be equipped with filtered venting systems so that radioactive substances will be reduced when gas and steam need to be released to prevent damage to containment vessels.

The venting facilities are not an immediate requirement for pressurized water reactors as PWRs are housed in containers larger than those of BWRs, giving more time until pressure rises inside the containers.

In the review, the regulator had questioned Tepco on its posture to ensure the safety of the units. The company last month agreed to a request from the regulator to include a safety pledge as part of its legally binding reactor safety program.

Safety programs drawn up for reactors need to be approved by the regulator and if it finds a grave violation, it can demand the utility halt nuclear power operations.

TEPCO's nuclear plant to clear NRA check

https://www3.nhk.or.jp/nhkworld/en/news/20171004_16/

Japan's nuclear regulator has taken a step further in allowing Tokyo Electric Power Company, or TEPCO, to restart its Kashiwazaki-Kariwa plant in Niigata Prefecture on the Sea of Japan coast.

The nuclear plant would be the first of those held by the operator of the crippled Fukushima Daiichi plant to soon be given the regulator's green light under the requirements introduced after the 2011 accident.

The commissioners of the Nuclear Regulation Authority on Wednesday unanimously adopted its draft assessment for the plant's No.6 and 7 reactors. The plant has 7 reactors.

The assessment says safety measures for the 2 reactors set forth by TEPCO meet the requirements.

The measures include introducing new equipment and procedures for use in case of severe accidents, such as leaks of radioactive substances from the plant's damaged containment vessel.

The reactors would also be the first of Japan's boiling-water-type reactors -- the same type as those that melted down at Fukushima Daiichi -- to get approval for restarting.

The regulator plans to invite the public to express opinions for a month starting on Thursday before it gives official approval.

Meanwhile, Niigata Governor Ryuichi Yoneyama has indicated that he will not decide on whether to give necessary consent for the restart before the prefecture's investigation into the 2011 accident is complete. The probe is expected to take 3 or 4 years.

In assessing the Kashiwazaki-Kariwa's restart, the regulator took the unusual step of looking into the eligibility of TEPCO as a nuclear plant operator.

In response, the firm promised to express determination for decommissioning the Fukushima Daiichi in the safety codes for the Kashiwazaki-Kariwa plant.

The commissioners also noted that a new emergency system to cool heated cooling water by using seawater is effective. They decided to include it in their regulation so that other boiling-water-type reactor operators take a similar measure.

They say the new system is more effective than ventilation that releases gas outside to lower inner pressure of reactors.

Outside the building in Tokyo where the NRA meeting was held, about 30 activists protested the decision. They said TEPCO is not qualified to run nuclear reactors and that the Fukushima Daiichi crisis is not over.

NRA should explain its decision

October 4, 2017

NRA questioned TEPCO's fitness to run plant
https://www3.nhk.or.jp/nhkworld/en/news/20171004_29/

Japan's nuclear regulator interviewed executives of Tokyo Electric Power Company in July after the utility's corporate culture was called into question.

The Nuclear Regulation Authority took the unusual step of looking into whether TEPCO was qualified to restart another nuclear plant.

The operator kept quiet about the meltdowns at its Fukushima Daiichi plant for more than 2 months after the accident in March 2011. It has also been criticized for giving misleading information about the ability of emergency facilities at its Kashiwazaki-Kariwa plant in Niigata Prefecture to resist earthquakes.

During the interview of executives, Shunichi Tanaka, the NRA's chairman at the time, criticized TEPCO. He said it wouldn't be qualified to operate a nuclear plant unless it showed its determination to decommission the Fukushima reactors and to produce results. He also asked TEPCO to respond in writing.

In a statement submitted in August, TEPCO said it was tackling the matter and expressed its resolve to complete the decommissioning.

But the document failed to outline any concrete plans. Despite that, the NRA decided to recognize TEPCO as a qualified nuclear plant operator. But it was on condition that TEPCO make clear in its safety code that it was resolved to decommission the Fukushima plant and prioritize safety over economic efficiency in its operation.

Now that the regulator has effectively judged that TEPCO's Kashiwazaki-Kariwa plant has met the new safety requirements, observers say the regulator should give the public an understandable explanation of its screening process.

Restart still nowhere in sight

October 5, 2017

Despite NRA's OK, restarting reactors in Niigata Pref. still nowhere in sight
https://mainichi.jp/english/articles/20171005/p2a/00m/0na/016000c
Irrespective of Japan's nuclear watchdog giving a green light to restarting two idled reactors at a nuclear power plant in Niigata Prefecture operated by Tokyo Electric Power Company (TEPCO) Holdings Inc., there are no clear prospects in sight as to when they will be reactivated as the utility has to win approval by the host prefecture and city.

- 【Related】TEPCO reactors clear safety review for 1st time after Fukushima

"I'm in no position to object to the screening done by the state. In return, the (safety) verification that the prefectural government is going to carry out is not something to be objected to by the state," Niigata Gov. Ryuichi Yoneyama told reporters on Oct. 4 following the Nuclear Regulation Authority (NRA)'s endorsement of a draft document that says the No. 6 and No. 7 rectors at TEPCO's Kashiwazaki-Kariwa Nuclear Power Plant meet new safety standards. The NRA now bears grave responsibility as it has

effectively approved the utility responsible for the worst nuclear accident in Japanese history to operate a nuclear power station again.
Yoneyama's "safety verification" refers to the three-point check proposed by the governor. Yoneyama, who assumed office after winning the 2016 gubernatorial election for the first time with the backing of the Japanese Communist Party and other anti-nuclear power groups, remains cautious about restarting idled nuclear reactors, saying that unless the following three points are examined by the prefectural government -- the cause of the Fukushima nuclear disaster, potential effects on people's livelihoods as well as health in case of an accident and safe evacuation measures -- he cannot even accept to have a discussion on the restart.
The reason Yoneyama attaches importance to these verification points is because he believes that the NRA's screening focuses on the nuclear plant's hardware such as the safety of buildings and equipment but disregards the potential effects on local residents' livelihoods and their health should an accident occur or the legitimacy of evacuation plans. As local residents' sense of distrust of nuclear plants and TEPCO still remain strong, the governor has no choice but to be cautious about allowing the utility to restart the reactors.
At the same time, two out of three committees tasked to work on the verification were just launched in September, and discussions on concrete subjects for examination have not started. In addition, the selection of members for the general overview board, which is supposed to organize the three committees, has not been completed.
Gov. Yoneyama has indicated his intention to make a decision on the restart of the nuclear plant a key issue in the next gubernatorial election scheduled for 2020, meaning that the timing of restarting the idled reactors is absolutely nowhere in sight.
Meanwhile, Masahiro Sakurai, mayor of the nuclear plant host city of Kashiwazaki, who was previously more moderate toward nuclear power policies than Yoneyama, has hardened his stance after it was learned that TEPCO failed to report to the NRA about the inadequate earthquake resistance of a building supposed to work as a hub in a nuclear accident. In July this year, Sakurai told TEPCO to re-evaluate its business model of having seven nuclear reactors concentrated at the Kashiwazaki-Kariwa plant as a condition for approving the restart of the No. 6 and 7 reactors. He emphasized during a news conference on Oct. 4 that he would be "demanding TEPCO submit plans to decommission the No. 1 to No. 5 reactors within two years."

Government is involved in nuclear matters whether it wants it or not

October 5, 2017
EDITORIAL: Tokyo must face up to its duty in legal process for nuclear restarts
http://www.asahi.com/ajw/articles/AJ201710050032.html
Tokyo Electric Power Co. Holdings Inc. was the culprit of an unprecedented disaster at the Fukushima No. 1 nuclear power plant in 2011.
The utility remains busy to this day cleaning up after the mess.
Let us ask: should TEPCO be allowed to reactivate part of its fleet of idled nuclear reactors?
The central government has the responsibility to provide explanations to the public and to seek to gain their understanding. It should not proceed with nuclear restarts without fulfilling that duty and without serious debate.

The Nuclear Regulation Authority has approved a draft of its safety screening results for two of the seven reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, which TEPCO is hoping to bring back online. The nuclear watchdog's document says the reactors conform to technical standards. The development means the central government procedures for allowing the reactors to go back online have turned the corner. That also defines a milestone that could accelerate the recent trend for a "return to nuclear power."

TOKYO LEAVING IT ALL UP TO OTHERS

The administration of Prime Minister Shinzo Abe has taken the stance that, if the NRA approves a nuclear reactor's conformity with regulation standards, the central government will respect that decision and allow the reactor to go back online upon gaining the understanding of hosting communities.

But something important is missing from that approach.

Decisions on nuclear restarts, in essence, should not all be left up to the NRA and local governments to make. The central government should be making such decisions from an overall perspective by taking into account a variety of factors, including the risk of accidents, safety measures and social need.

TEPCO's Kashiwazaki-Kariwa plant, of all nuclear power plants across Japan, stands out by the large number of serious issues that have to be addressed.

For example, will survivors of the Fukushima disaster accept the restarts? Will it be possible to ensure safety, including by working out emergency evacuation plans, and erase concerns among the residents of neighboring areas?

In calling for restarts of the Kashiwazaki-Kariwa reactors, officials have placed so much emphasis on a need to make money to cover the expenses of dealing with the aftermath of the Fukushima disaster. Be that as it may, are the restarts really necessary for ensuring a stable power supply and for keeping electricity rates at low levels, as they claim?

And how precisely is the government planning to lower its dependence on nuclear energy on the basis of remorse over the Fukushima disaster?

These questions are on the minds of many members of the public, including those in Fukushima and Niigata prefectures. The central government has to address those questions.

The NRA is only responsible for technical checks by experts on the safety of nuclear power-generating facilities. This time around, the NRA took a special step, applicable only to TEPCO, in trying to decide if the utility is "qualified" to operate nuclear reactors.

That very step taken shows a flawed nature of the current procedures for nuclear restarts.

The NRA discussed, among other things, if TEPCO has sufficiently improved its culture of safety and its cliquish mold, and if a need to assign considerable labor and cash to the decommissioning of the Fukushima No. 1 reactors will not leave safety measures neglected at the Kashiwazaki-Kariwa plant.

The NRA was right in doing so, but it ended up giving the green light on the basis of the TEPCO president's mere oath of determination that the utility will hold itself responsible for safety, even though the NRA had yet to delve deeply enough into the issues of TEPCO's management structure and organizational administration. That decision could only be described as slapdash.

NEED FOR OVERALL REVIEW OF PROCEDURES

As things now stand, the procedures for allowing a nuclear reactor to be restarted are all left up to the NRA, local governments in areas hosting the nuclear plant and the power utility operating the plant. The whole setup must be reviewed and redesigned into a mechanism that allows the central government to take ample responsibility.

The Abe administration emphasizes that the NRA screening standards are the most stringent in the world. The NRA itself, however, has reiterated that the standards only amount to minimum requirements.

The Abe administration, before everything else, should stop trying to create the impression that the NRA has fully guaranteed safety.

Emergency evacuation plans are not covered by the NRA screenings. The central government should have a hand in the matter.

There are also problems in the roles of the central and local governments.

Once the NRA procedure is over, the focus of attention shifts to whether prefectural and municipal governments in the area hosting the nuclear plant will grant their approvals for a reactor restart. That procedure, however, is only based on safety agreements with the power utility operating the plant.

In view of the serious nature of the damage that would result from a severe accident, the approval procedure should be given a legal status, along with direct involvement of the central government.

There is need for creating a system whereby all local governments within a 30-kilometer radius of a nuclear plant, which are obligated to develop emergency evacuation plans, consult with the central government, discuss a broad range of issues including effectiveness of the plans and the need for a restart, and decide whether to allow a reactor to go online.

The central government has said whether to restart individual nuclear reactors is a managerial decision on the part of power utilities, thereby staying away from coming to the fore.

The use of atomic energy, however, is a "national policy implemented by the private sector," which has been bolstered by a number of policy incentives. The central government is therefore not allowed to just remain leaving it all up to nuclear plant operators.

TEPCO, of all utilities, has come under de facto central government ownership because it could no longer pay damages for the Fukushima disaster and clean up radioactive substances out of its own resources. The industry ministry is controlling TEPCO's management policies.

The central government should assume the responsibility jointly with TEPCO for addressing questions and concerns over the planned nuclear restarts.

OPPORTUNITY FOR RETHINKING NUCLEAR ISSUE

When the Kashiwazaki-Kariwa reactors formally pass NRA screenings in the near future, that is expected to have a major impact on the future of nuclear energy in Japan.

All the 12 nuclear reactors that have so far passed NRA screenings represent pressurized-water reactors located in western Japan. The reactors at the Kashiwazaki-Kariwa plant will be the first boiling-water reactors--of the same type as the crippled reactors at the Fukushima No. 1 plant--to pass the screenings. That is likely to prime the pump and boost a trend for restarting more reactors in eastern Japan in the coming years.

Reactivation of the Kashiwazaki-Kariwa reactors would also revive a picture of the "pre-Fukushima" years in the greater Tokyo region, wherein major power consumption areas enjoyed benefits at the cost of pushing the risk of nuclear power generation on provincial areas.

Scars of the Fukushima disaster have yet to be healed more than six years after the tragic event. A majority of the public remains critical of the use of atomic energy.

Amid those circumstances is the growing list of completed check marks toward nuclear restarts, with the central government remaining ever elusive on the responsibilities it would have to assume.

We cannot afford to let such a situation just continue on. It is up to our entire society to face up to the issue of nuclear power generation.

Political parties should clearly set out their stances on the issue during campaigning for the Oct. 22 Lower House election. That would prompt debate in the Diet, which would, in turn, give the public an opportunity to rethink the matter.

The question of the restarts of the Kashiwazaki-Kariwa nuclear reactors should be a trigger for such a development.

"TEPCO's nature of covering up the truth remains unchanged"

October 5, 2017
Environmental economics expert questions clearing of TEPCO reactors in safety review
https://mainichi.jp/english/articles/20171005/p2a/00m/0na/005000c#cxrecs_s
The Nuclear Regulation Authority (NRA) has endorsed a draft document certifying that the No. 6 and 7 reactors at the Kashiwazaki-Kariwa power station in Niigata Prefecture operated by Tokyo Electric Power Company Holdings Inc. (TEPCO) have met new safety standards introduced after the Fukushima disaster -- paving the way for the reactors to be restarted.
This move, however, has been questioned by Kenichi Oshima, a professor in environmental economics at Ryukoku University. Below is a summary of his comments.

- 【Related】TEPCO reactors clear safety review for 1st time after Fukushima

* * * * *
In an assessment of whether the No. 6 and 7 reactors at the Kashiwazaki-Kariwa Nuclear Power Plant meet new safety criteria, TEPCO, which was responsible for the Fukushima nuclear disaster, was also screened over whether it was qualified to resume nuclear power plant operations. The NRA gave TEPCO a "passing grade" in the assessment, but TEPCO's nature of covering up the truth remains unchanged, and I have serious misgivings about the NRA certifying reactivation.
During screening by the NRA, it emerged that TEPCO had exaggerated the quake resistance of a quake-proof building that would be used as the command and control hub in case of an accident at the Kashiwazaki-Kariwa Nuclear Power Plant. In addition, the company has continued to take an irresponsible attitude in a lawsuit residents filed over the disaster at the Fukushima No. 1 Nuclear Power Plant, saying that it was not possible to predict the Great East Japan Earthquake and tsunami (that triggered the plant meltdowns). In the assessment, TEPCO basically just declared, "We'll do things properly." How does that enable the NRA to judge that the company is qualified as a nuclear power operator? I'm left doubtful.
Under its rehabilitation plan, TEPCO says that it will be able to cover the costs of handling the Fukushima nuclear disaster if the Kashiwazaki-Kariwa plant goes back into operation. But two successive governors of Niigata have taken a cautious approach toward reactivation, and if the feelings of prefectural residents are taken into consideration, there's probably no way this (reactivation) can be permitted. I imagine that unless TEPCO faces the reality that reactivation of the Kashiwazaki-Kariwa Nuclear Power Plant is difficult, it will find its management in disarray.

Restart: Are we talking about safety?

October 8, 2017
NRA's nod for a Tepco nuclear plant restart
https://www.japantimes.co.jp/opinion/2017/10/08/editorials/nras-nod-tepco-nuclear-plant-restart/#.WdyRpDtpGos

The Nuclear Regulation Authority's effective go-ahead last week for restarting two reactors in Niigata Prefecture came just a few months after the departing NRA chief, Shunichi Tanaka, called Tokyo Electric Power Holdings Co. unfit to run a nuclear power station. He said Tepco lacks the will to take the initiative in decommissioning the crippled Fukushima No. 1 plant, where three reactors suffered core meltdowns in the mega-disaster of March 2011.

While restarting reactors 6 and 7 at the giant Kashiwazaki-Kariwa plant on the Sea of Japan coast is not expected to take place anytime soon — due to opposition from the local governor, whose consent will be needed — it must be scrutinized whether the nuclear watchdog carefully assessed Tepco's qualifications as a nuclear plant operator after seeming to question its fitness so severely as recently as July.

Exposed to a tightening business environment due to liberalization of the power retail market, Tepco sees the restart of the Kashiwazaki-Kariwa plant as crucial to rebuilding the company's finances, which were battered by the massive cost of decommissioning the Fukushima No. 1 plant and paying damages to residents affected by the disaster — which will reach an estimated ¥16 trillion. The government believes that reopening the Niigata plant will help Tepco in its compensation efforts and measures to cope with severe accidents. But that should not factor in the safety screening before bringing the idled reactors back online.

The NRA's approval for reactivating the Kashiwazaki-Kariwa reactors was the first given to a plant run by Tepco, which continues to struggle in the fight to clean up the mess from the triple meltdowns at Fukushima No. 1 after the plant was flooded in a giant tsunami and lost emergency power supply to cool the reactors. It was also the first NRA nod — under a revamped safety standard following the 2011 crisis — for restarting a boiling-water reactor, the same type as used at Fukushima No. 1.

In screening Tepco's bid to restart the Kashiwazaki-Kariwa plant, the NRA focused on whether the power company responsible for the Fukushima debacle was fit to run a nuclear power plant. During a session in July, then-NRA chief Tanaka appeared to doubt that, telling Tepco executives that a company which cannot demonstrate its resolve and achievement to decommission the Fukushima No. 1 plant was not qualified to restart another nuclear plant.

That changed after Tepco told the nuclear watchdog in August that it was determined to follow through on the decommissioning of Fukushima No. 1. During NRA's sessions held in September, Tanaka said the experience of the Fukushima No. 1 disaster will be a plus for Tepco in its nuclear power plant operation and that the watchdog had reached a consensus that Tepco is qualified to restart the Kashiwazaki-Kariwa plant, setting the stage for the approval given last Wednesday. Toyoshi Fuketa, who took over as NRA chief after Tanaka stepped down Sept. 18, said the NRA ultimately made its judgment solely on the basis of whether Tepco is technologically capable of restarting a nuclear plant. **It would be unfortunate if the NRA's apparent turnaround was driven by its desire to reach a conclusion on the sensitive matter in time for Tanaka's exit.**

It is questionable whether the NRA's decision properly addresses people's concern over the safety of nuclear power — as indicated by media surveys that show a major portion of respondents are still opposed to restarting the reactors idled in the wake of the 2011 disaster. Six years later, nuclear energy remains a politically contested issue. While the administration of Prime Minister Shinzo Abe has pushed for the restart of idled reactors once they have cleared the NRA's screening, the new party launched by Tokyo Gov. Yuriko Koike — which is poised to be the main contender to Abe's ruling coalition in the

upcoming Lower House snap election — is calling in its campaign platform for a phaseout of nuclear power by 2030.

Power companies seek to reactivate their idled nuclear reactors to save on the huge cost of fuel imported to operate their thermal power plants. Tepco reportedly stands to gain up to ¥200 billion in annual profit by restarting the two reactors at the Kashiwazaki-Kariwa plant.

It's not clear, however, whether continued reliance on nuclear power will be a sustainable model for the power industry. In many other countries, nuclear power is becoming a costly business due to surging construction and maintenance costs. Power companies in Japan, now exposed to greater competition through electricity retail deregulation, will not be immune to this change.

Pace of restart approval not likely to increase in near future

November 8, 2017
NRA: Reactor restart approval pace unlikely to speed up
http://www.asahi.com/ajw/articles/AJ201711080019.html
REUTERS
The pace of approvals for nuclear reactor restarts in Japan, where most plants remain shut following the Fukushima disaster, is unlikely to pick up in the coming years, the new head of Japan's nuclear regulator said in an interview on Tuesday.
The comments from Nuclear Regulation Authority (NRA) Chairman Toyoshi Fuketa suggest Japan may not make headway in meeting its electricity generation targets. By 2030, the country was expecting nuclear to power about one-fifth of its generation. However, utilities are having difficulty grappling with tougher rules on protecting reactors from natural disasters in the earthquake-prone country.
Following the Fukushima nuclear disaster in 2011, the world's worst since Chernobyl in 1986, the NRA was set up in 2012 to draft new safety standards that have been described as among the world's toughest. Since then, 12 reactors at six nuclear plants have passed the safety requirements needed to restart, but only four reactors are currently operating. One more reactor that resumed operations after meeting the requirements has been shut down for scheduled maintenance.
Most of the approvals have been for reactors in western Japan and not on the east coast where Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant was located. The plant suffered multiple reactor meltdowns after an earthquake on the northeast coast caused a tsunami that swamped the site.
"We have accumulated experience in safety reviews, but comparatively speaking, many of the plants in eastern Japan that we are reviewing now have difficult natural conditions," Fuketa, 60, said in the interview. "It's doubtful the pace of approvals would quicken."
A majority of Japanese oppose nuclear power after Fukushima and restarts are a delicate political issue rather than just a matter of meeting technical safety requirements.
When asked if he could place a number of how many reactors may be approved for a resumption of operations in the next five years, Fuketa said: "I honestly do not know."
About a dozen other reactors are going through safety checks as part of a relicensing process under the new rules.

Fuketa is known for taking tough positions during safety reviews of reactors and has been instrumental in directing the clean-up of the wrecked Fukushima plant.
Japan's government set an energy mix plan in 2015 that forecasts relying on nuclear power to generate between 20 to 22 percent of the country's electricity in 2030. That requires having about 30 reactors operating by then.
Japan's nine regional power utilities and a wholesaler, Japan Atomic Power Co., have 42 nuclear reactors for commercial use, with a total generating capacity of 41,482 megawatts.

Tokai 2: So many uncertainties

November 25, 2017

Prospect uncertain for Tokai No. 2 nuke plant restart despite extension application
https://mainichi.jp/english/articles/20171125/p2a/00m/0na/012000
Even as Tokai No. 2 nuclear plant operator Japan Atomic Power Co. seeks Nuclear Regulation Authority (NRA) permission to extend the life of the station's sole reactor by 20 years, there appears no prospect the plant can be restarted in the foreseeable future.

- 【Related】Utility files application to extend operating period of Tokai nuclear reactor for 20 years
- 【Related】Japan to require new cooling system for boiling water reactors

Japan Atomic is seeking to add to the reactor's 40-year operational lifespan in order to restart the plant in Tokai, Ibaraki Prefecture. However, the company has not determined how it can fund the massive cost of necessary safety upgrades, while it also remains to be seen if local governments around the plant will consent to reactivation.
The NRA estimates that safety measures, including the construction of a coastal levee to protect the plant from a massive tsunami, will cost the utility some 180 billion yen.
Additionally, terror countermeasures will cost the operator some 100 billion yen.
All of Japan Atomic's reactors are currently offline, and it is relying heavily on base fees from five major power companies with which the company has electric power sales contracts. Therefore, the firm cannot easily invest large sums in safety measures. The firm believes the Tokai No. 2 plant could be restarted relatively easily, but if it is not, and the firm continues to have no electricity to sell, Japan Atomic's financial future will be in jeopardy.
To prevent this, Japan Atomic needs loan guarantees from other power companies so that it can borrow from banks the enormous amounts of cash needed to implement safety measures at the plant.
However, Japan Atomic's largest customer, Tokyo Electric Power Company (TEPCO) Holdings, Inc., is already on the hook for about 16 trillion yen to decommission the crippled Fukushima No. 1 nuclear plant and pay compensation to those affected by the nuclear disaster. TEPCO Holdings could come under fire from the public if it guaranteed loans for another company at the same time as TEPCO itself must cover the cost of dealing with the nuclear disaster.
Some TEPCO insiders point out that if the restart of the Tokai No. 2 plant was delayed, TEPCO's power purchase contract would not pay, and that any loan guarantees for Japan Atomic would also be highly risky.

Moreover, it remains unclear whether Japan Atomic can gain consent for reactivation from the local communities hosting the plant. The firm is holding talks with a consultative body comprising six municipalities within 30 kilometers of the Tokai No. 2 station to review their nuclear power plant safety agreement.
Japan Atomic offered to sign an agreement on Nov. 22 with all six municipalities, including Tokai, that would effectively give these local bodies the right to approve or disapprove the plant's reactivation.
Nuclear plant restarts since the outbreak of the Fukushima nuclear disaster have managed to gain consent from the local prefectural government as well as municipalities concerned. However, there is a possibility that local bodies in a broader area will require Japan Atomic to seek their approval for a Tokai No. 2 plant reactivation, depending on the content of the new agreement.
About 1 million people live within 30 kilometers of the Tokai No. 2 plant -- making it the most heavily populated such zone in the country. Local bodies in this zone are struggling to work out evacuation plans for local residents in case of a nuclear accident.

November 24, 2017

Utility files application to extend operating period of Tokai nuclear reactor for 20 years
The Japan Atomic Power Co. (JAPC) filed an application with the Nuclear Regulation Authority (NRA) on Nov. 24 for permission to extend the operating period of a nuclear reactor for 20 years beyond the 40-year limit.

- 【Related】Nuclear plant operator to request 20-year extension for boiling water reactor
- 【Related】Japan to require new cooling system for boiling water reactors
- 【Related】TEPCO's Niigata nuclear plant set to clear screening to restart reactors

The reactor at JAPC's Tokai No. 2 Power Station in Tokai, Ibaraki Prefecture, is the fourth nuclear reactor for which a request for such an extension has been filed with the nuclear power regulator.
Kansai Electric Power Co. earlier applied with the NRA for permission for a 20-year extension of the operating periods for its Mihama nuclear plant's No. 3 reactor and No. 1 and 2 reactors at its Takahama power station, both in Fukui Prefecture, and the nuclear watchdog has approved the extension for all three units.
Moreover, the Tokai No. 2 plant's reactor is the only boiling water reactor -- the same type as those at the tsunami-ravaged Fukushima No. 1 plant -- for which a 20-year extension of the operating period is being sought.
The Tokai No. 2 atomic power station is set to reach the 40-year limit in November 2018.
Under the amended Act on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors, nuclear reactors must be decommissioned after being in operation for 40 years in principle. However, the operating period can be extended by up to 20 years as an exception if certain conditions are met.

Fului agrees to restart Ohi plant (Nos.3 &4 reactors)

November 27, 2017

Fukui governor agrees to restart of 2 reactors

https://www3.nhk.or.jp/nhkworld/en/news/20171127_15/

The governor of Fukui Prefecture in central Japan has given the nod to bringing 2 reactors at a local nuclear power plant back online.

Governor Issei Nishikawa announced his decision on the Ohi plant at a news conference on Monday.

The plant's operator, Kansai Electric Power Company, says it hopes to restart the No.3 reactor in mid-January and the No.4 reactor in mid-March.

The 2 reactors on the Sea of Japan have already cleared screening by Japan's nuclear regulator.

The host town of Ohi and the Fukui prefectural assembly have already given their consent.

Nishikawa said he agreed to the restart after thorough consideration, based on the views of the town and the assembly.

As a reason for his decision, he said a prefectural expert's panel has confirmed the engineering safety of the plant.

He also cited the operator's plan to choose candidate sites for the interim storage of spent nuclear fuel within next year. He added that the central government has pledged to be actively involved in the process.

Fukui has demanded that such facilities be built outside the prefecture.

Nishikawa's nod comes as a trial continues at a high court on a request by local residents not to restart the reactors. A lower court in 2014 ordered Kansai Electric not to restart them, citing insufficient safety measures.

Five reactors at 3 nuclear power plants have been brought back online in Japan under new government regulations introduced after the 2011 Fukushima nuclear crisis.

Including the Ohi plant, 9 reactors at 5 plants have gained consent for restart by their local host governments.

Fukui gives OK to restart of Kansai Electric's Oi nuclear plant

http://www.asahi.com/ajw/articles/AJ201711270046.html

THE ASAHI SHIMBUN

FUKUI--Kansai Electric Power Co. has cleared all hurdles toward restarting two reactors at its Oi nuclear power plant early next year after gaining the consent of the prefectural governor here Nov. 27.

The utility plans to resume operations of the No. 3 and No. 4 reactors in January and March, respectively.

"I have agreed to the restart after taking into account the position of the Oi town government and Fukui prefectural assembly, as well as the response by the central government and the operator of the plant concerning our request to have an interim storage site for spent nuclear fuel to be built outside the prefecture," Governor Issei Nishikawa told reporters here the same day.

Nishikawa signed off on Kansai Electric's request following similar moves by the town government of Oi, which hosts the Oi nuclear plant, the town assembly and the prefectural assembly.
In response to the governor's request concerning the storage site, Shigeki Iwane, president of Kansai Electric, has already pledged to offer a proposed alternative site next year.
Industry minister Hiroshige Seko, too, vowed that the central government will be involved in drawing up the plan.
Nishikawa pushed for the construction of the interim storage facility outside the prefecture as a condition to agreeing to the restart of the Oi plant.
Five reactors are now operating in Japan after clearing new nuclear regulations established in the aftermath of the 2011 Fukushima nuclear disaster.
Two of the reactors are at Kansai Electric's Takahama plant in Fukui Prefecture.
The Fukui District Court, citing safety concerns, ordered a halt to the operations of Oi's No. 3 and No. 4 reactors in May 2014.
But Kansai Electric appealed the decision and has since been gearing up to restart the units.

Kobe Steel scandal impacts on restarts

November 30, 2017

Kobe Steel scandal delays reactor restarts
https://www3.nhk.or.jp/nhkworld/en/news/20171130_34/
Two Japanese utilities say they will delay the planned restarts of 4 nuclear reactors due to the data falsification of Kobe Steel products.

Kyushu Electric Power Company and Kansai Electric Power Company made the announcements on Thursday.

They said they will delay the restarts of the reactors by about 2 months in order to confirm the safety of equipment that use misrepresented Kobe Steel products.

The delays affect the Number 3 and 4 reactors at the Genkai nuclear power plant in Saga Prefecture, managed by Kyushu Electric, and the Number 3 and 4 reactors at the Ohi plant in Fukui Prefecture, run by Kansai Electric.

The operators originally planned to restart the reactors from January to March. They have passed the Nuclear Regulation Authority's screenings and received the consent of local governments.

They are now scheduled to be restarted from March to May.

Kobe Steel announced in mid-October that its misrepresented products had been shipped to 500 firms.

No restart yet for Joyo (experimental) reactor

December 4, 2017

Experimental nuclear reactor Joyo restart delayed
https://www3.nhk.or.jp/nhkworld/en/news/20171204_27/

The operator of a suspended experimental fast reactor in Ibaraki, north of Tokyo, has decided to delay its restart currently set by March 2022.

The Joyo experimental fast nuclear reactor is expected to replace the prototype fast-breeder nuclear reactor, Monju, as part of the development of fast reactors in Japan.

The Japanese government decided to scrap the trouble-marred Monju last year.

The Japan Atomic Energy Agency in March submitted a request for the state to carry out a safety assessment of Joyo with the aim of restarting the reactor by March 2022.

The document stated that Joyo will run on 100,000 kilowatts despite its total output capacity of 140,000 kilowatts to accommodate a smaller-scale evacuation plan for nearby residents in case of an accident.

The Nuclear Regulation Authority delayed the inspection, and instead asked the operator to run on its total capacity.

The agency is considering reducing the amount of nuclear fuel inside the reactor to reduce output.

Officials say they will apply for government inspections next year.

They say the agency must still decide when it will put Joyo back online.

High Court orders shutdown of Ikata No.3

December 13, 2017

High court orders first reactor shutdown

https://www3.nhk.or.jp/nhkworld/en/news/20171213_31/

For the first time, a Japanese high court has ordered the operator of a nuclear plant not to restart a reactor.

The Hiroshima High Court issued the injunction on Wednesday. It ordered Shikoku Electric Power

Company not to restart the No. 3 reactor at its Ikata plant in Ehime Prefecture. It's currently offline for regular inspections.

The decision reverses a lower court order in March. Residents had sued to have the reactor shut down, citing the threat of a serious accident.

The latest lawsuit considered whether Shikoku Electric had properly assessed the risk to the plant posed by the largest possible earthquake and eruptions of nearby volcanoes.

Presiding Judge Tomoyuki Nonoue said the likelihood wasn't small that the nuclear plant would be affected by pyroclastic flows from an eruption of Mount Aso on the neighboring island of Kyushu. He found fault with the plant's location. He added that the operator had underestimated the amount of volcanic cinder and ash that would fall on the plant.

He concluded that the Nuclear Regulation Authority's judgment that the plant had met the requirements needed for a restart was flawed. He noted that the NRA hadn't properly assessed the risk that residents faced from various dangers such as volcanoes.

Under the injunction, the reactor will remain shut down until September 30th of next year.

The No.3 reactor was restarted in August 2016. It has been offline since October for regular checks.

The decision is the first of its kind by a high court.

Shikoku Electric called the decision extremely regrettable. It said it had made an honest assessment of quake and volcano threats. It added it will appeal the ruling after careful study.

Restart of Tomari plant may be delayed

December 11, 2017

Screenings for restart of Tomari nuke plant likely to be prolonged
THE ASAHI SHIMBUN
http://www.asahi.com/ajw/articles/AJ201712110031.html

A possible active fault beneath the Tomari nuclear power plant in Hokkaido could prolong the government's screening process for a restart and deal a major financial blow to Hokkaido Electric Power Co., the plant's operator.
On Dec. 8, the Nuclear Regulation Authority (NRA) did not accept the assertion of Hokkaido Electric Power that no active fault existed in the compound of the plant. The NRA directed the utility to do additional research.

The ruling by the country's nuclear watchdog will inevitably delay the screening process and hurt the utility, which had been counting on a restart to help its financial situation.
In the screenings, which are based on the new safety standards introduced after the 2011 Fukushima No. 1 nuclear plant crisis, faults that moved after the period between about 130,000 and 120,000 years ago are regarded as being active.
If active faults exist just below key facilities, such as nuclear reactor buildings, the reactors must be decommissioned. Even if active faults do not exist just beneath them, those facilities are required to have high quake-resistance capabilities if those faults exist in the compound.
In 2013, Hokkaido Electric Power applied to NRA to approve the restart of all three reactors at the Tomari nuclear power plant in western Hokkaido. In the NRA's screenings, the company acknowledged that several faults exist in the compound of the plant.
However, the company asserted that those faults do not run through the layer of volcanic ash from about 200,000 years ago, which was found in the boring research at the time of construction of the No. 1 and the No. 2 reactors.
Based on the assertion, the firm insisted that those faults moved in the period earlier than 200,000 years ago and, therefore, are not active. The NRA accepted the statement at that time.
As the layer of volcanic ash was found only in the location of the boring research, however, the NRA also required the company to take boring samples in other places to support the assertion.
In response, the firm implemented boring research in six other sites in and outside the compound of the nuclear power plant. Then, the apparent layer of volcanic ash was not found in any of the six locations.
"We were very surprised because what should have been found was not found. It is certain that (the result) will have major influences on our screenings," said NRA Chairman Toyoshi Fuketa.
In an NRA screening meeting on whether to approve a restart on Dec. 8, Hokkaido Electric Power repeated its assertion that faults that exist in the compound of the nuclear power plant are not active.
The claim was based on the result of the analysis of the "ingredients of volcanic ash" found in the same places and on the topographical features of the area in and around the plant.
"The assessment we have made so far is appropriate," an official of the utility said in the meeting.
However, it failed to gain support as the NRA members cast doubts on the method used by the utility to determine when the faults were formed.
Hokkaido Electric Power said that it will show by late January the result of new research that uses a different method.
"We want to show the data (of the result) as early as possible," an official of the utility said after the meeting.
In the meeting, the company also acknowledged that one of the faults that exist in the compound of the nuclear plant runs just below the key facilities of the No. 1 and the No. 2 reactors.
So far, the utility had not revealed details on the locations of facilities and their distances from the faults as part of anti-terrorism measures.
Meanwhile, if Hokkaido Electric Power is unable to present sufficient data for the restart of the nuclear power plant, it will suffer further financial setbacks.
Even if the operation of the Tomari nuclear power plant is suspended, the utility will need nearly 70 billion yen (about $616.3 million) in maintenance costs.
After the operations of all the three reactors at the plant were suspended in 2011 and 2012, the utility raised electricity rates by an average 7.73 percent (11 percent for companies) in 2013 and 15.33 percent (20.32 percent for companies) in 2014 to avoid deficits.
As a result, the electricity charges imposed by Hokkaido Electric Power have become the highest in Japan.

High Court orders shutdown of Ikata No.3 (Part 2)

Lawyers hold up signs outside the Hiroshima High Court on Dec. 13 proclaiming an injunction had been ordered on operations at the Ikata nuclear power plant. (Koichi Ueda)

December 13, 2017

For 1st time, a high court rules against nuclear plant operations
http://www.asahi.com/ajw/articles/AJ201712130050.html
By KEI KOBAYASHI/ Staff Writer
HIROSHIMA--A high court for the first time has banned operations at a nuclear power plant.
The Hiroshima High Court issued the injunction in a verdict Dec. 13 that applies to the No. 3 reactor at the Ikata nuclear power plant in Ikata, Ehime Prefecture, operated by Shikoku Electric Power Co.
In the ruling, the high court concluded there was a chance the Ikata plant could be affected by a pyroclastic flow from Mount Aso if an eruption occurred similar in scale to a massive one 90,000 years ago on the southern island of Kyushu.
A computer simulation by Shikoku Electric of the possible effects from an eruption like the one in ancient times showed there was a possibility of a pyroclastic flow reaching the grounds of the Ikata plant.
The high court concluded that the Ikata plant was located in an inappropriate location and that the Nuclear Regulation Authority's decision that new safety standards had been met was not rational.
The company suspended operations in October to carry out a periodic inspection. If a judicial decision overturning the Dec. 13 high court ruling is not issued, the Ikata reactor will not be able to resume operations--even if the inspection is completed without problems.
For that reason, the latest ruling could affect the government's plans to resume operations at other nuclear plants more than six years after the triple meltdown at the Fukushima No. 1 nuclear power plant.
An official with Shikoku Electric Power labeled the court injunction as "extremely regrettable" and lamented the fact that it did not accept the company's assertion that the plant is safe.

"The verdict is unacceptable," the official said.
The utility plans to initiate procedures immediately to have the injunction suspended.
The injunction request was made by four residents of Hiroshima and Matsuyama cities.
Among the main points of contention before the high court were the rationality of new safety standards approved by the Nuclear Regulation Authority (NRA) in the aftermath of the 2011 Fukushima nuclear disaster; the rationality behind the expected maximum strength of an earthquake for the area; and an evaluation of the effect of volcanic ash on the reactor's operations.
While district courts have issued injunctions on operations at other plants, higher courts have overturned all those verdicts until now.
For example, the Fukui District Court in April 2015 and the Otsu District Court in March 2016 ordered operations stopped at the No. 3 and No. 4 reactors of the Takahama nuclear power plant in Fukui Prefecture operated by Kansai Electric Power Co., but those verdicts were later overturned.

Hiroshima High Court orders suspension of Ikata nuclear reactor in Ehime Prefecture, revoking district court ruling

https://www.japantimes.co.jp/news/2017/12/13/national/crime-legal/hiroshima-high-court-orders-suspension-ikata-nuclear-reactor-ehime-prefecture-revoking-district-court-ruling/#.WjD-oHkiGos
Kyodo

HIROSHIMA – The Hiroshima High Court on Wednesday revoked a lower court decision and ordered the suspension of a nuclear reactor at Shikoku Electric Power Co.'s Ikata power plant in Ehime Prefecture, dealing a blow to the government and utilities that are aiming to bring more reactors back online.
The high court suspension order — the first in a series of similar injunctions — mandates that the plant operator shutter the No. 3 unit at the Ikata power plant until the end of September next year.
The ruling blocks the planned resumption in January of the unit, which is currently offline for regular checks after it was restarted in August 2016.
Shikoku Electric said the court's decision is "unacceptable" and plans to file an appeal.
The court questioned a decision by the Nuclear Regulation Authority that potential risks associated with volcanic eruptions would not breach the stricter regulations introduced following the 2011 Fukushima nuclear crisis.
"Specific threats to the lives and health of residents are anticipated," the court said.
The latest decision follows a ruling by Otsu District Court in March 2016 that ordered Kansai Electric Power Co. to suspend two reactivated nuclear reactors at its Takahama plant. The district court decision was later overturned by the Osaka High Court.
The Fukushima nuclear crisis led to a nationwide halt of nuclear plants, but the government is looking to produce 20 to 22 percent of the country's electricity supply using nuclear power by 2030.
The focal points of Hiroshima High Court's decision Wednesday included whether estimates by the plant operator, Shikoku Electric Power Co., of the potential size of possible earthquakes, were reasonable, and whether safety screening conducted under stricter regulations set after the 2011 Fukushima nuclear disaster was credible.
Risks predicted in the event of a nuclear accident or natural disasters such as a volcanic eruptions were also contested.
The plaintiffs claimed that in calculating the size of a potential earthquake, the utility had underestimated the fact that the reactor lies above the epicenter of an anticipated Nankai Trough mega-quake, and that it is located near a geologic fault.

They added that the post-Fukushima regulations cannot ensure safety, and that major damage could occur at the time of an accident or disaster because the regulations were compiled without thoroughly determining the cause of the 2011 disaster.
But Shikoku Electric maintains that it has ensured safety and that there is no danger.
Hiroyuki Kawai, the lawyer representing the plaintiffs said, “Our plea was understood. We could protect the Seto Inland Sea. It is our victory.”
The plaintiffs had said that if the Ikata plant, which faces the Seto Inland Sea, was to be severely damaged, nuclear substances could spread and contaminate waters in the area.
In March, the Hiroshima District Court found that the new regulations set by the Nuclear Regulation Authority and Shikoku Electric’s estimates of a possible earthquake and tsunami were reasonable.
The district court had turned down the request to halt the reactor, saying, “There is no specific risk that residents will suffer severe damage due to radioactive exposure associated with an accident.”
Following the checks, Shikoku Electric had been expected to bring the reactor back online on Jan. 22 and resume operations on Feb. 20.
The plaintiffs were four residents from Matsuyama in Ehime and Hiroshima, located on the opposite side of the Seto Inland Sea to the nuclear plant. Similar injunctions have been contested at the Takamatsu High Court, Oita District Court and the Iwakuni branch of Yamaguchi District Court.

Shikiku Electric objects to injunction

December 22, 2017

Ikata reactor operator objects to court injunction
https://www3.nhk.or.jp/nhkworld/en/news/20171222_01

<image: >
The operator of a nuclear power plant in western Japan has filed an objection to a recent court order to shut down a reactor at the plant due to possible volcanic risk.

The Hiroshima High Court handed down the injunction on December 13th for a reactor at the Ikata plant run by Shikoku Electric Power Company.

The plant is located in western Shikoku, one of the 4 major Japanese islands. The reactor went back online in August of last year. It has been suspended for regular inspections since October.

The judge said the likelihood is not small that a massive eruption of Mount Aso, a volcano on the nearby island of Kyushu, could affect the plant.

On Thursday, Shikoku Electric lodged an objection to the injunction. The utility says the court noted the possibility that fragments of volcanic rock could reach the plant, citing an eruption 90,000 years ago. But the utility says the court didn't take the company's study of the site into account.

The utility also requested the court to suspend implementation of the injunction.

Following the objection, another judge at the high court will look into findings on the safety of the plant, including the risk of major volcanic eruptions.

It is believed to take some time for the second judge to decide whether the court should accept the company's request.

The likelihood is growing that the reactor will remain offline after February of next year, when routine checks are scheduled to end.

Kashiwazaki-Kariwa OK'ed but restart might take years

December 27, 2017

Tepco nuclear reactors pass safety review, 1st after Fukushima crisis
https://mainichi.jp/english/articles/20171227/p2g/00m/0dm/051000c#cxrecs_s
TOKYO (Kyodo) -- Two reactors Japan were cleared for reactivation by the nuclear regulator on Wednesday, becoming the first run by the operator of the crippled Fukushima power plant to formally clear stricter government safety standards imposed after the 2011 crisis.
The Nuclear Regulation Authority endorsed safety measures for the Nos. 6 and 7 reactors at the Kashiwazaki-Kariwa power plant in Niigata Prefecture at a meeting that was open to the public, with some members of the audience shouting their disapproval. The decision paves the way for the restart of the two reactors by Tokyo Electric Power Company Holdings Inc., known as Tepco.
However, the process of reactivating the reactors straddling the municipalities of Kashiwazaki and Kariwa in Niigata on the Sea of Japan coast could still take several more years as local governments need to give their consent.
Niigata Gov. Ryuichi Yoneyama, who has said it will take "at least three to four years" before he can decide on whether to approve the restart of the reactors, issued a statement saying he wants to be briefed on the plan and "examine the outcome of (the NRA) review."
The two units are boiling water reactors, the same as those that suffered meltdowns during the Fukushima crisis triggered by the massive March 2011 earthquake and tsunami in northeastern Japan. No BWRs had previously cleared Japan's tougher safety standards imposed after the disaster, partly because major refurbishments are required for added safety.
The NRA's approval of the two units brings the total number of reactors that have cleared the post-crisis safety regulations to 14, with the Japanese government pushing to restart nuclear plants that were taken offline after the crisis at the Fukushima Daiichi complex, the world's worst nuclear disaster since Chernobyl in 1986.
In addition to assessing the usual technical requirements, the NRA focused on whether Tepco is qualified to operate a nuclear power plant, as it continues to struggle with scrapping the Fukushima Daiichi complex -- an effort expected to take until around 2051 -- and dealing with contaminated water at the plant where radiation levels remain high.

Of around 800 public comments received by the regulator regarding its assessment of the Tepco reactors, about half of them questioned Tepco's qualification to run nuclear plants, according to the NRA.
At Wednesday's meeting, some of the members of the public voiced opposition, with one person saying, "It is not a technical or scientific assessment, but a political one."
In front of the building housing the NRA in Tokyo, civic group members gathered to protest the approval.
Yoshinari Usui, a forgmer public official from Kawasaki near Tokyo, said, "Tepco has no technical qualifications to run a nuclear power plant after causing such an accident. The restart of the Kashiwazaki-Kariwa units is totally unacceptable."
Han Kumata, 37, from Tokyo said, "I have absolutely no trust in Tepco even if it says it has implemented safety measures."
As a condition for gaining safety clearance, Tepco agreed to a request from the regulator to provide a safety pledge in its legally binding plant operation program.
The NRA says it can continue to monitor Tepco by conducting inspections and order the halt of operations if it finds any safety violations.
Facing huge compensation payments and other costs stemming from the Fukushima crisis, Tepco has been keen to resume operation of its reactors to reduce dependence on costly fossil fuel imports for non-nuclear thermal power generation.
Not all residents of Niigata oppose nuclear power, given its economic benefits.
"There may be risks but the local (municipality) cannot stand without nuclear power. I want the reactors to be restarted if they have been deemed safe," said Toru Murata from Kashiwazaki, who works in the construction industry.
A Niigata city resident Mie Kuwabara, 69, on the other hand expressed concern about the reactors coming back online, saying, "I think the possibility of a serious accident still remains," considering past problems at the plant including insufficient quake resistance of a building to be used as an emergency headquarters.
The two reactors are the newest among the seven units at the Kashiwazaki-Kariwa plant. The complex is one of the world's largest nuclear power plants, with a combined output capacity of 8.2 million kilowatts.

TEPCO reactors in Niigata OK'd, but restarts may still take years
http://www.asahi.com/ajw/articles/AJ201712270026.html
THE ASAHI SHIMBUN
Japan's nuclear watchdog approved safety standards at Tokyo Electric Power Co.'s nuclear power plant in Niigata Prefecture, but the governor wants answers about the 2011 Fukushima disaster before the company can restart any reactor.
After questioning TEPCO's commitment to safety, the Nuclear Regulation Authority on Dec. 27 gave its stamp of approval for the No. 6 and No. 7 reactors at its Kashiwazaki-Kariwa plant.
It was the NRA's first approval of boiling-water reactors since the 2011 accident at TEPCO's Fukushima No. 1 nuclear power plant, which operated the same type of reactor.
However, the Niigata prefectural government is unlikely to approve the reactor restarts at the Kashiwazaki-Kariwa plant until three or four years down the road.
Niigata Governor Ryuichi Yoneyama, whose approval is required for the resumption of reactor operations, has stated that he would not make a decision until the prefectural government completes its own assessment of the Fukushima nuclear accident.
Members of the public have also vehemently opposed allowing TEPCO to operate nuclear facilities.

Doubts were raised within the NRA on whether TEPCO was fit as a company to run a nuclear plant, considering the scale of the disaster in Fukushima Prefecture.
NRA officials in July asked TEPCO executives to appear at a meeting and explain their attitude toward safety.
In August, TEPCO submitted a document to the NRA that said in part: “We are prepared to go through with decommissioning the reactors at the Fukushima No. 1 plant. We will not place priority on economic interests over safety.”
The NRA compiled its draft inspection document in October. NRA officials said they will confirm TEPCO’s safety stance during screening of more specific measures designed for safety, which include an explanation of plant operating procedures.
The nuclear watchdog allowed the public to submit their views on the inspection document over a 30-day period.
At the NRA meeting on Dec. 27, 904 views were made public.
NRA officials said several hundred opinions were opposed to having TEPCO resume operations at the Kashiwazaki-Kariwa plant. Some argued that the utility had not improved its corporate posture. Others said the inspection document contained little in the way of specific plans for how TEPCO would go about ensuring safety.
But the NRA approved the document on the grounds that it would still have the opportunity to judge TEPCO’s fitness during the safety screening. The utility will submit specific safety measures as the next step in the process toward resuming operations of the two reactors at the Kashiwazaki-Kariwa plant.

Kashiwazaki-Kariwa: Local governments remain divided

December 28, 2017

Local gov'ts of areas hosting nuke plant in Niigata Pref. divided over reactivation
https://mainichi.jp/english/articles/20171228/p2a/00m/0na/008000c#cxrecs_s
NIIGATA -- There are no prospects that two reactors at the Kashiwazaki-Kariwa Nuclear Power Plant, which have passed a safety review by the Nuclear Regulation Authority (NRA), will be restarted in the foreseeable future, as local bodies hosting the plant remain divided over the issue.

- 【Related】TEPCO nuclear reactors pass safety review, 1st after Fukushima crisis
- 【Related】60 holes at Kashiwazaki-Kariwa nuke plant found unfilled in violation of building code
- 【Related】Environmental economics expert questions clearing of TEPCO reactors in safety review

Niigata Gov. Ryuichi Yoneyama, on the other hand, remains cautious about the resumption of the units' operations.
Gov. Yoneyama told Masaya Kitta, head of TEPCO's Niigata regional headquarters who visited the governor on Dec. 27 that the prefectural government cannot agree on the early reactivation of the plant.
"I have no intention of objecting to the decision by the NRA, but our position is that we can't start talks on reactivation unless our examination of three-point checks progresses," Yoneyama told Kitta. The governor was referring to his policy of not sitting at the negotiation table over reactivation unless three points are

examined by the prefectural government: the cause of the Fukushima nuclear disaster, potential effects on people's livelihoods as well as health in case of an accident, and safe evacuation measures. He has stated that it would take two to three years to complete the checks of these points.
The governor also told Kitta, "Our examination will never be affected" by the NRA's judgment that the plant meets the new safety standards. Moreover, the prefectural government is poised to independently examine the outcome of the NRA's safety review of the Kashiwazaki-Kariwa power station.
Kashiwazaki Mayor Masahiro Sakurai and Kariwa Mayor Hiroo Shinada were separately briefed by plant manager Chikashi Shitara on the outcome of the NRA safety review of the facility.
Both mayors have expressed their appreciation for TEPCO's response up to this point, and Sakurai urged the power company to "make efforts to reassure local residents (about the nuclear plant)," while Shinada urged the utility to "try to provide information in an appropriate manner."
In the meantime, if the reactivation of the atomic power station is to be delayed, there is a possibility that the national government's grants to the host municipalities will be reduced.
The Economy, Trade and Industry Ministry is continuing to provide such grants to local bodies hosting idled nuclear plants by deeming them to be running plants in some form. In April 2016, the national government revised its rules on grants to nuclear plant host municipalities and decided to reduce the amount of funding if the facilities are not restarted within nine months after the completion of the NRA's safety review, which is necessary for reactivation.
The No. 6 and 7 reactors at the Kashiwazaki-Kariwa plant need to pass two more inspections within a year. If it takes several years to form a consensus among the local governments concerned, however, grants will be reduced in fiscal 2020 at the earliest. The amounts of reductions are estimated at some 400 million yen for Kariwa, about 100 million yen for Kashiwazaki and approximately 740 million yen for Niigata Prefecture.

Local govts want a say in restarts

December 30, 2017
About 50% of local bodies near nuke plants want say over reactor restarts
https://mainichi.jp/english/articles/20171230/p2a/00m/0na/010000c
Roughly 50 percent of local governments within a 30-kilometer radius of a nuclear power plant -- excluding municipalities where the plant is located -- want to have a say in the restarting of nuclear reactors, a Mainichi Shimbun survey has found.

- 【Related】 Prospect uncertain for Tokai No. 2 nuke plant restart despite extension application

Among 121 neighboring local bodies, 60 of the 119 that provided answers in the survey said that they wanted to have a say in whether nuclear reactors can be reactivated.
Since the meltdowns at Tokyo Electric Power Co. (TEPCO)'s Fukushima No. 1 Nuclear Power Plant in 2011, the reactivation of nuclear reactors has been subject to consent from prefectures and municipalities hosting the facilities. However, taking into consideration the widespread damage and risks associated with the disaster in 2011, neighboring authorities have also been keen to get involved in the approval process.

A total of 155 local governments were targeted in the survey, which was conducted between September and November 2017 and addressed to local government heads and also to assemblies. The local authority where the Fukushima No. 1 power plant is located also took part.
Thirty-four of the 155 authorities (13 prefectural and 21 municipal) have a commercial nuclear power plant directly within their jurisdictions. The remaining 121 neighboring local bodies (eight prefectural and 113 municipal) are situated within 30 kilometers of a power plant.
Of the 155 local bodies approached, 153 local government heads -- excluding those of Iitate, Fukushima Prefecture and Ikeda, Fukui Prefecture -- gave answers while 154 local assemblies, excluding that of Iitate, cooperated.
Local government heads were asked whether they are for or against reactor restarts at the local nuclear power plant, the extent of their local government's involvement, and the status of any safety agreements with electric power companies. Assemblies were asked whether or not they have adopted any written statements concerning the restarting of nuclear reactors, among other questions.
Regarding the right to approve reactivation of reactors at nuclear power plants and the right to conduct on-site investigations -- which have effectively already been given to mainly local governments where plants are located -- the local government heads were asked if these rights should be extended to neighboring bodies as well. In response, 56 heads stated that it was necessary to grant such rights, seven said that it is partly necessary, 24 said it was unnecessary, one head did not know, 60 gave other answers, and five did not reply.
Altogether, 60 of the 63 heads who said the granting of such rights was "necessary" or "partly necessary" belong to neighboring local governments. Of these 60 local bodies, 16 said that they are against restarting nuclear reactors.
Meanwhile, of the 24 heads who said the granting of these rights was "unnecessary," 10 belong to local governments where a nuclear power plant is located, including Fukui Prefecture -- revealing a difference in attitudes between the immediate and nearby local governments.
However, of the immediate local governments, the town of Okuma in Fukushima Prefecture -- which was seriously affected by the 2011 disaster -- said that the rights need to be extended on the grounds that, "Once an accident happens, the impact spreads across a wide area."
The village of Tokai in Ibaraki Prefecture -- where the Japan Atomic Power Co.'s Tokai No. 2 Nuclear Power Plant is based -- was among those that replied that it is "partly necessary" to extend the rights.

Using erroneous data for 40 years...

January 24, 2018

Erroneous fuel data in use at Tokai No. 2 nuke plant for over 40 years
https://mainichi.jp/english/articles/20180124/p2a/00m/0na/001000c
The Japan Atomic Power Co. (JAPC) reported on Jan. 23 that it had been using erroneous data on the height of nuclear fuel rods inside the nuclear reactor at the Tokai No. 2 Power Station in Ibaraki Prefecture for at least 40 years.

- 【Related】Prospect uncertain for Tokai No. 2 nuke plant restart despite extension application
- 【Related】Utility files application to extend operating period of Tokai nuclear reactor for 20 years
- 【Related】Nuclear plant operator to request 20-year extension for 'boiling water reactor'

The JAPC filed the report with the government's Nuclear Regulation Authority (NRA) on Jan. 23. According to the company, data indicating the height of nuclear fuel rods -- from the bottom of the reactor to the top of the rods -- was set around 5 centimeters lower than the actual height.
The Tokai No. 2 power plant in the village of Tokai is in the final phase of a safety screening by the NRA for possible reactivation. However, as the JAPC will need to check whether there is any other incorrect data in use, the screening is expected to be delayed.

Ibaraki reactor to resume research

January 31, 2018

Japan Atomic Energy Agency approved to operate research reactor under post-Fukushima rules
https://www.japantimes.co.jp/news/2018/01/31/national/japan-atomic-energy-agency-approved-operate-research-reactor-post-fukushima-rules/#.WnHNunwiGos
Kyodo
A Japan Atomic Energy Agency research reactor cleared a regulatory safety review on Wednesday, becoming the first facility run by the government-affiliated research institute to pass post-Fukushima regulations.
The reactor, which is located in Ibaraki Prefecture and called the Static Experiment Critical Facility, gained approval from the Nuclear Regulation Authority to resume operations and will be used to conduct research on the extraction of melted fuel from nuclear plants.
The facility still needs to go through several final checks under new rules introduced after the Fukushima nuclear disaster in 2011.
The approval came after the JAEA responded to a request made in November by the Japan Atomic Energy Commission, a government nuclear panel, to clarify the purposes of storing plutonium-uranium mixed oxide fuel, known as MOX fuel, at the reactor.
Japan, while upholding a policy of reprocessing spent fuel from nuclear reactors and reusing extracted plutonium and uranium as reactor fuel, adopts a policy of not possessing plutonium — a material that can be used to make nuclear weapons — without a specified purpose.
In a document, the agency said it will not use MOX fuel "other than for peaceful purposes," winning approval from the Japan Atomic Energy Commission.
According to the JAEA, the reactor will be used to conduct research on the removal of melted nuclear fuel in an effort to support the decommissioning of the Fukushima No. 1 nuclear complex, which experienced core meltdowns following the March 2011 earthquake and tsunami disaster.
The JAEA previously came under heavy criticism for lax safety management following revelations of a number of equipment inspection failures at its Monju prototype fast-breeder nuclear reactor. The prototype had been envisioned to play a key role in the country's nuclear fuel recycling policy but is now set to be scrapped.
In June of last year, a nuclear exposure accident occurred at the institution's Oarai Research and Development Center in Ibaraki, causing internal radiation exposure in five workers, although no harmful consequences were detected in the surrounding environment.

Shimane No.3 reactor may go ahead

February 17, 2018

Utility eyes NRA screening nod for new nuclear reactor in Shimane
http://www.asahi.com/ajw/articles/AJ201802170020.html
THE ASAHI SHIMBUN
Chugoku Electric Power Co. will initiate procedures to gain approval to start operations of a nuclear reactor whose construction was halted in the aftermath of the 2011 earthquake and tsunami disaster.
The utility began construction of the No. 3 reactor at its Shimane nuclear power plant in 2005, and work was close to completion when the Great East Japan Earthquake struck, unleashing tsunami that devastated coastal areas of the northern Tohoku region.
Chugoku Electric Power initially planned to begin operations of the No. 3 reactor in March 2012, but the triple meltdown at the Fukushima No. 1 nuclear power plant prompted the government to review its safety standards.
The review process brought construction work to a halt at the No. 3 reactor of the Shimane plant.
Before Chugoku Electric Power can apply to the Nuclear Regulation Authority for a safety screening, it must gain the consent of Shimane prefectural authorities and the Matsue municipal government.
Sources close to the utility said the company would seek approval from the two entities as soon as preparations are completed.
A key reason behind the step is action taken by the NRA for the No. 2 reactor located on the same complex as the No. 3 reactor now under construction.
Chugoku Electric Power has applied for a safety screening to resume operations at the No. 2 reactor, and on Feb. 16 the NRA signed off on the utility's basic earthquake ground motion as the likely maximum quake that could strike the No. 2 reactor.
"Now that we have approval for the basic earthquake ground motion for the No. 2 reactor, we will work toward also applying for a safety screening for the No. 3 reactor," said a utility official.
If Chugoku Electric Power does submit an application for the No. 3 reactor it would be the second case of a safety screening application for a reactor under construction.
In December 2014, Electric Power Development Co. (J-Power) submitted an application to the NRA for a safety screening for its Oma nuclear plant in Aomori Prefecture.
The No. 3 reactor being constructed by Chugoku Electric Power is an improved version of the boiling-water type reactor similar to those at the crippled Fukushima No. 1 plant.
Even if the NRA approves the safety screening, operations will not begin immediately as additional work is needed to improve the safety of the reactor.

Fuel loading at Genkai 3

19.02.2018_No35 / News in Brief
Fuel Loading Begins At Japan's Genkai-3
https://www.nucnet.org/all-the-news/2018/02/19/fuel-loading-begins-at-japan-s-genkai-3

19 Feb (NucNet): Fuel loading at Japan's Genkai-3 nuclear reactor unit began on 16 February 2018, operator Kyushu Electric Power Company said.
Genkai-3 in the southern Saga Prefecture is a 1,127-MW pressurised water reactor (PWR) unit, which began commercial operation in 1994. There are four PWR units at the Genkai site, but Kyushu Electric plans to restart only the newer ones – Genkai-3 and-4.

Unit 3 was shut down for an annual outage in December 2010 and Unit 4 in December 2011. The units were never restarted following a nationwide nuclear shutdown after the March 2011 Fukushima-Daiichi accident.

The governor of Saga Prefecture approved the restart of Genkai-3 and-4 in April 2017, clearing the final regulatory hurdle. Kyushu Electric said the physical startup of Genkai-3 is scheduled for March 2018 but gave no precise dates.

Five units in Japan have resumed commercial operation after meeting revised regulatory standards. They are: Takahama-3 and -4, Ikata-3 and Sendai-1 and -2.

Idle reactors maintenance

Although the reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture are all offline, 6,000 or so people work at the complex each day. (Asahi Shimbun file photo)

March 8, 2018
Utilities spent 5 trillion yen on idle reactors after disaster
http://www.asahi.com/ajw/articles/AJ201803080090.html
THE ASAHI SHIMBUN
Electric power companies spent more than 5 trillion yen ($47 billion) to maintain and manage idle reactors, passing on the tab to consumers as "costs for nuclear power generation."

The expenditures by seven utilities for the five-year period between fiscal 2012 and fiscal 2016 were covered mainly by electricity charges.
Although the companies say they can gain profitability by restarting idle reactors, they have yet to initiate procedures to bring about half of the units back online.
The utilities in question are the Hokkaido, Tohoku, Tokyo, Hokuriku, Chubu and Chugoku electric power companies and Japan Atomic Power Co.
The hidden costs emerged after The Asahi Shimbun scrutinized financial statements of 10 utilities with nuclear reactors.
Of the 10, the Kansai, Kyushu and Shikoku electric power companies have resumed partial reactor operations.
It turned out that the seven utilities spent a combined 5.09 trillion yen on 34 idled nuclear reactors in the five-year period after the 2011 Fukushima nuclear disaster.
The expenditures consisted of personnel and outsourcing expenses for maintenance and management of the reactors; spent nuclear fuel reprocessing, which is not an issue with thermal or hydraulic power generation; financial outlays related to compensation for the triple meltdown at the Fukushima No. 1 nuclear power plant; and depreciation costs concerning the construction of nuclear reactors.
Restarting a single reactor with an output capacity of one gigawatt would translate into a revenue increase of 100 billion yen annually and cover their financial outlays to date, the utilities insist.
The three power companies that have resumed limited reactor operations spent 2.47 trillion yen in the five-year period as costs for nuclear power generation. They have 20 nuclear reactors, of which seven have been restarted, including ones not currently in operation.
Circumstances surrounding nuclear power industry have changed drastically since the Fukushima nuclear disaster.
At that time, there were 54 nuclear reactors operating on a commercial basis in Japan. Fourteen are due to be decommissioned.
Of the remaining 40 reactors, seven have restarted. As for the remaining 33 reactors, utilities have yet to apply to the Nuclear Regulation Authority for screening to restart 15 of them.
That is mainly due to costs the companies would incur to implement safety measures under new standards introduced after the Fukushima disaster and the fact that profitability will decline in the case of aged or small reactors.
Even among reactors that utilities applied to reactivate, the prospects for doing so remain murky due to concerns among local governments or the possibility of active faults running just below the reactor buildings.
(This article was written by Takaoki Yamamoto and Eiji Shimura.)

Ohi No.3 reactor back online

March 14, 2018

Ohi No.3 reactor back online
https://www3.nhk.or.jp/nhkworld/en/news/20180314_33/

Another Japanese nuclear reactor has been restarted following the March 2011 nuclear accident in Fukushima in Japan.

The Number 3 reactor at the Ohi nuclear plant in Fukui Prefecture is run by Kansai Electric Power Company. It was reactivated on Wednesday afternoon following the removal of control rods that suppress atomic fission.

It is expected to reach criticality early on Thursday, begin power generation and transmission on Friday, and go into commercial operation in early April.

It is the 6th reactor at 4 nuclear power plants in Japan to be restarted under new regulatory requirements for commercial nuclear plants that were introduced after the serious accident at the Fukushima Daiichi plant.

Two of the reactors are at the Takahama plant, located about 13 kilometers to the west of the Ohi plant. If both plants are damaged simultaneously by an earthquake or tsunami, efforts to respond to the disaster or evacuate residents could be disrupted.

Kansai Electric Power plans to restart the Number 4 reactor at Ohi in mid-May.

In 2014, the Fukui District Court ruled against putting the Number 3 and Number 4 reactors back online. The ruling was appealed to a higher court, which has yet to rule on the issue.

A 60-year-old local resident said he's against the restart because he doesn't know where and how he should evacuate if there's an accident.

Another local person, who is 67 years old, says he has visited the plant several times and found its equipment and management to be fine. He said he wanted the utility to supply electricity without keeping the reactors idle.

Coastal nuclear reactor resumes operations, joins 2 units nearby
https://mainichi.jp/english/articles/20180314/p2g/00m/0dm/091000c
FUKUI, Japan (Kyodo) -- Kansai Electric Power Co. restarted Wednesday a reactor at its Oi plant on the Sea of Japan coast, located close to two other units already online, amid lingering safety concerns following the Fukushima disaster.
It is the first time that multiple nuclear reactors within the same vicinity have been in operation since the crisis at the Fukushima Daiichi plant, triggered by the March 2011 earthquake and tsunami.
The No. 3 reactor at the Oi plant is a mere 14 kilometers from the No. 3 and 4 units at the Takahama plant, all in the central Japan prefecture of Fukui.
Local residents are worried about the lack of an effective evacuation plan in the event accidents hit both the Takahama and Oi complexes at the same time.
The No. 3 Oi unit is the sixth reactor to resume operations in Japan after clearing stricter safety regulations implemented in the wake of the Fukushima disaster.
The government of Prime Minister Shinzo Abe, seeing nuclear power as an "important base-load power source," is promoting the restart of nuclear reactors considered safe by regulators.
Under the current national energy policy, the government plans to generate between 20 and 22 percent of total electricity using nuclear power in fiscal 2030.

Kansai Electric aims to start commercial operations of the No. 3 Oi reactor in early April. The No. 4 reactor at the Oi plant is also expected to restart in May, having cleared the Nuclear Regulation Authority's safety review along with the No. 3 unit in May 2017.

Genkai No.3 restarted

March 23, 2018

Genkai No.3 reactor being restarted
https://www3.nhk.or.jp/nhkworld/en/news/20180323_22/
The Number 3 reactor at the Genkai nuclear power plant in Saga Prefecture, southwestern Japan, has been restarted for the first time in 7 years and 3 months.

Kyushu Electric Power Company initiated restart procedures on Friday by removing the control rods that suppress atomic fission.

The company says the reactor will reach criticality -- a self-sustained nuclear reaction -- early on Saturday, and begin power generation and transmission on Sunday. The reactor is expected to go into commercial operation in late April.

The reactor runs on MOX fuel, which is a mixture of plutonium extracted from spent nuclear fuel and uranium.

It is the 7th reactor to be restarted under new regulations introduced for commercial nuclear power plants after the 2011 Fukushima accident.

The six reactors currently in operation are 2 at the Sendai plant in Kagoshima Prefecture, one at the Ikata plant in Ehime Prefecture, 2 at the Takahama plant in Fukui Prefecture, and one at the Ohi plant, also in Fukui.

Kyushu Electric plans to restart the No. 4 reactor at the Genkai plant in May.

The Genkai plant is located in a coastal area, with 20 small islands within a 30-kilometer radius. Experts point out the importance of evacuation plans for the islanders in the event of a nuclear accident in bad weather.

Leak forces shutdown of No.3 Genkai reactor

March 31, 2018

March 31, 2018

Steam leak prompts power generation to halt at Japan nuclear plant
https://mainichi.jp/english/articles/20180331/p2g/00m/0dm/002000c
FUKUOKA (Kyodo) -- Kyushu Electric Power Co. stopped generating and supplying electricity at its nuclear reactor in southwestern Japan on Saturday after detecting a steam leak the previous day.
The utility said there has been no radiation leak and that it will inspect the reactor, which resumed operation only a week ago at the Genkai power plant in Saga Prefecture.
According to Kyushu Electric, staff discovered at around 7 p.m. Friday that steam was leaking from the pipe of a device used for the removal of oxygen and other dissolved gases from the feedwater to steam generators.
The No. 3 reactor at the plant resumed operation on March 23 after being offline for over seven years, amid lingering concerns among residents about how to evacuate from islets near the plant in the event of a serious accident. It restarted power generation two days later.
Following the latest incident, Kyushu Electric's plan to restart the No. 4 reactor in May could be delayed, the utility said.
The No. 3 unit was suspended for a regular inspection in December 2010, three months before a massive earthquake and tsunami sparked a crisis at the Fukushima Daiichi nuclear plant.
It cleared the Nuclear Regulation Authority's safety screening in January 2017 under stricter, post-Fukushima regulations and was later approved for reactivation by the Genkai municipal government and Saga prefectural government.

Steam leak found at Genkai nuclear power plant
https://www3.nhk.or.jp/nhkworld/en/news/20180331_09/
The operator of the Genkai nuclear power plant in southwestern Japan has found a steam leak in a reactor just one week after putting it back online. It suspended power generation early Saturday.

Kyushu Electric Power Company says a worker found the small leak at the No. 3 reactor around 7 PM on Friday. The plant is located in Genkai Town in Saga Prefecture.

The utility says the steam does not contain radioactive substances, and that monitoring posts around the plant show no change in radiation levels. It says there has been no harm to the environment.

Kyushu Electric says the leak occurred in a pipe connected to equipment that removes oxygen, carbon dioxide and other substances from the steam.

The reactor was generating power at 75 percent of its capacity at the time. The utility says it gradually

lowered output through the night, halting it completely by around 6 AM on Saturday.

Kyushu Electric says it is working quickly to determine the cause and resume operations.

The leak is an unwelcome setback for the utility, which put the reactor back online on March 23rd, ending a break of more than 7 years in operations. The reactor began generating and transmitting power 2 days later.

The reactor was suspended for a regular inspection after the 2011 earthquake and tsunami, which triggered the Fukushima nuclear accident.

Restarts: New deal fairer to municipalities?

June 3, 2018

EDITORIAL: Tokai nuke plant deal with local entities a model for all restarts
http://www.asahi.com/ajw/articles/AJ201804030021.html
Cities and towns adjacent to areas where nuclear power plants are located have no say over plant operators' decisions to restart offline reactors even though they face safety risks similar to those borne by nuclear host communities.
The recent agreement between the operator of the Tokai No. 2 nuclear power plant in Ibaraki Prefecture and surrounding municipalities is a big step toward fixing the serious flaw in the procedure for obtaining local approval for reactor operations.
Japan Atomic Power Co. (JAPC) agreed on March 29 to seek approval from five surrounding municipalities including the city of Mito as well as Tokai village, which hosts the nuclear plant, and the prefecture before bringing its idled reactor back on stream.
The agreement expands the scope of local governments that have the effective "right to consent" concerning JAPC's decisions to restart its reactor at the plant beyond the host town to include surrounding municipalities.
It was the first time that a nuclear power plant operator has agreed in writing to obtain prior consent on the restart of its reactors from surrounding municipalities.
JAPC is currently working to restart the boiling water reactor. About 1 million people live within 30 kilometers of the plant, more than in any other 30-km area around a nuclear plant in this nation.
In Japan, municipalities located within a 30-km radius from nuclear plants are required to craft evacuation plans to prepare for possible accidents at those facilities.
Many of the local governments within this area are struggling to work out effective and plausible evacuation plans, while local residents are living in anxiety.
The five municipalities located in the 30-km area had been demanding that they be given the same "right to consent" as that enjoyed by Tokai.
The agreement stipulates that it effectively establishes a system that requires the plant operator to obtain "prior consent" from the six municipalities to any decision to restart the reactor through prior consultation with them.

The deal represents progress toward a more democratic process of building a consensus among the parties concerned.
But the agreement leaves some important questions unanswered, such as what if the six municipalities fail to reach an agreement. The plant operator should implement the agreement in a way that places the highest priority on the safety of local residents. It should be willing to continue prior negotiations until it obtains consent from all the local governments involved.
Local governments in various parts of the nation, including the Kansai and the Kyushu regions, have taken exception to the current system, which only gives the right to consent to the prefectures and host municipalities involved.
Surrounding communities have every right to demand that they also have a say over decisions to restart reactors given that they have to bear the burdens of accepting the risk of accidents and developing evacuation plans.
But electric utilities operating nuclear plants loathe facing higher barriers to resuming the operations of reactors.
If they want to win the trust of local communities, however, they should shed their reluctance to seek approval from a wider range of local governments.
The agreement between JAPC and the local governments is not legally binding and is vague about the company's responsibility for the safety of local residents.
The government has said it is "not in a position" to get involved in such an agreement between an electric utility and local governments.
But the government should be accused of irresponsibility if it acts like a bystander with regard to this issue.
The government should instead take the initiative for new legislation to establish formal rules for agreements between nuclear utilities and local communities over operational decisions.
Close cooperation among Ibaraki Prefecture, Tokai and the five surrounding municipalities has opened the door to their agreement with JAPC.
In many areas with nuclear plants, however, there is a rift between the host communities and surrounding municipalities.
The prefectural governments in such areas can play an important role in solving the rift.
The latest agreement--call it the "Ibaraki formula"--should set a model for other areas facing the same problem.
--The Asahi Shimbun, April 3

Japan Atomic Power grants local gov'ts say in reactor restart under new agreement
https://mainichi.jp/english/articles/20180330/p2a/00m/0na/003000c
Japan Atomic Power grants local gov'ts say in reactor restart under new agreement

- 【Related】TEPCO, Tohoku Electric to give Japan Atomic financial boost to help restart reactor
- 【Related】About 50% of local bodies near nuke plants want say over reactor restarts
- 【Related】Prospect uncertain for Tokai No. 2 nuke plant restart despite extension application

Japan Atomic Power Co. has agreed to give not only the Tokai Municipal Government that hosts the company's Tokai No. 2 nuclear plant but also five surrounding municipalities the right to effectively approve reactivation of the plant.
This is apparently the first agreement in Japan that gives not only local bodies hosting a nuclear plant but also surrounding municipalities such a right.
The five local bodies are Mito, Hitachi, Hitachinaka, Naka and Hitachiota in Ibaraki Prefecture, all within a 30-kilometer radius of the power plant. The mayors of these five municipalities plus Tokai gathered with Japan Atomic President Mamoru Muramatsu at the Tokai Municipal Government headquarters on the evening of March 29 and signed the accord.
Under the agreement, all six municipal governments can express opinions on reactivation of the plant or any extension of its operational life, and demand explanations from the plant operator.
There have been growing calls from municipalities surrounding those hosting nuclear plants for the right to approve the stations' operations following the outbreak of the Fukushima nuclear crisis. However, most nuclear plant operators have refused to grant such rights to local bodies not actually hosting a plant.

A fairer deal (2)

April 4, 2018

Editorial: JAPC pact seeking local bodies' consent for N-plant restart a good move
https://mainichi.jp/english/articles/20180404/p2a/00m/0na/022000c
Japan Atomic Power Co. (JAPC) has signed a pact with six municipalities within a 30-kilometer radius from its Tokai No. 2 nuclear power plant in Tokai, Ibaraki Prefecture, over prior approval of the facility's reactivation. Under the accord, the company must effectively obtain consent in advance from not only the village of Tokai, which hosts the nuclear station, but also Mito and four other surrounding cities after holding consultations.

- 【Related】Japan Atomic Power grants local gov'ts say in reactor restart under new agreement
- 【Related】Fukushima & Nuclear Power

While some issues remain unclear, including how to respond when the opinions of the six municipalities are divided, the pact is unprecedented in that it includes the need to obtain approval for reactivation from not only the local body hosting a nuclear plant but also from surrounding municipalities.
If a nuclear plant accident breaks out, its impact would extend beyond local municipalities hosting the facility. Nevertheless, surrounding municipalities not home to the plant are not granted the right to give prior consent to reactivation. JAPC's new pact should serve as a role model for reviewing such disparities across the country.
While host municipalities are usually reluctant to allow surrounding local bodies the right to give prior consent for reactivation, it was the former Tokai village mayor who initiated the latest scheme, calling on surrounding municipalities to negotiate with JAPC in the wake of the Fukushima No. 1 Nuclear Power Plant disaster in March 2011. A former proponent of nuclear power, the ex-mayor turned himself anti-nuclear after the Fukushima crisis, which broke out in the neighboring prefecture.

After the Fukushima disaster, the central government expanded areas where local governments need to draw up nuclear evacuation plans for residents from within an 8-10 kilometer radius of a nuclear plant to a 30-kilometer radius. In the case of the Tokai No. 2 nuclear plant, approximately 960,000 people live in a 30-kilometer radius from the facility -- the largest figure in the country. Nonetheless, local municipalities are still struggling to devise their own nuclear evacuation schemes.
JAPC may well have judged that it would be easier to obtain local understanding for reactivation if the right to prior consent was given to surrounding municipalities as well.
The central government and power companies operating nuclear plants should not take the JAPC pact as an exceptional case. There are seven nuclear reactors, operated by three utilities, which have been put back online under the new regulatory standards introduced in the aftermath of the Fukushima disaster. Before restarting these reactors, utilities obtained approval from only the cities, towns and prefectures hosting the nuclear facilities. Power companies apparently believed that expanding the right to prior consent could set a high hurdle for reactor restarts.
With regard to Kyushu Electric Power Co.'s Genkai nuclear plant in Saga Prefecture, which was restarted just last month, four surrounding cities have opposed the reactivation out of concern for resident evacuation plans. If electric companies are to keep ignoring the voices of residents of surrounding municipalities, public distrust in nuclear power would only be left growing.
Minister of Economy, Trade and Industry Hiroshige Seko spoke lightly of the JAPC pact with six municipalities, saying, "The central government is not in a position to get involved in it." The minister's comment clearly illustrates that he feels the matter as someone else's affair.
Under the country's basic energy plan, it is stated that the central government should come to the fore and make efforts to obtain the understanding of and cooperation for reactivation from concerned parties including local bodies hosting nuclear plants. The central government is urged to introduce laws on the procedures in which local bodies within a 30-kilometer radius from a nuclear plant give consent to reactivation, in a manner better reflecting their intentions.

Niigata governor quitting will affect nuclear future

April 18, 2018

Niigata governor to quit
https://www3.nhk.or.jp/nhkworld/en/news/20180418_35/
Niigata Governor Ryuichi Yoneyama has announced he's stepping down over an alleged sex scandal. His sudden departure throws into question the future of a nuclear power plant in the central Japan prefecture. Yoneyama has been cautious about the plant operator's efforts to restart the facility.

Yoneyama held a news conference on Wednesday, the day before a weekly magazine was expected to run a story about the scandal.

Yoneyama revealed that he had tendered his resignation earlier in the day to the chairperson of the prefectural assembly.

He said he decided to resign to avoid further turmoil and take responsibility for his actions. He added that he wanted to offer his sincere apology for undermining the trust of many people.

Yoneyama was elected governor in October 2016, with the recommendation of the Japanese Communist Party, the Liberal Party, and the Social Democratic Party.

He has been cautious about the restart of the Kashiwazaki-Kariwa nuclear power station in the prefecture.

It is run by Tokyo Electric Power Company, the operator of the Fukushima Daiichi nuclear plant, which was crippled by the March 2011 earthquake and tsunami.
The utility has been seeking local consent to restart the Kashiwazaki-Kariwa plant.

Governor quits over sex scandal, affects nuclear reactor restart
https://mainichi.jp/english/articles/20180418/p2g/00m/0fp/074000c
April 18, 2018 (Mainichi Japan)
NIIGATA (Kyodo) -- Niigata Gov. Ryuichi Yoneyama said Wednesday he will resign after admitting to a sex scandal in a move affecting the approval process for the restart of Tokyo Electric Power Company Holdings Inc.'s nuclear reactors in the central Japan prefecture.

- 【Related】Niigata governor to decide in few days if he'll resign over alleged affair
- 【Related】TEPCO's Niigata nuclear plant set to clear screening to restart reactors

"I sincerely offer apologies for betraying the trust of many people," Yoneyama told a press conference, admitting that his relationship with a woman, as described in a weekly magazine due out Thursday, may "look to some as prostitution."
Shukan Bunshun magazine alleged in an online teaser article Wednesday that the 50-year-old governor has been paying money to have sex with a 22-year-old college student. At a news conference Wednesday, the governor said he gave a woman he met online "presents and money so she would like me more."
Since being elected governor in 2016, Yoneyama has refrained from approving the restart of the No. 6 and 7 reactors at the Kashiwazaki-Kariwa nuclear complex.
The governor has said he cannot make the decision until the prefectural government completes its own assessment of what caused the Fukushima Daiichi nuclear disaster in 2011.
All seven Kashiwazaki-Kariwa units are boiling water reactors, the same as those at the Fukushima Daiichi nuclear plant where three of six reactors melted down in the days after a massive earthquake and tsunami in March 2011. Last December, two reactors at the Kashiwazaki-Kariwa complex cleared safety reviews under the stricter, post-Fukushima regulations.
On Tuesday, Yoneyama said he would consider whether to quit over a forthcoming magazine article about a "woman issue." Calls for his resignation were growing in the Niigata prefectural assembly.
The gubernatorial election to pick Yoneyama's successor is expected to be held in early June. Yoneyama will resign with two and a half years of his term remaining.
The seven-reactor Kashiwazaki-Kariwa complex is one of the world's largest nuclear power plants with a combined output capacity of 8.2 million kilowatts.
Facing huge compensation payments and other costs stemming from the Fukushima disaster, Tepco is keen to resume operation of its reactors to improve its financial performance.
The Japanese government of Prime Minister Shinzo Abe also supports restarting nuclear reactors that have cleared post-Fukushima safety reviews.

Yoneyama won the Niigata governorship in October 2016 with the support of the Japanese Communist Party and the Social Democratic Party, which are both opposed to nuclear power. He defeated contenders including a candidate backed by Abe's Liberal Democratic Party and its junior coalition partner Komeito.

Governor resigns. What now?

April 19, 2018

Will resignation of key governor weaken Japan's anti-nuclear movement?
by Stephen Stapczynski
Bloomberg

A governor who has been blocking the restart of the world's biggest nuclear power plant in his prefecture has resigned, but it remains to be seen whether the move will create an opening for the nation's pro-nuclear forces.
Niigata Gov. Ryuichi Yoneyama, who campaigned on his opposition to restarting Tokyo Electric Power Co. Holding Inc.'s Kashiwazaki-Kariwa reactors, said Wednesday he would resign over allegations he paid women for sex.
The governor was one of a few high-profile opponents to nuclear power, which the public has viewed with skepticism since the 2011 Fukushima disaster. He was also the biggest roadblock for Tepco's effort to run reactors in his prefecture, two of which have been given the all-clear by regulators. Although the country has imposed stronger safety regulations since 2011, only five of its 39 operable reactors are online.
"Yoneyama was not a leader, but certainly an important figure in a position to influence the fate of reactors," said Jeff Kingston, the director of Asian studies at Temple University's Japan campus. "Not many of those, so he will be missed."
Yoneyama repeatedly said he wouldn't support a restart until a panel of experts appointed by the prefecture investigate the Fukushima disaster and study evacuation plans in case of an emergency at Tepco's Niigata plant. He said in January that the process would take at least three years.
When is the next election?
A vote is likely to be held around the beginning of June, according to an official at the prefecture's election commission. The assembly president will officially inform the commission of Yoneyama's resignation in the coming days, which will then trigger a gubernatorial election within 50 days.
Would the next governor also oppose restarts?
Probably. The last two governors were against restarting the reactors and 64 percent of voters in the last election opposed the move, according an exit poll conducted by the Asahi Shimbun.
"It is likely that the next governor will continue an anti-restart policy," wrote Daniel Aldrich, a professor at Northeastern University, in an email. "Anti-nuclear sentiment is still high across the country."
Prime Minister Shinzo Abe's Liberal Democratic Party supports the restarts, while most of the opposition parties don't. Both sides will likely field candidates.
High-ranking officials from the Constitutional Democratic Party, the nation's largest opposition party, which is also against nuclear restarts, and the Democratic Party told the Sankei Shimbun Wednesday that opposition parties should band together behind one candidate.

Tamio Mori, who was backed by the LDP in the 2016 Niigata election, could be a potential contender for Abe. Mori is the former mayor of Nagaoka City, and was seen as the more pro-nuclear candidate in the 2016 election when he captured 46 percent of the vote. He didn't respond to an emailed request for comment.

What about the review panel?

This timeline for its work might speed up if the new governor is pro-restart, according to Miho Kurosaki, an analyst at Bloomberg New Energy Finance.

"I don't think the panel review will be removed fully," said Kurosaki, highlighting lingering safety concerns in the community over a 2007 earthquake that temporarily shut the facility.

Does Tepco even need local approval?

While the local governor's approval is traditionally sought by utilities before they resume operations at a reactor, it's not required by law. Kyushu Electric Power Co. continued operating reactors at its Sendai facility despite opposition from a newly elected anti-nuclear governor in 2016.

"The 'gentlemen's agreement' that has provided some unwritten capacity to nuclear host community decision makers is in fact quite weak," Aldrich said. "Even if another anti-nuclear governor is elected within Niigata, I believe that the economic and political pressure on utilities will push them to restart reactors."

Ohi No.4 restarted

May 10, 2018

Ohi No.4 reactor restarted

https://www3.nhk.or.jp/nhkworld/en/news/20180509_30/

Japan's 8th reactor is back online. Kansai Electric Power Company on Wednesday restarted a reactor at the Ohi plant in Fukui Prefecture, central Japan.

At the plant, workers pulled out the control rods that suppress atomic fission of the No.4 reactor.

The facility is expected to reach criticality early Thursday, begin power generation and transmission on Friday and go into commercial operation in early June.

The reactor had complied with new government regulations put in place following the 2011 Fukushima Daiichi nuclear accident.

Two months earlier, the utility reactivated the No.3 reactor at the plant. Two more reactors are running at its Takahama plant about 13 kilometers west of Ohi.

Although they all passed the government's new regulations, attention is now focused on the threat of multiple accidents at these plants in the event of an earthquake and tsunami.

This summer, the government plans to hold its first drill based on a scenario that accidents have occurred

simultaneously at the Ohi and Takahama plants.

In 2014, the Fukui District Court ruled against putting the No.3 and No.4 reactors at Ohi back online. It said estimated tremors of possible quakes at the plant are too optimistic. The ruling was appealed to a higher court, which has yet to decide the issue.

And now there are eight

June 6, 2018

Japan's Ohi-4 Has Resumed Commercial Operation, Says Operator
https://www.nucnet.org/all-the-news/2018/06/06/japan-s-ohi-4-has-resumed-commercial-operation-says-operator
6 Jun (NucNet): Japan's Ohi-4 nuclear reactor unit in Fukui Prefecture, southwest Japan, entered commercial operation mode yesterday at 16:00 local time, operator Kansai Electric Power Company said in a statement.
Kansai Electric connected Ohi-4, a 1127-MW pressurised water reactor unit, to the grid on 11 May 2018 for the first time since the unit had been shut down in September 2013 in the aftermath of the March 2011 Fukushima-Daiichi accident.

Ohi-4 becomes the eighth nuclear plant at one of five sites, which has been restarted under new regulatory standards introduced following the 2011 accident.

Ohi-3, a twin unit, resumed commercial operation in April 2018.

Ohi-3 and -4 were the first two reactors to resume operation in Japan after the Fukushima-Daiichi accident but were both taken offline in September 2013 for scheduled refuelling and maintenance.

Their restarts where delayed when in May 2014 the Fukui district court ruled that it would not allow Ohi-3 and -4 to return to operation.

The governor of Fukui Prefecture allowed the restart of Ohi-3 and -4 in November 2017 after courts rejected challenges by anti-nuclear groups.

All of Japan's 48 reactors were taken offline as a result of the Fukushima-Daiichi accident for safety assessments and upgrading measures.

The eight units that have been restarted in Japan since the Fukushima accident are: Ohi-3, Ohi-4, Genkai-3, Sendai-1, Sendai-2, Ikata-3, Takahama-3 and Takahama-4.

Will Tokai No.2's operational life be extended?

June 22, 2018

Tokai nuclear plant passes key test, resumption still in the cards
http://www.asahi.com/ajw/articles/AJ201806220040.html
THE ASAHI SHIMBUN
June 22, 2018 at 15:30 JST
The Tokai No. 2 nuclear power plant in Ibaraki Prefecture passed a major earthquake safety test on June 21, paving the way for the Nuclear Regulation Authority to approve the extension of its operational life beyond 40 years.
NRA officials visited a facility in Hyogo Prefecture on June 21 to observe a test of equipment at the currently offline nuclear plant that is designed to keep the reactor building airtight even in the event of a strong earthquake.
The test was conducted at the National Research Institute for Earth Science and Disaster Resilience, located in Miki, Hyogo Prefecture. The institute contains a building that can replicate the tremors of earthquakes.
Japan Atomic Power Co. brought in equipment designed to keep in place blowout panels attached to the wall of the Tokai No. 2 nuclear reactor building. The test was to confirm that the device operated appropriately even under the maximum shaking simulation.
The panel, measuring five meters square and weighing two tons, was shaken strongly for about 90 seconds to test if it would stay sealed. The outcome was not perfect, with a five-centimeter opening appearing as some parts were damaged by the shaking. A worker then manually sealed the panel, and airtightness was confirmed.
Japan Atomic Power will have to change the design of the equipment to ensure that it can remain sealed even if hit by the maximum expected quake.
NRA Commissioner Shinsuke Yamanaka, who observed the test, said that while additional measures were needed, there were no major technical problems in the fundamental design.
"With today's test, a major hurdle was overcome," he said.
The Tokai No. 2 nuclear power plant will reach 40 years of operation in November, but the NRA is expected to decide that the plant meets new safety standards implemented in the wake of the 2011 Fukushima nuclear accident.
However, Japan Atomic Power faces other issues beyond design conditions. For the Tokai No. 2 plant to resume operations, the consent of the Ibaraki prefectural government as well as six municipal governments in the vicinity of the plant must be obtained. However, many local governments are cautious about having operations resume.
On June 19, the Mito city assembly passed a document opposing the resumption of the plant.
Japan Atomic Power will also have to find 174 billion yen ($1.6 billion) in funds for the construction work that will be necessary for safety measures. While Tokyo Electric Power Co. Holdings Inc. has indicated it was prepared to provide financial assistance, it is still unclear if Japan Atomic Power can come up with all the money to cover the costs that can further increase.
(This article was written by Yusuke Ogawa and Toshio Kawada.)

Tokai No.2: Ready to be restarted and extended for another 20 years?

June 28, 2018

Japan Atomic's Tokai No. 2 plant set to pass restart screening
https://mainichi.jp/english/articles/20180628/p2a/00m/0na/016000c
TOKYO -- The Nuclear Regulation Authority (NRA) said on June 27 that it is set to complete a safety screening of Japan Atomic Power Co.'s Tokai No. 2 nuclear power station in Tokai, Ibaraki Prefecture -- a reactor Japan Atomic is looking to have both restarted and its operational life extended.

- 【Related】Editorial: JAPC pact seeking local bodies' consent for N-plant restart a good move
- 【Related】Japan Atomic Power grants local gov'ts say in reactor restart under new agreement
- 【Related】TEPCO, Tohoku Electric to give Japan Atomic financial boost to help restart reactor

Japan Atomic filed a written amendment for the Tokai No.2 nuclear plant's safety measures with the NRA on the same day. Commenting on the move, NRA Chairman Toyoshi Fuketa said at a news conference, "We can forecast the prospects for the screening." After NRA officials examine the amendment, the nuclear watchdog is expected to present a draft report at a regular meeting stating that the nuclear plant has met the new safety standards.
The Tokai No. 2 nuclear plant will be decommissioned if the facility can't pass three types of NRA screenings, one each for adherence to the new safety standards, construction plans for updating the plant, and the operational life extension. All the screenings must be passed by Nov. 27, 2018, the day before the plant reaches its 40-year operational limit.
While there were concerns the construction plan screening may take too long to meet the deadline, the NRA judged at a June 26 meeting that the basic design for the reactor has met the security standards as a result of tests on safety measure devices and other evidence. That results in promoting the process of restarting the nuclear reactor and extending the operational periods for up to 20 years.
(Japanese original by Toshiyuki Suzuki, Science & Environment News Department)

Nukes: How many restarts yet?

July 3, 2018

Nuclear reactor restarts likely as Cabinet OKs new energy plan
By SHINICHI SEKINE/ Staff Writer
http://www.asahi.com/ajw/articles/AJ201807030061.html
A new wave of nuclear reactor restarts became more likely as the government approved the new Basic Energy Plan on July 3, confirming that nuclear power will remain a key component of Japan’s energy strategy.
The latest Basic Energy Plan, which charts the nation’s mid- and long-term energy policy, marks the fifth in a series that is required by law to be reviewed about every three years.

The second plan to be revised under the administration of Prime Minister Shinzo Abe stated for the first time that the country will strive to make renewable energy a major power source, although it noted fluctuations in output due to weather conditions.
Renewables can become a viable source of a stable power supply when they are combined with rechargeable batteries and hydrogen, according to the plan.
The plan also maintained the reliance on coal-fired thermal power as a base-load energy source despite high emissions of carbon dioxide.
The Abe administration decided to promote nuclear energy when it revised the plan in 2014, reversing the policy of the previous government led by the then-Democratic Party of Japan, which pledged to phase out nuclear power by 2039 in the face of mounting public concern over the safety of nuclear power following the 2011 Fukushima nuclear disaster.
Under the latest plan, the ratio of nuclear energy, renewables and coal thermal power in the nation's overall energy as of fiscal 2030 will remain at 20-22 percent, 22-24 percent and 26 percent, respectively, in line with the government's target set three years ago.
Experts say about 30 reactors need to be reactivated to achieve the 20-22 percent target, but only nine have gone back on line so far after they cleared the more stringent reactor regulations that took effect after the Fukushima accident.
The plan did not touch on the need for building a new nuclear plant in light of the widespread public opinion against nuclear energy. The last Basic Energy Plan did not mention the subject, either.
The latest plan re-endorsed using the nuclear fuel cycle, in which plutonium extracted from spent nuclear fuel at nuclear plants is used to generate power.
But the plan, noting calls from the United States, said that Japan "will make efforts to cut the stockpile of plutonium."
Japan holds a total of 47 tons of plutonium, equivalent to 6,000 Nagasaki-type atomic bombs, a source of criticism from the United States and other countries.
The country has failed to reduce its plutonium stockpile due to little progress in the nuclear fuel cycle over decades.
The project to operate the Monju prototype fast-breeder reactor in Fukui Prefecture, the core part of the nuclear fuel cycle, rarely worked over 20 years due to numerous glitches. The government finally decided to pull the plug on it in 2016.
Burning a mixed oxide form of plutonium and uranium has not spread among conventional nuclear reactors, although it was considered a way to reduce the plutonium stockpile.
In its attempts to export nuclear plants, the country has hit major problems wherever it has pitched them. But the government will maintain the export policy as a key component of the administration's strategy for expanding the Japanese economy.
According to the Basic Energy Plan, "Japan is determined to make a positive contribution to enhancing the safety of nuclear energy and the peaceful use of nuclear energy" through exports of nuclear plants.

NRA clears restart of Tokai 2 reactor

Residential areas spread around the Tokai No. 2 nuclear plant in Tokai, Ibaraki Prefecture. (Satoru Semba)

July 5, 2018

The reactor closest to Tokyo is cleared by nuclear watchdog
THE ASAHI SHIMBUN

The Nuclear Regulation Authority approved safety measures at the only nuclear plant in the Tokyo metropolitan area, but questions remain on whether its aging reactor can restart and if its operator will survive.

At a July 4 meeting, the NRA concluded that Japan Atomic Power Co.'s measures to protect the Tokai No. 2 nuclear plant from a severe accident, such as a core meltdown, in a powerful earthquake and tsunami meet the stricter safety regulations put in place in 2013.

"We believe the measures were designed in a way to generate appropriate and sufficient results," Toyoshi Fuketa, chairman of the NRA, said.

The plant is located in the village of Tokai, Ibaraki Prefecture, northeast of Tokyo.

The Tokai No. 2 reactor is the first to pass the NRA's safety regulations among those affected by the 2011 Great East Japan Earthquake and tsunami.

It is also the 15th reactor cleared by the NRA since the quake and tsunami caused the triple meltdown at the Fukushima No. 1 nuclear plant and forced the shutdowns of all reactors in Japan.

The NRA's assessment will become official after it solicits public opinions over 30 days.

However, the plant's sole reactor, with an output capacity of 1.1 gigawatts, will mark the end of its 40-year life span on Nov. 27. Japan Atomic Power will need approval from the NRA by November to extend the reactor's operational life by 20 years.

On top of that, the company will have to obtain NRA approval for details of the company's project to strengthen the facility, also by Nov. 27.

And the company needs the consent of Tokai, host of the plant, as well as Ibaraki Prefecture and five neighboring cities.

About 960,000 people reside within 30 kilometers of the Tokai No. 2 plant, making it the most crowded 30-km zone around nuclear power facilities in the nation.
Nuclear power plant operators normally gain approval for reactor restarts only from the host community and the prefectural government.
But Japan Atomic Power in March reached an agreement with Tokai village and the five cities to reactivate the plant only after they all endorsed the restart.
Last month, the Mito municipal assembly adopted a motion objecting to the restart of the Tokai No. 2 reactor.
Central government guidelines call on municipalities sitting within 30 km of a nuclear facility to devise evacuation plans in advance.
Mito, with a population of 270,000, has not secured places for 90,000 potential evacuees. In fact, only three of the 14 municipalities around the Tokai No. 2 nuclear plant have come up with evacuation plans so far.
The establishment of evacuation plans is not a legal requirement for restarting a nuclear power plant.
But local leaders have said they will take it into consideration when they weigh their decision on the Tokai No. 2 reactor.
One other problem facing Japan Atomic Power is that the NRA's screening procedures have been stalled.
If further delays cause the company to miss the deadline for submitting required documents to the NRA, Japan Atomic Power could be forced to decommission the plant.
The Tokai No. 2 reactor is the only unit that the company can bring back online in the near future.
Of the company's four reactors, two are already on their way to be decommissioned.
Prospects for restarting the No. 2 reactor at its Tsuruga plant in Fukui Prefecture are slim because many seismologists have said an active geological fault runs under the reactor building.
The Tokai No. 2 reactor appears to be Japan Atomic Power's last chance for survival.
The company is expected to spend 174 billion yen ($1.58 billion) on safety measures, including construction of a sea wall to protect the plant against tsunami.
Japan Atomic Power used to supply power to Tohoku Electric Power Co. and Tokyo Electric Power Co. before the Fukushima disaster. The two utilities said they will provide funds for Japan Atomic Power's measures.

July 4, 2018

Nuclear watchdog OKs restart of aging nuclear plant hit by tsunami
TOKYO (Kyodo) -- Japan's nuclear watchdog on Wednesday gave the green light to the restart of an aging nuclear power plant northeast of Tokyo, idled since it was hit by the tsunami that caused meltdowns at the Fukushima Daiichi plant.

- 【Related】Japan Atomic's Tokai No. 2 plant set to pass restart screening
- 【Related】Japan approves 70-year plan to scrap nuclear reprocessing plant

The Tokai No. 2 plant is the first nuclear plant affected by the March 2011 earthquake and tsunami disaster to have cleared screening by the Nuclear Regulation Authority, part of the steps required before it can actually resume operations.

The plant, located in the village of Tokai in Ibaraki Prefecture, suffered an emergency automatic shutdown of its reactor and was cut off from its external power source following the quake.
After being hit by a 5.4-meter tsunami, one of its three emergency power generators was incapacitated. But the other two remained intact and allowed the reactor to cool down three and a half days after the disaster.
Despite the approval by the NRA, the Tokai plant still needs to clear two more screenings by regulators by November, when it will turn 40 years old, otherwise it could face the prospect of decommissioning.
Tougher safety rules introduced in the post-Fukushima years prohibit in principle the operation of nuclear reactors beyond 40 years. But extending a unit's life for an additional 20 years is possible if operators make safety upgrades and pass regulators' screening.
Actual plant operation is unlikely before March 2021 when construction to bolster safety measures is scheduled to be completed. The restart plan also needs to be approved by local municipalities.
The Tokai No. 2 plant, operated by Japan Atomic Power Co., uses a boiling water reactor, the same type as those used at the crisis-hit Fukushima Daiichi plant, which saw core meltdowns and spewed a massive amount of radioactive materials into the atmosphere in the 2011 disaster.
It is the eighth plant approved of a restart under the stricter safety rules introduced after the 2011 Fukushima nuclear crisis and the second with a boiling water reactor following the Kashiwazaki-Kariwa nuclear plant run by Tokyo Electric Power Company Holdings Inc.
The plant's evacuation plan -- which covers 960,000 residents, the largest number of potential evacuees for a nuclear plant in Japan due to its location in a metropolitan area -- has yet to be compiled.
The operator filed for a safety screening to restart the plant in May 2014. It predicts a potential tsunami as high as 17.1 meter and expects some 180 billion yen ($1.63 billion) is needed to construct coastal levees and beef up power sources among other safety measures.
Japan Atomic Power solely engages in the nuclear energy business but none of its reactors has been online since the 2011 quake. Given its financial problems, the NRA has asked it to show how it will finance the safety measures and Tokyo Electric Power and Tohoku Electric Power Co. have offered to financially support the company.

Ikata-3 gets OK to restart

September 26, 2018

High Court Allows Restart Of Japan's Ikata-3 Reactor
https://www.nucnet.org/all-the-news/2018/09/26/high-court-allows-restart-of-japan-s-ikata-3-reactor
Plant Operation
26 Sep (NucNet): The Hiroshima High Court yesterday accepted an appeal by Shikoku Electric Power Company allowing it to restart the Ikata-3 nuclear power plant in Ehime Prefecture in southern japan, saying worries over a volcanic eruption damaging the plant are groundless.
The decision is a reversal of the court's earlier provisional injunction that demanded the utility halt the unit until the end of this month, citing safety risks associated with potential volcanic activity in a nearby prefecture.

The temporary suspension order was issued in December 2017 following a request from a local opposition group. It was the first case in which a high court had prohibited operations at a nuclear plant since the 2011 Fukushima-Daiichi accident led to a nationwide shutdown of all nuclear plants pending safety inspections.

Following the court's decision, Shikoku Electric said it will restart the 846-MW pressurised water reactor unit on 27 October. The unit has been offline for maintenance since October last year.

Mayor of Naka,Ibaraki opposed to restart of Tokai 2

October 24, 2018

Naka mayor opposed to Tokai No.2 restart
https://www3.nhk.or.jp/nhkworld/en/news/20181024_40/

The mayor of a city north of Tokyo adjacent to the host village of the Tokai No.2 nuclear power plant has voiced opposition to putting its reactor back online.

The facility, operated by Japan Atomic Power Company, has met government requirements introduced after the 2011 accident at the Fukushima Daiichi nuclear plant.

It is also expected to win approval next month for extended operation, though it is 40 years old.

Attention is focused on whether the operator can obtain consent from Tokai Village, where the plant is located, and 5 nearby cities before it can restart the reactor.

Naka City Mayor Toru Umino on Wednesday met citizens opposed to the restart.

He said he has no choice but to say no, as it's impossible to draw up a plan to evacuate 960,000 residents in the area.

Umino is the first mayor among those of the 6 municipalities to voice opposition to the restart.

He later said he will ask the company whether the restart will be put on hold if even one of the 6 opposes the plan.

October 23, 2018

Mayor of city near Tokai No. 2 nuke plant to oppose reactor reactivation

https://mainichi.jp/english/articles/20181023/p2a/00m/0na/020000c

NAKA, Ibaraki -- The mayor of this city has revealed that he will oppose the planned reactivation of the Tokai No. 2 nuclear power station in Ibaraki Prefecture northeast of Tokyo in an interview with the Mainichi Shimbun.

- 【Related】 Tokai No. 2 nuke plant passes tighter safety checks introduced after 2011 quake
- 【Related】 Editorial: JAPC pact seeking local bodies' consent for N-plant restart a good move
- 【Related】 Fukushima & Nuclear Power

Toru Umino is the first mayor expressing such a view among the heads of six local municipalities that have sealed a safety agreement with plant operator Japan Atomic Power Co. (JAPC).

His remark in the Oct. 22 interview is significant because the six municipalities including Naka surrounding the nuclear plant have effective right to give consent on the restart of the plant. That right is included in a new safety agreement they signed with JAPC in March about the facility in the village of Tokai, Ibaraki Prefecture.

As a reason for his stance, Umino cited the difficulty in formulating a wide-area evacuation plan that local municipalities are required to prepare for a severe accident at the nuclear complex.

"There's no way we can devise a perfect plan. There would be a terrible traffic jam with cars trying to go through highway tollgates. Bus companies would not send their drivers (to evacuate residents)," said Umino. "It would be safest to keep the reactor offline considering the safety of local residents."

Regarding the local governments' right of consent, Umino said, "In my understanding, the reactor cannot be put back online if even one local municipality opposed it, but the JAPC considers it differently." The mayor also disclosed that his city plans to conduct a large-scale opinion survey on local residents about whether they agree with the resumption of the reactor's operation.

The new safety agreement between the JAPC and the six municipalities stipulates that prior consultation will be held among them before restarting the reactor. However, the pact does not specify a scenario where the opinions of the six local governments are divided over reactivation. The municipalities include the cities of Naka and Mito as well as the village of Tokai.

The central government's Nuclear Regulation Authority (NRA) certified in September that the Tokai No. 2 plant has met the new safety standards introduced in the aftermath of the 2011 nuclear disaster. The NRA also authorized the construction plan for the facility on Oct. 18. In addition, the authority is expected to give the green light to an extension of the operational life of the aging reactor beyond the 40-year rule by Nov. 27, the deadline for the procedure.

Onawaga No.1 to be scrapped

October 25, 2018

Utility plans to scrap reactor at Onagawa plant
https://www3.nhk.or.jp/nhkworld/en/news/20181025_33/

Tohoku Electric Power Company has told Miyagi Prefecture that it is going to decommission an aging reactor at its Onagawa nuclear power plant.

The 3 reactors at the plant in northeastern Japan have been offline since the March 2011 earthquake and tsunami.

The utility's president, Hiroya Harada, conveyed its decision to Miyagi Governor Yoshihiro Murai on Thursday.

Harada explained that additional safety steps would create technical difficulties as the No.1 reactor is more than 30 years old. The measures are required under government regulations that were introduced after the 2011 disaster.

Murai asked Tohoku Electric Power to put top priority on safety in scrapping the reactor as the work is expected to take a long time. The governor also asked the utility to properly disclose information and maintain stable power supplies.

The utility hopes to put the 2 other reactors back into operation. The No.2 reactor is being checked by the nuclear regulator, and the firm is preparing to apply for an inspection of the No.3 reactor.

Utilities have decided to decommission 10 reactors at 7 plants, including Onagawa, since the 2011 disaster at the Fukushima Daiichi plant. They cite the huge cost of additional safety measures. These figures do not include the all 6 reactors at Fukushima Daiichi.

Tohoku Electric to scrap aging Onagawa nuke plant reactor over maintenance costs
https://mainichi.jp/english/articles/20181026/p2a/00m/0na/027000c

Tohoku Electric Power Co. has decided to decommission the idled No. 1 reactor at its Onagawa Nuclear Power Station in the northeastern Japan prefecture of Miyagi, the utility's president Hiroya Harada announced on Oct. 25.

- 【Related】Tohoku Electric to scrap aging No. 1 unit at Onagawa nuclear plant
- 【Related】Tohoku Electric considering decommissioning Onagawa nuke plant reactor
- 【Related】Tokai No. 2 nuke plant passes tighter safety checks introduced after 2011 quake

The company decided to scrap the reactor after determining that it would be burdensome to bring it up to new safety standards implemented in the wake of the Fukushima nuclear disaster triggered by the March 2011 Great East Japan Earthquake and tsunami.

To bring the plant back online, Tohoku Electric would need to greatly strengthen the reactors against earthquakes and tsunamis, and provide measures against terrorism to pass strict screening by the Nuclear Regulation Authority (NRA). Though the company has not provided details of the required work, it is believed it would cost a huge amount.
Furthermore, a rule implemented in the wake of the Fukushima disaster limits the operational life of nuclear reactors to 40 years in principle, and 34 years have passed since the Onagawa plant's No. 1 reactor went into service in June 1984. This means the reactor could only operate for a few years even if it were reactivated.

Additionally, the No. 1 reactor has an output of just 524,000 kilowatts, smaller than the 825,000 kilowatts of the plant's No. 2 and 3 reactors. All three reactors at the plant -- the oldest of four nuclear stations operated by Tohoku Electric -- remain idled in the wake of the 2011 tsunami, which flooded the No. 2 reactor building.

In its basic energy plan, the government has designated nuclear power as an important baseload source of energy, and it aims to increase the rate of nuclear power generation in the country to 20-22 percent of total electricity production by fiscal 2030. This is premised on having around 30 nuclear power reactors in operation, but since the Fukushima nuclear disaster, just nine reactors have passed NRA screening and been reactivated.

The decision to dismantle the No. 1 reactor at the Onagawa plant means that 10 reactors at seven plants -- not including the reactors at the disaster-stricken Fukushima Daiichi Nuclear Power Station in northeastern Japan -- have now been slated for decommissioning.

"Even if other nuclear power plants are reactivated in the future, unless exemptions are permitted to allow the reactors to operate for up to 60 years, then reactors will start being decommissioned one after another. Reaching the target nuclear power ratio in (Japan's) energy is quite a high hurdle," an official at one major power company commented.

Ikata reactor restarted

Shikoku Electric restarts Ikata nuclear reactor
October 27, 2018 (Mainichi Japan)

https://mainichi.jp/english/articles/20181027/p2g/00m/0dm/050000c#cxrecs_s

MATSUYAMA, Japan (Kyodo) -- Shikoku Electric Power Co. on Saturday restarted a reactor at the Ikata nuclear power plant in western Japan after a suspension of nearly one year due to a high court order.

- 【Related】Japan court rejects local call to prevent restart of Ikata reactor
- 【Related】Experts divided on court OK for restart of Ikata nuke reactor
- 【Related】Hiroshima High Court overturns injunction against Ikata reactor restart

The restart of the No. 3 unit at the plant in the town of Ikata in Ehime Prefecture, announced by the power company after midnight, came after a Japanese high court accepted an appeal by the utility in late September ruling that there are no safety risks associated with potential volcanic activity in the nearby region.

Shikoku Electric said if all goes smoothly the No.3 unit will reach criticality, a controlled self-sustaining nuclear fission chain reaction, in the evening.

The company said it will start producing and transmitting electricity on Tuesday, before possibly putting the reactor into commercial operation on Nov. 28.

The decision by the Hiroshima High Court was an about-face from its provisional injunction issued in December last year that demanded the power company halt the No. 3 unit, capable of generating 890,000 kilowatts of electricity, until Sept. 30 following a request from a local opposition group.

The group had argued that Shikoku Electric underestimated the risk of pyroclastic flows reaching the plant if a big eruption occurred at the caldera of Mt. Aso, which is about 130 kilometers away.

The temporary suspension order was the first in which a Japanese high court banned operations at a nuclear plant since the 2011 meltdowns at the Fukushima Daiichi complex.

But the high court said Sept. 25 that the group's claim of a possible destructive volcanic eruption during the plant's operating period has no satisfactory grounds and there is a small chance of volcanic ash and rocks reaching the facility.

The reactor had been idle for maintenance since October last year. Before that, it had gone back online in August 2016 after clearing stricter safety regulations implemented in the wake of the Fukushima nuclear disaster.

Shikoku Electric had already decided to decommission the aging No. 1 and 2 reactors at the plant.

The No. 3 unit becomes the eighth reactor to be in operation in Japan at a time when a large majority of reactors in the country remain offline following the 2011 nuclear disaster.

At the time of the meltdowns, Japan had 54 nuclear reactors for commercial use.

20-tear life extension for Tokai 2 approved by NRA

November 7, 2018

Aging Tokai nuclear plant outside Tokyo cleared to restart

http://www.asahi.com/ajw/articles/AJ201811070061.html

THE ASAHI SHIMBUN

The nation's nuclear watchdog on Nov. 7 formally approved a 20-year extension of the only nuclear reactor in the Tokyo metropolitan area, although local communities will have the final say on the restart.

Operator Japan Atomic Power Co. will need the consent of the Ibaraki prefectural government, as well as six local municipalities, including the village of Tokai, where its aging Tokai No. 2 nuclear plant is located.

The company faced having to prepare to decommission the plant's 40-year-old reactor if it failed to meet a Nov. 27 deadline on revised and more stringent safety standards implemented by the Nuclear Regulation Authority in the aftermath of the 2011 nuclear disaster in Fukushima Prefecture.

After the triple meltdown at the Fukushima No. 1 nuclear plant, the operational life of nuclear reactors was set at up to 40 years in principle. But power companies can continue to operate their facilities for an additional 20 years if their reactors pass the NRA screening.

So far, all requests to the NRA to extend the operating life of old reactors have been approved.

The reactor at the Tokai No. 2 plant is the fourth to clear the NRA for extended operations since the Fukushima disaster. It is located about 120 kilometers from the heart of Tokyo.

The 1.1-gigawatt boiling water reactor is the only unit at the Tokai No. 2 plant and is of the same design as the crippled reactors at the Fukushima No. 1 nuclear plant.

The Tokai No. 2 plant was also affected by the tsunami generated by the magnitude-9.0 Great East Japan Earthquake on March 11, 2011.

It is the first time for a reactor affected by the tsunami to be approved for an operational extension. It is also the first boiling water reactor to gain such approval.

The NRA examined the reactor's pressure vessel and other equipment, and concluded that the unit could operate safely until November 2038.

But it remains unclear if Japan Atomic Power can restart the plant under its earliest time frame of 2021, due to local opposition.

In October, Mayor Toru Umino of Naka, one of the six municipalities around the plant, announced his opposition to the extension. The city assembly of Mito, another municipality, adopted a resolution against the extension in June.

About 960,000 people live within a 30-km radius of the plant, making it the most densely populated site among the nation's nuclear facilities.

After the Fukushima disaster, municipalities in close proximity to a nuclear plant were required to craft an evacuation plan to respond to a nuclear emergency.

But only three of the 14 municipalities around the Tokai No. 2 nuclear plant within that range have done so due to the difficulty of arranging transportation for such a large number of people.

Bringing the reactor back online is expected to cost Japan Atomic Power at least 174 billion yen ($1.54 billion), a sum that includes construction of a seawall and other safeguard measures.

The company hopes to have those measures in place by the end of March 2021.
It may well also have to spend tens of billions of yen in the future to meet a new requirement that nuclear facilities are able to contain damage from a terrorist attack.

Plant to restart if Ibaraki prefectural government and six nearby municipalities give their consent

NRA approves extension of tsunami-hit Tokai No. 2 plant, but restart awaits local agreement

https://mainichi.jp/english/articles/20181107/p2a/00m/0na/010000c

TOKYO -- The Nuclear Regulation Authority (NRA) has approved the extension of operations at Japan Atomic Power Co.'s Tokai No. 2 Power Station in the eastern Japan prefecture of Ibaraki by up to 20 years, but the restart of the aging facility still awaits local approval.

- 【Related】Eastern Japan cities sign nuclear accident evacuation accord
- 【Related】Evacuation drill held near nuclear plant in capital of Shimane Pref.
- 【Related】Tokai No. 2 nuke plant passes tighter safety checks introduced after 2011 quake

The government's nuclear regulator made the decision on Nov. 7 after the nuclear plant passed three inspections, including one to see if the complex meets the new regulatory standards introduced in the wake of the March 2011 outbreak of the Fukushima nuclear crisis.

The move could allow Japan Atomic Power to continue operating the atomic power station in the village of Tokai until Nov. 27, 2038.

Attention is now focused on whether the decision will win approval from the Ibaraki Prefectural Government and six municipalities around the station with which the company has signed safety agreements.

Nuclear reactors can be operated for up to 40 years in principle. However, the period of operations at such plants can be extended just once by up to 20 years. The Tokai No. 2 plant's sole unit is the fourth nuclear reactor for which an extension has been approved following the No. 1 and 2 reactors at Kansai Electric Power Co.'s Takahama plant and the No. 3 reactor at the firm's Mihama plant, both in the central Japan prefecture of Fukui.

The Tokai No. 2 station will be the first nuclear plant for which an extension has been approved among those that sustained damage in the March 2011 Great East Japan Earthquake and tsunami. Furthermore, the plant's reactor is the sole boiling-water unit -- the same type as those at the tsunami-ravaged Fukushima Daiichi Nuclear Power Station -- for which an extension of operations has been green-lighted.

Japan Atomic Power applied to the NRA for safety inspections for the Tokai No. 2 power station in May 2014 with an eye to reactivating it and for permission to extend the operations at the plant in November 2017.

The facility would have been decommissioned if it had not passed the three inspections by Nov. 27 this year. Therefore, the NRA barely made the deadline.

The plant's large boiling-water reactor with an output of 1.1 million kilowatts stopped following the Great East Japan Earthquake on March 11, 2011. The power station temporarily lost its external power source. Moreover, it was hit by up to 5.4-meter-high tsunami waves triggered by the temblor, making one of the three emergency power generators unusable. However, the plant used the remaining two generators to continue cooling the reactor core.

Out of reflection on the trouble, Japan Atomic Power has decided to take additional safety measures, including the installation of a reinforced concrete storm surge barrier on the assumption that the plant could be hit by tsunami waves up to 17.9 meters high.
The NRA deemed these safety measures are appropriate in light of the new regulatory standards.

In inspections of the power station to see if its reactor pressure vessel has deteriorated, the atomic power regulator concluded that it can endure the extension of operations beyond the 40-year limit.

Japan Atomic Power intends to secure 174 billion yen to implement these safety measures after receiving financial assistance from Tokyo Electric Power Co. and Tohoku Electric Power Co. and complete the work by March 2021.

The operator of the Tokai No. 2 station has signed safety agreements with five municipalities around the plant besides the municipal government of Tokai that hosts the power station and the prefectural government, effectively allowing these surrounding municipalities to approve or disapprove reactivation of the plant. Japan Atomic Power's agreements with five surrounding municipalities are the first of its kind allowing municipalities other than those hosting atomic power stations to approve or disapprove operations at such plants.

Among the five municipalities, Toru Umino, mayor of the Ibaraki Prefecture city of Naka, has already clarified the city's opposition to reactivation of the power plant.
Japan Atomic Power's Tokai Power Station, situated on the premises that host the Tokai No. 2 plant, is in the process of being decommissioned.

Ikata 3

March 15, 2019

15.03.2019_No53 / News in Brief
Japanese Court Rejects Call To Suspend Operation Of Ikata-3

https://www.nucnet.org/all-the-news/2019/03/15/japanese-court-rejects-call-to-suspend-operation-of-ikata-3

15 Mar (NucNet): A Japanese district court rejected today a plea from local residents to suspend operation of the Ikata-3 nuclear power plant in Ehime Prefecture, southern Japan, local media reported.
The decision by a branch of the Yamaguchi District Court is in line with past rulings by other regional courts and allows the continued operation of Ikata-3, the Mainichi daily said.

The 846-MW Ikata-3 pressurised water reactor resumed commercial operation in September 2016 after owner and operator Shikoku Electric Power Company completed all regulatory safety checks.

Ikata-3 was at the time the fifth reactor in Japan to have restarted commercial operation following the March 2011 accident at the Fukushima-Daiichi nuclear station which resulted in the shutdown of Japan's reactor fleet.

In November 2018, the Takamatsu High Court rejected calls from local residents to suspend operation of Ikata-3, upholding a lower court decision from July the previous year.

The Takamatsu High Court said at the time that the reactor unit poses no danger because it meets stricter safety standards introduced after the Fukushima-Daiichi accident.

According to the Mainichi, concerns about the operation of Ikata-3 have remained among locals, leading them to turn to the courts in search of an injunction.

What's TEPCO doing?

TEPCO takes risk over soaring costs at Tokai nuclear plant

http://www.asahi.com/ajw/articles/AJ201903150001.html

THE ASAHI SHIMBUN
March 15, 2019 at 07:00 JST
Tokyo Electric Power Co. and other utilities are taking a huge gamble by providing hundreds of billions of yen (billions of dollars) to restart an aging nuclear power plant in need of safety upgrades.
Japan Atomic Power Co. intends to resume operations of the one reactor at the Tokai No. 2 nuclear plant in Ibaraki Prefecture in January 2023, but 300 billion yen--nearly double the initial estimate--is reportedly needed to ensure its safety.
TEPCO, which will be provided with electricity from the Tokai plant, will offer 190 billion yen, or two-thirds of the total cost. Tohoku Electric Power Co., Chubu Electric Power Co., Kansai Electric Power Co. and Hokuriku Electric Power Co. will also offer financial support.

But it remains unclear whether municipalities around the plant will approve the plan to restart the reactor.
If Japan Atomic Power fails to win consent from the local governments and is forced to scrap the Tokai No. 2 plant, TEPCO and other power distributors could suffer big financial losses.
TEPCO was effectively turned into a state property after the crisis unfolded at the Fukushima No. 1 nuclear power plant in March 2011. With taxpayers' money injected into it, TEPCO's plan to offer assistance to another operator's nuclear facility that has no clear prospects of restarting will inevitably provoke controversy.
Japan Atomic Power initially estimated safety improvement costs for a levee to block tsunami and other measures at 174 billion yen.
But the estimate has soared partly because of anti-terrorism equipment needed following the plant's restart.
Under Japan Atomic Power's recently released plan, an estimated 120 billion yen is needed between April 2019 and late 2022 in preparation for the plant's restart.
TEPCO, which will buy 80 percent of the electricity generated at the plant, will cover the same percentage of the expenses, or 96 billion yen.
Tohoku Electric will cover the remaining 24 billion yen, or 20 percent of total cost, based on its ratio of power supplied from the plant.
TEPCO is expected to use bank loans to provide "up-front payments" to Japan Atomic Power for electricity sent from the Tokai No. 2 plant.
Tohoku Electric has yet to decide whether to adopt TEPCO's strategy or offer support through the loan guarantee system.
Between January 2023 and March 2024, following the planned restart, an estimated 180 billion yen will be needed to operate the plant. Japan Atomic Power will borrow the funds from banks.
TEPCO will guarantee 96 billion yen of the debt, while Tohoku Electric will guarantee 24 billion yen, and Chubu Electric and other two utilities will guarantee 60 billion yen.
Although Kansai Electric, Chubu Electric and Hokuriku Electric do not receive power from the Tokai No. 2 plant, they will provide assistance, emphasizing that they used to get electricity from the No. 2 reactor at Japan Atomic Power's Tsuruga nuclear plant in Fukui Prefecture.
The Tsuruga No. 2 reactor, whose operations have been suspended, sits directly above an active fault, so it will be difficult to bring the reactor back online.
The three companies' assistance for the restart of the Tokai No. 2 plant could draw criticism from their shareholders.
"It is difficult to find a reason for offering support as we will not receive electricity from it," an insider said. "The move may result in shareholders' filing a lawsuit against the companies' management."
With two of its four reactors being decommissioned, Japan Atomic Power is struggling financially. The reactor at the Tokai No. 2 plant is the only one with prospects of going online.
Japan Atomic Power has not produced any power recently except for immediately after the accident at the Fukushima No. 1 plant. It is barely surviving on annual basic charges totaling 100 billion yen from TEPCO and four other companies that had concluded power supply contracts with it.
If the Tokai No. 2 plant is decommissioned, Japan Atomic Power would be at greater risk of going under, causing severe losses for utilities that have invested in the company.
That is why the utilities are considering extending a helping hand to Japan Atomic Power.

REMAINING UNCERTAINTY, HIGH RISKS

The Tokai No. 2 nuclear plant, which has operated for more than 40 years, passed tougher safety standards in September last year. And in November, the plant was given permission to extend the reactor's operational life by 20 years.
Japan Atomic Power announced on Feb. 22 its intention to resume operations at the plant.
However, the 2011 earthquake and tsunami caused the loss of outside power sources and an emergency power generator to stop at the Tokai No. 2 plant.
Many locals still oppose the restart of the reactor.
Anti-nuclear sentiment was further fueled when Japan Atomic Power set the restart time for January 2023 without holding sufficient talks with the local municipalities.
Six municipalities near the Tokai No. 2 plant have argued that Japan Atomic Power should gain their consent before the reactor restart. However, Japan Atomic Power has not made clear if it regards their consent as essential.
In addition, evacuation plans for nearly 1 million residents within 30 kilometers of the plant have not been worked out.

New Techniques - Alternatives & Renewables

Coal for Fukushima

November 23, 2013

TEPCO, Mitsubishi plan coal-fired power plants at Fukushima

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311230048

REUTERS

The operator of Japan's wrecked nuclear plant and three Mitsubishi group firms plan to build a new type of energy-efficient coal-fired power plants in Fukushima, a source said on Nov. 23.

Tokyo Electric Power Co. (TEPCO) will tie up with Mitsubishi Heavy Industries, Mitsubishi Corp. and Mitsubishi Electric to build integrated gasification combined-cycle (IGCC) stations.

Mitsubishi group companies will have a majority of stake in the new plants while cash-strapped TEPCO will be in charge of running the facilities, which they plan to put online around 2020, the source said.

TEPCO has been under pressure to introduce energy-efficient facilities as all of its nuclear power plants have been closed since the Fukushima disaster, with no immediate prospects of restarting any nuclear plants given public distrust.

Mitsubishi Heavy also aims to be a leading player in the new IGCC technology, which will increase power output by 20 percent from conventional coal power plants, using the same amount of fuel.

Three reactors suffered core meltdowns at the Fukushima No. 1 nuclear plant after the March 2011 earthquake and tsunami that triggered explosions and forced the evacuation of 160,000 people from nearby towns and villages.

CTBTO: New system to track airborne radioactivity

November 27, 2013

CTBTO enhances airborne radioactivity tracking
http://www3.nhk.or.jp/nhkworld/english/news/20131127_11.html

An international nuclear test monitoring body has launched a new system that can predict the movements of airborne radioactivity more quickly and accurately.

The Comprehensive Nuclear-Test-Ban Treaty Organization, or CTBTO, began using the system on Tuesday.

The CTBTO observes airborne radioactive materials and seismic tremors caused by nuclear tests through its facilities around the world. But it can also monitor the dispersion of radioactivity in the event of a nuclear accident.
The new system can locate the source and predict the movements of radioactivity in the air with greater accuracy, at 20 times the speed of previous systems.

Japanese government officials were among the guests at a launch ceremony on Tuesday at the organization's headquarters in Vienna. Japan contributed about 737,000 dollars to upgrade the system in the wake of the Fukushima nuclear crisis.

The CTBTO analyzed the spread of radioactivity during the nuclear accident. Japan expects the international organization to provide accurate and reliable data on the dispersion and effects of radioactivity.

The CTBTO also monitored radioactive materials when North Korea conducted nuclear tests.

Advanced coal plant from TEPCO

November 30, 2013

TEPCO to build advanced coal plants in Fukushima
http://www3.nhk.or.jp/nhkworld/english/news/20131129_43.html

Tokyo Electric Power Company will build 2 advanced coal-fired power plants in Fukushima. The utility says it wants to contribute to the prefecture's recovery from the nuclear disaster.

TEPCO's Fukushima headquarters chief announced the project on Friday. Yoshiyuki Ishizaki said the coal-fired power generation systems will be built on the compounds of 2 existing power plants in Iwaki City and Hirono Town.

Ishizaki said the planned facilities will use both gas and heat from coal to achieve the world's highest level of power-generating efficiency.

Each facility will have a capacity of 500 megawatts and will be operational by the early 2020s.

TEPCO says the project will create up to 2,000 construction jobs per day, and its total economic benefit to the region will amount to 1.5 billion dollars.

Ishizaki said Japan has the top-of-the-line coal gasification technology. He added TEPCO will make sure the investment won't affect nuclear compensation payments or delay the decommissioning of its Fukushima Daiichi nuclear plant.

New aerial vehical to measure radiation

December 16, 2013

IAEA demonstrates aerial radiation monitor
http://www3.nhk.or.jp/nhkworld/english/news/20131216_24.html

The International Atomic Energy Agency has demonstrated an unmanned aerial vehicle designed to measure radiation levels in areas too dangerous for humans to access.

The aircraft on Monday hovered over Fukushima City near the site of the 2011 nuclear accident.

The prototype was designed based on a disc-shaped aircraft used for inspecting post-disaster sites around the world.

Presently, an unmanned helicopter developed by the Japan Atomic Energy Agency monitors radiation levels over evacuation zones in the prefecture.

But the IAEA 6-rotor prototype is easier to maneuver. It can thread its way close to building walls and electric cables.

It is radio-controlled. It can fly on automatic pilot by pre-programming data regarding the topography and buildings in the area.

The IAEA hopes to make the aircraft available to Fukushima prefecture in 2 years after test flights in the no-go zones.

Drone used to measure radiation over Fukushima

January 24, 2014

Radiation monitoring drone tested in Fukushima

http://www3.nhk.or.jp/nhkworld/english/news/20140124_43.html

An unmanned aircraft equipped with a radiation monitoring device has been tested over a town close to the disabled Fukushima Daiichi nuclear power plant.

The remotely-controlled aircraft took off on Friday from the evacuated town of Namie. The small plane circled the area for about 30 minutes and measured ground-level radiation. The results were immediately sent to land-based personal computers.

The drone aircraft was jointly developed by the Japan Atomic Energy Agency, or JAEA, and the Japan Aerospace Exploration Agency, JAXA.

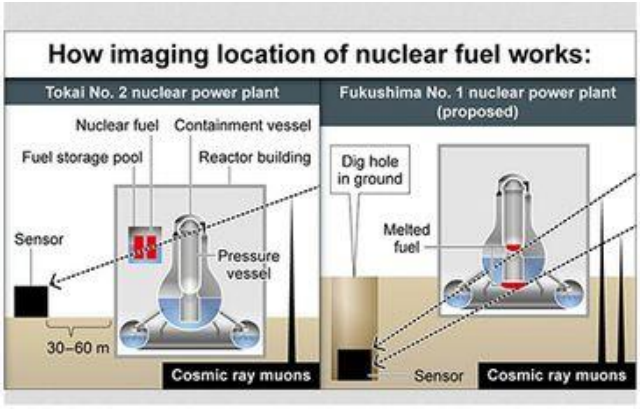
Unlike manned aircraft that must keep a minimum altitude of 300 meters, the drone can fly lower to follow the outlines of an area's topography.

Developers of the aircraft say this greatly increases the accuracy of radiation measurements.

Chief JAEA researcher Tatsuo Torii says he and his team plan to measure radiation in the forests that cover large parts of Fukushima.

More test flights are planned before the drone becomes fully operational in 2015.

New rays to see through reactor



January 24, 2014

Scientists: Cosmic rays can see through nuclear reactor, locate fuel

By JIN NISHIKAWA/ Staff Writer

Japanese scientists have developed a method to use cosmic rays to see through a nuclear reactor, raising hopes for locating and accounting for melted fuel inside the crippled Fukushima nuclear plant.

"Installing several sensors outdoors for a month or so is enough to get a picture of internal structures," said Fumihiko Takasaki, a particle physics scientist at the High Energy Accelerator Research Organization. "Our technology is well established, so I hope it will be used to help decommission the stricken reactors at the Fukushima No. 1 nuclear power plant."

Takasaki and his co-workers installed sensors outdoors at the Tokai No. 2 nuclear power plant in Ibaraki Prefecture between February 2012 and December 2013 to detect muon particles contained in cosmic rays. Muon beams, which are absorbed more easily in high-density materials such as uranium, can be used to obtain see-through images, much in the way of X-ray radiography.

The measurements allowed the scientists to outline the shape of the reactor containment vessel, locate the fuel storage pool and size up the amount of nuclear fuel being stored. The perspective images clearly showed the fuel was stored in two separate sections in the storage pool.

At the Fukushima plant, high radiation levels are preventing workers from staying for a long time inside the No. 1, No. 2 and No. 3 reactor buildings, where meltdowns occurred following the March 2011 Great East Japan Earthquake and tsunami.

Tokyo Electric Power Co., the plant operator, has yet to learn where the nuclear fuel currently lies. The locations and amounts of the melted nuclear fuel should be identified by the time the government and TEPCO plan to start extracting it in the first half of fiscal 2020.

Even if the melted fuel has escaped into the basement levels, it can still be located by installing sensors in underground holes, the scientists said. Each sensor unit weighs 800 kilograms, not including the steel sheets for shielding radiation, and costs around 20 million yen ($200,000), they added.

Japan & geothermal energy

February 6, 2014

Source : The Motley Fool
http://www.fool.com/investing/general/2014/02/06/japan-looks-at-dozens-of-new-geothermal-power-plan.aspx

Japan Looks at Dozens of New Geothermal Power Plants
By Oilprice.com

This article was written by Oilprice.com -- *the leading provider of energy news in the world. Also check out these recent articles:*
In the aftermath of the 11 March 2011 Fukushima Daiichi nuclear crisis, the then ruling Democratic Party of Japan took all of the country's 54 nuclear reactors offline before subsequently restarting two NPP reactors at the Oi nuclear power facility in Fukui Prefecture.

Nevertheless, not unexpectedly, resistance to nuclear power generation nearly three years after the Fukushima Daiichi debacle, which shut down six reactors, remains quite substantial.

Accordingly, seeking alternative power sources has increased, with the result that construction plans for mid-sized geothermal plants is becoming a boom energy concern across Japan in the wake of the 2011 "Great East Japan Earthquake" that effectively destroyed the Fukushima Daiichi six nuclear reactor complex.

As a significant milestone on Japan's increasing diversification of energy sources, in April Chuo Electric Power Co. will open a new geothermal plant in Kumamoto Prefecture, Japan's first geothermal power plant opened since 1999.

The move toward renewables by the world's third largest economy is not insignificant.

Regarding Japan's ongoing power issues the U.S. government's Energy Information Administration noted in its most recent country analysis brief, "Japan is the world's largest liquefied natural gas importer, second largest coal importer... the third largest global net oil importer, is highly dependent on the Middle East for the majority of its supply. It is seeking to diversify its supply sources in Russia, Southeast Asia, and West Africa... Japan relies on LNG imports for virtually all of its natural gas demand... Japan consumed about 37% of global LNG in 2012, as the Fukushima disaster spurred greater demand for LNG in the power sector since 2011. "

As Japan was the world's third largest producer of nuclear power after the United States and France before the Fukushima Daiichi nuclear power plant accident, where to go from here with indigenous power reserves, as opposed to ramping up hydrocarbon imports?

Accordingly, Japan's Ministry of Economy, Trade and Industry has targeted 20 sites across the country for potential geothermal power generation.

And Japan's incipient geothermal power lobby has some long-standing friends.

During a 5 December 2012 speech at the United Nations University in Tokyo, Iceland's ambassador to Japan, Stefan Larus Stefansson, gave an upbeat assessment of Japan's enormous untapped geothermal potential, citing Iceland's 85-year history of success in this area as a model, telling his audience that 66 percent of Iceland's primary energy comes from geothermal resources and in contrast, despite having the world's third-largest potential for geothermal energy, Japan built its last geothermal energy plant in 1999, and all research funding from the government ceased in 2003, while nearly all geothermal turbines in Iceland were constructed in Japan.

Three Japanese industrial concerns-Toshiba, Mitsubishi Heavy Industries and Fuji Electric have a combined total of over half the world market for geothermal turbines, even though currently geothermal power accounts for a mere 0.3 percent of Japan's total electricity production.

But Stefansson's relentless advocacy of geothermal power for Japan may have yet an ace up his sleeve. When in August 2012 Stefansson presented his ambassador credentials to Japanese Emperor Akihito, the monarch expressed great interest in the role of Japan related to global warming, querying Stefansson about Iceland's geothermal energy industry before asking about trade relations between Iceland and Japan.

While the initial kilowatt-hour price of geothermal remains higher than hydrocarbon-based power generation, Japan remains an indigenous power source costing out eventual kilowatt hours after factoring out start-up costs. And, unlike most other renewable energy sources, like hydroelectric power generation, it is available 24/7.

Except for initial sticker shock on start-up prices then, there seems little not to like in Tokyo.

Green energy

March 3, 2014
Nuke-shy firms launch green energy initiatives
by Megumi Iizuka
Kyodo
http://www.japantimes.co.jp/news/2014/03/03/national/nuke-shy-firms-launch-green-energy-initiatives/#.UxSyqIXrV1s

ODAWARA, KANAGAWA PREF. – Moves by businesses and citizens to set up renewable energy plants at the regional level have been spreading in the hope of breaking away from nuclear power in light of the man-made disaster at the Fukushima No. 1 plant triggered by the March 2011 earthquake and tsunami.

In the city of Odawara, Kanagawa Prefecture, Houtoku Energy Co. has been set up by 38 small and midsize companies, including a “kamaboko” fish sausage maker and a fish market.

“After the March 11 disaster, I thought (continuing to rely on nuclear plants) won’t work anymore. Besides, when there is no place to abandon nuclear waste, setting up nuclear plants is just like building apartments without toilets,” Houtoku Energy President Takeo Minomiya said.

In late January, the company set up 256 solar panels on the roof of an elementary school to generate 50,804 kilowatt-hours of electricity a year, enough to run 14 households. It is also building a large solar power plant in the city for 300 households.

The company will sell the electricity to Tokyo Electric Power Co. under a feed-in tariff system that requires utilities to buy electricity generated from renewable energy at fixed prices. The power can also be used at the school during disasters.

"Instead of just lamenting the current situation, we wanted to take action to make Japan a better place," said Minomiya, a former board member of Sony Corp.

Since its establishment in December 2012, Houtoku Energy has raised ¥58 million in investment. In January, it also began soliciting investments worth ¥100,000 each from citizens.

Minomiya said he hopes to take advantage of Odawara's rich natural environment, including its forests and rivers, to generate power from renewable energy. The energy will be used for the region's needs, with the profits passed on to local investors in the form of dividends.

Elsewhere in Japan, citizens have funded solar power plants and wind farms. Such initiatives include Shizuoka Future Energy Co. in Shizuoka Prefecture and Satsuma Shizen Energy LLC in Kagoshima Prefecture.

Some companies are even generating electricity by using food waste, including from "udon" noodles from factories in Kagawa Prefecture and pulp left over from making mandarin orange juice in Ehime Prefecture.

Noriaki Yamashita, senior researcher at the Institute for Sustainable Energy Policies, said there are more than 100 such local-level power plants throughout Japan.

"The 2011 nuclear disaster raised awareness among people . . . and the number of such power plants could explode going forward," if the feed-in tariff system becomes more popular, he said.

The government said in its latest draft energy policy that it considers nuclear energy an important energy source. Japan's most influential business lobby, Keidanren, has been calling for the restart of idled nuclear reactors.

But such views do not represent all business owners, especially small and midsize companies, said Teisuke Suzuki, executive vice president of fish sausage-maker Suzuhiro Kamaboko Co. in Odawara and one of the central figures who drove the movement to set up Houtoku Energy.

He brought together small and midsize businesses nationwide to form the Network of Business Leaders and Entrepreneurs for a Sustainable Business and Energy Future, which holds seminars on renewable energy and helps establish self-sustaining energy systems in communities.

After radioactive cesium was detected in Ashigara tea produced in the area, even though Odawara is about 300 km away from the crippled Fukushima plant, his company lost customers immediately after the disaster started, he said, noting that a clean and safe environment is a prerequisite for any business.

The subsequent rolling blackouts implemented by Tepco, operator of the Fukushima plant, also hit his factory.

"I felt my business was in danger," he said, adding that he realized the need to generate green energy in a regional community so that his company would not be totally dependent on big power companies or the government.

Suzuki's movement slowly gained support from small and midsize companies and the number of business owners supporting the network has grown to about 300, he said.

"We may not be able to do something big from the outset but it is important to start small activities," he said. "By sharing information about local activities to generate green energy, we hope that people in other communities will realize they can also do something themselves."

Robot practice

March 18, 2014
Robot practice for nuclear accidents
http://www3.nhk.or.jp/nhkworld/english/news/20140318_44.html

Workers at a nuclear power plant in Niigata on the Sea of Japan on Tuesday learned how to maneuver a remote-controlled robot in areas of high radiation.

The exercise took place at the Kashiwazaki-Kariwa plant, assuming a scenario in which all 7 of the plant's reactors have lost their power sources following a strong earthquake.

About 350 people, including employees of plant operator Tokyo Electric Power Company, participated in the drill.

The robot moves slowly on a wheeled platform 50 centimeters wide. It features an arm that can reach as far as 2 meters, with a camera at its end. The robot can be controlled from distances of up to 100 meters.

In the nuclear accident at the Fukushima Daiichi plant 3 years ago, radiation levels were so high that workers were unable to enter the area, thus delaying efforts to cope with the accident.

The drill used a robot of the same type as one deployed at the Fukushima Daiichi plant a month after the disaster began.

Watching the robot's movements on a computer display, participants maneuvered around in the rubble and picked things up.

The Kashiwazaki-Kariwa plant's safety center chief, Shiro Arai, says the robot is indispensable for gaining control of a situation in areas that are too dangerous for humans to enter.

Coal-fired plants as an alternative?

March 28, 2014
Utilities looking at coal-fired plants to ensure stable power supply

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201403280064

THE ASAHI SHIMBUN

With the nation's 48 nuclear reactors offline, utilities are looking to construct more thermal power plants, most of which are expected to be coal-fired facilities that are cheaper to operate than ones fueled with liquefied natural gas and crude oil.

Although a drawback to coal-fired thermal power plants is the large amounts of carbon dioxide they emit, their fuel cost is one-fourth that of oil thermal power plants.

Major electric companies are aiming to secure a stable power supply in the mid- to long term through this new construction, which will see the changeover from aging thermal power plants to more cost-effective ones.

Tohoku Electric Power Co. and Kyushu Electric Power Co. included the expansion of thermal power plants in their electricity supply plans for fiscal 2014, which were submitted to the industry ministry on March 27. Tohoku Electric and Kyushu Electric will restart plans to build a unit at the Noshiro Thermal

Power Plant in Akita Prefecture and a unit at the Matsuura Thermal Power Plant in Nagasaki Prefecture, respectively.

Construction on the thermal plants had been frozen after the electricity demand did not increase as much as previously projected.

Chubu Electric Power Co. and Kansai Electric Power Co. announced March 25 and 26, respectively, their plans to construct thermal power plants.

“We concluded that we need new sources of power in terms of the economy and the stability of the electricity supply,” said Akihisa Mizuno, president of Chubu Electric.

Tokyo Electric Power Co. is seeking to build thermal power plants with a combined output capacity of about 6 gigawatts for fiscal 2014, and some additional ones in the future.

The nation is relying on thermal power generation for 90 percent of its overall power needs following the accident at the Fukushima No. 1 nuclear power plant triggered by the March 2011 Great East Japan Earthquake and tsunami. The accident forced the shutdown of the nation's nuclear reactors for safety inspections.

Many of the 48 reactors are not expected to restart soon, if ever, due to their age or location above active seismic faults.

Others must pass new stringent safety standards before being given the green light for a restart.

Since the Fukushima accident, aged and inefficient thermal power plants have been operating at full capacity to make up for the loss of electricity supplied by nuclear power.

However, the increasing imports of fossil fuels needed to operate the thermal plants have weighed heavily on the finances of the electric companies. Therefore the utilities hope to lower the fuel costs through the construction of more energy-efficient facilities.

In regards to the increased carbon dioxide emissions from the coal-fired plants, the electric power industry will be forced to come up with ways to further curb the emission levels.

Reduce greenhouse gases not optional

March 18, 2014

U.N. panel: Reduce greenhouse gases or suffer catastrophic effects

http://ajw.asahi.com/article/sci_tech/environment/AJ201403180044

THE ASAHI SHIMBUN

Greenhouse gases must be cut 40 to 70 percent within 36 years to prevent cataclysmic environmental changes, according to a U.N. panel's draft report that urges an immediate shift away from coal-fired power plants.

The draft report by the Working Group III of the Intergovernmental Panel on Climate Change details how the international community should reduce greenhouse gas emissions to curb temperature increases, including the promotion of renewable energy sources.

The IPCC is expected to finalize the draft at a meeting scheduled for April in Germany.

According to the draft obtained by The Asahi Shimbun, growth in both the world's population and the global economy has accelerated the increase in greenhouse gas emissions since 2000.

The draft report estimates that annual greenhouse gas emissions across the planet were equivalent to 49.5 billion tons of carbon dioxide in 2010, raising the level of greenhouse gases in the atmosphere to around 400 parts per million (ppm)--the highest figure over the past 800,000 years.

To prevent drastic climate changes, the IPCC urges nations to keep temperature increases within 2 degrees compared with levels before the Industrial Revolution in the mid-19th century.

To achieve this goal, the panel advises U.N. member states to take measures to ensure the atmospheric greenhouse gas concentration stays at or below 480 ppm until the end of the century.

It also cites a probability of 50 percent or more that temperature rise will be kept within 2 degrees even if the atmospheric concentration is between 480 ppm and 530 ppm.

According to the draft report, global greenhouse gas emissions must be cut by 40 to 70 percent by 2050 from 2010's figures to keep temperature increases at or below 2 degrees.

It is unclear when emissions will be able to start declining, but as a countermeasure, the panel emphasizes the necessity of shifting to low-carbon and renewable power generation.

As a first step, nations should replace coal-fired power plants with natural gas-fired ones for the time being, the report said.

They should eventually raise the ratio of low-carbon energy, like nuclear power, and renewable power generation, such as solar power and wind electricity generation, by three to four times from the current 17 percent.

The draft report also calls on countries to introduce more energy-saving technologies for traffic systems, building operations and manufacturing industries.

The U.N. panel's previous report released seven years ago emphasized nuclear power and anticipated its expanding market share. But the latest draft points out challenges facing the difficult-to-control power generation method, such as safety and dealing with nuclear waste.

The latest draft report evaluates nuclear power as a mature low-carbon technology but says its global share as an electricity-generating method has been falling since 1993.

TH

Certainly not looking good for small-scale renewables

April 11, 2014
Small-scale renewable energy producer disappointed with new gov't energy policy
http://mainichi.jp/english/english/newsselect/news/20140411p2a00m0na008000c.html

Figures in Japan's renewable energy sector are voicing their disappointment with the government's new basic energy plan, which reaffirms the country's commitment to nuclear power now and in the future.

The plan "has no high (renewable energy) targets, and doesn't contain any measures to support small and medium energy producers. Only the big producers with megasolar stations will survive," said 75-year-old Yoichi Yamakawa, president of Tama Energy LLC, a solar energy firm based in Tokyo's Tama district with small arrays atop universities and other buildings.

Tama Energy's business concept is local power generation for local consumption. The company says that if electricity is generated primarily on a local basis, the business will contribute to the local economy by helping keep people, goods, and money circulating in the community. Plans based on this local power generation model have also been adopted by the city of Odawara, Kanagawa Prefecture, and Fukushima Prefecture's Aizu region, among other bodies.

The new basic energy policy, however, does not give a clear picture of the government's attitude to the promotion of renewable energy.

"This will pluck the sprout of localized energy generation before it even has a chance to grow," lamented Yamakawa.

April 11, 2014(Mainichi Japan)

Koizumi-Hosokawa to promote renewables

April 15, 2014
Former PMs to launch group for renewable energy

http://www3.nhk.or.jp/nhkworld/english/news/20140415_29.html

Former Japanese prime ministers Morihiro Hosokawa and Junichiro Koizumi are moving to launch an organization toward ending Japan's reliance on nuclear power.

Hosokawa ran for Tokyo governor in February with a pledge to work for that goal, but finished third. Koizumi supported him in the campaign.

Sources say a meeting to launch the general incorporated organization next month is to be held in Tokyo on May 7th.

They say the group will promote the use of renewable energy sources to end nuclear power generation in Japan.

They add that it is expected to oppose restarting of nuclear reactors in Japan and its export of nuclear

plant technology. The organization may also support candidates in local elections next year.

All of Japan's 48 reactors at 16 commercial nuclear power plants are offline.
Apr. 15, 2014 - Updated 09:07 UTC

Sakuraichigo

April 18, 2014
New remote-control robot developed to explore nuclear accident sites

The disaster-response robot "Sakuraichigo" navigates a staircase in Tokyo. (Mainichi)
http://mainichi.jp/english/english/newsselect/news/20140418p2a00m0na003000c.html

A new remote-control robot has been developed to explore underground at nuclear power plants in the event of an accident, groups including Chiba Institute of Technology have announced.

The robot, dubbed "Sakuraichigo," was delivered to the Japan Atomic Power Co.'s nuclear emergency situation support center in Tsuruga, Fukui Prefecture, in February. The same type of robot is to soon be

deployed at the stricken Fukushima No. 1 Nuclear Power Plant. Nichinan, a maker of prototypes for cars and appliances in Ayase, Kanagawa Prefecture, worked on the robot's development.

The robot is an upgraded version of the "Quince" robot that has been used to detect contaminated water and photograph the crippled plant since the 2011 disaster. With its robotic arm folded up, it measures just 53 centimeters long and 42 centimeters wide. The robot was made compact so that it would be able to navigate in narrow underground passages at the plant.

The robot is equipped with four cameras as well as instruments for measuring temperature and radiation. It has also been waterproofed to allow it to function within radioactive water at the site, and it can operate wirelessly for around eight hours at a time. During a demonstration to the media, the robot traveled up and down a set of stairs at a 45-degree angle.

Koizumi and Hosokawa launch new association for renewables

May 7, 2014
Former PMs launch group for renewable energy
http://www3.nhk.or.jp/nhkworld/english/news/20140507_45.html

Former Japanese prime ministers Morihiro Hosokawa and Junichiro Koizumi have launched an organization dedicated to ending Japan's reliance on nuclear power.

Hosokawa ran for Tokyo governor in February pledging to work for that goal, but finished third. Koizumi supported his campaign.

The two, along with other founders, held an inaugural meeting of the association in Tokyo on Wednesday.

The group will promote the use of renewable energy sources to end nuclear power generation in Japan.

Group representative Hosokawa referred to an energy plan the government approved last month. Under the plan, nuclear plants will be allowed to resume operation if they meet new safety standards.

Hosokawa denounced the plan, saying the government had not reflected on the 2011 nuclear disaster at all.

He said he campaigned in the Tokyo gubernatorial election determined to fight these absurdities and will continue working to correct what should be corrected.

Koizumi said he had been telling the public that the claim that nuclear generation is safe and low-cost is a big lie.

Koizumi added he will work with Hosokawa to promote renewable energy and create a nation without nuclear power.

The organization plans to hold town meetings across the country. It will oppose restarting nuclear reactors and exporting nuclear plant technology.

The group may also support candidates in nationwide local elections next year.
May 7, 2014 - Updated 13:00 UTC

Convert Fukushima farmland to develop renewables?

June 16, 2014
Gov't looks to deregulate farmland use in Fukushima for renewable energy development
http://mainichi.jp/english/english/newsselect/news/20140616p2a00m0na004000c.html

The government is looking to relax the requirements to convert agricultural land in areas near the crippled Fukushima No. 1 Nuclear Power Plant that are designated as evacuation zones to non-farming purposes to promote construction of renewable energy generators on abandoned farms in the areas.

The move aims at tackling issues surrounding farmland use in 10 municipalities in Fukushima Prefecture, including the towns of Namie and Futaba, which are under evacuation orders.

Agricultural land goes to waste when left abandoned, and farmers in these areas may avoid raising crops in fear of harmful rumors even after evacuation orders are lifted.

Farmland use is strictly regulated under the Agricultural Land Act, except in urban areas. In special zones for disaster recovery, however, converting farmland into non-agricultural uses is allowed as an exception if municipal governments establish restoration plans for local disaster recovery.

Many local governments, however, hesitate to work on farmland conversion as their land reconstruction plans must meet government-set requirements, which stipulate that farm land conversion must be "necessary and appropriate for disaster recovery" and "will not affect development of local farming."

The government is looking to turn the renewable energy sector into a key industry and is considering including plans to reduce necessary procedures for farmland conversion in its growth strategy that the Cabinet is set to approve by the end of June. It aims at simplifying paperwork related to farmland

conversion that must be reported to prefectural and national governments and supporting farmland owners in procedures for land registration and land surveys.

Meanwhile, local farmland owners have requested the government to not just simplify procedures necessary for land conversion but also reduce regulation hurdles.

Prime Minister Shinzo Abe in March mentioned the possibility of including disaster-affected areas in "strategic special zones" that are subject to deregulation.
June 16, 2014(Mainichi Japan)

Japano-Ukrainian satellite to check on Chernobyl and Fukushima

June 19, 2014
Japan, Ukraine to launch 2 nuclear power plant-monitoring satellites
http://mainichi.jp/english/english/newsselect/news/20140619p2g00m0dm071000c.html

TOKYO (Kyodo) -- Japan and Ukraine will jointly launch two small satellites to monitor environmental damage near Japan's Fukushima Daiichi nuclear power plant and Ukraine's Chernobyl power plant, Japanese officials said Thursday.

The space launch vehicle, the Ukrainian-designed Dnepr rocket, will lift off early Friday morning Japan time from the Dombarovsky space center in Russia's Ural region carrying 33 satellites from 17 countries including the two Japanese ones.

Japan's state-run University of Tokyo developed the two satellites, while the rocket is operated by ISC Kosmotras, a Moscow-based joint venture owned by Russia and Ukraine.

The University of Tokyo, Japan's top university, said it has developed the two satellites with low costs with less than 300 million yen (about $2.9 million) per unit.

The joint Japan-Ukraine satellite project would be a key step for Japan's space development efforts with low costs, university officials said.

The launch had been planned for last year but fell behind schedule.

Officials with links with Ukraine had expressed concern about the delay amid worsening ties between Ukraine and Russia, but project leader Shinichi Nakasuka, a professor at the University of Tokyo, said the delay was not caused by the political situation.

The two satellites are the Hodoyoshi-3 and Hodoyoshi-4. The Hodoyoshi-3 satellite measures 50 centimeters by 70 cm and weighs 56.5 kilograms. The Hodoyoshi-4 satellite is slightly bigger at 63.7 kg.

The two satellites will take photos of the two nuclear power plants and surrounding areas regularly and receive data from instruments near the plants, the officials said.

The Fukushima Daiichi nuclear power plant was severely damaged by the March 11, 2011 earthquake and tsunami which hit northeastern Japan. In April 1986, the world's worst nuclear disaster hit the Chernobyl nuclear power station in Ukraine.

Nakasuka said the two satellites will also monitor river levels as part of efforts to prevent flooding. A total of 22 countries, such as Japan, Vietnam, Thailand and Bangladesh, will receive relevant data.

The Dnepr rocket, which was originally developed as an intercontinental ballistic missile named SS-18, was repurposed as a space launch vehicle. The three-stage rocket measures 34.3 meters in height with a diameter of 3 meters.

University of Tokyo officials said the Dnepr rocket has successfully launched satellites 18 times.
Last year, the rocket put into orbit a meteorological satellite for Japan's Weathernews Inc.

New drones for Fukushima plant

June 24, 2014
Drone flying indoors without GPS
http://www3.nhk.or.jp/nhkworld/english/news/20140724_40.html

A university research team in Japan has developed a new drone that can fly indoors without using GPS. It will be used for inspecting the Fukushima Daiichi nuclear power plant.

A research group from Chiba University, along with about 10 firms including Japanese electronics makers, developed the plane. It's about one square meter and has 6 propellers.

Conventional drones need positioning information provided by infrared or other rays to fly indoors where GPS does not work.

The new model has a sensor to allow it to figure out its position and surroundings. It is designed to avoid obstacles.

Global competition is intensifying in the drone market. Amazon and Google are among companies developing unmanned planes.

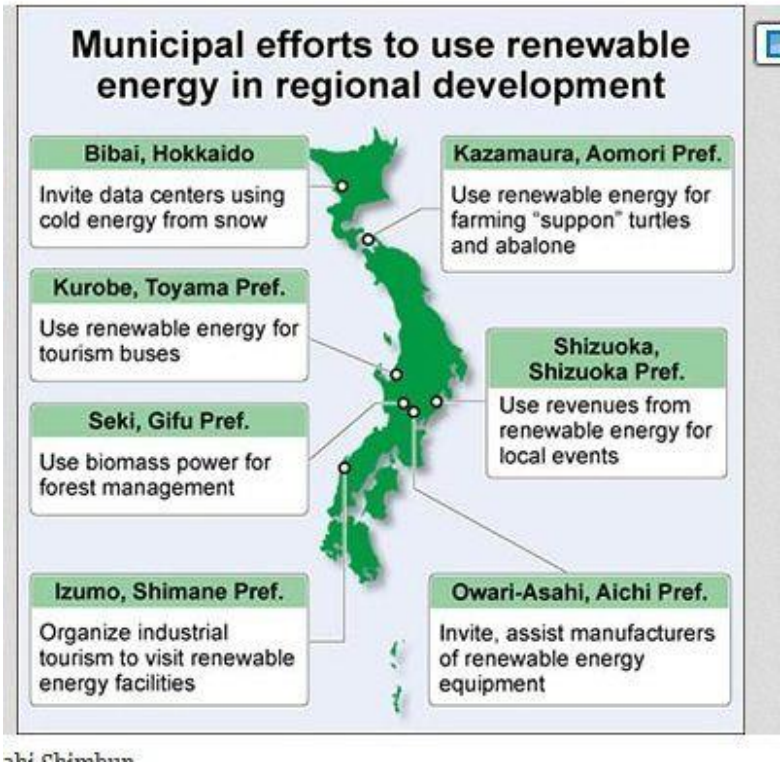
Most municipalities in favor of renewable energy

July 22, 2014
Survey: 80% of municipalities eager to promote renewable energy
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201407220038



THE ASAHI SHIMBUN

About 80 percent of municipal governments across Japan are keen to promote renewable energies in the hope that the new energy sources, technology and sales revenue will help revitalize regional development, a survey shows.

The Asahi Shimbun and Hitotsubashi University carried out a joint survey to mark the second anniversary of the government feed-in-tariff system introduced in July 2012 to kick-start the market for renewable energy.

Of 1,279 municipal governments that responded, 74 percent said they currently operate power facilities using renewable energies.

More than 60 percent said that local governments, corporations and citizens groups are involved in the operation of renewable energy plants, symbolizing local initiatives to promote recyclable energies.

The industry ministry has reported the number of power plants using renewable energy and their outputs in each of the qualified prefectures. But this is the first time that an extensive survey has been conducted to uncover each municipality's scope of use of renewable energies and its willingness to introduce them in the future.

The Asahi Shimbun and a research team of Hitotsubashi University led by Shunichi Teranishi, a specially appointed professor of environmental economics, sent out inquiries to all 1,741 municipalities across Japan and had received responses from 1,279 local governments as of July 21.

Asked why they are promoting recyclable energies, the municipalities said they want to reduce emissions of greenhouse gases, develop sources for local energy production, effectively use idle lands and promote regional development.

Although the municipalities have long purchased electricity and fossil fuels from outside sources, the development of locally produced new energy can play a key role in sustaining their economies, alleviating the impact of population decline.

In Akita Prefecture, about 100 local manufacturing companies are working together to develop a "Made in Akita" wind power generator in a project led by the prefecture and a local bank.

It is an ambitious project to locally produce the more than 20,000 parts needed to construct the wind turbine. Such equipment is currently manufactured by major electronics companies.

"The popularization of renewable energy has increasingly allowed local municipalities to produce electricity on their own," said Tetsunari Iida, director of the Institute for Sustainable Energy Policies. Iida said the development of renewable energies is a move away from the "colony model" of energy consumption, in which local communities depend on outside energy producers.

"It is important for local communities to develop energy sources by their own initiatives and circulate the benefits within their communities," he said.

The survey also said that 284 municipalities cited the lack of sufficient capacity in their local energy transmission network as an obstacle to introduce locally produced energy.

The problem stems from the fact that Japan's energy transmission network is created on a mass production and consumption model, and local networks are given relatively low capacity.

As many as 402 local governments said difficulties in financing is a major obstacle, while 388 cited the lack of know-how.

Although the industrial groups have called for a review of the current feed-in-tariff system on grounds it causes higher utility prices, about 30 percent of local municipalities said the system should be maintained to help promote renewable energy.

No power revolution

August 16, 2014

Power play: the debate over renewable energy

Two years after a new feed-in tariff system for alternative energy went into effect, we discover that the promised power revolution looks more like an evolution

http://www.japantimes.co.jp/news/2014/08/16/business/power-play-debate-renewable-energy/#.U--zYGOnq1s

by Eric Johnston
Staff Writer

On Aug. 26, 2011, the same day that Prime Minister Naoto Kan resigned after widespread criticism of his handling of the meltdowns at the Fukushima No. 1 nuclear power plant that followed the Great East Japan Earthquake and tsunami in March 2011, the Diet passed legislation that created a new feed-in tariff system for renewable energy.

It was a major victory for renewable advocates, who had spent more than a decade pushing for a feed-in tariff system that would kick-start the country's power revolution. However, the system was only approved after weeks of political wrangling between Kan, who wanted it, and the pro-nuclear power village comprised of Ministry of Economy, Trade and Industry bureaucrats, business lobbies such as Keidanren, local and national politicians in the Liberal Democratic Party — who were (and remain) in the pockets of the nuclear industry — and the utilities themselves.

The feed-in tariff system went into effect in July 2012 amid much expectation of new energy revolution. Two years later, though, it might be more accurate to say "evolution" than "revolution."

There is no doubt private investment continues and public support, if anything, is now stronger for renewable energy than it was in 2011. Even though electricity prices have risen between 6 percent and nearly 10 percent for households, and up to 17 percent for industrial users due to a rise in imported fuel costs, media polls earlier this year by Asahi and Kyodo showed that 60 percent of respondents remain opposed to restarting the nation's idled 48 reactors as a way of reducing those costs.

At the same time, however, a host of logistical and engineering issues need to be overcome if the country's supply of electricity from renewable sources is to rise significantly. If large-scale hydroelectric power is excluded, renewable energy is the source of around 2 percent of the nation's electricity consumption at present, according to the most recent calculations.

Data from the Agency for Natural Resources and Energy shows that total renewable energy capacity was just over 30 gigawatts as of the end of April. Of that amount, over 9.7 gigawatts has been added to the grid in the past two years since July 2012. 2012. Of the more than 9.7 gigawatts of power created under the feed-in tariff system, roughly 9.5 gigawatts comes from solar power. And of this amount, about 7.4 gigawatts comes from solar facilities that generate more than 10 kilowatts of power.

But the 9.7 gigawatts that has been added to the grid represents less than one-seventh the 71 gigawatts that has actually been certified in the form of new facilities under the feed-in tariff system. The government has certified 1.2 million renewable energy-related projects, large and small, since July 2012. However, only about 644,000 were actually generating electricity as of April.

By the end of 2013, more than 90 percent of the solar power projects generating less than 10 kilowatts were up and running in Hokkaido, Chugoku, Chubu and and Kyushu. Nationwide, though, only about 10 percent, on average, of solar facilities generating more than 1,000 kilowatts were online, with the percentages for Hokkaido and Tohoku under 5 percent.

In a speech last year in Austria, Ritsumeikan University sociology professor Asami Takehama touched on some of the fundamental challenges facing the spread of renewable-generated electricity in Japan. First, she said, inter-zone transmission grids are weak, which means that even if you can produce a lot of renewable energy in, say, Hokkaido, where the grid is largely controlled by Hokkaido Electric Power Co., you can only send a limited amount of electricity to the grids in Tohoku or Tokyo Electric Power Co.

In addition, Takehama said, the utilities do not have to give priority access to using electricity generated by renewables under the new feed-in tariff system. The law states that utilities can refuse such electricity if it "unreasonably" harms their profits.

Finally, the utilities are still not legally obligated to expand their current grids to connect to renewables, moves that, given that current nationwide grid system, would involve huge expenditures.

"Tepco and the monopolies can refuse connection to the grid for whatever reason they choose," says Andrew DeWit, a professor in the School of Policy Studies at Rikkyo University and an expert on the country's renewable energy policy.

These barriers help explain the huge gap between the 9.7 gigawatts of renewable electricity capacity since July 2012 and the 71 gigawatts worth of renewable energy that has actually received official approval since then.

"The (feed-in tariff) system was not designed properly. The government didn't expect such an explosive growth of solar power. They just introduced a very simple registration process and put the burden of checking the details on the utilities," says Mika Ohbayashi, director at Japan Renewable Energy Foundation.

"The utilities check all necessary documents for starting grid connection operations, but the registration process is handled by each district METI branch," she added. "Only a few people at each branch are tackling the enormous number of submissions, and we can imagine they are just automatically giving permission to all applicants and passing them along to the utilities."

The current feed-in tariff system is set up so that applicants are guaranteed the fixed rate for their project once it has been accepted. Those who want a higher tariff rush to register before the end of the fiscal year before a new, lower tariff goes into effect the following year.

The latest figures show virtually all investors are still going into solar power, where, initially, the feed-in tariff was ¥42 per kilowatt-hour before being reduced to between ¥32 and ¥37 per kilowatt-hour earlier this year, for either 10 or 20 years depending on the type of project. As many solar power projects are able to generate electricity well below that rate, prospective candidates have expressed an interest to invest knowing they'd be paid ¥42 or even ¥32 per kilowatt-hour over an either 10- or 20-year period by the purchaser (depending on the size of the project).

The other renewables covered by the feed-in tariff system — wind, geothermal, mini-hydro and biomass — lag behind solar in terms of new investment but some are attracting more attention among certain players. In an attempt to garner more offshore wind investment, the government this year created a feed-in tariff of ¥36 per kilowatt-hour over 20 years for that category. The feed-in tariff for onshore wind facilities is ¥22 per kilowatt-hour over 20 years.

Companies such as Toshiba, Hitachi and Sumitomo Electric are investing big in offshore wind power. A 2011 Environment Ministry estimated its potential at 1,600 gigawatts and onshore potential at 280 gigawatts. At the moment, onshore facilities have a cumulative capacity of about 2.7 gigawatts nationwide. However, offshore wind farms still face massive costs and technical challenges.

"Wind development should have focused onshore," DeWit said. "Offshore wind in Japan confronts a few technical challenges such as a steeply sloping subsea (no continental shelf), although it has enormous potential."

It remains unclear, however, whether such potential can be realized at a cost-competitive rate. The jury's also still out on the exact role regional governments and Tokyo should take in providing incentives for fostering new projects and providing financial incentives. Such issues are of particular interest to those parts of Japan that are seen as having particularly good prospects for renewable energy development and where, increasingly, local politicians see renewable energy investment as a way to revive local economies, regardless of what the central government decides.

In the central government's long-term strategic energy plan, released in April, much of the media focus was on the role nuclear power would play in the coming years. In the end, the pro-nuclear power administration of Prime Minister Shinzo Abe — backed by influential lobby groups such as Keidanren, the power utilities and local governments hosting nuclear power plants that are deeply reliant on associated central government subsidies — announced that "nuclear power is an important base-load power source as a low carbon and quasi-domestic energy source."

The report neither called for the phasing out of nuclear power, as many antinuclear advocates hoped, nor said it would remain a critical part of the nation's energy mix, as many pronuclear advocates wanted. Thus, there is some confusion on both sides as to what the government plans to do with nuclear power in the coming years.

In the long-term plan, Abe and his government also categorize nuclear power as a quasi-domestic energy source, even though the fuel for the country's reactors is all imported from abroad (most of Japan's oil, coal and natural gas is also imported).

The energy plan did include a section on fully domestic renewable energy sources but the outlook, at least for the next few years, was cautious at best.

"Renewable energy has various challenges in terms of stable supply and cost at this moment, but it is a promising, multi-characteristic and important energy source that can contribute to energy security as it can be domestically produced free of greenhouse gas emissions," the English translation of the report said.

If Tokyo appears somewhat hesitant to fully embrace renewable energy, localities from Hokkaido to Kyushu appear to remain willing to move forward. A survey conducted last month by Hitotsubashi University and the Asahi Shimbun of 1,700 local governments showed that 80 percent were keen to support local renewable energy projects in the hope that sales from the electricity generated could be used to cover things such as local education costs and social welfare services for the elderly, as well as provide new employment opportunities.

A large part of what is driving the hope is the potential for certain regions. By some calculations, Hokkaido has enough wind power to generate the equivalent of 150 nuclear power plants. Local towns in the farming area of Obihiro have also begun projects to convert agricultural waste into biogas and biomass fuel.

In Tohoku, there is a particularly strong effort at the community level to create local renewable energy projects. As of April, more than 32,000 small- and large-scale renewable energy facilities had been certified in Fukushima Prefecture alone under the feed-in tariff system, although only about 13,000 had actually started up.

And while, nationally, renewable energy sources account for less than 2 percent of the mix, the picture looks very different at a local level. Japan Status Report 2014 notes that eight prefectures, mostly in Kyushu and Tohoku, as well as Nagano and Toyama, supply at least 10 percent of their electric power and heat from renewable sources. Oita, Toyama and Akita prefectures lead the nation, with more than 15 percent of their electricity coming from renewables, mostly geothermal and mini-hydro.

In the end, however, it will be a combination of local and regional initiatives, political leadership and a national strategy that is more proactive toward renewable energy development that will determine how quickly, and to what extent, Japan shifts out of other fuel sources and into renewables.

Ohbayashi says the national government, at the very least, needs to make the feed-in tariff system more profitable. The government should not only earmark subsidies for large, established firms but also for individuals and small groups, she said. It should offer assurances of grid connections, low-interest loans and more transparent procedures.

DeWit says that funding allotted for renewables also needs to be spent more effectively. "The central government has thrown a lot of money at renewables and energy efficiency since 3/11, but the funds are often not used as effectively as they might be," he says. "That indicates the 'bottom up' local governments need to do more, linking local and regional initiatives with civil society and hungry private-sector players."

Over the coming years, the electricity market is scheduled to be liberalized further, with legislation to end regional monopolies and give consumers more choice. By 2020, the last stage of liberalization, in which

utilities will have to separate their power generation and transmission operations, is expected to take place.
While such moves are likely to create more renewable energy opportunities — especially at the local level in places where there is already abundant energy and local political will to tap it — the guiding principles of Japan's national energy policy have always been a "best" energy mix that is "safe, stable and secure" and renewable energy is still viewed with suspicion in that regard.
Thus two years after the creation of the feed-in tariff system, it's clear that Japan's renewable energy industry — growing in importance and moving forward in many parts of the country — is still, at the national policy level at least, seen as risky and costly in terms of overcoming various economic and logistic problems. Everyone agrees that the potential remains great, and that technologies are improving, making solar, wind and other alternatives more cost-efficient. Virtually all predications, even among staunch pro-nuclear advocates, suggest that renewable energy will play a more important role for Japan in the years to come.
However, entrenched political interests and public concerns, especially in large urban centers, about the lights going off and electricity bills increasing if renewable energy is ramped up too quickly remain. Any combination of national policy measures, private technological innovation and local government incentives that leads to greater renewable energy use overall will have to overcome this mentality first.

Thermal power for Kanagawa?

August 26, 2014

TEPCO mulls building highly efficient thermal power plant in Kanagawa

http://mainichi.jp/english/english/newsselect/news/20140826p2a00m0na025000c.html
Tokyo Electric Power Co. (TEPCO) is considering building a highly efficient coal-fired thermal power station jointly with Electric Power Development Co., a Japanese electricity supplier, in a suburban city of Kanagawa Prefecture.
As TEPCO sees no prospects for the restart of the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture due to opposition from local residents, the company is looking to boost electricity output with relatively cheap thermal power to prepare for potential price competition when Japan's electricity market is liberalized in 2016.
TEPCO and Electric Power Development Co., better known as J-Power, are looking to build a new thermal power plant on the premises of the currently idled Yokosuka Thermal Power Station in Kanagawa Prefecture and start its operation by the 2020s. The project is expected to cost some 200 billion yen.
TEPCO will finalize the new thermal station plan in consideration of a joint fuel-procurement and thermal power project under negotiation with Chubu Electric Power Co. and other companies.
The planned thermal station will generate electricity in an integrated gasification combined cycle, in which power is generated with gasified coal fuels. It will increase power generation efficiency by around 15 percent, allowing the plant operator to reduce greenhouse gas emissions and offer cheaper electricity.
TEPCO and J-Power mull making a joint bid for the thermal power generation of some 6 million kilowatts in a tender TEPCO plans to offer this fiscal year.
Coal-fired thermal power accounted for 16 percent of the electric output TEPCO generated in fiscal 2013, while more costly liquefied natural gas (LNG) made up 63 percent of TEPCO's total electricity output.

Meanwhile, the average of LNG-generated power among 10 electric power companies across the country was 44 percent.

New way to measure radiation in reservoirs

September 21, 2014

Atomic Energy Agency finds more effective way to measure radiation in reservoirs

http://ajw.asahi.com/article/sci_tech/technology/AJ201409210005
By CHIKAKO KAWAHARA/ Staff Writer
The Japan Atomic Energy Agency has developed a new way to measure radiation in agricultural reservoirs that will enable the government to streamline decontamination work.
Previously, it had been estimating overall figures in agricultural reservoirs in Fukushima Prefecture, home of the stricken Fukushima No. 1 nuclear power plant, by sampling a few points in each body of water.
The agency's new method uses a detector that is 20 meters long and shaped like a rope. It has a plastic core that emits light when it senses radiation. The surveyors use two boats to drag the detector along a reservoir's bed and take readings across an entire horizontal plane.
"It's a simple method that allows us to get very reliable data," said an agency official.
Fukushima Prefecture has agricultural reservoirs in 3,730 locations. At the end of last year, the prefectural government and the farm ministry's Tohoku regional office examined the mud at the bottom of 1,939 reservoirs. They detected cesium readings of more than 8,000 becquerels per kilogram of mud at 468 reservoirs outside the evacuation zone, which were supplying water for farming at rice paddies and other fields even after the onset of the nuclear crisis triggered by the 2011 earthquake and tsunami disaster.
Outside the zone alone, there were five areas where the readings reached 100,000 becquerels.
Instruments for measuring airborne radiation levels in the atmosphere do not work in water. So far, the agency's surveys have extracted and analyzed mud from one or two locations in each reservoir.

New way to test cesium in water

September 25, 2014

Quicker way found to test for radiation in water

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201409250023
THE ASAHI SHIMBUN
Kajima Corp. and analysis equipment maker Nikkin Flux Inc. have jointly developed equipment that quickly examines large quantities of water for radioactive cesium.
The box-shaped device, measuring 2.2 meters by 2.7 meters, is expected to be used at interim storage facilities for radioactive soil and debris generated from decontamination work due to the Fukushima nuclear disaster.
The equipment is able to analyze 1,800 times the amount of water that conventional systems can, and at nine times the speed, according to officials of the two companies.

For example, it can measure cesium levels in 3,500 liters of water, equivalent to 18 home bathtubs, in about 20 minutes, compared with existing systems that take more than three hours to analyze two liters of water.
The device was developed using general contractor Kajima's waste-water processing know-how and technologies owned by Nikkin Flux, a Tokyo-based company.
The two firms also intend to sell the equipment to general waste disposal facilities, the officials said.

One way of seeing it

September 25, 2014

Kyushu Electric suspends buying renewable energy, fearing supply instability

http://ajw.asahi.com/article/business/AJ201409250029
THE ASAHI SHIMBUN
Kyushu Electric Power Co. on Sept. 25 stopped signing contracts with renewable energy companies, fearing a further expansion of clean energy could lead to an unstable power supply in local areas.
The utility had been buying electricity from private power generators based on the government's feed-in tariff system for clean energy. But the company said the previous day that it would temporarily halt its dealings with clean power stations with an output of 10 kilowatts or more in almost all areas of the Kyushu region.
Kyushu Electric said it will continue accepting surplus power generated by solar panels and other devices of general households.
Many applications for setting up solar panels have been submitted in Kyushu, where the land receives good sunlight and is affordable for solar panel installation.
The number of applications surged before the government reduced the predetermined purchase prices of renewable energies on April 1 because new power operators tried to sell their electricity at higher prices to Kyushu Electric.
According to Kyushu Electric officials, the utility found that its output of solar and wind power would total 12.6 gigawatts if it accepted all applications from private operators. That output could cover about 80 percent of electricity demand in the areas Kyushu Electric serves during peak electric use hours in summer.
However, solar power is an unstable electricity source because it is inevitably affected by the weather and cannot be generated at night.
Sending large amounts of such electricity into power cables can make the electrical frequency unstable and degrade the quality of electricity, resulting in occasional power failures and other problems, Kyushu Electric officials said.

Halting clean energy access

October 1, 2014

Under strain, utilities halt new access to clean energy

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201410010034
By KUNIAKI NISHO/ Staff Writer

T**hree regional utilities have temporarily suspended grid access for new clean energy producers**, citing the risk of overload.
Hokkaido Electric Power Co., Tohoku Electric Power Co., and Shikoku Electric Power Co. said they will not accept new applications from renewable energy developers as of Oct. 1.
Kyushu Electric Power Co. and Okinawa Electric Power Co. have already limited such access.
The move threatens the government's alternative energy push following the Fukushima nuclear crisis that unfolded in 2011.
The utilities said any further increase in their purchase of new energy through the government's feed-in-tariff system could cause blackouts and other glitches due to the limited capacity of their electricity distribution networks.
The government introduced the feed-in-tariff program in July 2012 with the aim of doubling the country's renewable energy dependence from around 10 percent to more than 20 percent.
The program offers attractive rates to alternative energy developers and triggered a boom in clean energy projects, particularly solar power.
The suspensions were announced during a meeting of the industry ministry's New and Renewable Energy Subcommittee on Sept. 30. The ministry set up a working panel the same day to decide the next step.
Okinawa Electric suspended new orders for clean energy from early August, while Kyushu Electric started limiting access from Sept. 25.
The utilities, excluding Okinawa Electric, will continue to purchase surplus energy produced by households.
According to the industry ministry, about half of the solar energy producers using the feed-in tariff system are in the utilities' service areas.
The availability of inexpensive, large land lots has helped solar energy production expand in the zones.
They do not cover the three major metropolitan areas of Tokyo, Osaka and Nagoya.
Solar energy production capacity fluctuates greatly depending on time of day and season, the utilities said.
A surge in energy supply can impair utility distribution equipment and cause blackouts.
The industry ministry's working panel will discuss measures to encourage utilities to continue increasing the procurement of renewable energy, such as creating a system to allow regional utilities to exchange surplus electricity.

Too much clean energy?

October 2, 2014

Clean energy boom challenges power grid

Bloomberg
Four regional utilities stopped signing contracts to buy renewable energy from big solar power plants and other suppliers starting Wednesday, limiting an influx that is testing the nation's electricity grid.
The decision by the utilities serving Shikoku, Hokkaido, Tohoku and Okinawa, and a similar move last week by Kyushu Electric Power Co., threatens to undermine the national push to expand renewable energy supply in the wake of the Fukushima nuclear crisis.
Grid access "has been the largest impediment for clean energy developers in Japan," Mika Obayashi, director of the Tokyo-based Japan Renewable Energy Foundation, said in a statement last week after Kyushu Electric's announcement.

At the heart of efforts by utilities to limit clean energy access is the design of the electricity distribution network and whether it is able to handle the flow of intermittent supplies of power from hundreds of different producers. The grid is being challenged and utilities are starting to balk.

Kyushu Electric, which supplies power to almost 9 million residential and business customers, said Sept. 24 that it will suspend responding to applications by developers seeking access to its grid while it reviews how much more clean energy it can handle.

Shikoku Electric Power Co., Tohoku Electric Power Co., Hokkaido Electric Power Co. and Okinawa Electric Power Co. are also restricting access to varying degrees, as blackouts could occur if all output from renewable energy suppliers is transmitted to the utilities' grids, causing overcapacity.

The moves run counter to the efforts of policymakers to promote and increase the use of renewable energy to alleviate the publicly touted plight of energy-dependent Japan.

Japan introduced incentives to encourage renewable energy development in July 2012, offering some of the world's most attractive rates to developers through the feed-in tariff program, which required utilities to purchase electricity generated from renewable sources at fixed prices. A boom in clean energy projects — particularly in solar — resulted.

"The design of the feed-in tariff program could have included clauses to avoid a situation like this," said Takehiro Kawahara, an analyst for Bloomberg New Energy Finance. "The current design did not take into account any measures on matching renewable energy project development with local electricity demand nor ease of integration of approved projects into the existing grid infrastructure."

A working group will be set up to review Japan's grid, including how much access is available for clean energy and how access can be expanded, the Ministry of Economy, Trade and Industry said Tuesday.

About 72,000 megawatts of clean energy projects have been approved since the feed-in tariff program's inception. The bulk of the approvals, or 96 percent, has been solar. Japan had 31,000 megawatts of renewable energy at the end of 2010, according to Bloomberg New Energy Finance data.

Not all clean energy projects qualifying for incentives have been built, signaling various bottlenecks ranging from the availability of land to the cost of equipment and labor. As of June, METI said that 11,090 megawatts of approved projects had started operating, 15 percent of the total.

Kyushu Electric's decision is already affecting developers and installers with plans in the region.

Sanix Inc., a solar-panel installer with headquarters in Fukuoka, said it may shift workers.

"We will inevitably be affected as we won't be able to install systems in areas covered by Kyushu Electric," the company said in a statement Sept. 25. "We will review our plans for hiring, advertising and adding branches to minimize the impact" of the utility's decision, the company said.

Kyushu Electric's decision may also affect a 430-megawatt solar station under development on Ukujima, an island off Kyushu in Nagasaki Prefecture. The project, touted by developer Kyocera Corp. and its partners as the largest in the world to be built on agricultural land, has yet to secure grid access from Kyushu Electric.

"We want to continue talks with Kyushu Electric while gathering more information and working with our partners," Kyocera spokesman Sanae Iwasaki said Sept. 25 after Kyushu Electric's announcement. Orix Corp. and Germany's Photovolt Development Partners GmbH are among Kyocera's partners in the Ukujima project.

Some industry officials say the surge in feed-in tariff applications overwhelmed expectations, meaning utilities had difficulty estimating how much additional power they could take on. But the same phenomena has been witnessed in other countries.

Developers rushed at the end of the fiscal year for approval before the government lowered tariffs for solar projects. In March, Kyushu Electric received about 70,000 applications for grid access, equaling the amount received in the previous 11 months.
"The way solar expanded so abruptly was something that people in the industry didn't anticipate, including myself," said Hiroshi Takahashi, a research fellow at Fujitsu Research Institute who says the tariffs for solar energy were too high. "The scheme has some problems. Developers rush at the end of fiscal year because the tariffs are only changed once a year."
For the Japan Renewable Energy Foundation's Obayashi, the pushback from Japan's utilities is symptomatic of a larger problem. Besides solar, Japan has installed very little in the way of competing clean energy, such as wind or geothermal.
"The serious problem is little growth in renewables other than solar," Obayashi wrote in a Sept. 5 column in which she looked at the challenges to the incentives program.
For wind power, grid access is proving a particularly troublesome hurdle for developers in Japan, Obayashi wrote.
"Operation of grids by power utilities that own generation facilities is obviously problematic in securing fair management in grid connection," she wrote.

Too much clean energy? (2)

EDITORIAL: Measures needed to prevent renewable energy boom from going bust

http://ajw.asahi.com/article/views/editorial/AJ201410040038

The positive growth of electricity production using renewable energy powered by the feed-in-tariff (FIT) system is beginning to show signs of losing steam.
Major power utilities are suspending the acceptance of new entries into the FIT program because the capacity of their transmission lines to take additional electricity has reached its limit in some areas. Of the 10 big utilities that are legally required to purchase all power generated from renewable energy sources at fixed prices, five, including Kyushu Electric Power Co., have stopped making new FIT contracts in almost all the areas they serve.
This inability by utilities to accept all the electricity produced under the FIT program due to capacity deficiency reflects the strong investment interest in renewable energy and the high expectations for the use of green power.
But solar and wind power has one big drawback. The amount of electricity generated with these energy sources tends to fluctuate wildly due to factors such as weather conditions, time of day and the season. Such fluctuations in power generation, unless they are properly adjusted, can affect the frequency and voltage of the power, causing power failures and malfunctioning equipment.
One solution is to expand transmission lines for integrated operations to wider areas so that the effects of the fluctuations in power generation can be buffered more easily.

Thicker power lines between utilities will allow for the transmission of surplus power generated from renewable energy sources in one area, say Kyushu, to other areas where there is demand.
Decisions on investing in power grids in the past had been left up to the individual utilities.
The situation, however, will change when the scheduled power market reform separates the operation of transmission lines from the business of power generation. This will encourage investment in transmission grids based on a broader perspective that is not restricted by the needs of the individual utilities.
Starting in April next year, a new operational entity will take charge of integrating the transmission lines operated by regional power companies. The new body will be responsible for developing trunk transmission lines and connecting lines between utilities.
This new system will make it easier to expand and enhance transmission grids in response to policy needs and requests from power generation companies.
Some issues remain to be sorted out, such as how the costs should be shared. But it is vital to carry through such power system reforms without delay.
It will take time, however, to build up a large network of transmission lines covering wide areas. There are also problems that need to be solved, including the insufficient capacity of transmission lines at locations where they are connected to power plants.
The Ministry of Economy, Trade and Industry will set up a working group to study the formula for calculating the maximum amount of green electricity individual utilities can accept, as well as conditions for such acceptance.
The ministry should consider taking steps to ensure early, preferably ahead-of-schedule, implementation of plans to bolster transformers and storage batteries, instead of leaving utilities to decide when to take these measures.
As for large-scale solar farms, which account for the majority of applications for power sales under the FIT program, the ministry may need to ensure the appropriate scale by using the price mechanism. It can do so, for instance, by reviewing the purchase prices more frequently than the current once a year.
Promoting the use of renewable energy is a global trend. It is important from the viewpoint of developing alternative energy sources that can replace nuclear power and fossil fuels and of tackling global warming.
In its new basic energy supply plan, the government designated about three years from 2013 as a period for "maximum possible acceleration" in the effort to spread the use of renewable energy. It has set a target of increasing the share of clean power as part of the nation's overall electricity production to more than 20 percent by 2030.
The government should figure out ways to prevent the current renewable energy boom from going bust.

Too much clean energy? (3)

October 5, 2014

Unprepared for green electricity

http://www.japantimes.co.jp/opinion/2014/10/05/editorials/unprepared-green-electricity/#.VDFjNxanp1s

Under the feed-in-tariff system introduced in July 2012 by the then Democratic Party of Japan administration, the nation's major power companies are required by law to buy, in principle, all the electricity generated by solar, wind, geothermal and medium-to-small-scale hydro-power sources and biomass at fixed prices.

The purchase costs are to be added to electricity charges. It was hoped that the system would help revitalize local economies and reduce Japan's dependence on nuclear power. Recently, however, one power company after another has announced a decision to stop such purchases.

They say the oversupply of green electricity due to the required purchase of all such power could wreck the stable supply of electricity to businesses and households.

The situation has prompted the trade and industry ministry to prepare for a review of the feed-in-tariff system. Given what has happened, it is clear that the system was not well thought out and needs to be redesigned.

But in the review, the ministry should not use the recent development as an excuse to put a brake on the expansion of power generation through renewable sources and to maintain the weight of nuclear power in the supply of electricity. It should uphold the goal of expanding green power generation, and bring together the accumulated knowledge and technologies of the power and other industries to achieve it.

On Sept. 24, Kyushu Electric Power Co. announced that it would halt the purchase of green electricity in the whole Kyushu region, starting the next day, including putting on hold some 70,000 plans for generation of green power by entities that have applied to Kyushu Electric for contracts to sell the electricity.

Kyushu Electric's decision affected not only the renewable energy businesses but also local governments, including the Kumamoto prefectural government, which had pushed for introduction of green electricity.

Okinawa Electric Power Co. had stopped the feed-in purchases in August.

Hokkaido Electric Power Co., Tohoku Electric Power Co. and Shikoku Electric Power Co. followed the Kyushu power firm with a decision to suspend the purchase of green electricity beginning this month.

Tokyo Electric Power Co. and Kansai Electric Power Co. have also halted such purchases in some parts of the areas serviced by them.

In making their moves, the power companies have cited a clause in the Law on Special Measures Concerning Procurement of Renewable Electric Energy by Operators of Electric Utilities, which exempts them from the duty to buy green electricity if the purchase of such power poses a danger to stable supply of electricity.

Behind their moves is a rapid increase in the volume of green electricity they have had to agree to buy.

Green energy operators rushed to make last-minute applications for electricity sales to the power firms before the government lowered on April 1 the prices at which the utilities must buy power from various renewable energy sources.

The power companies explain that if all the electricity from renewable energy sources is supplied to their transmission grids, the total supply will exceed their capacity, which could lead to stoppage of the power companies' generators.

They also say that the wild ups and downs in the output of solar and wind power due to weather changes will make it extremely difficult for them to adjust the output of their power generators to cope with the fluctuations. If the adjustments fail, it could damage their power grids.

Both cases could result in blackouts.

The government should be blamed for failing to foresee a large number of applications for sale of green electricity to the power companies.

There may be some entities that have applied to the power firms for the electricity purchase contracts without proper investment plans. However, many entities have already carried out necessary investments for power generation through renewable energy sources on the belief that the power firms will fulfill their duty to buy the electricity from them.
The government and the power companies should realize that power from renewable sources accounted for only 2.2 percent of the total electricity generated in fiscal 2013.
Green electricity has the advantages of emitting very little carbon dioxide in the process of power generation. Severe accidents like the one that may happen at a nuclear power plant are unlikely. Green power generation facilities scattered around the country reduce the risk of severe power shortages. It is clear that green electricity's weight in total power generation in this country should be sharply increased.
In reviewing the feed-in-tariff system, the trade and industry ministry should not forget this point and should remember that the government's energy basic plan adopted in April calls for reducing Japan's reliance on nuclear power as much as possible as well as for aggressive introduction of renewable energy, citing a government advisory body's document that states that green electricity should account for about 20 percent of the total power generation in 2030.
The Natural Resources and Energy Agency estimates that if all the green energy facilities that have signed feed-in-tariffcontracts with power companies and received approval from the government as of the end of May went into operation, their total output in 2030 would top 20 percent of the nation's total power generation.
Development of large-capacity and high-efficiency batteries, an increase in the capacity of the power grids, including building of transmission lines across different service areas, and upgrading of the facilities to convert the different frequencies of electric currents — 50 Hertz in eastern Japan and 60 Hertz in western Japan — are needed to solve major technical problems inherent to the supply of electricity generated through green sources.
Trillions of yen are estimated to be needed for such projects, and power companies are reluctant to invest. To stimulate such investments, the government should first declare clear percentages as goals in expanding the share of green electricity in the nation's total power generation.
Also important for the government would be to clarify what party or parties should shoulder the cost of such investments — which was left unaddressed when the system was introduced in 2012.

Renewables too important to be left to utilities

Editorial: Gov't must not leave promotion of renewable energy to private utilities

http://mainichi.jp/english/english/perspectives/news/20141007p2a00m0na004000c.html
A dark shadow has been cast on efforts to spread the use of renewable energy.
Major power companies are suspending new applications for access to the power grid from solar- and wind-power suppliers through the feed-in tariff (FIT) system, because supply has soared at a rate that exceeds the capacity of utilities' transmission lines.
To accelerate the spread of power generated from renewable energy sources, the government must take responsibility for expanding the capacities of utilities to take on energy.

Over 10 million kilowatts of electricity is generated from renewable sources in Japan, and when combined with facilities that already have FIT contracts, the total comes out to over 70 million kilowatts. If all such generators were put into operation, the government's goal, as stated in its basic energy plan, to produce over 20 percent of energy through renewable sources in 2030, would be fulfilled.

Under current circumstances, however, such an accomplishment may become just a pie in the sky. The Kyushu, Hokkaido, Tohoku, Shikoku and Okinawa electric power companies have announced that they are temporarily suspending new entries into the FIT system.

The fixed prices at which utilities are required to purchase renewable energy are re-evaluated every April. In March, shortly before that re-evaluation took place, there was a rush of applications from renewable energy producers hoping to sell power -- primarily solar -- at high prices, before prices dropped. As a result, the supply of energy with certification from the Ministry of Economy, Trade and Industry (METI) exceeded the peak demand of the aforementioned five utilities. That means that even if the power companies stopped all of their power generators, there would still be surplus energy if all the renewable power generators were in operation.

Disruption in the balance between energy supply and demand can put excess strain on the power grid, potentially causing large-scale power outages. The utilities say they will spend several months assessing the capacity of their transmission grids in accepting renewable power. We urge them to make the utmost effort to accept as much clean energy as possible, instead of rejecting it because of supply fluctuations.

METI plans to set up a panel of experts to verify the capacities of the five companies' transmission lines. This process is necessary, but that work alone will not solve the fundamental problem of utilities being unable to accept electricity that exceeds peak demand.

Renewable energy farms are mostly located far away from cities, where land is cheap. The current situation of surplus energy could have been predicted when the FIT system was first adopted. The system's design must promptly be reworked.

To expand renewable energy, efforts must be made to strengthen transmission grids across utilities, and allow the buying and selling of power across regions. However, this will cost several trillion yen. At a time when there is no clear vision for the future of energy in Japan, it is too heavy a burden for private power companies to shoulder by themselves. Assistance from the government is indispensable.

Assuming that Japan will continue to use nuclear power, the government estimates that a nuclear fuel cycle program will cost close to 20 trillion yen. At the same time, the expansion of renewable energy projects is essential if we are to reduce our dependence on nuclear energy. Our limited funds should be diverted to the latter.

Reviewing feed-in tarifs for renewables

October 16, 2014

Gov't eyes drastic review of renewable energy feed-in system

http://mainichi.jp/english/english/newsselect/news/20141016p2a00m0na015000c.html

The Ministry of Economy, Trade and Industry has begun considering a fundamental review of the so-called feed-in tariff system which obliges utilities to purchase power generated from renewable sources at fixed prices.

The potential overhaul of the FIT scheme, introduced in July 2012, is being discussed by the New Energy Subcommittee of the ministry's Advisory Committee for Natural Resources and Energy. Renewable energy suppliers were baffled by recent decisions by Kyushu Electric Power Co. and four other utilities to stop signing new contracts to buy renewable energy from solar power suppliers in their service regions.

The industry ministry has since come under pressure to deal with the problem swiftly. Meanwhile, measures to hold down power prices for regular consumers have also emerged as a major issue. The government is likely to be tested on whether it is truly serious about boosting renewable energy supplies.

At the subcommittee meeting on Oct. 15, a number of committee members called for a review of the FIT system, with some of them saying, "Unless solar power generation is curbed, plans to introduce other renewable energy sources will be adversely affected," and, "To stop accepting renewable energy will undermine the credibility of the (FIT) system."

Five utilities -- Hokkaido Electric Power Co., Tohoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co. and Okinawa Electric Power Co. -- have stopped signing new renewable energy purchase contracts. As of June, the industry ministry had certified planned and completed renewable energy facilities with a combined total output of 71.78 million kilowatts -- which would mean oversupplies in the service areas of all five of the above utilities. The electric companies have explained that the excessive renewable supply could destabilize overall power supply and even cause power outage.

In order to expand renewable energy supplies, measures should be taken to improve power transmission networks to allow surplus power to be supplied to other regions, store it in batteries, and curb renewable energy output, among other steps. If such measures are taken, utilities will be able to accept renewable energy even if the output of that energy is increased. In fact, Germany, Italy and Spain are even now maintaining stable local supplies by adjusting power generation and transmission throughout Europe as needed. In Germany and Italy, solar and wind power generation accounts for more than 10 percent of total electricity supply, and about 25 percent in Spain.

Nevertheless, the Japanese industry ministry and power companies failed to take measures to deal with the problem ahead of time. An industry ministry study group suggested in 2010 that battery installations and energy transmission and distribution networks must be improved if solar power output exceeds 10 million kilowatts. But the government and utilities did not take any specific action until June this year, when the renewable energy output was certain to vastly exceed 10 million kilowatts.

On the delay in taking action, the industry ministry said, "Because facilities are designed almost exclusively for solar power generation and the (cost) burden on the people could be increased in the future, we were not able to enhance power transmission lines without reviewing the system."

According to the ministry's estimates, if all the facilities certified under the FIT system by June this year were to go into operation, the cost to purchase renewable energy would amount to 2.7 trillion yen per year, forcing the utilities to put a monthly 935 yen surcharge on electricity bills for an average household. If power transmission cables were to be enhanced to expand the renewable energy supply system, the **financial burden on consumers** would be increased further.

Because of all this, a proposal was made at the subcommittee meeting on Oct. 15 that a questionnaire be conducted to **ascertain how much extra cost consumers could tolerate**. The subcommittee will also

consider placing priority on introducing low-cost renewable energy by having a bidding system to hold down purchase prices. The subcommittee also discussed the need to address the overemphasis on solar power by promoting geothermal power generation, which is far less vulnerable to weather conditions.
The industry ministry is aiming to make its conclusions by the end of this year, so that it will be able to use them for discussions on purchase prices for next fiscal year. There has, however, been little progress in the question of the future "energy mix" -- the ratios of different energy sources in total generating capacity -- because the target for nuclear power output cannot be set until nuclear reactors are actually reactivated, a senior industry ministry official said. **The target for renewable energy output could, in other words, be affected by the ratio of nuclear power output.**
As such, some experts say that it will be difficult to promote renewable energy. At the subcommittee meeting, many panel members voiced opinions against a move to return to the policy of nuclear power dependence, with one saying: "I fear that the problems with the (electricity) system will lead to renewable energy bashing." Another commented, "Nuclear power generation costs money, too."
The decisions by the five utilities to stop signing new renewable energy contracts have caused a stir among renewable energy suppliers and local governments.

October 16, 2014(Mainichi Japan)

Government looks to reassess feed-in tariff system for renewable sources of electricity

Green energy tariffs draw scrutiny

http://www.japantimes.co.jp/news/2014/10/15/business/green-energy-tariffs-draw-scrutiny/#.VD7Y6BanrIU

by Eric Johnston
Staff Writer

A committee involved with the nation's energy policy met Wednesday to discuss revisions to the 2-year-old feed-in tariff system for renewable energy.
It will also investigate a utility that recently halted renewable electricity purchases under the system by claiming it didn't have the capacity to handle the large amounts being generated.
Since the feed-in tariff system was introduced in July 2012, obliging utilities to purchase electricity generated from solar, wind, geothermal, mini-hydro and biomass sources for a fixed price over a fixed period, growth in renewable energy has been rapid.
As of April, about 10 gigawatts of renewable energy capacity has been installed and is underway. Of this, about 7 gigawatts, mostly in solar panels, was installed in fiscal 2013.
But expansion has brought problems. Last month, Kyushu Electric Power Co. announced it was suspending talks with renewable energy suppliers, except for residential solar arrays under 10 kilowatts.

The reason, the company said, was that its grid doesn't have the ability to transmit generated power from all of the approved projects if they went online, and that there was a risk of overloading the grid and creating instability in the supply.
A subcommittee of the industry ministry's Advisory Committee for Natural Resources will look into whether Kyushu Electric really can't handle more renewable electricity, and review grid capacity at the other major utilities. The committee may also allow utilities to go more than 30 days without purchasing renewable electricity, as a way of making it easier to balance supply, capacity and demand.
Under the feed-in tariff program, over 90 percent of the projects approved have been for solar projects. But concerned about over-relying on one source, the government will look at ways to increase the number of other renewable energy projects, especially wind and geothermal. Kyushu has one of Japan's largest concentrations of geothermal resources, and the government says it wants to prioritize easier grid connections for this power source.
The committee is expected to issue a final report by the end of this year and suggest possible new legislation.
Also to be discussed are proposals for a bid system that gives priority to approval of renewable energy projects that can provide electricity at the cheapest possible rates, and for shortening the period when feed-in tariff rates are revised from once a year to twice a year.

How to promote renewables?

October 18, 2014

Editorial: System to facilitate promotion of renewable energy needed

http://mainichi.jp/english/english/perspectives/news/20141018p2a00m0na002000c.html
An advisory council to the Economy, Trade and Industry Ministry has begun reviewing the so-called "feed-in-tariff" (FIT) scheme for renewable energy, where power companies buy electricity generated from renewable energy sources such as solar light, amid rising fears that the balance between power demand and supply could be disturbed due to utilities being flooded with offers in this regard.
Five power suppliers including Kyushu Electric Power Co. have stopped signing new contracts to buy electricity generated from renewable energy sources. However, since such sources account for only about 2 percent of total power used in the country (excluding hydroelectric power), the introduction of renewable energy should not be systematically hindered even if the FIT scheme needs to be reviewed.
Renewable energy sources play a key role in stepping up countermeasures against global warming, while decreasing the country's reliance on nuclear power. From a long-term perspective, therefore, the government should set a high target for introducing renewable energy while achieving a balance between the spread of such energy sources and the burden on consumers.
The FIT scheme was introduced in July 2012. By this past June, the total output of power generation facilities that operated using renewable energy had reached 11 million kilowatts. This was roughly 50 percent more than the amount before the introduction of the system -- thereby highlighting the FIT's effect in promoting the introduction of renewable energy sources.
The problem is that solar light constitutes an overwhelming majority of renewable energy used for power generation. Unlike wind power, solar power generators are easy to introduce insofar as such facilities do not require an environmental assessment by the national government. Power generation facilities using

renewable energy sources, with a total output of some 60 million kilowatts, are not in operation even though they have been approved by the government. A vast majority of these facilities are solar power generators.
The price at which utilities buy electric power generated from renewable energy sources under the FIT scheme is reviewed every April. Since the price charged is that which is in place when the national government approves such facilities, however, power suppliers were flooded with applications for contracts at the end of last fiscal year shortly before the price was lowered this past April.
Under the ministry's plan to revise the scheme, excessive emphasis on solar power would be reconsidered -- and the price to be charged would be that which was in place at the time of the start of operations at such power generators, rather than at the time of government approval. The ministry will also consider setting an upper limit to the burden on consumers, and introducing a market mechanism for the operators of power generation facilities.
A review of the timing for determining the purchase price and promotion of renewable energy sources other than solar lights is appropriate. However, the introduction of the market mechanism needs to be carefully and thoroughly discussed. An extra burden is placed upon consumers since the price of electric power generated from renewable energy sources is added to power charges. On the other hand, renewable energy has drawn attention as a way to revitalize local economies. Certain consideration should be given to such efforts.
If all of the approved power generation facilities using renewable energy are to be in operation, the cost of buying such electricity would amount to 2.7 trillion yen a year, according to an estimate by the Economy, Trade and Industry Ministry. This would increase the extra financial burden on consumers from the current 225 yen to 935 yen per month on average. However, money paid for such electricity will eventually be passed on to regions that host power generators using renewable energy. Therefore, the promotion of renewable energy should be considered from the viewpoint of investing in Japan's future.
The Economy, Trade and Industry Ministry has also begun reviewing each utility's capacity to accept power generated from renewable energy. Power grids need to be reinforced across power companies' service areas to significantly increase the amount of electricity generated from renewable energy. Still, utilities can increase their capacity to accept such power by effectively and efficiently using lines that connect different utilities' power grids.
Pumped-storage power generation facilities, which are often built along with nuclear power stations, should be proactively utilized as power storage batteries to adjust the output of power generated from renewable energy sources.

Green power: Review the power system

October 23, 2014

Planting a green power grid

http://www.japantimes.co.jp/opinion/2014/10/23/editorials/planting-a-green-power-grid/#.VEjr3Banp1s
The sudden decisions by five power companies to stop purchasing electricity from renewable energy sources under a feed-in-tariff (FIT) system have forced the government to start reviewing the system itself.

The review will include possibly introducing a tender system for green power-generating entities hoping to sell electricity to power firms and increasing the weight of wind and geothermal power in the purchase of green power.

But the government should not forget a more important thing than tinkering with the FIT system — improving the power grid and the related technological basis so that the share of green electricity will greatly increase in Japan's total power output. It also must not use the planned restart of nuclear power plants as an excuse to put a brake on the growth of renewable energy sources.

Backed by a call for greater use of green energy in the wake of the March 2011 meltdowns at Tokyo Electric Power's Fukushima No. 1 nuclear power plant, the then Democratic Party of Japan administration introduced the FIT system in July 2012. The nation's major power companies are required by law to buy, in principle, all the electricity generated by solar, wind, geothermal and medium-to-small-scale hydro-power sources and biomass at fixed prices. But Okinawa Electric Power Co. stopped feed-in purchases in August and last month regional power monopolies in Kyushu, Shikoku, Tohoku and Hokkaido announced they will suspend the purchase of green electricity — a course of action made possible by a clause in the FIT law that exempts the power firms from the duty to buy green electricity if the purchase of such power poses a danger to stable supply of electricity.

Behind their move is a rush of last-minute applications by green energy-generating entities to sell electricity to the power companies before the government lowered purchase prices on April 1. As of the end of June, solar power accounted for 96 percent of green electricity approved for future sale to power companies. The power companies argue that they had to stop accepting the applications because either the anticipated oversupply of green electricity to their power grids could lead to the stoppage of their generators or wide fluctuations in the output of solar and wind power due to weather changes will make adjusting their generators extremely difficult. Both cases, it is feared, could lead to blackouts.

The power companies have failed to provide detailed information to back up their arguments. For example, they have not disclosed how much electricity their power transmission lines can send to, or receive from, other power companies; to what extent their power plants — such as thermal power plants using natural gas whose outputs are easily adjustable — can cope with fluctuations of green supplies; and how much excess electricity supplied from renewable sources could be used by pump-storage hydroelectric plants to pump up water during the day to generate power at night.

It is imperative that the power companies make public these figures and other relevant information. This will enable experts and ordinary citizens alike to determine whether the power companies are making sufficient efforts to buy electricity from renewable sources. Only then can there be a discussion of what concrete steps should be taken, including how much to increase the capacity of transmission lines and the specifications for developing more efficient batteries.

Increasing competition in the transmission and distribution of electricity will also help increase the capacity to handle green electricity supplies. The government should speed up the process of separating power transmission and distribution sections from the major power companies, originally scheduled for 2018 or later, and consider the merits of completely shielding new transmission and distribution entities from the control of power companies.

Green electricity, except large-scale hydraulic power, accounted for a mere 2.2 percent of total electricity generated in Japan in 2013. This volume is too small. Given the inherent risks involved in nuclear power generation and the ethical and environmental problems that semi-permanent storage of high-level nuclear waste will cause for future generations, it is logical that Japan should make concrete efforts to greatly increase the percentage of green energy by setting a clearly defined goals while aiming eventually for ending reliance on nuclear power.

Japan & renewable energy

http://www.renewableenergyworld.com/rea/news/article/2014/09/japan-installs-11-gw-of-renewable-energy-in-two-years?cmpid=rss

Japan Installs 11 GW of Renewable Energy in Two Years
Solar energy makes up the most additional energy capacity.

Chisaki Watanabe, Bloomberg septembre 29, 2014 |
Tokyo -- Japan has added 11,090 megawatts of clean energy capacity since July 2012, when it began an incentive program to encourage investment in renewables, according to the Ministry of Economy, Trade and Industry.
Of the total, Japan has added 10,880 MW of solar capacity through the end of June, according to METI data updated on Sept. 26.
Japan, which has a total population of 127 million, has approved 71,780 MW of renewable energy projects, according to the ministry data. Solar accounts for 96 percent of the approved capacity.
In related new, a unit of General Electric Co. and partners will get a 90 billion yen ($822 million) loan from Japanese banks to build a 231-MW solar power station in western Japan.
GE Energy Financial Services, Toyo Engineering Corp., and Kuni Umi Asset Management Co. will build the 110 billion yen station in Okayama prefecture, the companies said in a statement today.
Construction will start in November and the station will start running in 2019, according to the statement.
The Bank of Tokyo-Mitsubishi UFJ, Mizuho Bank, and Sumitomo Mitsui Banking Corp. will serve as lead arrangers of the 22 1/2- year syndicated loan, which will also be provided by regional financial institutions.
Yasuyo Yamazaki, the president and chief executive officer of Kuni Umi Asset Management and a key player in the project, said: “In addition to the Setouchi solar project, we developed a mega-solar power plant in Mito-city Ibaraki Prefecture and started the construction of a woodchip biomass fuel power plant in Kawaminami-cho, Miyazaki Prefecture. Now we are planning a wind farm in Nakadomari-cho, Aomori Prefecture. With these projects, we are contributing to the Ideal Region Development with renewable energy.”
Sushil Verma, a managing director and Japan business leader at GE Energy Financial Services, said: “Japan’s favorable regulatory policies make solar power attractive and diversify the country’s power generation sources. For us, the Kuni Umi project expands our international and renewable energy footprints, which already include investment commitments of $1.8 billion in equity and debt in more than one gigawatt of solar power projects worldwide.”
In addition to capital, GE will supply some of the inverters — marking the debut in Japan of the GE *1 MW Brilliance Solar Inverter,* which eliminates the need for an intermediate transformer, resulting in higher conversion efficiency and superior grid performance, according to GE.

"Drastic reform" needed

November 6, 2014

As I See It: Total picture needed for future electric power system

http://mainichi.jp/english/english/perspectives/news/20141106p2a00m0na005000c.html

Five utilities including Kyushu Electric Power Co. have suspended signing new contracts to buy power generated with renewable energy, such as solar power and wind power, under a system in which major electricity suppliers are required to buy such power at a fixed price. This is because these firms were not fully prepared to accept renewable energy, highlighting the inadequacy of the government's institutional program.

The government, which is now reviewing the system, should proactively and patiently work on drastic reform of the electric power generation and supply system.

The system was launched in July 2012 largely out of reflection of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant that broke out in March 2011. The spread of renewable energy is effective in preventing global warming and power generation using such energy sources has a low risk of accidents. Since businesses that use renewable energy to generate electricity do not have their own power grids, the government requires major power companies to purchase power generated by designated businesses using renewable energy for up to 20 years.

The system is modeled after one in Germany that is an advanced country in terms of the use of renewable energy. However, the five utilities stopped signing new contracts to purchase power generated with renewable energy on the grounds that the amount of such power is likely to exceed their capacity. No wonder the system, which Japan introduced by imitating one in Europe despite power companies not being prepared to accept such power, hit a snag.

To ensure a stable power supply, a demand-supply balance that is perfect must be achieved at all times, according to industry sources. If the supply of power surpasses or dips below demand, it would destabilize the frequency and voltage, which could trigger a power blackout.

However, most renewable energy that utilities are supposed to buy is solar power, which is unstable because the generated amount of such power depends largely on weather conditions. Such being the case, the amount of power could surpass demand on a sunny day, which could cause power outages.

Surplus power should be sold to other utilities that have enough capacity to accept electricity. However, it is technically impossible under the current system. The capacity of power cables connecting power grids owned by different utilities is limited. Therefore, solar power and electricity generated with other renewable energy sources cannot be supplied to these cables in principle because the generating amount cannot be predicted. This is because major power companies have enjoyed regional monopolies and seldom supply surplus power to other firms or receive such electricity from other companies, while the government approved such monopolies.

The service area of Tokyo Electric Power Co. fell seriously short of power following the Fukushima No. 1 plant accident, highlighting the need for power interchange between electric power companies. The government has finally begun to reform the system and set up an organization that will play a leading role in controlling the power interchange next spring. However, the establishment of a broad power interchange system will come later.

A senior official of the Economy, Trade and Industry Ministry admitted that many officials knew that the current system under which power companies are required to buy power generated with renewable energy at a fixed price would be deadlocked sooner or later. Numerous solar power generation companies were set up one after another for the sole purpose of making profits, contributing to the confusion.

Three years have already passed since the law regulating the power purchase system came into force. Nevertheless, the government failed to take any action while being aware of problems with the system, nor did it set a numerical target for expanding the use of renewable energy for power generation. It highlights the irresponsibility of the government while the administration of Prime Minister Shinzo Abe is enthusiastic about restarting nuclear power stations.

The Fukushima Prefectural Government, which regards the spread of renewable energy as the pillar of its disaster recovery efforts, has solicited solar power generation companies to set up power stations in the prefecture. Therefore, an official of the prefectural government expressed concern that the five major utilities' suspension of signing new contracts to purchase renewable energy could adversely affect the prefecture's recovery plans.

Japan lags behind many other countries in the introduction of renewable energy. According to the International Energy Agency, the ratio of renewable energy to the total power generation amount is high among European countries -- 20.9 percent in Germany and 26.4 percent in Spain. The figure comes to 6.2 percent in the United States, but in Japan it is a mere 2.2 percent. The ratio has doubled from the pre-nuclear disaster period, but still remains low. Therefore, Japan needs a system under which utilities are required to buy renewable energy at a fixed price.

Japan should learn from European countries' efforts to expand the use of renewable energy. The power grids of European countries are connected with each other by cables with sufficient capacity, allowing these countries to supply surplus electricity generated with renewable energy to others within the region. European countries are introducing a system to predict the amount of power that can be generated with renewable energy based on meteorological observations and a device to automatically limit the amount of power generated with such energy sources if the supply of electricity is likely to reach a surplus.

The costs of establishing such systems pose a challenge. A study group within the Economy, Trade and Industry Ministry estimates that it will cost 4 to 6 trillion yen to improve power grids owned by utilities to prevent blackouts if the amount of solar power is increased to 53 million kilowatts -- almost equal to power generated by nuclear plants before the outbreak of the Fukushima crisis -- by 2030. The costs of buying renewable energy are added to utility fees consumers pay. As such, if power grids are reinforced, it will further increase the financial burden on consumers. This is one of the reasons why the government has not reviewed the system under which utilities must buy renewable energy at a fixed price.

However, **power companies are expected to spend a combined amount of over 2 trillion yen on safety measures in preparation to reactivate idled nuclear plants. If utilities are prepared to pay such a huge amount of money, they should trim the financial burden of renewable energy on consumers.**

In the German electric power system, top priority is placed on the use of renewable energy while thermal power is used to make up for fluctuations in generation amounts at power stations using renewable energy.

In contrast, Japan puts priority on nuclear and thermal power while pushing renewable energy to the sidelines. In reviewing the system, it is necessary to rectify Japan's excessive reliance on solar energy among various renewable energy sources. However, efforts to spread renewable energy sources must not be dampened. The government and the electric power industry should present a total picture of the future of Japan's electric power generation and supply system in which renewable energy will play a key role.

Robot brings safety, dexterity to Fukushima cleanup arsenal

http://ajw.asahi.com/article/business/AJ201411080026

By MAKOTO UKAI/ Staff Writer

UOZU, Toyama Prefecture--A machinery maker here has developed a "crawling" robot capable of penetrating hard-to-reach areas for decontamination work at the crippled Fukushima No. 1 nuclear power plant.

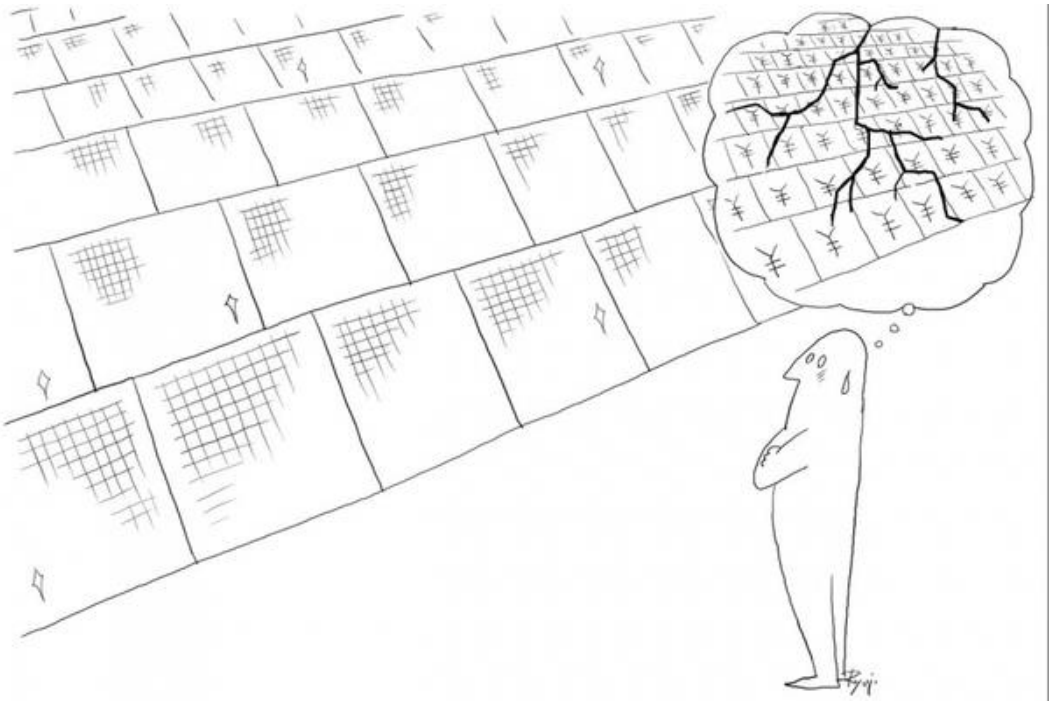
The device, built by Sugino Machine Ltd., moves along on a caterpillar track comprising a belt wrapped around a set of wheels. A user can safely manipulate it up to 100 meters from a contaminated area while viewing live footage from a built-in camera.

The Fukushima plant is scheduled for decommissioning after it was devastated in the Great East Japan Earthquake and tsunami on March 11, 2011.

"This is the first radio-controlled robot in Japan that can get into every nook and cranny of a building. We want it to be used to help decontaminate the Fukushima nuclear power plant," a Sugino Machine official said.

The robot is 110 centimeters long, 70 cm wide and 80 cm tall, making it more compact than a conventional work robot. It is capable of traversing rubble and uneven surfaces to travel to the work site, then use interchangeable equipment mounted on top to suck up dust and dirt, remove contaminants by discharging high-pressure water and perform other tasks.
The device is capable of carrying a load of up to 100 kilograms and has a battery life of five hours. It went on sale in October with a price tag of about 10 million yen ($86,750).
Sugino Machine, known for its high-pressure cleaning and cutting equipment, has been developing machines for use in nuclear-related facilities for nearly 50 years, since Japan started building nuclear power plants.
The company began working on the decontamination robot following the March 2011 disaster, which triggered a triple meltdown at the Fukushima plant.
"Robots that can enter hazardous environments that are off-limits to humans and fully perform work there have a big role to play," said Hideaki Sakai, the 57-year-old manager of the production control department. "We want to promote technological development to help the post-disaster recovery process in Fukushima."

Japan & green energy



A losing bet on green energy

http://www.japantimes.co.jp/opinion/2014/11/25/commentary/japan-commentary/a-losing-bet-on-green-energy/#.VHSXIMl5B1s
“What if our company goes bankrupt?” shouted an official of a company seeking to generate electric power with solar photovoltaics at a meeting on Oct. 3 at which Kyushu Electric Power Co. explained its decision to suspend receiving applications for sale of electricity from renewable energy sources to the power firm.
Under a scheme known as feed-in tariffs (FIT) that the government instituted in 2011, power utilities are required to purchase at fixed prices electric power generated by other entities by using renewable energy

sources. But the scheme has proved to be unworkable as Kyushu Electric's action was followed by Tohoku, Shikoku, Okinawa and Hokkaido Electric Power companies.

The utilities' actions have dealt a serious blow to entities planning to build solar power generating facilities and manufacturers of solar panels. Moreover, entities that have already entered into contract with the utilities for green power sales also fear that the deals might prove unworkable.

When the Diet passed the law to create the FIT scheme, the lawmakers failed to learn from the experiences of Germany, where a similar scheme introduced earlier only was causing heavy burdens on both households and businesses. The most ardent proponent of FIT at the time was then Prime Minister Naoto Kan, who was so enthused about spread of green energy that he made the Diet's passage of the FIT legislation a condition for his resignation.

The current trouble "could have been prevented even after the introduction of the system, had the purchase prices of electricity generated through renewable energy sources been kept at reasonable levels," comments a newspaper reporter who specializes in energy issues.

Kazuhiro Ueta, a Kyoto University economics professor who argues that Japan should free itself from nuclear power and that a broader use of renewable energy sources is key to solving energy problems, served as head of a committee responsible for determining the prices and duration for the purchase by power companies of electricity generated through renewable energy sources. Ueta set the purchase price for electricity from solar panels at ¥42 per kilowatt hour for the initial year of 2012. He contended that by 2030, electricity coming from renewable energy sources should account for 20 percent of the nation's total electricity. But that price was very high compared with the ¥30 per kilowatt hour that was being contemplated by those who were thinking of entering into the solar power generating business. The high purchase price quickly caused bubbles of solar panel installation plans.

Ueta insisted that Japan can't hope to attain a broad use of green energy unless suppliers of such energy are given favorable treatment for the first three years. He said that this would not place a financial burden on citizens because the purchase price will be lowered commensurate with technological progress.

His words now sound like a joke as the scheme has hit a snag halfwaythrough the third year of its existence.

During the past two years, the per kilowatt-hour purchase price of electricity from solar panels was lowered to ¥36 and further to ¥32. But the utilities were flooded with applications from those seeking to sell them electricity from solar panels since the prices of solar panels also fell. As of April, there were solar power facilities with a combined capacity of 71 million kilowatts nationwide. This staggering number came as a surprise even for a high official of the Ministry of Economy, Trade and Industry, which is in charge of the FIT system.

The sudden action on the part of the utilities to suspend acceptance of power-sale applications under FIT has hit the market hard. A company in Miyagi Prefecture had bought property adjacent to its stocking yard in preparation for building a giant solar power generating facility. Its executive says, "We bought the land because we thought that it would have been cheaper than paying rents for the next 20 years. But our project has come to naught."

In Kyushu, there was a boom of building houses equipped with solar panels that can generate more than 10 kilowatts — the upper limit for ordinary households. Their major selling point was that excess power generated by the panels cold be sold to Kyushu Electric Power, thus generating money to pay back housing loans. Following the utility's change of course, many troubles are said to have surfaced with customers' refusal to accept such houses or demand for canceling the contracts.

An example of a large corporation hard hit by the latest change on the part of the power utilities is found in Sanix, Inc., whose stock is listed on the First Section of the Tokyo Stock Exchange. The main line of

business for this Fukuoka-based company is termite extermination. Participation in the FIT scheme was to serve as a shot in the arm for Sanix, whose balance sheets had remained in the red for nine consecutive years before returning to black in March 2012. In the 12 months through last March, the company reported a record ¥84.2 billion in sales and an operating profit of ¥4.5 billion.

But Sanix started facing financial problems after Kyushu Electric Power stopped receiving new applications for electricity sales under the FIT scheme. Sanix is said to have been forced to ask banks for new loans and have fallen into arrears in its payments to other companies, while its stock price, which exceeded ¥1,600 in May, has fallen to a third of that level. Sanix has thus been pushed into an inferno as the banks that know its past history are reluctant to provide new loans, according to an official of a business research company.

Those who made exorbitant profits in the bubbles created by the FIT scheme were not limited to corporations selling and installing solar panels. Leasing companies made contracts for solar panels throughout the country to the point of forming a bubble.

But should a company like Sanix falter, disasters would fall on those leasing companies because they can only claim ownership of the solar power generating facilities. If the landowners of the property on which such facilities were installed demand that the land be returned to its original condition, leasing companies would have no other choice but to dispose of the facilities.

In the case of solar panels with an expected power-sale period of 20 years, many of the leasing contracts were made valid for an unusually long period of 15 years on the assumption that the purchase by power companies of electricity generated by the solar panels is guaranteed and that the market values of the panels are unlikely to depreciate much.

But with the recent change of attitude by the utilities, there has emerged an oversupply of solar panels on the market. There is also a risk of the market values of the panels being pushed down further because no one has confirmed that they will last 20 years.

Uncertainties confronting leasing companies have been aggravated as they themselves have started entering into the solar power generation business on their own. A high-ranking official of a major leasing firm says that Orix Corp., the leader in the leasing business, has committed to solar power projects in a scale exceeding ¥200 billion while other major leasing firms each have committed in a scale of about ¥100 billion. Although an official in charge of credit control of a certain leasing company warned about the risk, the top management did not listen.

A high-ranking executive of a leading leasing company has been quoted as saying at a board meeting, “We will no longer be here when any problem arises.” His statement is irresponsible but he apparently does not notice the imminent dangers.

The about-face by the utilities has shocked many of those who jumped at the solar power business. And there is no prospect at all for the situation to turn better.

This is an abridged translation of an article from the November issue of Sentaku, a monthly magazine covering political, social and economic issues.

Detecting radioactive strontium in less than 30 minutes

December 1, 2014

New technology to speed up detection of radioactive strontium tenfold

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412010027

THE ASAHI SHIMBUN

New updated equipment that is scheduled to go into operation at the Fukushima No. 1 nuclear power plant in December will detect radioactive strontium 90 in contaminated water in less than 30 minutes, compared to the seven to 10 days it now takes.

The advanced detection equipment was developed as part of a group effort centered on the work of Yoshitaka Takagai, an associate professor of analytical chemistry in the Faculty of Symbiotic Systems Science at Fukushima University. Researchers from PerkinElmer Japan Co., based in Yokohama, were also involved in the research.

University officials discussed the plan to deploy one of the new devices Nov. 27.

"We want to reduce the burden on the small number of people working at the plant site," said Takagai. "We also hope that improved efficiency in analysis will, in the long run, lead to a shortening of the time it takes to decommission the reactors."

The improved technology involved making changes to an analytical device so that it automatically separates strontium 90 in order to analyze it in a shorter period of time.

Tokyo Electric Power Co., the operator of the Fukushima No. 1 plant that was damaged by the 2011 Great East Japan Earthquake and tsunami, will use the equipment to test rainwater that has accumulated within containment barriers set up around tanks that store radioactive contaminated water.

The university first announced the completion of the new equipment in September 2013. Further improvements were made after consulting with officials from the plant with an eye toward actual operations. As a result, the accuracy of the analysis has improved tenfold from the first version.

The equipment is now also capable of measuring even lower concentrations of strontium. The minimum level it can detect is 0.3 becquerels per liter. That analysis can be completed in as little as 23 minutes.

Two more of the devices are scheduled for installation in the next fiscal year. The new equipment is designed to screen fresh water, but further efforts will be made to develop the technology so it can also analyze seawater.

Renewable challenge

December 4, 2014

RENEWABLE CHALLENGE: Shizen Energy oriented to communities hosting solar farms

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201412040006

By MARI FUJISAKI/ Staff Writer

Editor's note: This is the first of a two-part series on efforts being made to promote renewable energy sources.

* * *

When fears spread across Japan after the Fukushima nuclear accident started, Ken Isono decided to scrap his plans to travel abroad.

He said the triple meltdown at the Fukushima No. 1 nuclear plant in March 2011 made him feel that his generation had a responsibility to increase power sources that do not harm the natural environment.

That led to the creation of Shizen Energy, a company that promotes renewable energy sources and gives back to the host communities.

The Tokyo-based company started out with just Isono and two of his friends. It now employs about 60 people and has set up solar farms in five prefectures ranging from the Tohoku region to Kyushu that generate a total of 7.5 megawatts of electricity.

Shizen Energy is also involved in an additional 155 power generation plans in 26 prefectures.

One of the company's projects is unfolding in Koshi, Kumamoto Prefecture, located northeast of Kumamoto city. The Koshi area is known for its dairy and vegetable farming because it is blessed with abundant sunlight and fertile soil created by nearby Mount Aso.

In February 2014, about 14,500 square meters of idle land owned by the Koshi municipal government was transformed into a solar power generation facility with a capacity of 1 megawatt.
The facility, situated amid onion fields, features 3,920 solar panels capable of generating enough electricity for about 360 households.
It is jointly operated by Shizen Energy, the Koshi municipal government and Kumamoto Flour Milling Co., a company based in Kumamoto city.
The project is expected to generate about 40 million yen ($347,000) in annual revenue through sales of the electricity to power companies under the feed-in tariff system. The system purchases electricity at higher prices to encourage the promotion of renewable energy sources.
A number of electric power companies have recently said they would temporarily stop buying energy through the feed-in tariff system because the limited capacity of their distribution networks could cause blackouts and other glitches.
At least five utilities have made that decision, affecting about 20 projects that Shizen Energy is involved in. However, Isono, 33, is unfazed.
“We expected this to happen,” he said. “In the meantime, we will proceed with plans that require more time to construct than solar farms, such as wind power generation. We will stop blaming others for our problems.”
Shizen Energy and its partners believe their projects can continue because they help the host communities. For the Koshi project, the company agreed to set aside several million yen a year from its revenues to support local agriculture.
“We hope to have the solar farm here for 20 years,” Isono said. “We want to develop ties with the local community so residents will be able to say they were glad to have the facility.”
Local farmers in their 20s and 30s will decide how the money is used. At a meeting in autumn 2013 to hash out what projects to support, Midori Goto, a dairy farmer, proposed starting an “izakaya” bar and cafe that uses locally grown produce.
In explaining why she became involved in the project, Goto said, “Unlike subsidies, we were able to freely think about how to use the money.”
After graduating from university, Isono developed an interest in environmental business on a visit to the Caribbean. He learned that the blue ocean and mangrove forests were being threatened by oil exploration projects.
Although he later joined Recruit Co., he continued to feel the need to resolve environmental problems through business.
He left Recruit after two years and joined a wind power generation company. However, the reality of wind power was somewhat different from Isono’s ideal.
For one thing, many local residents were opposed to wind power projects because they marred the landscape and the windmills caused noise pollution.
Isono considered moving abroad to work on renewable energy sources. But the accident at the Fukushima No. 1 nuclear power plant changed his plans.
Personal connections were used to get Shizen Energy started. In one case, the father of a company member was asked for permission to install solar panels on the roof of his factory.
Through trial and error, the company developed the ability to handle all aspects of managing a solar farm, from searching for available land to designing, constructing and running the facility.
The start of the feed-in tariff system in July 2012 gave Shizen Energy added momentum. Local governments seeking to install solar farms on idle land were impressed by the stance of Isono and his colleagues to revert benefits to the local community, and orders started coming in to Shizen Energy.

In January 2013, the company entered a partnership with juwi, one of the world's largest solar power generation companies, that has a similar business model as Shizen Energy.
In keeping with the local orientation of the company, Isono also plans to move the company headquarters from Tokyo to Fukuoka city in Kyushu by the end of the year.
"The nuclear accident demonstrated the risks of having businesses concentrated in Tokyo," Isono said. "Rather than being centered in Tokyo, we want to conduct business that leads to more jobs in outlying areas."

COMMENTARY: Fukushima battling utilities' 'no more green energy' decision

http://ajw.asahi.com/article/views/column/AJ201412110019

By TOSHIHIDE UEDA/ Senior Staff Writer
FUKUSHIMA--Officials and entrepreneurs in Fukushima Prefecture remain undaunted by the decision of regional power utilities to suspend purchases of electricity generated with renewable energy sources.
During a meeting in Tokyo on Nov. 18, Fukushima prefectural government officials argued squarely against the rationale being made by the utilities.
"It's like discussing a sentence to punish a case that has yet to take place," said Shuzo Sasaki, director of the prefectural government's energy division. "That could end up shutting out people who are steadily pursuing their renewable energy projects."
He was speaking at an expert subcommittee of the Fukushima prefectural government's coordinating council for promoting the introduction of renewable energy sources.
Five regional utilities--Hokkaido Electric Power Co., Tohoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co. and Okinawa Electric Power Co.--announced in succession at the end of September that they were no longer signing new contracts to purchase electricity generated from renewable energy sources under the feed-in-tariff system.
They said the supply potential could far outstrip demand if the introduction of renewables were to proceed at the current pace.
The expert subcommittee, headed by Ryuichi Yokoyama, a professor of energy engineering with Waseda University, was assembling a recommendation calling on power companies to resume accepting more renewable energy sources since the end of October.

In the case of Tohoku Electric, the provider of electricity to Fukushima Prefecture, the output capacity of solar power plants in its service area, authorized by the industry ministry under the feed-in-tariff system, totaled 10.73 gigawatts as of the end of May.
That compares with a weekday demand of 9.7 gigawatts in May, when the use of electricity is at its lowest, apparently showing that supply would exceed demand if all the plants were to go online.
The figures are deceptive, however.
To start with, solar power cannot be generated at night, and its daytime output depends on the weather.
The power supply would never exceed demand unless multiple chance developments come together, such as a long spell of fine weather over all seven prefectures served by Tohoku Electric--all of the Tohoku region along with Niigata Prefecture--and winds strong enough to keep wind turbines operating at capacity across all that area.
The prefectural government's expert subcommittee finalized the recommendation at the end of November to call on relevant central government ministries and agencies, as well as utilities, to take prompt response measures.

PLANTS AUTHORIZED ONLY ON PAPER

In a draft recommendation to the central government and utilities presented on Nov. 18, the subcommittee pointed to another reason why supply is unlikely to exceed demand.
“The national government and power utilities should eliminate ‘paper-only authorizations’ of power plants by disqualifying operators of stalled projects and create room for accommodating late starters,” part of the document read.
The purchase price for green energy under the feed-in-tariff system is determined at the time of authorization, and remains unchanged for 20 years in the case of a solar power plant with an output capacity of 10 kilowatts or more.
Paper-only authorizations, whereby an operator is granted the right to a project while the locked-in price for power remains high but does not know if it will ever start the project, are spreading throughout Fukushima Prefecture.
The output capacity of solar power plants authorized under the feed-in-tariff system in the prefecture totaled 4.41 gigawatts at the end of July, the largest of all 47 prefectures of Japan. But only 210 megawatts, or less than 5 percent of that figure, were up and running.
For example, no construction project is under way at any one of the 16 authorized large-scale solar power plants in the prefectural capital of Fukushima.
The 16 plants have an average output of 40 megawatts. Building plants of that dimension would require some 80 hectares of land, along with farmland conversion permits, forest development permits, environmental impact assessments and various other procedures.
“But no single application has been received by the prefectural government,” said Sasaki, director of the energy division. “The prefectural government is not aware of any single project.”
Things are no different with smaller plants. Nishigo, a village in the south of the prefecture, has more than 3,800 authorized plants under 50 kilowatts in output capacity, but only 23 of them are up and running.
In the meantime, no power plant has been authorized in the towns of Futaba and Okuma, which co-host Tokyo Electric Power Co.’s Fukushima No. 1 nuclear power plant, the site of the 2011 nuclear disaster.
That is presumably because all residents were evacuated from those towns and are not expected to return any time soon.
The Law on Special Measures for Fukushima Reconstruction and Revitalization says, “As one of the national policies concerning the reconstruction and revitalization of Fukushima following the nuclear disaster, the national government shall take the financial measures necessary for developing and

introducing renewable energy, the financial measures necessary for diversifying energy sources, or other measures as necessary."

But the door was shut to the two towns before they could ever start any efforts for reconstruction and revitalization.

UNRELENTING PURSUIT OF GREEN ENERGY

The utilities' "no more green energy" decision has failed to discourage entrepreneurs from seeking to produce electricity with renewable energy sources for local consumption.

A ceremony in Kitakata, Fukushima Prefecture, on Oct. 29 celebrated the completion of the Oguni solar power plant with an output capacity of 1 megawatt. It was the first megawatt-class solar power plant built by Aizu Denryoku, a company established last year to pursue local production of energy for local consumption.

The group affiliated with the electric power company, headed by President Yauemon Sato, plans to start generating solar power to a total output capacity of 2.54 megawatts by the end of this year.

Aizu Denryoku had planned to expand its operations further the next fiscal year. Tohoku Electric's decision to suspend purchases of electricity generated with renewable energy sources has left most of the company's projects in limbo, but the company knows it cannot afford to wait for Tohoku Electric's response if it wants to proceed.

Aizu Denryoku continues requesting municipal governments and other parties to provide land plots or assistance in other ways so that the company can still expand its operations, be it only slightly, by building more small-scale power plants under 50 kilowatts in output capacity, which are not affected by Tohoku Electric's new policy.

I wrote in a previous commentary about moves by the Tonokuchiseki land improvement agency to initiate micro-hydropower generation along the Tonokuchiseki canal, which draws water from Lake Inawashiroko to the city of Aizu-Wakamatsu, both in Fukushima Prefecture.

"We just cannot afford to stop," Tetsuyuki Sato, chief of the land improvement agency, told me when I visited him a second time. "We have decided to add another employee."

Micro-hydropower plants are also being affected by the utilities' suspensions, but so few of them have been authorized. The industry ministry said it would map out incentives to promote new purchase agreements for micro-hydropower, along with geothermal power and other forms of renewables.

"We will just go on, unaffected, with our project," said Ichiro Endo, president of the Tonokuchiseki micro-hydropower generation company and head of the geotechnical consulting department with Asano Taiseikiso Engineering Co., a Tokyo-based partner in the project. "We hope to begin selling electricity to Tohoku Electric in fiscal 2016."

Hope (maybe) for renewables

December 12, 2014

Eased rules on renewable energy to encourage resumption of utilities' purchases

http://ajw.asahi.com/article/business/AJ201412120058

By KUNIAKI NISHIO/ Staff Writer

The government plans to scrap the limit on electricity generated through solar and wind power stations, paving the way for five power utilities to resume purchases of electricity from renewable energy suppliers early next year.

The government introduced the feed-in tariff program in July 2012 to double Japan's renewable energy dependence from around 10 percent to more than 20 percent.

However, the five utilities--Hokkaido Electric Power Co., Tohoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co., and Okinawa Electric Power Co.--stopped signing contracts with solar and wind power companies earlier this year. They feared the surge of applicants could hamper the stable supply of electricity.

The economy ministry had been considering raising the ceiling on the amount of power the utilities could receive from the renewable energy suppliers. But it instead decided to lift restrictions on the amount of electricity that could be generated by the suppliers.

Currently, electric power companies can order renewable energy suppliers to restrict power generation without providing compensation on 30 days a year.

Under the revisions, utilities can still order suppliers to restrict power generation but on an hourly basis. Under the current rules, the orders are issued a day in advance.

The revisions mean that every power station will need communication devices to allow the utilities to directly control the supply levels.

In addition, the utilities can now only order such restrictions on renewable energy facilities with a capacity of 500 kilowatts or more. The new rules will allow utilities to give such orders to any kind of power station, including those for ordinary households.

The ministry will make its final decisions by year-end.

If the revisions take effect, all renewable energy businesses accepted into the government's feed-in tariff project will be able to provide power to the utilities.

However, the utilities' prices and conditions for buying energy from the suppliers will likely become more stringent, and the government may be forced to restructure the overall project to produce a more profitable business model for the suppliers.

Under the current guidelines, Kyushu Electric and Tohoku Electric will only be able to use about half of the 29 gigawatts of power generated through the project, according to the ministry.

Too much solar for utilities

December 16, 2014

Seven utilities only capable of accepting 58% of solar power energy

http://www.japantimes.co.jp/news/2014/12/16/business/economy-business/seven-utilities-capable-accepting-58-solar-power-energy/#.VJBdIXt1Cic

Kyodo

A study has found that seven of the nation's utilities lack the transmission network capacity to accept all of the solar power energy that suppliers plan to generate under the feed-in tariff system, the Ministry of Economy, Trade and Industry said Tuesday.

Combined, they can only accept 58 percent of the total, METI said, underscoring a major flaw in the scheme introduced two years ago.

The planned amount already exceeds the network capacities of six of the seven utilities.

METI was looking into the transmission capacities of power companies after five utilities recently placed limits on their clean energy intake, citing network limitations and dealing a blow to the government's plan to increase renewable energy supply following the 2011 Fukushima nuclear crisis.
Under the feed-in tariff system, utilities are obliged to purchase all electricity generated from such sources as solar, wind and geothermal power at fixed rates for a set period.
Bu the system ran into a roadblock after new suppliers flooded the solar power business, prompting the utilities to suspend signing power-purchasing contracts in September amid fears that overcapacity could cause blackouts.
METI plans to introduce a system that would allow utilities to ask suppliers to be more flexible with their electricity output.
Solar power suppliers have been approved to provide 40.54 million kilowatts of electricity, but the seven utilities — Hokkaido Electric Power Co., Tohoku Electric Power Co., Hokuriku Electric Power Co., Chugoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co. and Okinawa Electric Power Co. — can only accept a total of about 23.69 million kw, according to METI.
The failure of the feed-in tariff scheme has brought about confusion in suppliers and local municipalities that have sought to promote renewable energy, including prefectures in northeastern Japan hit by the March 2011 earthquake and tsunami.

Buying renewable energy again

December 23, 2014

Five major utilities resuming purchases of renewable energy

http://mainichi.jp/english/english/newsselect/news/20141223p2a00m0na007000c.html

Five major utilities have unveiled plans to resume their signing of contracts to buy renewable energy, with three of them intending to do so in mid-January.
Kyushu Electric Power Co. announced on Dec. 22 that it would resume buying electricity generated through solar power in mid-January. Hokkaido Electric Power Co. and Tohoku Electric Power Co. are also set to follow suit at about the same time. Shikoku Electric Power Co. and Okinawa Electric Power Co. resumed their signing of contracts to buy such renewable energy on Dec. 18.
The utilities decided to resume buying renewable energy after the Ministry of Economy, Trade and Industry decided to introduce a new rule from mid-January to allow utilities to rein in the amount of renewable energy they purchase if their renewable energy output exceeds the capacity of their transmission networks.
Under current rules, power companies can tell suppliers to limit their output of energy generated through solar and wind power without paying compensation for up to 30 days a year, but only for levels reaching 500 kilowatts or more. Under the new rule, the 500 kilowatt restriction will be removed. Additionally, the industry ministry decided to do away with the 30-day limit for the five utilities, as well as for Hokuriku Electric Power Co. and Chugoku Electric Power Co.
Under the change, the seven companies will be allowed to restrict the amount of renewable energy they buy from suppliers without limit if the amount exceeds the purchasable amount calculated by the industry

ministry. The new rule could slow the pace of new entrants into the so-called feed-in tariff system, as suppliers will have a higher risk of failing to sell electricity.
Junichi Komiya, president of Oita Builder, which builds and maintains solar power facilities, voiced concern that there could be a sharp increase in the number of clients cancelling their solar power projects after the 30-day cap on purchase restrictions is abolished. "It might mean withdrawing from projects," he said.
A representative of the industry ministry commented, "Utilities need to carefully explain to what extent they are going to restrict output, so that prospective solar power plant operators can calculate the risk."

Promote renewable energy without overburdening customers

December 24, 2014

EDITORIAL: Rules for renewable energy suppliers should not overburden consumers

http://ajw.asahi.com/article/views/editorial/AJ201412240023
With the nation's major electric power companies suspending the signing of new purchase contracts with suppliers of solar energy and other renewables under the feed-in tariff program, the government has come up with a set of countermeasures.
The utilities suspended accepting suppliers' applications for contracts because the potential supply amounts exceeded the utilities' handling capacities.
The government's countermeasures aim to change the existing rules of sustainable energy supply to render it easier for utilities to control the volumes they purchase from suppliers. In exchange, more suppliers will be able to access the grid. The new rules apply only to suppliers that are newcomers to the business and have no standing contracts yet with the utilities.
Since these are only stopgap measures, they are inevitably imperfect. For one, suppliers that are already generating energy or have signed contracts with the utilities are excluded from the new rules.
The date of the conclusion of the contract is the key element under the new rules. Even if a new supplier were to run its business more efficiently than an established supplier, the latter would be given priority for supplying electricity. One can hardly expect fair competition if the winner is decided by when it started its business, not by its efficiency. The government definitely needs to rework its measures to ensure the survival of competent operators.
We are also concerned that the new rules may overburden consumers.
Since energy purchase costs are calculated by adding a set amount of profit to the supplier's costs and are reflected in electricity charges paid by users, the consumers ultimately bear the additional costs.
According to calculations based on various materials, nearly half the projects have profit rates exceeding the system's initial projections.
The feed-in tariff system guarantees profit to sustainable energy suppliers to encourage newcomers and reduce purchase costs once raw materials come down in price along with wider use of renewable energy. The goal is to enable the renewable energy industry to become self-reliant. But if even all this still places an excessive burden on consumers, the system would have to be improved.
Under the current system, renewable energy suppliers are under no obligation to disclose management information. This prevents consumers from knowing the costs and profits of each operator or power plant.

The government needs to introduce a mechanism that requires operators to disclose business data to consumers. If the government ascertains the financial conditions of established operators and applies the same purchase rules to them and new operators, the feed-in tariff system would be more equitable and should enable additional newcomers to join the club.
If changes are made to the established rules too frequently, operators would be unable to make business projections, and the system itself would lose credibility. However, the renewable energy industry is a new, growing industry where regulations and competition go hand in hand. Certain trials and errors are unavoidable. Germany has implemented a policy of retroactively applying new rules to established operators.
We hope our government will keep trying to improve the system for the bigger goal of promoting renewable energy while minimizing the burden on consumers.
--The Asahi Shimbun, Dec. 24

Multiplying solar power capacity in Tokyo

January 3, 2015

Tokyo aims to quadruple solar power generation capacity by 2024

http://mainichi.jp/english/english/newsselect/news/20150103p2g00m0dm004000c.html
TOKYO (Kyodo) -- The Tokyo metropolitan government has set a goal of quadrupling solar power generation capacity in the capital to 1 million kilowatts by 2024, installing solar panels on the rooftops of buildings including houses and schools, officials said Friday.
The target will be introduced to promote Tokyo as an environmentally friendly city in the run-up to the 2020 Olympics and Paralympics to be hosted by the metropolis, they said.
As of late March in 2013, Tokyo had solar power facilities capable of generating 260,000 kw in total. About 10 percent of newly built detached houses had such facilities, while the ratio was 0.5 percent among existing housing.
It is difficult to set up mega solar power plants in Tokyo due to the lack of land, the officials said.
In fiscal 2015, the Tokyo government is planning to introduce measures to support those who install solar power generation facilities when they renovate their houses.
The metropolitan government also aims to roughly double electricity generated by solar power at schools and housing estates it runs from 10,000 kw in 2014 to 22,000 kw by 2020.
The government will install solar panels on the roofs of its facilities' parking areas in fiscal 2015 and promote the renting of rooftop space by building owners to solar power generators.
"Although Tokyo land prices are high, we'd like to increase solar power generation by utilizing rooftop spaces," a Tokyo government official said.
January 03, 2015(Mainichi Japan)

Renewable energy to secure power in case of a disaster

January 9, 2015

Moves grow to use renewable energy as power source during disasters

http://mainichi.jp/english/english/newsselect/news/20150109p2a00m0na013000c.html

Moves to introduce renewable energy to secure power in case of serious natural disasters have been spreading throughout the country.
In most cases, solar panels are installed on rooftops, and power generated by such systems is usually sold to utilities and used for self-consumption in case of a disaster-triggered power blackout.
Hirotada Hirose, 72, who manages a five-story office building in Shibuya Ward, Tokyo, set up 200 rooftop solar panels, each measuring 1 meter by 1.6 meters, for roughly 20 million yen. The building houses a legal firm office, a beauty parlor and other establishments. The solar panels generate 4,500 kilowatts-hour a month, which is equal to power consumed by 15 ordinary households.
Most electricity generated by the panels is stored in batteries while surplus power is sold to Tokyo Electric Power Co. (TEPCO).
If a serious disaster triggers a power outage, electric power stored in the batteries will be used for lighting and to operate pumps for restrooms among other devices inside the building.
"Evacuation shelters set up after the Great East Japan Earthquake (in March 2011) often got dark because of power blackouts and gasoline used for emergency power generators was in short supply," says Hirose. "Renewable energy is reliable in case of emergencies."
Houtoku Energy, a company in Odawara, Kanagawa Prefecture, which generates electricity using renewable energy, has launched a project to supply power to facilities that will be used as evacuation shelters in case of serious disasters.
The company leases the rooftops of two municipal elementary schools, which will be used as shelters in case of disasters, at low costs to set up solar panels. The company will sell power generated by the solar panels to TEPCO and supply power free of charge to be used for evacuees if the schools gymnasiums are turned into shelters in case of disasters and a power failure occurs.
Odawara was included in areas where TEPCO planned to conduct rolling power blackouts shortly after the outbreak of the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant.
"We hope to prevent power outages in case of natural disasters and help the local community," said a company official.
Five major utilities -- Hokkaido, Tohoku, Shikoku, Kyushu and Okinawa electric power companies -- suspended signing new contracts to buy power generated with renewable energy in September last year. However, these power companies have decided to resume signing new contracts after the Economy, Trade and Industry Ministry is set to enforce rules that will allow utilities to restrict the amount of power they purchase.
Hiroshi Takahashi, senior researcher at Fujitsu Research Institute who is knowledgeable about energy policies, calls for government support for the use of renewable energy to secure power in case of emergencies.
"**The government should provide support for the introduction of renewable energy to generate electricity at the time of natural disasters and other purposes that will contribute to the public utility,"** he said.

TEPCO to promote renewables in Fukushima Pref.

January 9, 2015

TEPCO to provide more support for renewable energy

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jan. 9, 2015 - Updated 10:19 UTC+1
Tokyo Electric Power Company says it will support Fukushima Prefecture's plan to promote renewable energy as a pillar of reconstruction from the 2011 disaster and nuclear accident.

TEPCO President Naomi Hirose met economy minister Yoichi Miyazawa on Friday. Hirose said his utility will make efforts to fulfill its responsibility as the company that caused the accident.

Hirose said **the utility will renovate a seldom-used transformer substation near the damaged Fukushima Daiichi nuclear plant so it can buy electricity generated from renewable energy sources in the prefecture.**

The president of Tohoku Electric Power Company, Makoto Kaiwa, was also at the meeting.

Kaiwa said his company will preferentially buy electricity generated in former evacuation zones in the prefecture.

The utility's service area covers mainly northeastern Japan, including Fukushima and two other prefectures worst-hit by the disaster.

Economy minister Miyazawa said the government will allocate funds to buy battery cells and transmission lines in the draft extra budget for this fiscal year to help introduce green energy sources.

METI proposes reducing buying price of solar energy

January 16, 2015

METI eyes lowering solar energy buying rate under feed-in tariff system

http://mainichi.jp/english/english/newsselect/news/20150116p2a00m0na012000c.html

The Ministry of Economy, Trade and Industry (METI) has proposed lowering the buying rate of solar power but maintaining the prices of other renewable energy at current rates under the feed-in tariff system in fiscal 2015. METI advanced the proposal during a meeting of experts on the system under which utilities are obliged to buy all clean energy at fixed rates.
The system is coming under scrutiny because an unexpectedly large number of new suppliers have entered the solar power business, triggering fears that Kyushu Electric Power Co. and other utilities may face a shortage of capacity to accept such energy leading to blackouts.
The focus now is on how much the panel on assessing procurement prices would lower the price of photovoltaically-generated electricity as it addresses the issue of curbing the costs needed to purchase the electricity on top of electricity prices. METI will set the buying prices of solar and other renewable energy for fiscal 2015 sometime in March after getting the results of the panel's findings.
The buying rate of electricity under the feed-in tariff system is calculated by adding certain profits to power generation costs. But the government has set the buying rate at high levels over the first three-year

period following the launch of the system to promote renewable energy in the aftermath of the 2011 Great East Japan Earthquake and tsunami and subsequent Fukushima nuclear disaster. During the panel's meeting on Jan. 15, METI proposed scrapping the plus profit scheme for corporate solar energy and lowering the price after July this year when the feed-in tariff system marks its third anniversary.
However, METI plans to promote wind, geothermal and other renewable sources at a profit. No such profit is added to photovoltaic power generation for ordinary housing.
METI, citing lower operating costs for photovoltaic power generation, proposed reducing the buying price. But it proposed keeping the current buying prices for other renewable energy sources, saying there are too few examples of power generation through such sources and there is not enough data to warrant a review of their operations.
Since the introduction of the feed-in tariff system in July 2012, the government has sanctioned 73.49 million kilowatts of renewable energy through November last year, with solar energy accounting for more than 90 percent of the total. According to METI's projections, annual purchases would amount to nearly 2.702 trillion yen if all sanctioned renewable energy projects start power generation. Such costs are added to power bills and Japan faces the twin challenges of correcting an overreliance on solar energy and reducing the financial burden on the public.

Power companies reopen doors to solar

January 28, 2015

4 power companies resume purchases of solar power with more control

http://mainichi.jp/english/english/newsselect/news/20150128p2a00m0na004000c.html

Four major power companies in Japan reopened their doors to buying solar power on Jan. 26, as government regulations making it easier for them to restrict their purchases came into force.
The move by Hokkaido Electric Power Co., Tohoku Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co., was a response to new rules from the Ministry of Economy Trade and Industry that give the utilities more flexibility in asking renewable energy suppliers to restrict the amount of power they provide, should the need arise.
At the same time, suppliers of renewable energy now face an increased risk of not being able to sell all the electricity they produce. This could discourage market newcomers.
Major power companies in Japan are required to purchase power generated through renewable sources at fixed prices. However, by October last year, the four power companies, together with Okinawa Electric Power Co., had halted procedures to purchase new units of solar power. The utilities explained that they faced too many applications from solar power suppliers wanting to sell them electricity, and that the amount they would receive would exceed their capacity.
In December, the ministry introduced rules allowing utilities to flexibly control generation of renewable energy when they had too much, making it easier for power companies to accept renewable energy.

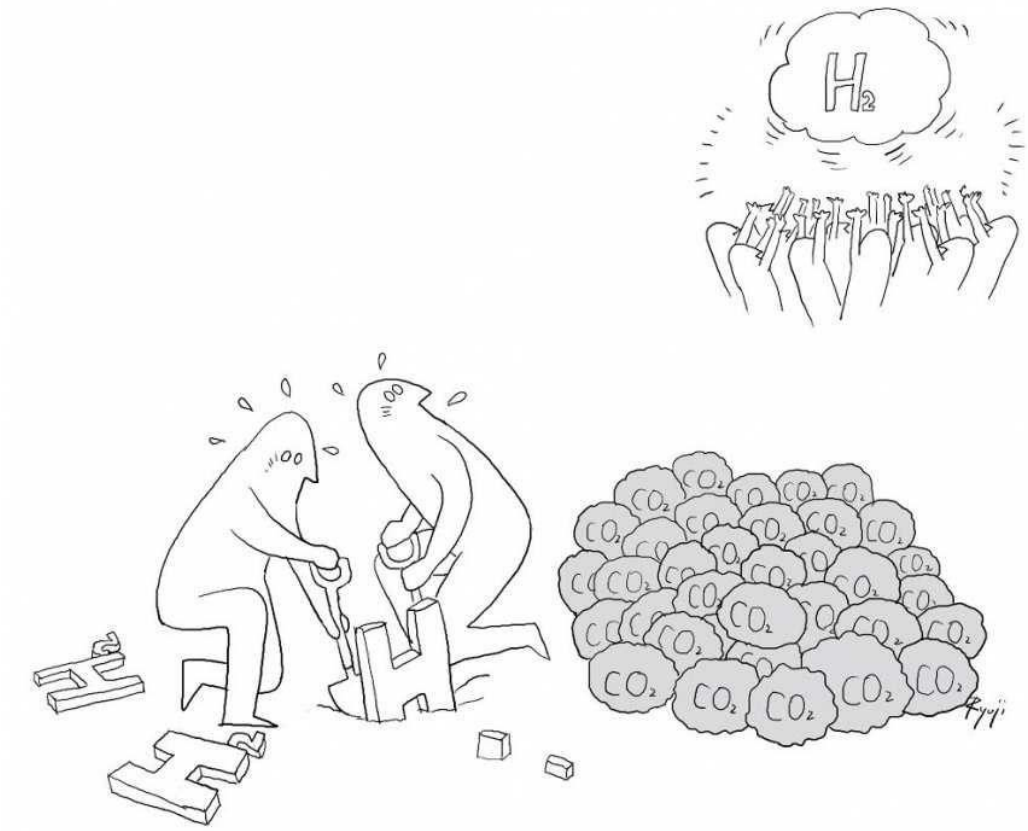
Originally, power companies were able to restrict purchases of solar and wind power only when the generating capacity was 500 kilowatts or more. Under the rules that came into force on Jan. 26, the generating capacity provision was removed, allowing restrictions for all solar and wind power, including power for homes. Furthermore, the length of time they could retain restrictions was changed from 30 days per year to 360 hours per year for solar power and 720 hours for wind power, allowing them to implement restrictions by the hour rather than by the day.
Furthermore, since the Hokkaido, Tohoku and Kyushu power companies had already topped the limit for solar power that the Ministry of Economy, Trade and Industry had calculated that they could receive, they will face no limits on the length of time over which they can implement restrictions on purchases. However, with no upper limit on restrictions, the risks for renewable energy suppliers increase. This could result in companies giving up on entering the market one after another. The Hokkaido, Tohoku and Kyushu power companies accordingly decided this fiscal year to announce forecasts for the length of time over which they would implement restrictions. Furthermore the Organization for Cross-regional Coordination of Transmission Operators will be set up in April, to check whether power companies' restrictions on power generation are appropriate.
In order for renewable energy to spread nationwide, it is necessary to boost transmission lines feeding the Tokyo, Chubu and Kansai power companies. In fiscal 2015, the Ministry of Economy, Trade and Industry plans to formulate targets for introducing renewable energy in the future, and decide on how to cover the cost of boosting transmission lines.

Hydrogen future: exaggeration and fabrication

January 27, 2015

Japan’s hydrogen energy hype

http://www.japantimes.co.jp/opinion/2015/01/27/commentary/japan-commentary/japans-hydrogen-energy-hype/#.VMoNBS51Cos



Much excitement is permeating within the industrial segments related to hydrogen energy, following the government's announcement in June 2014 of the "Strategic Road Map for Hydrogen and Fuel Cells." It calls for creation of a "hydrogen-based society" as **a trump card to prevent a further global warming** and designates 2015 as the "first year"of the age of hydrogen.

In reality, however, the clean image of hydrogen-based energy and its economic viability are much exaggerated.

The government and business enterprises are rushing to building a hydrogen society in order to create huge public works largely funded by government subsidies, and gain rights and interests from them.

Creating demand for a hydrogen fuel and distributing it would require infrastructure preparations of enormous scales like mass-marketing of fuel cell-powered automobiles, building networks of hydrogen supply stations, construction of hydrogen liquefaction plants and creation of transport systems for liquefied hydrogen.

In contrast, the popularization of electric vehicles would not require large investments. Although battery cars represent another candidate for the next generation of motor vehicles, they can rely on facilities already existing throughout the country to generate and transmit electricity and, besides, quick recharging stations can be built for only around ¥5 million each.

As **the infrastructure needed for a broad use of hydrogen is virtually non-existent**, hundreds of billions of yen would have to be invested in construction of new hydrogen plants throughout the country. In addition, ¥600 million will be needed to build one hydrogen station to supply hydrogen to fuel cell vehicles — 120 times more than the cost of setting up a quick charging station for battery cars.

With an eye on making the 2020 Tokyo Summer Olympic Games an arena to showcase Japan's hydrogen energy technologies, the government is working on plans to run fuel cell buses around the sports facilities

and expanding networks of hydrogen fuel supply stations in the four metropolises of Tokyo, Nagoya, Osaka and Fukuoka.

Under the plans, the number of hydrogen stations will increase to 1,000 by 2025 nationwide from 100 in 2015, with the government bearing one half of the costs. This alone would represent splashing more than ¥300 billion in the taxpayer money.

In support of the plans, rosy statistics have been released by the government and think tanks. One corporation estimates, for example, that by 2020, the size of the fuel cell auto market will expand to the scale of ¥500 billion while the market for electric power generation using hydrogen will reach ¥900 billion.

Similarly, Deloitte Tohmatsu Consulting Co. forecasts that the sale of fuel cell cars will expand so rapidly that in 2025, 850,000 such cars will be sold in the United States, another 710,000 in Europe and 200,000 in Japan.

Lots of efforts are being made to drive home to the public the clean image of hydrogen as an energy source. The government is feverishly publicizing that hydrogen is the "ultimate clean energy source." Hydrogen may appear to be the most appropriate substance to be touted as capable playing the principal role in building a carbon-free society because when it reacts with oxygen, only water is emitted. Moreover, some experts claim that if the exhaust heat is utilized in an energy supply system, the overall energy conversion efficiency could reach 90 percent, far surpassing 40 percent for thermal power generation.

These views would be correct if hydrogen was a primary energy source existing independently in nature. But hydrogen is a secondary energy source that must be obtained by reforming the composition and characteristics of hydrocarbons, which are the main components of natural gas and kerosene.

Since carbon dioxide is emitted in the process of producing this secondary energy source, it becomes clear that the government's claim that hydrogen is the "ultimate clean energy source" is fishy.

Furthermore, hydrogen will have to be liquefied and refrigerated at 253 C below zero in order to be transported. This process would consume large amounts of energy and generate carbon dioxide. Thus it is no exaggeration to say that the claim of hydrogen being carbon free is a sheer fabrication.

Studies are being conducted on directly combusting hydrogen to power cars and generate electricity, rather than using it for fuel cells. Although no carbon dioxide is emitted in this process, **nitrogen oxides**, which form when nitrogen in the atmosphere combines with oxygen, are emitted, as in the case of gasoline-powered automobiles and thermal power stations.

Another shortcoming is the small size of the hydrogen molecule and a technological solution has yet to be found to prevent hydrogen leakage from pipe seams.

The aforementioned rosy statistics about the impact of the use of hydrogen on the economy are a pie in the sky because they are based on an optimistic assumption that all problems related to technologies and costs would be resolved easily. In other words, it represents a wishful thinking of those hoping to make windfall profits from colossal investments.

Some people say that even from a geopolitical standpoint, Japan is not fit to become a hydrogen society. European countries, for example, have closely meshed networks of pipelines that supply natural gas from Russia and they can easily obtain hydrogen with a simple method of reforming natural gas. The abundance of facilities to generate electricity through renewable energy sources, like solar and wind power, will make it possible to obtain hydrogen by using excess electricity to electrolyze water almost free of cost.

These processes are not feasible in **Japan, which doesn't have gas pipelines or excess electricity. As a result, it faces the high costs of obtaining hydrogen by reforming expensive liquefied natural gas and liquefied petroleum gas imported from the Middle East**. There is no prospect in sight of the costs of producing hydrogen dramatically falling.
The recent fall in crude oil prices has reduced the cost competitiveness of hydrogen as an energy source. Moreover, hydrogen cars costing ¥7 million each cannot be expected to be sold in large volumes in the most competitive, Asian auto market.
If the present trends continue, fuel cell automobiles made in Japan may survive solely with large subsidies provided by the government and may be sold and used only in Japan.
In the long run, it is essential to continue research on fuel cells. Development of an alternative material to platinum, which is used as catalyst in the production of hydrogen but is the cause of the high costs, is necessary.
While a number of domestic organizations are engaged in such research projects, **the government appears to be making the foolish move of providing subsidies to spread immature technologies that have not yet reached the level of practical use**. This could turn out to be a repeat of a similar folly the government committed in the promotion of solar power generation.
Politicians, bureaucrats and business circles are all rushing to the hydrogen-related projects, for which huge investments will be made, on the pretext of "reducing reliance on Middle Eastern oil" and "creating a low carbon society."
Ultimately, the taxpayers would have to pick up the bill for the public works projects the government will undertake blindly without assurance for their economic viability.
This is an abridged translation of an article from the January issue of Sentaku, a monthly magazine covering political, social and economic scenes.

Can lignin be an answer?

February 3, 2015

Plant-Based Molecule 'May Be Key' To Fukushima Cleanup, Say Scientists

http://www.nucnet.org/all-the-news/2015/02/03/plant-based-molecule-may-be-key-to-fukushima-cleanup-say-scientists
Research & Development
3 Feb (NucNet): A team of scientists from Japan and the US say they may have discovered a way to remove radioactive caesium from the millions of litres of contaminated water being held at Japan's Fukushima-Daiichi nuclear power station following the 2011 accident.
The team's discovery stemmed from their work with **lignin, a component of plant cell walls that is a hugely abundant by-product of pulp and paper production.**

Yuichiro Otsuka, a researcher at the Forestry and Forest Products Research Institute in Tsukuba, Japan, and Tomonori Sonoki, professor of biochemistry and molecular biology at Hirosaki University in Japan, have been working with scientists from Virginia Tech in Blacksburg, Virginia, on ways to use waste lignin to produce more useful "platform chemicals" that can be used as precursors for the production of biofuels and biopolymers.

Through a bacterial fermentation of lignin waste compounds, the team was able to produce **a unique molecule known as PDC, which can be combined with other molecules, or polymerised, into a variety of useful bioplastic compounds**. The team determined the process for making large amounts of PDC from several types of lignin from pulp mills.

Although the targeted PDC molecule was intended as a platform chemical for biopolymer production, a surprising finding by the team led to a discovery that may help clean up radioactive caesium.

"Caesium is a unique compound known as an alkali metal," said Barry Goodell, professor of sustainable biomaterials in Virginia Tech's College of Natural Resources and Environment. "Metals like this can be removed from solutions if appropriate binding compounds can be identified, but finding an appropriate compound for the binding of caesium has been very difficult. **The Japanese have been desperate to find an alkali metal binding compound that is specific to caesium."**

Because of the chemical structure of PDC, the team surmised that it might also be able to bind certain alkali metals. In the lab, when the PDC compound was tested on a nonradioactive isotope of caesium, the scientists discovered that **PDC is especially good at both binding to caesium and pulling it out of a solution in a manner so that it could be readily collected.**

When tests of the PDC were done with mixtures of other metal salts such as sodium chloride, the common table salt that is also the major salt in seawater, caesium was selectively bound by the PDC, allowing it to be pulled out of the solution for selective disposal.

"This could be a finding of major importance for the cleanup of the Fukushima-Daiichi reactor disaster," a statement on Virginia Tech's website said.

Japanese researchers are now exploring how the PDC compound can be further scaled up and how it can be applied to wastewater in Japan contaminated with radioactive caesium.

New robot for Fukushima Daiichi (2)

February 7, 2015

Robotic snake set to examine innards of melted Fukushima reactor

http://www.japantimes.co.jp/news/2015/02/07/national/robotic-probe-set-examine-inside-melted-fukushima-reactor/#.VNXn4C51Cos

AP
HITACHI, IBARAKI PREF. – A snakelike robot designed to examine the interior of one of the three meltdown-hit reactors at the Fukushima No. 1 nuclear power plant is ready to begin its expedition.

Assessing the damage in the reactors is a crucial step in decommissioning the poorly protected plant, which was crippled by core meltdowns triggered by the Great East Japan Earthquake and tsunami in March 2011.
Remote-controlled robots are essential for the job because the radiation in the reactors chambers is so high it would kill any person who got close.
Using information gathered by the robot, Tokyo Electric Power Co., the plant operator, plans to repair the damaged chambers enough so they can be filled with water in preparation to remove the melted radioactive debris, an operation planned to begin in about a decade.
The 60-cm-long robot, developed by electronics giant Hitachi and its nuclear affiliate Hitachi-GE Nuclear Energy, was demonstrated this week at a Hitachi-GE facility northeast of Tokyo. It is expected to enter the No. 1 reactor as early as April, officials said.
It has a lamp at the front and is designed to crawl like a snake through a 10-cm-wide pipe into the containment vessel. From there it must dangle and descend onto a platform just below the reactor core's bottom, an area known as the pedestal.
There, the robot is to transform into a U-shaped crawler and capture live images and temperature and radiation levels and transmit them to a control station outside the building.
Expectations for the robot probe are high after earlier efforts at assessment met with limited success.
"Depending on how much data we can collect from this area, I believe (the probe) will give us a clearer vision for future decommissioning," Hitachi-GE engineer Yoshitomo Takahashi said.
After its exploratory trip, which will make the robot extremely radioactive, technicians plan to store it in a shielded box. They have no plans to reuse it.
Different robots must be designed for each reactor, since each is slightly different.
According to computer simulations, all of the fuel rods in unit 1 probably melted and pooled at the bottom of the containment chamber, but there had been no way of confirming that until now.
A brief fiberscope observation conducted in 2012 produced images that were scratchy and of limited use.
To assess the debris at the bottom of the damaged reactor chambers, which are usually filled with water, an amphibious robot is being developed for deployment next year.
The damage from the melted fuel burned holes in the reactors, thwarting efforts to fill them with cooling water. As a result, water must be pumped into them continuously, producing an endless stream of radiation-contaminated water that is hampering the plant's cleanup process.

295 billion kWh of renewable energy by 2030?

February 21, 2015

Ministry estimates Japan can produce 295 billion kWh of renewable energy in 2030

http://mainichi.jp/english/english/newsselect/news/20150221p2a00m0na018000c.html

The Ministry of the Environment has estimated that up to 295.2 billion kilowatt hours (kWh) of renewable energy including solar, wind and geothermal power could be produced in Japan in 2030, the Mainichi has learned.
That equates to about 31 percent of Japan's total energy production in fiscal 2013, which stood at 939.7 billion kWh. In fiscal 2013, renewable energy accounted for just 2.2 percent of the total.
The ministry outsourced calculation of the estimates to Mitsubishi Research Institute, and they were reported in a closed panel meeting in December last year. It does not plan to officially release the estimates until around June this year.
The estimates cover three scenarios. One is if energy policies remain as they are now, in which case 2030 would see 203.2 billion kWh of renewable energy (21 percent of the total production in fiscal 2013). However, if policies were expanded as much as possible, with electricity widely transferable across the country, then in 2030 solar power would generate 113.4 billion kWh, and wind power 56.9 billion kWh. With geothermal and small- and medium-scale hydroelectric power factored in, a maximum of 295.2 billion kWh could be produced, according to the estimates.
The Ministry of Economy, Trade and Industry predicts that if all the renewable energy sources it authorized through June 2014 were to operate, it would cost over 2.7 trillion yen a year to buy the power in a feed-in tariff system. However, the Ministry of the Environment, anticipating reduced prices for the feed-in tariff system, estimates that even with the largest predicted amount of renewable energy production in 2030, costs for buying the power could be kept to 2.25 trillion yen. If today's energy policies were maintained, it predicts the figure would only be around 1.36 trillion yen.
Furthermore, the Ministry of the Environment predicts that since renewable energy would serve as a replacement for fossil fuels, by 2030 Japan could save 11 trillion to 25 trillion yen that would otherwise end up overseas.
Under the basic energy plan that the Cabinet passed in April last year, it was stated that the government would aim to exceed the goal it had held until then of raising the level of renewable energy production in 2030 to 20 percent. As early as April, the Ministry of Economy, Trade and Industry plans to finish compiling its own energy analysis. Its views on energy sources for 2030 and the amount of power that would come from nuclear power plants will be the focus of debate.
The Ministry of the Environment's estimates could affect the panel's discussions, but the ministry has not officially released its estimates and does not plan to do so until around June this year. An Environment Ministry official said, "The numbers change based on the conditions. They are not an expression of the ministry's views, and we do not want them to cause undue speculation, so we cannot release them yet."

New drone for Fukushima Daiichi

February 21, 2015

Japan's 1st mass-produced drone takes maiden flight

http://ajw.asahi.com/article/business/AJ201502210031

By RYO SHIMURA/ Staff Writer

MINAMI-SOMA, Fukushima Prefecture--The nation's first mass-produced drone underwent a test flight here Feb. 20 ahead of work assisting cleanup crews near the stricken Fukushima No. 1 nuclear power plant.

The drones will be manufactured just north of the stricken Fukushima plant and some of them will be used to record radiation levels during cleanup and decontamination work in areas affected by the 2011 nuclear disaster.

The drone was developed by the Autonomous Control Systems Laboratory, which is headed by Kenzo Nonami, a robotics professor at Chiba University.

The production base for the drones is a factory in Minami-Soma owned by Kikuchi Seisakusho Co. of Hachioji, Tokyo. The company is a major manufacturer of precision parts.

The plan calls for producing 400 drones this year. Each drone will be 90 centimeters in diameter, weigh 3 kilograms and be capable of carrying a load of up to 6 kg.

The drones will navigate via a global positioning system and will be able to fly continuously for about 30 minutes.

Each drone will cost between 2 million and 3 million yen ($16,800 and $25,200).

There are currently an estimated 2,000 drones flying in Japan, but most are foreign-made robotics that cost about 100,000 yen. Most of the foreign-made drones are flown by drone enthusiasts as a hobby and lack the durability to be put to practical uses.

"We want to engineer a comeback (for Japan) by using a domestic model," Nonami said.

This will reproduce just any quake

March 7, 2015

FOUR YEARS AFTER: Seismic device can reproduce any quake

http://ajw.asahi.com/article/0311disaster/quake_tsunami/AJ201503070019

A 1/40 scale model of a building undergoes a seismic test at a Shimizu Corp. facility in Tokyo on March 4. (Takashi Kamiguri)

By TAKASHI KAMIGURI/ Staff Writer

To promote protection against natural disasters, Shimizu Corp. developed a device that can reproduce the vibrations of the strongest earthquakes ever recorded, including the magnitude-9.0 temblor that struck the Tohoku region four years ago.

Measuring 7 meters by 7 meters, the square-shaped device supports buildings or replicas weighing up to 70 tons and assesses their quake-resistance levels and other features.

The equipment has the highest vibration-generating ability in the private sector, officials of the general contractor said.

In a demonstration experiment on March 4, Shimizu officials used the device to reproduce the vibrations observed in Sendai during the Great East Japan Earthquake on March 11, 2011. A 1/40 scale model of a 40-story, 150-meter high-rise was placed on top of the device. When the machine vibrated, the model deformed like a real building and wildly swung from side to side.

According to the officials, the shaking equipment can reproduce an earthquake even with a maximum intensity of 7 on the Japanese seismic scale.

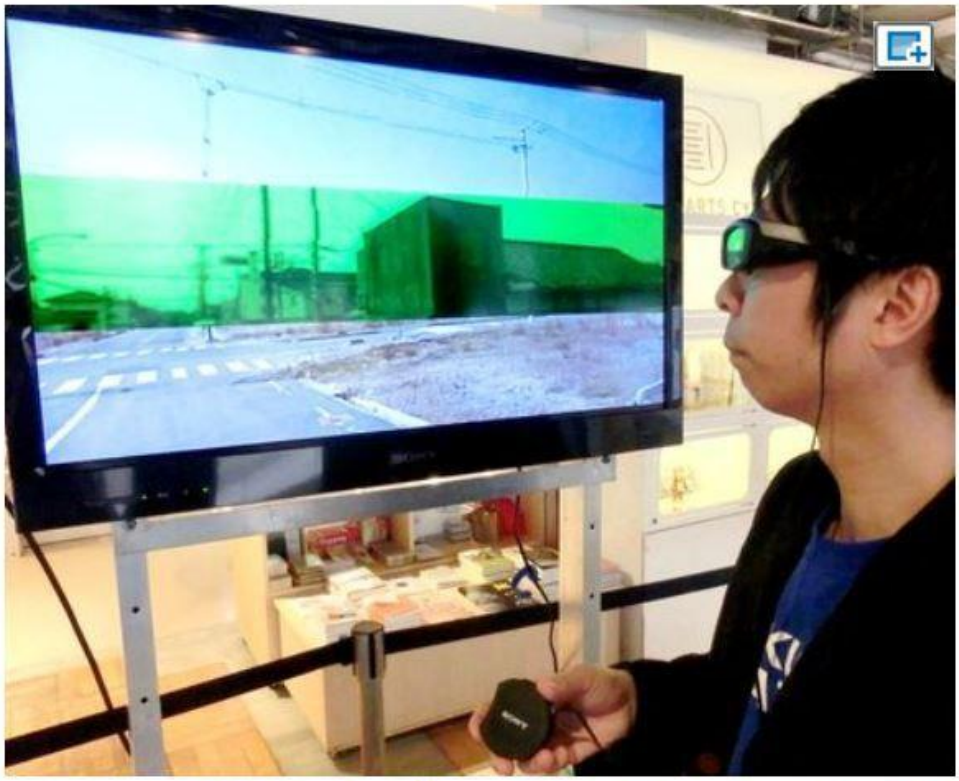
The maximum amplitude of vibrations is 80 centimeters horizontally and 40 cm vertically, double the scale of the Great Hanshin Earthquake that devastated the Kobe area in 1995.

The device also makes it possible to simulate how construction methods would fare if hit by an earthquake stronger than the March 2011 disaster and any other quake observed around the world, the officials said.

Tokohu: Before and after

March 10, 2015

FOUR YEARS AFTER: Students' vision realized with smart glasses that show pre-quake Tohoku
http://ajw.asahi.com/article/0311disaster/quake_tsunami/AJ201503100092



Prototype smart glasses show how a Tohoku town appeared before the 2011 Great East Japan Earthquake and tsunami. (Shinya Takagi)

By SHINYA TAKAGI/ Staff Writer
Sendai website development firm DMP and Sony Corp. have teamed to create a pair of smart glasses that will show how the Tohoku region appeared before the devastation caused by the March 2011 Great East Japan Earthquake and tsunami.
The concept for the wearable computer device was the brainchild of students at the Miyagi Prefectural Agricultural High School in Natori. After DMP learned of the students' idea, the company pitched it to Sony, which assisted in the development of the smart glasses.
When the device is worn at a location in Tohoku, the wearer will see an overlaid photo of the scene as it appeared before the disaster struck on March 11, 2011.
"It's easier to use this device than simply using photographs to help people imagine how things were before the disaster," said Kei Sato, a 32-year-old DMP project planner.

A prototype of the smart glasses will be unveiled during the U.N. World Conference on Disaster Risk Reduction to be held in Sendai between March 14 and 18. The developers plan on having the final product ready within fiscal 2015. They also plan to include a simultaneous smartphone narration of what occurred in each locale during the disaster.
Currently, the prototype contains only images of Natori before the earthquake and tsunami. Guests at the conference will be invited to use the glasses to see how Natori formerly looked.
DMP plans to cooperate with municipalities and other establishments to add more images of the cities and towns in the region prior to the disaster

More precise radiation measurements from the air

March 17, 2015

Measuring radiation from airship

http://www3.nhk.or.jp/nhkworld/english/news/20150317_37.html

Mar. 17, 2015 - Updated 13:01 UTC+1
A research team at Fukushima University has developed a system to measure radiation levels on mountains using an airship.

The group showed the system to media on Tuesday.

The 14-meter-long unmanned airship has 2 devices on its bottom that measure radiation levels and types of radioactive substances on the ground.

The craft took off from the university and slowly circled a mountain in the suburbs of Fukushima City to take measurements.

The group says the system is expected to obtain data more accurately than airplanes because airships can fly lower and more slowly.
The state uses airplanes to measure radiation from the air.

The system is expected to show where radioactive substances traveled from and accumulated after the accident at the Fukushima Daiichi nuclear power plant in March 2011. The group hopes it will help develop efficient methods for decontaminating mountains.

Team leader Professor Akira Watanabe says providing scientific data is the first step in ensuring a sense of safety, so his team will work to carry out precise measurements.

On Tuesday, strong wind blew the airship off its initially planned route, reportedly causing it to fall in a

mountain forest. The team faces the challenge of achieving stable flight in windy and other poor weather conditions.

Large potential for renewables

April 4, 2015

Renewable energy could account for 35 percent of 2030 power supply: ministry

http://mainichi.jp/english/english/newsselect/news/20150404p2a00m0na013000c.html

Renewable energy sources could be expanded to account for 24 to 35 percent of Japan's power supply in 2030, according to estimates released by the Ministry of the Environment on April 3.

"The potential for the introduction of renewable energy is large. There are also large policy problems to tackle, however, such as handling the cost of reinforcing the power line network," a ministry official commented.

An expert committee for the Ministry of Economy, Trade and Industry is considering how much higher the country can go than the goal of at least 20 percent for renewable energy sources put forth by the nation's basic energy plan, and the new estimates could influence the committee's conclusions.

Out of the national power output of 939.7 billion kilowatt-hours for fiscal 2013, renewable energy sources including hydroelectric power accounted for only 10.7 percent. According to the newly released estimates, if the full extent of possible preparations were made -- such as reinforcing power lines to allow power exchange across wide areas, and setting up batteries to store charge -- as much as 356.6 billion kilowatt-hours of renewable energy generation would be possible by 2030.

Even if these preparations are not made, however, renewable energy is still predicted to rise to 241.4 billion kilowatt-hours. By these calculations, assuming demand of 1 trillion kilowatt-hours, at least 24 percent should be possible to provide with renewable energy.

The estimates predict that the financial burden on the country's citizens caused by the government buying up renewable energy will be between 1.78 to 2.56 trillion yen. It also predicted between 1.1 to 2.3 trillion yen in average annual economic ripple effects, however, from factors such as construction and infrastructure investment, as well as between 93,000 and 187,000 new jobs per year.

Furthermore, due to less import of fossil fuels, the estimates show that between 15 and 29 trillion yen of funds could be kept from leaving the country through 2030. Annual carbon dioxide emissions could drop by between 86.06 million and 172.8 million tons, while a goal of cutting carbon dioxide emissions by around 10 percent compared to 1990 levels would also be possible.

These estimates were put together by the Mitsubishi Research Institute at the request of the environmental ministry. They were originally planned to be released around June, but members of both the ruling and opposition parties requested that they be released before the expert committee makes its conclusions, which could come as soon as mid-April.

April 04, 2015(Mainichi Japan)

Renewables: METI vs Environment Ministry

April 7, 2015

Miyazawa doubts estimate of renewable energy use

Apr. 7, 2015 - Updated 08:49 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150407_21.html

Japan's Economy, Trade and Industry Minister Yoichi Miyazawa has doubts about the feasibility of the Environment Ministry's plan regarding the nation's energy mix.

The Environment Ministry said earlier this month that energy from renewable sources can supply up to 35 percent of the country's total energy demand in the future. The Industry Ministry also plans on boosting the ratio of renewable energy from the current goal of 21 percent, but has not set a specific target.

Miyazawa told reporters on Tuesday that he has no idea how the Environment Ministry's estimate is viewed by insiders. He said the estimate does not fully take into account a possible increase in costs that would occur as a result of the increase in renewable energy.

Miyazawa said it is difficult to use the estimate to work out Japan's energy mix.

Also on Tuesday, Environment Minister Yoshio Mochizuki said his ministry's estimate is different from those of other ministries because it has yet to calculate the necessary technology.

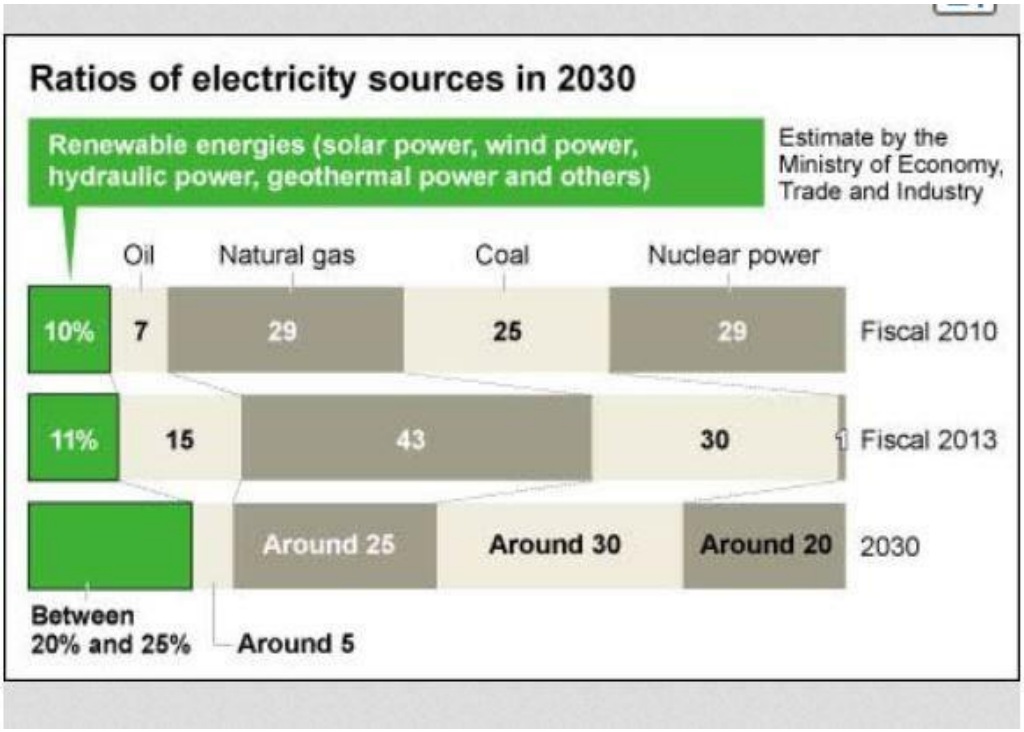
Mochizuki said it is obvious that the figure cannot be achieved through hope alone, but that his ministry would like to increase power from renewable sources as much as possible.

What electricity mix for 2030?

April 8, 2015

Industry ministry seeks renewable energy ratio of 20% to 25% in 2030

http://ajw.asahi.com/article/behind_news/politics/AJ201504080030



By TOMOYOSHI OTSU/ Staff Writer

The industry ministry rejected a proposal by the Environment Ministry and is calling for renewable energy sources to supply "between 20 and 25 percent" of Japan's electricity in 2030, sources said April 7.

The Environment Ministry on April 3 had called for a range between 24 percent and 35 percent.

However, the Ministry of Economy, Trade and Industry said that plan was unrealistic, and it proposed a lower range to avoid increases in electricity charges and to curb the costs for corporate activities.

Prime Minister Shinzo Abe on April 7 received a report from a ruling Liberal Democratic Party task force on the nation's "energy mix" for 2030. The contents are almost identical to the proposals of the industry ministry.

"Based on the ideas described in the report, I want to proceed (with the energy mix plan)," Abe said.

Renewable energies include not only solar power, wind power and geothermal power but also hydraulic power.

In fiscal 2013, renewable energies, centering on hydraulic power, accounted for 11 percent of Japan's electricity supply.

The industry ministry plans to double the ratio by 2030. During the period, the combined ratio of solar power and wind power is expected to increase from 2 percent to 10 percent.

The ratios of hydraulic power and geothermal power will likely remain unchanged because it is difficult to construct large-scale dams and environmental assessments for constructing geothermal power plants requires much time.

The ratio of nuclear power will be around 20 percent in 2030, according to the ministry's plan. The proposal does not mention replacing old nuclear reactors or building new ones. It assumes that current nuclear reactors will continue operating even after they have reached their lifespan of 40 years.

The industry ministry plans to coordinate its opinions with the LDP, junior coalition partner Komeito and the Environment Ministry about the energy mix plan for 2030.

The industry ministry will submit a draft of the plan to its experts' council at the end of this month. The proposal is expected to be completed by the end of May.

The ministry calculated the power generation capacities of renewable energy sources and the costs for 2030 based on several factors, including the amount of electricity that can be accepted on the current power grid and construction plans for wind farms.
It calculated that a ratio of renewable energies much higher than 20 percent would require more than 1 trillion yen (about $8.3 billion) for expansion of the power grid and other measures, resulting in sky-high electricity charges, the sources said.
The Environment Ministry's calculations showed that the ratio of renewable energies could be raised to between 24 percent and 35 percent.
But industry minister Yoichi Miyazawa refused to use that result, saying, "It does not pay sufficient consideration to feasibility."
The industry ministry places importance on nuclear power, coal-fired thermal power, hydraulic power and geothermal power as "base-load electric sources," which indicate their power generation costs are low and their facilities can be operated around the clock.
The ministry wants to raise the combined ratio of those base-load electric sources to more than 60 percent, matching the ratios in the United States and some European countries.
It is difficult for Japan to raise the ratio of coal-fired thermal power because of concerns about the large quantities of greenhouse gas emissions.
But the ministry also does not want to depend on solar power or wind power, citing their high operational costs and unstable power supplies.

Renewables: Japan can afford to be more ambitious

April 10, 2015

EDITORIAL: A more ambitious renewable energy target is feasible

http://ajw.asahi.com/article/views/editorial/AJ201504100031

The Ministry of Economy, Trade and Industry is considering an energy policy target of raising the renewable energy share in Japan's overall energy mix to the lower half of the 20-percent range by 2030.
The ministry is expected to make a formal decision before this summer on the composition of energy sources 15 years down the road.
The government's Strategic Energy Plan, approved last year, called for increasing the ratio of renewable energy to a level above 20 percent. The target set in 2010 before the disaster at the Fukushima No. 1 nuclear power plant was about 20 percent.
This modest rise in the target cannot be a sign that important lessons from the nuclear disaster have been learned and absorbed.
With 15 years still left until 2030, the ministry should consider an additional increase in the target.
At the same time, the ministry stresses the advantages and necessity of nuclear power generation and plans to set a target of around 20 percent for the future share of nuclear energy.
The harrowing accident at the Fukushima plant brought to light the fact that nuclear power is a highly unstable and costly power source in Japan, which is prone to natural disasters including earthquakes.
To raise the rate of self-sufficiency in energy supply without depending on nuclear power while trying to stop global warming, it is vital to make renewable energy a major power source as quickly as possible.

There are, of course, many challenges that must be overcome to promote renewable energy.
Sufficient measures should be taken to prevent sharp rises in electricity rates because of the huge costs needed to finance the feed-in-tariff system that requires utilities to buy electricity generated with renewable energy sources at fixed prices. Big expenses are also required to develop power transmission networks to send electricity produced in areas fit for renewable power generation to areas where power is consumed.
Still, there are many steps the government can and should take to increase the use of renewable energy.
It should promote, for instance, operational technology to adjust output fluctuations in renewable power generation, which is susceptible to natural conditions, and support the development of new materials to raise the efficiency of solar panels. More policy incentives should also be given to promote cogeneration systems for efficient heat utilization and micro-power generation for local consumption.
The government should map out more specific plans to promote technologies and systems that are likely to make significant progress by 2030.
The way the decisions concerning the energy mix are made by the industry ministry alone is also questionable.
A report released on April 3 by the Environment Ministry contained an estimate showing the target for renewable energy could be higher than the one being considered by the industry ministry.
Industry minister Yoichi Miyazawa brushed aside the Environment Ministry's estimate as "unfeasible."
But Hidefumi Kurasaka, a professor at Chiba University who chaired the Environment Ministry's working group that produced the estimate, tweeted, "Reading the report shows you (Miyazawa's argument is) clearly wrong."
Both ministries are working on the issue by using taxpayer money. The government should clearly explain to the public what kind of differences there are between the two sides and which claim is more reasonable.
The government should also make more serious efforts to develop a fair and unified view on the issue.
We suggest that members of the Environment Ministry's panel be invited to take part in the industry ministry's decision-making process on the energy mix.
A major reform usually entails bearing a new burden. Whether the burden is justifiable depends on the benefits to be gained.
Japan has learned bitter lessons from the nuclear accident and strongly felt the need to switch from nuclear power to renewable energy.
No matter how difficult making this shift may be, returning to the old energy regime before March 11, 2011, is no option.
--The Asahi Shimbun, April 10

Energy choices depend on how you look at safety

April 12, 2015

Reactor closures to test Abe's green energy pledges

http://www.japantimes.co.jp/news/2015/04/12/national/reactor-closures-to-test-abes-green-energy-pledges/#.VSqdTpPwlLM

by Chisaki Watanabe **and** Emi Urabe
Bloomberg

Japan's plan to mothball at least five aging nuclear reactors highlights the challenge Prime Minister Shinzo Abe faces as his administration debates how to replace lost electricity generation with power sources that are cheap, clean and safe.

The decision announced by the reactors' operators last month to decommission the plants, all dating from the 1970s, will eliminate output equivalent to about 65 percent of the power produced by all the solar panels currently installed nationwide. That's even after solar use has surged, making Japan the second-biggest solar market in the world for two years running.

The policies are under a microscope as Abe's ruling Liberal Democratic Party indicated earlier this month it wants to see nuclear energy play a prominent role in generating the nation's electricity, a plan opposed by most voters following the 2011 meltdowns in Fukushima. In the meantime, policymakers are wrestling with how to mix in renewables with traditional forms of energy and determining what scale of greenhouse gas cuts it can promise for a United Nations deal on global warming this year.

"It is possible to partially replace nuclear with clean energy, but we need to turn to coal at the moment," said Keigo Akimoto, chief researcher at Kyoto-based Research Institute of Innovative Technology for the Earth. "I support increasing renewables. We should not be misguided about the scale."

The implications are global, since countries such as the United States and Germany face the question of what to do with their own aging atomic plants. In Germany, Chancellor Angela Merkel has announced that her country would gradually turn off all nuclear. The reactor fleet in the U.S. is one of the oldest in the world, and a wave of retirements is expected beginning in the 2030s, the International Energy Agency estimates.

Environmentalists in Japan, mindful of the Fukushima No. 1 nuclear disaster, say the country has shown it can do without nuclear through efficiency gains and renewables.

Utilities, meanwhile, say they're having difficulty accommodating all the new electricity from clean sources such as solar that is testing their grids.

Japan's biggest business lobbies argue industry can't do without nuclear power and the steady supply of reliable power it produces. The nation's 48 viable reactors are shuttered pending new safety checks by the nation's regulator.

"The most important thing is to optimize different power sources such as nuclear, thermal and renewables," Hajimu Yamana, a professor at Kyoto University Research Reactor Institute, said at a meeting at the Ministry of Economy, Trade and Industry on March 30. The ministry oversees the nuclear sector.

For all the concerns about the safety of nuclear energy, one fact is unassailable: Since the triple meltdown, the nation's utilities are getting the bulk of their electricity from fossil fuels, despite a government-backed push to expand sources of renewable energy such as solar.

The five reactors that the utilities said in March they planned to decommission, among the smallest and oldest in Japan, annually produced about 13 terawatt-hours on average before the 2011 disaster, according to Bloomberg calculations using data supplied by the plant operators. Compare that with contributions from solar, which totaled 19.9 terawatt-hours in the year to March 31, based on estimates by Bloomberg New Energy Finance.

"We are at a crossroads, and yet we are still evaluating power sources in the same way we did before the earthquake," said Yasuko Kono, secretary-general of Shodanren, a union of consumer groups urging policymakers to consider the potential of renewables and energy savings. **"The choices we will make will depend greatly on how we look at safety."**

The Abe government is under increasing pressure to set a long-term plan for how much electricity should come from what sources. Divided views on nuclear's role are preventing the nation's policymakers from making international pledges on greenhouse gas emissions ahead of climate talks in December.

"Our discussions on nuclear power have been focusing too much on negative aspects," Kyoto University's Yamana said. "Four years have passed and we need to look at nuclear calmly," he said, adding that atomic power helps Japan cut greenhouse gas emissions.

Nuclear's share of the electricity mix is at the center of the policy debate. In fiscal 2010, the nation derived nearly 30 percent of its power from nuclear while renewables provided almost 10 percent, with the majority of that coming from hydropower.

Four years after the triple core meltdown at the Fukushima No. 1 plant, the public remains cautious about nuclear.

According to a March poll by the Nikkei newspaper and TV Tokyo, 62 percent of respondents said reactors shouldn't be restarted, while 27 percent supported the resumption of nuclear power.

Meanwhile, power rates have risen 20 percent for homes and 30 percent for industry use since the nuclear crisis began in March 2011, according to date from the Ministry of Economy, Trade and Industry.

Keidanren, the nation's top business lobby, said April 6 that nuclear power should supply more than 25 percent of electricity by 2030, while renewables should be around 15 percent.

The panel of LDP lawmakers that presented their findings to Abe on Tuesday recommended the nation get its electricity from base-load sources on a par with other developed countries, which is currently above 60 percent.

"For utilities, there is no economic incentive to add clean energy," said Ali Izadi-Najafabadi, a Bloomberg energy finance analyst in Tokyo. He said Japan's current approach may benefit utilities in the short term. "In the long term, it hurts the country including manufacturers," as domestic companies may miss out on opportunities to compete in fully liberalized markets abroad because they lack such experience at home, he said.

If all of the nation's reactors are to be decommissioned after the 40 years considered the operational age limit by Japanese regulators, only 20 will be in working condition by 2030, accounting for about 15 percent of power supply, according to an analysis by Keizai Doyukai. To keep nuclear capacity at 20 percent, utilities would need to seek government approval to extend operations, the group said in a report.

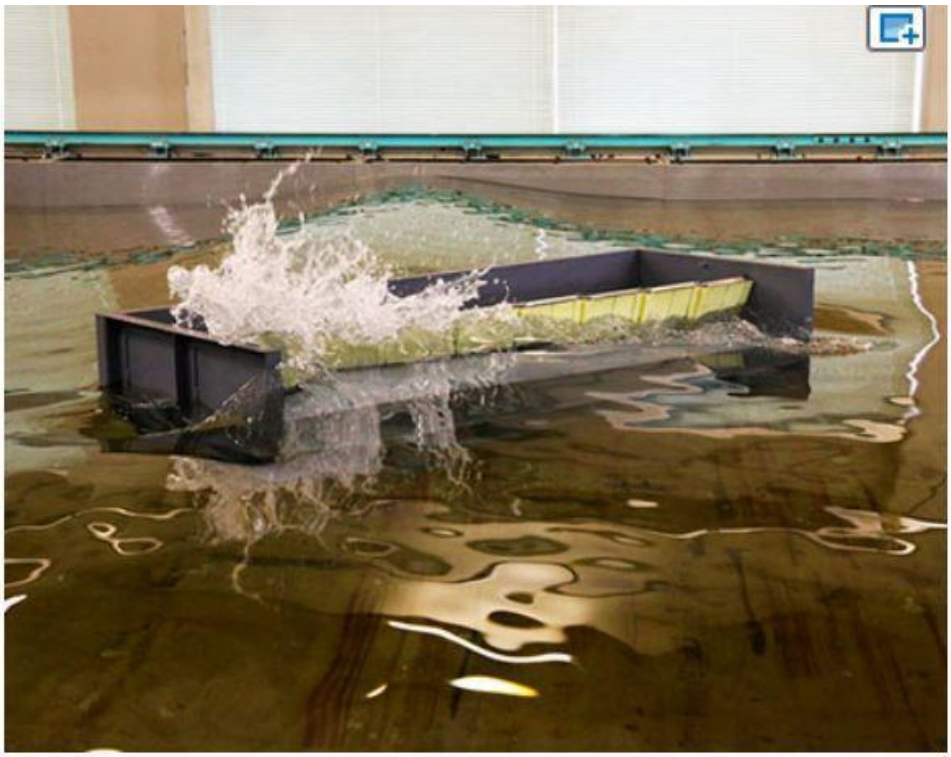
"Renewable energy has to be more stable and cheaper, and energy storage needs to develop further," Teruo Asada, who heads the group and also serves as the chairman of major trading company Marubeni Corp., told reporters in March.

New anti-tsunami walls

April 15, 2015

Self-elevating sea walls able to counter tsunami hundreds of meters wide

http://ajw.asahi.com/article/0311disaster/quake_tsunami/AJ201504150067



Flap gates rise in a test at Nagoya University on April 7. (Taku Hosokawa)

By AYAKO TSUKIDATE/ Staff Writer

NAGOYA--Researchers say coastal barriers that use the force of waves to elevate automatically, and so spread the impact of tsunami or storm surges, proved effective in simulated tests and could offer an alternative to erecting massive sea walls.

Researchers at Nagoya University performed the experiment in laboratory conditions on April 7 with assistance from Hitachi Zosen Corp. and a number of organizations.

They found that the barriers can handle a tsunami measuring several hundred meters across.

When placed atop conventional sea walls, the so-called flap gates provide additional height and a buffer but do not mar the scenery as long as they remain flat.

Researchers created a scale model of a comprehensive coastal barrier because structures in the past were only capable of dealing with waves of up to around 10 meters across. This limited their use to openings in sea walls and other small spaces.

"This mechanism raises a sea wall just in the nick of time," said Norimi Mizutani, a professor of civil engineering at the Nagoya University Graduate School of Engineering. "So this is the answer that local residents have been looking for because it preserves the scenery but counters tsunami at the same time."

Many municipalities have been under pressure to erect higher sea walls since the magnitude-9.0 Great East Japan Earthquake of March 11, 2011, triggered towering tsunami that devastated coastal areas of the Tohoku region.

However, gaining the consent of residents has been a challenge due to concerns that such massive structures will wreck the landscape.

When water rises and pushes up against the flap gate, the buoyant force raises the structure to form a wall, thus blocking the inundation.

A model with eight panels connected with a metal cable and one-fourth the size of the envisioned design was used for the test.

115 megawatts of solar power in Rokkasho in November

April 17, 2015

Japan's largest solar-powered plant in Rokkasho set for July start

http://ajw.asahi.com/article/business/AJ201504170039

Solar panels cover a large area at Eurus Rokkasho Solar Park in Rokkasho, Aomori Prefecture, on April 16. (Takashi Kamiguri)

THE ASAHI SHIMBUN

ROKKASHO, Aomori Prefecture--Japan's biggest solar power plant is scheduled to start a trial run in July in this village where the opening of a planned nuclear fuel reprocessing plant has been repeatedly delayed.

Construction of the Eurus Rokkasho Solar Park is almost complete. It is capable of generating 115 megawatts, which is enough to supply 38,000 households and makes it the largest solar-powered producer of electricity in the nation.

The facility uses 513,600 solar panels, most of which were produced by Mitsubishi Electric Corp. After the trial period, the power plant is expected to enter full operation in November.

In contrast, the Rokkasho plant to reprocess spent nuclear fuel, a key element of Japan's nuclear recycling program, has been postponed a number of times due to technical difficulties.

Thinking outside the box

April 19, 2015

Determined sake brewer seeks to revive Fukushima with renewable energy

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201504190028
By TOSHIHIDE UEDA/ Senior Staff Writer
KITAKATA, Fukushima Prefecture--Yauemon Sato's determination to forge ahead with his ideas, no matter how unorthodox, has led fellow workers to describe him as "a dump truck with broken brakes."
This way of thinking has apparently helped to keep his family's sake brewery in business since 1790. It could also be the reason why local governments are investing in the 64-year-old's plan to revitalize Fukushima Prefecture.
After the triple meltdown at the Fukushima No. 1 nuclear power plant in March 2011, Sato decided that the only way the prefecture could be revived was through renewable energy sources.
In August 2013, he established Aizu Denryoku, an electric power company, and brought together individuals with diverse backgrounds to serve as executives and advisers. One was a special adviser of the Japanese subsidiary of a major U.S. semiconductor manufacturer, while another once headed the Fukushima prefectural board of education.
Another member of the group was an ethnologist who promoted Tohoku area studies.
They were all impressed by Sato's fortitude.
Sato is the ninth-generation chief of the Yamatogawa Shuzoten sake brewery in Kitakata of the Aizu region in western Fukushima Prefecture. When explosions rocked the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co., Sato thought the 200-year old family business was done for.
However, **radiation levels in the Aizu region never reached alarming levels.**
Sato felt somewhat guilty because he continued with his life and business while compatriots in other areas of Fukushima Prefecture were evacuating by the thousands.
"All I thought about was what the Aizu region could do," Sato said. "Nothing will begin as long as all we say is, 'The central government is to blame and TEPCO is to blame.'"
Sato took note of the many power plants already established in the Aizu region, which boasts a bountiful water supply that has helped foster a vast expanse of forest.
Construction of hydraulic power plants in the area started in the Meiji Era (1868-1912), and those plants today have a total generation capacity of about 4 gigawatts.
Much like the Fukushima No. 1 nuclear plant, most of the power generated at those hydraulic plants has gone to the greater Tokyo metropolitan area.
"The water used in hydraulic power plants originally was the rain and snow that fell in the great outdoors of Fukushima," Sato said.
He felt that bringing back such resources would allow Fukushima to generate all the electricity it needed without relying on outside sources.
He also believed that such a move would be important to allow Fukushima to move away from being "a colony" of sorts to the Tokyo area.

Sato started with solar power because installation was much easier than constructing hydraulic power plants.
As a first step, **Aizu Denryoku** built the Oguni solar power plant in Kitakata with an output capacity of 1 megawatt. Smaller facilities were then set up in 23 locations.
By fiscal 2014, Aizu Denryoku and its subsidiaries were operating plants with a combined capacity of 2.54 megawatts and selling the electricity to Tohoku Electric Power Co., which is in charge of supplying all of Fukushima Prefecture.
Aizu Denryoku plans to increase its generating capacity to 5 megawatts by the end of fiscal 2015.
But even at that level, the capacity would only be 0.1 percent of the capacity of the existing hydraulic power plants in the Aizu region.
Moreover, Tohoku Electric in late 2014 introduced a maximum limit on the volume of electricity it would purchase from renewable energy sources.
Such moves are not enough to stop the "dump truck with broken brakes."
"We will move to our next stage," Sato said.
By focusing on the initial target of the bountiful water and forests of the Aizu region, **Sato plans to start micro-hydro power generation and the use of woody biomass.**
Thinking outside the box is in Sato's genes.
In the late 1970s, his father opposed the redevelopment plan put together by the Kitakata municipal government. Instead, he wanted to promote Kitakata as a "town of warehouses" by capitalizing on the heritage of numerous old warehouses remaining in the city.
On one occasion, he spent 70 million yen to move and restore old warehouses. That led some to speculate that the older Sato had lost his mind.
However, there was huge untapped interest in viewing those old warehouses, and the tourism business took off in Kitakata.
The popularity of Kitakata ramen shops also helped to increase the number of tourists from about 50,000 in 1975 to about 1.2 million today.
The younger Sato says **his battle with major utilities will require his own financial resources combined with the power of local communities.**
To bring about that goal, Sato contacted all 17 municipalities in the Aizu region about investing in Aizu Denryoku. In March 2015, four towns and villages decided to inject capital.
"Things are looking more interesting now," Sato said.

Fukushima must do away with "caldrons of hell" (Sato)

May 1, 2015

INTERVIEW/ Yauemon Sato: Fukushima must reclaim energy resources to avoid 'caldrons of hell'

http://ajw.asahi.com/article/views/opinion/AJ201505010047

By TOSHIHIDE UEDA/ Senior Staff Writer

KITAKATA, Fukushima Prefecture--Yauemon Sato, the ninth-generation chief of a sake brewery operating here since 1790, likens the crippled reactors at the Fukushima No. 1 nuclear power plant to "caldrons of hell."

In a recent interview with The Asahi Shimbun, Sato said the nuclear disaster "continues to recur every day," referring to the huge stockpile of radioactive water that keeps growing--and often leaks--more than four years after the core meltdowns.

Aizu Denryoku, an energy company that he founded in 2013, was his answer to the question of what direction the "Fukushima rebirth" should take after the nuclear disaster.

As a corporate manager, Sato was determined not to be content with a "mere social movement."

He now runs more than 20 solar power plants.

Sato also plans to venture into micro-hydropower generation and the use of woody biomass, which will allow his business to tap into resources generated by the bountiful water and forests of the Aizu region in western Fukushima Prefecture, where Kitakata is located.

"Aizu has enough energy resources to be self-sufficient," Sato said. "The water of Lake Inawashiroko and the water of the Tadamigawa river initially used to be ours. It's probably time to have them returned to us."

Excerpts from the interview follow:

* * *

Question: What drives you to be so active, including in the use of renewable energy?

Sato: You know the caldron of hell? You will be sent to hell and will be boiled in that caldron if you do evil. And there are four such caldrons in Fukushima Prefecture, at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co.

Q: You mean the No. 1 through No. 4 reactors that succumbed to accidents, right?

A: Yes. And the disaster has yet to end. It continues to recur every day.

More than 300 tons of water, contaminated with intense levels of radioactive substances, are being generated every day at the nuclear plant, right? We have a family business of a sake brewery, with a yearly turnover of about 350 million yen ($2.9 million). We brew about 300 kiloliters of sake, which weighs some 300 tons, every year. More radioactive water is being generated day after day than the amount of sake we produce in a year.

Q: The whole village of Iitate, Fukushima Prefecture, remains evacuated to this day because of the nuclear disaster. You had been supporting Iitate even before the nuclear disaster was triggered by the Great East Japan Earthquake and tsunami. Could you elaborate on your work?

A: Everything started when the chamber of commerce and industry in the village asked me to brew sake with rice from Iitate. I agreed to be a "Madei ambassador" to support the village, and the appointment ceremony took place in January 2011. The nuclear disaster broke out only two months later.

Iitate has nothing to do with nuclear power. "I will have to help in some way or other," I thought to myself.

Q: "Madei," which means something like "cordially" in the local dialect, is a catchword of Iitate's community development efforts, right?

A: Yes. Norio Kanno, mayor of Iitate, said at the appointment ceremony that community development of a "Madei village" was almost complete. But all that was ruined by the nuclear disaster.

Why, to begin with, did Fukushima Prefecture host as many as 10 nuclear reactors? Well, it did so to send electricity to Tokyo. But Fukushima Prefecture residents were not asserting themselves loud enough in the face of the central government and TEPCO.

These were some of the ideas I shared with Yumiko Endo, former head of the Fukushima prefectural board of education, and with Norio Akasaka, a Gakushuin University professor of ethnology who is

promoting “Tohoku studies.” And the first thing we did was to set up Fukushima Kaigi, a forum for citizens to think about a “Fukushima rebirth,” in the summer of 2011.

Q: That forum gave you an opportunity to get to know Jun Yamada, a senior adviser to Qualcomm Japan, the Japanese arm of the major U.S. chipmaker, right?

A: Yes. Yamada and I discussed what we should be doing from that time on, and we agreed that we were both corporate managers who were by no means living aloof in a world of serious literature. It was no use just cursing the central government and TEPCO. We should not content ourselves with a mere social movement. So we eventually agreed: Why not set up a business?

Q: And the business you set up was Aizu Denryoku, right?

A: Yes. Just imagine, what are the requisites for human lives? You can maintain your life if only water, food and energy are available.

The 17 municipalities of Fukushima Prefecture’s Aizu region have a combined population of 280,000 or so. And the region has enough rice and energy resources to be self-sufficient. The hydropower plants in Aizu alone have enough generation capacity to cover the power demand of all households in Fukushima Prefecture.

Q: But those hydropower plants belong to TEPCO, Tohoku Electric Power Co. and Electric Power Development Co. Most of the electricity they generate is being sent to the greater Tokyo area. What do you think about this arrangement?

A: The rights to use water for generating power are not in our hands. But the water of Lake Inawashiroko and the water of the Tadamigawa river initially used to be ours. It’s probably time to have them returned to us.

The nuclear plants also stand on the soil of Fukushima Prefecture. Why are our resources always being taken away? Let’s go and reclaim what has been taken away from us--that’s what I am saying.

Q: Tohoku Electric has set a maximum limit on the volume of electricity it would purchase from renewable energy sources. What is your approach to the tough job of breaking vested interests?

A: My father began skipping wholesalers and retailers to sell our sake directly to tourists in Kitakata. That sparked terrible outrage from associations of wholesalers and retailers. But when customers, once they had acquired an appetite for our products, began placing orders with retailers, those retailers had to deal in our products in the end. A clientele will never fail to materialize if only you make fine products.

Q: You have a growing circle of like-minded people. Iitate Denryoku, a solar power generation company, was set up in Iitate in September 2014, with you as vice president. How are these efforts going?

A: Another group of people in Tadami, Fukushima Prefecture, is moving to set up a Tadami Denryoku power generation company. Four of the 17 municipalities in the Aizu region--Inawashiro, Bandai, Nishi-Aizu and Kita-Shiobara--decided in March to invest in Aizu Denryoku.

We are aiming to create what we would call a “stock company of a public nature.” We are still facing various challenges, such as the question of rights over the use of water. But we plan to spread micro-hydropower generation, which uses water from rivers and other familiar sources, and the use of biomass, which relies on wood from forests and other sources, in the years to come.

Solar power generation is something we just began with to solidify the foundation of our company.

Q: You are calling on all municipal governments in Aizu to inject capital in your company. What kind of role do you expect governments to play?

A: Community development is up to local people in the private sector, and it is not something that governments are supposed to take into their hands. Governments are there to back up what the private sector does. That’s how the efforts to promote (Kitakata) as a “town of warehouses” and a “town of ramen” really took off and got on track.

* * *

Born in 1951, Yauemon Sato, a graduate of the Department of Brewing and Fermentation at the Tokyo University of Agriculture Junior College, began serving his apprenticeship at the Yamatogawa Shuzoten sake brewery, his family's business, in 1973.

He was inspired by how his father, Yauemon Sato VIII, scrambled to promote Kitakata as a "town of warehouses" and engaged in architecture preservation efforts of the Japanese Association for Machi-nami Conservation and Regeneration.

Sato, who took over his family business as the ninth-generation chief in 2006, also serves as CEO of the Japan Jizake Cooperative, which organizes local sake brewers, and as chief secretary of an all-Japan association of locally based energy providers, whose founders include power utilities that serve localized areas.

Aizu Denryoku was named after a company that existed before World War II. It was so named in hopes of reviving the tradition of its predecessor, which supplied electricity to local communities.

High costs fo renewables as an excuse for nukes

May 27, 2015

Nuclear power crucial as renewable energy too costly, ministry says

http://ajw.asahi.com/article/behind_news/politics/AJ201505270040

THE ASAHI SHIMBUN

The high cost of renewable energy means Japan has no choice but to rely on nuclear power to provide between 20 and 22 percent of its energy by 2030, according to an industry ministry report.

That would be a small drop in the reliance on nuclear power from the levels before the 2011 Fukushima nuclear disaster.

The shift away from nuclear energy to renewables, including solar power, will generate "pressure for drastic rise in energy cost," stated the report released May 26. The ministry, a staunch supporter of nuclear energy, concluded it is the least expensive method of power generation.

While nuclear energy should provide between 20 and 22 percent of Japan's electricity, renewable energy should account for 22 to 24 percent in fiscal 2030.

About 27 percent of Japan's electricity was provided by nuclear power on a yearly average in the decade up to the 2011 Fukushima nuclear disaster.

The proposal also said that nuclear power was required to keep power costs at a manageable level for corporations and households and also to enable Japan to reduce greenhouse gases to levels set by advanced economies in the West.

The draft report was released by an expert committee at the Natural Resources and Energy Agency headed by Masahiro Sakane, a senior adviser at Komatsu Ltd. It will be finalized at a meeting of the committee in early June and adopted as the government's official energy-mix plan in July at the earliest after going through a public-comment phase.

All the nation's reactors were shut down after the disaster, and hurdles remain high for the government to restart many of them due to strong public opposition and safety concerns of local governments.
In its Strategic Energy Plan released in April 2014, the government underscored its intention to push for reactor restarts but said "dependency on nuclear power generation will be lowered to the extent possible."
At a news conference April 26, the industry minister Yoichi Miyazawa said that high energy costs and other concerns "will be all solved by increasing the ratio of nuclear power."
The minister emphasized that the 20-22 percentage scenario was the minimum possible reliance on nuclear energy.
While the Strategic Energy Plan projected that renewable energy must account for far more than 20 percent of Japan's future plan, the draft report pointed out that solar and wind power output are particularly unstable.
The proposal states that Japan should rely on just 7 percent of energy from solar power and 1.7 percent from wind power.
During the committee sessions, Yukari Takamura, a professor of international law at Nagoya University, and two other members submitted opinion papers that asserted the discussions at the committee do not fully address the need to reduce nuclear energy and increase dependency on renewable energy.
But the figures in the draft proposal are likely to be approved in the committee's next meeting in early June.

Ceramic blocks to store radioactive water?

May 27, 2015

Potter creates ceramic cure to help stop radioactive water leaks at Fukushima

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201505270060

By KEIZO FUKATSU/ Staff Writer
YOKKAICHI, Mie Prefecture--A manufacturer of traditional ceramics has created special blocks that can absorb water, a development that could enable radioactive water at the Fukushima No. 1 nuclear power plant to be stored safely.
"Contaminated water would not leak if it is stored inside the blocks," said Taiji Mizutani, who heads Mizutani Shoten. "We will commercialize the product after verification experiments and hope evacuees from Fukushima will be able to return to their homes as early as possible."
Mizutani came up with the idea of developing water-absorbing blocks with unglazed ceramics when he was working as a volunteer in the Tohoku region, which was devastated by the March 2011 Great East Japan Earthquake and tsunami.

The 37-year-old expressed concern about frequent reports of highly radioactive water leaking from storage tanks at the stricken plant.
Since the disaster, Mizutani has visited affected areas more than 10 times and interacted with people who were evacuated from their homes near the nuclear plant.
“I always wanted to help them return to their hometowns,” Mizutani said.
He first realized ceramics may be useful for storing radioactive water when he found biscuit ware absorbs glaze more easily. Then, Mizutani began testing the water-absorbing quality of ceramics.
He mixed chaffs of grain with soil mainly comprised of clay. Because rice hulls burn away when the soil is fired, hollows remain where the chaffs existed. Mizutani also kept the firing temperature at around 700 degrees to remove water from the clay and create tiny linear cracks.
According to Mizutani, the hollows and cracks help the ware absorb water. It took Mizutani almost a year to develop the highly absorbent material.
While ordinary unglazed ceramic ware absorbs 40 percent of its weight in water, Mizutani's “spongelike” block absorbed a volume equivalent to its own weight in just two minutes in one experiment, Mizutani said.
He has received patents for the special block as well as his original water-storage system, in which contaminated water is stored after being absorbed by the ceramic blocks laid on a huge pool made of high-density concrete.
He intends to reach out to Tokyo Electric Power Co., the operator of the Fukushima plant, so the product can be used in the decommissioning process at the crippled facility.

International contest for nuclear disaster robots

May 29, 2015

Japan's presence grows at contest for nuclear disaster robots

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201505290009

By HISATOSHI KABATA/ Staff Writer
Prompted by government funding, five Japanese teams will compete in an international contest that tests robots’ response and rescue abilities in nuclear disasters.
The Robotics Challenge, inspired by the Fukushima nuclear accident that started in March 2011, will be held June 5 and 6 in Pomona, California.
Twenty-five teams from six countries and one region will enter the event sponsored by the Defense Advanced Research Projects Agency (DARPA) of the U.S. Department of Defense.
The finalist robots must tackle eight tasks within an hour under scenarios that simulate real-world nuclear disasters. For example, they will be tested on their abilities to travel through rubble, drive a vehicle, open doors, operate valves, use a tool to break through a wall, and climb an industrial ladder.
All competing teams can receive research and development funds from the U.S. military.
However, Japanese universities and research institutes have been reluctant to receive such money apparently because of the military connection. The Japanese finalists said they have no intention of accepting prize money even if they win.

The only Japanese team that participated in the Robotics Challenge semi-finals in 2013 was a venture team from the University of Tokyo.
But the Ministry of Trade, Economy and Industry is promoting Japan's strengths in applying robotics for disaster response efforts.
The ministry's New Energy and Industrial Technology Development Organization sought candidates for the Robotics Challenge and offered 100 million yen ($813,000) each to three teams over a two-year period: the National Institute of Advanced Industrial Science and Technology (AIST) based in Tsukuba, Ibaraki Prefecture; the University of Tokyo; and a combined team of the University of Tokyo, the Chiba Institute of Technology, Osaka University and Kobe University.
In early May, the AIST team repeatedly tested a bipedal walking robot on a course featuring a steep ladder, doors and valves. The test area also contained a road where concrete blocks were scattered randomly.
The robot calculated the locations, sizes and shape of the blocks before walking carefully through the course.
"This is a good opportunity to grasp where our team stands in robotics research," said Fumio Kanehiro, the team leader who heads the institute's humanoid research group. "We hope our robot will successfully complete the tasks."
A ministry official said, "There is no possibility of technology transfers to the United States."

Massive solar power plan in Kagoshima Pref.

May 28, 2015

Solar plant for 30,000 households planned in Kagoshima

http://ajw.asahi.com/article/sci_tech/environment/AJ201505280059

An artist's rendition of a mega solar power plant that will be constructed in Kagoshima Prefecture (Provided by Gaia Power)

By SHUSAKU ISOBE/ Staff Writer

Construction of a massive solar power plant on a vast forested mountainside in Kagoshima Prefecture is set to get under way in September.

The plant will be one of the largest in Japan and have an output of 92 megawatts, companies involved in the project said May 27. An estimated 340,000 solar panels will be installed on commercial land covering about 2 million square meters.

A consortium comprising Kyudenko Corp.; Kyocera Corp.; Century Tokyo Leasing Corp.; and Gaia Power, a company in Anan, Tokushima Prefecture, which builds and manages solar power facilities, said annual power generation will be 99.23 gigawatt-hours, which is sufficient to supply 30,500 households.

The project will cost around 35 billion yen ($282 million).

The site, which straddles Kanoya city and the town of Osaki, was originally going to be a golf course. The plant is expected to become operational in October 2017.

Robots challenge in California

June 6, 2015

Disaster-response robots compete in California

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Jun. 6, 2015 - Updated 04:38 UTC+2

Robots from around the world are competing for a 2-million dollar first-prize in the US state of California. Engineers have entered devices designed to respond to natural and man-made disasters.

The 2-day DARPA Robotics Challenge started on Friday.

The competition was launched by a US Defense Department research institute. It aims to help develop robots capable of assisting humans in rescue and restoration operations.

Members of the institute say the Fukushima nuclear accident in Japan in 2011 was one inspiration.

Twenty-three teams are participating in the event.

Four teams are from Japan. Among them are the University of Tokyo, and the National Institute of Advanced Industrial Science and Technology.

At a simulated disaster site, the entrants remotely controlled their humanoid robots in a bid to overcome 8 tasks such as crossing a debris field, driving a vehicle and opening a door.

The teams compete in how many tasks they can complete and the total points earned.

A large crowd has gathered to watch the robots in battle. Spectators cheer whenever a machine clears a challenge.

Robots compete in Fukushima-inspired U.S. challenge

http://www.japantimes.co.jp/news/2015/06/06/business/tech/robots-compete-in-fukushima-inspired-u-s-challenge/#.VXLURUbwmos

AFP-JIJI

POMONA, CALIFORNIA – Robots from six countries, including the United States, Japan and South Korea, went diode-to-diode Friday in a disaster-response challenge inspired by the 2011 Fukushima nuclear meltdown.

The winner of the DARPA Robotics Challenge (DRC), to be announced Saturday after a two-day competition in California, will take home $2 million. The runner-up will get $1 million, and $500,000 will go to the team in third place.

They will also win kudos for triumphing after a three-year robotics contest organized by the Defense Advanced Research Projects Agency (DARPA), which commissions advanced research for the U.S. Defense Department.

"The U.S. military has an implicit mission to respond to humanitarian disaster relief. But in order to do so, you need the tools to effectively respond," said DARPA official Brad Tousley. "In many cases, you'd like to send robots into the places that it's very dangerous for humans to go into," he said, citing nuclear reactor disasters and also earthquakes and epidemics like Ebola

In all, 24 mostly human-shaped bots and their teams — 12 from the United States, five from Japan, three from South Korea, two from Germany and one each from Italy and Hong Kong — won through to the finals.

Over the two days, each robot has two chances to compete on an obstacle course comprising eight tasks, including driving, opening a door, opening a valve, punching through a wall and dealing with rubble and stairs.

The challenges facing them in Pomona, just east of Los Angeles, were designed specifically with Fukushima in mind.

After the March 11, 2011, mega-quake and tsunami, a team of plant workers set out to enter the darkened reactor buildings and manually vent accumulated hydrogen. They had to turn back due to radiation — and in the days that followed, hydrogen built up, fueling explosions that extensively damaged the facility, contaminating the environment and drastically worsening the crisis.

"If the Japanese had had advanced robotics systems that could have used tools that we use in everyday life … they might have prevented some of the damage from the subsequent hydrogen explosions," said Tousley.

While the robotics teams competing in Pomona are focused on the tasks in hand, they also have their eyes on more than just winning the competition.

"Hong Kong is a financial center. … We hope we can inspire the people with more innovation, to be interested in engineering and technology," said Robert Hung from Hong Kong University.

Maurice Fallon of the Massachusetts Institute of Technology said that while robots could become crucial in disaster responses, "the applications outside of this domain are very wide. Eventually we hope that the technology that is being demonstrated here will be used in our daily lives, from home help to elderly care to agriculture and construction — there are many applications."

But watching the competition in Pomona, it must be said that the technology can appear less than impressive. It takes most robots five minutes to open a door, while many of them give up on the task of getting out of a car.

JAXON, the robot from Team NEDO-JSK of the University of Tokyo, is not the only bot to take a tumble, in its case after failing to properly grasp a valve wheel. It had to be carried away on a stretcher.

They are not exactly Transformers yet.

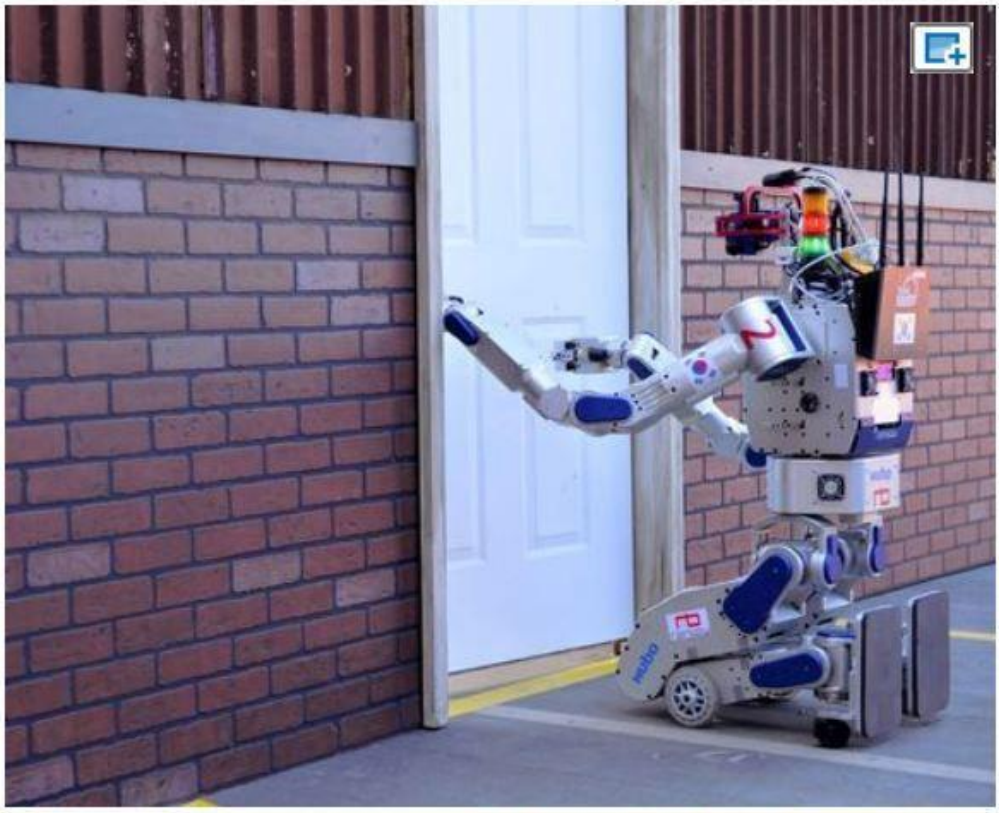
"There is a long way to go," admitted Tousley. "There's fact and there's fiction. There's a lot of fiction out there that robots are much more capable than they really are.

"But part of DARPA's job is to show the possible, and what we can start to do. And then, often, other organizations and other countries or other companies will invest more to bring it along. But it's our job to start that process."

South Korea wins robot challenge

June 8, 2015

South Korean team wins $2 million prize in disaster-response robot test
http://ajw.asahi.com/article/behind_news/social_affairs/AJ201506080009



The South Korean team robot wins the DARPA Robotics Challenge Finals on June 6 in Pomona, Calif. (Provided by DARPA)

THE ASSOCIATED PRESS
POMONA, Calif.--The robots drove, walked through rubble, climbed stairs, turned valves and sometimes fell, amid cheers and groans from a crowd of thousands at the Fairplex here.
After three years of research, development and an obstacle course of competition, a South Korean team on June 6 won the three-year, $3.5 million U.S. contest to create a robot capable of responding to disaster conditions that are unsafe for humans.
Team Kaist of Daejeon took home $2 million in first-place prize money for its DRC-Hubo robot, which successfully completed eight tasks related to disaster response in less than 45 minutes at the DARPA Robotics Challenge Finals.

The contest by the U.S. Defense Advanced Research Projects Agency (DARPA) started after the 2011 Fukushima No. 1 nuclear power plant disaster in Japan. Workers couldn't vent hydrogen from the overloaded reactors without enduring excess radiation. The idea was to create a robot that could do such important emergency tasks in the future and get to the problem site.
Competition was fierce among 23 international teams, including a dozen from the United States and 11 from Japan, Germany, Italy, South Korea and Hong Kong. The robots were timed while navigating eight tasks they would likely encounter in emergency scenarios. The challenge required the teams have their robots face increasingly difficult competitions over two years.
Team IHMC Robotics of Pensacola, Fla., finished second, winning $1 million for its robot Running Man. Tartan Rescue of Pittsburgh, Pa., and its robot CHIMP, designed by Carnegie Mellon University's National Robotics Engineering Center, came in third, winning $500,000.
The event was live-streamed, and YouTube videos culling together clips of the robots taking falls throughout the competition were tweeted out.
"These robots are big and made of lots of metal, and you might assume people seeing them would be filled with fear and anxiety," said Gill Pratt, DARPA program manager and the competition organizer in a statement. "But we heard groans of sympathy when those robots fell. And what did people do every time a robot scored a point? They cheered! It's an extraordinary thing, and I think this is one of the biggest lessons, the potential for robots not only to perform technical tasks for us, but to help connect people to one another."

Special drone for Fukushima reactors

JUne 11, 2015

Drone being developed to fly autonomously inside Fukushima reactor buildings

http://www.japantimes.co.jp/news/2015/06/11/national/science-health/drone-developed-fly-autonomously-inside-fukushima-reactor-buildings/#.VX3PAkbwmot

JIJI
CHIBA – A drone is being developed to survey the interior of reactor buildings at Tokyo Electric Power Co.'s Fukushima No. 1 plant.
The unmanned aircraft will use lasers to detect and avoid obstacles in flight and will be able to land to replace its batteries in the absence of an operator.
A test flight was completed at the plant's No. 5 reactor building, which escaped severe damage in the March 2011 nuclear disaster.
It is not known when the meter-wide hexacopter will be ready to begin inspections inside the buildings housing the No. 1 to No. 3 reactors, which suffered meltdowns, but the team behind it is confident the drone will have a role to play.
"The time will certainly come when drone technology will be of help," said a member of the development team.

The drone is the work of Autonomous Control Systems Laboratory Ltd., a university-based venture headed by Kenzo Nonami, a professor at Chiba University.
The six-propeller drone is equipped with a camera, an instrument to measure radiation levels, and a dust collector.
The aircraft is different from conventional drones in that it can detect walls and other obstacles by laser, even when inside a reactor building, where GPS would not work and where radiation doses may be too high for humans.
The information gathered during a survey flight is converted into three-dimensional data in real time, enabling the production of images of damaged walls and dangling piping, for instance.
The lab has also developed an instrument for automatic battery replacement to eliminate the risk of plant workers being exposed to radiation during battery changes.
When the power begins to run low, the drone automatically lands on a "heliport" on the flatbed of a truck and loads itself with a new battery. This will enable it to prolong its mission.
In the demonstration test at the plant's No. 5 reactor building, the drone was used to carry out an inspection from the first floor to the fifth floor, where a pool for spent fuel is located. The test proved the aircraft's ability to shoot video and measure radiation levels.
Nonami started developing the drone soon after the March 2011 nuclear crisis began, anticipating that there would be demand for a flying robot in what is shaping up to be a decades-long cleanup.
"Once the work shifts to the stage of removing melted nuclear fuel from damaged reactors, radiation doses are expected to rise in the work areas," Nonami said.
"I think the drone will be useful as it can be sent to measure radiation levels and contribute to giving the highest priority to human safety."

7,000 kilowatts wind turbine in Fukushima

June 23, 2015

World's most powerful floating wind turbine unveiled in Fukushima

http://ajw.asahi.com/article/business/AJ201506230043

An enormous floating wind turbine at Onahama port in Iwaki, Fukushima Prefecture, on June 22 (Kenichiro Shino)

By KENICHIRO SHINO/ Staff Writer

IWAKI, Fukushima Prefecture--A floating wind turbine that will have the planet's largest generating capacity was shown to the public at Onahama port here on June 22 ahead of test runs scheduled for late this year.

Ten companies, including Marubeni Corp. and Mitsubishi Heavy Industries Ltd., and the University of Tokyo took part in an experimental study project initiated by the economy ministry to develop the wind turbine.

The turbine has three 82-meter-long blades and rises 189 meters from the ocean surface when the blades are in a vertical position, roughly equivalent to the height of a 50-story skyscraper. It will able to produce 7 megawatts of electricity, which can supply about 6,000 households.

For the trial runs from December, the turbine will be fixed on floats and transported about 20 kilometers off the coast of Fukushima Prefecture where it will generate electricity. The electricity will be transmitted to the coast via underwater cables.

The project team plans to have the turbine operational for practical application as soon as possible after the offshore tests.

June 22, 2015

Largest offshore wind turbine unveiled in Fukushima

http://www.japantimes.co.jp/news/2015/06/22/business/economy-business/largest-offshore-wind-turbine-unveiled-in-fukushima/#.VYksUEbwmid

JIJI
IWAKI, FUKUSHIMA PREF. – A huge floating wind turbine for an experimental offshore power generation project was unveiled Monday at Onahama port in Iwaki, Fukushima Prefecture.
With an output capacity of 7,000 kilowatts, the turbine is the largest piece of offshore wind power generation equipment in the world.
The project, commissioned by the Ministry of Economy, Trade and Industry in fiscal 2011, aims to establish a business model to kick-start domestic wind turbine exports.
The new turbine, some 220 meters high including the floating foundation, will start operating some 20 km off Fukushima in September.
Since the turbine isn't fixed to the sea bottom, it will transmit electricity to land via submarine cable.
Offshore turbines enjoy the benefit of more stable wind than onshore models, and are more efficient because they are not hampered by the constraints posed by land and transportation.
A 2,000-kilowatt wind turbine has already started operations off Fukushima. A third turbine with an output capacity of 5,000 kilowatts will be installed in fiscal 2015.

Scorpion robot for Fukushima

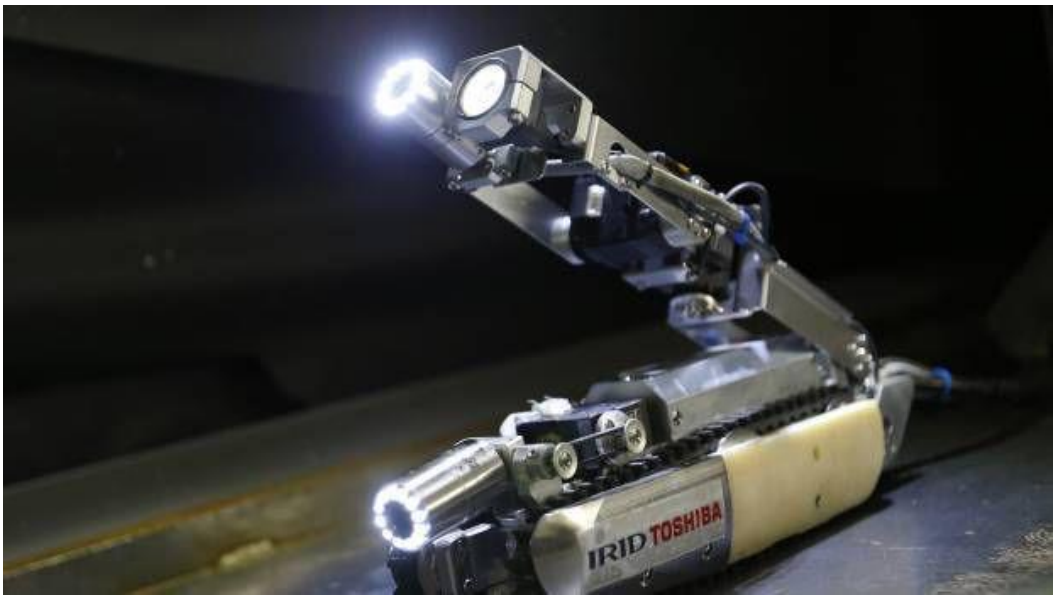
July 1, 2015

Shape-changing robot built to photo melted fuel at Fukushima reactor

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507010051

By HIROMI KUMAI/ Staff Writer
YOKOHAMA--Toshiba Corp. unveiled a shape-shifting robot that could finally reveal the actual condition of melted nuclear fuel at the crippled Fukushima No. 1 power plant.
The robot will likely be deployed in August in the No. 2 reactor containment vessel for the first survey underneath a reactor core at the plant, Toshiba officials said at a June 30 demonstration for reporters at its Keihin works here.
Equipped with two cameras and light-emitting diodes, the robot will be tasked with taking pictures of the melted fuel.
More than four years after the March 2011 Great East Japan Earthquake and tsunami caused the triple meltdown at the Fukushima plant, high radiation levels are still preventing workers from approaching the reactor containment vessels to accurately assess the damage within.
"We hope the robot will gather as much information as possible with the two cameras," a company official said.
According to Toshiba officials, the probe was developed at the request of the International Research Institute for Nuclear Decommissioning, an organization consisting of electric power companies and nuclear reactor manufacturers.
To pass through narrow spaces, the probe transforms into a 54-centimeter-long tubular shape that measures 9 cm in width and 9 cm in height.

The back part of the robot, which contains one of the cameras, can be rotated to take pictures from different angles.
The device can also right itself if it overturns, Toshiba said.
The probe will enter the central part of the containment vessel through a rail link and operate on the iron-mesh floor beneath the reactor core.
The robot can identify objects up to 3 meters away, even in poor visibility caused by steam or other factors, according to Toshiba.
Robotic probes developed by another company were used to survey the No. 1 reactor containment vessel at the plant in April, but those devices did not enter areas directly underneath the reactor core.
One got stuck between obstacles on the floor, rendering it inoperable.
A monitoring camera installed in the containment vessel to control the second robot later malfunctioned because of high radiation levels, forcing plant operator Tokyo Electric Power Co. to give up its plan to retrieve the robot.



A robot developed by Toshiba Corp. is demonstrated at its laboratory in Yokohama Tuesday. As Japan struggles in the early stages of a decades-long cleanup of the Fukushima nuclear crisis, Toshiba developed the robot, which raises its tail like a scorpion and collects data, to hopefully locate some of the melted fuel in the stricken reactor 2. | AP

Toshiba rolls out 'scorpion' robot to look inside crippled reactor at Fukushima No. 1

http://www.japantimes.co.jp/news/2015/07/01/business/tech/toshiba-rolls-scorpion-robot-look-inside-stricken-fukushima-reactor-2/#.VZOcnUbwmic

by Mari Yamaguchi
AP

YOKOHAMA – A new robot that raises its tail like a scorpion is scheduled to survey melted nuclear fuel inside one of the three wrecked reactors at Tepco's Fukushima No. 1 plant.
Toshiba Corp., codeveloper of the device, which was demonstrated on Tuesday, said the robot will venture into reactor 2′s primary containment vessel in August after its operators undergo a month of training.

Officials hope the robot can see the fuel in the pressure vessel in the middle of the reactor. The location of the fuel has yet to be pinpointed because of the dangerously high radiation levels nearby.
The unprecedented work of decommissioning the Fukushima No. 1 plant, which was crippled in the 2011 earthquake and tsunami, is expected to take decades.
The scorpion robot is the second to enter a primary containment vessel, after a "snake" robot was sent into the worst-hit reactor 1 in April. The robot stalled inside the reactor and was unable to spot melted-fuel debris there.
This time, the scorpion crawler, which is 54 cm (21 inches) long when it is stretched out, will enter through a duct designed as a passageway for fuel rods.
During the demonstration at a Toshiba lab near Tokyo, the robot slid down a railing and stretched out like a bar, with a head-mounted LED showing its way. After crawling over a slight gap and landing on a metal platform, the robot lifted its tail and looked up the bottom of the control rod drive, a structure above the platform simulating where some melted nuclear fuel might be left.
The scorpion also demonstrated it can roll back upright if it hits an obstacle and rolls over. The ability comes from a tail joint in the middle that bends.
One operator controls the robot with a joystick, and another monitors the video feed from the robot and other data. At the Fukushima plant, the robot will be operated remotely from the command center in a separate building.
The work is expected to take a full day. The robot is designed to tolerate radiation, which should allow it to stay inside reactor 2 for more than 10 hours.

Next-generation robots for Fukushima

The Sakura remote-controlled transfer robot, developed by New Energy and Industrial Technology Development Organization, is operated during a demonstration in Narashino, Chiba Prefecture, in February 2013. | BLOOMBERG

Fukushima in the frame for robot, drone testing center

http://www.japantimes.co.jp/news/2015/07/08/tech/fukushima-frame-robot-drone-testing-center/#.VZzvmfnwmid

JIJI
A center dedicated to testing next-generation robots is set to be built in Fukushima Prefecture under plans being developed by the Japanese government.
Government officials said it was planned to put the center into use around 2017 as a core part of its strategy to boost the use of robots in dangerous locations, such as damaged nuclear power plants, natural disaster-hit areas such as the Tohoku region and workplaces with labor shortages.
The center will also establish a testing field for drones, or unmanned aerial vehicles, which can be used in cases such as surveying buildings after a disaster.
An association of companies and research institutes engaged in the development of drones opened an airfield for test flights in Tsukuba, Ibaraki Prefecture, in May. However, at 100 meters long and 38 meters wide, Japan still lacks a facility for long-distance flights.
Tomoyuki Izu, president of enRoute Co., a drone developer in Fujimino, Saitama Prefecture, welcomed the government plan and called for an airfield big enough for "unrestricted" trial flights.
Shuji Yumitori, head of the Robot and Machinery System Technology Department at the government-affiliated New Energy and Industrial Technology Development Organization, said areas such as Fukushima were "full of the raw data needed for development."
He urged the government to set the world's highest technological standards of innovation and safety.
If Japan created an image that robots meeting the "Fukushima Standards" can be readily used in any disaster site, Japanese-made robots will be "highly rated" in the global market, especially in Asia, Yumitori added.

Onuma goes solar

August 20, 2015

Nuclear slogan writer who saw the light now banks on solar power

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201508200003

By AKEMI KANDA/ Staff Writer
NASU-KARASUYAMA, Tochigi Prefecture--It's the dawn of a sunny new day for a man who as a schoolboy dreamed up an upbeat slogan for a signboard used to promote the now crippled Fukushima No. 1 nuclear power plant.
Yuji Onuma, 39, recently launched a solar power plant here to bring about a "bright future" without nuclear energy.
Onuma, the creator of the iconic "Nuclear energy is the energy of a bright future" sign that still hangs in Futaba, Fukushima Prefecture, hopes his new venture will mark a fresh start for his life, which was greatly affected by the country's energy policy.

“Until the Fukushima accident occurred, I thought my life relied on the prosperity of nuclear energy, but I lost everything when the nuclear plant ended up as a failure,” he said. “My life is still intertwined with the electric industry, but I could make a fresh restart this time thanks to this renewable energy project.”
In 1988, Onuma, then an elementary school sixth-grader in Futaba, which co-hosts the damaged plant, came up with the signboard slogan as a homework project.
The slogan became a local fixture on an overhead signboard that greets visitors at the entrance to a central shopping street of the town. After growing up, he became a real estate agent and operated apartments for plant workers in the town.
But in the wake of the Fukushima nuclear disaster, triggered by the Great East Japan Earthquake and tsunami in March 2011, his family's life has been turned upside down, just as it has for all Futaba residents.
The family has spent more than four years living as evacuees, first in Anjo, Aichi Prefecture, and elsewhere. These experiences have made Onuma reflect on his elementary school slogan and his naive acceptance of nuclear energy.
Thus, in building his solar power plant in Nasu-Karasuyama in eastern Tochigi Prefecture, Onuma and his wife, Serina, 40, decided to place a signboard with the modified message, “Renewable energy is the energy of a bright future” in its compound.
It is the sixth solar power plant he has built in Tochigi and Ibaraki prefectures since he opened the first in Sakura, Tochigi Prefecture, in May last year.
The six power plants are capable of generating a total of 236 kilowatts of electricity, which ironically is sold to Tokyo Electric Power Co., the operator of the Fukushima No. 1 nuclear plant, using the government’s feed-in-tariff system for renewable energy. The system, introduced in July 2012, obligates electric utilities to purchase renewable energy generated by developers at fixed rates.
Onuma’s solar power plants bring in about 200,000 yen ($1,600) a month for his family after the loan payments for their construction are deducted.
“I thought I could contribute to the creation of a nuclear-free world through the renewable energy business,” Onuma said.
He added that he became even more motivated to create a nuclear-free society in Japan after his two children were born while the family was living as evacuees.
Meanwhile, Futaba town officials now plan to remove the brittle signboard later this year at the earliest and preserve it elsewhere.
Onuma has advocated preserving the overhead signboard as is to serve as a reminder of the devastating effects of the nuclear disaster as a "negative legacy."

He added that he became even more motivated to create a nuclear-free society in Japan after his two children were born while the family was living as evacuees.
Meanwhile, Futaba town officials now plan to remove the brittle signboard later this year at the earliest and preserve it elsewhere.
Onuma has advocated preserving the overhead signboard as is to serve as a reminder of the devastating effects of the nuclear disaster as a "negative legacy."

Budget for renewables to be increased

August 21, 2015

Budget request for renewable energy to be boosted

http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html

Aug. 21, 2015 - Updated 13:57 UTC+2
Japan's industry ministry is planning to ask for increased funding to promote renewable energy and energy saving measures for the fiscal year that begins next April.

The move follows the government setting **a new target to raise the ratio of renewable energy in the country to a range between 22 and 24 percent by fiscal year 2030**. That's more than twice the current level.

Officials plan to subsidize the updating of hydroelectric power facilities run by utilities and local governments to increase their output. They will also raise subsidies to help support surveys for geothermal power generation.

The industry ministry is to request about **1.1 billion dollars for renewable energy.**

The officials will also request about **2 billion dollars for energy saving measures. That would nearly double the amount compared to the current fiscal year.**

They say it will seek an energy-related budget of about 8 billion dollars in total. This would be an increase of more than 20 percent from the initial budget for the current fiscal year.

Algae plant in Minami-Soma

August 25, 2015

1st algae-based oil producing facility in Fukushima set up in devastated region

http://ajw.asahi.com/article/0311disaster/recovery/AJ201508250056

THE ASAHI SHIMBUN
MINAMI-SOMA, Fukushima Prefecture--An experimental facility to produce oil from algae was constructed on former farmland that was abandoned after the March 2011 Great East Japan Earthquake and tsunami struck the region.
“The new plant embodies local efforts toward a local energy production and consumption policy in areas hit by the tsunami,” Minami-Soma Mayor Katsunobu Sakurai said recently. “I expect operations at the facility will lead to more job opportunities in the region.”
The Algae Industry Incubation Consortium, operator of the large-size biomass plant, which is headed by Isao Inoue, a professor emeritus of the University of Tsukuba, will compile a commercialization plan for its algae-based technology by the end of the fiscal year.
The Minami-Soma city government bought abandoned fields in coastal areas, and provided the consortium with 1.2 hectares of land, where the joint firm constructed various facilities, such as pools to cultivate Scenedesmus and other native algae, using state subsidies.

The consortium plans to mass-produce algae there by adding nitrogen and phosphorus as nutrients, as well as carbon dioxide for photosynthesis, to the culture fluid, and then stirring it with paddle wheels. The operator will study the profitability of the oil generating technology after conducting experiments to convert algae into crude oil through exposing the organisms to high temperatures and high pressure. During the three-year period until the end of this fiscal year, it plans to spend a total of 1.1 billion yen (9.16 million) for the oil producing facility. The biomass plant is the first such facility in Fukushima Prefecture.
The production efficiency for algae-derived oil is higher than that for other biomass fuel. In addition, algae are typically not edible, so there is no risk that use of algae for generating oil will lead to food shortages, unlike corn.

Kyushu Power & geothermal

August 30, 2015

Kyushu utility to double geothermal power generation by 2030

http://ajw.asahi.com/article/business/AJ201508300012
By JUNICHIRO NAGASAKI/ Staff Writer
KOKONOE, Oita Prefecture--Because it is volcanically active, the island of Kyushu is ideally suited to geothermal power generation. That prompted Kyushu Electric Power Co. to announce an ambitious plan on Aug. 5 to double its geothermal output by 2030.
Even though geothermal power accounts for a miniscule share of overall electricity demand, the regional utility said it plans to gradually add more power stations in years to come. One bonus is that geothermal generation offers a more stable electricity supply source compared with solar or wind power.
Kyushu Electric held a completion ceremony on Aug. 5 at the Sugawara Binary Cycle Power Station, a geothermal power generation facility in the town of Kokonoe in Oita Prefecture. With an output of 5,000 kilowatts, it will produce approximately 30 million kilowatt hours a year, or enough to power 8,000 typical homes.
The station's operator is Kyuden Mirai Energy Co., a subsidiary that works with renewable energy.
Including this facility, Kyushu Electric operates seven geothermal power stations in Kyushu. One of them is the Hacchoubaru Geothermal Power Station, an 110,000-kilowatt facility in Kokonoe that is the largest of its kind in Japan. The power company's total geothermal output is around 200,000 kilowatts, accounting for 40 percent of all geothermal generation in Japan.
At the ceremony, President Michiaki Uriu revealed that by 2030, Kyushu Electric will roughly double its current output by adding 180,000 kilowatts. The company has plans for new facilities in Minami-Aso in Kumamoto Prefecture and Ibusuki in Kagoshima Prefecture, but Uriu stated, "That will not be enough. We will add yet more."
Like other utilities, Kyushu Electric is obliged to diversify its power sources in the aftermath of the 2011 nuclear disaster in Fukushima Prefecture.
Solar power generation has rapidly expanded in Kyushu. However, Kyushu Electric has placed restrictions on purchases of solar power because the amount of electricity produced is precariously affected by the weather.
Geothermal power offers a stable supply.

"It doesn't suffer from the disadvantage of fluctuating with weather conditions. So if we can properly manage the resource, we can generate electricity for perpetuity," Uriu said.
While there are expectations that geothermal power will act as a "baseload" power supply around the clock, the technology has been slow to spread. Even at Kyushu Electric, which has the edge over other regional utilities in the development of this technology, geothermal generation only accounted for around one percent of the power supply capacity this summer.
One reason is resistance from local hot spring inns and others who worry that the source of the hot springs will be depleted. The recently completed Sugawara Binary Cycle Power Station uses a well, locally-owned by the town of Kokonoe, to capture steam. In return, Kyushu Electric pays the town about 100 million yen ($830,000) a year as a steam purchase charge.
This mechanism provides a large benefit for the local community.
"We have to have a mutually beneficial relationship with local communities," Uriu said. "We will use this as a model case and continue to develop geothermal power generation into the future."
Geothermal power is typically generated by taking extremely hot and pressurized steam that rises from the ground to spin a turbine, whereas "binary power generation" can produce electricity even if the steam's temperature is relatively low.
With this approach, pentane and other substances with a low boiling point are heated with the steam and evaporated, and the subsequent steam spins the turbine. Although the output is relatively small, it means that more sites can be used as power stations. And it is this factor that is expected to help spread the technology.

New robot to decontaminate No3. building

September 3, 2015

Robot to decontaminate reactor building

http://www3.nhk.or.jp/nhkworld/english/news/20150903_30.html

Sep. 3, 2015 - Updated 13:09 UTC+2
Engineers have tested a robot designed to remove radioactive substances from high places in nuclear reactor buildings at the crippled Fukushima Daiichi power plant in northeastern Japan.

The plant's operator, Tokyo Electric Power Company, plans to use the device as soon as October to decontaminate the building of the facility's No. 3 reactor.

The robot emits high-pressure jets of frozen carbon dioxide grains onto walls and scrapes off the coating along with radioactive substances. The machine's ladder-like structure with a nozzle can reach as high as 8 meters.

Engineers at electronics maker Toshiba tested the robot on Thursday at a factory in Toyohashi City, Aichi Prefecture. Part of the reactor building was simulated at the factory.

The engineers operated the robot remotely while watching footage from 22 cameras attached to the machine. They carefully scraped a blue coating off a 3-meter-high wall.

The device is expected to speed up decommissioning work at the plant, where other robots could not remove radioactive substances from high places. High radiation levels in the reactor buildings prevent workers from entering them.

Toshiba senior engineer Hitoshi Sakai said little is known about contamination at high places in the buildings. He added that his firm wants to create an environment that's accessible for workers by removing radioactive substances.

Solar accounted for 10% of Japan's power needs on hottest days

September 3, 2015

Solar power proved its worth this summer

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201509030045
By DAISUKE HIRABAYASHI/ Staff Writer
Solar power accounted for 10 percent of the nation’s electricity when demand peaked this summer, showing that alternative energy is a key resource in times of need.
A survey by The Asahi Shimbun found that **Kyushu Electric Power Co. covered 24.6 percent of all its electricity needs, or 3.65 gigawatts, with solar facilities from 12 p.m. to 1 p.m. on Aug. 6, when the company said power demand peaked in areas it serves.**
The newspaper asked all major regional power companies what day power demand peaked in areas they serve between July and August, the maximum hourly solar output on that day and the time their solar plants recorded peak outputs.
Valid responses were received from all utilities except Okinawa Electric Power Co.
All nine responding utilities said their highest demand was recorded in early August, and that their solar output peaked between 11 a.m. and 2 p.m.
The reported maximum hourly outputs of the utilities’ solar plants totaled 15 gigawatts--equivalent to the amount of energy produced at around a dozen nuclear reactors in an hour.
The amount of electricity needed across the country during the hours the companies' solar plants were generating maximum output was estimated at 150 gigawatts.
That means **solar power covered 10 percent of all electricity needs during the hottest days of August.**
The survey also showed that **solar power generation accounted for around 16 percent and 12 percent of all power needs for Shikoku Electric Power Co. and Chugoku Electric Power Co., respectively, on their days of peak consumption.**
The nine companies’ ratios of solar power varied, depending on whether their plants received sufficient sunlight and the size of the facilities.

All of the nation's nuclear reactors remained offline until recently due to the nuclear disaster in Fukushima Prefecture that was set off by the March 2011 earthquake and tsunami.
Because of this, utilities have tried to avert power shortages by operating oil thermal power plants, which emit huge amounts of carbon dioxide.
Solar power accounted for just 2 percent of all power generation on an annually adjusted basis.
Even so, **the study showed that clean energy was useful during the dog days of August and helped reduce greenhouse gas emissions.**
Kyushu Electric and Chubu Electric Power Co., however, pointed out that solar power is not 100-percent reliable because "unexpected changes in the weather make it difficult for utilities to correctly estimate solar plants' outputs."
Photovoltaic stations with a total output of 2.84 gigawatts had been introduced as of the end of fiscal 2009. The figure surged to 27 gigawatts by the end of fiscal 2014, due largely to the government feed-in tariff system for clean energy.

Solar & Fukushima

September 16, 2015

Solar farms grow in shadow of Fukushima plant

http://www.japantimes.co.jp/news/2015/09/16/national/solar-power-farms-grow-shadow-fukushima-plant/#.VfmQ0ZfwlLN

JIJI
FUKUSHIMA – Parcels of farmland totaling 250 hectares near the crippled Fukushima No. 1 nuclear plant are returning to life and being covered with solar panels, amid government incentives to invest in renewable power.
At least one village has set up its own tiny power company, and together the solar farms are scheduled to generate about 160 megawatts of electricity.
Tohoku Electric Power Co. will buy the output, according to prefectural and municipal officials in Fukushima Prefecture.
Japan strictly regulates the conversion of farmland to other uses, to keep a lid on disorderly development.
The cases in Fukushima Prefecture were made possible after the central government eased restrictions as an exceptional measure to promote reconstruction following the quake, tsunami and nuclear disaster in Tohoku in March 2011.
Under the measure, such farmland conversion needs to be part of municipal governments' reconstruction plans.
It was driven by a program that the central government adopted in July 2012 requiring major power suppliers to purchase electricity generated from solar, wind, geothermal and other renewable sources at set prices.
Solar power is the easiest renewable to install because the equipment is simple. It was also considered profitable due to relatively high purchase prices, a prefectural official said.
Now, an unexpected rush of entries into the solar power sector has been pushing down purchase prices.

“Further increase in solar power generation is unlikely because of dwindling profitability,” said an official in the village of Iitate, where two large solar power plants are currently planned.
Given the circumstances, an effort is now underway to promote solar power generation while trying to keep farmland intact. Under the so-called solar sharing system, solar panels are positioned so that crops can grow beneath them.
Solar sharing is being tested by Iitate Denryoku, a power company set up by residents of Iitate, which initially pursued large-scale solar power generation but has shifted its approach due to the glut of solar power.
“Whether crops grown there will be sold is uncertain, given public concern about radiation,” said Iitate Denryoku President Minoru Kobayashi, who was a dairy farmer in the village until the disaster. “If solar power generation provides a stable revenue source, this will become an incentive for people to resume farming here. ”

New robot

October 29, 2015

Robot for decontaminating high places to be deployed at Fukushima nuke plant

A new radioactive cleanup robot is seen. (Mainichi)

A new radioactive cleanup robot is seen. (Mainichi)

http://mainichi.jp/english/english/newsselect/news/20151029p2a00m0na011000c.html

A new robot designed to help decontaminate high, hard-to-reach places at the disaster-stricken Fukushima No. 1 nuclear plant will go into service in mid-November, plant operator Tokyo Electric Power Co. (TEPCO) has decided.

The tracked robot is a compact 2 meters high, but can extend cleaning equipment about 8 meters up. Decontaminating the upper reaches of the reactor buildings has hitherto been impossible, obstructing cleanup efforts, and TEPCO hopes the new robot will help solve the problem.

The utility plans to deploy the robot on the first floor of the No. 3 reactor building, home to one of three reactors that melted down in March 2011 and especially radioactive. Decontamination work on the building's floors and other easily reachable areas has been ongoing, but piping and other spots higher up are more complicated to get to and have not been cleaned yet. Some 70 percent of the radiation inside the No. 3 building is from contaminants in its higher reaches.

The remote-controlled robot sprays dry ice onto contaminated equipment such as piping, scrapes off the ice and sucks it up -- along with the radioactive materials.

The new cleanup robot is seen extended to its full 8-meter height. (Mainichi)

The new cleanup robot is seen extended to its full 8-meter height. (Mainichi)

Maximum radiation levels now stand at 9 millisieverts per hour on the first floor of the No. 1 reactor building, 30 millisieverts in the No. 2 reactor building, and 125 millisieverts in the No. 3 building. TEPCO

has stated that those radiation levels must be brought down to 3 millisieverts per hour or less before it will send human workers into the buildings.
October 29, 2015 (Mainichi Japan)

Feed-in tariffs review: Public consensus essential

October 31, 2015

Review of feed-in tariff system

http://www.japantimes.co.jp/opinion/2015/10/31/editorials/review-feed-tariff-system/#.VjTi0yt1BLN

A review of the feed-in tariff system, introduced in 2012 to promote introduction of renewable energy following the shutdown of nuclear reactors in the wake of the 2011 disaster at Tokyo Electric Power Co.'s Fukushima No. 1 power plant, is underway by a panel of experts at the Ministry of Economy, Trade and Industry.
Planned amendments to the system, aimed at addressing several problems that came to light in its first three years, should be implemented in ways that contribute to boosting the scant share of renewable sources in the nation's electricity supply. The reform should also be accompanied by greater efforts to build a public consensus on what cost the nation is ready to shoulder to establish a sustainable energy supply.
Currently, electricity generated by renewable sources accounts for only 12.2 percent of the nation's total. The share of sources such as solar and wind but not including hydro stands at a mere 3.2 percent. To achieve the government's goal of boosting the renewable share to 22 to 24 percent in 2030 — and hopefully beyond — the system to expand renewable energy supply needs to be based on a long-term vision.
The feed-in-tariff system, which began in July 2012, makes it mandatory for power companies to buy electricity generated by renewable sources at fixed prices set by the government, so that the prospect of stable revenue will facilitate investment in renewable power generation. The system has indeed sharply boosted the introduction of solar power, whose facilities can be built relatively easily and quickly. Solar power output during the peak-demand period in summer 2014 reached 6.33 million kilowatts — the equivalent of six nuclear reactors.
However, much of the increase in renewable energy output capacity under the system — more than 90 percent of the total — has been concentrated in solar. This sharp increase in output led several major power companies to suspend purchases of electricity from solar power operators, on the grounds that their power supply system could be disrupted.
It has also been pointed out that many operators of solar power businesses that have obtained a government permit to sell the electricity at a high fixed price have not started producing power because they're waiting for the cost of solar panels and other items to decrease.
The system should be corrected to prevent distortions in the way renewable energy develops. And yet it appears indisputable that the system is contributing to expansion of the use of renewable energy in this country. In the ongoing review, t**he government should not lose track of the system's basic**

purpose — to reduce the risks for businesses that are serious about developing renewable energy, and to get all of society to share the cost of expanding the use of renewable energy.
The fixed prices for purchase of electricity from renewable sources are set high to ensure a profit margin for the producers. The power companies' cost of buying such electricity is passed on to households and businesses.
During the current fiscal year, the total cost of purchasing renewable energy is projected to reach ¥1.8 trillion. The cost is expected to rise to as high as ¥4 trillion in 2030 if the renewable supply is doubled from the current level in line with government targets.
Reportedly under consideration in the ministry's review of the system is a mechanism to introduce an auction for energy operators if the output of solar power reaches a certain level, so that the purchase of power from more efficient operators would be prioritized and trim the overall cost.
Also called for in the review is a more balanced promotion of various renewable sources whose output is less affected by weather conditions than solar. The ministry is believed to be weighing whether to fix purchase prices for wind, hydro, geothermal and biomass for several years ahead — instead of revising them annually — to promote investments in energy facilities that require a long period to be completed. This could reduce the risk of price fluctuations for prospective operators and encourage them to cut costs.
Under the feed-in-tariff system, the additional charges that consumers pay for electricity will increase as the power supply from renewable sources rises. While the government and power producers should make sustained efforts to win the understanding and support of consumers, the latter will also need to think about the benefits and problems of the system as they weigh the impact on their pocketbooks.
To help build a popular consensus on the issue, discussions of the feed-in tariff system and other measures to promote introduction of renewable energy should be made transparent, rather than being monopolized by the bureaucracy and business interests.

Renewables for Fukushima

January 9, 2016

Foundation supporting renewable energy business operators to be set up in Fukushima

http://mainichi.jp/english/articles/20160109/p2a/00m/0na/009000c

FUKUSHIMA -- Corporations and organizations working to promote renewable energy in the wake of the nuclear meltdowns at the Fukushima No. 1 nuclear plant announced Jan. 8 that they will establish a fund to support renewable energy projects in the prefecture.
A foundation to operate the Fukushima shizen energy kikin (Fukushima natural energy fund) will be founded as early as the end of February, and donations will be accepted beginning in early March. The group is also planning to build a museum to pass down lessons learned from the nuclear disaster to future generations.

The chief representative for the group is Yauemon Sato, the president of Aizu Electric Power Co., which promotes solar power generation in the Aizu region of Fukushima Prefecture. Sato, along with Tetsunari Iida, executive director of the nonprofit organization Institute for Sustainable Energy Policies (ISEP), and Tsuyoshi Yoshiwara, adviser to Jonan Shinkin Bank who has continued to call for Japan to phase out nuclear power, made the announcement at a press conference in Fukushima. Internationally renowned musician Ryuichi Sakamoto is also among the fund's founders.
It was a donation of approximately 3 million yen received from a German civic energy company that prompted Aizu Electric Power's Sato to propose that the fund be set up. Not only will the foundation provide funds to renewable energy business operators, but will also be involved in the development of business plans and in helping companies and organizations work with each other. The aim is for the fund to reach several billion yen in scale; the foundation will also call for land donations.
Since the outbreak of the nuclear disaster, the Fukushima Prefectural Government has set a goal of switching all energy sources within the prefecture to renewable energy by the year 2040. "It's important that the nuclear phase-out begins with Fukushima," Sato said. "We want to achieve recovery based on natural energy through civic power -- without relying on government agencies."
A symposium with former Prime Minister Junichiro Koizumi -- who in recent years has been calling for the elimination of nuclear power -- will be held March 9 to commemorate the foundation's launch. For more information, contact ISEP at 03-5942-8937.

Amending feed-in tariff system

January 24, 2016

Reviewing the feed-in tariff system

http://www.japantimes.co.jp/opinion/2016/01/24/editorials/reviewing-feed-tariff-system/#.VqSrcVKDmov

The trade and industry ministry plans to revise the law governing the feed-in tariff system introduced in 2012 to promote introduction of renewable energy. Through the amendment, the government hopes to achieve a cost-effective expansion of green energy use and hold down the financial burden on consumers.
Since renewable energy in Japan remains more expensive than in other countries, it is reasonable to devise measures to reduce the cost added on to electricity bills. But in so doing, the government needs to take the utmost care so that its emphasis on efficiency will not discourage potential renewable energy producers from entering the market or force out community-based small-scale operators.
The system started in July 2012, following the shutdown of the nation’s nuclear reactors in the wake of the March 2011 disaster at Tokyo Electric Power Co.’s Fukushima No. 1 plant. By requiring the major power companies to purchase at fixed prices electricity generated by solar, wind, geothermal, biomass and medium- to small-scale hydro power, the system aims to facilitate investments in renewable energy sources and expand the use of electricity from such sources. The cost the utilities have paid for the purchases is tacked on to consumers’ electricity bills.

Japan adopted the feed-in tariff system based on the experiences of other countries, especially in Europe, where it contributed to expanded use of renewable energy. The system has indeed led to a steady increase in the amount of electricity generated from renewable sources, although its share in the nation's total power supply still remains small. As of the end of March 2015, the amount of such electricity grew 1.9 times from before the system was introduced. The share of such energy rose from 10.4 percent of the power market in fiscal 2011 — 9 percent from hydro power and 1.4 percent from other renewable sources — to 12.2 percent in fiscal 2014 — 9 percent from hydro and 3.2 percent from other sources. However, solar power accounts for a lopsidedly large portion of power generated from green sources — 96 percent of such electricity produced in the first three years after the system was introduced. Since the prices at which the utilities were required to buy electricity from solar power suppliers were set relatively high, large numbers of businesses sought certification as power suppliers. Yet fewer than 30 percent of the certified solar power-generation facilities have so far gone into operation. Many of the certified operators are believed to be putting off installing solar panels until the cost of panels goes down so they can maximize their profits.

The trade and industry ministry's plan to revise the feed-in tariff system is largely motivated by the prospect that the amount the power companies pay to buy green-source electricity — which is added to electricity bills — will increase greatly. The cost for fiscal 2015 is expected to reach ¥1.32 trillion, translating into a yearly burden of ¥5,688 for each household, according to the internal affairs ministry.

The trade and industry ministry is considering introduction of a bidding system in which prospective renewable power producers submit tenders — in place of the current system of setting fixed prices — if it would be effective in reducing the burden on consumers. As a first step, it is thinking of using a bidding system for solar power facility operators. In certifying the operators as power suppliers under the system, priority will be given to those who offer their electricity at the cheapest prices. There is a certain limit to the total cost of purchasing the power. Certification for the operators may be revoked if they fail to install and start operating solar panels.

For green energy sources whose lead time from the planning phase to the launch of operation is longer, such as wind and geothermal power, a system of presenting to prospective operators in advance the fixed purchase prices to be in force for the coming several years will be introduced.

The bidding system may make it difficult for prospective operators to correctly predict future price trends, thus complicating their investment plans. Hesitation on the part of operators to make new investments may create a situation in which the combined supply of electricity will fall short of the quota. The ministry needs to make sure that the steps under consideration will not hamper or disturb prospective operators' investments and entry into the green energy market.

Community-based small-scale operators may give up offering tenders from the beginning due to their weak technological and commercial footing. Since these operators can play an important role in reviving local economies, the ministry should take necessary steps to prevent large-scale operators from eliminating smaller firms and effectively securing regional monopolies.

The structure of Japan's electricity industry, in which major utilities own and manage transmission lines in addition to generating electricity, is partly responsible for the high cost of renewable energy. The setup allows the major power firms to refuse or reduce the purchase of electricity from green operators under certain conditions. The separation of power generation and transmission under the ongoing wave of liberalization has to wait until 2020. The ministry should review the overall power industry structure and take necessary steps to help lower electricity bills while expanding the use of green energy.

Worldwide more wind than nukes

February 20, 2016

Global wind power capacity tops nuclear energy for first time

http://www.japantimes.co.jp/news/2016/02/20/national/global-wind-power-capacity-tops-nuclear-energy-for-first-time/#.VshjTeaDmot

Kyodo

The capacity of wind power generation worldwide reached 432.42 gigawatts (GW) at the end of 2015, up 17 percent from a year earlier and surpassing nuclear energy for the first time, according to data released by global industry bodies.

The generation capacity of wind farms newly built in 2015 was a record 63.01 GW, corresponding to about 60 nuclear reactors, according to the Global Wind Energy Council based in Brussels. The global nuclear power generation capacity was 382.55 GW as of Jan. 1, 2016, the London-based World Nuclear Association said.

Both wind power and nuclear energy are being touted as alternatives to fossil fuel power as they produce fewer greenhouse gases.

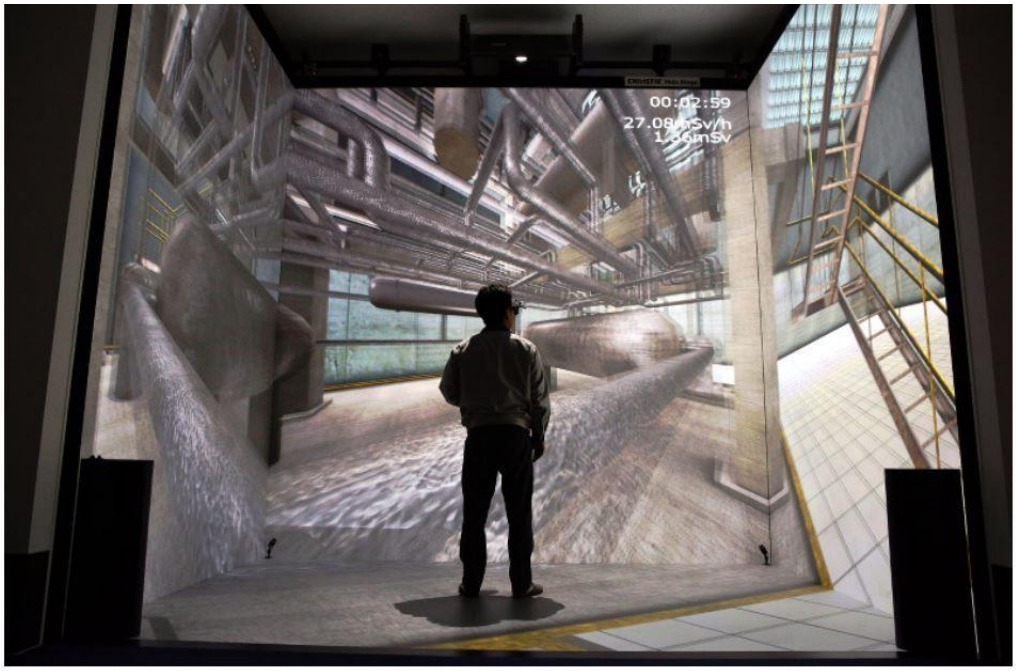
Wind energy has captured renewed attention as technological innovation has considerably lowered its generation costs while nuclear power continues to suffer a backlash following the 2011 Fukushima meltdowns.

Wind power is the leading energy source in the transition from fossil fuels to renewables, the wind energy council said as it released the data last week.

China led all other countries in wind energy generation capacity with 145.10 GW. Beijing is promoting wind power to shift from coal and other fossil fuels to combat air pollution and global warming.

Coming in second behind China is the United States with 74.47 GW, followed by Germany with 44.95 GW, then India with 25.09 GW and then Spain with 23.03 GW. Japan produced 3.04 GW.

Virtual reality to train nuclear workers



A virtual reality image of a reactor building at the stricken Fukushima nuclear plant is seen at Japan Atomic Energy Agency's Naraha Remote Technology Development Center in Naraha, Fukushima Prefecture. (Mainichi)

February 21, 2016

Nuclear plant workers to begin training in virtual reality reactor building in April

http://mainichi.jp/english/articles/20160221/p2a/00m/0na/002000c

NARAHA, Fukushima -- A virtual reality representation of the nuclear reactor buildings at the stricken Fukushima No. 1 Nuclear Power Plant is set to begin operation in April, for use in devising decommissioning plans and for plant workers to practice what they'll be doing once they're inside the actual reactor buildings.

Set up at the Naraha Remote Technology Development Center of the Japan Atomic Energy Agency (JAEA) in the Fukushima Prefecture town of Naraha, the system includes a 3.6-meter-high screen onto which the interior of a reactor building is projected. Specially made glasses allow the user to see the scene -- recreated based on the original design plans and data collected by robots sent inside the buildings by plant operator Tokyo Electric Power Co. -- in 3D. Users can experience walking up and down stairs and see dimly lit pipes throughout the building. Radiation levels and time spent "inside" are indicated at the top of the screen so that users can keep track of how much radiation they've been virtually "exposed" to.

"If plant workers train in this virtual reality environment before they actually go into the reactor buildings, we anticipate that their work inside the plant will go a lot more smoothly," a representative for the center said.

The decommissioning process for the nuclear plant is expected to take 30 to 40 years.

Japan & wind power

February 27, 2016

Japan behind on wind power

http://www.japantimes.co.jp/opinion/2016/02/27/editorials/japan-behind-wind-power/#.VtLNMuaDmot

As nuclear power plants are being restarted in Japan, the government should stop to consider what the rest of the world is doing. Last year, global wind power capacity surpassed nuclear for the first time. Japan, however, is already far behind this global trend, with only a small fraction of its energy coming from wind.

Data released by the Global Wind Energy Council, a body that tracks worldwide energy usage, shows that a record 63.01 gigawatts of energy was added to worldwide wind power capacity in 2015 to reach a total of 432.42 GW. That compares with 382.55 GW for global nuclear power capacity, according to the London-based World Nuclear Association.

That small victory for clean energy was not helped much by Japan, where only 3.04 GW of wind power was produced in 2015. The government drafted a plan to boost wind power to 1.7 percent of the nation's energy mix by 2030, but this figure is startlingly low compared with the current percentage — 3 percent — of global electricity supplied by wind power. The Environment Ministry estimates that Japan has the potential to build enough wind power facilities to produce 280 GW, but that potential has not even begun to be tapped.

With its total installed capacity reaching 145.1 GW in 2015, China topped the European Union's 141.6 GW, The United States followed with 74.47 GW. India, with 2.62 GW, pushed past Spain into fourth place. The shift from coal and fossil fuels to wind power is an important step toward reducing air pollution, especially in China. The Japanese government has yet to undertake a future-oriented policy to get in line with these global trends.

Wind power does have some drawbacks, such as the effects of turbines on animals and the environment, as well as conflicts over land-use rights. These are not inconsiderable, but they should be investigated and resolved in the process of development. Japan is not that much different from other countries in this regard, though the energy production and distribution infrastructure for wind power remains another hurdle in many regions of the country. The longer it takes to initiate, though, the more expensive infrastructure will become.

Environmental impact assessments and planning for land use should continue to ensure that wind power increases as part of the total energy mix in Japan. The main problem is a lack of will on the part of the national government. Japan's continued use of nuclear energy and fossil fuels is not a viable energy strategy. Mixing in a higher percentage of wind power is essential if Japan's long-range energy needs are to be met in a rational way.

NRA's new simulator

March 24, 2016

NRA shows how it will train staff to respond to a nuclear crisis

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201603240067

By HIROMI KUMAI/ Staff Writer

The nation's nuclear watchdog showed off its new training facility that simulates the central control room of a nuclear power plant so key staff can respond better to an emergency.

The site, inside a building in Tokyo's Minato Ward, was completed in February at a cost of 1.58 billion yen ($14.01 million). The Nuclear Regulation Authority showed it off to reporters on March 23.Monitors modeled after instruments and other equipment in the central control room line the entire wall of the training facility. It is also fitted with six sets of terminals that can display changes in conditions of the reactor core and a containment vessel in the event of a nuclear accident.

The central control room, as its name implies, regulates and monitors all operations inside a nuclear power plant.

Three people, including individuals who have headed a nuclear operations team at plants around the country, will serve as instructors.

From April, the start of the new fiscal year, the NRA's staff members in charge of examining, inspecting and responding to nuclear emergencies will learn how to form the correct judgement in times of crisis at a nuclear plant.

"Although there has been few chances to touch (the real instruments), we can now experience what it is like," said an official at the facility.

"We want to enhance our staff members' sense of actually responding to a nuclear accident and equip them with the proper expertise as soon as possible."

Nuclear power simulator to help NRA prepare for possible disasters

http://mainichi.jp/english/articles/20160324/p2a/00m/0na/004000c

Employees from the Nuclear Regulation Authority Secretariat are seen in Tokyo's Minato Ward on March 23, 2016, training in a nuclear power plant central control room simulator. (Mainichi)

The Nuclear Regulation Authority (NRA) unveiled to members of the press on March 23 its nuclear power simulator, which has been newly built within its Human Resource Development Center in Tokyo's Toranomon district to provide training for potential situations of nuclear disaster.

Replicating the functions of a central control room, the simulator is equipped with a touch panel featuring 69 different types of control boards and instruments. It can recreate the conditions occurring when a major disaster takes place at both boiling-water and pressurized-water types of nuclear reactors. Plans are additionally in place to add functions for latest model reactors.

The simulator -- which was completed at the end of February, and cost a total of 1.6 billion yen to construct -- is poised to serve as a useful tool during study sessions organized on behalf of NRA Secretariat employees.

While such employees will not operate nuclear reactor equipment during times of actual disaster, NRA Human Resource Development Center Vice Director Juichiro Ito notes that the simulator "will be effective in terms of conferring the ability to provide guidance during times of emergency."

Japan & Solar

April 2, 2016

Japan solar power generation jumps 23 times over 10 years

http://mainichi.jp/english/articles/20160402/p2a/00m/0na/013000c

Solar panels set up along the southern end of the Tottori Airport runway are seen on Feb. 21, 2015. (Mainichi)

Japan is pumping out 23.3 times more solar power than it was a decade ago, with a particularly large generating jump after the introduction of feed-in tariffs, according to estimates by Chiba University and Institute for Sustainable Energy Policies (ISEP) researchers.

Since fiscal 2005, Chiba University and the NGO ISEP have put out a renewable energy generation estimate at the end of March every year. In fiscal 2005, solar power sources produced 1.23 million megawatt-hours, while in fiscal 2014 they produced 28.69 million megawatt-hours, equivalent to the yearly power usage of 5.21 million homes, according to the estimates. Around 80 percent of the jump occurred after the introduction in fiscal 2012 of feed-in tariffs, a system where utilities buy up electricity from private renewable energy producers at fixed rates.

Meanwhile, other alternative energy sources have seen much less growth. Wind power, which requires comparatively large-scale development, grew by 2.2 times over the past 10 years, and biomass power generation grew by 3.5 times. Wind power production rose from 2.25 million megawatt-hours to 5.05 million megawatt-hours, and biomass power production rose from 0.56 million megawatt-hours to 1.96 million megawatt-hours.

Chiba University professor Hidefumi Kurasaka says, "In order to meet the goal of cutting domestic greenhouse gas emissions by 80 percent by 2050, the large-scale introduction of renewable energy is essential. The national government should move forward with frameworks to advance types of renewable energy besides solar. Furthermore, the purchase price for solar energy is being lowered every year, which may weaken the growth of solar power generation."

Under the feed-in tariffs, power companies pay renewable energy producers for a period of up to 20 years at a fixed price. The prices differ per energy type, and are set every year by the economy, trade and industry minister according to factors such as the proliferation of that energy type. In the case of solar power-producing companies, at the start of the tariffs in July 2012 they were paid 40 yen per kilowatt-hour, but with the spread of solar power the price was lowered to 24 yen per kilowatt-hour for fiscal 2016.

Fukushima: What energy future?

May 19, 2016

INSIGHT: Fukushima's 'caldrons of hell' keep questions unanswered

http://www.asahi.com/ajw/articles/AJ201605190001.html

By TOSHIHIDE UEDA/ Senior Staff Writer

A convenience store in Okuma, Fukushima Prefecture, on March 12, 2016, remains as it was when the 2011 earthquake and tsunami triggered the nuclear accident. (Satoru Semba)

A convenience store in Okuma, Fukushima Prefecture, on March 12, 2016, remains as it was when the 2011 earthquake and tsunami triggered the nuclear accident. (Satoru Semba)

After spending slightly more than two years in the capital of Fukushima Prefecture, I was assigned to The Asahi Shimbun's Tokyo head office starting on May 1. I moved house the other day.

I had previously never been based in Fukushima, although I have long covered energy policy and a number of nuclear accidents as a reporter for the newspaper.

On April 11, 2014, shortly after I was assigned to Fukushima, I was told the words that would serve as a starting point for my news-gathering activities there. I am citing that phrase, which I quoted in a previous column, for a second time here:

"Whatever the future of nuclear power generation, it will remain essential to expand renewable energy sources to ensure a stable energy supply and to fight global warming. Fukushima Prefecture has swaths of land and a historical background for doing so.

The energy industry has always been its leading local industry. The prefecture is home to the Joban coal field, and Iwaki was a city of coal mines. Nobody will be able to change Japan unless Fukushima takes it upon itself to do the task."

The remark was made by Yukihiro Higashi, then professor of thermal energy at Iwaki Meisei University.

After the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster in 2011, the Fukushima prefectural government defined "building communities that do not rely on nuclear energy" as a leading principle of its post-disaster rebuilding efforts.

It set a goal of having renewable energy sources cover all energy demand in the prefecture by around 2040. Higashi played a central role in working out that vision.

The goal may seem preposterous, but the professor's remarks led me to realize that it isn't.

LEADING ENERGY PLAYER

Fukushima Prefecture produced 10 percent of Japan's electricity before it was hit by the nuclear disaster. Most of that electricity was sent to the greater Tokyo area, so the prefecture was sometimes sarcastically referred to as a "colony of Tokyo."

But all that would have been impossible had it not been for the "swaths of land" and the "historical background" suitable to having electric power generated there.

Energy has always been the representative local product of Fukushima Prefecture. That history dates back to the late Edo Period (1603-1867), when the Joban coal field was discovered.

Energy created in the prefecture continued to support Japan's modernization even after electricity replaced coal as the leading player.

Living in Fukushima Prefecture provides plenty of opportunities to learn about that history.

A cluster of old hydroelectric plants stands in the environs of Lake Inawashiroko. A dozen of these plants, which were built during the Meiji (1868-1912) and Taisho (1912-1926) eras and taken over by Tokyo Electric Power Co., continue to send electricity to the greater Tokyo area to this day.

A step-like array of hydroelectric plants along the Tadamigawa river in the prefecture's western Oku-Aizu district was built in the postwar period in a desperate drive to "rebuild Japan."

Both hydroelectric undertakings drew on the bountiful water resources that are the blessings of the prefecture's terrain.

Nuclear reactors and a bunch of giant thermal power plants began to spring up along the Pacific coast during the high economic growth of the postwar period.

When cast in the context of that history, the goal set forth by the prefectural government appears to betray the pride of its own "leading local industry." The prefecture's people pledged that they are the ones who will replace the leading player of energy.

Ten days after I met Higashi, I visited the Yamatogawa Shuzoten sake brewery in Kitakata, Fukushima Prefecture, to see Yauemon Sato, the ninth-generation chief of the brewery, which has been operating since the mid-Edo Period.

Sato had founded Aizu Electric Power Co. in August 2013, setting out on an ambitious plan to help rebuild the prefecture by means of renewable energy sources.

"You know the caldron of hell?" Sato asked me. "You will be sent to hell and will be boiled in that caldron if you do evil. There are four such caldrons in Fukushima Prefecture. And they are still gaping."

The No. 1 through No. 4 reactors of TEPCO's Fukushima No. 1 nuclear power plant, which caused a calamity that will go down in the history of humankind, could certainly be called "caldrons of hell."

The use of renewable energy sources is a means for closing those caldrons and for obliterating them from Fukushima Prefecture.

More than two years later, the use of renewable energy sources is steadily gaining ground in the prefecture, covering 26.6 percent of all energy demand as of the end of March. The goal remains far in the distance, but the ratio has been gaining about 1 percentage point every year.

The caldrons are still gaping. TEPCO has yet to solve the question of how to block groundwater from flowing into the reactor buildings, which is only increasing the stockpile of water contaminated by radioactive substances. That is preventing the utility from starting serious work to decommission the reactors.

LEFT IN LIMBO

"What should we do?" a 59-year-old woman, evacuated from Okuma, which co-hosts the crippled nuclear power plant, to Koriyama, also in Fukushima Prefecture, asked me when I interviewed her about a year ago.

“Should we go on with our new life here, or should we return to our hometown? My thoughts remain in limbo, and I cannot get around to making up my mind.”
I did not know how to answer her question.
More than 94,000 people of Fukushima Prefecture continue to live as evacuees. The government of the town of Okuma, where all residents remain evacuated, plans to create a rebuilding base with a “habitable environment,” hopefully by fiscal 2018.
But full rebuilding of the town lies far beyond that goal. And that is leaving many people “in limbo.”
What should we do? My pursuit of that unanswered question will continue.

Wind for Fukushima

May 24, 2016

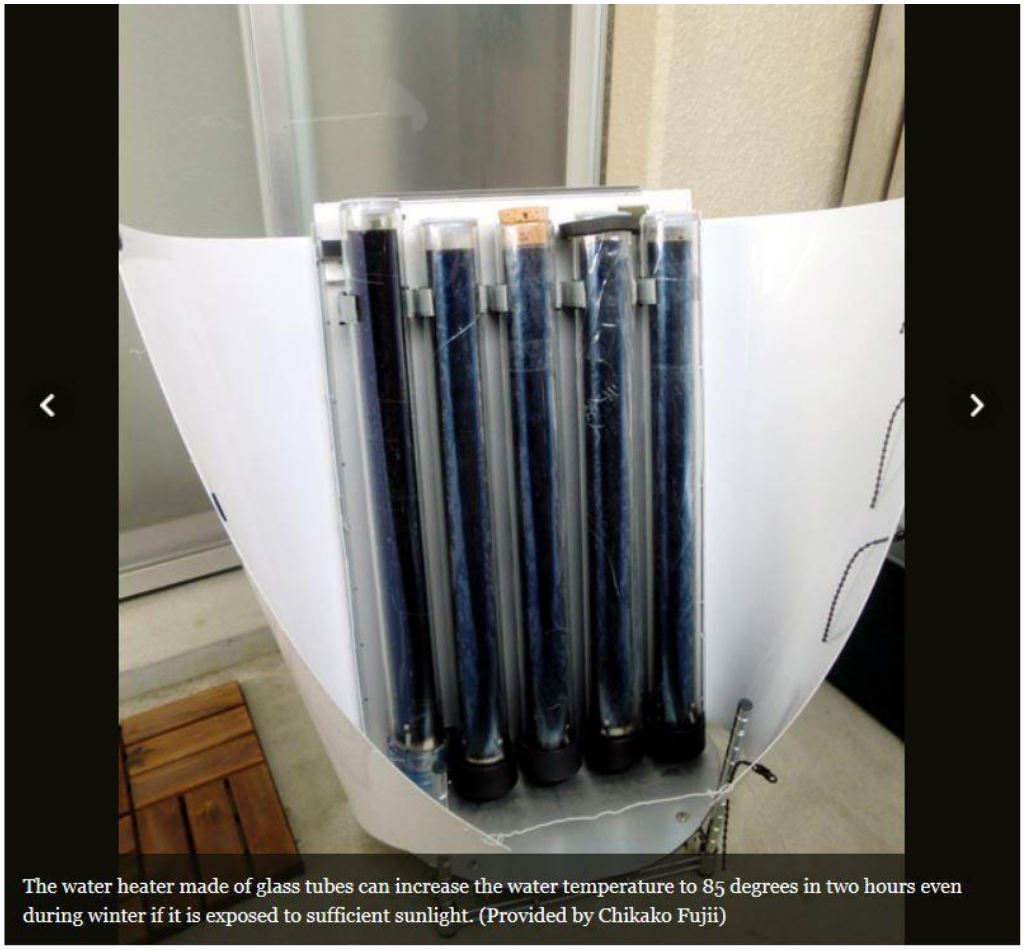
Wind power facilities planned for Fukushima Prefecture

http://mainichi.jp/english/articles/20160524/p2a/00m/0na/015000c
The national government and the Fukushima Prefectural Government have agreed to set up 500 megawatts' worth of wind power plants in Fukushima Prefecture and begin sending the generated power to the Tokyo metropolitan area by 2020, it was learned on May 23.
The project is part of a plan to redevelop Fukushima Prefecture as a leading area in renewable energy. Hundreds of 2- to 3-megawatt wind power turbines are planned to be set up along the coast and in the Abukuma region, where relatively stable wind power can be obtained. At around 500 megawatts, the full amount of power generated is expected to be about one-tenth of what the crippled Fukushima No. 1 Nuclear Power Plant used to produce.
The Fukushima Prefectural Government is proceeding with checks of the wind in potential construction sites along the coast and in the Abukuma region and with assessments of the expected impact on the environment in order to find which areas are best suited to wind power.
The Shin-Fukushima transformer substation, out of use since the 2011 nuclear disaster, is planned to be used in sending the power. The Ministry of Economy, Trade and Industry is moving forward with plans to set up power lines to connect the existing power grid with the new wind power plants.
Within the year, Fukushima Prefecture will invite businesses to participate in the project. Participating businesses will pay 1 million yen per megawatt of power produced to an organization for the promotion of renewable energy in Fukushima Prefecture consisting of the central government, the Fukushima Prefectural Government and Fukushima No. 1 nuclear plant operator Tokyo Electric Power Co., among other groups.
Michiaki Hirose, president of Tokyo Gas Co., one company considering joining in the project, says, "We want to do what we can for Fukushima. If it is economically feasible we will go ahead with the project."
According to Japan's New Energy and Industrial Technology Development Organization, over the 10 years leading up to fiscal 2014, the number of wind turbines in Japan grew from 920 to 2,034, with the total power generation from them growing from 920,000 kilowatts to 2.93 million kilowatts. Since 2012 there has been a system for power companies to buy up wind power generated by others at a fixed price.

However, wind farms over a certain size require an environmental impact assessment to be done beforehand, causing a time delay. There are also cases where local residents conduct protests due to concerns about sound pollution and the effects of wind farms on the environment.
The Electricity Business Act was amended in 2015 after a series of incidents in Japan of wind turbine blades falling, and from fiscal 2017 utilities will be required to perform regular maintenance checks on their wind turbines.

No electricity for 4 years...

Chikako Fujii says she uses a human-powered dynamo remodeled from a bike-type training machine to generate power in emergencies. (Junichi Bekku)



The water heater made of glass tubes can increase the water temperature to 85 degrees in two hours even during winter if it is exposed to sufficient sunlight. (Provided by Chikako Fujii)

June 1, 2016

Woman gives up electricity and goes 'off grid' for 4 years

http://www.asahi.com/ajw/articles/AJ201606010003.html

By JUNICHI BEKKU/ Staff Writer

Chikako Fujii used to leave the TV on all the time, but since the Fukushima nuclear disaster inspired her to go "off grid" nearly four years ago, she has consumed literally no energy supplied from her regional power company.

Fujii, 55, a textile dyeing artist, uses a tiny amount of electricity generated primarily by solar panels set up on her veranda that measure a total of just 1.6 square meters.

The lifestyle choice means that Fujii cannot power an air conditioner, a refrigerator or a TV with such a small quantity of energy, but those things don't concern her.

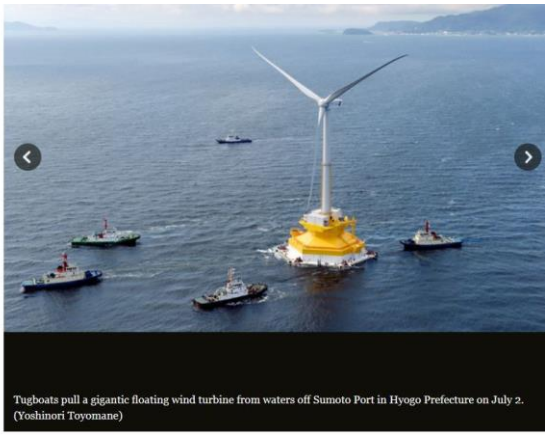
"I enjoy working out how to lead a life without using electricity," she said.

A resident of Kunitachi, western Tokyo, Fujii terminated her contract with Tokyo Electric Power Co. in September 2012, after rolling blackouts were implemented in the wake of the March 2011 Great East Japan Earthquake and tsunami, which triggered a triple meltdown at the Fukushima No. 1 nuclear power plant.

Fujii said that before the disaster struck, she habitually left the TV on so that she could check the time whenever she wanted.

But when she stopped using her home appliances one by one, she found her electricity bill could be reduced.
While she paid more than 4,000 yen ($36) per month for electricity before the disaster, the figure gradually dropped to around 2,000 yen. When she finally unplugged the refrigerator, which requires much power, the bill reached 800 yen.
“I thought I might be able to live without relying on the power company, and decided to start an off-grid life for the fun of it,” Fujii said.
The solar panels installed on the veranda have a power production capacity of 260 watts and can generate more than 1 kilowatt-hour of power on a typical sunny day--enough to operate a washing machine for three hours to dye fabrics with plant-derived materials.
However, when cloudy weather continues for a week during the June rainy season or due to a typhoon, the electricity stored in the battery dries up. When that happens, Fujii uses a pedal-operated sewing machine and an old charcoal-powered iron for her work instead of electric ones.
One night, Fujii was asked by a business partner to send a document by e-mail on short notice.
She pedaled hard a human-powered dynamo remodeled from a bike-type training machine to generate electricity to use her computer.
As Fujii cannot use an air conditioner, she made small holes in a plastic bag containing water and hung it above the veranda to sprinkle water automatically to cool the surrounding air.
In lieu of an electric kettle, she painted plastic bottles black and exposed them to sunlight to heat the water inside.
In December last year, Fujii also introduced a handmade heater made out of a used tempura oil-based lamp and a flowerpot put over the lamp upside down. According to Fujii, 20 milliliters of oil can keep the flowerpot hot for three to four hours.
She said she daily consumes only 500 to 800 watt-hours of power at home, about one-12th that for an ordinary household.
“I always live while being conscious of the weather,” Fujii said. “For example, when I wake up to find it is sunny, I think I should use the washer today. Thinking this way is fun for me.”

Wind off Fukushima



Tugboats pull a gigantic floating wind turbine from waters off Sumoto Port in Hyogo Prefecture on July 2. (Yoshinori Toyomane)

SUMOTO, Hyogo Prefecture--A massive floating wind turbine with an output capacity of 5 megawatts began the slow journey to its final destination off the coast of Fukushima Prefecture on July 2.

The turbine had been undergoing assembly off the coast of Sumoto Port on Awajishima island, Hyogo Prefecture.
With its completion, tugboats began the slow trip to waters off Fukushima Prefecture. Traveling at a speed equivalent to a human adult walking at a brisk pace, or between six to eight kph, the turbine is expected to complete the journey of about 960 kilometers and reach the waters where it will be permanently installed on July 8, according to the schedule.
It will be one of three to be set up about 20 kilometers off the coast of Fukushima as part of an experimental research project of the Ministry of Economy, Trade and Industry.
The electricity-generating windmill was constructed by a group of companies, including Japan Marine United Corp. and Hitachi Ltd.
Each of the three wings on the turbine is 62 meters long. The tip of one of the wings stands about 150 meters above water at its highest point.
According to the industry ministry, the turbine's output of 5 megawatts will make it the second largest capacity in the world behind one already installed off Fukushima Prefecture. The first has an output capacity of 7 megawatts.
The base for the second turbine was constructed in Sakai, Osaka Prefecture.

Floating wind turbine begins slow trip to off Fukushima coast

By HIROYUKI YOSHIDA/ Staff Writer

Tugboats pull a gigantic floating wind turbine from off the coast of Sumoto Port in Hyogo Prefecture to its eventual destination off the coast of Fukushima Prefecture. (Makoto Nagano)

What's happening to Japann's solar boom?

July 14, 2016

Sun no longer shines on Japan’s solar boom as subsidies wane

http://www.japantimes.co.jp/news/2016/07/14/national/sun-no-longer-shines-japans-solar-boom-subsidies-wane/#.V4fRIqJdeov

by Chisaki Watanabe and Stephen Stapczynski
Bloomberg

Japan’s solar boom is beginning to falter.
Until recently, the resource-poor nation has been one of the leading markets for photovoltaic (PV) units, helping to prop up an industry hurt by falling prices for the technology and policy changes. But four years after the introduction of generous incentives to promote clean energy in the wake of the March 2011 Fukushima nuclear disaster, data show the boom is losing steam.

The slowdown — after several years of rapid growth — threatens to undermine the government's push to find a clean alternative to nuclear power and dims what has been a bright spot for the global photovoltaic industry.

"As the declining volume of PV module shipments shows, the market is shrinking," said Takehiro Kawahara, an analyst for Bloomberg New Energy Finance.

Repeated tariff cuts and difficulty securing land and grid connections are among some of the reasons that have led to a drop in new applications to develop solar, Kawahara said.

For Japanese panel makers such as Sharp Corp. and Kyocera Corp., "the shrinking domestic market forces them to lower costs to remain in competition with international players or consider exiting the segment," he said.

Solar power-related bankruptcies are increasing, according to Teikoku Databank Ltd. The number of companies that went bust rose to 36 in 2015, from 17 in 2013 and 21 in 2014. Bankruptcies continue to accelerate, with 17 seen in just the first five months of 2016, Teikoku said.

Some question what Japan has got for all the money spent on promoting clean energy. While more solar energy is being produced, it still comprises a fraction of the nation's power generation mix.

The data, drawn from government and industry sources on solar's contribution to the power mix as measured by what is purchased and produced by the nation's 10 regional utilities, show the percentage has gone from about 0.4 percent in 2012 to about 3.4 percent in 2015.

Solar has grabbed the lion's share of what is known as feed-in tariffs — above-market rates awarded to producers of clean energy. With available land for solar in short supply and some utilities saying they cannot accept more intermittent solar power, that is a worry for some. Also, only about a third of the solar projects awarded the preferred rates have actually begun producing power.

The bulk of the clean energy capacity approved by the government under the FIT program since 2012 has been in solar, raising concern that the tariffs do not seem to have stimulated much in the way of other clean energy sources.

"Feed-in tariffs have proved there's potential for 80 gigawatts of solar in Japan," said Masaaki Kameda, secretary-general at the Japan Photovoltaic Energy Association, the country's solar lobby. "But to bring online this potential, various policies need to be applied continuously," he said.

The government has tightened rules for projects that have been delayed and plans to introduce an auction system for large-scale solar next year.

"Now that we know that solar power generation systems can certainly supply energy, it is important to find out how we can make the most of the generated power," Kameda said.

Prime Minister Shinzo Abe has tried to play it both ways — saying he's a supporter of clean energy, while also backing a continued role for nuclear and a big role for coal. Despite clouds over the nuclear industry and repeated failed attempts to get reactors back online, Japan's latest policy pronouncements see nuclear accounting for as much as 22 percent of Japan's power mix by 2030. Similarly, the government sees a bright future for coal at 26 percent.

Japan's solar market is expected to shift to rooftops. Between 2016 and 2040, Japan will add 94 gigawatts of new solar, including 65 gigawatts of rooftop PV, BNEF said in a report last month.

If Japan wants to achieve a much higher penetration of renewables, "an independent system operator would be necessary to ensure the grid connection approval process is neutral," said Kawahara.

Hurdles mar Japan's renewable energy equation

http://www.japantimes.co.jp/news/2016/07/22/business/hurdles-mar-japans-renewable-energy-equation/#.V5IbZ6Jdeot

by Jarni Blakkarly

At Yamakura Dam, 45 km southeast of Tokyo, construction workers are screwing together a 51,000-piece jigsaw puzzle of floating solar panels. When completed, it will be one of the world's largest floating solar projects.

Roughly 30 percent of the work on the project in Chiba Prefecture is complete, and when it comes online in 2018, the 13.7 megawatt facility will provide enough electricity to power almost 5,000 households annually.

However, even attention-grabbing projects like this one will produce less than 1 percent of what's needed for Japan to reach its 2015 goal of doubling its renewable energy use to between 22 and 24 percent by 2030 from around 10 percent at present.

The growth of renewable energy in Japan risks being smothered by a wave of newly approved coal mines across the country, as the government is expected to lower its optimistic goal of reviving nuclear energy.

Experts say the government energy policy review, expected as early as next year, will likely result in a downgrading of the forecast for nuclear power's role in the 2030 energy mix — to between 10 and 15 percent from its current 22 to 24 percent. The move to amend the forecast, initially made in 2015, comes as the government faces ongoing legal challenges and public backlash against the restart of nuclear reactors that were taken offline in the aftermath of the 2011 Fukushima reactor meltdowns.

Downgrading the nuclear proportion of the energy mix will provide a fresh wave of opportunities for alternative energy sources to play a larger role.

However, experts say burdensome environmental assessments for wind and geothermal energy, disadvantaged access to the power grid, as well as 48 approved new coal mines, will mean renewable energy may see few of the benefits.

In almost every prefecture nuclear power and fossil fuels are classified as “baseload” energy sources and given priority access to the electricity grid. While renewable companies have access, they are the first to be switched off in the event of excess power and they aren’t compensated.

Ali Izadi-Najafabadi, head of Bloomberg New Energy Finance in Japan, said this is the opposite of the way systems are configured in Europe, where renewables get first access to the grid because they have the lowest marginal cost of production.

“The government said they wanted to make sure the baseload generators wouldn’t have to adjust the baseload for renewables, which are unreliable. It’s a bit of a flawed argument,” Izadi-Najafabadi said.

He said it was “more about the financial arguments” for the operators of these plants. “These generators are only cheap if you produce at a constant rate,” he said.

Gerhad Fasol, CEO of Eurotechnology Japan, a company that works with European technology companies investing in renewable energy here, says the country has a long way to go to catch up with the rest of the world. “Japan had the initial solar surge in 2011, but now there needs to be a focus on how to broaden and diversify,” Fasol said.

Shortly after the March 2011 Fukushima meltdowns the government introduced generous incentives for investment in renewable energy in the form of feed-in tariffs where the government buys renewable energy at above-market rates.

Data from Japan’s 10 largest regional utility companies showed the share of solar in the energy mix rose to around 3.4 percent in 2015 from 0.4 percent in 2012.

But as the initial feed-in tariffs have since been scaled back, the solar investment boom is fading. Sales in photovoltaic units are on the decline and Teikoku Databank Ltd. said in a recent report that the number of solar companies going bankrupt is rising sharply.

Izadi-Najafabadi said that while large-scale solar energy investment will likely see a “significant slowdown” over the next few years, Bloomberg New Energy Finance expects a massive uptake in rooftop solar, driven by consumers incentivized by favorable loan options from banks.

“The government forecast solar would be 7 percent of the energy mix in 2030; our forecast is closer to 12 percent. We also think the government might exceed their overall 22 percent total renewable prediction. Rooftop solar is really going to drive this,” Izadi-Najafabadi said.

Others, however, are not as optimistic. Shaun Burnie, senior nuclear specialist for Greenpeace Germany, who has analyzed Japan’s nuclear program since 1991, said large-scale renewable investment will continue falling and the government may not reach its renewable energy goals unless hurdles regarding access to the grid are surmounted.

“If you are a solar company and you aren’t guaranteed access to the grid, why would you invest? There is a critical role for the government in untangling the grid and wresting back control from the utility company in the next four years,” said Burnie.

“There is an intentional destabilization of renewables from the utility companies (through denying access to the grid) and it needs to stop.”

One of the reasons the government gives coal and nuclear energy preferential treatment is because they are considered more stable than renewable energy sources, which are reliant on weather.

In Europe, Burnie pointed out, an emphasis on a range of renewable energy sources provides most countries with a stable baseload of energy.

In Japan, the spread of renewable energy to sectors other than solar is thwarted by complicated environmental assessment approvals, which take between two and five years and are not required for nuclear power or coal-fired power plants.
There are only a few wind farms currently operating in Japan and most are offshore and in trial phases. Strong community resistance in parts of the country has also severely limited investment in land-based wind energy.
The country also has significant potential for geothermal energy, with **a** National Institute of Advanced Industrial Science survey in 2008 finding Japan has the third-highest resources for geothermal in the world.
However, investment has also been slowed by the environmental assessment process and resistance from the *onsen* hot springs industry, which is concerned about the impact accessing more geothermal energy will have on their business.
In the U.S., President Barack Obama announced a moratorium on all new federal coal-mining leases in January and many developed countries are slowly weaning themselves off coal. However, in Japan the government is increasingly turning to fossil fuels to fill the energy gap left by idled reactors.
Liquefied natural gas has been used to fill much of the country's short-term electricity needs and the approval of the 48 new coal mines in the past several years appears to indicate the government's medium to long-term goals.
"We say in Japan it's easier to build coal-fire power plants than wind farms," said Nao-yuki Yamagishi, leader of the World Wildlife Fund Japan's climate and energy group.
Yamagishi said that if the 48 new coal plants approved by the government come online, coal will overshoot a 26 percent target in the 2030 energy mix, down from 30 percent in 2013, and block space for further potential renewable energy increases.
Yamagishi said the recent move toward coal has made him skeptical about whether Japan is capable of fulfilling the pledge it made last December at the COP21 climate conference in Paris.
Japan vowed a 26 percent cut in greenhouse gas emissions by 2030, a pledge at the lower end compared with other OECD countries.
"The current administration doesn't place any emphasis on climate change," Yamagishi said, adding that the recent Upper House election campaign had a lot of discussion about nuclear energy, but nothing about climate change.

Goethermal hurdles

Geothermal power promises energy boon for Japan, but hurdles remain

http://mainichi.jp/english/articles/20160724/p2a/00m/0na/002000c

July 24, 2016 (Mainichi Japan)

July 24, 2016 (Mainichi Japan)

Japanese version

Kyushu Electric Power Co.'s Hatchobaru Geothermal Power Plant is seen in Kokonoe, Oita Prefecture, in this Feb. 21, 2012 file photo. The Hatchobaru plant is the largest of its kind in Japan, producing 110,000 kilowatts. (Mainichi)

Japan is a country of volcanoes, and the Ministry of Economy, Trade and Industry is looking to take advantage of all that subterranean heat as a major future power source by backing efforts to find the most promising geothermal electricity generation sites.

Japan has the third greatest geothermal energy potential in the world, behind only the United States and Indonesia. However, the costly drilling surveys needed to find optimal generating sites take time, and don't always turn up a viable heat source. These risks have stalled geothermal energy development in Japan, while the nascent industry also faces the need to coordinate with the country's many hot spring resort businesses, among other hurdles.

Geothermal power generation has the potential to provide a steady supply of electricity and requires no fuel. These obvious benefits have prompted the government to target a trebling of Japan's geothermal power output by 2030. However, it generally takes about five years of drill survey work to find just one profitable subterranean heat source. If no viable heat source can be found, investors are left with nothing -- a reality that has made many project developers reluctant to get into the business.

To alleviate the risks inherent in the search for geothermal heat sources, the industry ministry has decided to task the government-backed Japan Oil, Gas and Metals National Corp. (JOGMEC) with identifying likely hotspots, drilling down 500 meters and collecting subterranean heat data to narrow down the list of potential generating sites. The national government will cover a certain amount of these initial exploration costs, and pass on the fruits of the project to private enterprises, thereby alleviating much of the risk and financial burden of developing geothermal power. The ministry will request a budget appropriation for the project in the fiscal 2017 budget.

The government in fact already has a number of geothermal power promotion policies in place, but so far none have produced significant results. When the feed-in tariff system for renewable energy was

introduced in 2012, the government also loosened environmental regulations for projects in national and quasi-national parks, where most geothermal enterprises were being developed. Via JOGMEC, the government is also providing loan guarantees and financial support to geothermal project developers for geological and drilling survey costs.
However, while small-scale enterprises have been multiplying, large-scale projects aimed at pumping out 7,000 kilowatts or more have stagnated. So far, only three such projects -- including one in Yuzawa, Akita Prefecture, which started construction last year -- have come to fruition, producing about 60,000 kilowatts total. The government set a geothermal energy generation target of three times the current 520,000 kilowatt total by 2030 in its energy mix plan released last year, but achieving that goal is a long way off.
However, geothermal energy development's challenges aren't only technical. Geothermal projects require prefectural approval, but it has proven difficult to gain the understanding of local hot spring resort owners worried that the projects will impact hot spring sources. There is also a wide technical knowledge gap between geothermal power businesses and local government officials, making it hard for those officials to moderate between concerned local residents and the businesses.
To try to bridge this gap, the government has set up a 23-member geothermal power generation advisory expert committee within JOGMEC, and will provide information and data analysis to local governments that request it. It will also launch a geothermal energy data exchange network in August to allow local governments to exchange information on the topic.
Experts have called the moves an important first step. However, they have also pointed out that it is hard to expect significant development of geothermal energy unless there is a major change in the attitude of hot spring resort operators, who continue to harbor deep suspicions about the technology. Measures are needed to advance compromise and cooperation among all the interested parties.

Only 33% renewables in 2040

August 16, 2016

Renewable energy likely to only make up 33% of Japan's total output in 2040: research

http://mainichi.jp/english/articles/20160816/p2a/00m/0na/013000c

Renewable energy such as solar and wind power is predicted to account for only 33 percent of Japan's total energy output in 2040 -- the eighth spot among the world's top nine CO2 emitting countries and regions, according to a report released by British research organization Bloomberg New Energy Finance (BNEF).

- 【Related】Geothermal power promises energy boon for Japan, but hurdles remain
- 【Related】Japan solar power generation jumps 23 times over 10 years
- 【Related】What benefits, options will liberalization of electricity industry bring to consumers?

BNEF predicts that renewable energy will account for 45 percent of the world's total energy output in 2040. BNEF's long-term forecast shows that the portion of renewable energy occupying Japan's total power to be generated in 2040 is expected to remain small at a time when the world is moving ahead to shift away from fossil fuels.
BNEF came up with a long-term forecast on the energy mix of the world's 110 countries as of 2040 after taking into account each country's energy policy, costs of generating electricity through each method and their market competitiveness, among other factors.
According to the report, by 2040, Brazil will top the list of countries with the highest ratios of renewable energy to their total energy output at 92 percent, followed by Canada at 83 percent, the European Union (EU) at 70 percent and Mexico at 69 percent. Brazil and Canada are highly expected to introduce hydraulic power generation while the EU is forecast to dominate the market as it is likely to take advantage of lower solar and wind power generation costs in such countries as Germany, the report says.
Because many of the new coal-fired thermal power stations being built in Japan are expected to continue to operate even in 2040, Japan is not expected to have much room for adopting additional renewable energy, the report predicts. Japan set a goal of having renewable energy account for 22 to 24 percent of the country's total energy output, but even if the goal is achieved, BNEF says that Japan will not be able to further increase renewable energy output by 2040 unless it takes new policy measures such as forcing coal-fired thermal power stations to shut down.
Under the so-called Paris Agreement, a new framework adopted late last year for combating global warming, the international community is effectively committed to zero greenhouse gas emissions in the latter half of this century, for which efforts in the power sector to shift away from fossil fuels will play a great role. A BNEF official in Japan said that renewable energy cannot be widely accepted quite easily in Japan partly because it is difficult to cut renewable energy costs due to high labor costs.

Is Japan's nuclear industry really back on its feet?

Japan's big 'nuclear restart' overtaken by conservation and renewables

http://www.theecologist.org/News/news_analysis/2987971/japans_big_nuclear_restart_overtaken_by_conservation_and_renewables.html

Jim Green
12th August 2016

For all Japan's talk of 43 'operable' nuclear reactors, only two are actually running, writes Jim Green, as renewables and a 12% fall in demand eat into the power market. And while Japan's 'nuclear village' defends safety standards, the IAEA, tasked with promoting nuclear power worldwide, has expressed deep concerns over the country's weak and 'fragmented' safety regulation.

As renewables continue to become cheaper and more ubiquitous, customers will be increasingly tempted by Japan's extremely high electricity prices to make and store their own electricity and to drop off the grid altogether.

According to the World Nuclear Association, Japan has 43 'operable' power reactors (they are 'operational' according to the IAEA), three under construction, nine 'on order or planned', and three 'proposed'.

The numbers suggest that Japan's nuclear industry is finally getting back on its feet after the Fukushima disaster - but nothing could be further from the truth.

Before considering the industry's current problems, a little historical context from the World Nuclear Industry Status Report 2016:

"[I]t has been 17 years since Japan's nuclear output peaked at 313 TWh in 1998. The noticeably sharp decline during 2002-2003, amounting to a reduction of almost 30%, was due to the temporary shutdown of all 17 of Tokyo Electric Power Company's (TEPCO) reactors - seven at Kashiwazaki Kariwa and six at Fukushima Daiichi and four at Fukushima Daini.

"The shutdown was following an admission from TEPCO that its staff had deliberately falsified data for inclusion in regulatory safety inspections reports. During 2003, TEPCO managed to resume operations of five of its reactors.

"The further noticeable decline in electrical output in 2007 was the result of the extended shutdown of the seven Kashiwazaki Kariwa reactors, with a total installed capacity of 8 GWe, following the Niigata Chuetsu-oki earthquake in 2007. TEPCO was struggling to restart the Kashiwazaki Kariwa units, when the Fukushima earthquake occurred."

How many of Japan's reactors are really 'operable'?

Nuclear power accounted for 29% of electricity generation in Japan in 2010, down from the historic peak of 36% in 1998, and plans were being developed to increase nuclear's share to 50%. But all of Japan's reactors were shut down in the aftermath of the Fukushima disaster. Reactors didn't power a single light-bulb from September 2013 to August 2015.

Japan had 55 operable reactors before Fukushima (including the ill-fated Monju fast reactor). In addition to the six reactors at Fukushima Daiichi, the permanent shutdown of another six reactors has been confirmed - all of them smallish (<559 MWe) and all of them ageing (grid connections between 1969 and 1977): Kansai Electric's Mihama 1 and 2, Kyushu Electric's Genkai 1, Shikoku's Ikata 1, JAPC's Tsuruga 1, and Chugoku Electric's Shimane 1.

So Japan now has 43 'operable' or 'operational' reactors, and it isn't hard to identify some with little or no prospect of ever restarting, such as the four Fukushima Daini reactors (or Monju for that matter).

Two reactors at Sendai in Kagoshima Prefecture were restarted in August and October 2015. And that's it - only two of Japan's 43 'operable' or 'operational' reactors are actually operating. Moreover an anti-nuclear candidate, Satoshi Mitazono, was elected governor of Kagoshima Prefecture in early July 2016 and he announced that he will seek the shut-down of the two Sendai reactors - he can prevent their restart after they shut down for inspection later this year.

As of 1 July 2016, 11 utilities had applied to the Nuclear Regulatory Authority (NRA) for safety assessments of a total of 26 reactors, including seven reactors that have completed the assessment process. Apart from whatever hurdles the NRA might put in their way, there are other obstacles: citizen-led lawsuits; local political and public opposition; economic factors, in particular the questionable economics of large investments to upgrade and restart aging reactors; and the impact of electricity deregulation and intensified market competition.

It's anyone's guess how many reactors might restart, but the process will continue to be drawn out - the only strong candidate for restart this year is the Ikata 3 reactor in Ehime Prefecture.

The government's current energy policy calls for a 22-24% nuclear share of electricity generation by 2030. That is less than half of the pre-Fukushima plans for future nuclear growth (the 50% target), and

considerably lower than the 29% nuclear share in 2010. Currently, nuclear power - the two Sendai reactors - account for less than 1%.
To reach the 20-22% target would require the operation of around 35 reactors by 2030, which seems highly improbable.

Cheap renewables picking up high-level support

The use of both fossil fuels and renewables has increased since the Fukushima disaster, while energy efficiency has made the task considerably easier - national power consumption in 2015 was 12% below the 2010 level.
The *World Nuclear Industry Status Report* comments on energy politics in Japan:
"Japanese utilities are insisting on, and the government has granted and reinforced, the right to refuse cheaper renewable power, supposedly due to concerns about grid stability - hardly plausible in view of their far smaller renewable fractions than in several European countries - but apparently to suppress competition.
"The utilities also continue strenuous efforts to ensure that the imminent liberalization of the monopoly-based, vertically integrated Japanese power system should not actually expose utilities' legacy plants to real competition.
"The ability of existing Japanese nuclear plants, if restarted, to operate competitively against modern renewables (as many in the U.S. and Europe can no longer do) is unclear because nuclear operating costs are not transparent. However, the utilities' almost complete suppression of Japanese wind power suggests they are concerned on this score.
"And as renewables continue to become cheaper and more ubiquitous, customers will be increasingly tempted by Japan's extremely high electricity prices to make and store their own electricity and to drop off the grid altogether, as is already happening, for example, in Hawaii and Australia."
The Japan Association of Corporate Executives, with a membership of about 1,400 executives from around 950 companies, recently issued a statement urging Tokyo to remove hurdles holding back the expansion of renewable power - which supplied 14.3 percent of power in Japan in the year to March 2016.
The statement also notes that the outlook for nuclear is *"uncertain"* and that the 20–22% target could not be met without an improbably high number of restarts of idled reactors along with numerous reactor lifespan extensions beyond 40 years.
Andrew DeWit, a professor at Rikkyo University in Tokyo, said the push signalled *"a profound change in thinking among blue-chip business executives."* DeWit added:
"Many business leaders have clearly thrown in the towel on nuclear and are instead openly lobbying for Japan to vault to global leadership in renewables, efficiency and smart infrastructure."

Safety concerns - the case of Takahama

The restart of the Takahama 3 and 4 reactors in Fukui Prefecture is indicative of the nuclear industry's broader problems. Kansai Electric Power Company (KEPCO) first applied to the NRA for permission to restart the reactors in July 2013. In February 2015, the NRA gave its permission for KEPCO to make the required safety upgrades. The restart process was delayed by an injunction imposed by the Fukui District Court in April 2015, but the ruling was overturned in December 2015.
Takahama 3 was restarted in late January 2016, and TEPCO was in the process of resolving technical glitches affecting the start-up of Takahama 4, when the Otsu District Court in neighbouring Shiga Prefecture ruled on 9 March 2016 that the reactors must be shut down in response to a petition by 29 citizens.
The court found that investigations of active fault lines and other safety issues were not thorough enough, it expressed doubts regarding the plant's ability to withstand a tsunami, and it questioned emergency

response and evacuation plans. Citizens and NGOs also questioned the use of arbitrary figures in KEPCO's safety analysis, and fire protection.

Nuclear Engineering International reported on 2 February 2016:

"While there are plans on paper to evacuate some Fukui residents to Hyogo, Kyoto, and Tokushima prefectures, many municipalities there have no detailed plans for receiving evacuees. Kyoto Governor Keiji Yamada said he did not feel adequate local consent had been obtained, citing concerns about evacuation issues. Shiga Governor Taizo Mikazuki said there was a lack of sufficient disaster planning."

On July 12, the Otsu District Court rejected KEPCO's appeal and upheld the injunction preventing the operation of Takahama 3 and 4. KEPCO plans to appeal the decision to the Osaka High Court.

Meanwhile, KEPCO is considering whether it is worth investing in upgrades required for the restart of the Takahama 1 and 2 reactors. The NRA controversially approved 20-year lifespan extensions for the two reactors (grid connected in 1974 and 1975), but citizens have initiated a lawsuit to keep them shut down.

Japan's 'lax' and' inadequate' regulatory regime

While safety and regulatory standards have improved in the aftermath of Fukushima, there are still serious problems. Citizens and NGOs have raised countless concerns, but criticisms have also come from other quarters.

When the NRA recently approved lifespan extensions for two Takahama reactors, a former NRA commissioner broke his silence and said *"a sense of crisis"* over safety prompted him to go public and urge more attention to earthquake risks. Kunihiko Shimazaki, a commissioner from 2012 to 2014, said: *"I cannot stand by without doing anything. We may have another tragedy ..."*

Professor Yoshioka Hitoshi, a Kyushu University academic who served on the government's 2011-12 Investigation Committee on the Accident at the Fukushima Nuclear Power Stations, said in October 2015:

"Unfortunately, the new regulatory regime is ... inadequate to ensure the safety of Japan's nuclear power facilities. The first problem is that the new safety standards on which the screening and inspection of facilities are to be based are simply too lax. While it is true that the new rules are based on international standards, the international standards themselves are predicated on the status quo.

"They have been set so as to be attainable by most of the reactors already in operation. In essence, the NRA made sure that all Japan's existing reactors would be able to meet the new standards with the help of affordable piecemeal modifications - back-fitting, in other words."

Even the IAEA has slammed the feeble NRA

An International Atomic Energy Agency (IAEA) review in early 2016 made the following recommendations (among others) regarding the NRA:

- To attract competent and experienced staff, and develop competencies relevant to nuclear and radiation safety.
- To amend relevant legislation with the aim of allowing NRA to improve the effectiveness of its inspections. The NRA inspection programme *"needs significant improvement in certain areas. NRA inspectors should be legally allowed to have free access to any site at any time. The decision process for initiating reactive inspections should be shortened."*
- To strengthen the promotion of safety culture including a questioning attitude.
- To give greater priority to the oversight of the implementation of radiation protection measures.
- To develop requirements and guidance for emergency preparedness and response in relation to radiation sources.

The IAEA further noted that the NRA's enforcement provisions are inadequate:

"There is no clear written enforcement policy in place at the NRA. There is no documented process in place at NRA for determining the level of sanctions. NRA inspectors have no power to enforce corrective actions if

there is an imminent likelihood of safety significant event. They are required to defer to NRA headquarters. ... NRA processes for enforcement are fragmented and some processes are not documented.
"NRA needs to establish a formal Enforcement Policy that sets forth processes clearly addressing items such as evaluation of the severity level of non-conformances, sanctions for different levels of non-conformances, processes for issuance of Orders, and expected actions of NRA inspectors if significant safety issues develop."

As the industry declines, expect new safety cutbacks

The narrative from government and industry is that safety and regulatory standards in Japan are now adequate - or they soon will be once teething problems with the new regime are sorted out. NRA Chair Shunichi Tanaka claims that Japanese regulatory standards are *"the strictest in the world."*

But Japan's safety and regulatory standards aren't strict. Improvements are ongoing - such as NRA actions in response to the IAEA report, and reports that legislation will be revised to allow unscheduled inspections of nuclear sites. But improvements are slow, partial and piecemeal and there are forces pushing in the other direction. An Associated Press report states that nuclear laws will be revised in 2017 but not enacted until 2020.

Reactor lifespan extensions beyond 40 years were meant to be *"limited only to exceptional cases"* according to then Prime Minister Yoshihiko Noda, speaking in 2012. Extensions were considered an emergency measure against a possible energy crunch. But lifespan extensions have been approved in the absence of an energy crunch, and more will likely follow.

If Japan's nuclear history is any guide, already flawed safety and regulatory standards will be weakened over time. Signification elements of Japan's corrupt 'nuclear village' are back in control just a few years after the Fukushima disaster. Add to that aging reactors, and utilities facing serious economic stress and intense competition, and there's every reason to be concerned about nuclear safety in Japan.

Tomas Kåberger, Professor of Industrial Energy Policy at Chalmers University of Technology in Sweden, noted in the foreword to the latest edition of the World Nuclear Industry Status Report:

"A nuclear industry under economic stress may become an even more dangerous industry. Owners do what they can to reduce operating costs to avoid making economic loss. Reduce staff, reduce maintenance, and reduce any monitoring and inspection that may be avoided.
"While a stated ambition of 'safety first' and demands of safety authorities will be heard, the conflict is always there and reduced margins of safety may prove to be mistakes."

Dr Jim Green *is the national nuclear campaigner with Friends of the Earth Australia and editor of the* Nuclear Monitor *newsletter, where this article was originally published. Nuclear Monitor, published 20 times a year, has been publishing deeply researched, often critical articles on all aspects of the nuclear cycle since 1978. A must-read for all those who work on this issue!*

Robots needed for Fukushima

September 4, 2016

Robot technologies sought for Fukushima reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160904_12/

Japan's academic societies are soliciting robot technologies that will allow direct surveying of molten fuel in the crippled nuclear reactors in Fukushima.

The atomic energy society and robotics society are seeking ideas for remotely-controlled robots that could travel 25 meters through water and complicated ductworks to reach the fuel and return with samples.

Removing the molten fuel is considered the most difficult step in dismantling the plant.

The Japanese government and Tokyo Electric Power Company have been using robots to survey around the reactors, with a hope to begin removing the molten fuel by 2021.

But highly dangerous conditions in the buildings and the accumulation of tainted water have hampered the work, and workers have yet to reach the molten fuel.

Officials at the societies say they want to test some of the ideas at a research facility near the plant and hope to use them in actual probes.

The deadline for applications is set for the end of January.

New robot to locate melted fuel in No.2 reactor

September 6, 2016

Robot to probe nuke fuel debris in Fukushima No. 2 reactor

http://www.asahi.com/ajw/articles/AJ201609060001.html

By TAKASHI SUGIMOTO/ Staff Writer

A robot will be sent into the No. 2 reactor containment vessel at the crippled Fukushima No. 1 nuclear power plant to locate the melted fuel inside and assess its spread ahead of future retrieval.

Tokyo Electric Power Co. announced on Aug. 25 that it would undertake the difficult operation early next year at the soonest.

Under consideration for the work is a scorpion-shaped robot developed by Toshiba Corp., whose slender body allows it to pass through narrow openings. It is designed to raise its rear camera toward the front to capture images when it has arrived at a planned survey location.

The robot will crawl through an entrance into the No. 2 reactor containment vessel and travel along a rail to go deeper into its interior and confirm the state of the melted fuel inside and other conditions.

TEPCO and other parties are planning to draw on the survey results to decide on the fuel retrieval method as early as fiscal 2018 and set out on the actual retrieval process, expected to pose extreme difficulties, in 2021.
The initial plan would have sent the “scorpion" into the No. 2 reactor last summer, but radiation levels around the entrance were so high that cleanup work had to be done to reduce them for workers who would be sending the scorpion in.
Remote operations to remove a steel plate that blocked the entrance also turned out to be a time-consuming process.
If the operation to send the robot proceeds as planned, its use will still be a year and a half behind schedule.
Robots of a similar kind were sent last year into the No. 1 reactor and were partially successful in capturing images inside the containment vessel. However, the survey has had rough going, as the robots failed to spot any fuel.
TEPCO and the government are planning to draw on the robot survey results and other information to make a decision in fiscal 2018 on the melted fuel retrieval method for the No. 1, No. 2 or No. 3 reactors.
They are hoping to use the “submersion method,” which would involve filling the containment vessel with water to reduce worker radiation doses, during the retrieval work to be started in 2021. However, water is leaking from holes in the containment vessels, and the holes have yet to be located.
TEPCO and other parties have begun weighing alternative retrieval methods that do not involve filling the containment vessels with water.

Greater use of renewables reduces CO2

September 13, 2016

Renewables credited with 28 million-ton drop in Japan utilities’ carbon emissions in 2015

http://www.japantimes.co.jp/news/2016/09/13/business/renewables-credited-28-million-ton-drop-japan-utilities-carbon-emissions-2015/#.V9eZ_zVdeot

Kyodo
An association of Japanese electric power companies said Monday that carbon dioxide emissions by its members declined in fiscal 2015 to around 441 million tons, partly due to greater use of renewable energy.
The preliminary figure represents a fall of 28 million tons from the previous year, said the Electric Power Council for a Low Carbon Society, which was set up in February with the aim of taking effective measures to fight global warming.
The decline in carbon dioxide emissions by Japan’s electricity industry reflects an increase in the use of solar and other renewable energy sources, as well as a decline in the use of fossil-fuel power generation following the restart of Kyushu Electric Power Co.’s Sendai nuclear power plant in 2015, the council said.
The council is composed of 42 companies, ranging from major utilities such as Kansai Electric Power Co. to newcomers to Japan’s electricity retail business, including JX Holdings Inc. and Osaka Gas Co.

The latest survey covered 39 of the companies that were operating in the year ended March.

Hydrogen plant for Fukushima?

September 30, 2016

Fukushima Prefecture study could lead to world's largest hydrogen plant

http://www.japantimes.co.jp/news/2016/09/30/national/fukushima-prefecture-study-lead-worlds-largest-hydrogen-plant/#.V-4kpcldeos

JIJI
From stigma to startup, Fukushima Prefecture stands a chance of becoming known for something other than its festering nuclear debacle. Three power companies have announced a study into a joint hydrogen manufacturing facility in the area.
Toshiba Corp., Tohoku Electric Power Co. and Iwatani Corp. said Thursday the facility could have a capacity equivalent to 10,000 kilowatts, the world's largest.
The government has already said it will build a major renewable energy base in the prefecture, producing hydrogen by solar, wind and other green energy sources. It hopes the gas will be used to power hydrogen fuel cell vehicles during the 2020 Tokyo Olympics.
The three companies will conduct the feasibility research under a deal awarded by the state-affiliated New Energy and Industrial Technology Development Organization.
Hydrogen will be produced through water electrolysis using surplus electricity. It will be stored until extra electricity is needed, when it will help to bridge fluctuations in supply from other renewable sources.
The system is expected to produce 900 tons of hydrogen annually, enough to power 10,000 fuel cell vehicles. The three firms aim to bring the system on line in fiscal 2020.

Japan must increase renewable energy targets

November 4, 2016

Renewable energy key to reducing Japan's CO2 emissions under Paris accord
http://mainichi.jp/english/articles/20161104/p2a/00m/0na/005000c
As the Paris climate accord came into effect on Nov. 4, Japan is under pressure to carry out a public pledge to reduce greenhouse gas emissions by 26 percent compared with 2013 levels by 2030.

- 【Related】Paris accord takes effect to combat global warming

Under domestic guidelines determined in a Cabinet decision in May this year, it will be necessary to cut office and household emissions by 40 percent to achieve the target. Officials envisage a shift to light-emitting diode (LED) lights, which use less power compared with other types of lighting, and an increase in hybrid vehicles, but there has been little progress on these fronts due to the costs involved.

Meanwhile, the energy sector is an area of serious concern. Japan's greenhouse gas reduction goal was based on the government's expectations that it would extend the life of the nation's aging nuclear reactors, and rebuild or build new reactors so that nuclear power would account for 20 to 22 percent of the nation's energy mix by fiscal 2030. However, the reactivation of nuclear power plants in Japan has not progressed, and there are no prospects of replacing reactors or building new ones. There has been a stream of plans to build new coal-fired power plants, which emit large amounts of carbon dioxide, and Japan has fallen behind in the world trend of pouring effort into the introduction of renewable energy.
In 2015, Cochin International Airport in India's southern state of Kerala opened a major solar plant and became the first airport in the world to run completely on solar power. The airport's managing director, V.J. Kurian, explained that it was decided to shift to renewable energy as it was cheaper.
According to the International Energy Agency, the average worldwide cost of solar power in 2015 was one-third of the average cost in 2010. The fact that cost of renewable energy has declined to a level that can rival that of fossil fuels pushed China and India to ratify the Paris Agreement at an early stage.
In Japan, however, construction costs including the cost of installing solar panels are higher than in other countries, and the cost of renewable energy generation is about double that in Germany or China. Under the nation's basic energy plan, it is envisaged that renewable energy (including hydropower) will account for 22 to 24 percent of Japan's energy mix by fiscal 2030. As of fiscal 2014, however, the rate stood at just 12.2 percent. Under the Paris Agreement it is necessary to revise targets upward every five years, and renewable energy holds the key in doing so.
Teruyuki Ono, executive director of the Tokyo-based Renewable Energy Institute, calls for Japan to make an effort.
"We should set higher targets and implement them by setting higher goals for the introduction of natural energy and thoroughly implementing energy conservation measures," he said.

Solar boom in Japan

November 30, 2016

Japan’s solar energy boom

http://www.japantimes.co.jp/news/2016/11/30/business/sun-setting-japans-solar-energy-boom/#.WD6WtH2Dmos

by Anne Beade
AFP-JIJI
CHIBA – The sun is setting on Japan’s clean-energy boom, despite projects like a massive floating solar farm near Tokyo, as the government cuts subsidies and bets on nuclear and coal-fired power, critics say.
Workers at the floating power station, one of the world’s biggest, have just finished laying about 50,000 interconnected panels on a vast dam reservoir.

Taking up space equivalent to several Tokyo Dome-sized baseball stadiums, the vast carpet of panels will supply power to about 5,000 homes from early 2018.
The project is the centerpiece of a solar-dominated wave of renewable energy investments that followed the 2011 Fukushima nuclear crises.
The disaster forced the shutdown of reactors that had supplied about one-quarter of resource-poor Japan's energy.
To plug the gap, electricity providers have been obliged since 2012 to buy power generated from green suppliers, including solar, at above-market rates — known as feed-in tariffs — fixed by the government each year.
But renewable energy investments have plateaued and are set to fall in the coming years as Tokyo cuts back subsidies while commodities including coal, oil and natural gas remain cheap.
Japan is also facing a shortage of land for new solar installations.
Kyocera Corp., which is behind the floating farm south of Tokyo, is building a solar plant on an abandoned golf course.
"Several dynamics in the Japanese power sector have shifted since (2012) — such as weakening government support, cheaper fuel alternatives and electricity sector reform — which have all contributed to the slowdown in growth," BMI Research said in a report.
Some say Japan's future solar potential now sits squarely on the roofs of millions of homes.
"There is still a big potential for the Japanese market," said Atsuhiko Hirano, head of Solar Frontier, a unit of Japanese oil giant Showa Shell.
"Utility-scale projects have been the driver so far. In contrast, the residential market has not grown so much. So there is still much more area where we can grow.
"(But) we are pushing the government to go further."
Solar accounts for a small fraction of Japan's energy mix — 3.3 percent in 2015. But Tokyo has said it wants renewables — also including hydro and wind power — to account for 22 to 24 percent of the total by 2030.
Critical government support appears to be waning, however, as Tokyo drives a push to restart mothballed atomic reactors — an unpopular move among the nuclear-wary public.
The pro-nuclear drive is supported by utilities, which complained about being forced to buy and distribute subsidized power, especially with oil and natural gas prices at multiyear lows.
Japan is also raising eyebrows with plans to invest billions of dollars at home and abroad in new power plants fired by cheap coal — even as it calls for more green power at home.
That includes half a dozen large coal-fired power stations within about 100 kilometers of Tokyo, which Greenpeace has branded "simply insane" over health concerns posed by air pollution.
Coal is also the biggest climate change culprit, generating more carbon pollution per unit of energy generated than oil or gas.
Within the G-7 club of rich nations, Japan is alone in investing heavily in coal-fired energy on its own soil, with more than 40 new power plants in the pipeline.
That sets it apart from even big polluters such as China and India which are pushing away from coal-fired power — although U.S. President-elect Donald Trump has vowed to bring back coal and refocus U.S. energy policy on fossil fuels.
"Japan is betting its economy and energy security on risky coal investments," said Taylor Dimsdale, Washington-based head of research at energy think tank E3G.
"The coal development pipeline in the rest of the G-7 countries has dried up with no further plants expected beyond a handful of projects that are already under construction."

Japan was among the worst performers in terms of countries cutting back on energy-related CO2 emissions in an annual ranking released during U.N. climate talks in November.
Critics say they don't have much hope for Tokyo's long-term commitment to renewable energy.
"After the Fukushima disaster there was an infatuation with renewable energy and the government was clearly pressing the accelerator," said Kimiko Hirata, international director for the Japanese NGO Kiko Network.
"But since then, I feel like it's putting the brakes on that policy and concentrating its focus on revising nuclear power and building new coal-fired power plants."

New cesium-absorbinbg sponges

November 27, 2016

Researchers create radioactive decontamination sponges using Prussian blue pigment

http://mainichi.jp/english/articles/20161127/p2a/00m/0na/007000c

Researchers have announced they have successfully created cesium-absorbing radiation decontamination sponges using Prussian blue pigment, the same type of pigment used in famous Japanese Edo-era ukiyoe paintings.
Prussian blue pigment was used in the renowned "Thirty-six Views of Mount Fuji" works by Edo-era artist Katsushika Hokusai. While it has been known that Prussian blue is good at sticking to radioactive cesium, work to actually use the pigment had until now not progressed far.
The research group combined the pigment with the next-generation material "cellulose nano-fiber," which is made of the ingredients of paper, miniaturized to an exceedingly small size. This allowed the researchers to overcome the problem of the pigment being easily diluted by water. They then incorporated this combination into foam resin sponges.
In February last year they buried around 1.5 kilogram's worth of sponges, each a few cubic centimeters in size, in the soil of around 30 square meters of farmland in Namie, Fukushima Prefecture, near the disaster-stricken Fukushima No. 1 Nuclear Power Plant. They say that after four weeks, the cesium content of the soil was reduced by up to half of what it had been.
Until now, cesium absorbents have faced a problem of high production costs, but University of Tokyo professor Ichiro Sakata, who was part of the research group, says the new sponges' cost won't be "much different from that of a kitchen sponge." After absorbing materials, the sponges can be shrunk to about 1 percent of their original size, which would assist in reducing garbage volume, he says.
The research results were published in the Nov. 15 edition of the British academic journal Scientific Reports.

Robot competition

December 4, 2016

Students test skills for robot missions inside Fukushima plant

http://mainichi.jp/english/articles/20161208/p2g/00m/0dm/080000c

By TERU OKUMURA/ Staff Writer
NARAHA, Fukushima Prefecture--A student contest for developing robots for decommissioning work at the crippled Fukushima No. 1 nuclear power plant was held here on Dec. 3 to nurture young people willing to tackle the decades-long undertaking.
In the plant, robots are being used instead of human workers because of the dangerous radiation levels.
A total of 15 teams from 13 colleges of technology throughout the country took part in the competition, named "The 1st Hairo Sozo Robocon" (The 1st robot contest to compete in creativity for reactor decommissioning).
It was organized by a council of teaching staff at colleges of technology and the education ministry.
"Decommissioning work may give you a negative impression. But it is the same as space development in that both of them challenge unknown fields. I think that the students will be interested in the work," said Shigekazu Suzuki, associate professor of mechanical engineering at the National Institute of Technology, Fukushima College, a leading member of the council.
The students were challenged with robotic tasks such as delivering a piece of baggage to the 3.8-meter-high second floor or checking the state of a bumpy floor.
Their efforts to protect robots from radiation or technologies to operate them remotely were also evaluated. That reflects the reality at the Fukushima No. 1 plant that workers cannot enter some areas due to high radiation levels or robots may not operate properly there.
A team from the Osaka Prefecture University College of Technology was chosen for the top prize.
The contest was held at the Naraha Remote Technology Development Center of the Japan Atomic Energy Agency, an affiliate of the government.
About 40 robots have already been utilized at the plant. However, seven of these have been unable to return as they fell over or were caught between cracks.
Since the decommissioning work is expected to take up to 40 years, it is a major challenge to secure the necessary human resources and develop proper technologies.

Robot contest for scrapping Fukushima reactors

http://www3.nhk.or.jp/nhkworld/en/news/20161203_25/

More than a dozen groups of engineering students have competed in a robot contest to determine whether their models could be used to help decommission damaged reactors at the Fukushima Daiichi nuclear power plant.

Fifteen teams from 13 national institutes of technology took part in the competition in Naraha Town, Fukushima Prefecture, on Saturday.

It is the first-ever event to raise interest among young people in the decommissioning project. Experts estimate that it will take 4 decades to complete the dismantling work. The organizers included the science ministry.

Robots developed by the students took on the task of ascending and descending a steep stairway modelled after actual buildings housing the reactors. The robots also had to take a video of a high place.
The organizers limited working time to between 5 and 10 minutes after considering the effects of strong radiation on electrical devices. The participants in principle needed to operate their robots via cables as radio waves cannot penetrate the thick concrete walls surrounding the reactors.

A team from a Tokyo institute succeeded in taking a video of a high spot by using an extendable arm. One of the members said his team had considered the impact of radiation during the designing stage and had reduced the number of electrical parts to create a practical mechanism. He added the group will advance its research to contribute to the restoration of the area around Fukushima.

The organizers hope interested companies will launch joint research projects using the students' designs.

New "muscle robots"

A "spider" robot developed for use inside the Fukushima No. 1 Nuclear Power Plant is unveiled to the Mainichi Shimbun at a factory in Hiroshima on Feb. 28, 2017. (Mainichi)

March 1, 2017
Factory unveils 'muscle robots' to be used in Fukushima nuke plant dismantling
http://mainichi.jp/english/articles/20170301/p2a/00m/0na/010000c

HIROSHIMA -- A factory here where so-called "muscle robots" to help decommission the Fukushima No. 1 Nuclear Power Plant are being developed was unveiled to the Mainichi Shimbun on Feb. 28.
The robot development project is a joint effort among Hitachi-GE Nuclear Energy Ltd., Hiroshima-based equipment maker Chugai Technos Corp., and other firms. The companies are aiming to use the robots -- which are powered by water pressure and springs, and thus unlikely to be affected by radiation -- to crush and remove nuclear fuel that melted down six years ago. The companies have developed six types of robot so far.
The machines unveiled on Feb. 28 include a six-limbed "spider" robot that can move around and transport objects. The robot is 2.8 meters long when the arms are fully extended, and the companies plan to give it the ability to hang from scaffolding and climb onto equipment.
Although surveys of the interior of the Fukushima plant reactors have been conducted, details on the state and location of the melted nuclear fuel remain sketchy. The "muscle robots" are still in their preliminary stages of development, and the companies say they will continue to tweak the devices to respond to the actual conditions inside the reactors as they become known.

Joint renewables projet with Germany

March 20, 2017
Japan, Germany ink pact on green energy project
https://www3.nhk.or.jp/nhkworld/en/news/20170320_10/

Japan and Germany have signed an agreement to start a joint project to stabilize renewable energy supplies.

Japan's New Energy and Industrial Technology Development Organization, or NEDO, and the Niedersachsen state government in northern Germany inked the deal in the state capital, Hannover, on Sunday.

3 Japanese firms, including a battery maker, and a German power company plan to take part in the 3-year project, which is set to begin next month.

They say they want to stabilize green energy supplies by saving electricity at a large storage facility when an amount well above the level of demand goes into power grids.

They say stored electricity will be used during power shortages.

Germany is sharply increasing its output of wind, solar and other forms of green energy, as the government tries to phase out nuclear power by 2022. But fluctuating output that depends on weather conditions poses a major challenge.

NEDO Chairman Kazuo Furukawa says his organization wants to introduce what it will learn in Germany to Japan and help Japanese firms start businesses in other countries.

Investment in renewables down in 2016

April 17, 2017
Renewable energy investment falls in 2016 amid drop in prices, spending
http://www.japantimes.co.jp/news/2017/04/07/business/2016-saw-fall-renewable-energy-investment-prices-eased-output/#.WOdiIGekKos

AP, AFP-JIJI
BERLIN/PARIS – Global investments in renewable energy fell by almost a quarter in 2016 amid a drop in prices and lower spending in some markets, according to a U.N.-backed report published Thursday.
Overall investments reached $241.6 billion last year, down from $312.2 billion in 2015, said the United Nations Environment Program.
But investors got more bang for their buck: renewable energy capacity increased by 138.5 gigawatts, 8 percent more than the 127.5 gigawatts added the year before.
That's because installing solar, wind and other systems for generating renewable energy became cheaper last year.
China invested $78.3 billion, about a third less than the previous year — the first drop in over a decade.
U.S. investment dipped by 10 percent, to $46.4 billion, as developers paced their projects to take advantage of tax credits. Japan's investment more than halved to $14.4 billion last year.
In Europe, spending on renewables increased slightly to $59.8 billion, driven by big wind power projects in Britain and Germany.
India saw the completion of a massive solar project in Tamil Nadu state in 2016. It will be the world's biggest until China finishes expanding the Longyangxia Dam photovoltaic complex later this year.
Many countries see renewable energy as an essential part of international efforts to reduce carbon emissions that contribute to global warming.
Investment in power generated from fossil fuels was roughly half that of renewables last year, according to the report, which is based on data from Bloomberg New Energy Finance.
"Ever-cheaper clean tech provides a real opportunity for investors to get more for less," said Erik Solheim, Executive Director of UNEP.
The proportion of electricity coming from renewable sources, not including large hydropower plants, rose from 10.3 percent to 11.3 percent in 2016.
The European electricity industry association EURELECTRIC announced Tuesday its 3,500 members won't invest in new coal-fired power plants after 2020.
"With power supply becoming increasingly clean, electric technologies are an obvious choice for replacing fossil fuel-based systems … to reduce greenhouse gases," said EURELECTRIC president and CEO of the Portuguese energy group EDP, Antonio Mexia.

Hydrogen for Fukushima

August 29, 2017

Fukushima Prefecture high on hydrogen for greener society

By TERU OKUMURA/ Staff Writer

One of the world's largest hydrogen production plants is planned for the town of Namie, part of efforts to build a hydrogen-based, eco-friendly society in disaster-hit Fukushima Prefecture.

The New Energy and Industrial Technology Development Organization (NEDO) announced its plan on Aug. 1, following the opening of the prefecture's first hydrogen station on the site of the Koriyama city government office in June.

Although hydrogen is drawing increasing attention as a new type of energy to replace fossil fuels, hurdles remain, particularly over costs, for its widespread use.

But still, the green energy business is expected to help the prefecture recover from the 2011 Great East Japan Earthquake and tsunami as well as the subsequent nuclear crisis.

NEDO's planned plant is a core project intended to promote use of the gas and nurture relevant industries to establish a futuristic hydrogen society in Fukushima Prefecture. The plant will produce hydrogen using renewable energy, such solar and wind power.

One disadvantage of renewable energy is the difficulty in ensuring a stable electricity supply. The planned factory will attempt to get around this problem by converting electricity generated from renewable energy into hydrogen because the gas is easier to store and transport.

After Tohoku Electric Power Co. dropped its plan to build a nuclear plant in Namie, the construction site and the surrounding area were selected for the hydrogen factory.

Part of the site will be provided free of charge to the Namie municipal government.

While 4.5 hectares of the land will host the hydrogen plant, the remaining 35 hectares will be used to set up solar panels.

Hydrogen produced at the facility will be used primarily to supply power to fuel-cell vehicles, which run on motors operated by electricity generated by combining hydrogen and oxygen.

The facility will have a total capacity of 10 megawatts, enough to supply hydrogen to 10,000 fuel-cell vehicles.

Fuel-cell cars emit only water while in operation, and their energy efficiency is higher than that of gas-powered and other types of vehicles.

Toshiba Corp., Tohoku Electric and Iwatani Corp. were chosen in autumn last year as operators of the hydrogen facility. Its construction will start next summer, and experimental operations are expected to begin by 2020

.

HYDROGEN FOR FUEL-CELL VEHICLES

The Koriyama city government has introduced a fuel-cell vehicle for official use. The first hydrogen station for fuel-cell vehicles in Fukushima Prefecture opened in the parking lot of the city government office in June.

According to the city and other sources, the station in Koriyama was the third in northeastern Tohoku region, after two stations in Sendai.

Another hydrogen station will be installed in Minami-Soma, Fukushima Prefecture. And a movable station is planned to provide hydrogen in the cities of Fukushima and Koriyama.

However, the use of fuel-cell vehicles has not spread sufficiently.

Although a central government subsidy is available, fuel-cell vehicles cost more than 7 million yen ($63,700) each, and there are few hydrogen stations.
According to Koriyama city, Japan had 1,500 registered fuel-cell vehicles as of the end of last year. The city government's fuel-cell vehicle, in fact, was the first one to operate in Fukushima Prefecture.
Starting this fiscal year, the prefectural government started offering a subsidy to set up hydrogen stations. It also plans to begin a subsidy program targeting those who want to buy fuel-cell vehicles by the end of August at the earliest to contribute to realizing a hydrogen society.

Power line (allowed) capacity major obstacle to more renewables

November 9, 2017

EDITORIAL: Unused power line capacity should be given to green energy
http://www.asahi.com/ajw/articles/AJ201711090024.html
Promoting power generation using renewable energy sources such as wind and solar power is vital for Japan's efforts to reduce its dependence on nuclear power while cutting its greenhouse gas emissions.
But **established electric utilities' reluctance to allow new power suppliers to use surplus capacity in their transmission lines is emerging as a major obstacle to growth in renewable power generation in this nation.**
The big utilities claim there is no unused capacity in their transmission lines in many areas, forcing many renewable power suppliers to abandon their business plans. These smaller and greener electricity suppliers cannot afford the heavy investment needed for transmission capacity expansion, which would require many years and be enormously expensive.
Last spring, Tohoku Electric Power Co., which supplies electricity to the northeastern Tohoku region, announced there is no surplus capacity in its transmission lines in the northern parts of the region. Since then, other major utilities, which enjoy a near regional monopoly in the power market, have made similar claims in various parts of the nation.
A Kyoto University research team has checked these claims and found them to be untrue.
The team used data provided by a public institution that monitors and supervises the use of power transmission lines nationwide to estimate how the core transmission lines in the four Tohoku prefectures of Aomori, Akita, Iwate and Yamagata were actually used. The group found that, in fact, only 2 to 18 percent of the capacity was used. Its analysis for the facilities in Hokkaido produced similar results.
None of the established utilities has disclosed details of the formulas they use to calculate surplus capacity in their power lines. Basically, however, their calculations are based on the hypothetical situation where all the power generation facilities that have contracts for connection to their transmission lines operate at full capacity. These contracts are concluded on a first-come-first-served basis. Even nuclear power plants that have yet to be completed are counted, let alone ones that are currently offline.
This is an extremely unreasonable approach. The Ministry of Economy, Trade and Industry and the public organization supervising transmission lines are considering measures to correct the problem. They need to quickly come up with fair and transparent rules concerning the issue.
A key viewpoint for debate on this issue is for whom the power grids exist.
Legally, the power lines belong to the utilities that operate them. But the costs of building and maintaining the networks are passed on to consumers through electricity rates.

In other words, transmission lines are public assets that have been developed with money widely collected from power consumers, or the entire public.
From this point of view, the current system for connecting to transmission lines is seriously flawed because it allows utilities to give preferential treatment to their own power generation facilities, including planned or idle nuclear power plants, and shut out newcomers such as renewal power suppliers.
A radical review of the system is needed to make the most of the existing power grids and keep down the additional financial burden on newcomers as much as possible.
The established utilities have taken a dim view of the Kyoto University study. Tohoku Electric Power says the published data concerning the use of its power cables only represent one aspect of the reality. The firm contends that using only this data to evaluate the necessity of capacity expansion is not fair.
Instead of defending their stance, the utilities should first disclose detailed information about the use of their transmission lines.
If they try to tip the debate in their favor by monopolizing the relevant data, they will inevitably be suspected of erecting a barrier to entry into the market.
In the United States and Europe, where the operations of power generation and transmission facilities are clearly separated, various plans and systems have been developed to ensure a stable power supply and prevent blackouts despite connections of unstable renewable power generation facilities to the grids.
Japan plans to separate the operations of power generation and transmission facilities in 2020.
How to respond to the issue of the alleged scarcity of surplus capacity in transmission lines will be a key test of the commitment of the government and the power industry to creating transparent and fair business environments for the years after the separation.
--The Asahi Shimbun, Nov. 9

Only 20% of transmission lines capacity used by utilities!

Number and average usage rates of major utilities' core electric power transmission lines

Hokkaido Electric Power Co.	38 (19)	14.5% 〈14.1%〉
Tohoku Electric Power Co.	34 (23)	12.0% 〈 9.5%〉
Tokyo Electric Power Co.	77 (31)	27.0% 〈36.6%〉
Chubu Electric Power Co.	77 (48)	20.4% 〈25.4%〉
Hokuriku Electric Power Co.	10 (3)	14.8% 〈25.9%〉
Kansai Electric Power Co.	50 (9)	25.5% 〈23.7%〉

January 28, 2018

Major utilities using less than 20% of capacity of electric lines

http://www.asahi.com/ajw/articles/AJ201801280022.html

THE ASAHI SHIMBUN

The Asahi Shimbun

Usage rates of core electric power transmission lines operated by 10 major utilities are only 19.4 percent on average of capacity, contradicting a claim by these companies, according to a newly conducted analysis. The remaining free capacity can be used to transmit electricity generated by renewable energies such as wind power or solar power.

However, major electric power companies are refusing to allow the use of the free capacity for transmission of renewable energies, saying that there is no available capacity in many of those lines.

The study was conducted by Yoh Yasuda, a specially appointed professor at Kyoto University's economics course on renewable energies. It marked the first time in Japan that usage of the core transmission lines was surveyed on a nationwide scale.

"The usage rates of transmission lines with 'zero free capacity' should be higher," Yasuda said. "In reality, however, they have more free capacity in some cases. It is incomprehensible. Why do utilities say that their free capacity is at zero? Why do they restrict connection of the equipment for renewable energies by citing the zero free capacities as a reason? They are required to make reasonable and highly transparent explanations to those questions."

The results of the analysis are scheduled to be announced in a symposium in Tokyo on Jan. 29.

Yasuda surveyed the 10 utilities' 399 high-voltage core electric power lines, such as 500,000 volts or 275,000 volts, based on data released by the Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

The data covered the period from September 2016 to August 2017.

The usage rate is the ratio of capacities of electricity that actually flowed in the lines to the maximum capacities of electricity that can flow in a year.

According to the analysis of the data, the usage rate of Tokyo Electric Power Co. (TEPCO) was the highest at 27.0 percent while that of Tohoku Electric Power Co. was the lowest at 12.0 percent.

The so-called "crowded transmission lines," meaning that the usage rate temporarily exceeded 100 percent, occurred at least once in 60 lines. Of these, 22 lines were those of TEPCO.

Meanwhile, 139 of the 399 lines were categorized as "free capacity is zero." However, their average usage rate was only 23.0 percent, which was almost the same as the 19.4 percent of the 399 lines.

According to the major utilities, zero free capacity is based on the premise that all existing power plants are running at their full capacities, including idled nuclear power plants and aged thermal power plants. Therefore, the actual flow of electricity through the transmission lines was much smaller.

In a news conference held in November 2017, Satoru Katsuno, chairman of the Federation of Electric Power Companies of Japan, was asked about the circumstances that despite transmission lines having free capacity, equipment to transmit renewable energies could not be connected to those lines.

At that time, he said, "We are putting priority on nuclear power as a baseload power source."

An official of a major utility also explained, "Free capacity cannot be measured based only on electricity that actually flowed in transmission lines."

In Europe and the United States, however, transmission lines are used based on the capacity of electricity that actually flows through the lines. As a result, renewable energies have been introduced in large quantities.

Therefore, the economy ministry has begun to consider greater utilization of the free capacity.

The ratio of transmission lines whose free capacity is zero is high for utilities in eastern Japan, such as Tohoku Electric Power, Chubu Electric Power Co., Hokkaido Electric Power Co. and TEPCO.
On the other hand, the corresponding ratios for utilities in western Japan are low.
For utilities such as Tohoku Electric Power and Hokkaido Electric Power, the usage rates of transmission lines with zero free capacities were lower than those of all the transmission lines under their jurisdictions.

The challenge of renewables in Japan

March 12, 2018

News Navigator: What issues are there concerning the spread of renewable energy?
https://mainichi.jp/english/articles/20180310/p2a/00m/0na/022000c
The Mainichi Shimbun answers some common questions readers may have about renewable energy in Japan, and the issues that surround its continued expansion in the country.
Question: What's the situation concerning the introduction of renewable energy in Japan?
Answer: The government has set a target of having 22 to 24 percent of domestic power generation stemming from renewable energy (including hydraulic power) by 2030. Excluding hydraulic power, this percentage increased drastically from 1.1 percent in fiscal 2010 to 7.8 percent in fiscal 2016. The country has already achieved nearly half the 2030 target, with the exception of hydraulic power.
Q: So things are progressing smoothly?
A: The real challenge is from now. In July 2012, the country introduced a feed-in tariff (FIT) scheme, under which electric power companies are obliged to purchase electricity from renewable energy sources at a fixed price. As a result, the introduction of renewable energy suddenly increased.
However, renewable energy facilities relating to solar and wind power are being concentrated in certain regions such as Hokkaido, Tohoku and Kyushu -- where land prices are cheap and conditions for generating power are good -- resulting in a shortage of utility line capacity to carry electricity into urban areas. Therefore, unless new power lines are built, the introduction of further renewable energy will be difficult.
Q: So the problem can be solved by building more power lines?
A: That's easier said than done. It takes about 10 years to construct major power lines, as land needs to be bought and iron towers need to be built. In October 2016, Tohoku Electric Power Co. searched for renewable energy operators capable of generating about 2.8 million kilowatts (kW), as part of a power line construction plan, and received a response from operators able to generate a total of 15.45 million kW. However, so far, construction has failed to get off the ground, as Tohoku Electric Power is unable to buy power from the majority of applicants.
Q: How can the situation be resolved?
A: In fiscal 2018, the government is set to introduce an initiative called "Connect and Manage," which will make effective use of the surplus capacity of existing power lines. Until now, the capacity of power lines had been set with emergencies in mind, and more than half of the lines' capacity is empty. As a result, there are plans to make more efficient use of these lines based on the actual amount of power that is being generated.

Looking ahead to the initiative, Tohoku Electric has changed the capacity of newly established power lines allocated to outsiders from about 2.8 million kW to 3.5 to 4.5 million kW. However, this is still not enough. A long-term plan spanning several decades is required. (Answers by the Business News Department)

Problems of renewables in Fukushima

March 11, 2017

Fukushima powers toward 100% goal on renewables as grid and cost woes linger
https://www.japantimes.co.jp/news/2018/03/11/national/fukushima-powers-toward-100-goal-renewables-grid-cost-woes-linger/#.WqY57XwiGos

by Eric Johnston
Staff Writer

OSAKA – Seven years after the triple meltdown at the Fukushima No. 1 nuclear plant, Fukushima Prefecture remains committed to becoming an international center for renewable-energy research and a domestic pioneer by meeting 100 percent of its energy demand via renewables by 2040.
But grid connection issues, investment costs and a government policy that still favors investment in other energy sources — especially nuclear — continue to present challenges to researchers, businesses and Fukushima policymakers with an interest in renewable energy.
In 2014, the prefecture announced it was aiming to have renewables supply 40 percent of its energy demand by 2020, two-thirds by 2030 and 100 percent by 2040.
As of April 2017, renewable energy accounted for 28 percent of the prefecture's energy needs and about 60 percent of its electricity consumption.
Fukushima's installed capacity in renewables, excluding large-scale hydropower, had reached nearly 1.4 gigawatts by early 2017, equivalent to one large nuclear reactor. This included 925 MW of solar power, 209 MW of biomass and 174 MW of wind, with small shares for geothermal (65 MW) and small-scale hydro (17 MW).
The prefecture also hosts several organizations promoting renewable energy, including the Fukushima Renewable Energy Institute in Koriyama, which is part of the National Institute of Advanced Industrial Science and Technology. There, researchers look into improving the technology, efficiency and use of several forms of renewable energy, including photovoltaic, wind, shallow geothermal and geothermal. The institute also does research on using hydrogen obtained from renewable energy sources.
"With technological support from the institute, a support program for local businesses in the quake- and tsunami-damaged areas is being carried out and human resources are being developed in collaboration with local universities. As a result, there have been 107 joint research projects implemented and nine successful examples of commercialization," said Masaru Nakaiwa, the institute's director-general, in an e-mail interview with The Japan Times.

“As a research institute playing a role in a new energy society for Fukushima, the Fukushima Renewable Energy Institute has been tying up with local business, and it’s gratifying to see the results,” said Masayoshi Hamada, state minister for reconstruction, after a third tour of the institute in February.
Yet while official and public enthusiasm over renewable energy has grown since 2011, and while over 15 percent of Japan’s electricity was generated by renewables in fiscal 2016, Nakaiwa said that does not mean that renewable energy is spreading compared with other OECD countries.
“The big problems remain cost and grid connection capacity, although it’s remarkable that we’ve seen a recent movement in the manufacturing industry, the backbone of support for Japan, to steadily expand its use of renewable energy. The United Nations Sustainable Development Goals have drawn international attention, and the fact that visible consideration for the environment is greatly reflected in a firm’s value is thought to be the main reason” for the shift, he said.
In September 2016, the central government created a renewable energy plan for Fukushima that meant additional support for maximizing its use in Fukushima, including the development of “smart” communities.
The plan gave a particular boost to long-standing government and industry efforts at storing and using hydrogen produced from other renewable energy sources.
In January, Tadashi Mogi, a senior official at the Ministry of Economy, Trade and Industry’s Energy Efficiency and Renewable Energy Department, updated a meeting of the International Renewable Energy Agency on what was going on in Fukushima.
“The potential of solar and wind power in Fukushima is maximized. Currently, delivering the electricity produced by such renewable sources to the large power-consumption areas like Tokyo is unfeasible due to a lack of transmission capacity. But development of transmission lines will begin at a high pace from next year,” he said.
Mogi also noted that pilot projects had been initiated at so-called smart communities in five cities and towns in Fukushima. These include Shinchi, Soma, Namie, Naraha and Katsurao. In those projects, electricity and heat from distributed power sources and renewable energy are supplied to public facilities or even an entire urban district.
The government sees Fukushima-generated hydrogen in particular as a key energy source and plans to promote it internationally in 2020.
“The Fukushima Plan for a New Energy Society, which is the pioneer of this basic strategy, has already begun its activities,” Prime Minister Shinzo Abe said in December at a meeting of the Ministerial Council on Renewable Energy, Hydrogen and Related Issues. “In Namie, a hydrogen production project of the world’s largest scale, using renewable energy with zero CO2 emissions, started last summer. Clean hydrogen made in Fukushima will be used for the Tokyo Olympic and Paralympic Games.”
Wind, particularly offshore wind, is another renewable energy source that Fukushima is pursuing. The Fukushima Offshore Wind Consortium is supported by METI and includes major firms like Marubeni, Mitsubishi Heavy Industries and Hitachi Ltd. The project now has three turbines: 2-MW and 5-MW turbines from Hitachi and a 7-MW turbine from MHI.
The Japan Wind Power Association has proposed that onshore and offshore wind power provide 36GW of electricity by 2030, equivalent to the output of about 30 nuclear power plants. The central government has set a target of generating 820 MW from offshore wind turbines by 2030. As of February 2017, there were nine offshore wind projects nationwide, including fixed and floating offshore turbines that were generating nearly 60 MW.
In March 2017, the association identified a number of problems with offshore wind power in Japan, including cost and poor electric grid infrastructure in areas with good wind like Hokkaido and Tohoku.

The more populated central and western parts of Japan, where grid infrastructure is often better, have only moderate wind speeds, making it difficult for wind farms to turn a profit. Also cited as hurdles were legal issues over the common use of sea areas as well as concerns from politically powerful fishing unions.
In Fukushima itself, a 2017 prefectural survey showed support for renewable energy remained strong, with 54 percent of respondents saying they wanted to keep using it in their daily lives and 14 percent saying they did not.
Between local efforts to meet the 2040 goal of 100 percent use, and central government and business support for Fukushima to become a testing ground for renewable energy technologies, the march toward moving Fukushima from a nuclear past to a renewable future continues.
This is part of a series looking at how the Tohoku region is attempting to rebuild itself seven years after the March 11, 2011, disasters.

Pushing renewables but remaining dependent on nukes

April 10, 2018
Japan pushes renewables, keeps nuclear in energy plan through 2050
https://mainichi.jp/english/articles/20180410/p2g/00m/0dm/063000c
TOKYO (Kyodo) -- Japan will accelerate the development of renewable energy and keep its current policy of lowering its dependence on nuclear power as it aims for a low-carbon society, a government panel report on the country's energy plan through 2050 showed Tuesday.
The long-term policy comes as Japan lags behind the global trend to invest in renewables, and nuclear power is no longer deemed a cheap energy source in the wake of the core reactor meltdowns at the Fukushima Daiichi plant in 2011, with utilities required to invest massively to meet tougher safety regulations.
"Japan will keep the policy of lowering its dependency on nuclear power generation as much as possible while seeking to expand economically independent and carbon-free renewable energy," the report by the eight-member panel said. The members include scholars and business executives.
The report did not set out numerical percentages of the country's future energy mix in 2050. An official at the Ministry of Economy, Trade and Industry said it is hard to predict a specific energy scenario as it depends on how technological developments in energy sources progress.
The most recent targets set out in 2015 seek to have renewable sources account for 22 to 24 percent and nuclear 20 to 22 percent of electric power generation in fiscal 2030.
Under the 2015 Paris climate accord, Japan aims for an 80 percent cut in greenhouse gas emissions by 2050 from 2013 levels.
The report acknowledged that while there have been global movements to phase out nuclear power following the Fukushima crisis, efforts have also been made to enhance the "safety, economic feasibility and mobility" of nuclear power generation.
Japan should first regain public trust in nuclear power following the Fukushima disaster, triggered by the March 2011 massive earthquake and tsunami, and strive to "strengthen personnel, technology and industry base" in pursuit of nuclear reactors with enhanced safety, the report stated.
"There have been concerns that our country's high-level nuclear technology and personnel will be lost following the Fukushima crisis. The panel members pointed out the need to maintain them to enhance safety of nuclear reactors," the ministry official said.

The official said the report puts an emphasis on the development of renewable energy out of a "sense of crisis," with the country currently slow to invest in such energies.
"Honestly speaking, Japan does not have competent companies in the field of renewable energy and we rely heavily on imports of renewable technology, such as solar panels. The panel is concerned Japan should recoup in the long-term," the official said.
Noting that output of solar and wind power generation tends to be influenced by the weather, the panel called for the development of batteries to store surplus renewable energy and converting it to hydrogen.
As for thermal power generation, the report said it will remain a major power source in 2050 but inefficient coal plants should be phased out with more focus on gas plants.
The report is set to be reflected in a separate government energy plan through 2030 that is due to be finalized this summer.

Time to switch to green

April 13, 2018

Editorial: Japan must make concerted push to switch to green energy economy
https://mainichi.jp/english/articles/20180413/p2a/00m/0na/017000c
An expert committee at the Ministry of Economy, Trade and Industry recently finalized long-term energy plan recommendations through the year 2050. Solar, wind and other renewables were given pride of place as "main power sources," and we commend the committee for its proactive attitude to expanding green energy, a sector in which Japan lags behind countries in Europe and elsewhere.

- 【Related】Japan pushes renewables, keeps nuclear in energy plan through 2050

However, there are many obstacles that must be overcome to realize this renewable energy future. To make sure this goal does not end up a mere flight of fancy, we call on the government to develop tactics that will get Japan steadily to its green energy goals.
The long-term energy plan recommendations were drawn up with the Paris Agreement limiting global warming in mind, and form the compass needle by which Japan's energy policy is plotted. Indeed, the government is looking to finalize Japan's revised basic energy plan as early as this summer, and it will reflect the committee's ideas.
The ultimate goal is for Japan to free itself entirely from carbon-based energy. That means ending dependence on fossil fuels -- oil, coal, and natural gas. Expansion of renewable energy plays the leading role in accomplishing this.
However, there are difficulties with renewables, including instability due to changes in the weather, high costs, and patching green energy generation sources into the electricity distribution network. That is likely why the committee recommendations set the target ratio of Japan's energy mix made up of renewables at 22 to 24 percent in 2030 -- the same as it is under the current basic energy plan.
For the sake of the long-term strategy and overcoming the aforementioned obstacles, the recommendations call for a plan to concentrate efforts on developing essential technologies such as storage batteries, hydrogen fuel systems, and smart electricity distribution systems. This idea is based on

the belief that Japan cannot catch up with European countries and China if it uses existing technologies, and that it is necessary to put more efforts into developing next-generation technologies.
Creating new technology always takes time and money. Thus, the government must lay out a truly concrete path to get the work done. To cultivate renewables as the "main energy source," we call on Japan to leverage knowhow from the private and public sectors to make the best of existing high-efficiency electricity distribution technologies and the like, and to secure power sources that can compensate for the instability inherent in green energy generation.
One aspect of the recommendations is the positioning of nuclear power. The long-term energy strategy calls for atomic energy to be "reduced as much as possible," but also retains it as one option to help Japan free itself of fossil fuels. It would be difficult for the government to earn the public's understanding for retaining nuclear power by dressing it up as a just policy to wean the country off carbon.
Japan must end its dependency on nuclear power as quickly as possible. Making renewables this country's main energy source is a must for that to happen.

Clean energy for Japan

June 25, 2018

Japanese firms shift to clean energy despite state's enduring commitment to nuclear power
https://www.japantimes.co.jp/news/2018/06/25/business/japanese-firms-shift-clean-energy-despite-states-enduring-commitment-nuclear-power/#.WzDNqIoyWos

by Hidetoshi Takada
Kyodo
As Japan's government clings to nuclear power even after the Fukushima crisis, the private sector is moving ahead with greater use of renewables to power their operations amid growing international awareness of climate change.
As Japan's government clings to nuclear power even after the Fukushima crisis, the private sector is moving ahead with greater use of renewables to power their operations amid growing international awareness of climate change.
For instance, in March Daiwa House Industries Co. became a member of both RE100 (Renewable Electricity) and EP100 (Energy Productivity), two global initiatives by the Climate Group.
RE100 is a global, collaborative initiative of influential businesses committed to using 100 percent renewable electricity, while EP100 brings together companies committed to doubling energy productivity to lower greenhouse gas emissions. Among RE100's 136 members are U.S. General Motors Co. and Dutch consumer goods giant Unilever.
Printer-maker Ricoh Co., the first Japanese firm to join RE100, was followed by five firms such as online stationery retailer Askul Corp. and retail giant Aeon Co., aiming to meet the electricity needs of their global operations with renewable energy between 2030 and 2050.

Daiwa House says it is the world's first company in the construction and housing sectors to join both campaigns and the first to declare it is taking bold action, as part of EP100, among Japanese firms. Currently, there are 15 EP members. Daiwa aims to achieve both goals by 2040.

Katsuhiro Koyama, general manager of Daiwa's environment department, spurred debate over achieving the targets after returning to Japan from the COP23 global climate round in Germany last November.

He had previously taken a cynical view of such tech giants as Apple Inc., Google Inc. and Microsoft Corp. participating in the RE100 clean energy initiative, seeing it as an "atonement for their sins" for consuming huge amounts of electricity.

But as one of the Japanese delegate members to the global conference, Koyama said he was "inspired" by the firms' "serious aspirations to leverage clean energy producers" after hearing various discussions.

The Osaka-based Daiwa group has invested an estimated ¥46.6 billion in the construction of its own solar, hydro and wind-power plants nationwide since 2007, producing power equivalent to about 60 percent of the group's annual use of 481 million kilowatt hours. Meanwhile, it doubled its electricity use efficiency in fiscal 2016 compared to fiscal 2005.

Japanese businesses became much more aware of renewable energy in the wake of the Hokkaido Toyako summit in 2008, in which the Group of Eight countries set a long-term target to reduce greenhouse gas emissions. The 2011 Great East Japan Earthquake, which triggered the suspension of all nuclear power plants, also sparked public concerns over the country's energy mix.

The ratio of renewable energy to the nation's entire power output capacity has risen from 10 percent in fiscal 2010 to 15 percent in fiscal 2016, according to the Agency for Natural Resources and Energy, boosted by a feed-in tariff system that obliges utilities to buy electricity generated by renewable energy at fixed prices. The scheme has attracted businesses large and small — even individuals — to pour money into the field of photovoltaics as they requires less effort to install and operate in a shorter period of time compared to other types of energy sources, said Yushi Inoue, a research director at think tank Mitsubishi Research Institute.

Individual power producers are actively trying to connect with grids in northeastern Japan, and in a recent offering sought to supply "more than three times what we can accept," according to a spokesman of Tohoku-Electric Power Co., the regional utility.

The region, part of which was devastated by the mega-quake seven years ago and the subsequent nuclear disaster, has a number of favorable locations for wind power plants.

Meanwhile, a similar scheme in Europe that utilizes renewable energy certificates and a guaranteed origin of electricity generated from such sources has gained momentum among environmentally conscious firms, particularly after the 2008 summit in Hokkaido. The tradable green certificate proves "environmental added value" created by renewable energy producers, and can be purchased by electricity users.

Despite the financial burden, Ajinomoto Co. switched its energy source to renewables for its entire annual electricity use of 4.5 million kilowatt hours at its Tokyo headquarters and major sales bases at home in the business year to March 2018.

Japan's major seasoning- and food-maker extended the move to its four group arms in April, aiming to boost its renewable energy use to 50 percent of the group's total energy consumption by fiscal 2030.

The targeted figure is part of various nonfinancial targets compiled for the first time in its three-year business management plan that started in fiscal 2017, said Mototsugu Shiratsuchi, general manager of the environment management support group of Ajinomoto.

Although the volume of certified renewable energy is fairly small relative to the entire clean energy output in Japan, it has been steadily rising — reaching 378 million kilowatt hours in the year to March 2018, according to the Japan Quality Assurance Organization, the accreditation body.
Japan Natural Energy Co., the leading certificate issuer, has over 150 firms as long-term clients, such as Sony Corp., Asahi Breweries and about 300 customers on a one-time contract basis.
The company is the pioneer in the field with about an 80 percent market share, according to the accreditation body.
President Masaru Terakoshi said that one of Japan's global carmakers employed the certificate as part of its corporate social responsibility policy for 15 years but terminated a contract with the issuer two years ago.
The automaker, however, is set to repurchase the warrant this year following re-examination of how it can apply the certificate to its production activity.
Terakoshi declined to specify which automaker, but the example indicates that Japan's multinational corporations are becoming more aware of taking leadership roles in the fight against climate change.
"Otherwise, companies face a risk of losing clients," he said, as most of the world backs the landmark Paris accord goal of effectively reducing net carbon dioxide and other greenhouse gas emissions to zero in the second half of this century.
The tradable certificate is widely used. Some hotels, for example, buy the warrants to show that their banquets are sustained by clean energy.
In its latest draft energy mix plan, due to be finalized this summer, the Ministry of Economy, Trade and Industry called nuclear power "an important baseload energy source." This stance appears to conflict with public opinion, which shifted after the 2011 Fukushima disaster. In addition to public sentiment against nuclear power plants, the government's tougher safety standards led to the shutdown of all reactors.
In the fiscal year through March 2017, fossil fuels accounted for 83 percent of Japan's electricity output capacity. Renewables are currently at 15 percent.
The ministry proposes that nuclear power should account for 20-22 percent of the country's power sources in 2030, and renewables 22-24 percent, which still lags behind the equivalent figures seen for major European nations in 2015.

Toward a reduction of the plutonium stockpile?

July 3, 2018
Tokyo plans shift toward renewable energy, planning for first time to cut plutonium stockpile
https://www.japantimes.co.jp/news/2018/07/03/national/tokyo-eyes-renewable-energy-plans-cut-plutonium-stockpile/#.WztfKIoyVLM
Kyodo, Staff Report
Japan will shift further toward renewable energy and cut dependence on fossil fuels and nuclear power, according to the country's energy plan approved Tuesday by the Cabinet.
Ahead of the automatic July renewal of the U.S.-Japan agreement on the peaceful use of nuclear energy, the plan for a medium- to long-term energy policy also mentioned that Japan will work to reduce its plutonium stockpile for the first time.
The increased focus on renewables under the 2015 Paris climate accord underscores the nation's daunting challenge to reduce greenhouse gas emissions drastically in the years ahead.

The government, which updates the energy plan roughly every three years, kept its goals the same for its mix of energy sources in fiscal 2030 but did not give specific numbers for fiscal 2050 — the year when it has to clear its specific commitment in fighting global warming.
Toward 2030, the government aims to have renewables account for 22 to 24 percent, fossil fuels 56 percent and nuclear power 20 to 22 percent of the country's electricity generation, the energy plan showed.
With its 2016 energy self-sufficiency ratio below 10 percent, resource-poor Japan needs to secure stable energy supplies for economic activity and national security while also ensuring the safety of nuclear power generation following the 2011 Fukushima accident.
The country also needs to accelerate efforts to fight global warming, now that it has set the goal of achieving an 80 percent cut in greenhouse gas emissions in fiscal 2050 from 2013 levels.
The energy plan calls for supporting the development of a sustainable market for renewables, such as solar, wind and geothermal power, and encourages the use of hydrogen.
Placing a priority on safety, the nation will cut dependence on nuclear power generation "as much as possible," the energy plan said.
Still, it also acknowledged that nuclear power is one of the viable choices to achieve a shift away from using coal and other fossil fuels and cut greenhouse gas emissions.
Much of the country's nuclear power plants have been taken offline since the Fukushima disaster. The administration of Prime Minister Shinzo Abe is seeking to restart plants that have cleared safety checks.
The Japan-U.S. nuclear pact currently enables Japan to continue its spent-fuel reprocessing program for 30 years to July 2018.
Spent fuel from nuclear reactors is reprocessed to extract uranium and plutonium, which is then recycled into fuel called mixed oxide, or MOX, for use in fast-breeder reactors or conventional nuclear reactors.
In a June 21st open letter to International Atomic Energy Agency Director General Yukiya Amano that expressed concern about the management of plutonium stocks, three anti-nuclear groups said efforts to restart nuclear reactors, especially those that use MOX fuel, to meet the long-term energy goal for nuclear power were unrealistic.
"Our analysis over recent years, and to the present, indicates that Japan will fail to meet its nuclear restart target of 30 gigawatts by 2030 by a wide margin. Many more nuclear reactors are likely to be decommissioned" in the coming years joining the 17 that have been declared such since 2011, said a letter jointly signed by Hideyuki Ban, co-director of Citizens' Nuclear Information Center, Aileen Mioko Smith, director, Green Action, and Shaun Burnie, a senior nuclear specialist at Greenpeace Germany.
"In addition to the four reactors that have resumed operation with partial MOX fuel cores, it is uncertain how many of the remaining six reactors that have received MOX approval will actually restart during the next 10 years. They are all confronted with multiple challenges, including seismic faults, as well as legal and political opposition," the letter added.

Decarbonisation & Japan

July 3, 2018

Japan's energy and decarbonization challenge
by Tomoaki Nakanishi
The government has just reviewed its energy strategy or Basic Energy Plan — the first review in four years. In the 2017 COP23 United Nations Climate Change Conference held in Bonn, Germany, an international network of nongovernmental organizations awarded the Fossil of the Day prize to Japan. But in reviewing its energy strategy, Japan has declared that it will meet the challenge of developing new energy sources and technologies and achieving decarbonization under a long-term timetable stretching to 2050 by taking into consideration the Paris agreement adopted at the 2015 COP21 conference.
The energy landscape has undergone rapid changes in recent years.
First, the prices of energy from renewable sources have fallen on a global scale and new endeavors to develop new technologies for decarbonization, such as energy storage and digital control technologies needed for large-scale introduction of renewable energy, have started with the participation of a wide range of industrial sectors.
Second, new risks that are qualitatively different from conventional geopolitical risks have arisen with the rising presence of emerging powers such as China and India.
Third, competition for dominance in technological development for decarbonization has kicked off among major countries and energy companies, leading people to anticipate the emergence of a society in which technologies will serve as key resources.
In foreseeing the situation in 2050, it must be recognized that the degree of uncertainty for the future is extremely high. At the same time, the high degree of uncertainty means that there will be possibilities in the future. In facing an era of both uncertainty and possibilities, it will be important not only to set an ambitious goal to pursue the possibility of every option but also to consider multiple scenarios that should be scientifically reviewed on the basis of the latest technological trend and global situation for flexible adjustments.
To begin with, Japan, poor in domestic energy resources, is an insular country with no power transmission networks connected with other nations. Therefore it has tried to cope with its intrinsic situation by

exploring the possibility of every energy source to achieve the best mix of 3E+S — energy security, economic efficiency and environmental protection with safety serving as the major premise.
In developing Japan's energy strategy, the recent experience of Germany offers a useful suggestion. Germany is trying to achieve decarbonization by fading out nuclear power and expanding renewable energy sources. But now it faces difficulty in reducing its dependency on coal-fired thermal power generation although its use of renewable energy sources is expanding. It must be noted that as a result, its reduction of carbon dioxide emissions has become slow and household electricity bills have risen.
It also must not be forgotten that a nation like Germany, which can sell or buy electricity to and from neighboring countries through international power transmission networks, can absorb to some extent the fluctuation of power output from renewable energy sources by means of export and import of electricity.
In any case, each country is trying to build an optimum energy system under its given conditions, which are different from one country to another. In this situation, it is important to develop an energy policy under the 3E+S approach.
Let me discuss individual energy sources. The first is a zero-carbon emission power source consisting of renewable energy sources and nuclear power.
After the Great East Japan Earthquake of 2011, Japan reviewed its nuclear power policy from scratch. While seeking to reduce the dependency on nuclear energy for power supply as much as possible, the energy policy aims to squarely tackle the problem of the high cost of renewable energy sources — which remain relatively high compared with overseas — so as to turn the renewables into a major power source.
In view of the fact that nuclear power is an important option already in use for achieving decarbonization, Japan will immediately start seeking reactors excellent in safety, flexibility and economic efficiency as well as developing back-end technologies to win back public trust in nuclear power.
The second is coal-fired thermal power. Currently Japan has highly advanced technologies to utilize coal. For example, by introducing an integrated gasification combined cycle (IGCC), which uses a high-pressure gasifier to turn coal and other carbon-based fuels into pressurized gas, and an integrated gasification fuel cell cycle (IGFC), a fuel cell-based power cycle consuming gasified solid fuels such as coal and biomass fed directly to fuel cells operation at high temperature, it will become possible to cut carbon dioxide emissions significantly even compared with the latest coal-fired plant currently in use. (IGCC will be able to reduce the emissions by about 10 percent more and IGFC 30 percent.) Japan is currently building a large, commercial-use IGCC power plant and carrying out a demonstration experiment of IGFC.
Japan can greatly contribute to reducing global greenhouse gas emissions by passing its highly efficient coal-utilization technologies to countries that have no other choice but to rely on coal as an energy source. Japan, on the other hand, will phase out its low-efficiency coal-fired power generation.
Japan's journey toward 2050 has just begun. It will try to accomplish an ambitious goal of achieving an 80 percent reduction in greenhouse gas emissions on multiple scenarios that will be scientifically reviewed. Although the goal is ambitious, the approach will be flexible. Concrete measures must be worked out from now on.
To achieve the goal, the government and the private sector must fully cooperate. In partnership they will push innovative technological development in areas needed for decarbonization, such as power storage, use of hydrogen, nuclear power, diversification of energy sources and heat utilization.
In the financial market, where environmental, social and governance criteria are gaining importance recently, energy companies and the financial sector will have dialogue to build a funding circulation mechanism, in which they will jointly write a scenario to change the energy landscape and pursue decarbonization.

Since the annual global carbon dioxide emissions top 30 billion tons, with Japan emitting roughly 1.1 billion tons, it is clear that worldwide proliferation of non-carbon technologies is indispensable. Japan will serve as a bridge to link energy-consuming nations and resource-rich countries.
Japan is determined to contribute to and fulfill development of new energy sources/technologies and decarbonization, a long-term goal of humankind, by implementing policies under the new basic energy plan.
Tomoaki Nakanishi is former director of the International Affairs Office of the Natural Resources and Energy Agency at the Ministry of Economy, Trade and Industry.

Time to choose renewables

A large-scale solar power plant that started operation in Niigata in July (Provided by Orix Corp.)

August 27, 2018

EDITORIAL: Time is now to turn renewables into 'mainstay' energy sources
http://www.asahi.com/ajw/articles/AJ201808270016.html
A large-scale solar power plant that started operation in Niigata in July (Provided by Orix Corp.)
We know which direction we should be going.
The problem is how we should go about getting there. It is time to be working out strategies and putting them into practice over the years to come.
The latest edition of Japan's basic energy plan, which was approved by the government in July, includes a passage saying that efforts should be made to turn renewable energy options, such as solar and wind power, into "mainstay" power sources.
A substantial expansion in the use of renewables, which does not involve carbon dioxide (CO2) emissions, is indispensable for achieving the double goals of fighting global warming and becoming less reliant on

nuclear power. The use of renewable energy sources also comes with the big advantage of domestic availability for Japan, a country poor in natural resources.
Many other nations are already speeding up efforts in that direction on the back of technological innovations and a sharp drop in costs. It is all too natural for Japan to follow that global trend.
The latest plan, however, also appears indecisive in some respects. For example, its future introduction target for renewables remains unchanged from a previously stated goal.
A mountain of challenges remains to be solved to make sure that the whole shebang will not end up as mere slogans. Ideas on how they could be solved should be sought both in Japan and abroad, and the undertaking should be sped up across the entire society.

NUMERICAL GOAL SHOULD BE RAISED

The latest plan, revised for the first time in four years, says in one passage, "We should address challenges squarely toward the goal of introducing renewable energy options in large scales and turning them into mainstay power sources that are self-reliant in economic terms."
Given that, the plan is too halfhearted in sticking to the previous goal of having renewable energy account for 22 to 24 percent of the total power to be generated in fiscal 2030.
The share of renewables has already grown to some 15 percent in Japan. The possibility has emerged that the numerical goal will be achieved ahead of the initially planned date.
Many European nations are aspiring to even higher levels. For example, the ruling coalition of Germany has agreed on setting a target share of 65 percent for renewables in 2030.
Japan should also pursue possibilities for raising the share of renewables to a maximum.
The first thing to be done in that respect is to lift the existing restrictions on the use of the power grid, which are practically serving as a barrier against power generated from renewable energy sources.
Renewable energy power producers often hesitate about working out development plans because major electric utilities, which own the power grid equipment, explain to them that they don't have enough capacity in their transmission capability.
Some leeway, in fact, is reserved in their transmission capacity, including a part that is kept unused in providing against a time of technical failures. The industry ministry and the power industry are discussing possible improvements to the operation of the power grid.
There is a pressing need for developing fair and transparent rules to allow a maximal use of the equipment that is currently available.

PAIR OF DRAWBACKS TO OVERCOME

Overcoming a pair of drawbacks is key to the goal of getting renewable energy options on a stable track of expansion. One is the cost of power generation, which remains higher than in other countries, whereas the other lies in the instability of the power supply potential, which varies depending on the weather.
The slowness of cost reduction in Japan is partly attributable to the feed-in tariff (FIT) system, which was introduced in 2012. The system has certainly been a driving force behind a spread of renewable energy sources, but experts have also pointed out that it is helping to allow the renewables industry to preserve its high-cost structure.
The FIT system is an assistance measure for guaranteeing a certain level of income to renewable energy power producers. The cost for doing so is added on top of electricity rates in the name of a levy, and the total burden borne by the public has grown to some 2 trillion yen ($18 billion) a year. The system should inevitably be reviewed to keep that amount to a minimum.
The essential thing is to prompt competition and efficiency improvement on the part of power producers while at the same time ensuring the potential for growth will not be ruined. There are a variety of ways to

do so, such as expanding a mechanism for purchasing electric power from a producer that has presented a lower price during a bidding process.
There should perhaps also be discussions on shifting the focus of policy initiatives in the coming years from direct subsidization through the FIT system to carbon tax, to be imposed on CO2 emissions, and to emissions trading. The use of market mechanisms would help allow renewables to become self-reliant at an earlier date.
In the meantime, how to level out variability in the output of wind and solar power will emerge as a major challenge as their output grows. There is no choice, for the time being, but to rely mostly on thermal power for that purpose, but the use of other means is indispensable for reducing CO2 emissions.
More specifically speaking, a variety of options are available, including the use of storage batteries and the development of a power grid that allows electric utilities to supply power to each other on a broader, regional scale. Different technological means should be assessed carefully for their extent of progress and economic efficiency so the most effective components can be combined and put to use.
DIFFERENT ROLES FOR PUBLIC, PRIVATE SECTORS
The effort to turn renewables into mainstay energy sources would take decades to complete. Sorting out the roles to be played by the public and private sectors and allowing a broad array of actors to work together are essential in overcoming hurdles and pressing ahead with that effort.
An important task to be done by the central and local governments is to develop an environment that allows private-sector players to actively engage in research, development and investments. Apart from designing the FIT and other basic systems, there is also a mountain of other things to do, such as working out rules for the use of offshore areas as wind farms and providing information on land plots that are suitable for hosting renewable power plants.
Businesses, which are the main players of action on the ground, should be ready to quickly seize business opportunities and pinpoint social agenda. Renewables account for a core part of energy-related investments overseas, thereby giving rise to a gigantic growth market.
There has been a noteworthy move in Japan's industrial circles, which appeared to be starting a bit late. More than 100 entities, including major businesses, local governments and other groups, in July set up the Japan Climate Initiative, a platform for working together to help spread the use of renewables and disseminate information on them. Its corporate participants come from a broad array of industrial sectors such as manufacturing, financing and construction.
An attempt to reshape society into one that is sustainable on the fronts of energy and the environment has now turned into a global swell and is generating new development opportunities. That momentum should be allowed to infiltrate public administrative bodies, businesses, consumers and other parties so that it will serve as a driving force for opening up a new age to come.

Technology developed to remove tritium from water

August 28, 2018

Researchers develop technology to remove radioactive tritium from water
https://mainichi.jp/english/articles/20180828/p2a/00m/0na/013000c
OSAKA -- A team of researchers from Kindai University and private companies in western Japan has developed a new filter enabling the removal of water containing radioactive tritium.

- 【Related】Decommissioning Fukushima reactors will take time but progress continues
- 【Related】NRA chair ties nuke plant restart to TEPCO taking lead on Fukushima decommissioning
- 【Related】High-priced Fukushima ice wall nears completion, but effectiveness doubtful

The researchers hope their technology will eventually be used in processing water leaking from the Tokyo Electric Power Co.'s crippled Fukushima No. 1 Nuclear Power Plant. The waste water contains tritium but the radioactive material cannot be removed with the current filtering technology.
Tritium is an isotope of hydrogen. Water containing tritium has chemical features almost identical to water with ordinary hydrogen, and separating tritium water is difficult.
The research team, comprising professor Tatsuhiko Ihara of Kindai University specializing in inorganic material chemistry, and researchers from Osaka-based Toyo Aluminium K.K. and others, has developed an aluminum filter with extremely tiny holes 5 nanometers or less in diameter each. The filter can stop vapors of tritium water, and the separation rate was "almost 100 percent," according to a team representative.
At the Fukushima No. 1 plant, over 800,000 metric tons of radioactive water that leaked from the facility is stored on the premises. The research team will cooperate with local companies in Fukushima Prefecture and others to develop equipment that can be put to actual use to separate tritium.
The radioactive material exists in the natural environment, and the Nuclear Regulation Authority maintains that there should be no problem in releasing water containing tritium into the sea if its concentration levels are lowered sufficiently. This stance faces strong oppositions from local fishermen and others who worry about negative rumors about their catches due to the discharge of such water. The government has set up a panel of experts to examine how to process tritium water.

Kyushu Electric mulls cutback on solar power

http://www.asahi.com/ajw/articles/AJ201808290050.html

THE ASAHI SHIMBUN

FUKUOKA--The sun could be setting on renewable energy in Kyushu, as solar power plant operators face the prospect of being forced to suspend their successful operations to make way for resurgent nuclear power.

Kyushu Electric Power Co. is considering using its right to order solar power operators to stop production temporarily, possibly, next month because of a surplus of power resulting from the resumption of operations at the utility's four nuclear reactors on the main island of Kyushu. Unlike renewables, nuclear energy has the status as one of Japan's top priority power sources.

The order would be the first of its kind on a main island in the nation if the utility proceeds with it.

Solar power generation is thriving in Kyushu partly because the region, which is situated in the south in the nation, enjoys more sunlight hours and less snow than others.

Buoyed by government subsidies to promote renewables in the wake of the 2011 Fukushima nuclear disaster, solar quickly spread in Kyushu.

At some points during the year, solar power has provided the vast majority of energy used in Kyushu. For example, it accounted for more than 80 percent of electricity used in the region as of 1 p.m. on April 29 during the Golden Week holidays.

Now, the amount of power generated by solar energy that Kyushu Electric buys from operators under the feed-in-tariff system is growing at a pace of 50 megawatts a month on average.

But the spread of renewables' growth has a drawback, according to utilities.

A power supply in excess of demand causes fluctuations in electric frequency that could result in power outages across a broader area.

Fukuoka-based Kyushu Electric has tried to coordinate supply and demand by curtailing the operation of thermal power plants and producing power at night with water pumped up during the day by solar energy.
When such coordination becomes difficult, electric power companies can issue a directive for solar power operators to halt their operations temporarily under a rule set by the government.
Kyushu Electric has already turned to this option in remote islands such as Ikishima island, Nagasaki Prefecture, and Tanegashima island, Kagoshima Prefecture.
The option of output control looms large in spring and autumn, the two seasons when demand for power to use heaters and air conditioners remains low, but solar power output soars due to clear weather on many days.
When factories and company offices are closed on holidays in those seasons, a need for output control becomes more likely.
“We may issue a directive for output control this autumn,” a Kyushu Electric official said.
When the company decides on output control of solar energy, based on the projected power demands by taking into account data on weather and other factors, it is supposed to notify solar energy operators via e-mail by the evening before.
Kyushu Electric is now capable of supplying more power through conventional sources with the restart of all its four nuclear reactors--two units at its Sendai nuclear plant in Kagoshima Prefecture and another two at its Genkai plant in Saga Prefecture.
Renewables are the first energy sources to be subjected to output control under the government rule. Nuclear energy is the last, because the government designates it a “base load power source,” alongside hydraulic power and geothermal power. The government says those sources are relatively inexpensive to produce power and their output is stable.
Experts say one solution to fully utilize renewable energy output is to strengthen tie-ups between regional utilities so that a surplus of power in one region can be used elsewhere.
Projects to reinforce the capacity of power lines between utilities are getting under way for that purpose. But electric power companies on the receiving end are not eager to receive power from other utilities, because it means their own power stations may then experience drops in the rates of their output.
“We need to draw up rules to coordinate between utilities, including how to share the financial cost, and to optimize the use of renewables beyond regional boundaries,” said Yukari Takamura, professor of environmental law at Nagoya University, who is well-versed in power generation systems.

Japan's Kyushu Electric may restrict renewable energy supplies after nuclear ramp-up

https://www.reuters.com/article/japan-nuclear-renewables-restrictions/update-1-japans-kyushu-electric-may-restrict-renewable-energy-supplies-after-nuclear-ramp-up-idUSL3N1VK2J8
By Osamu Tsukimori - August 29, 2018
TOKYO, Aug 29 (Reuters) - Kyushu Electric Power Co may start restricting third-party supplies of solar energy after it restarts a fourth nuclear reactor, the company said on Wednesday, underscoring the risks to a government push to boost renewable energy.
Japan’s fifth-biggest utility by sales plans to restart the No. 2 reactor at its Sendai station later on Wednesday, giving Kyushu the most nuclear generation since the 2011 Fukushima disaster led to the shutdown of Japan’s atomic power sector.
The move could lead to possible restrictions on the purchase of renewable energy as early as next month, a Kyushu spokesman told Reuters, declining to be identified because of company policy.

“Output restrictions can occur when power demand is low and solar power generation is high, such as in the autumn, spring or at the year-end and beginning of the year,” the spokesman said.
The Fukushima disaster prompted a shift in Japan toward renewable energy, backed by mandatory preferential rates for solar, wind and other supplies.
Introduced in 2012, the preferential rates, known as feed-in-tariffs, were at the time among the highest in the world, sparking a rush of investments by startups and other companies.
Only one of Japan’s other nine nuclear operators, Kansai Electric Power Co, the country’s second-biggest utility by sales, so far has reactors running.
However, the slow return of nuclear, which once accounted for 30 percent of Japan’s electricity generation, is now threatening the once-guaranteed income for operators of renewables.
The government changed regulations in 2015, allowing the old utilities, which control the country’s transmission grids, to restrict supplies of renewable energy from their solar or wind farms if they deem it necessary to maintain grid stability.
The orders can be made at short notice and without having to pay compensation.
Solar power has grown particularly fast on the island of Kyushu, where Kyushu Electric operates, because of plentiful sunshine and available land.
“Given the increase in solar capacity in Kyushu it is not necessarily a surprising event and we have seen this type of thing happening in Europe where renewables have grown fast,” said Professor Yoh Yasuda, project professor of renwable energy economics at Kyoto University.
Kyushu had 8 gigawatts of solar capacity connected to the grid at end-June, just shy of the 8.2 gigawatts that a government committee estimated in 2016 would be the maximum the utility could take without curtailment.
Should Kyushu start restricting supplies the curtailment may affect as much as 4.2 gigawatts of the available capacity, the spokesman said, adding suppliers would be given a day’s notice. (Reporting by Osamu Tsukimori; writing by Aaron Sheldrick; editing by Richard Pullin)

How committeed is Japan to sustainable energy?

A giant solar farm in an industrial zone of Oita in 2014 (Asahi Shimbun file photo)

October 17, 2018

EDITORIAL: Commitment to sustainable energy tested like never before
http://www.asahi.com/ajw/articles/AJ201810170029.html

With its pathetically limited natural resources, it is nothing short of sheer wastefulness for Japan to "throw away" any ready-to-use natural energy.

What the nation should be doing instead is to think how best to put that available energy to maximum use.

Kyushu Electric Power Co. required some solar power plant operators in the region to temporarily suspend operations, explaining that daytime supply of power was in surplus and tipping the supply-demand balance, potentially inviting major power outages that must be prevented at all costs.

The utility's decision was fully in keeping with government rules, and was exercised for the first time in Japan, save for remote islands.

Thanks to its plentiful sunshine, Kyushu has made strong leaps in solar power generation. Until recently, Kyushu Electric dealt with daytime power surpluses by curbing thermal power output and using the surpluses for pumped hydroelectric energy storage for load balancing.

But such measures have proved insufficient of late.

If the use of sustainable energy continues to grow, this will likely lead to more temporary shutdowns at power plants using renewable energy around the nation, which in turn will shrink operators' revenues and may stymie the growth in use of sustainable energy.

To prevent that from happening, there is clearly a crucial need to be able to adjust and balance climate-caused load fluctuations from solar and wind power generation.
The government and the power industry need to work out countermeasures without delay.

Systems of power storage involve large-capacity storage batteries and pumped hydroelectric energy storage. Another good option is to build wide-coverage grids to transmit power from one region to another.

However, these types of infrastructure reinforcement will be quite costly, and the question, of course, is who foots the bill. Obviously, any project of this nature must be planned with utmost efficiency and due consideration for the needs or circumstances of each region.

Government assistance will also be needed for the development of new technologies, such as for low-cost batteries.

But there also are ideas that can be tried out by individual and corporate consumers alike. One, for instance, would be to run water heaters during solar power generation's peak load hours. Applying a discount rate for those hours should serve as a consumer incentive. Utilities need to be innovative.

Kyushu Electric's latest move showed that as more idle nuclear reactors go back online, the less chances there will be for reliance on sustainable energy. The utility's operation of four nuclear reactors has had the effect of rendering the existing solar power redundant.

The government's "priority power supply rule" places the highest emphasis on the operation of "long-term fixed power sources," which include nuclear power plants. According to the Ministry of Trade, Economy and Industry, this is necessitated by the "technical difficulty of adjusting nuclear power output."

But the government's Basic Energy Plan, revised this year, aims to position sustainable energy as the main power source. If this is the case, how could it be appropriate to hold onto the "priority power supply rule" that is becoming an obstacle to that aim?

The root cause of the present problems lies in the fact the Basic Energy Plan continues to position nuclear power generation as the fundamental power source.

Before anything, the government must rethink this situation and seriously consider specific ways to reduce the nation's reliance on nuclear energy.

The government is being tested on its stated commitment to making sustainable energy the main power source.

Too much power?

October 16, 2018

VOX POPULI: Balance of power would tilt from nuclear to solar if logic prevailed

Vox Populi, Vox Dei is a daily column that runs on Page 1 of The Asahi Shimbun.
http://www.asahi.com/ajw/articles/AJ201810160023.html

Going on a trip after being jilted by one's lover is a frequent theme of popular Japanese songs, and the destination is often somewhere cold and bleak in the north.

In mega-hit "enka" ballads, such as "Tsugaru Kaikyo Fuyugeshiki" (Tsugaru Strait winter scene) and "Kita no Yado kara" (From an inn in the north), icy winds heighten the heartache.

In contrast, blissful newlyweds used to invariably head south, according to "Ryoko no Susume" (Encouragement of travel) by Yozaburo Shirahata.

Miyazaki Prefecture on the southern island of Kyushu was the top honeymoon destination, bar none, before overseas travel became common for the public.

In the mid-1970s, Miyazaki attracted more than 30 percent of honeymooners nationwide. Neighboring Kagoshima Prefecture was also popular.

Both prefectures offered plenty of sunshine, which was deemed ideal for newlyweds.
This sunny climate must also be the reason for the growing number of solar panels installed in Kyushu.

That should make us happy, but Kyushu Electric Power Co. apparently feels otherwise.
The regional utility has ordered a partial suspension of solar power generation, saying the arrival of cooler weather has reduced consumers' reliance on air conditioners.

It explained that surplus power generation can disrupt the supply-demand balance and cause outages.

This is something I'd never heard before, but I suppose power generation follows a complex system.

Still, the utility's four nuclear reactors have remained in operation in accordance with the national government policy of prioritizing nuclear power generation.

Seven years have passed since the Fukushima nuclear disaster prompted the nation to promote solar power generation after seeing the risks of relying on nuclear power.

But have the nation's utilities been just sitting around all these years, not bothering to prepare themselves for renewable energy?

The companies have no time to waste. They must reinforce their grids to enable mutual sharing of electricity and stop nuclear reactors that are redundant.

Solar power generation is taking off not only in the south, but also around the nation.
Northern Japan also has many localities suited for wind turbine installation.

When young trees are starting to grow, so to speak, they must not be allowed to wither.

--The Asahi Shimbun, Oct. 15

Fukushima winf turbine removed

October 27, 2018

Fukushima wind turbine, symbol of disaster recovery, to be removed
https://mainichi.jp/english/articles/20181027/p2g/00m/0dm/009000c

FUKUSHIMA, Japan (Kyodo) -- A floating wind turbine built off Fukushima Prefecture to symbolize recovery after the 2011 nuclear disaster will be removed, a government source said Friday.

- 【Related】Samurai horsemen show off skills in traditional Fukushima festival
- 【Related】Wildfire rages in highly radioactive Fukushima mountain forest
- 【Related】5 more minors in Fukushima Pref. at time of nuclear accident diagnosed with thyroid cancer

The offshore power facility was put in place as the Fukushima prefectural government introduced renewable energy after the triple reactor meltdown at the Fukushima Daiichi nuclear power plant in the days following the huge earthquake and tsunami of March 2011.
Experimental studies were conducted with a view toward commercialization but the turbine, one of the world's largest with a rotor diameter of 167 meters, was deemed unprofitable due to multiple malfunctions decreasing the utilization rate.
"At present, we are considering a method of removal because the maintenance cost is too high," said the government source.
The turbine is one of three on a floating wind farm 20 kilometers off the coast of Naraha city in Fukushima Prefecture.

The cost of removal of the 15.2 billion yen ($135 million) turbine with an output capacity of 7,000 kilowatts is expected to be around 10 percent of the building cost.
Studies on the two other turbines are planned to conclude in fiscal 2018, but the study period is expected to be extended to seek any possibility of commercialization.
The turbine started operating in December 2015 but was riddled with operating problems.
Its utilization rate over the year through June 2018 was 3.7 percent, well below the 30 percent necessary for commercialization.
The two other turbines, of different size, have utilization rates of 32.9 percent and 18.5 percent.

New robot to inspect molten fuel

January 28, 2019

TEPCO unveils device for handling nuclear debris

https://www3.nhk.or.jp/nhkworld/en/news/20190128_32/

The operator of the Fukushima Daiichi nuclear power plant has unveiled a device that could become the first to directly handle fuel debris inside one of the facility's crippled reactors.

Tokyo Electric Power Company showed the device to the media on Monday ahead of a survey scheduled for next month at the plant's Number 2 reactor. It's one of the reactors that experienced meltdowns in 2011.

TEPCO has found what appears to be a mixture of molten nuclear fuel and structural parts at the bottom of the reactor's containment vessel.

The device, which is equipped with a camera and a dosimeter, is attached to a pole that extends up to 15 meters long. Its tip works like tongs, allowing it to pick up the possible debris.

TEPCO plans to send the device into the containment vessel to see how hard the possible debris is, and whether it can be moved.

Removing debris is a key step toward decommissioning the plant.

Toshihiro Yasuda of Toshiba Energy Systems & Solutions, which developed the device, says the survey is an important step toward coming up with ways to remove the debris.

In the second half of fiscal 2019, which starts in April, TEPCO plans to conduct a more detailed survey that would involve extracting a small sample of the debris.

The company aims to decide by March 2020 at which reactor to start removing debris. It hopes to start the work in 2021.

January 29, 2019

Toshiba unveils robot to probe melted Fukushima nuclear fuel

THE ASSOCIATED PRESS

Toshiba Corp. unveiled a remote-controlled robot with tongs on Monday that it hopes will be able to probe the inside of one of the three damaged reactors at Japan's tsunami-hit Fukushima nuclear plant and grip chunks of highly radioactive melted fuel.

The device is designed to slide down an extendable 11-meter (36-foot) long pipe and touch melted fuel inside the Unit 2 reactor's primary containment vessel. The reactor was built by Toshiba and GE.

An earlier probe carrying a camera captured images of pieces of melted fuel in the reactor last year, and robotic probes in the two other reactors have detected traces of damaged fuel, but the exact location, contents and other details remain largely unknown.

Toshiba's energy systems unit said experiments with the new probe planned in February are key to determining the proper equipment and technologies needed to remove the fuel debris, the most challenging part of the decommissioning process expected to take decades.

The three reactors at the Fukushima plant suffered core meltdowns after a massive 2011 earthquake and tsunami damaged key cooling systems.

In last year's probe, a camera developed by Toshiba Energy Systems & Solutions Corp. and the International Research Institute for Nuclear Decommissioning found large amounts of deposits in that area, including parts that resembled pebbles or gravel.

The 30-centimeter (12-inch) long robot unveiled Monday will carry a radiation dosimeter, thermometer, LED lights, a camera and a pair of tongs as it slowly slides down from a pipe.
The probe, attached by a cable on its back, is to dangle from the pipe and descend to the bottom of the reactor vessel's pedestal, a structure directly below the core from which the melted fuel fell.

Toshiba plans to use the new device to touch and grip the deposits with the tongs, which can hold a lump as wide as 8 centimeters (3 inches) weighing up to two kilograms (4.4 pounds), to investigate its hardness and other details, said Jun Suzuki, a Toshiba ESS group manager for the project.

"Until now we have only seen those deposits, and we need to know whether they will break off and can be picked up and taken out," Suzuki said. "Touching the deposits is important so we can make plans to sample the deposits, which is a next key step."

The probe will mainly examine the fuel debris' physical condition rather than its radioactive components or other details which require actual sampling and safe storage.

"We are taking one step at a time," said Tsutomu Takeuchi, a Toshiba ESS senior manager for the Fukushima decommissioning project. "First we'll find out if those deposits can be picked up." If the device is unable to lift anything, that's also a key finding, he said. In that case, they will need a cutting device to tear off a sample piece.

TEPCO and government officials plan to determine methods for removing the melted fuel from each of the three damaged reactors later this year so they can begin the process in 2021.

Olympics

Olympics: Exchanging athletes with Ghana and Netherland

January 25, 2016

Fukushima towns to partner with Ghana, Netherlands for Olympics

http://www.japantimes.co.jp/news/2016/01/25/national/fukushima-towns-partner-ghana-netherlands-olympics/#.VqXntlKDmot
Kyodo
FUKUSHIMA – Two municipalities in Fukushima Prefecture are poised to partner up with Ghana and the Netherlands in a central government project to promote exchanges between local people and athletes coming to Japan for the 2020 Tokyo Olympics.
The town of Inawashiro and the city of Koriyama will interact with athletes from Ghana and the Netherlands, people involved in the project said Monday.
The government is pitching the 2020 Games as an opportunity to show the world it has recovered from the 2011 earthquake, tsunami and nuclear crisis.
The project could boost the chances of the municipalities hosting training camps before the games, which would help brush away the negative image of the triple disaster.
Inawashiro has historic ties with Ghana, as it is the hometown of famed Nobel-nominated bacteriologist Hideyo Noguchi (1876-1928), who died in the capital of present-day Ghana while studying yellow fever.
Koriyama is a sister city of Brummen, the Netherlands. Koriyama has also played host to some 8,000 evacuees from other parts of the prefecture following the meltdowns at the Fukushima No. 1 nuclear plant.
The area's farming and tourism industries have been hit by persistent concerns over radiation exposure.
The central government is shouldering half of the municipalities' costs for hosting sports and cultural exchanges after they choose specific countries, regions or types of sports to work with.
Roughly 70 municipalities had applied for the host town project by the first deadline in December.

Security, but what about safety?

April 4, 2016

2020 Tokyo Olympics CEO weighs in on security, differences with Rio

http://www.japantimes.co.jp/news/2016/04/04/national/2020-tokyo-olympics-ceo-weighs-security-differences-rio/#.VwN7HHpdeot

by Andrew Mckirdy
Staff Writer

The CEO of the 2020 Tokyo Olympics says security is his greatest concern but believes Japan will be safe from the kind of mass street protests currently overshadowing this summer's Rio de Janeiro Games.
"If I had to choose just one challenge from many it would have to be security," Toshiro Muto told The Japan Times in an exclusive interview. "There are many threats of terrorism in the world. It's not just a physical threat, but also the threat of cyberterrorism.
"The level of threat that terrorism poses gets more and more complicated each year. No one knows how sophisticated cyberterrorism will have become by 2020.
"To combat this, the organizing committee, Tokyo Metropolitan Government and national government need to be able to deal with it at every level. Cooperation is vital."
Tokyo will take on the mantle of the next Olympic host city when Rio hands over the flag at the closing ceremony of this summer's games, which will run Aug. 5 to 21.
Rio's hosting of the event has been relegated to an afterthought in Brazil amid a major political crisis engulfing President Dilma Rousseff that has brought millions to the streets in protest.
The Olympics have proved to be a lightning rod for demonstrations in recession-hit Brazil, with many people angry at the billions of public dollars being spent on the event.
But Muto, a former deputy governor of the Bank of Japan, is confident that Tokyo can avoid similar scenes despite public concern over the cost of hosting the Olympics.
"The demonstrations in Brazil are down to the fact that the economy is in great difficulty and the government is in trouble," he said. "At times like that, there are bigger things to think about than a sports festival.
"I don't think that kind of problem will occur in Japan. Of course you never know what will happen, but I think the environment in Brazil and Tokyo is completely different."

Tokyo 2020 organizers have managed to cut around $1.5 billion in costs by scaling back plans for the competition venues, but the games have nonetheless been accused of gobbling up public funds and slowing the pace of recovery in the areas affected by the 2011 Great East Japan Earthquake.
"If you look at it in isolation, labor costs have started to rise recently and I understand that could have a negative effect on recovery," Muto said. "But I think a successful Olympics will help people in the affected areas.
"Until very recently, there were around 8 million foreign tourists visiting Japan a year. In 2015 it rose to almost 20 million. The government thinks around 40 million tourists will visit in 2020. Those people will not only visit Tokyo but places all around the country. In the areas affected by the disaster there are various tourist spots, so it should have a beneficial effect."

The 2020 Olympics have suffered a series of embarrassing setbacks over the past year, with design issues still plaguing the construction of the new National Stadium and a logo still to be chosen after the original was scrapped last summer amid accusations of plagiarism.
Muto believes preparations are heading in the right direction and remains confident that the organizing committee is on the same page as its political partners.
“As the organizing committee, the most important thing is bringing in income from sponsors. In Tokyo’s case we are well on course,” he said. “We have more than 30 sponsors so far. Apart from that, the IOC (International Olympic Committee) and IPC (International Paralympic Committee) have been visiting Tokyo to carry out their project reviews, and each time they say our progress is ahead of schedule. That’s great to hear.
“When it comes to communication, the relevant parties have covered a lot of ground, but there are a lot of things we still have to do. We can’t just be satisfied with what we’ve done. That doesn’t mean I’m not happy with what we’ve done, but you always have to be open to communication and new ways of thinking.”
Tokyo 2020 organizers launched a public competition to find a new logo last October, with a shortlist of four set to be unveiled early this month after an initial submission of 15,000 entries.
Muto believes interest in the games remains high, and he hopes to involve the public every step of the way.
“One way for the public to be involved is as volunteers,” he said. “At this moment, we think we will need around 80,000. There are different kinds of volunteers — at the stadium, helping out with different languages and in specialist areas such as medical care.
“Of course the organizing committee has to make the Olympics a success as a sporting festival, but that’s not where it ends. After that comes the legacy. One thing we are concerned with is how to touch the hearts of young people and how to have an impact after the games have finished. I understand the need for the public to be involved in the Olympics.”
French prosecutors investigating corruption allegations into the former head of world athletics last month expanded their probe to examine the bidding for Tokyo 2020.
Muto insists that Tokyo has done nothing wrong, and he believes sports can still contribute to society despite a recent spate of global scandals.
“If the stories that have been printed about sporting scandals are true, it’s very disappointing,” he said. “If they are, I’d like these organizations to think long and hard about what they can do to improve themselves. I am not aware of any such problems in Japanese sports.
“Events like the Olympics bring the whole world together and go beyond race and nationality. Through sport you have a festival of humanity and peace.
“In the future, if the Olympics cost huge sums of money to stage, it will place a big burden on the people of that country. If that happens, more and more people will speak out against it. It’s not appropriate to have an extravagant Olympics. If it’s an Olympics that avoids wasting money, then I believe it can contribute toward peace.”

Tokyo Olympics all about normality and recovery

April 9, 2016

Abe: Tokyo Olympics to show Japan's reconstruction

http://www3.nhk.or.jp/nhkworld/en/news/20160409_18/
Prime Minister Shinzo Abe says he wants the 2020 Tokyo Olympic and Paralympic Games to demonstrate how Japan has recovered from the 2011 earthquake and tsunami.

Abe spoke at a cherry blossom viewing party he hosted on Saturday at the Shinjuku Gyoen National Garden.

About 16,000 guests from various fields enjoyed the flowers.

Abe said that 5 years since the disaster, residents of the affected areas continue to struggle to rebuild their lives. He said these people worry that memories of the disaster are fading among the rest of the population.

Abe said he would like to use the Tokyo Games to show the world how Japan has rebuilt and regained its strength.
April 4, 2016

Abe to work for Olympic torch relay in Fukushima

http://www3.nhk.or.jp/nhkworld/en/news/20160404_33/
Japan's Prime Minister Shinzo Abe says he will strive to ensure that the torch relay course for the 2020 Tokyo Olympics and Paralympics will pass through Fukushima Prefecture.

Abe met in Tokyo with 18 students from 2 high schools in the prefecture.

The schools have been using temporary buildings due to the 2011 Fukushima Daiichi nuclear accident.

The students asked Abe to include a road along the coast of Fukushima in the torch relay course. They also asked that decontamination work be sped up so that **there will be no need for the runners to be anxious.**

The prime minister said he thinks that having the torch relay pass through the prefecture would show the world that Fukushima has recovered from the disaster.

Olympics: Some events could take place in Fukushima

October 20, 2016
Bach: Events could be held in northeast Japan
http://www3.nhk.or.jp/nhkworld/en/news/20161019_29/

The head of the International Olympic Committee has suggested holding some events of the 2020 Tokyo Games in areas of northeastern Japan that were devastated by the earthquake and tsunami of 2011.

IOC President Thomas Bach, now visiting Japan, met Prime Minister Shinzo Abe in Tokyo on Wednesday.

Bach told Abe the IOC is thinking of holding some Olympic events in the disaster zone to contribute to revival efforts. He said this could show the world how the areas have recovered. Abe welcomed the idea.

Abe also promised the government's participation in talks to cut costs for the games.

Bach had proposed 4-way talks by the Tokyo Metropolitan Government, the IOC, Tokyo 2020 organizers and Japan's government.

Reporters later asked Bach if baseball and softball will be held in Fukushima City. Bach said it's an option under consideration. He added that since the sports are very popular in Japan, having the country's team play in the disaster zone would send a strong message.

2020 Olympics: Baseball in Fukushima?

November 9, 2016
Fukushima eyed for baseball, softball games in 2020 Olympics
http://www.japantimes.co.jp/news/2016/11/09/national/fukushima-eyed-baseball-softball-games-2020-olympics/#.WCRF_8mDmos

by Andrew Mckirdy
Staff Writer
Tokyo 2020 Olympic organizers on Wednesday gave the green light for disaster-affected Fukushima Prefecture to host baseball and softball games.
Three cities — Fukushima, Koriyama and Iwaki — are under consideration to stage part of the competition as the two sports return to the Olympic program after an absence of 12 years.
Riccardo Fraccari, president of the World Baseball Softball Confederation, will visit Japan next week to inspect the venues. The International Olympic Committee will make the final decision when it holds its executive board meeting from Dec. 6 to 8.
"We want to emphasize this as a 'recovery games' and we want to work together with everyone to move it forward," said 2020 executive board member Toshiaki Endo.
"These Olympics and Paralympics are not just for Tokyo but for the whole of Japan. We only have 1,353 days left, so we need everyone to make an effort so we can put on a fantastic event."
IOC President Thomas Bach floated the idea of hosting baseball and softball games in Fukushima during a visit to Tokyo last month to take part in the World Forum on Sport and Culture.
"I felt that President Bach had a strong feeling toward Fukushima when he came here," said Fukushima Gov. Masao Uchibori. "The idea of a 'recovery games' is once again in the spotlight and people are thinking carefully about how that can be achieved.
"It can show the courage of Fukushima Prefecture and the Tohoku region, and on a wider scale Kumamoto and Tottori — places that are working hard to recover from disaster."
The Yomiuri Giants professional baseball team occasionally hosts Nippon Professional Baseball games at all three venues. Fukushima Azuma Baseball Stadium and Iwaki Green Stadium both have capacities of 30,000, while the older Koriyama Kaiseizan Baseball Stadium holds 18,200.

Neighboring Miyagi Prefecture is hoping to stage rowing and canoe sprint events as a result of a cost-cutting review currently being undertaken by the IOC, Tokyo Metropolitan Government, Tokyo 2020 organizers and the national government.
“Miyagi Prefecture, Iwate Prefecture and Fukushima Prefecture all suffered a lot of damage from the Great East Japan Earthquake,” said Uchibori.
“These three prefectures have a close bond and always work together. We want to form a movement. We want to show our appreciation to people and get people excited about the Tokyo Olympics. I’d like to consult with my fellow governors.”
Uchibori also said he would like his prefecture to host other Olympic-related events such as training camps and a section of the torch relay.
Baseball and softball were voted back onto the Olympic program as a joint bid at an IOC session in Rio de Janeiro in August ahead of the Summer Games. The format of the competitions has yet to be decided.

Fukushima: Olympic "possibilities"

November 19, 2016

Head of baseball-softball body visits Fukushima

http://www3.nhk.or.jp/nhkworld/en/news/20161119_22/

The head of the world governing body for baseball and softball has visited Fukushima Prefecture to inspect possible venues for the 2020 Tokyo Olympic Games.

World Baseball Softball Confederation President Riccardo Fraccari met Fukushima Governor Masao Uchibori on Saturday.

Earlier this month, the 2020 organizing committee approved a plan to hold some baseball and softball matches in Fukushima, which suffered a nuclear accident in 2011.

The governor told Fraccari that radiation levels in almost all areas of the prefecture have already lowered to the level common in major cities around the world.

Uchibori expressed hope that the prefecture could host matches, saying the people want to meet with visitors from around the world.

Fraccari then visited 2 sites in the cities of Fukushima and Koriyama.

He indicated that the review of the sites will take into consideration security conditions, facilities for athletes, and schedules.

The executive board of the International Olympic Committee will officially select venues in a meeting scheduled for early December.

November 20, 2016

Foottball chief inspects Fukushima stadiums for Olympic possibilities

http://www.japantimes.co.jp/news/2016/11/20/national/world-baseball-softball-chief-inspects-fukushima-stadiums-olympic-possibilities/#.WDHMoH2Dmos

Kyodo

KORIYAMA, FUKUSHIMA PREF. – World Baseball Softball Confederation President Riccardo Fraccari stopped short of issuing a verdict after inspecting Fukushima Prefecture's suitability as a potential host for the 2020 Olympic baseball and softball competitions.

Fraccari on Saturday scouted Azuma Stadium in the city of Fukushima and Koriyama's Kaiseizan Stadium, but insisted the purpose of his visit this time was to gather intelligence rather than reach any kind of conclusion.

A third city, Iwaki, is also under consideration and Green Stadium has already received a visit from Fraccari.

"At the moment, I'm just collecting information of the stadiums," said Fraccari, who met with Fukushima Gov. Masao Uchibori ahead of the stadium tours.

"The problem for Fukushima is not just the stadium," Fraccari said. "We have to check about the transportation, the facility for the teams and the schedule."

The 2020 organizing committee is looking to open the baseball and softball tournaments in the prefecture, with Japan set to play in the opening games of both.

Fraccari did not mention a deadline for the competition format and overall schedule but noted that the stakeholders would have to work fast. The organizing committee wants to finalize the details at the International Olympic Committee's executive board meeting from Dec. 6 to 8.

"Yesterday, it was a good meeting with Tokyo 2020," he said. "We work very close with them, we cooperate a lot because both of us have the best interests in the games in 2020."

"We have to work very fast because we don't have too much time," he added. "We don't yet have a fixed deadline, for sure, but we have to work very, very soon towards the entire games' (plan)."

Uchibori reiterated Fukushima's willingness to host the two sports.

"We want to express our strong desire to organize the events in Fukushima Prefecture," Uchibori told Fraccari in his native Italian.

"It will help unite the people of Fukushima, and help unite the prefecture and the world. They're fantastic sports," he added.

Uchibori reassured Fraccari that radiation levels in Fukushima Prefecture, home to the wrecked Fukushima No. 1 nuclear power plant, remain no different than in major cities worldwide.

The March 2011 earthquake and tsunami cut off all power to the plant, triggering a triple core meltdown that spewed radioactive fallout into the environment and over much of the agriculturally dependent prefecture. Decontamination is ongoing.

"In almost all areas in the prefecture, the figures are the same as any of the world's major cities," Uchibori said.

Fukushima as venue for Olympics events?

February 4, 2017

Olympic organizers consider Fukushima stadium for baseball, softball events

http://www.japantimes.co.jp/news/2017/02/04/national/olympic-organizers-consider-fukushima-stadium-baseball-softball-events/#.WJXMHvKDmos

Kyodo

The 2020 Tokyo Games organizers said Friday they are looking at the possibility of renovating Azuma Stadium in the city of Fukushima to host part of the Olympic baseball and softball events.
The World Baseball Softball Confederation inspected the stadium in November and requested improvements the following month, asking that turf be laid in the infield and more seats placed in the stands.
Yokohama Stadium was picked as the main venue for the sports by the International Olympic Committee in December, and the WBSC is calling for several other stadiums to be made available in the Tokyo metropolitan area.
Talks with the WBSC have dragged on since, but the organizers are looking to negotiate with the confederation before getting the approval from the IOC at its board meeting in March.
"We'll be asking to use Yokohama as the main venue and Fukushima as another," said Yukihiko Nunomura, vice chief executive of the 2020 organizing body. "The prefecture also has room to discuss revamping."

More on Olympics costs

February 17, 2017

Work on facilities outside Tokyo for Olympics estimated to cost 43.8 billion yen

http://mainichi.jp/english/articles/20170217/p2a/00m/0na/014000c

The Tokyo Olympics and Paralympics organizing committee has estimated the cost of building and remodeling 11 facilities for the 2020 Games in six prefectures outside the capital at approximately 43.8 billion yen, it has been learned.

- 【Related】Areas outside capital hosting Olympic events want Tokyo to stick to cost pledges
- 【Related】Olympics: 2020 organizers estimate total cost at 1.6-1.8 tril. yen
- 【Related】Tokyo governor's wishes not reflected in 4-party talks on Olympic venue changes

The Tokyo Organising Committee of the Olympic and Paralympic Games notified the local bodies that host these venues of the estimated costs during a four-party working group meeting between the committee, the Tokyo Metropolitan Government, other relevant local bodies and the national government that began in late January.

The estimated costs of work on stadiums for soccer in Miyagi and Hokkaido are some 2.7 billion yen each, and those of remodeling the Makuhari Messe complex in Chiba for wrestling, fencing and taekwondo come to approximately 7.3 billion yen. Work to remodel four facilities in Saitama Prefecture for golf and basketball and other sports will likely total about 18.7 billion yen. Moreover, the costs of improving two facilities in Kanagawa Prefecture for sailing and other sports are expected to cost around 5.4 billion yen and those of remodeling a bicycle racing venue in Shizuoka Prefecture will be about 6.9 billion yen.
The estimated total costs do not include those for sports to be newly added to the Olympics and Paralympics from the 2020 Games. Sources familiar with the issue say the cost of work at Tsurigasaki beach in Ichinomiya, Chiba Prefecture, for surfing and Yokohama Stadium in Yokohama for baseball and softball events will likely amount to nearly 50 billion yen.
The International Olympic Committee has urged the organizing committee to reduce expenses while local bodies that have experience in hosting large-scale events have also called into question the committee's estimates. As such, the estimated costs could later change.
When Japan was bidding to host the 2020 Olympics and Paralympics, the organizing committee was expected to fully foot the costs of constructing and remodeling facilities for the Games.
As a result of a review of expenses for organizing the Games, the organizing committee showed its estimates, which would require local bodies hosting the venues for the Games to shoulder part of the costs.
However, as the concerned local government urged the organizing committee to stick to the original principle, the four-party working group was consulting over the matter.

Football to redeem Fukushima

February 20, 2017

NHK Video

Rebuilding Fukushima through Soccer

https://www3.nhk.or.jp/nhkworld/en/news/editors/3/rebuildingfukushimathroughsoccer/

https://www3.nhk.or.jp/nhkworld/en/news/videos/20170220141242874/
A former soccer training facility close to Japan's crippled Fukushima Daiichi Nuclear Plant has been used as a staging point for recovery work since the 2011 nuclear disaster, but that's about to change.
Temporary dormitories for workers stand where there used to be a soccer field at the facility, called J-Village. The area is filled with memories for Shigenari Akashi, who worked as a coach for a junior youth team there for more than 10 years.
"National tournament finals used to be held here. Children from all over the country would practice hard, aspiring to play here," Akashi says.
J-Village was Japan’s first national soccer training center. It opened in 1997 and over the years saw more than a million visitors. The complex was even used to train the national teams of Japan and Argentina.
But the nuclear disaster changed everything. The facility is just 20 kilometers from the plant, so Tokyo Electric Power Company rented it to set up an operational base for containing the accident.

"I was in shock and at a loss for words when I saw the Self-Defense Forces' tanks here, and the gravel laid on the natural turf for the parking lot," says Akashi.
At the end of last year, the moment he had been waiting for finally arrived as TEPCO began work to return the facility to its original form.
Fukushima Prefecture has even bigger plans -- tt wants to build Japan's first "all-weather soccer field" at the site. Part of the facility is scheduled to open in the summer of 2018.
The Japan Football Association has given the project its full support. The Japanese national team will use the new J-Village as its training base for the 2020 Tokyo Olympics.
But there are bigger challenges than rebuilding. There are fears over radiation levels -- in some areas they're still higher than international standards recommend. So the J-Village operator has a plan.
"The construction work will focus on largely replacing the soil, a technique we expect will reduce radiation levels more than usual decontamination methods," says Eiji Ueda, who is executive vice president at the facility. "We can emphasize how safe it is by hosting national teams from Japan or perhaps abroad for training."
A town near J-Village was evacuated because of the disaster. Residents got the green light to move back a year and a half ago but few have returned as most of the evacuees still live in a neighboring city.
Akashi and his co-workers have been giving soccer classes for children, including some who lived near J-Village. But there are mixed feelings about playing there again.
"I want to use the new J-Village, but I live far away now, so it will be hard to go there very often," says a boy at the facility.
"We still have the lingering memory of it being used as the staging ground for decommissioning work," says one father.
For Akashi, he's got a specific goal in mind.
"In reviving J-Village, we want to give back local people a gathering place and their sense of pride. We believe this will also help to revive Fukushima as a whole," he says.
The clock on the J-Village scoreboard is stopped at 2:46 p.m., the moment the earthquake struck. The deep rift created over the last 6 years will need to be filled so that the clock can move forward once more.

Letter to the IOC

March 13, 2017
Letter sent to by **Mitsuhei Murata**
Former Ambassador to Switzerland
To Mr. Bach, President of the IOC

Sent: Monday, March 13, 2017 3:37 PM

Dear President Thomas Bach,

I wish to remind you of the serious warning of Professor Shuzo Takemoto concerning the problem of the Unit 2 of the Fukushima Daiichi. In his view,if the building of the Unit 2 should encounter an intensity 7 earthquake,which is considered highly possible, it will be destroyed and

scatter the remaining nuclear fuel and its debris, making the Tokyo metropolitan area uninhabitable. Last week,two big earthquakes,whose seismic intensities were 5 and 4, actually occurred in Fukushima.

Conscientious Japanese citizens are bewildered by the widening gap between the ongoing Olympic preparations and the increasing report regarding the deepening of the Fukushima crisis.The Moritomo School scandal continues to draw nation-wide attention,reminding us of its similarity with the total breach of the initial commitments by the Tokyo Olympics.
Six years after the 3/11 Fukushima accident,the policy of returning refugees to their home towns based on the 20 milisieverts ICRP standard is maintained.
Last week,Japanese television TBS interviewed its vice chairman Jacques Rochard who expressed his surprise that this standard,destined to cases of emergency, should not have been lowered as initially recommended.
It is urgently needed to correct the current policy.
The foregoing is fully supported by the following two articles.

http://www.counterpunch.org/2017/02/20/fukushima-a-lurking-global-catastrophe/
https://limitlesslife.wordpress.com/2017/03/12/remembering-6th-anniversary-of-fukushima-march-11-2017/

We are being reminded of Chinese ancient Lao Tsu's famous saying "Heaven's vengeance is slow but sure".
This is the will of heavens and the earth, that is to say,the law of history researched by philosophy. We are taught by this law that immorality is not allowed to last long and that the all dictatorships are made to end.

More and more Japanese citizens are calling for the retreat from the Tokyo Olympic 2020.
Le Figaro has reported the appearance in Paris of a call for boycotting it.
http://www.lefigaro.fr/flash-actu/2017/03/11/97001-20170311FILWWW00139-manifestations-contre-le-nucleaire-ce-samedi.php

The International Olympic Committee faces a heavy responsibility.
Please allow me to count on your understanding and your support.

With highest and warmest regards,
Mitsuhei Murata
Former Ambassador to Switzerland

Fukushima as softball venue?

March 16, 2017

IOC expected to OK Fukushima stadium for 2020 baseball-softball venue: sources

Kyodo

PYEONGCHANG, SOUTH KOREA – The 2020 Tokyo Olympics organizing committee is expected to win approval from the International Olympic Committee to add the renovated Azuma Stadium in Fukushima Prefecture for the baseball-softball competition, sources said.

The ballpark lies in an area hard hit by the March 2011 earthquake and tsunami. Because the IOC has indicated an understanding of the desire of organizers to assist in rebuilding disaster areas, the proposal will likely be accepted, the sources said Wednesday.

The IOC's executive board began a two-day meeting on Thursday in Pyeongchang, the site of next year's Winter Olympics.

On Friday, Yoshiro Mori, the president of the organizing committee, and Toshiro Muto, the CEO, will report on Tokyo's progress at the meeting.

In December, the IOC declined to add Azuma Stadium to the approved main venue, Yokohama Stadium. But the sources said the executive board is now prepared to accept one stadium as an additional venue.

The committee wants to split the six-team baseball tournament into two groups for the first round, but the World Baseball Softball Confederation wants a full round-robin and one more stadium in the Tokyo metropolitan area to accommodate it.

Although the two parties still appear to be far apart on the competition format, one IOC source said the issues can be debated separately.

"Once the Fukushima venue is approved, we can adjust from there," the source said.

The executive board is also expected to receive an update on the situation of the 2020 golf venue, Saitama Prefecture's Kasumigaseki Country Club. The club does not allow women the same membership as men, and the IOC has called the policy unacceptable.

No Olympics in Fukushima!

No Olympics or Paralympics in Radioactive Fukushima!

<image: https://assets.change.org/photos/5/ll/ks/MXLlkSujQuqeeaq-128x128-noPad.jpg?1460136549>

Fukushima Fallout Awareness Network

https://www.change.org/p/no-olympics-or-paralympics-in-radioactive-fukushima
Children are our most beloved and cherished gift and they are also the most vulnerable to the generational damage of man-made radiation in air, food, soil and water. Around the world children who are currently adolescent and possibly younger are in training to compete at the 2020 Summer Olympics and Paralympics in Japan. Their parents most likely have no idea that some of the venues are near the most devastating and ongoing nuclear and industrial disaster in world history, Fukushima Daiichi.
Source:http://globalnews.ca/news/2571822/japan-olympics-minister-backs-fukushima-as-host-venue-for-2020/
http://in.reuters.com/news/picture/inside-fukushimas-j-village?articleId=INRTR2TVZW
On March 11, 2016, the fifth anniversary of the Fukushima triple nuclear meltdowns, the Japanese Olympic minister Toshiaki Endo stated to the Associated Press that preliminary **softball and baseball** could be moved from the host city of Tokyo to Fukushima Prefecture. But it gets worse, **now soccer** has been added too. This isn't mere speculation, in fact organizers are developing **J Village**, only a few miles from Fukushima Daiichi, into a **training facility** for Japan's soccer team and possibly more. J Village was used as a **disaster staging and support facility** during the early days of the Fukushima Daiichi nuclear disaster.
Source:http://www.japantimes.co.jp/sports/2016/01/30/soccer/j-village-to-serve-as-2020-olympic-soccer-training-center/#.VwWPM32AOko
SO HOW DID WE GO FROM THE WORLD'S WORST NUCLEAR AND INDUSTRIAL DISASTER TO ONE OF THE VENUES FOR THE 2020 GAMES? In a stunning development in 2013, Japan's Olympic bid was won by Prime Minister Shinzo Abe when he promised the International Olympic Committee (IOC) that "it (Fukushima Daiichi) has never done, and will never do, any damage in Tokyo". Consequently, the IOC and International Paralympic Committee (IPC) are now left to engage in a dangerous game of **bait and switch**

by using venues not only in Tokyo as originally agreed upon, but also in Fukushima Prefecture, not far from the Fukushima Daiichi nuclear disaster site.
Source: http://www.insidethegames.biz/articles/1015905/how-tokyo-2020-won-its-olympics-and-paralympic-bid-despite-fukushima
Holding Olympic games in Fukushima Prefecture **will endanger young athletes**. To date there is **no solution** in sight to the ongoing radiation releases leaking into air, soil, food and water not only from Fukushima Daiichi but also from areas around the country that have been used for the open storage and incineration of **toxic and radioactive tsunami rubble and garbage.**
The man in charge of decommissioning Fukushima Daiichi, Naohiro Masuda, stated on NHK television in Japan that the **solution** to the radioactive leaks at Fukushima Daiichi **"still needs to be invented**" and appealed for international assistance. Meanwhile, the Japanese government and IOC are planning for children, parents and coaches worldwide to travel to the region for the 2020 Olympics.
Source: http://www3.nhk.or.jp/nhkworld/english/news/nuclearwatch/20150331.html
Hundreds of types of radioisotopes are emitted in nuclear accidents, many of which are long-lived and remain hazardous for millions of years. Easily inhaled, they pose a significant danger to everyone in affected environments and certainly to athletes during strenuous competition. Consider these facts:
****There is no safe dose.** Women are 2 times more vulnerable to the harmful effects of ionizing radiation than men; **girls are at 10 times more at risk, boys are 5 times more at risk.** The Biological Effects of Ionizing Radiation 7 (BEIR 7) report states "it is unlikely that a threshold exists for the induction of cancers" meaning that any dose of radiation, no matter how small, carries health risks.
Following the Chernobyl nuclear disaster it became scientifically evident that the **DNA damaging effects** of ionizing radiation are **passed on to future generations.**
Source: http://www.nirs.org/radiation/radhealth/radhealthhome.htm
http://static1.1.sqspcdn.com/static/f/356082/23097333/1373633249137/radchild.pdf?token=tvHeUhkD2v%2BuhKtz620LTq25fEQ%3D
http://www.ratical.org/radiation/Chernobyl/HEofC25yrsAC.html
****Highly radioactive water used to cool Fukushima Daiichi's damaged reactors is leaking and also being intentionally discharged into the Pacific Ocean every day**. In addition, highly radioactive soil and other toxic waste has been moved to locations all over Japan and stored in open fields or incinerated by the ton. In one location, nearly 11 million tons of bagged radioactive garbage, soil and more is accumulating in Tomioka, Fukushima Prefecture.
Source: http://fukushima-diary.com/2016/03/2029900000-bq-of-cs-134137-leaked-as-contaminated-water-in-fukushima-plant/
https://www.youtube.com/watch?v=qqTwxa2ir_E https://www.youtube.com/watch?v=UCP7PFT9coU
****Radioactive hotspots have been detected in other areas of Japan including Tokyo.** In one case even further south, **in Yokohama,** a petition on behalf of public schools and childcare facilities is pleading for the removal **highly contaminated mud** from rainwater recycling tanks, school roofs and gutters.
Source: https://ssl.form-mailer.jp/fms/b1285961429052
https://www.youtube.com/watch?v=IBkrIgJUWLk
http://www.fukuleaks.org/web/?p=10688
****Bioaccumulation and migration of radionuclides** are extremely complex issues. Greenpeace has reported high readings in areas of Fukushima Prefecture where extensive decontamination measures had already been taken by the government. This information has informed local citizens who had been told previously that they could return home.
http://www.greenpeace.org/japan/ja/library/publication/20160304_report/

Tokyo Electric and Power Company (TEPCO) the owner of Fukushima Daiichi reactors, as of March 2017, has not been able to locate the molten fuel that continues to release significant amounts of radioactive material into the Pacific Ocean. **TEPCO is incinerating more than 8 tons of garbage per day, much of it toxic and radioactive, with plans to burn 90% of all waste on site. It's just one example of an aggressive nationwide incineration campaign underway for several years.
Source: http://www.neimagazine.com/news/newsnew-incinerator-for-fukushima-waste-4849989
http://www.japantoday.com/category/national/view/tepco-group-contracts-kyoto-firms-to-incinerate-iwate-waste
****TO MARKTHE 6th ANNIVERSARY of the ongoing Fukushima disaster, March 11, 2017,** nuclear engineer, Arnie Gundersen of Fairewinds Energy Education, provides **the most recent update on the condition and near impossible task of "cleaning up" the Fukushima site:**
Source: http://www.fairewinds.org/fukushima/
****Drinking water and food** are critical concerns, because **internal contamination** is the most dangerous form of radiation exposure. Trace amounts of radionuclides from Fukushima Daiichi have been found in the tap water of numerous cities, and some samples contain both Cesium 134 and 137. Cumulative trace amounts can pose a significant health problem because there is no safe dose.
Source: http://www.fukuleaks.org/web/?p=15134
****Laboratory tests have documented that some of the **highest concentrations of radiation from Fukushima Daiichi are airborne which then settle to the ground.** Recent samples from vacuum cleaner bags collected in Japan show readings as high as a shocking 4,454 Becquerel's per kilogram.
Source: http://www.iwakisokuteishitu.com/pdf/e-monthly_data.pdf
****The International Commission on Radiological Protection (ICRP) guideline for the public is 1 millisievert per year compared to Japan's 20 mSv/year since the disaster.** By hosting the Olympics, Japan is willing to expose not only their own citizens but also children, young adults, families and coaches worldwide to higher than publicly acceptable levels of radiation per the ICRP. The emergency guideline of 20 mSv/year was never intended by ICRP to be a long term solution.
Source: http://www.icrp.org/docs/p111(special%20free%20release).pdf
Allowing the Olympic and Paralympic games in Fukushima is nothing less than preposterous, because it's impossible to shield children from widespread radioactive contamination. Even **after 30 years, *the 30 km area around Chernobyl remains an exclusion zone,*** *yet only 5 years after the Fukushima disaster began there are misguided plans to train young athletes in the town of Nahara at J Village, which is* ***located 19 km (12 mi) from Fukushima Daiichi****.*
Source: http://www.greenpeace.org/international/en/publications/Campaign-reports/Nuclear-reports/Nuclear-Scars/
http://kyodonews.net/news/2016/01/30/47883
Here in the United States, Presidential candidate and Senator Bernie Sanders has stated grave concerns about the dangers of nuclear power and has called for the immediate closure of the Indian Point nuclear reactors near New York City. Now that you know the facts, we petition you to learn as much as possible too and then work to stop **any and all plans that will endanger** athletes, their families and coaches worldwide due to the Fukushima Daiichi ongoing nuclear disaster at the 2020 Olympics and Paralympics. Holding the 2020 Games in Fukushima or in fact anywhere in Japan will not, in reality, make the Fukushima Daiichi humanitarian and environmental crisis go away. It will only spread it much farther afield. **The whole world is watching this very dangerous game.**

No it is not a joke

April 12, 2017

Fukushima's Upcoming Olympics

http://www.counterpunch.org/2017/04/12/fukushimas-upcoming-olympics/

by Robert Hunziker

Japan will hold soccer and baseball events in Fukushima Prefecture for the Tokyo 2020 Olympics. This is not a spoof. Effective March 2017, the Japan Football Association displaces Tokyo Electric Power Company's emergency operations center at J-Village, the national soccer training center before the nuclear meltdown occurred.

To naysayers that say this is a joke, the answer is 'no this is not a joke'. It is absolutely true Olympic events will be held in Fukushima Prefecture, thereby casting aside any and all concerns about the ongoing nuclear meltdown; after all that's history.

Or, is it?

Here is the announcement as carried in The Japan Times some months ago: "The men's and women's national soccer teams for the 2020 Tokyo Olympics will use the J-Village national soccer training center, currently serving as Tokyo Electric Power Co.'s forward base in dealing with the Fukushima nuclear crisis, as their training base, the Japan Football Association revealed Saturday."

For those who missed the past few classes, Fukushima is home to the worst industrial accident in human history as three nuclear reactors experienced 100% meltdown, the dreaded "China Syndrome." Molten core, or corium, in all of the reactors, highly radioactive and deadly, frizzles robots. Tokyo Electric Power Company (TEPCO) says it may take 40 years to clean up the disaster zone, but that is a wild guess.

Nobody on planet Earth has any idea where the radioactive molten cores are, within the reactor containment vessels or burrowed into the earth, and/or what happens next, e.g., there's speculation that Unit #2 is rickety and could collapse from another big earthquake (Japan is riddled with earthquake zones, experiencing an earthquake on average every day) thus collapsing, which leads to an untold, massive disaster, rendering the city of Tokyo uninhabitable.

According to Dr. Shuzo Takemoto, Engr. / Kyoto University, February 2017: "The Fukushima nuclear facility is a global threat on level of a major catastrophe… The problem of Unit 2… If it should encounter a big earth tremor, it will be destroyed and scatter the remaining nuclear fuel and its debris, making the Tokyo metropolitan area uninhabitable."

Numerous efforts by TEPCO to locate the melted cores have been useless. As of recently: "Some Nuclear Regulation Authority members are skeptical of continuing to send robots into reactors in the crippled Fukushima No. 1 plant to collect vital data on the locations of melted nuclear fuel and radiation levels… investigations utilizing robots controlled remotely generated few findings and were quickly terminated" (Source: Nuke Watchdog Critical as Robot Failures Mount at Fukushima Plant, The Asahi Shimbun, March 24, 2017).

All of which inescapably brings to mind the following question: How could anybody possibly have the audacity to bring Olympic events to the backyard of the worst nuclear meltdown in history whilst it remains totally 100% out of control?

Answer: Japan's PM Shinzō Abe and the International Olympic Committee (IOC).
According to Naohiro Masuda, the head of decommissioning, TEPCO does not know how to decommission the nuclear facilities. Meanwhile, ongoing radiation is a constant threat to air, soil, food, and water, e.g., state inspectors have discovered deadly high levels of cesium pooling at the base of Fukushima's 10 big dams that serve as water reservoirs (drinking water and agriculture). For example, Ganbe Dam 27,533 Bq/kg and Mano Dam at 26,859 Bq/kg whereas Japan's Environment Ministry's safe limit for "designated waste" is set at 8,000 Bq/kg. That limit is for "waste," not drinking water. (Source: High Levels of Radioactive Cesium Pooling at Dams Near Fukushima Nuke Plant, The Mainichi – Japan's National Daily Since 1922, September 26, 2016.)
Japanese officials are ignoring the extraordinarily high levels of cesium at the bottom of the dam reservoirs because the top water levels do meet drinking water standards. The prescribed safe limit of radioactive cesium for drinking water is 200 Bq/kg. A Becquerel ("Bq") is a gauge of strength of radioactivity in materials such as Iodine-131 and Cesium-137. As it happens, Cesium-137 is one of the most poisonous substances on the face of the planet.
Additionally, open storage and incineration of toxic and radioactive rubble is ongoing throughout the prefecture. In fact, the entire prefecture is a toxic warehouse of radioactive isotopes, especially with 70% of Fukushima consisting of forests never decontaminated, yet the Abe administration is moving people back to restricted zones that Greenpeace Japan says contain radioactive hot spots.
According to Greenpeace Japan, which has conducted 25 extensive surveys for radiation throughout Fukushima Prefecture since 2011: "Unfortunately, the crux of the nuclear contamination issue – from Kyshtym to Chernobyl to Fukushima- is this: When a major radiological disaster happens and impacts vast tracts of land, it cannot be 'cleaned up' or 'fixed'." (Source: Hanis Maketab, Environmental Impacts of Fukushima Nuclear Disaster Will Last 'decades to centuries' – Greenpeace, Asia Correspondent, March 4, 2016).
With the onset of the Fukushima Diiachi meltdown, the Japanese government increased the International Commission on Radiological Protection guidelines for radiation exposure of people from 1 millisievert (mSv) per year up to 20 mSv/yr. As such, according to the standards set by the International Commission on Radiological Protection, ICRP Publication 111, Japan's Olympics will expose Olympians and visitors to higher than publicly acceptable levels of radiation. After all, the emergency guideline of 20 mSv/yr was never meant to be a long-term solution.
With the onset of Olympic venues in Fukushima, maybe that will open the way for the 2024 Olympics in Chernobyl. But, on second thought that will not work. Chernobyl's Exclusion Zone is 1,000 square miles (off limits for hundreds, maybe thousands, of years) because of an explosion in one nuclear power plant that is now under control whereas Fukushima has three nuclear meltdowns that remain, to this day and into the unforeseeable future, radically out of control and extremely hazardous.
Mystifying and Confusing?
Yes, it's mystifying and confusing, but the games go on.

Retreat from Olympics

June 15, 2017

Dear Friends,

On 17 June from 13:00,Hiroshi Kume,famous radio commentator is presenting a wide-show program entitled "Should we retreat from the the Tokyo Olympic Games 2010 ?" Olympic Gold Medal marathon runner Ms. Hiroko Arimori will be present. Mr. Kume and Ms.Arimori have been opposing the Tokyo Olympic Games.The program will conduct a nation-wide referendum among the listenners. It is an extremely opportune and significant program.

The present situation in Japan is based on hiding Fukushima.The media have abandonned their mission. The awaited decision to retreat from the Olympic now seems to be the only way to awaken Japan anf the world. I am firmly convinced that it is inevitable. Its impact is beyond immagination.

I am sending you a communication on June 14 from the Natural Solutions Foundation, reflecting the growing concern of the Internationa Community. "We have posted your eBook at the Institute for Health Research Journal web site. http://www.inhere.org/InHeRe.Journal.html **"**

Please allow me to count on your understanding and support.

Mitsuhei Murata
Former Ambassador to Switzerland

Retreat from Olympics (2)

June 17, 2017

Dear Friends,

The results of the nation-wide referendum among the listenners conducted on 17 June by the Hiroshi Kume's wide-show program entitled "Should we retreat from the the Tokyo Olympic Games 2010 ?" are extremely impressive.All age categories except "under 19 years old" have overwhelmingly supported the retreat from the 2020 Olympic Games. The results could not but have a far reaching impact on this vital issue. The future of Fukushima depends on it.

This development coincides with another significant one.
In a surprise move, the International Olympic Committee announced on 16 June
that it was ending its Olympic sponsorship deal with Mcdonald.
The fast-food giant pulled out of its current, estimated ￡40-million-a-year, deal with
the International Olympic Committee more than three years early,
citing a “focus on different priorities”,severing a relationship that dated to 1976.

A new page is being opened as regards the Olympic Games 2020.

Trying to "foil nuclear terrorism"

July 19, 2017
Japan taps tech to foil nuclear terrorism ahead of Tokyo Olympics
http://www.japantimes.co.jp/news/2017/07/19/national/japan-taps-tech-foil-nuclear-terrorism-ahead-tokyo-olympics/#.WW8f7FFpyou
Kyodo
With the 2020 Olympics and Paralympics in Tokyo just three years away, the government is stepping up efforts to prevent terrorist attacks using nuclear and other radioactive materials.
The Japan Atomic Energy Agency has developed a device capable of detecting nuclear materials during airport baggage screening and is enhancing its nuclear forensics analytical technology.
“We want to improve deterrence against nuclear terrorism,” an agency official said.
At a meeting of the Education, Culture, Sports, Science and Technology Ministry in December, Mitsuru Uesaka, president of the Atomic Energy Society of Japan and a professor at the University of Tokyo, said it was important to “enhance nuclear security” ahead of the games.
There have been numerous incidents overseas involving attempts to smuggle nuclear materials.
In 1994, investigative authorities intercepted and seized illegally transferred nuclear material at Munich Airport in Germany. The material — mixed oxide fuel containing weapons-grade plutonium — was found on a Lufthansa flight from Moscow. Smugglers were arrested and the MOX fuel was later identified as having been used at a nuclear reactor in the former Soviet Union.
There are also fears that the radical militant group Islamic State might have made a “dirty bomb” capable of scattering radioactive materials. Unlike nuclear weapons, such devices can be made relatively cheaply without advanced skills.
To stop nuclear materials from entering Japan through airports, the agency developed a device to detect very small amounts of uranium concealed in luggage by irradiating luggage with a beam of neutrons. The result is available in less than a second.
Baggage screening at domestic airports usually uses X-rays, but an expert at the agency said conventional screening is not effective in detecting nuclear materials.
“X-rays can detect suspicious metal objects, but cannot tell whether objects are nuclear materials or not,” said Yosuke To, leader of the research group behind the project at the agency.
The agency has also been developing nuclear forensics capabilities through analyzing “nuclear fingerprints,” such as particles and isotopic compositions, of materials stored at facilities related to

nuclear power generation in the country. The agency has been working on registering the data in a database as well.
These efforts are aimed at determining the point of origin and routes of transit involving nuclear or radioactive materials when such materials are illicitly removed, lost or stolen.
As of the end of 2015, there were 454 confirmed incidents around the world involving unauthorized possession of nuclear materials and related criminal activities, 762 incidents involving reported theft or loss of such materials, and 1,622 incidents involving other unauthorized activities and events related to such materials, according to an International Atomic Energy Agency report.
In one high profile incident in Japan, a former employee of an inspection company in Ichihara, Chiba Prefecture, stole iridium-192 and dumped it into a river in 2008.

Letter by Ambassador Murata to the CIO President

Dear Friends,

I am sending you my message addressed to President Thomas Bach of the IOC.

Mitsuhei Murata
Former Ambassador to Switzerland

From: mitsu
Sent: Tuesday, August 01, 2017 2:44 PM

Dear President Thomas Bach,

Please allow me to send you this message that reminds us of the problems confronting the Tokyo Olympic Games 2020.

We can grasp distinctly the spirit of the Olympic Charter is being neglected as regards the political utilization of the Olympic Games.
Relevant prescriptions are as follows.
"The Olympic Games are competitions between athletes in individual or team events and not between countries" (Chapter 1, clause6).
"The IOC and the OCOG shall not draw up any global ranking" (Chapter 5, clause 57).

A special treatment of 5 years grace period, accorded to the limitation of overtime work in consideration of the Olympic Games, has caused a tragedy concerning the construction of the Olympic National Stadium. A newly employed worker has recently committed a suicide due to overwork. His latest monthly work time registered 200 hours surpassing the newly established limit of 100 hours. This 5 years grace period must be abolished as soon as possible.

A glance at the attached articles criticizing the Tokyo Olympic Games 2010 published in Japanese newspapers will be sufficient to understand the new trend of the public opinion in Japan.The first criticizes holding the Games in intensisive heat.The second is the similar warning by the Mainichi News Paper, one of the 4 sponsorng major news papers.The temperature being expected to surpass 34 degrees C. by then, it points out serious dangers of heatstrokes,not only for the athletes,but also for spectators and volunteers.

Moreover, the same trend can be observed internationally, as evidenced by the following article.

https://www.bloomberg.com/...07.../why-no-one-wants-the-olympics

I am convinced all the problems boil down to one question; Can the "under control" assertion be still be trusted?

With highest and warmest regards,

Mitsuhei Murata
Former Ambassador to Switzerland

Message from Ambassador Murata

Message from Ambassador Murata (August 19, 2017)

Dear Friends,

There are symptoms that allow us to foresee an important change in Japan.
The Japanese major media seem to start shifting toward supporting the retreat from the Tokyo Olympic Games 2020.
The Asahi Newspaper and the Mainichi Newspaper, both of them sponsoring the Tokyo Olympic Games, surprised the readers by the following frank expressions.

< Olympic preparations have given rise to such consequences as the soaring of construction costs, the shortage of workers, death due to overwork etc. The Olympic Games that sacrifices human life and health is nothing but a sheer contradiction>(The editorial of August 14,2017)

<The Tokyo Olympic Games is based on the false assertion that "Fukushima is under control", assertion that deceives the whole world. The Abe Cabinet passed by force the law on conspiracy under the pretext of the Tokyo Olympic Games, law that could restrict human rights and menace democracy. We should at least retreat from "the sickness of the Tokyo Olympic Games!"

(The evening edition of the Mainichi News Paper of August7, 2017)

"The results of the nation-wide referendum among the listeners conducted on 17 June by the TV Asahi news anchor Hiroshi Kume's wide-show program entitled "Should we retreat from the the Tokyo Olympic Games 2010 ?"are impressive. All age categories except "under 19 years old" have overwhelmingly(83%) supported the retreat from the 2020 Olympic Games.

Mr. Hiroshi Kume revealed in his radio broadcast of August12 that the Olympic Organizing Committee had addressed him opposing arguments. He told the listeners that they proved their "Olympic First"position, in stead of "Athletes First", explaining why the Tokyo Olympic Games is taking place at the hottest period in Japan（July21~August9）. The IOC had accepted the request of 3 American television networks to make the acceptance of it the prerequisite of the candidacy. Actually, the imposed choice of this hottest period is the target of increasing criticism, because of the obvious dangers of heat strokes menacing athletes, spectators, volunteers etc.(The evening edition of the Mainichi News Paper of July 29, 2017)

In view of the unimaginable impact the cancellation of the Tokyo Olympic Games, it could not but develop into a major political issue sooner or later.
In this connection, some former prime ministers are expected to play an important role.
Former Prime Minister Kan Naoto who experienced the 3/11 disaster while in office is engaged in pleading the world to stop using nuclear reactors, source of humanly unacceptable consequences.
Former Prime Minister Yukio Hatoyama voiced his opposition against it in his interview given by Japan Times a year and a half ago.
Former Prime Minister Junichiro Koizumi continues to condemn strongly the false assertion "under control". He has established a relief fund to help American soldiers, victims of the TOMODACHI operation after the 3/11 nuclear disaster.
Among former prime ministers who have not taken position on the Olympic issue, some deserve special attention.
Former Prime Minister Morihiro Hosokawa played a role in promoting the removal of nuclear fuel rods from the unit 4 reactor in Fukushima Daiichi.
Former Prime Minister Yasuo Fukuda is now drawing special attention.
On August 2, the Kyodo News interviewed him. He most severely criticized Prime Minister Abe, asserting that Japan would be ruined due to his control of high ranking bureaucrats by dint of the Cabinet Bureau of Personnel Affaires established in 2014.
(Japanese version: http://yuruneto.com/hukudayasuo/**)**

This interview has not yet been reported abroad, as of August 20, according to the Kyodo News. Its impact is expected to be far reaching.

An important change seems to be in the making.

With warmest and highest regards,

Mitsuhei Murata
Former Ambassador to Switzerland

Too busy rebuilding

November 13, 2017

Tohoku areas snub Olympic program, focus on rebuilding
http://www.asahi.com/ajw/articles/AJ201711130010.html
By TAKAHIRO OKUBO/ Staff Writer
The vast majority of municipalities in the Tohoku region are snubbing a government exchange program related to the 2020 Tokyo Olympics, saying they are simply too busy rebuilding from the 2011 disaster.
The central government wants to use “Tohoku reconstruction” as a theme for the Games and a way to promote the revival of devastated areas. But scorn is now being heaped on this idea.
In the run-up to the Summer Olympics, the government is pushing the Reconstruction “Arigato” Host Town international exchange program involving municipalities in Iwate, Miyagi and Fukushima, the three prefectures hardest hit by the Great East Japan Earthquake and tsunami on March 11, 2011.
Under the program, disaster-hit municipalities will invite athletes, rescue workers and people who contributed relief goods to the victims to check on the rebuilding progress, allowing local residents to interact with people from across the globe.
Only 11 cities and villages of all 127 municipalities in the three prefectures applied for the program between Sept. 15 and Oct. 31.
“The most important phase of reconstruction is now getting under way,” said an official of a city in Iwate Prefecture that did not apply. “We are suffering from a worker shortage and can’t afford to think of the Tokyo Olympics.”
In fact, there was such little initial interest in the exchange program that officials of the Cabinet Secretariat had to urge cities, towns and villages to participate.
A central government source said that combining the Tohoku rebuilding efforts with the Olympics is nonsensical.
“Disaster recovery and the Olympics are basically two different things,” the source said.
The central government decided to extend the period of accepting applications because the results so far have been embarrassing.

Letter from Ambassador Murata to Abe

Dear Friends, I have sent the attached message dated March 1,2018, to Prime Minister Shinzo Abe.Its gist is as follows: “The preparations for the Tokyo Olympic Games are widely recognized as causing the sharp rise of prices of materials and serious lack of workers,thus constituting a major factor standing in the way of the reconstructionof North Eastern Japan. The monthly magazine "FACTA"(March,2018)has published a shocking article entitled"Material evidence of Dentsu bribing the Tokyo Olympic Games".It reveals the contentof the secret contract between Dentsu and former international athletics federation (IAAF) President Lamine Diack.The " Facta" and the French paper "le Monde"had jointly obtained the document which the French Prosecuter's Office

had confiscated. In view of the deepening sense of crisis of the International Community regaradingthe unstoppable radioactive contamination emanating from the Fukushima Daiichi,an influential member of the IPPNW renews his proposal to postpone the Tokyo Plympic Games.("they should at least be postponed until the situation in Fukushima is under better, perhaps even global control .——— Probably the whole world would understand and agree, and Japan would avoid the risk and embarrassment, that for ongoing unresolved nuclear problemswith the Fukushima reactors, in the end national delegations might cancel their Olympic participation"） From many quarters,requests have been addressed to President Bach of the IOCto reverify the "under control"assertion, but they remain without response.To cope with the increasingly preoccupying situation in Fukushima, Former Prime Ministers are being approached to write a joint letter to President Bach in order to ask him to clarify his position."(http://kurionet.web.fc2.com/murata.html**) Mitsuhei Murata Former Ambassador to Switzerland**

Letter from Ambassador Murata to the UN Secretary-General

Letter from Ambassador Murata to the UN Secretary-General

The Honorable António Guterres
Secretary–General of the United Nations Organization
New York City, NY.

_____

Tokyo, May 26, 2018
Dear Secretary-General António Guterres,
Please allow me to draw your attention to the persistent and deepening Fukushima crisis.
It is essential not to forget the crucial fact that the state of emergency promulgated after the Fukushima accident still persists and will not be annulled hereafter for more than 100 years according to reliable experts.
It is simply abnormal not to consecrate maximum efforts to this task. The Tokyo Olympic Games 2020 should be considered as out of the question. Its preparations, however, are being promoted without hesitation.

The International Olympic Committee continues not to respond to increasing legitimate requests from various quarters to reexamine the false assertion "under control", publicly condemned as a "big lie" by Former Prime Minister Junichiro Koizumi. He is now engaged in promoting a national movement against nuclear reactors, together with Former Prime Minister Morihiro Hosokawa.

Former Prime Minister Yukio Hatoyama, in the interview article of the Japan Times of January 21,2016, pleaded for Japan's retreat from the Tokyo Olympic Games. He has recently sent me a message in which he expressed his appreciation and expectations of women's role in this crucial problem.

In this connection, there is a growing support for the plea to make shift the current paternal civilization based on power and domination to a maternal civilization based on harmony and solidarity.
On May 16,the House of Councilors unanimously approved a law aimed at equalizing eventually the number of male and female candidates in national elections.

Women are expected to remind the world of the very lesson of the Fukushima nuclear accident that requires the shift of priority from economy to life.
The current Japanese society, exposing one scandal after another, reminds the whole world of the well-known warning of the ancient Chinese philosopher Laozi; "The Heaven's vengeance is slow but sure". It reminds us of the law of history that does not allow immorality to last long.
I wish you the best of luck in your noble and increasingly challenging mission.
Please accept, Secretary-General António Guterres , the assurances of my highest consideration.

Mitsuhei Murata
Former Japanese Ambassador to Switzerland and Senegal
Honorary Professor of Tianjin University of Science and Technology (China)

Boosting nuke antiterrorism ahead of Olympics

July 11, 2018
Japan to beef up nuclear security before Rugby World Cup, Olympics
https://mainichi.jp/english/articles/20180711/p2g/00m/0dm/106000c
TOKYO (Kyodo) -- Japan's nuclear watchdog decided Wednesday to oblige facilities using any of about 200 radioactive materials to introduce antitheft measures to enhance nuclear security ahead of the 2019 Rugby World Cup and 2020 Tokyo Olympics.

- 【Related】Nuclear watchdog OKs restart of aging nuclear plant hit by tsunami
- 【Related】Editorial: Time to transform Japan's nuclear plant inspection system
- 【Related】Japan drops in Hiroshima Report rankings due to refusal to sign nuclear ban treaty

As part of the country's efforts to boost counterterrorism steps before hosting the major sporting events, the government will aim at enforcing related laws in September 2019, in time for the Rugby tourney kicking off on Sept. 20 that year, which would cover some 500 business operators, the Nuclear Regulation Authority said.
Hospitals and companies and the like would be required to install surveillance cameras near their storage sites for radioactive materials. The containers must be kept in rooms with solid doors and manuals and communication equipment must be provided for personnel to deal with intruders, to prevent such materials from falling into the hands of terrorists.
Nuclear power plants have already introduced a personal background investigation system to prevent potential terrorists from being hired as workers.

According to the NRA, the planned regulation would cover radioactive substances including cesium 137 and cobalt 60, which are widely used for medical and industrial purposes, but which could be used in so-called dirty bombs.
Amid the globally mounting threat of terrorism, the International Atomic Energy Agency advised countries in January 2011 to take measures to better manage radioactive materials.
Tokyo, however, has yet to introduce these steps due to its need to deal with the 2011 Fukushima Daiichi nuclear disaster.
In Brazil, instruments for radiation therapy were taken away from the former site of a hospital and then dismantled. But it led to large-scale exposure and the deaths of four people in 1987.

Torch relay in Fukushima to lift spirits?

July 13, 2018

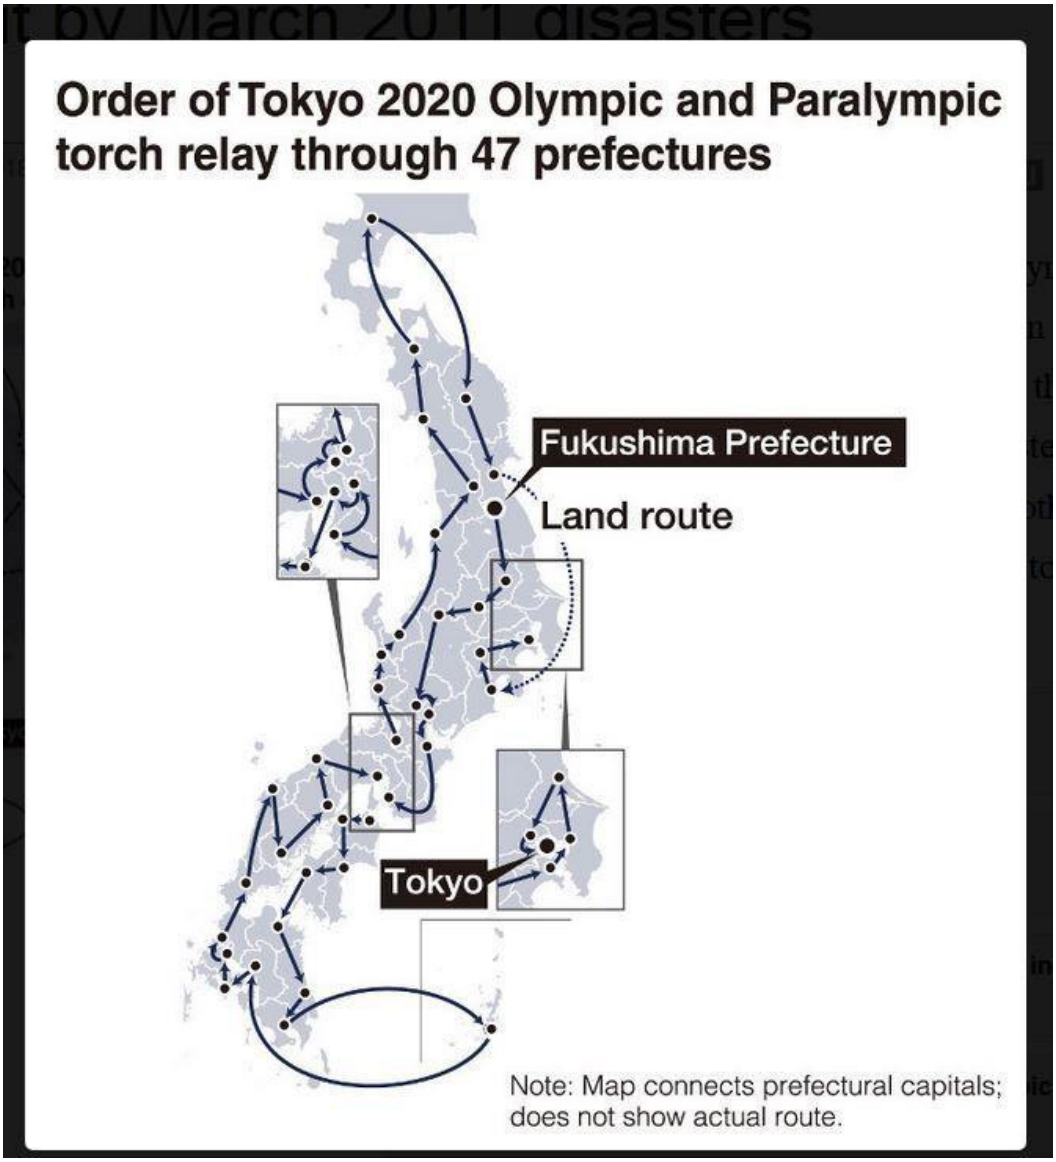
1964 Olympic torch bearer hopes 2020 runners will spur hope in Fukushima
https://mainichi.jp/english/articles/20180713/p2a/00m/0na/018000c
YABUKI, Fukushima -- A 71-year-old man here who served as a torch bearer in the 1964 Tokyo Olympics looks to see young people from this prefecture encourage residents affected by the nuclear disaster through their torch relay ahead of the 2020 Tokyo Games.

- 【Related】Tokyo 2020 torch relay plan draws attention to areas hit by March 2011 disasters
- 【Related】2020 Olympic torch relay to start in Fukushima on March 26
- 【Related】Tokyo Olympics

Fukushima Prefecture was on July 12 named the starting point for the 2020 Olympic torch relay in Japan. 1964 runner Masao Yabuki, a resident of the prefectural town of Yabuki, hopes that the relay will play a part in boosting disaster recovery, as touted by the Tokyo 2020 organizing committee.
"I hope the torch relay will uplift the spirits of those affected by the disaster, if only a little," said Yabuki, a former Japan Agricultural Cooperatives employee.
Yabuki was a third-year student and a member of a track team at what is now Shirakawa Jitsugyo High School in Shirakawa in southern Fukushima Prefecture, when he was chosen to run in the city, alongside two teammates. "I was probably picked as I was a third-year student back then. I was just lucky," he recalled.
He was assigned to run through an approximately 2-kilometer zigzag course from the entrance to the castle town's downtown area to the city hall. He practiced by holding a metal bat high up in the air with his right hand while running.
On Sept. 30, 1964, he covered the designated stretch with the real Olympic torch in his hand as some 100,000 spectators filled the streets.
"My mind was completely blank. I couldn't even hear cheers from spectators as I was so absorbed," he said.
Nearly half a century later, Yabuki's house was partially damaged due to a massive earthquake registering a lower 6 on the Japanese seismic intensity scale of 7 in his area on March 11, 2011.

In the wake of the Fukushima nuclear disaster triggered by the quake and ensuing tsunami, temporary housing units for evacuees from the nuclear disaster were built in the town of Yabuki. Seven years on, people who are still unable to return to their hometowns are living in those housing units.
Last year, Yabuki drove through areas along the Pacific Coast stricken by the tsunami and nuclear disasters. What he saw were rice paddies and fields long left unattended and almost empty streets, even in areas where nuclear evacuation orders had already been lifted. In other areas where such orders remained in place, towns were overgrown with wild grass and trees. Such landscapes saddened Yabuki.
The Fukushima Prefectural Government will establish an organizing committee for the 2020 Games to select the specific torch relay path. The governments of 15 cities, towns and villages in the prefecture -- which were damaged by the 2011 tsunami and ordered to evacuate residents due to the nuclear crisis -- are calling for their streets to be included in the relay route.
While Yabuki wishes to once again become a torch bearer himself, even if to cover just 100 meters, he believes that the upcoming torch relay should be one that can uplift local residents by covering the coastal "Hamadori" region of Fukushima, not the mid-inland "Nakadori" region including the town of Yabuki, to embody the spirit of the "disaster recovery Olympics" by conveying the current situation to the rest of the country.
(Japanese original by Shuji Ozaki, Fukushima Bureau)

Torch relay in Fukushima



July 13, 2018

Tokyo 2020 torch relay plan draws attention to areas hit by March 2011 disasters
https://mainichi.jp/english/articles/20180713/p2a/00m/0na/007000c

With the starting point for the 2020 Tokyo Olympic and Paralympic Games torch relay set to begin in Fukushima Prefecture, which was hit hard by the March 2011 quake, tsunami and nuclear disaster, anticipation is growing in the prefecture and other areas ahead of the two-year countdown mark to the games on July 24.

- 【Related】1964 Olympic torch bearer hopes 2020 runners will spur hope in Fukushima
- 【Related】2020 Olympic torch relay to start in Fukushima on March 26
- 【Related】Swimmers put on traditional-style show in bid to join Tokyo 2020 torch relay
- 【Related】IOC approves extension of Tokyo Olympic torch relay
- 【Related】Mori requests longer Olympic torch relay for flame to travel through disaster-hit areas

The torch relay for the 1964 games wrapped the entire country up in passion for the event, but the 2020 relay looks to become an even bigger phenomenon, making its way through all 47 of Japan's prefectures.
The Tokyo Organising Committee of the Olympic and Paralympic Games established a committee and began selecting the route and the starting point in February 2017. From the outset, the committee had planned to pay special attention to disaster-hit areas, but the relay was to begin in late March, and in the northern Japanese regions of Hokkaido and Tohoku, the temperature would still be low.
Moving from the southernmost prefecture of Okinawa northward with the blooming spring cherry blossoms was the most logical choice, and there were southwestern areas of the country such as Kumamoto Prefecture, which was hit by a double earthquake disaster in April 2016, and other areas around the country that could represent Japan's resilience. There were arguments as to whether or not the message of recovery should be limited to just the areas hit by the March 2011 triple disaster.
Still, the committee decided to begin the route in Fukushima Prefecture to dispel any doubts that the image of "disaster recovery" held up by the organizing committee and the government would be obscured.
The idea of holding the games as a sign of recovery had been put forward since the International Olympic Committee general assembly met in September 2013 when the Tokyo games were decided, but the proposal ended up being a double-edged sword -- foreign media were still pointing out the risks of contaminated water leaking from the Fukushima No. 1 Nuclear Power Plant. Japanese Prime Minister Shinzo Abe, however, who traveled to where the assembly was held in Buenos Aires, explained that the "situation was under control."
Despite the government's commitment to a games in the spirit of recovery, the people of Japan have not been so fast to warm up to the idea, asking what the games will actually do for the reconstruction of the regions hit by disasters. With personnel, financial resources and facilities lacking, there were quite a few disaster-hit municipalities that viewed things like "host town" registration to plan exchanges with participating countries and regions as well as the hosting of pre-game training camps as burdensome. In November 2016, the Tokyo 2020 organizing committee decided that Fukushima Prefecture would be the venue for the baseball and softball events of the games, and in April this year, it was decided that the Olympic flame from Greece would be exhibited in the three prefectures on the northeastern Pacific coast hit hardest by the March 2011 disasters -- Fukushima, Miyagi and Iwate -- as a "flame of recovery."
"**We have to create some substance to the image of the games as an event of recovery**," said Minister in charge of the Tokyo Olympic and Paralympic Games Shunichi Suzuki, emphasizing the need to connect the activities of the games to the regions they hoped to uplift.
In the relay path announced on July 12, the torch will not travel through the three prefectures of Fukushima, Miyagi and Iwate at once, but rather travel south from Fukushima to do away with worries about the March temperatures in the northern region of Japan. So far, there have not been any complaints.
Mayor Hiroshi Kameyama of the heavily hit city of Ishinomaki in Miyagi Prefecture, just north of Fukushima, who fought for his city to be the relay starting point, released a comment stating, "We're all a part of the Tohoku region, and I hope that having Fukushima Prefecture, where there are still quite a number of victims of the disaster, decided as the starting point for the relay will provide strength in moving toward reconstruction."

IPPNW launches a campaign about the "Radioactive Olympics"

International Campaign
“Tokyo 2020 - The Radioactive Olympics”
In 2020, Japan is inviting athletes from around the world to take part in the Tokyo Olympic Games. We are hoping for the games to be fair and peaceful. At the same time, we are worried about plans to host baseball and softball competitions in Fukushima City, just 50 km away from the ruins of the Fukushima Dai-ichi nuclear power plant. It was here, in 2011, that multiple nuclear meltdowns took place, spreading radioactivity across Japan and the Pacific Ocean - a catastrophe comparable only to the nuclear meltdown of Chernobyl.
The ecological and social consequences of this catastrophe can be seen everywhere in the country: whole families uprooted from their ancestral homes, deserted evacuation zones, hundreds of thousands of bags of irradiated soil dumped all over the country, contaminated forests, rivers and lakes. Normality has not returned to Japan.
The reactors continue to be a radiation hazard as further catastrophes could occur at any time. Every day adds more radioactive contamination to the ocean, air and soil. Enormous amounts of radioactive waste are stored on the premises of the power plant in the open air. Should there be another earthquake, these would pose a grave danger to the population and the environment. The nuclear catastrophe continues today.
On the occasion of the Olympic Games 2020, we are planning an international campaign. Our concern is that athletes and visitors to the games could be harmed by the radioactive contamination in the region, especially those people more vulnerable to radiation, children and pregnant women.
According to official Japanese government estimates, the Olympic Games will cost more than the equivalent of 12 billion Euros. At the same time, the Japanese government is threatening to cut support to all evacuees who are unwilling to return to the region.
International regulations limit the permitted dose for the general public of additional radiation following a nuclear accident to 1 mSv per year. In areas where evacuation orders were recently lifted, the returning population will be exposed to levels up to 20 mSv per year. Even places that have undergone extensive decontamination efforts could be recontaminated at any time by unfavourable weather conditions, as mountains and forests serve as a continuous depot for radioactive particles.
Our campaign will focus on educating the public about the dangers of the nuclear industry. We will explain what health threats the Japanese population was and is exposed to today. Even during normal operations, nuclear power plants pose a threat to public health – especially to infants and unborn children.
There is still no safe permanent depository site for the toxic inheritance of the nuclear industry anywhere on earth, that is a fact.
We plan to use the media attention generated by the Olympic Games to support Japanese initiatives calling for a nuclear phase-out and to promote a worldwide energy revolution: away from fossil and nuclear fuels and towards renewable energy generation.
We need to raise awareness of the involvement of political representatives around the world in the military industrial complex.
We denounce the attempt of the Japanese government to pretend that normality has returned to the contaminated regions of Japan.
We call on all organisations to join our network and help us put together a steering group to coordinate this campaign. The Olympic Games are still two years away – now is still time to get organised.

We look forward to hearing from you,
with best regards,
For the campaign „Nuclear Free Olympic Games 2020“:

Reconstruction Olympics?

August 10, 2018

Tokyo's road to 'Reconstruction Olympics' not an easy one
https://mainichi.jp/english/articles/20180810/p2a/00m/0na/014000c
TOKYO -- Showcasing Japan's reconstruction from the devastating earthquake in 2011 to the world is one of the main themes of the Tokyo Olympics and Paralympics in 2020, but displaying this is no easy task.

- 【Related】Dealing with the heat of the 2020 games: A racewalker keeps cool by icing his palms
- 【Related】Japan crafts new cybersecurity strategy for 2020 Tokyo Olympics
- 【Related】Japan-US friendship born out of private lodging in 1964 lives on toward Tokyo 2020

Two years ahead of the Tokyo Games, the organizing committee is making additional efforts to emphasize the reconstruction aspect of the global athletic event. In recent weeks, the committee announced Fukushima Prefecture, which was hit hard by the Great East Japan Earthquake, tsunami and the ensuing nuclear crisis, as the starting point for the Olympic torch relay. It also revealed that the first event of the Games, a softball match involving Japan, will be held at the Azuma ballpark in the city of Fukushima on July 22, 2020, two days before the official start of the 2020 Games. The ballpark hosted a Japan-U.S. softball match in June this year, attracting some 7,000 spectators.
Holding events and competitions is one thing, but conveying the message of the massive damage caused by the quake, subsequent tsunami and triple core meltdowns at the Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant that forced hundreds of thousands of residents to flee, is another. Organizers are busy discussing how to present the information to athletes and reporters visiting from overseas.
The organizing committee plans to set up a "reconstruction support booth" inside the main press center for international visitors as well as the athletes' village and display images of devastation and reconstruction using cutting-edge equipment.
But some in the committee are worried that footage of huge tsunami engulfing thousands of houses or of areas left abandoned following the evacuation of residents caused by the nuclear accident may have some adverse effects on viewers.
A committee official in charge of the presentation said, "I want people to know what happened back then, but the images might prove to be very shocking to some and affect competition." Food items produced in areas hit by the disaster will be served at the athletes' village, but this may fuel negative rumors about food safety rather than dispel them.

In early September, the organizing committee plans to hold the first briefing targeting the international media, and explain the status of preparations. Another plan is also being considered for the Tokyo Metropolitan Government to invite journalists from overseas to tour disaster-affected areas in the Tohoku region in northern Japan and show them competition venues and reconstruction efforts. These proposals are designed in part to judge how the foreign media will report on those areas.
Tokyo was selected as the host city for the 2020 Games in September 2013 at a session of the International Olympic Committee. At that time, the international media emphasized concerns about leaking radioactive water from the Fukushima nuclear plant. Prime Minister Shinzo Abe, in his speech at the meeting, assured that the situation was "under control," helping Tokyo to win enough support to be chosen as the host venue. The 2020 Tokyo Games has come to shoulder a responsibility to show to the world that areas affected by the 2011 disaster have mostly been restored.
The Olympics always show the reality of the host city and country to the world. During the 2016 Rio Games, the situation of poor neighborhoods in the city was reported on globally. The organizers in Tokyo are trying to figure out what needs to be done to get the actual situation in disaster-hit areas reported on accurately during the Olympics and Paralympics.

"That's how dangerous the Tokyo Olympics are"

August 13, 2018
Olympic heat wave fears: What steps can Tokyo take?
https://www.japantimes.co.jp/news/2018/08/13/reference/olympic-heat-wave-fears-steps-can-tokyo-take/#.W3Kj68IyWos
by Tomohiro Osaki
Staff Writer
Japan has become well-known for its *omotenashi* (hospitality), with the concept being part of Tokyo's pitch when it bid to host the 2020 Olympics.
But this year's record heat wave, which has so far killed more than 100 people and led to tens of thousands more being rushed to the hospital, has raised concern that some foreign visitors to the games may not find them as hospitable as organizers had hoped.
Fears have been rekindled over what experts say will likely be a sweltering 2020 Games, which will start on July 24 and finish on Aug. 9. Tokyo is now facing significant pressure to hammer out measures to combat the searing heat, including a potential revival of daylight saving time.
With the games just two years away, what can Tokyo do to minimize the risk of heatstroke? Could it possibly push the event back to a cooler time to avoid the hottest period of the year? Here is a look at those and other questions:
Why are the 2020 Games being held in midsummer in the first place?
To be fair, it's not like Tokyo had much of a choice. The July-August window was a precondition set by the International Olympic Committee (IOC) as it sought aspiring hosts.
When Tokyo last hosted the Summer Olympics in 1964, the two-week event kicked off on Oct. 10.
But today, an October Olympics is considered difficult because it would compromise the IOC's bid to capitalize on broadcasting rights paid by TV stations — one of its biggest revenue sources. The IOC wants to avoid having the quadrennial games coincide with other popular sporting events, such as the Major

League Baseball playoffs and the European soccer season in the fall, due to fears of splitting up airtime and TV ratings.

A case in point: Doha, Qatar, known for its scorching summer weather, also bid for the 2020 Olympics. It was granted special permission by the IOC to pitch an October Olympics — only to be knocked out in the first round. The committee's evaluation report, according to Reuters, later admitted that in the event of an autumn Olympics, broadcasters would have difficulties "attracting the same audience levels" as they could when the games are held in July and August.

Is it possible to move the Olympic schedule to a cooler time?

A spokesman for the Tokyo Olympic Organizing Committee said the "probability is extremely low" that the July-August period could be postponed, because it would be seen as Tokyo violating the original arrangement with the IOC. Such a major rethink, if at all possible, would necessitate Tokyo negotiating with the IOC for approval, said the spokesman, who declined to give his name per internal policy.

Any attempt to push the event to a cooler period risks exposing Tokyo to global backlash given that the city advertised its summer climate as "mild" and "ideal" for athletes to perform when it bid for the 2020 Games.

"Anyone with common sense knows that Tokyo during this period of time is far from being ideal for sporting activities," said Makoto Yokohari, a professor of urban engineering at the University of Tokyo. "I just have to wonder on what basis they called Tokyo's weather mild and athlete-friendly. … That's an impossible assessment."

How dangerous is it to hold the games in the middle of summer?

Experts say the heat presents the risk of a life-threatening heatstroke.

Yokohari has conducted a study of temperature and rainfall records from 1971 to 2000 for all of the Olympic host cities. Although Tokyo trailed behind Athens and Atlanta in terms of heat, its abundant rainfall suggests it is "the hottest and the most humid" host, the professor said.

Akio Hoshi, a professor of sports and health sciences at Toin University of Yokohama, agrees. Hoshi's team analyzed 50 years' worth of Meteorological Agency data to ascertain what is called the "wet-bulb globe temperature (WBGT)" — a comprehensive heat index based on temperature, humidity, wind speed and sunlight — from July 24 to Aug. 9 each year.

His study, which covered a period from 1964 to 2014, revealed that Tokyo's WBGT has risen by an average 0.4 degree per year in recent years and is projected to hit as high as 34 degrees in 2020. That's well beyond the 31-degree threshold flagged by the Environment Ministry as extremely dangerous, and the level at which all exercise should be suspended in principle. A sporting event coupled with the sizzling heat heightens the risk of life-threatening heatstroke, Hoshi said.

"I think we've come to a point where not only the Olympics but other midsummer sporting events, such as the Koshien baseball tournaments and nationwide high school championships, must be reconsidered," he said.

What about daylight saving time?

Recent weeks saw debate flare up anew over whether Japan should introduce daylight saving time in a bid to minimize the impact of the heat.

According to Kyodo News, Prime Minister Shinzo Abe instructed his ruling Liberal Democratic Party last week to look into the possibility of introducing daylight saving time — with a view to moving the clock two hours forward during the games — at the request of Yoshiro Mori, president of the Olympic organizing committee and a former prime minister.

Despite Abe's apparent eagerness, however, the government remains split, with Chief Cabinet Secretary Yoshihide Suga repeatedly striking a negative note. Changing the clock "would impact the lives of the public.

There are only two years left before the games, too," Suga told a regular news briefing last week.

Experts agree that adopting daylight saving time would be effective in combating the heat — if not a game-changer.

"Under the current plan, the marathon is slated to kick off at 7 a.m. … which is seen as the earliest schedule possible given the time of transportation and preparation needed by volunteers," Yokohari said. "But saving (an hour of) daylight, for example, would allow the race to begin at effectively 6 o'clock. That's better than doing nothing," he added.

Japan experimented with daylight saving from 1948 to 1951 under the U.S. Occupation. But the custom came to an end amid complaints that daylight saving led to farmers working longer hours. Concerns this time around are more varied.

"Compared with the last time we did it, we have computers now … There is just too much preparation necessary," a senior government official said.

What other measures are being discussed?

Popular ideas include applying special anti-heat coatings to road surfaces, pruning and growing trees along sidewalks to offer more shade, setting up mist-spraying equipment and moving forward the start time for some events.

An experiment conducted by the Tokyo government Monday has shown that water sprinkling would keep temperatures on the street surface up to around 5 degrees cooler than the surrounding air temperature.

The organizing committee is even looking into what it touts as a "cool sharing" initiative, where building owners along the marathon course would be asked to keep their doors open to offer a bit of cooler air.

The cool-sharing initiative is a "last-resort" measure that basically relies on the goodwill of volunteers and is far from being a problem-solver — and so are other measures eyed by officials, Yokohari said.

"These are hardly effective enough to offset the possibility of heatstroke," he said.

As a fundamental solution, the professor suggested relocating venues for high-risk sports, such as marathons, to cooler places like Hokkaido or Nagano Prefecture, citing an ongoing plan to hold some softball games in Fukushima Prefecture in lieu of Tokyo.

Current measures under consideration are "not entirely useless," Yokohari said. "They are helpful to a certain degree, but even if all of them are implemented, the fact still remains that Tokyo's heat level will keep hovering within a 'danger zone.' "

"In other words, that's how dangerous the Tokyo Olympics are."

Lighting of Olympic flame totake place on March 11

September 2, 2018

Olympic flame for 2020 Games to be lit on 3/11 anniversary, IOC chief says in interview

https://www.japantimes.co.jp/news/2018/09/02/national/olympic-flame-2020-games-lit-3-11-anniversary-ioc-chief-says/#.W4vVSMIyVLM

Kyodo

JAKARTA – The Olympic flame-lighting ceremony for the 2020 Summer Games will take place on March 11 — the ninth anniversary of the earthquake and tsunami that devastated the Tohoku region, International Olympic Committee President Thomas Bach said Saturday.

"I think this is a wonderful idea," Bach said in an interview in Jakarta. "The IOC has alre
hat wherever possible we want to contribute to the reconstruction of the area."

The Tokyo Olympic Organizing Committee proposed the date, but Bach's statement was the first public announcement to confirm the IOC's support for holding the ceremony on the anniversary of the 2011 Great East Japan Earthquake.

The Olympic flame has been kept alight in Olympia in western Greece since Nazi Germany introduced the idea of a torch relay for the 1936 Berlin Summer Games.

After the relay begins in Greece, the flame will be transported to Japan, where it will be displayed in Fukushima, Iwate and Miyagi, the three prefectures most heavily damaged by the calamity, which also triggered a nuclear crisis and left more than 18,000 people dead or missing.

The Japan leg will begin in Fukushima on March 26 and travel around the country for 121 days.

A day before he attends the closing ceremony for the Asian Games, the largest multisport event in the world behind the Olympics, Bach said he plans to visit northeastern Japan in November to "show our solidarity with the people and to encourage the people in the region."

Referring to Japan's record-high temperatures this summer, Bach, 64, said he is confident that the IOC, working together with the Tokyo organizing committee, will be able to come up with the "right mixture of measures" to protect athletes and spectators during the Tokyo Olympics.

He said introducing daylight saving time in Japan during the summer may be an effective way to address potential health risks but at the same time stressed it will be important to craft a "good package," rather than just focusing too much on one measure.

He also said the IOC, along with North and South Korea, has been exploring the possibility of "some joint actions during the Olympic Games in Tokyo" and to achieve this goal adequate preparations with other national Olympic committees should begin at an early date.

"We have not only opened the door for political talks but also we have also kicked off developments in sports," he said. "We are ready to continue to support this rapprochement on the Korean Peninsula."

North and South Korea formed a joint team in women's ice hockey during the Winter Olympics in Pyeongchang in February. It was the first time for an integrated Korean team had competed in Olympics history.

They also fielded unified teams in women's basketball, rowing and canoeing at the Asian Games, which opened on Aug. 18.

Their dragon boat racing team celebrated the first gold medal won by a combined team participating at an international multisport event on Aug. 26. The victory was punctuated by a rendition of the popular Korean folk song "Arirang" that served as the combined team's national anthem during the podium ceremony.

As for Sapporo's interest in hosting the Winter Olympics in 2026 or 2030, Bach said the move is in line with the IOC's policy of taking advantage of existing facilities and bringing the Olympics back to a "traditional winter sports destination."

While stressing it is too early to talk about which city might host those Winter Olympics, he said Sapporo has a good chance to succeed in clinching the 2030 Games even if it does not get selected for 2026.

"I think this is fair to say the candidates for '26 who are following up on the whole procedures will of course have a certain advantage for 2030," he said.

For obvious reasons, they will have “all the knowledge” and “more expertise and more time” to work out their projects according to their needs and cooperation with the IOC, the IOC chief said.
“I think they would be in the kind of pole position” as they would also be able to gain the confidence of the IOC in advance, he said.
While he spoke in favor of those issues, when it came to the likelihood of esports, or competitive multiplayer video gaming, becoming an Olympic event in the near future, he was not as confident.
He said substantive discussions are needed, for example, to determine whether esports should be regarded as sports in the first place or as a contradiction of Olympic values.
“This will be for my successor,” he said. “There are at this moment too many open questions. . . . It will take time.”

Using schools to recup silver

September 2, 2018

Criticism grows against gov't 'urban mines' plan for Tokyo 2020 medals
https://mainichi.jp/english/articles/20180902/p2a/00m/0na/012000c
TOKYO -- Yet another government program linked to the 2020 Tokyo Games is facing criticism: extracting silver from used mobile phones and computers for Olympic and Paralympic medals.

- 【Related】Gov't faces criticism for 'mobilizing' students as volunteers for 2020 Tokyo Olympics
- 【Related】Daylight saving time causes more trouble than benefits, say critics
- 【Related】Officials spray water on Olympic course sidewalk in trial to beat the heat

Critics say the collection drive is reminiscent of a World War II government order to the public to donate metal items to make aircraft and bullets. They also lambasted the plan as a product of groupthink in the same vein as other games-related government initiatives, such as heat countermeasures, introduction of daylight saving time, and "mobilization" of student volunteers.
This fall, the Ministry of the Environment will urge some 230 municipalities hosting Olympic and Paralympic athletes to cooperate, and install device collection boxes of its own at public elementary and junior high schools.
According to the ministry, about 40 kilograms of gold, 4,900 kilograms of silver and 3,000 kilograms of copper are needed to make some 5,000 medals for the Tokyo Games. There is already enough gold and copper thanks to a collection drive organized at NTT DoCoMo mobile phone shops and post offices. But stocks of silver, which is in particular need because the metal is used as the basis for gold-plated medals, are insufficient, according to ministry officials.
However, there is a growing tide of Twitter commentary critical of the plan to get that silver. "Now they want us to provide the metals. It's creepy," one tweet said, in an apparent reference to the government's wartime metal donation drive. The education ministry's effort to have universities call off classes during the games so that students can serve as volunteers has similarly been compared to war support efforts.
A proposal to introduce daylight saving time to avoid the summer heat during competitions has also been attacked as akin to wartime mobilization because it would place an enormous burden on computer programmers required to adjust software and force workers to stay on the job longer. A call to ease the

heat by spraying water in certain neighborhoods was likened to the desperate wartime plan to counter an Allied invasion of the Japanese home islands with bamboo spears.
Scholars and academics are particularly angry at the use of schools and students for the projects. "The mentality to utilize school organizations is really scary," one tweet said, while another commented, "Don't increase the burden on people on the front line of education."
The amount of precious metals contained in a used electronic device is negligible, but a huge number of these items, which are said to be lying dormant in people's homes, are called "urban mines." The project to "dig" out the metals to make Tokyo 2020 medals was received warmly when it was announced two years ago.
Komei Harada, an honorary researcher at the National Institute for Materials Science who proposed the idea, said the project team in charge of making the medals had failed to set up a system or create an atmosphere allowing the public to cooperate easily. According to Harada, recycling small home electronics produced 2.3 metric tons of silver in 2016. "What is needed for the medals is to double that figure, and that amount can be collected if people are willing to support the drive," he said.
However, unlike the 1964 Tokyo Games, the upcoming Olympics and Paralympics is tied to commercial sponsors, and it is difficult for municipal governments and recycling companies that are not games' sponsors to use the Olympics and Paralympics name to promote precious metals collection. Under the environment ministry plan, however, elementary and junior high schools will have to foot the bill. "People may come to dislike the games or recycling," said a worried Harada.
Some internet commenters assert that buying silver is cheaper than "urban mining." A Tokyo Games public relations official countered this by saying that it is not a matter of cost. "The medal project was designed to promote a sense of participation and the culture of recycling," explained the official.
But what is the organizing committee going to do if there is simply not enough silver? "It's not like we cannot make medals. There is an established system for procurement," the official said, but did not venture to detail how the system works, saying, "We cannot answer a hypothetical question."

Uncontrollable Olympics

September 12, 2018

Japan's recent typhoon, earthquake are reality checks for Olympic planning: IOC official
AP
https://www.japantimes.co.jp/news/2018/09/12/national/japans-recent-typhoon-earthquake-reality-checks-olympic-planning-ioc-official/#.W5oavfmYSos
An IOC inspector working on the 2020 Tokyo Olympics said Wednesday the powerful typhoon and deadly earthquake that hit Japan in the last 10 days have been a wake-up call for organizers.
The most powerful typhoon in 25 years left 11 dead in the Osaka area of western Japan when it struck Sept. 4. A few days later, a deadly earthquake hit the northern island of Hokkaido and killed about 40.
John Coates, an Australian who heads the inspection team, said what happened "has hit home to me."
Coates helped organize the 2000 Sydney Olympics. He said organizers there simulated disasters.
"You don't have to dream anything up in this country," he added. "It's very sad to say."
He said disaster preparation "is being factored" into the planning.

The other uncontrollable problem could be Tokyo's searing heat, which set records this summer with temperatures soaring regularly over 38 degrees.
Coates, an International Olympic Committee member, said that body favored going onto daylight saving time.
"It does seem a very good solution to us," Coates said.
Yoshiro Mori, a former Japanese prime minister and head of the local organizing committee, has asked the Japanese government to consider moving the clocks forward.
Japan does not change its clocks as many countries do.
Mori has turned down suggestions of switching the games to October when temperatures are cooler. The 1964 Tokyo Olympics were held in October.
Organizers also confirmed what was long known: the swim finals will be held in the morning, as they were in Beijing in 2008.
This is primarily to accommodate the American broadcaster NBC, which will telecast the finals live during evening viewing hours in North America.
There is some local resentment of scheduling events to accommodate foreign broadcasters.
Finals are scheduled from 10:30 a.m.-12:30 p.m. local time. Preliminary heats will be from 7-9 p.m. local time. The first final will be the men's 400-meter individual medley on July 26.
"It's in the morning, but it's 10:30 or 11. That's not abnormal hours," said Koji Murofushi, a former Olympic gold — and silver-medalist in the hammer throw, who is the games sports director.
Organizers also announced plans to start recruiting 80,000 unpaid volunteers. A Japanese reporter told Coates there was some criticism in Japan about using volunteers.
"They are hinting that it is similar to forced labor," she said.
An Associated Press study several years ago showed that using unpaid volunteers saved the IOC at least $100 million, maybe more.
"Volunteers are volunteers," Coates replied. "And they don't have to apply if they don't want to."
The IOC generates almost $6 billion in income over a four-year Olympic cycle. Coates explained 90 percent of the money goes back to national Olympic bodies, sports federations and local organizers.
"The economics of it necessitates having to have volunteers," Coates said. "They get trained, they get their uniforms. They are part of something very exciting."
He added: "I think it's a fine model … and I don't think there's a case for paying volunteers."
IOC members receive per diems of between $450-900 when they are on Olympic business, and other generous perks like paid lodging at top hotels.
In other business, organizers announced the Olympic torch will be kindled on March, 12, 2020, in Greece. The handover ceremony to Japanese organizers is set for March 19 with the torch arriving in Japan on March 20.
The flame will be displayed in three northern prefectures hit by the 2011 earthquake and tsunami until March 26 when the relay begins from the Fukushima region and runs across Japan's 47 prefectures.

Corruption endemic to Olymics process

January 12, 2018

VOX POPULI: Corruption seems to be endemic to the Olympic process

http://www.asahi.com/ajw/articles/AJ201901120028.html

Vox Populi, Vox Dei is a daily column that runs on Page 1 of The Asahi Shimbun.
The job of Olympic consultants is said to gather--and sell--accurate information concerning members of the International Olympic Committee to the cities bidding for the Olympic Games.
The process of information gathering is so thorough that the consultants even go so far as to mine each IOC member's personal data, such as whether the individual is happily married, how many children he/she has, if there is any topic he/she resents discussing, and so on.
In 1998, a bribery scandal surfaced in connection with Salt Lake City's candidature for the 2002 Winter Olympics. Many IOC members were forced to resign for accepting expensive gifts that ranged from cash to a scholarship for a member's son.
After this scandal, the IOC banned visits by its members to candidate cities, thereby blocking direct contact between the parties.
But ironically, this opened the doors wide to the Olympic consultancy business. "No successful bidding without consultants" became an axiom.
And now, with next year's Tokyo Olympics drawing near, another allegation of corruption has surfaced.
Tsunekazu Takeda, president of the Japanese Olympic Committee, has been under investigation by French judicial authorities. The allegation against the Japanese bidding committee is that payments it made to a Singaporean consultancy firm were meant as bribes for IOC members.
Takeda was questioned by prosecutors in Paris last month.
"Revenge is a dish best served cold" is a saying that originated in France, a nation that prides itself on its gourmet tradition. It means that anyone planning a revenge should be patient and plan thoroughly.
One fleeting suspicion that arose in my mind was that the French could be trying to get even with us Japanese for indicting Carlos Ghosn, a much-respected figure in France.
After all, there is the Japanese saying, "Edo no kataki wo Nagasaki de utsu," which may translate as "to take revenge on someone in an unlikely place."
But, no, matters are obviously much more complex than I had imagined for even a second.
In any case, just when Japan seemed to be getting ready for the big event next summer, we get hit with this disturbing development so early in the new year.
The Olympics are a truly tricky business.
--The Asahi Shimbun, Jan. 12

Vox Populi, Vox Dei is a popular daily column that takes up a wide range of topics, including culture, arts and social trends and developments. Written by veteran Asahi Shimbun writers, the column provides useful perspectives on and insights into contemporary Japan and its culture.

Letter from Amb. Murata about the Olympics

Dear Friends,

The International Community is increasingly concerned about the Tokyo Olympic Games.

The February 3, 2019 edition of the *Washington Post* published an article about the present tragic situation in
Namie town in Fukushima prefecture where family separations continue and vacant houses are being torn down.
(https://www.washingtonpost.com/world/asia_pacific/near-site-of-fukushima-nuclear-disaster-a-shattered-town-and-scattered-lives/2019/02/02/0dea7886-1e8c-11e9-a759-2b8541bbbe20_story.html?noredirect=on&utm_term=.43dccd79b04f)
The Tokyo Olympic Games cannot serve as a perfect cover-up for the present situation in Fukushima.

The February 1, 2019 edition of the *People's Daily of China* carried an article on President Xi-Jinping's meeting with
President Bach of the IOC in which the former repeatedly referred to the importance of integrity in making preparations for the Winter Olympic Games in Beijing. His concern seems to reflect the impact of the
serious problems connected to the Tokyo Olympic Games, including the latest actions of the French prosecution
office in investigating possible corruption. For this reason, President Xi's remarks are considered opportune and important.

We notice mounting criticism regarding the hosting of baseball and softball games in Fukushima prefecture.
This criticism can no longer be ignored for obvious reasons.

The February 6, 2019 edition of *Sankei* newspaper reported that demonstrations had taken place in London
protesting against Japan's restarting of commercial whaling and calling for a boycott of the Tokyo Olympic Games.

The IOC and the JOC should also bear in mind that the International Community has not forgiven the huge, immoral
lies claiming the Fukushima Nuclear Accident was "under control" or that "July-August is ideal" for hosting the Olympic Games.

Please allow me to count on your understanding and support.

Former Japanese Ambassador to Switzerland

"Reconstruction" Olympics?

February 27, 2019

'Reconstruction Olympics' theme said not to have caught public eye

AOMORI, Japan (Kyodo) -- Half of 42 municipalities in northeastern Japan hit by a massive earthquake in 2011 said the public is not fully aware of the government's efforts to showcase the region's recovery from the disaster through the 2020 Tokyo Olympics, a Kyodo News survey showed Wednesday.

- 【Related】Olympics: Tokyo to invite children from disaster-hit prefectures
- 【Related】Olympics: Tokyo 2020 adds test events including basketball, baseball
- 【Related】Olympics: 2020 torches to be made of recycled aluminum from Fukushima

The heads of 21 local governments in Fukushima, Iwate and Miyagi prefectures said in the survey that the "reconstruction Olympics" theme has yet to fully catch on among the public.
Asked whether the slogan has gained public attention, two mayors said "it has not" while 19 mayors said "it mostly has not." Eighteen said "it has a little" and two said "it has." The remaining municipality -- the Fukushima city of Soma -- did not answer.
"The phrase 'reconstruction Olympics' was thought up but no substantial progress has been made and the affected areas feel left behind," said an official of Minamisanriku town in Miyagi Prefecture. "We have limited manpower and cannot spare personnel for Olympic events."
"The sporting event will be held under the banner of the 'reconstruction Olympics' but venues are centered on Tokyo," said an official of Otsuchi town in Iwate Prefecture.
The Tokyo Olympic Organizing Committee has promoted projects involving the disaster-stricken areas, such as holding baseball and softball games in Fukushima and starting the Japan leg of the Olympic torch relay in the prefecture, which was also hit by a nuclear crisis in the wake of the earthquake and subsequent tsunami.
Before the relay, the flame will be displayed in the three northeastern prefectures.
The Fukushima city of Iwaki appreciated the move to highlight the recovery of the affected areas in the Summer Olympics. "Fukushima will be hosting some games and the torch relay will start here. We have been given certain roles to play," a city official said.
Asked what they expect from the Tokyo Games in a multiple-choice question, the biggest group of 36 mayors picked "promoting our progress toward recovery," while 20 mayors, mainly from Fukushima, chose "overcoming reputational damage."
"We want to use the Olympics as a chance to regain sales channels for our farm products," said an official of the Fukushima town of Namie.
Hisashi Sanada, a professor of the anthropology of sport and Olympic history at the University of Tsukuba, said efforts by the central government and the organizing committee to promote reconstruction through the sporting event were "not enough."
"The state needs to explain in detail to municipalities what kind of support it can offer and the local governments should also rack their brains about how to link (the Olympics) to regional development," Sanada said.

Missing volunteers for the Olympics

February 23, 2019
Disaster-hit Fukushima still short of volunteers for 2020 Games

Kyodo
https://www.japantimes.co.jp/news/2019/02/23/national/disaster-hit-fukushima-still-short-volunteers-2020-games/#.XHKNU7jjLyQ

FUKUSHIMA - Fukushima Prefecture is still well short of its target for recruiting volunteers to help it stage some events during the 2020 Tokyo Olympics and Paralympics — a setback in its efforts to showcase its recovery from the 2011 earthquake, tsunami and nuclear crisis.
With the recruiting deadline set for the end of this month, the prefecture, due to host several softball games and a baseball game, is only a third of the way to its target of 1,500 volunteers.
Of the 503 people who had applied as of early February, 70 percent were in their 40s or above, with much lower participation from those in their teens and 20s, according to the prefecture.
Prefectural officials said the low number of applicants may be because the schedules for most of the games have yet to be set, while also acknowledging that promotion efforts have barely paid off.
One of the main themes of the Tokyo Games is to demonstrate Japan's reconstruction from the 2011 disasters, and Fukushima, one of the hardest-hit areas, wants to use the opportunity to illustrate the progress it has made and convey a message of gratitude for support. It also hopes to promote inbound tourism.
The prefecture has increased events aimed at recruiting volunteers at company offices and colleges, while seeking to reassure potential volunteers that they can always change their minds later and withdraw their applications.
At a recruiting event in early February in the city of Fukushima, around 80 people gathered to listen to a presentation by a prefectural official on the role of volunteers.
An 18-year-old high school student who was due to start working this spring noted at the meeting that "getting the schedules soon would make it easier for us to participate."
The first of the six softball games the prefecture is hosting will be held on July 22, 2020, in the city of Fukushima — the first event of the entire Tokyo Games — while the one baseball game it is staging will be held at the same venue on July 29.
But schedules for the five other softball games have yet to be determined.
Two types of volunteers are being sought for the 2020 Games. Those who will volunteer during actual events are recruited by the Tokyo 2020 organizing committee, while city volunteers such as those Fukushima is seeking to recruit, are organized by local governments and will provide transport and sightseeing information to visitors, among other roles.
"Whenever the opportunity arises, I want to call out for more volunteers by stressing how attractive (the job) is," said Takahiro Sato, head of the prefecture's Olympic and Paralympic promotion office.

Tohoku flowers in victory bouquet

March 3, 2019
Tohoku flower growers putting the petals to the Olympic medals
http://www.asahi.com/ajw/articles/AJ201903030006.html

By ISSEI SAKAKIBARA/ Staff Writer

Flower growers in northeastern Japan are reviving an Olympic tradition to symbolize the resilience and perseverance of not only the medal-winning athletes but also the disaster-stricken Tohoku region.
The Tokyo Organizing Committee of the Olympic and Paralympic Games has decided to award all medalists a "victory bouquet" as an extra prize at the event next year.
The committee plans to feature flowers from the region devastated by the 2011 Great East Japan Earthquake, tsunami and nuclear disaster, and it expects the Olympics to play a part in rebuilding from the triple disaster.
Gentian and eustoma from Miyagi and Fukushima prefectures are currently in the running to be featured in the bouquet.
"It is encouraging and heartening for growers that our flowers will be featured in the Tokyo Games," said Hiroshi Kawamura, a 63-year-old flower grower in Namie, Fukushima Prefecture.
The entire town of Namie was evacuated in the aftermath of the triple meltdown at the Fukushima No. 1 nuclear power plant. Most areas of the town remain off-limits.
"I hope (the Tokyo Olympics) will become a springboard for revitalizing the flower-growing industry in the disaster-stricken region," Kawamura said.
Presenting a flower bouquet to winners at an Olympic medal ceremony was a tradition up until the 2014 Winter Games in Sochi, Russia.
But the organizers of the 2016 Rio de Janeiro Olympics and the 2018 Pyeongchang Winter Olympics dropped that tradition because flowers quickly spoil and athletes cannot bring them home due to quarantine issues.
Instead, medalists at those events received a figurine featuring the Olympics logo or a stuffed toy of the official mascot.
In 2015, two years after Tokyo won the bid to host the 2020 Games, people in the flower industry in Japan started urging organizers to bring back the bouquet tradition.
They have developed new breeds suitable for growing in extreme heat, the expected weather in Tokyo between July 24 and Aug. 9, when the Olympics will be held. They have also conducted demonstration experiments of preservation methods that make flowers last longer.
The Tokyo organizers initially considered a ceramic or lacquer work as an extra prize for the medalists. But they are now pushing the idea of adding a flower bouquet to an Olympic memento, which athletes can take home.
The International Olympic Committee (IOC) has approved of the bouquet idea.
The Tokyo organizers said they will discuss the specifics with the IOC, such as shapes of the bouquet and which prefectures the flowers will come from.

“With flowers, I hope to express our gratitude for the people overseas who have provided aid for the Tohoku recovery,” said Nobuo Isomura, the 68-year-old chairman of a national promotion association of flower growers, which also promotes support of agriculture of the Tohoku region.

Gundersen on the 2020 Olympics

March 8, 2019
Atomic Balm Part 2: The Run For Your Life Tokyo Olympics

https://www.fairewinds.org/demystify/atomic-balm-part-2-the-run-for-your-life-tokyo-olympics

Written by Arnie Gundersen
Edited by Maggie Gundersen

Thank you to Fairewinds’ Friends, who have written and called us to share their appreciation for Fairewinds’ post *Atomic Balm Part 1*, and for taking the time to read and understand our analysis of the real reasons the Summer Olympics were placed in Tokyo in 2020.
To begin Part 2, let’s talk about the scientific studies that Dr. Marco Kaltofen and I began together back in 2012. Before the ongoing catastrophe created by the Fukushima meltdowns, the *maximum allowable* radiation exposure emanating from commercial atomic power reactors was 100 millirem per year (1 milli Sievert per year) to civilians worldwide. Because radiation workers receive compensation for the increased body burden they take on by working in a high radiation risk environment, workers were allowed a maximum of 5,000 millirem per year of radiation (50 milli Seiverts of 5 Rem – depending upon which term one is applying). Although that is the legal upper limit, most workers in atomic power industry

actually receive approximately 2,000 millirem per year (20 milli Sieverts or 2 Rem). According to DOE 2016 Occupational Radiation Exposure
Over the past 5-year period, all monitored individuals received measurable total effective dose (TED) below the 2 rem (20 mSv) TED ACL, which is well below the DOE regulatory limit of 5 rem (50 mSv) TED annually.
Since the Fukushima meltdowns, the government of Japan changed the rules by increasing the allowable amount of radiation civilians are subjected to at 20-times higher than was previously allowed, which is almost the same as the highest dose exposure nuke workers may receive in an entire year!
A significant portion of the Olympic games, including men's baseball and women's softball and the Olympic torch run, as well as the soccer training facility, will occur on land that the government of Japan has declared to be part of a "nuclear emergency". This means that athletes and civilians will legally be exposed to *allowable* radiation levels that are 20 times higher than levels that exist at other athletic facilities on any other continent. Therefore, according to the National Academy of Science's Linear No Threshold (LNT) radiation risk assessment, the athlete's risk of radiation related maladies has also increased 20 times higher than if they stayed home.
The people living in and around the Fukushima Daiichi disaster were informed by Japan's government that they must return to their contaminated homes and villages if the radiation levels there were 2 Rem, *even though they are being subjected to daily doses of radiation that is* 20 *times higher than any people living near any nuclear plants in Japan were ever subjected to*.
Rather than completing an effective cleanup, Japan's government is forcing its evacuees to return to their allegedly clean but still highly contaminated homes if they wanted to continue to receive their financial refugee stipend. There are three fundamental problems that make the exposure to Japanese civilians much worse than the new dose limit.

The first problem is with the government of Japan's clearance criteria that only areas in and around homes have been allegedly decontaminated. I measured radiation along highways and then 50-feet into the surrounding woods, only to find that the woods remained highly contaminated, so that when it rains or snows, or the wind blows the dust or pollen from the woods, that radiation migrates back to people's supposedly clean and radiation-free homes. I went to the top of 4-story high rooftops in Minamisoma that had been completely cleaned and repainted following the meltdowns. These rooftops were recontaminated by dust on the wind, blowing in radiation from the surrounding mountains. Peoples' homes and communities that were claimed to be clean are indeed being recontaminated every day.
The second problem is that the government of Japan is measuring only one type of radiation prior to forcing the refugees to return. Only the direct radiation from cesium is being measured with handheld Geiger Counters. Such measurements are the measurement of external gamma rays that travel through the human body uniformly, much like X-rays. Dr. Marco Kaltofen and I have long noted that ingestion of small radioactive particles, called hot particles or fine radioactive dust (or nanoparticles), migrate into peoples' lungs and GI systems causing internal organs to receive heavy radiation doses for years on end. TEPCO and the government of Japan are ignoring the presence of these hot particles.
The third and final problem is that some hot particles are extraordinarily radioactive, much more so than the average hot particles. In a peer-reviewed paper that Dr. Kaltofen and I wrote, we detail our scientific research which proves that more than 5% of these particles are up to 10,000 times more radioactive than the average of all 300-particles we studied. Of course, this means that peoples' internal organs are constantly bombarded with extraordinarily high levels of radiation, much higher than the civilian evacuees are subjected to.

These three additional selfie-videos that I took while in Fukushima during September 2017 show what is really happening near Fukushima. We cannot forget about the magnitude of these exposures to all people in order to create an image of normalcy by Japan's hosting of the Tokyo Olympics.

The migrating radioactive dust from Fukushima has had and will continue to have a devastating effect on thousands of people who lived near the reactors and are now being forced to return as well as hundreds of thousands who reside much further away. Highly radioactive samples were found as far away and in such populous places as Tokyo. In its effort to try and restore everything to the way it was before the triple meltdowns, the government of Japan has failed to realize that Japan and in fact the world, is a much different place than it was before the Fukushima Daiichi disaster. Japan continues to force refugees to return to contaminated villages and is marketing what can only be irradiated products from Fukushima. Cleaning up after a nuclear meltdown is no easy task, in fact a total clean-up is technically impossible, by slapping Band-Aids and quick fixes onto the problem instead of acknowledging the scope, severity, and root causes of the issues, the politicians and government officials of Japan and TECPO are endangering the lives of thousands of Japan's citizens in order to protect their political standing, personal financial status, and the wallets of the nuclear industry.

According to the Asia Pacific Journal (AJP) last week, in a brilliant essay written by University of Chicago professor Dr. Norma Field, a Robert S. Ingersoll Distinguished Service Professor in Japanese Studies in East Asian Languages and Civilizations:

We might pause over predictions that the 2020 Olympics-Paralympics may end up costing 3 trillion yen (approximately 26.4 billion USD), many times the original budget for what was promised to be the most "compact Olympics" ever. These games are often touted as the "recovery Olympics" (fukkō gorin).

It is not hard to conjure ways that these monies might have been used to benefit the entire region afflicted by the triple disaster and especially, the victims of the enduring nuclear disaster. A pittance of the Olympics budget would have sustained modest housing support for evacuees, compulsory or "voluntary." Instead, the highly restricted, arbitrarily drawn evacuation zones have been recklessly opened for return of evacuated citizens despite worrisome conditions prevailing over wide swaths of the region.

The Olympic soccer center that served TEPCO as a base for radioactively contaminated disaster workers (where they slept, donned protective gear, and were screened) has been contaminated by radioactivity yet is scheduled to be the training site for the national soccer team.

In Dr. Field's essay for APJ, which was an introduction to a longer essay by the recently retired Kyoto University Reactor Research Institute professor: Dr. Koide Hiroaki, she wrote:

…As medical journalist Aihara Hiroko observes with not a little irony, "**Surely the Tokyo Olympics will be a superb occasion for displaying 'recovery from disaster,'" but also for revealing to the international community the "real consequences of the human-made disaster resulting from the national nuclear energy policy: the imposition of long-term evacuation and sacrifice on the part of area residents**." **[Emphasis Added]**

Dr. Field's introduction and Dr. Koide Hiroaki's extensive article in *APJ* are crushing to read, yet they do not tell the whole story. I feel it is important to expand upon the ongoing radiation exposures that the 160,000 Fukushima refugees are still experiencing, eight years after the meltdowns. This science, that governments are hiding from people around the world, is not difficult to understand, especially if we also focus on the desire of world governments to keep alive the ever-intertwined nuclear power and nuclear weapons opportunities they have invested in so heavily -– financially, politically, and emotionally. During my four trips to Japan, and from all the people who have written to Fairewinds from Japan since we first published our book there, I have met, spoken with, or communicated with numerous refugees from Fukushima and truly believe that Fairewinds understands their traumatic losses.

While people world-wide might cheer the Tokyo Olympians, the human perspective should focus on the real victims, those who are being shoved out-of-sight.
The bottom line is that to reduce cleanup costs while spending enormous funds on the Olympics, the government of Japan treats its 160,000 Fukushima evacuees as if they were radiation Guinea Pigs, forcing them to return to recontaminated areas to try and convince the world everything is ok, meanwhile making it difficult for serious scientists to accurately assess the effects of radiation on these evacuees. The billions of dollars being spent on the Olympics would be much better used to help those displaced by the Fukushima Daiichi disaster. Help these families find permanent homes and employment and new supportive communities far away from the contaminated areas that they are now forcibly being returned to.

"Recovery Olympics", really?

March 10, 2019
'Recovery Olympics' moniker for 2020 Games rubs 3/11 evacuees the wrong way

https://www.japantimes.co.jp/news/2019/03/10/national/recovery-olympics-moniker-2020-games-rubs-3-11-evacuees-wrong-way/#.XIUMrLjjLyQ

by Magdalena Osumi
Staff Writer
This is the fourth in a series examining how the northeast and the nation are progressing with efforts to deal with the March 2011 earthquake, tsunami and nuclear crisis.
ISHINOMAKI, MIYAGI PREF. - The town of Rifu on the outskirts of Sendai is set to host 10 soccer matches during the 2020 Olympics and Paralympics in line with the organizers' plan to tout the games as the "Recovery Olympics."
For Rifu, expectations are high the 2020 Games will draw international attention and lure more tourists, as Tohoku's tourism sector struggles to recover from the Great East Japan Earthquake and ensuing tsunami on March 11, 2001. As part of the plan, an arena in Miyagi Prefecture is set to get a face-lift for the games.
"It's an honor for us to host such a large-scale event," said Fumitsugu Komatsu, who manages the facilities selected to host soccer matches in 2020.

The central government hopes the quadrennial sports event will serve as a platform to show that the nation has recovered from the disasters.
But recovery wasn't one of the original themes for the Tokyo Games. The concept was added when it became apparent Tokyo wouldn't be able to secure all the venues needed in the capital or its vicinity.
When organizers thus turned to the disaster-hit prefectures of Miyagi and Fukushima, which will host the softball and baseball games, the recovery spin was born, with officials saying the event would contribute to reconstruction.
Moreover, the reconstruction plan for the Tohoku region is expected to end when fiscal 2020 closes in March 2021, putting an end to various central government subsidies that helped both victims and municipalities.
"The Tokyo 2020 Games have become a goal for us to show the region has recovered," said Yasuki Sato, a Miyagi Prefecture official tasked with coordinating the preparations.
But residents in the area view the preparations as something happening in the background. In fact, some believe they are actually hindering the region's recovery.
Setsuo Takahashi, a resident of Ishinomaki, Miyagi Prefecture, whose house was swept away by tsunami eight years ago, is among the skeptics.
"Cheering the victims through sports is a good idea," he said. "But the Olympics have nothing to do with the people who live here. It's a different world, unreachable for us."
What most concerns Takahashi, who is now living in a new house he built in a residential area for the evacuees, is that preparations are taking priority over reconstruction, slowing the process.
Masahiko Fujimoto, a professor at Tohoku University's Graduate School of Economics and Management, said the affected areas may be losing workers to businesses in Tokyo, including for construction projects related to the games.
"The Olympics are, in part, negatively affecting the local economy. The event won't have any impact on the coastal towns," he said.
Indeed, the coast of Ishinomaki, dotted with trucks and cranes, remains largely under construction to restore damaged areas.
"Eight years on, this is still where we are," Akinari Abe, a member of Tohoku University's Volunteer Support Center, said last month as he looked out over the city from Hiyoriyama Park.
"We don't want anybody to tell lies that Tohoku has recovered," said Abe, 30. "People need to realize that the reality isn't so rosy."Many people here worry that after the Olympics, the Tohoku region, with all its struggles, will be forgotten."
The calamity killed at least 15,897, injured 6,157 and left over 2,500 unaccounted for, according to police figures. In addition, of the 470,000 forced to evacuate in the immediate aftermath, 51,778 remained unable to return to their homes as of Feb. 27, according to Reconstruction Agency data.
Nearly all of the 30,000 homes planned for relocation are ready to go in the hardest-hit prefectures of Miyagi, Iwate and Fukushima, plus five neighboring prefectures, including Aomori, Ibaraki and Chiba.
With the infrastructure nearly finished, the focus has shifted to the mental and physical well being of the victims, especially the elderly, many of whom are having difficulty adjusting to new environments after their community bonds were severed.
Former fisherman Koetsu Kondo, 76, moved into a residential complex in Ishinomaki near the Oppa River in October 2017.
"This is my second home now," Kondo said as he covered himself with a quilt from his *kotatsu* (heated table) at his home in late February. His wife, Yoko, opted not to discuss her experience with the calamity.

Before March 2011, the family had lived in a tiny hamlet on the coast. Although their home survived the tsunami, which in some places exceeded 30 meters, the liquefaction damage made returning to the area too risky.

Kondo said he has learned to accept his fate and that he's trying to pick up the pieces of his life. He says he's lucky he has someone to lean on as most of the other evacuees have no one to turn to.

Takahashi, the Ishinomaki man who lost his house and now lives across the street from Kondo, is helping him cope with the grief of losing relatives. The grief runs so deep that Kondo said he chose to rent an apartment near Takahashi so he wouldn't have to cross paths with his cousin, who lost his eldest son and wife in the tsunami.

"I can't look him in the eyes — it's too painful," he said. "They say time's a healer but that's a lie. Wounds only deepen with time. Before I go to sleep I still see their faces."

Kondo knows that for elderly men coping with traumatic events, starting anew in unfamiliar surroundings can be too much to bear. Yet he feels he has no choice.

So far, Ishinomaki has built 65 public housing complexes for disaster victims, and 4,456 new apartments are expected to be finished by the end of the month.

"But the construction of public housing is just a step forward toward recovery. The recovery process requires a support network to ensure a sense of security," said Hiroaki Maruya, a professor at Tohoku University's International Research Institute of Disaster Science who specializes in social systems for disaster mitigation. "The real recovery process starts after the survivors settle down."

The municipalities in the region are well aware of the challenge.

"We're concerned that such turmoil in their lives will exacerbate stress-related health problems; we worry this may lead to the rise in solitary deaths and suicides," said Hiroshi Oka, manager of Ishinomaki's recovery planning section, adding that stress-related problems are prevalent in seniors.

The Ishinomaki Municipal Government has launched a campaign to prevent suicides through medical consultations, including relaxation classes and other forms of support. The city also periodically conducts checkups on evacuees in the designated recovery districts.

According to Oka, data shows that the health of an evacuee begins to deteriorate after spending a year in a new neighborhood. Oka said some 80 percent of the evacuees in the recovery districts live alone or with only one family member.

Financial problems add to their struggles by preventing them from moving out of temporary housing.

Ishinomaki's plan calls for having everyone in temporary housing moved to so-called recovery housing — apartment complexes instead of makeshift shelters — by the end of March. But as of the end of February, 807 Miyagi residents, including 203 in Ishinomaki, had yet to do so, their governments say. Subsidized rent for the new facilities will be terminated at the end of March 2021.

The authorities say they are now seeking ways to assist the evacuees from that point on.

"The 10-year period we had thought would suffice doesn't seem enough" to help communities recover, said Tomoharu Terashima, who manages one of the recovery task forces from Miyagi Prefecture.

"Reconstruction has taken too much time, so we're asking ourselves if after 10 years we can pull the plug," he said.

The Reconstruction Agency, which was set up to coordinate reconstruction efforts after 3/11, will also soon be dissolved. The Land, Infrastructure, Transport and Tourism Ministry and the Health, Labor and Welfare Ministry are expected to absorb its projects.

Experts warn of more challenges ahead.

Maruya, the Tohoku International Research professor, said the biggest problem is that many people fled areas that were already struggling with shrinking and rapidly graying populations. Most have no plans to return.

“Those who have left and settled down, found new jobs and sent their children to new schools won’t come back just like that” despite the new housing facilities, elevated ground and restored infrastructure, he said. “Because people are not coming back, it may all be in vain.”

The entire community, in fact, will likely disappear, Maruya said.

“For a region already struggling with rapid graying and depopulation before March 2011, it won’t be possible to bring back the population or restore industrial prosperity.”

Michio Ubaura, a Tohoku University professor with expertise in regional and urban reconstruction, says the disaster-hit areas are home to an aging population and a growing number of vacant homes — the same challenges other towns in Japan face.

The quake and tsunami, however, accelerated these demographic woes, forcing small towns in the region to deal with them decades earlier.

“Projections from before the disaster are becoming reality 10 or 20 years earlier than predicted,” he said. “What we’ll see in a decade is what we had expected to see in 30 years.”

When night falls in Ishinomaki, lights can be seen dotting the area around some of the aging temporary housing units where those who can’t afford to leave still live.

In contrast, a huge cauldron that was kept alight throughout the 1964 Tokyo Olympics has been put on display nearby as a symbol of recovery ahead of the 2020 Games.

“The previous Olympics gave us hope for a better life,” said Takahashi. “But the 2020 Games we can’t afford to take part in will only benefit Tokyo.”

This is a series examining how the northeast and the nation are progressing with efforts to deal with the March 2011 earthquake, tsunami and nuclear crisis.

Tokyo 2020: The radioactive Olympics (IPPNW)

http://www.radioactive-olympics.org/information-in-english/appeal.html
https://www.fukushima-disaster.de/fileadmin/user_upload/pdf/english/flyer_tokyo_2020_engl.pdf

Tokyo 2020 - The Radioactive Olympics

In 2020, Japan is inviting athletes from around the world to take part in the Tokyo Olympic Games. We are hoping for the games to be fair and peaceful. At the same time, we are worried about plans to host baseball and softball competitions in Fukushima City, just 50 km away from the ruins of the Fukushima Dai-ichi nuclear power plant. It was here, in 2011, that multiple nuclear meltdowns took place, spreading radioactivity across Japan and the Pacific Ocean – a catastrophe comparable only to the nuclear meltdown of Chernobyl.

The ecological and social consequences of this catastrophe can be seen everywhere in the country: whole families uprooted from their ancestral homes, deserted evacuation zones, hundreds of thousands of bags of irradiated soil dumped all over the country, contaminated forests, rivers and lakes. Normality has not returned to Japan. The reactors continue to be a radiation hazard as further catastrophes could occur at any time. Every day adds more radioactive contamination to the ocean, air and soil. Enormous amounts of radioactive waste are stored on the premises of the power plant in the open air. Should there be another earthquake, these would pose a grave danger to the population and the environment. The nuclear catastrophe continues today. On the occasion of the Olympic Games 2020, we are planning an

international campaign. Our concern is that athletes and visitors to the games could be harmed by the radioactive contamination in the region, especially those people more vulnerable to radiation, children and pregnant women.

According to official Japanese government estimates, the Olympic Games will cost more than the equivalent of 12 billion Euros. At the same time, the Japanese government is threatening to cut support to all evacuees who are unwilling to return to the region. International regulations limit the permitted dose for the general public of additional radiation following a nuclear accident to 1 mSv per year. In areas where evacuation orders were recently lifted, the returning population will be exposed to levels up to 20 mSv per year. Even places that have undergone extensive decontamination efforts could be recontaminated at any time by unfavourable weather conditions, as mountains and forests serve as a continuous depot for radioactive particles. Our campaign will focus on educating the public about the dangers of the nuclear industry. We will explain what health threats the Japanese population was and is exposed to today. Even during normal operations, nuclear power plants pose a threat to public health – especially to infants and unborn children. There is still no safe permanent depository site for the toxic inheritance of the nuclear industry anywhere on earth, that is a fact.

We plan to use the media attention generated by the Olympic Games to support Japanese initiatives calling for a nuclear phase-out and to promote a worldwide energy revolution: away from fossil and nuclear fuels and towards renewable energy generation. We need to raise awareness of the involvement of political representatives around the world in the militaryindustrial complex. We denounce the attempt of the Japanese government to pretend that normality has returned to the contaminated regions of Japan. We call on all organisations to join our network and help us put together a steering group to coordinate this campaign. The Olympic Games are still two years away – now is still time to get organised. We look forward to hearing from you, with best regards,

For the campaign „Nuclear Free Olympic Games 2020“:

Jörg Schmid
Henrik Paulitz
Alex Rosen

Press Release IPPNW Germany March 25 2019

"Tokyo 2020 - The Radioactive Olympics"

Tomorrow in one year, on March 26 2020, the Olympic torch relay will start in the radioactively contaminated Fukushima Prefecture. This is why tomorrow, a group of anti-nuclear oranizations in Germany, Switzerland, France and Japan will launch an international information campaign entitled „Tokyo 2020 - The Radioactive Olympics”. The campaign will focus on the ongoing radioactive contamination of parts of Japan due to the nuclear catastrope of Fukushima, which began eight years ago.

Dr. Alex Rosen, chairman of the German affiliate of the International Physicians for the Prevention of Nuclear War (IPPNW), one of the principal organizations behind the campaign explains: „We are

concerned about the health consequences of radioactive contamination, especially for people with increased vulnerability towards radiation, such as pregnant women and children.“
International regulations limit the permitted dose for the general public of additional radiation following a nuclear accident to 1 mSv per year. “In areas where evacuation orders were recently lifted, the returning population will be exposed to levels up to 20 mSv per year, however”, says IPPNW physician and founding member of the campaign, Dr. Jörg Schmid. “Even places that have undergone extensive decontamination efforts could be recontaminated at any time by unfavourable weather conditions, as mountains and forests serve as a continuous depot for radioactive particles. Now the Japanese authorities are trying to force the people evacuated from the contaminated areas to return by cutting their financial assistance and ending housing schemes for nuclear refugees,” says Schmid.
The campaign, which will continue all the way until the end of the Olympic Games, has a clear message: We denounce the attempt of the Japanese government to pretend that normality has returned to the contaminated regions of Japan”, says Rosen. “Already now, we are seeing an increased rate of thyroid cancers in Fukushima children and adolescents. And this is only the tip of the iceberg. More than 50,000 nuclear refugees continue to live as displaced persons in their own country. At the same time, more and more radioactive refuse is seeping into groundwater and the ocean and the decontamination and reconstruction work is largely carried out by unskilled and uninformed subcontractors, without proper training or protection. Normality looks different.“

Supportes of the Campaign „Tokyo 2020 - The Radioactive Olympics“

- antiatom-fuku
- German-Japanase Community Dortmund
- IPPNW-Dortmund
- Doro-Chiba (National Railway Motive Power Union of Chiba)
- Fukushima Collaborative Clinic
- Granny Peace Brigade, NYC
- IPPNW Deutschland
- IPPNW / PSR SchweizNo Nukes Asia Forum Japan
- Manhattan Project for a Nuclear-Free World
- NAZEN (National Conference for the immediate closure of all nuclear power plants)
- Preserving Deciduous Teeth Netowork (PDTN)
