INTRODUCTION

J'ai « découvert » l'écologie au début des années 70, croisant dans le même temps la pollution, les luttes paysannes et la malbouffe, la médecine qui avait (déjà) perdu son âme, les mouvements sociaux et bien sûr le nucléaire qui a occupé une grande partie de ma vie.

Après la catastrophe de mars 2011 au Japon, j'ai suivi chaque jour une partie des grands journaux japonais anglophones pour essayer de sauvegarder un maximum d'articles ayant trait à Fukushima. L'idée était de conserver une sorte d'archive accessible à tous, qu'ils soient écrivains, journalistes ou tout simplement intéressés.

Le blog « Fukushima-is-still-news » a été poursuivi jusqu'en 2019. Ci-dessous, la conclusion parue le jour où j'ai décidé d'arrêter mon blog.

End of March 2019: Time to stop this blog
29 Mars 2019
Rédigé par fukushima-is-still-news et publié depuis Overblog

I have been collecting and spreading information on the Fukushima disaster for more than 8 years.
More than ever I am convinced that the name of my blog « Fukushima-is-still-news » was aptly chosen. Or perhaps i should have called it « Fukushima should still be news ». What i'm getting at is that i know the disaster is going on and we cannot simply forget Fukushima and turn the page. But the mode of action I chose 8 years ago has its limits and it is time for me to stop this blog.
I don't want the contents to be lost, so I will try and publish the lot with the Éditions de Fukushima so that the information remains available online.
Good bye for now. I am not doing a disappearing act. I'm still there tracking what's going on in the world of nukes.

C'est maintenant chose faite. Le blog *fukushima-is-still-news* est désormais disponible aux Éditions de Fukushima. Une fois de plus merci à mon ami Pierre, qui m'a convaincue à l'époque de tenir ce blog et m'a aidée à le lancer.

Odile Girard

Avertissement

La mise en page de dizaines de milliers de pages étant trop fastidieuse, nous avons préféré dans un premier temps éditer les volumes 7 à 16 sans mise en page particulière plutôt que de risquer de ne jamais les éditer. Chacun de ces livres est donc, dans la version présente, constitué des articles du blog copiés de manière brute. Les articles sont disposés a priori chronologiquement. Nous nous excusons donc pour l'absence de table des matières. La recherche peut toutefois facilement être effectuée par mot clé avec la fonction CRTL + F

Le présent volume est le quinzième d'une collection de 16 ouvrages :

Vol. 1 : Daiichi Nuclear Plant (2012-2014)

Vol. 2 : Daiichi Nuclear Plant (2015-2019)

Vol. 3 : Radioactive Fallout And Waste,
No.4 Fuel Removal,
Nuclear Workers,
and UN Conference

Vol. 4 : Nuke Safety (2012-2015)

Vol. 5 : Nuke Safety (2016-2019)

Vol. 6 : Reprocessing,
Storage Nuclear Waste,
and Decommissioning

Vol. 7 : Practical Problems For The Japanese Population
2012-2014

Vol. 8 : Practical Problems For The Japanese Population
2015-2017

Vol. 9 : Practical Problems For The Japanese Population
2018-2019

Vol. 10 : Health Effects Of Radiation
and Collateral Effects

Vol. 11 : Anti-Nuclear Activity-Opinion

Nuclear Future

What to do with spent nuclear fuel

May 17, 2012

Editorial: Gov't must not fear policy change on spent nuclear fuel

http://mainichi.jp/english/english/perspectives/news/20120517p2a00m0na018000c.html

Well over 10,000 tons of spent nuclear fuel is stored at nuclear power plants across Japan. If the nation's nuclear reactors are restarted, then the amount will only increase.

Up until recently Japan had promoted a nuclear fuel cycle in which all spent fuel was to be reprocessed, with the plutonium extracted from this fuel being used again in nuclear power plants. However, the crisis at the Fukushima No. 1 Nuclear Power Plant has shaken this national policy. If the number of nuclear power plants is to be reduced and reliance on nuclear energy decreased, Japan must make major revisions to its nuclear fuel cycle strategy.

To prepare a base for discussion, a subcommittee of the Japan Atomic Energy Commission listed and assessed three options for dealing with spent fuel: the current approach of reprocessing all spent nuclear fuel; a "concurrent" approach of reprocessing some spent fuel and directly disposing of other spent fuel if some nuclear plants are kept in operation; or disposing of all spent nuclear fuel. The concurrent approach would keep the Rokkasho Reprocessing Plant in Aomori Prefecture in operation while preparing to directly dispose of some fuel.

Considering that the government had hitherto been completely devoted to reprocessing spent fuel, there is significance in its listing of direct disposal as an option. The government also can be congratulated for taking a zero nuclear power plant scenario into consideration. However, an overview of government discussions on the issue creates the impression that the government is half-hearted about changes to its policy.

To begin with, the Rokkasho Reprocessing Plant does not have the capacity to handle 100 percent of the spent fuel from Japan's nuclear reactors, and the policy of reprocessing all spent nuclear fuel is a pie in the sky. As such, choosing the "concurrent" options would effectively mean treading the same "reprocessing" path that Japan has been on.

In light of technical issues, safety and cost, we have urged the government to abandon reprocessing and draw the curtains on the nuclear fuel cycle. The subcommittee's findings also back up direct disposal of all spent nuclear fuel as the cheapest option.

In terms of nuclear nonproliferation, there is merit in direct disposal. The subcommittee predicted that plutonium extracted through reprocessing could be used up, but this seems unrealistic. And the practice of stockpiling plutonium, which can be used in nuclear weapons, without any plans to use it is questionable.

At the same time, if Japan were to decide to directly dispose of all spent fuel, then Aomori Prefecture, which had accepted spent fuel on the presumption that it would be reprocessed, could ask electric power companies to take the spent fuel home with them or otherwise refuse to accept it.

It is only natural for the local bodies concerned to raise objections. Surely then, the government should try to achieve a solution by taking responsibility and explaining the need for a policy change to local bodies and the public when it develops measures.

Up until now, the handling of spent nuclear fuel was deemed a private enterprise. The government should clarify its responsibility. The party benefiting from nuclear power needs to bear some of the responsibility for disposing of spent nuclear fuel.

The subcommittee's evaluation will be considered by the Japan Atomic Energy Commission and delivered to the government's Energy and Environment Council. We hope the government can decide on a policy without getting caught up in its past.

What options for nukes?

May 17, 2012

Panel compiles report on future N-fuel cycle

http://www.yomiuri.co.jp/dy/national/T120516004823.htm

Jiji Press

Following a meeting Wednesday, a subgroup of the Atomic Energy Commission issued a final report outlining options for the future of the country's nuclear fuel cycle.

The subgroup gave its evaluation of the options from seven perspectives, including economic efficiency and the impact of policy changes required for some options, but it stopped short of recommending which option to adopt.

"Any option would involve many tasks, and the government faces a tough choice," Tatsujiro Suzuki, who chairs the subgroup of the Cabinet Office commission, told a news conference after the meeting.

Suzuki said which option to take depends on the nation's future reliance on nuclear energy.

The commission will examine the paper and report the outcome to a panel on the environment and energy under the wing of the National Policy Unit. The paper is expected to influence the government's energy policy to be adopted as early as this summer.

The subgroup calculated costs for three scenarios--complete fuel recycling, partial reprocessing combined with disposal, and complete disposal--with assumed nuclear dependence rates between zero percent and 35 percent in 2030.

If Japan chooses complete recycling, which it currently hopes to realize, uranium consumption would be curbed and the amount of radioactive waste would be the least among the options, according to the report.

But this would be economically inefficient, the subgroup said, adding this option would be difficult unless the country begins full operation of its fuel reprocessing plant in Rokkasho, Aomori Prefecture, and develops a practical fast-breeder reactor.

Partial reprocessing would make it necessary for the government to gain support for storage and disposal facilities for spent nuclear fuel, according to the report.

But this option would allow the government flexibility and is considered the best solution if a decision on long-term nuclear energy use will not be reached anytime soon, the subgroup said.

Complete disposal, or burying all spent nuclear fuel underground, would be the best option if the country completely eliminates reliance on nuclear power. This option would be most economically efficient, although the nation would need to research safe fuel disposal technology, the subgroup said.

The organization also presented a possible option of maintaining the status quo until Japan finalizes its policy on nuclear fuel.

This option would give the government time to make preparations for a possible policy change, but would require additional expenses, the subgroup said.

Under this option, the government could choose between starting full operations of the Rokkasho reprocessing plant or dropping the program, according to the report.

Independent information and public trust

http://www.nucnet.org/all-the-news/2012/05/14/fukushima-information-was-challenging-for-regulators-conference-hears
14.05.2012_No93 / News in Brief

Fukushima Information Was 'Challenging' For Regulators, Conference Hears

Policies & Politics
14 May (NucNet): Most nuclear regulatory bodies and international organisations tried to communicate authenticated data during the crisis at the Fukushima-Daiichi nuclear plant, but it proved challenging because reliable information was not always available, a conference heard.

The two-day conference on crisis communication held last week in Madrid heard that public demand for information was "overwhelming" during the weeks following the March 2011 accident, inevitably triggering frustration linked primarily to "diverging national recommendations on health protection measures".

Luis Echávarri, director-general of the OECD's Nuclear Energy Agency (NEA), which organised the conference, said the accident at Fukushima-Daiichi further highlighted the need for clear plans in times of crisis, when independent, objective and fact-based information is critically needed.

The NEA said in a statement that while it was clear from the discussions that regulators should continue to improve their crisis communication plans, public trust is "highly dependent on credibility built over time, far before a crisis occurs".

This implies that regulators should "regularly demonstrate their competence and independence" which will help ensure that their messages will be listened to in a crisis situation," the NEA said.

Toward liberalisation

May 20, 2012

Panel seen urging liberalizing power

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120519003539.htm

A government advisory panel has agreed to recommend that retail sales of electricity to households be totally liberalized, sources said.

The Economy, Trade and Industry Ministry panel of experts on reforms of electrical power systems, chaired by Prof. Motoshige Itoh of the University of Tokyo, said Friday the electricity retail business, including supply to households, should be completely liberalized.

The panel also said the current method used by electric power companies to decide charges should be abolished to introduce competition to the industry. Currently, utility charges are calculated by totaling such costs as labor and fuel and adding a percentage as a profit margin.

The panel also is expected to call for accelerating other steps to liberalize the electricity business, such as separating power generation and distribution of electricity by regional electric power companies, to prevent utilities from having monopolies in their service areas and keeping electricity rates at high levels even after liberalization.

If the reforms are realized, households will have more choices in selecting electricity suppliers, which is expected to result in lower electricity bills.

The liberalization plan for household-use electricity will be included in a new basic energy plan the government plans to compile this summer.

As the electric power industry is expected to accept the plan, the government plans to submit a bill to revise the Electricity Business Law as early as spring next year.

After a period during which the public will be notified of the changes, the new scheme will go into effect as early as around 2015, the sources said.

If the electricity retail business is totally liberalized, consumers will be able to freely choose suppliers from among not only current regional electric power companies but also power producer and supplier firms, which may provide electricity at lower prices, and retail firms specializing in renewable energy resources.

If the current pricing method is abolished, the system that requires the ministry to approve power companies' applications before raising electricity charges will also be scrapped. As a result, power producers and suppliers will be able to freely set power rates.

The ministry on Friday presented to the panel a reform plan for the electricity industry, proposing the creation of a wide-area power distribution network that will enable utilities to supply electricity to each other, and establishment of a new nationwide organization to manage the network.

The ministry has begun negotiations with the electric power industry and other parties concerned to realize the plans.
The industry had opposed such liberalization for many years, but it apparently changed its policy due to the government's hard-line stance.

This spring, the government reviewed the utilities' current billing methods and decided to set upper limits on labor costs that can be reflected in electricity charges.

Electric power companies apparently concluded it would be to their advantage to accept the billing limits because they will make them more competitive when newcomers enter the market under liberalization, according to observers.

The ministry will separately consider measures to ensure electricity supply to remote islands and rural areas where depopulation is under way.

Liberalization of electricity retail businesses has been gradually implemented since 2000.

But even today, households and small stores, whose power consumption accounts for about 40 percent of total electricity use, can buy power only from regional electric power companies in their respective areas.

Earlier this year, Tokyo Electric Power Co. decided to drastically raise electricity rates.

Because ordinary households have no choice but to buy electricity from TEPCO despite the hike, there has been mounting criticism among the public toward the current system, rapidly boosting public support for liberalization.

Call on the US military in case of disaster?

May 19, 2012

Shizuoka governor says he would directly contact U.S. in event of nuke disaster

http://mainichi.jp/english/english/newsselect/news/20120519p2a00m0na010000c.html

SHIMODA, Shizuoka -- Shizuoka Gov. Heita Kawakatsu told U.S. government officials May 18 that he would directly seek U.S. military aid if a crisis hit the prefecture's Hamaoka Nuclear Power Plant.

Kawakatsu made the comment in a closed meeting attended by U.S. Ambassador to Japan John Roos. Later, at a news conference, Kawakatsu said, "After the Fukushima No. 1 Nuclear Power Plant disaster, President (Barack) Obama gave full rights to Ambassador Roos and prepared a team of well over 100 nuclear workers. I said that if there were a similar situation (at the Hamaoka Nuclear Power Plant), I would directly phone the ambassador. The ambassador responded, 'Of course.'"

The Shizuoka Prefectural Government says that the U.S. military in Japan operates under the security treaty with Japan and there are no legal grounds for a governor to call on the U.S. military.

Hideo Ogawa of the prefecture's disaster management department said the governor's comment represented his own thoughts.

Get ready for a no-nuke society

Editorial: Summer electricity savings a step toward a society without nuclear power

http://mainichi.jp/english/english/perspectives/news/20120519p2a00m0na013000c.html

A manufacturer work on fans called "Marugame Uchiwa" in Marugame, Kagawa Prefecture, on May 10. Traditional Japanese paper fans are gaining attention as the country strives to save energy ahead of the summer. (Mainichi)
拡大写真

The government has drawn up measures for summer electricity supply and demand on the assumption that none of Japan's 50 nuclear reactors will be reactivated, calling for energy-saving efforts across the country except in Okinawa Prefecture.

Electricity shortages this summer would restrict people's lives and economic activities. The government bears heavy responsibility for failing to quickly take effective measures while insisting on reactivating nuclear power plants. Electric companies, which have benefited from regional monopolies, should also reflect on their failure to fulfill their responsibility as power suppliers.

That said, energy conservation and power-saving are indispensable if Japan is to break away from nuclear power generation. Both the public and private sectors should ride out the summer with their eyes on a society free of nuclear power.

The government has set energy-saving targets for the service areas of seven utilities, excluding Tokyo and the Tohoku region, where utilities' surplus supply capacity is relatively high. It is considering rolling blackouts in the Kansai, Kyushu, Hokkaido and Shikoku regions to ease possible power shortages.

Fourteen months have passed since the outbreak of the nuclear disaster at the Fukushima No. 1 Nuclear Power Plant. It was earlier predicted that all nuclear power plants in the country would be suspended, triggering a power crunch.

However, the government failed to produce figures on electricity supply and demand until recently, pressuring people's lives as a result.

Utilities have also failed to promote energy conservation. **Instead, they insist on reactivating nuclear power plants, and have continued to promote all-electric homes** even in the aftermath of the nuclear disaster.

While this summer's power shortfall can be described as the price of negligence by the government and utilities, it can also be taken positively as the starting point for efforts toward ridding Japan of nuclear power.

Considering that the rolling blackouts in the service area of Tokyo Electric Power Co. last summer brought chaos to households and businesses, efforts should be made to avoid any power outages this summer.

The possibility of blackouts rises as electricity usage peaks. The government has called on utilities to introduce rates promoting energy-saving during peak hours, as well as "negawatt trading," in which utilities pay for the amount of energy saved.

Curbing peak demand is also expected to restrain excessive investment in power generation facilities and reduce power costs. To that effect, smart meters are indispensable for users to constantly measure power usage and fees, and we urge utilities to promote their use.

The government's latest plans envisage a trading market for small-scale power retailing and more power swapping among utilities. If surplus power is effectively interchanged between utilities, it will not only help overcome electricity shortages, but will also reduce waste at power generation facilities. Furthermore, such efforts could also overthrow the regional monopolies that major utilities have long held.

To depart from dependence on nuclear power generation, measures to curb peak demand and reduce power generation costs are crucial. The government and utilities must speed up their efforts without engaging in blame games.

Seems all's set for liberalisation

May 20, 2012

Panel seen urging liberalizing power

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120519003539.htm

A government advisory panel has agreed to recommend that retail sales of electricity to households be totally liberalized, sources said.

For better or worse, Japan might remain nuclear-free forever

By JOCHEN LEGEWIE
Special to The Japan Times
http://www.japantimes.co.jp/text/nb20120521ve.html

On May 5, Japan's last operating nuclear reactor was shut down, turning it into a nuclear energy-free country. The government is working desperately to restart two reactors in the town of Oi in Fukui Prefecture, but the outcome is difficult to predict.

In fact, some think Japan's nuclear-free status might not only survive the summer of 2012, but become a fact of life forever.

Until a few weeks ago such a scenario seemed unthinkable. The list of arguments for keeping atomic energy is long.

1) Nuclear dependency: Kansai, which is especially dependent on nuclear energy, is facing a shortage of up to 15 percent this summer even with energy-saving measures. Japan overall got 30 percent of its electricity from nuclear power before Fukushima.

2) Industrial resistance: Japan's business sector, especially the influential Keidanren, is lobbying hard for a quick return to nuclear energy. Manufacturers need secure and affordable energy. Many industries simply cannot afford temporary interruptions and might be forced to move overseas. Most businesses are showing signs of energy-conservation fatigue. Japan Automobile Manufacturers Association Chairman Toshiyuki Shiga has already hinted that the auto industry won't be amenable to another shift in business hours to weekends to save energy as it did in 2011.

3) Energy prices: Abandoning nuclear power will force utilities to import more fossil fuel. The total fuel costs of the nine big utilities will rise from ¥3.6 trillion to ¥6.3 trillion, which will translate into a jump in electricity prices of up to 30 percent or higher. LNG sellers in Qatar and Algeria are already starting to exploit Japan's desperate situation by demanding much more than they charge their European peers.

4) Carbon dioxide increase: A major shift to fossil fuels will mean a major increase in carbon dioxide emissions. Japan would spectacularly fail in its public commitments to pare greenhouse gas emissions.

5) Overseas resistance: Despite the shock waves created by the Fukushima disaster, no foreign government has asked Japan to abandon nuclear energy. Last month, the World Economic Forum even warned Japan about making a rapid break with nuclear as it "would jeopardize Japan's energy security."

Yes, the list of arguments is long. But so is the list of hurdles, with the most important being the reactivation of the first reactor. This is where all of Japan's troubles start and may never end. The government will need local support from the region hosting it.

Back in 2011, the government thought this region might be Kyushu, which traditionally had a positive stance on nuclear energy. But then came the scandal in July 2011 in which Kyushu Electric Power Co. workers were urged to pose as citizens lobbying to restart a local nuclear plant. The utility's credibility took a big hit and hasn't recovered since.

Likewise, the chances are low that Niigata will be this region. High hopes had been put on the massive Kashiwazaki-Kariwa power plant. It was the world's largest when it opened in 1997, and the people of Niigata used to take pride in it. But a long series of blunders by Tokyo Electric Power Co. have left the public betrayed, and Niigata Gov. Hirohiko Izumida is unwilling to play ball.

The national government has more to be blamed for than the utilities. It has spectacularly failed in two areas: It hasn't come up with a grand vision for energy policy and hasn't won back the trust of the people.

As of today, there is no independent nuclear watchdog deemed free of political interference. The Nuclear and Industrial Safety Agency is trusted only by 12 percent of the public, according to poll NISA itself conducted in March.

Hence it comes as no surprise the restart of the Oi reactors is opposed not only by the people of Fukui, but also by the governors of neighboring Shiga and Kyoto prefectures.

Add to this the opposition of Osaka Mayor Toru Hashimoto, who recently called for making the consent of every local government within 100 km of a nuclear facility a requirement for activation. According to a Yomiuri Shimbun survey, only six of the 34 governors and municipal heads are willing to consider restarts in their areas. And even then they demand clear safety standards.

The government needs to move quickly and decisively. It needs a neutral oversight body that can be trusted even by nuclear naysayers. Another group of faceless bureaucrats is no longer sufficient. It must include well-known individuals who can lend credibility to the new entity and its decisions.

Japan might take a page from the German government's playbook. Right after the Fukushima accident, the German government established the Ethics Commission, which discussed and subsequently made recommendations on the future of the nation's nuclear policy. It was made up of famous and highly respected individuals including businesspeople, academics and even a cardinal. While the German Ethics Commission paved the way for the country's exit from nuclear power, a similar approach might help Japan actually achieve the opposite — a restart, however temporary, of the nuclear power business.

At this very moment, the chances that a nuclear reactor in Japan will be reactivated appear to be fifty-fifty. It will all depend on the ability of the government to come up with a clear energy policy, change its disastrous information and communication policies, and address the issue sincerely with the public's interest in mind. Even last week's decision by the Oi Municipal Assembly to back the restarting of Kansai Electric's reactors is no guarantee this will happen.

Just imagine another trust-obliterating scandal or nuclear accident taking place after the next quake. The public reaction will be clear and turn May 5 into the day Japan followed Italy by shutting down its last nuclear reactor — forever.

Jochen Legewie is president of German communications consultancy CNC Japan K.K. (See his blog at www.cncblogs.jp)

What energy mix for 2030?

May 22, 2012

Gov't panel eyes 4 energy mix scenarios for 2030 with focus on future of nuclear power

http://mainichi.jp/english/english/newsselect/news/20120522p2a00m0na018000c.html

A Ministry of Economy, Trade and Industry (METI) panel is in final stages of discussions to compile and present four possible energy mix scenarios for 2030, ranging from zero reliance on nuclear power to no numerical targets for the country's dependence on atomic energy.

Because of conflicting views among panel members on the future role of nuclear power for the country, the Fundamental Issues Subcommittee under METI's Advisory Committee for Natural Resources and Energy has found it difficult to single out a best possible energy mix for 2030.

Therefore, the panel is set to present four possible energy mix scenarios: 1) the ratio of nuclear power in relation to the nation's total power generation in 2030 should be reduced to zero at an early date from 26 percent in fiscal 2010; 2) the ratio should gradually be reduced to 15 percent; 3) the ratio should remain at certain levels between 20 and 25 percent; and 4) no numerical targets should be set. The panel is to compile a set of final proposals and present it to the government's Energy and Environment Council by the end of May so that it would be reflected in the country's basic energy plan due to be drafted before the upcoming summer.

The Fundamental Issues Subcommittee was set up last October to thoroughly review the country's basic energy plan, as public confidence in nuclear power was dented in the wake of the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant. The 25-member panel, which is comprised of experts and other figures from environmental nonprofit organizations (NPOs) and consumer groups, has since been mainly discussing the future vision of the energy mix, including the role of nuclear power.

The panel is headed by Akio Mimura, chairman of Nippon Steel Corp. It has been discussing the best possible energy mix of nuclear power, renewable energy and thermal power as of 2030. The panel has tried to single out a best possible energy mix from six proposals: the ratio of nuclear power to total power generation would be set at zero percent, 15 percent, 20 percent, 25 percent, 35 percent, and no numerical targets.

Proposed revisions to the country's Nuclear Reactor Regulation Law set a "40 year rule," which in principle requires a nuclear reactor to be decommissioned 40 years after its initial operation. The "15 percent" plan -- the ratio of nuclear power to the total power generation -- was not initially on the list of options. But the Resources and Energy Agency estimated in late April that if the "40 year reactor decommissioning rule" was applied, nuclear power would account for 13 to 17 percent of total power generation depending on the number and capacity of newly built nuclear reactors and their operational efficiency.

Therefore, the proposal for a "15 percent" ratio of nuclear power was added to the list. The "zero percent" proposal is aimed at reducing nuclear power dependence to zero earlier than what can be achieved under the "40 year rule."

Under the "20 percent" and "25 percent" proposals, certain levels of nuclear power will be maintained with the construction of new nuclear reactors. The panel is now discussing unifying the two proposals because the ratio of nuclear power to total power generation is to change depending on the degree of renewable energy being introduced.

Because many members of the panel believe that the "35 percent" proposal, which is to increase the ratio of nuclear power to more than 26 percent registered in fiscal 2010 prior to the Fukushima nuclear accident, will not be able to secure "public understanding," it is likely to be dropped from the list of options. On the proposal not to set numerical targets for nuclear power dependence, many panel

members say something to the effect that, "It is the panel's responsibility to show the public what the government will do, and therefore it is difficult for the public to understand without numerical targets."

However, economists turned their back on the proposal to set numerical targets, with some saying, "If the government obliges (nuclear plant operators) to buy insurance against nuclear accidents, the higher the risks, the higher the insurance premiums will be. Unprofitable nuclear reactors will naturally be shut down." They argue that the ratio of nuclear power could change depending on the future energy policy. Because there are persistent calls for leaving it to market mechanisms, the proposal to set numerical targets is expected to remain on the list of options.

Difficult to cut green house gas emissions

May 24, 2012

Even with N-power, reducing emissions is hard

http://www.yomiuri.co.jp/dy/national/T120523005517.htm

The Yomiuri Shimbun

Estimated cuts in greenhouse gas emissions in 2020

(assuming steady progress toward projected ratios of nuclear power generation in 2030; cuts compared to 1990 levels)

			Assumed ratios of nuclear power generation in 2030				
			35%	25%	20%	15%	0%
Assumed annual economic growth of 1.8%	Energy-saving measures	Assuming energy-saving measures well executed	16%	14%	13%	12%	9%
		Current level of energy-saving measures	6%	3%	2%	1%	+1%
Assumed annual economic growth of 1.1%		Assuming energy-saving measures well executed	19%	17%	16%	15%	11%
		Current level of energy-saving measures	9%	6%	5%	4%	2%

Japan may be able to cut greenhouse gas emissions only by up to 19 percent in 2020 from 1990 levels under a scenario that would see the ratio of nuclear power generation reach 35 percent by 2030, according to estimates released Wednesday by an Environment Ministry council.

The Central Environmental Council's estimates suggest it will be difficult for Japan to achieve the Democratic Party of Japan-led government's target of a 25 percent reduction in greenhouse gas emissions by 2020--even if it purchases emissions quotas from overseas.

The council compiled the estimates in the wake of the crisis at the Fukushima No. 1 nuclear power plant following the earthquake and tsunami on March 11, 2011.

It first assumed five different government-set nuclear power generation ratios for 2030--35 percent, 25 percent, 20 percent, 15 percent and 0 percent. Nuclear power accounted for 26 percent of the nation's power supply before the disaster.

The council also took into consideration renewable energy, and assumed three different levels of energy-saving measures. It also considered two different economic growth rates. Based on these factors, the council calculated how much Japan would be able to reduce emissions for 30 different scenarios.

According to the estimates, greenhouse gas emissions could be cut 6 percent to 19 percent if nuclear power generation accounted for 35 percent of total electricity production in 2030.

If the ratio is reduced to 15 percent--an assumption based on a government policy to restrict nuclear reactor operations to 40 years--emissions could be reduced by 1 percent to 15 percent.

The estimates also showed that reduction rates would only reach 11 percent at most if nuclear power generation reached 0 percent. In this scenario, greenhouse gas emissions would increase by 1 percent if Japan achieved a growth rate of 1.8 percent.

The largest reduction in greenhouse gas emissions can be achieved if Japan sets its nuclear power generation ratio to 35 percent. This, however, is considered unlikely by the Central Environmental Council, as well as an Economy, Trade and Industry Ministry committee dedicated to researching power generation ratios for 2030.

The 25 percent reduction target submitted to the United Nations also includes overseas emissions quota purchases and carbon sinks, in which natural reservoirs such as forests absorb carbon dioxide, but it does not specify how these methods can contribute to a reduction in greenhouse gas emissions.

Under the Kyoto Protocol, a framework for greenhouse gas reductions from 2008 to 2012, Japan calculates that overseas emissions quota purchases can cut emissions by 1.6 percent and carbon sinks by 3.8 percent.

Reducing nuclear power to 15% of total power supply

May 25, 2012

Hosono in favor of atomic power comprising 15% of Japan's energy

http://mainichi.jp/english/english/newsselect/news/20120525p2g00m0dm103000c.html

TOKYO (Kyodo) -- Environment Minister Goshi Hosono said Friday he believes Japan's new energy policy, to be released this summer, can be based on the idea of reducing nuclear power to 15 percent of the nation's total electricity supply.

Hosono said "15 percent can be one base," while noting that limiting the operation of nuclear reactors to 40 years is the government's policy and the 15 percent idea is in line with the policy.

But Hosono also said, "A number of options were presented. They are being discussed by experts, and I do not rule out any options."

His comments came a day after an advisory panel to the Ministry of Economy, Trade and Industry explored five options for the future composition of Japan's energy sources.

The five options presented by the panel calls on the government to seek a society where nuclear power represents either zero percent, 15 percent, 20-25 percent or 35 percent in 2030, compared with 26 percent that nuclear energy accounted for in fiscal 2010. The other option calls on the government not to set numerical targets for future energy composition, letting it instead be determined by the market.

Nippon Steel Corp. Chairman Akio Mimura, who heads the panel, said Thursday after the panel's 24th meeting that he aims to finalize the panel's proposals at its next meeting next week. The expert panel's proposals are then to be submitted to the Energy and Environment Council as inputs of the nation's new energy policy to be put together this summer.

Under the conventional energy policy compiled before the Fukushima Daiichi nuclear power plant disaster, the government used to seek an increase in the nation's reliance on nuclear energy to 45 percent of total power supply by 2030 through the construction of new reactors on the basis of figures comparable to the panel's proposed options.

Since former Prime Minister Naoto Kan decided to reconsider Japan's energy policy from scratch in the wake of the nuclear crisis, triggered by the massive March 2011 earthquake and tsunami, the panel has been mulling policy options for the nation's future energy mix composition.

About the 40 year "limit"

June 14, 2012

New nuclear regulatory body to review 40-yr operation limit: parties
http://mainichi.jp/english/english/newsselect/news/20120614p2g00m0dm029000c.html

TOKYO (Kyodo) -- The ruling and opposition parties agreed Wednesday to include a 40-year limit on the operation of nuclear reactors in an envisioned bill to set Japan's new nuclear regulations, but decided to leave the possibility to review the controversial limit.

"The bill is expected to become one that seeks the new nuclear regulatory commission, after its launch, to swiftly judge (whether the 40-year limit is appropriate)," one of the lawmakers who provided a briefing about the talks between the parties said.

The ruling Democratic Party of Japan, the main opposition Liberal Democratic Party and its ally New Komeito party have also reached an agreement on other key issues, making it likely the envisioned bill will pass the Diet during the ongoing session.

The bill will feature the launch of a highly independent "nuclear regulatory commission" tasked to serve as a key organization to restore public confidence in nuclear regulations that has been shattered in the wake of last year's Fukushima Daiichi nuclear power plant disaster. The commission is likely to be created by September.

The commission would have a legally guaranteed independence unlike the existing Nuclear and Industrial Safety Agency, which has drawn criticism for being under the Economy, Trade and Industry Ministry, a promoter of nuclear power.

The appointment of the commission members will require the approval of the Diet, and all government officials who would serve as the commission's secretariat would basically not be able to return to the offices they originally came from.

Another point of argument has been on whether to retain the prime minister's right to give instructions to related entities at times of emergency, given that former Prime Minister Naoto Kan faced criticism for what some call his "excessive" involvement in trying to contain the nuclear crisis at the Fukushima plant.

During the negotiations, the parties agreed that the right would remain in place but would be "limited" to such cases as urging the regulatory commission to swiftly make a judgment on technical matters.

"The prime minister's right to issue instructions would not affect judgments (reached by the regulatory commission) based on technical knowledge," another lawmaker said.
To enhance the regulatory body's transparency, the commission would be required to report to the Diet how it is handling its work. Donations and aid for research funds to commission members are also expected to be disclosed.

The envisioned bill is likely to stipulate that the commission should act on the assumption that a nuclear accident can happen, given criticism that "a safety myth" of nuclear energy was prevalent among government and utility officials in Japan before the Fukushima accident.

The outcome of the negotiations suggests that the government and the DPJ ended up largely compromising in shaping the country's new nuclear regulation setup.

The government had initially sought to create what it calls a "nuclear regulatory agency" and was skeptical that the opposition parties-proposed five-member commission system could swiftly function in times of emergency.

The plan to place in principle a 40-year operational limit for reactors has also been a key element of the new nuclear regulation the government has been considering, but the latest agreement reached by the parties suggests the provision could eventually be watered down.
Some LDP lawmakers have argued there is no clear scientific basis for setting such a limit in a single uniform way.

Stop relying on nuclear power

June 13, 2012
Editorial: Japan must stick to greenhouse gas reduction bill without relying on nuclear plants

http://mainichi.jp/english/english/perspectives/news/20120613p2a00m0na011000c.html

As the Energy and Environment Council prepares to map out an innovative energy and environmental protection strategy this summer, Japan must stick to its long-term goal of reducing its greenhouse gas emissions by 80 percent by 2050 -- without relying on nuclear power.

The Central Environment Council, an advisory panel to the Environment Ministry, has worked out multiple scenarios that would re-evaluate Tokyo's pledge to the international community to reduce its emissions of carbon dioxide (CO_2) and other greenhouse gases by 25 percent from 1990 levels by 2020.

If Japan were to completely get rid of its nuclear plants by 2030, it could reduce greenhouse gas emissions by only 11 percent at most by 2020, even if renewable energy were introduced on the greatest possible scale. In comparison, if all reactors were decommissioned 40 years after the start of their operational life in strict accordance with government policy, the emission of gases responsible for global warming could be slashed by no more than 15 percent.

Japan cannot sidestep a review of its short-term target for reducing greenhouse gas emissions, as the country is trying to rely less on atomic power in the wake of the accident at the tsunami-hit Fukushima No. 1 Nuclear Power Plant. Still, the importance of preventing global warming remains unchanged. Japan is required to fulfill its responsibility as a developed country to achieve its long-term goal of an 80 percent cut by 2050.

Needless to say, it is not easy to achieve this long-term goal. But with technological innovation, Japan can promote renewable energy and develop energy-saving technology if it works out a strategic and ambitious vision for future energy to overcome restrictions caused by the slash in its reliance on nuclear plants.

Following the outbreak of the Fukushima nuclear crisis, Germany, which is particularly enthusiastic about promoting renewable energy, shut down seven aging nuclear reactors and decided to suspend operations at all of its nuclear plants by 2022. Nevertheless, it has not changed its goal of reducing greenhouse gas emissions by 40 percent from 1990 levels by 2020.

Japan's fiscal 2012 white paper on the environment calls for the introduction of renewable energy, such as wind and solar power, to regions devastated by the March 2011 Great East Japan Earthquake and tsunami to help rebuild these areas. The report estimates that introducing a mere 1 percent of the renewable energy that Iwate, Miyagi and Fukushima prefectures are capable of introducing would benefit these regions economically to the tune of over 8 billion yen.

In July, the government is due to introduce a system under which electric power companies would buy electric power generated by households at fixed prices. The anti-global warming tax, which will be imposed on fossil fuel depending on the amount of CO2 emissions, is set to be introduced in October. The government must ensure that these measures help promote the introduction of renewable energy and environment-friendly devices.

It was agreed at the 17th Conference of the Parties to the U.N. Framework Convention on Climate Change in South Africa at the end of last year to introduce a new framework to replace the Kyoto Protocol in 2020. Negotiations have begun on a framework in which all countries, including the United States and China, can participate.

As part of the new framework, Japan has proposed to introduce a bilateral offset credit mechanism, in which the amount of greenhouse gas emissions reduced through its exports of energy-saving devices and technology would be recognized as part of its own reductions. Such a proposal can win support from the international community only if Japan shows to the world that it is seriously working to prevent global warming, even after the major earthquake disaster.

The draft of a global warming countermeasures basic law, which will provide the legal basis for Japan's numerical target of reducing greenhouse gas emissions, was approved at a Cabinet meeting two years ago. Still, deliberations on the bill have been stalled because of the so-called "twisted" Diet, in which opposition parties control the House of Councillors while the ruling coalition has an overwhelming majority in the more powerful House of Representatives. The legislative branch is strongly urged to thoroughly discuss the bill with the details of the innovative energy and environmental protection strategy fully in mind.

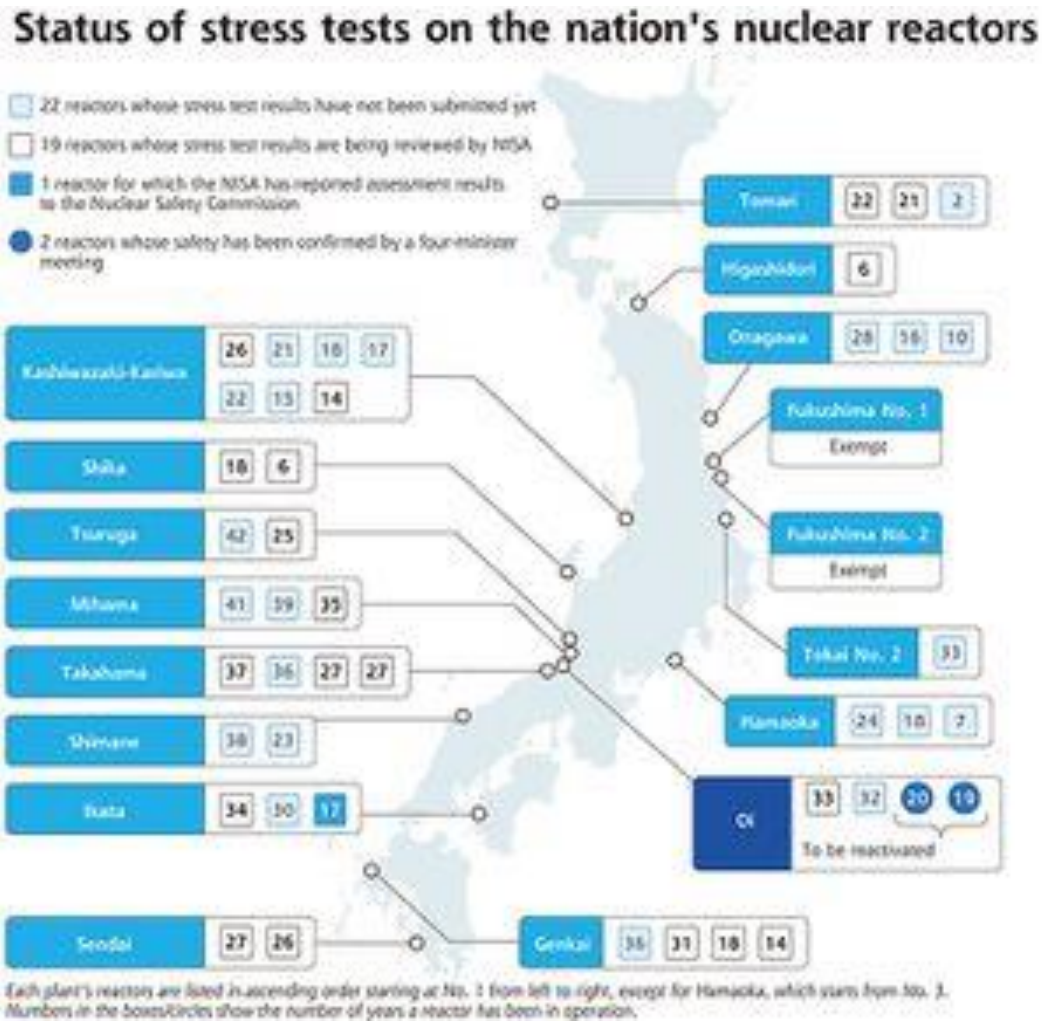
A lot of uncertainty

June 18, 2012

Uncertain prospects loom for post-Oi reactors

http://www.yomiuri.co.jp/dy/national/T120617002371.htm

Masayuki Takata / Yomiuri Shimbun Staff Writer



Now that the government has decided to reactivate the Nos. 3 and 4 reactors at the Oi nuclear power plant in Fukui Prefecture, attention has turned to which will be next among the nation's other 48 idle reactors.

Prime Minister Yoshihiko Noda and three Cabinet ministers in charge of nuclear energy policies gave the green light Saturday to resume operations of the two reactors at the plant run by Kansai Electric Power Co.

Which reactor will be reactivated next is expected to be left up to a new nuclear regulatory commission to be established in August at the earliest. However, there are no clear prospects for restarting more reactors because it has not been decided how the new organization will confirm their safety.

At a press conference held Saturday after the four-minister meeting, Economy, Trade and Industry Minister Yukio Edano said the Cabinet would not decide on reactivating the 48 reactors.

"The new regulatory organization will make its own decisions [regarding the safety of the reactors] independently" from the government, Edano said.

It is unclear, however, to what extent the nuclear regulatory commission will take the current safety standards into consideration when making its assessments.

The current standards, compiled at the request of Fukui Gov. Issei Nishikawa, consist of three main pillars:
-- Whether an operator has implemented measures to prevent a severe accident, such as a meltdown, even if a reactor loses all power.

-- Whether the government has confirmed first-stage stress test results for the reactor regarding whether it can avoid a severe accident even if hit by a disaster as powerful as the Great East Japan Earthquake and the ensuing tsunami.
-- Whether the operator has submitted medium- and long-term safety enhancements.

All the nuclear power plants that operate the 48 reactors have met the first criteria, while stress tests have been conducted for 20 reactors, in addition to the two at Oi.

The industry ministry's Nuclear and Industrial Safety Agency (NISA) and the Cabinet Office's Nuclear Safety Commission (NSC) are supposed to double-check stress test results. However, NISA has approved only the results for the No. 3 reactor at Shikoku Electric Power Co.'s Ikata nuclear power plant in Ehime Prefecture, which is expected to be reactivated following the Oi reactors.

The NSC, on the other hand, has been reluctant to review the stress test results for Ikata's No. 3 reactor, saying it is difficult for the organization to predict its future work because Diet deliberations have been delayed regarding a bill to create the nuclear regulatory commission.

At Saturday's press conference, Edano admitted the current nuclear regulatory system has not been working. "It's difficult to seek cooperation from the NSC," he said.

===
Have to wait till next summer?

The government plans to leave designing a new system to oversee nuclear reactors up to the new regulatory commission, which will be created as an "Article 3 commission" that is independent in terms of budgets and personnel, based on Article 3 of the National Government Organization Law.

A bill for launching the commission, which cleared the House of Representatives on Friday, requires the operational period of reactors to be limited to 40 years. It also introduces a so-called "backfit" rule requiring the utilization of the latest findings and technology for supervising reactors.

It will take about 10 months for the new commission to design concrete standards regarding new regulations stipulated by the bill. It is likely, therefore, that other reactors will not be restarted until next summer if these regulations are taken into consideration in deciding whether idle reactors can be reactivated.

The industry ministry is concerned over possible power supply shortages for this winter, mainly in Hokkaido Electric Power Co.'s service area, if the reactivation of other idle reactors is delayed. Therefore, it hopes operations will be resumed as soon as possible for the Nos. 1 and 2 reactors at the Tomari nuclear power plant in Hokkaido and the Nos. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture.
NISA is reviewing the stress test results for these reactors.

"The government could work with current stress tests and other provisional standards until the new regulations [stipulated by the bill on establishing the new regulatory commission] are implemented," an industry ministry official said.

A government official in charge of establishing the new commission, however, was skeptical.

"If we hasten procedures [on reactor restarts], the public's confidence in the new regulatory commission will be lost, just like it has been with NISA," he said.

In fact, some local governments around the Oi plant have criticized the current safety standards.

A wide variety of expertise for the new nuke regulatory panel

New nuclear power regulatory body to be headed by nuclear reactor expert

http://mainichi.jp/english/english/newsselect/news/20120619p2a00m0na014000c.html

A new nuclear power regulatory commission to be founded by reorganizing the government's nuclear power regulatory bodies will be headed by a nuclear reactor expert, nuclear disaster minister Goshi Hosono said.

Hosono told a House of Councillors Environment Committee session on June 18 that an expert in nuclear reactors should be appointed as chairman of the new regulatory body because its head will be authorized to decide on responses to emergency situations at nuclear plants solely at their own discretion.

The government is required to submit a plan to appoint five members of the commission to the Diet and gain endorsement.

Hosono told the Diet committee that he intends to name experts on nuclear reactors, earthquakes and prevention of exposure to radiation as members of the panel. "It's necessary to utilize a wide diversity of expertise. At least experts in three fields -- nuclear reactors, earthquakes and protection of people from being exposed to radiation -- should join the commission."

The upper house's Environment Committee began deliberations on a bill to set up the nuclear power regulatory commission on June 18.

Yukio Ubukata, a ruling Democratic Party of Japan (DPJ) member of the House of Representatives and one of the sponsors of the bill, told the upper house panel that candidates for regulatory commission members should disclose any donations they have received from nuclear plant operators.

"They should disclose their receipt of such donations before the Diet approves their appointments," he said, adding that those who deliberately cover up such donations could be dismissed.

Ubukata also said guidelines for selecting regulatory commission members will be mapped out before appointing its first members.

Whale and plutonium

June 20, 2012

Japan's tale of two stockpiles

http://www.japantimes.co.jp/text/eo20120620a3.html#.T-G-BlJIwpW

By PETER WYNN KIRBY
Special to The Japan Times

OXFORD, England — Mount Fuji stands as a powerful eco-symbol in Japan, invoked frequently to describe elements of Japanese nature and culture. According to Japanese writers and others, Mount Fuji's towering summit-cone and elegantly balanced slopes convey the remote majesty of nature, the essence of purity, a trove of immutable values, a model of aesthetic perfection, and a store of Japanese reserve, to name but a few.

Yet in illustrating how contemporary Japanese society actually works, the sacred peak faces competition from two other mountainlike entities. Lurking out of the public eye are two problematic stockpiles — of plutonium and whale meat — whose mountainous bulk not only looms over Japanese environmental policy and international relations but speaks to the problems that led to the 3/11 disasters.

Plutonium 239 — perhaps the planet's most dangerous substance — constitutes an environmental nightmare, but still hovers as an unrequited dream to some Japanese policymakers who hold out hope that the substance can provide limitless energy production and energy independence in a time of finite uranium stocks and expensive fossil fuel imports.

To this end, resource-poor Japan has amassed a huge stockpile of weapons-usable plutonium: more than 45 tons, or enough for roughly 5,000 nuclear warheads.

Though not lacking in enthusiasm, Japan's attempts over decades to create a plutonium cycle have proven expensive, misguided, poorly managed and even fatal. Faced with urgent reconstruction obligations in Tohoku, a cash-strapped Japanese government still continues to subsidize a flawed plutonium-energy infrastructure and the storing of this immensely toxic and dangerous substance. With a half-life of over 24,000 years, this budget item could bleed on for a very, very long time, as plutonium is so difficult to utilize safely.

Also troubling is the eerie stockpile of frozen whale meat in Japan, held in a peculiar limbo by skewed policy and declining appetite for whale. Vested Japanese interests defend whaling as a core element of Japanese tradition and the nation's controversial annual "scientific" whale hunt brings back whale meat that can be sold commercially. But in a case of costly political overreach, the gap between high-flown rhetoric and concrete demand for whale meat has led to an expensive storage problem: about 5,000 tons

of frozen whale products that must be kept below minus 18 degrees Celsius for long periods in industrial warehouses.

The costs aren't only financial. Japan's extreme stance on whaling, an example of almost Gallic cultural exceptionalism, means that the Japanese government often finds itself on the back foot when discussing environmental problems with international partners, not to mention cultivating a reputation for treaty-manipulation and doublespeak.

Not only is the whale stockpile the bitter fruit of failed policy decisions, like plutonium, but it is also toxic. Whale and dolphin meat is often high in methylmercury, notorious scourge of Minamata. Though mercury is particularly dangerous for children, whaling interests have tried to offload whale meat at a heavy discount for school lunches to reduce the stockpile and attempt to inculcate demand among young people. For example, a broad survey found that 18 percent of Japanese elementary and junior high schools had served whale during fiscal 2009-10, bought at one-third the price.

Such ideologically blindered disregard for citizen welfare is highly reminiscent of Japan's nuclear industry, of course. Well before the Fukushima nuclear crisis exposed the arrogance, incompetence and venality of Japan's nuclear clique, the nation's plutonium program gave pause.

In theory, a technologically adept and determined nation like Japan could create so-called fast-breeder reactors to produce energy, always yielding more plutonium to fuel power plants in the future. Yet Japan's prototype fast-breeder reactor, dubbed Monju after the bodhisattva representing transcendent wisdom, has performed in a rather more mundane and error-prone fashion. Completed in 1994, the plant tumbled offline in 1995 after a serious sodium leak ignited a major fire and caused extensive damage. A semigovernmental agency's bungled coverup brought infamy upon the plant, its operators and regulators, and the nuclear industry generally.

Fitful attempts to make Monju truly operational in recent years have largely failed. Yet along with sporadic reprocessing efforts elsewhere, the total spending on Japan's ill-conceived plutonium program has reached trillions of yen that could have helped foment a green revolution if instead invested wisely in renewable energy development, for example.

Despite all this, the plutonium juggernaut still lurches on. Just this April — only 13 months after the record Tohoku earthquake triggered Japan's Chernobyl — Japan Nuclear Fuel Ltd. restarted construction on a plant that will produce mixed-oxide fuel (a mix of plutonium and uranium, known as MOX) commercially. While MOX fuel provides a means of (very slowly) using up nuclear waste in existing reactors, it involves great risk. For example, it was the presence of plutonium in MOX-rods in spent-fuel pools at the crippled Fukushima No. 1 nuclear power plant that greatly increased the danger of the crisis.

Such a slow-motion shipwreck of an energy policy quietly plays out against the more widely publicized nuclear difficulties in Japan. Indeed, the awkward plutonium store is a telling result of the policy ineptitude that helped create the post-tsunami nuclear catastrophe.

After more than a year of revelations regarding the cozy, back-scratching ties between members of Japan's so-called "nuclear village," the parallels between Japan's nuclear program and its pro-whaling apparatus are striking. As Jun Morikawa explains in his book "Whaling in Japan: Power, Politics, and Diplomacy," Japan's whaling lobby seems as much to do with protecting ministry budgetary outlays and creating *amakudari* post-retirement sinecures as with the safeguarding of Japanese identity against Western cultural imperialism. Furthermore, stealth efforts to cultivate demand for whale in recent years bear an uncanny resemblance to the aggressive and cynical propaganda campaigns of Japan's nuclear proponents.

At root, both stockpiles are about resources, a long-standing policy fixation of Japanese leaders. While Japan's plutonium glut is at least partly about energy self-sufficiency (and deterrence), the nation's whale meat store remains entangled in domestic concerns over food self-sufficiency and fishing rights. For example, some scientists ("Science," April 26, 2007, page 534) suggest that Japan's "scientific" whaling research findings are actually intended to guide future large-scale whale harvest. Moreover, some Japanese fear that concessions on whaling might bring restrictions on Japan's far more important global fisheries trade.

In a larger sense, though, these two suggestive stockpiles bring up the important question of whether Japan can enact bureaucratic and cultural change to turn the country around at a critical juncture.

Dr. Peter Wynn Kirby is an anthropologist at the University of Oxford and a specialist in nuclear and environmental risk in Japan. His latest book is "Troubled Natures: Waste, Environment, Japan" (2011). (www.uhpress.hawaii.edu/p-9780824834289.aspx)

The Japan Times: Wednesday, June 20, 2012

Simply not ready

June 21, 2012

Crisis plans lag even as Japan's reactors restart

June 21, 2012
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201206210096

THE ASSOCIATED PRESS
If the Oi nuclear reactors plunged into a Fukushima-style meltdown, the only route for escaping or for sending help would be a winding, cliff-hugging road often closed by snow in winter or clogged by beachgoers in summer.

Radioactivity from such an accident at the plant in western Japan could contaminate the country's biggest freshwater source, Lake Biwa, which serves more than 14 million people.

Still, Japan's government has chosen to lift its post-Fukushima nuclear freeze and restart two reactors at Oi, even though construction of an alternative route to the facility is barely on the drawing board and despite the lack of any firm contingency plans for the water source.

The government is pushing hard to get some reactors back online before energy-hungry summer months, despite much public opposition. It says the nuclear industry has done more than enough during the shutdown to guard against meltdown risks -- even in the case of quakes and tsunamis like the ones that struck Fukushima -- and that crisis contingency plans are being revamped nationwide.

But some of the communities around the Oi plant don't feel ready for the startup -- especially given the government's own new guidelines to expand evacuation zones around reactors from the current 10-kilometer (6-mile) radius to 30 kilometers (18 miles).
And they're not the only ones.

Most of the communities around the country's 48 other reactors would not yet comply with new zone, according to local and central government officials and nuclear regulators interviewed by The Associated Press.

"If another crisis hits now, we can't do anything but flee," said Kaoru Tsuchiya, a crisis management official in Shiga province in western Japan, parts of which fall within the new evacuation zone around the Oi plants. "We feel so insecure."

The new guidelines raise Japan's nuclear emergency plans to international standards. But more than a year after the Fukushima crisis, many of the towns still lack safe evacuation routes, radiation monitoring equipment or medicine in case of exposure, leaving millions of residents without adequate protection.

The new criteria, released by nuclear officials in March as a benchmark for coming revisions to national and local master plans, would involve 135 towns in 21 prefectures around the country, affecting nearly 5 million people, according to the Nuclear and Industrial Safety Agency, or NISA.

Currently, 45 of those towns comply with the old contingency plan guidelines. Few, if any, comply with the new ones.
NISA disaster management official Hisatoshi Nakazaki said most of the towns are lagging because they are waiting to see a national disaster plan due later this summer. Local communities must compile their own plans within six months after that.

But in the meantime, they must **make do with whatever preparations they already have made.**

"In an emergency, they have to use the old evacuation plans, think quickly and use discretion," Nakazaki said.
The government decided last weekend to restart the Oi reactors. It said they have passed safety checks and noted they are especially important because they generate electricity for a region that has traditionally been heavily reliant on nuclear power.

The Oi reactors are being prepared now for restarting in July. Reactors at Ikata in southwestern Japan and Tomari on the northern island of Hokkaido are seen as next in line for resumption.

Public opposition to resuming operations remains high, however, because of the March 2011 crisis at Fukushima No. 1 nuclear power plant that turned into the world's worst atomic disaster since Chernobyl and because of lingering distrust of an industry widely seen as opaque.

Critics note that, in addition to the required safety checks, Japan should also mandate full reviews of crisis contingency plans before allowing any plants to operate, which would bring it more in line with rules in Europe and the United States.

The two Oi reactors sit on Wakasa Bay, a region known as Japan's "nuclear alley" and home to a total of 13 commercial reactors. Some of the crucial measures designed to protect residents in case of crisis at Oi won't be ready immediately -- a raised seawall next year and an onsite command center by March 2016.

Filtered vents, which could reduce radiation leaks to the environment, won't be ready for three more years.

The Fukui provincial government started land surveys only this month for the multibillion-dollar project to repair the sole route to the Oi nuclear plant, which sits at the tip of a peninsula, and to add a new alternate evacuation road. Heavy snowfalls and summer beach traffic often clog the existing, 740-meter (810-yard) access road.

Gov. Yukuko Kada of neighboring Shiga province accuses Prime Minister Yoshihiko Noda of emphasizing plant site safety to the exclusion of any discussion of safety procedures in the communities surrounding the plants.
"They still ignore the residents, and that's what angers me most," said Kada, an environmental scientist and independent politician.

Kada said Noda's government has refused to provide radiation simulation data that she has requested to compile an evacuation map and study the impact of radiation on Lake Biwa, where monitoring stations still need to be installed.
"I'm horrified by a thought that another Fukushima-class crisis could instantly make the lake water undrinkable," she said.

The neighboring city ofKyoto -- Japan's biggest tourist destination -- has only a tentative crisis plan, and its first-ever drill is still three months away, city disaster manager Fujio Yoshida said. Its contingency plans need to take into account a large number of foreign visitors, he said.

"Until Fukushima, we never imagined radiation reaching our city, or the need for crisis plans," he said.

The central government has earmarked $105 million to do feasibility studies, upgrade crisis management centers and take other steps to adapt to the new 30-kilometer (18-mile) guidelines.

The idea of expanding the evacuation zones is not new to Japan. A 2006 effort to match the 30-kilometer (18-mile) zone recommended by the International Atomic Energy Agency, was blocked by NISA officials who said it would "trigger confusion and escalate public fear over nuclear safety."

If it had been in place, it could have helped at least some of the 87,000 residents inside a restricted area around the Fukushima plant to evacuate more quickly and safely, officials have said. Within days of the disaster, residents within 20 kilometers (12 miles) of the plant had to be evacuated. Those living outside 10 kilometers (6 miles) had received no training.

In Ehime Prefecture, home to three reactors at the Ikata nuclear plant in southwestern Japan, officials are tackling their update of evacuation plans.

"We need a manual. We have to consider a much larger area than before," said prefectural crisis planning official Noriyuki Onishi. "We have to get started. We can't just wait and worry."

What does "security" mean?

June 22, 2012

Revised nuclear law stipulates aim to ensure Japanese national security

http://mainichi.jp/english/english/newsselect/news/20120622p2a00m0na015000c.html

Legislation enacted by the Diet on June 20 to establish a new nuclear regulatory panel in the wake of the Fukushima nuclear meltdowns contains an appendix revising the Atomic Energy Basic Law to read that the new entity will aim to contribute to Japan's national security.

The revised law is raising concerns that adding a security guarantee runs counter to the principle of limiting the use of nuclear energy to peaceful purposes.

Chief Cabinet Secretary Osamu Fujimura said at a news conference on June 21 that Japan remains committed to using nuclear power only for peaceful purposes and, abiding by the three non-nuclear principles, has no intention whatsoever to convert atomic power to military use.

The Atomic Energy Basic Law stipulates in Article 2 that research into and use of atomic power are restricted to peaceful purposes, championing democratic, independent and public disclosure principles. The appendix in question, however, alters Article 2 of the basic law, adding a sentence requiring the new regulatory body aim to contribute to national security. A similar revision has been made to the Nuclear Reactor Regulation Law.

Although the national security provision was not in the government's original draft bill, amendments submitted in April by the largest opposition Liberal Democratic Party (LDP) and New Komeito mentioned the security issue. Inclusion of the expression in the enacted bill reflects the view of the bill's backers that Japan's high-level nuclear technology is a potential deterrent and should be part of national security policy.

Some members of the House of Councillors Environment Committee on June 20 questioned if Japan plans to declare its intention to build nuclear arms.

In response, nuclear accident minister Goshi Hosono emphasized the government's commitment to honoring the basic law. Masayoshi Yoshino, the House of Representatives member of the LDP who submitted the new regulatory body bill, cited three areas -- security measures by the International Atomic Energy Agency to prevent the military use of nuclear materials, safety of nuclear power and nuclear security to prevent terrorism. Adding "security" to Article 2 means that these issues will be handled by the new regulatory panel, he said.

During the 2008 Lake Toya G8 Summit, Japan proposed an international initiative to address these three fields and consolidate the use of nuclear power only for peaceful purposes.

Initially enacted in 1955, the Atomic Energy Basic Law has been defined as the basic philosophy underpinning Japan's policy of using nuclear technology for peaceful purposes.

It took only four days, however, for the bill establishing the new regulatory entity to win parliamentary passage after it was submitted to the Diet on June 15. There was no full debate on the new panel's "security aim."

Revision of the Atomic Energy Basic Law (Part 2)

June 23, 2012

Editorial: National security clause must be deleted from law on atomic energy

http://mainichi.jp/english/english/perspectives/news/20120623p2a00m0na009000c.html

An addition to the Atomic Energy Basic Law stating that Japan's nuclear energy should contribute to national security has stirred controversy.

The amendment has fueled speculations about its true aim. Some wonder whether the interpretation of the clause could be stretched to open the way for nuclear weapons development. Others question whether the clause is aimed at underscoring the effectiveness of the development and use of atomic power for nuclear power plants and other purposes.

Japan's three non-nuclear principles of not producing, not possessing and not introducing nuclear weapons form the core of its national policy, and the nation's successive administrations have ruled out the possibility of the country developing such weapons of mass destruction.

The basic law limits research, development and use of atomic energy strictly to peaceful purposes, championing democratic, independent and public disclosure principles. As such, one cannot help but wonder whether the national security clause is aimed at changing Japan's basic policy on nuclear energy.

Chief Cabinet Secretary Osamu Fujimura emphasized that "the principle of using atomic energy for peaceful purposes remains unchanged and the government has no intention of diverting such energy to military use." This goes without saying. And if it is indeed true, then misleading expressions should be avoided. We demand that the national security clause be deleted from the law.

The Atomic Energy Basic Law was amended by incorporating the clause into the appendix in the law on the establishment of a nuclear regulatory panel, which was passed into law on June 20.

The clause was not in the original government-sponsored bill. However, the ruling Democratic Party of Japan (DPJ), the largest opposition Liberal Democratic Party (LDP) and New Komeito subsequently agreed to modify the bill and enact it as lawmaker-initiated legislation. At the time, the clause in question was incorporated into the appendix at the request of the LDP.

The Diet spent only four days deliberating the bill after it was submitted, and failed to thoroughly discuss whether Japan's atomic energy policy should contribute to the country's national security. Questions also remain as to whether it is justifiable to revise the basic law through the appendix of a separate law on the establishment of a new nuclear regulatory commission.

National security has been traditionally interpreted as "national defense mainly through military force." There are fears that the development of atomic energy could lead to the development and production of nuclear arms. Therefore, it is of great significance to declare that Japan's use of nuclear energy must be limited strictly to peaceful purposes and draw a clear line between such energy and national defense.

During Diet deliberations, an LDP legislator, who is one of the sponsors of the bill, said security in the law refers mainly to safeguards implemented by the International Atomic Energy Agency (IAEA). However, the meanings of "security" and "safeguards" are different. If the clause incorporated into the basic law is aimed at contributing to IAEA safeguards, it should clearly state that.

Some LDP legislators insist that Japan should maintain its high-level nuclear technology and demonstrate to the world its capability to develop nuclear weapons as a potential deterrent, linking atomic energy to national security.

South Korea responded to the inclusion of the clause in the basic law by saying, "We will watch the true intention behind the amendment and its future impact," against the backdrop of such a persisting idea in Japan.

The phrase, "contribute to Japan's national security," was also incorporated in the Aerospace Basic Act that was enacted in 2008. Moreover, a phrase stating Japan's space development must be limited to peaceful purposes was deleted from the Law Concerning the Japan Aerospace Exploration Agency in its amendments on June 20.

The fact that legislation relating to national security has been passed into law without sufficient discussions amid political confusion over the consumption tax hike has raised grave concerns.

It is high time to address unsolved nuclear issues

June 26, 2012

Editorial: Japan must earnestly take up issue of spent nuclear fuel disposal

http://mainichi.jp/english/english/perspectives/news/20120626p2a00m0na012000c.html

For half a century, Japan has stuck to a "nuclear fuel cycle" policy under which all spent nuclear fuel from the nation's nuclear power plants was to be reprocessed and used again in nuclear reactors. However, no efforts have been made to bring the policy in line with reality. Having experienced the disaster at the Fukushima No. 1 Nuclear Power Plant, the government must now make bold policy changes.

The Japan Atomic Energy Commission last week compiled four options pertaining to the future of the nuclear fuel cycle to correspond with the future of nuclear power generation in Japan.

According to the various scenarios, if Japan were to get rid of all of its nuclear reactors in 30 years, then all spent nuclear fuel should be disposed of directly. If nuclear power covered 15 percent of Japan's power generation by that time, a "concurrent" approach of reprocessing some spent fuel and directly disposing

of other spent fuel would be appropriate, and if the ratio of nuclear reactors stood at between 20 and 25 either a concurrent approach or full reprocessing of spent fuel would be appropriate. Under the zero nuclear plant scenario, operations of the fast breeder reactor Monju would also be halted.

Due to the costs involved, technical issues and safety concerns, we have called for the government to halt reprocessing of spent nuclear fuel and to draw the curtains on Japan's nuclear fuel cycle. The Atomic Energy Commission's options have opened the way for the government to alter its policy on the fuel cycle. It is strange that the government is adhering to a policy of reprocessing.

The nuclear fuel reprocessing plant being constructed by Japan Nuclear Fuel Ltd. in Rokkasho, Aomori Prefecture, doesn't have the capacity to reprocess all of the spent fuel produced by Japan's nuclear power plants. The idea of reprocessing all spent nuclear fuel in Japan was unrealistic from the outset. Since the government is trumpeting a policy of reducing dependence on nuclear power, any adoption of a "concurrent" approach in handling spent nuclear fuel raises serious doubts.

It is not only the cost that is of concern: **From the perspective of nuclear nonproliferation, it is problematic to keep on reprocessing spent nuclear fuel when there are no prospects of using the plutonium that the process would produce as fuel.**

In the Atomic Energy Commission's report on the various scenarios, it should be noted that there are outstanding issues to be addressed no matter which option is adopted. Development of technology and consideration of a system to directly dispose of spent nuclear fuel were left by the wayside under past government policy. The government must quickly take action and seriously consider dry storage of spent nuclear fuel. This is important not only from the perspective of lessening the risks associated with storing spent fuel in pools, but also in terms of securing an interim storage facility for the direct disposal of spent nuclear fuel.

Concerns have been raised that a government switch to a policy of direct disposal of spent nuclear fuel would adversely affect Japan Nuclear Fuel Ltd. and local bodies. It is the government's responsibility to address these concerns. One option could be for Japan Nuclear Fuel Ltd. to engage in other activities such as nuclear plant decommissioning work. Those benefitting from the work associated with such a change could perhaps also be made to bear part of the responsibility for storing the spent fuel. We call on the government to consider these issues.

The final disposal of high-level nuclear waste is an important topic no matter which option Japan selects, and the nation must take up the issue in earnest. Aimlessly continuing to operate nuclear power plants amounts to shifting the burden of spent nuclear fuel disposal onto the shoulders of our descendants.

A probe has been launched into secret meetings held by a subcommittee of the Atomic Energy Commission on the nuclear fuel cycle, which were attended by interested parties. Needless to say, depending on the results of the probe, the commission report on the fate of spent nuclear fuel will have to be reviewed.

TEPCO's nationalization approved

June 27, 2012
TEPCO shareholders approve public bailout plan
http://www3.nhk.or.jp/daily/english/20120627_34.html

Shareholders of the Tokyo Electric Power Company have accepted the utility's proposal to receive billions of dollars of public funds to help rebuild its finances.

The decision, made at TEPCO's annual shareholders meeting on Wednesday, formalizes a plan to effectively put the utility under government control.

The plan calls for the central government to acquire a stake of up to 75 percent in the utility in exchange for an injection of about 12 billion dollars in public funds.

The bailout is seen as a key step in proceeding with compensation for local residents affected by the crisis at the Fukushima Daiichi nuclear power plant.

TEPCO also decided to reshuffle its top executives, with Chairman Tsunehisa Katsumata and President Toshio Nishizawa resigning to take responsibility on the part of management. A majority of the new directors are being appointed from outside the company.

The shareholders rejected a proposal from the Tokyo Metropolitan Government, a major TEPCO shareholder, to allow a third party to examine the grounds for raising electricity rates.

With all its proposals endorsed by shareholders, the utility will begin compiling specific restructuring plans. As the top shareholder, the government will now have a major influence in how the company rebuilds itself and compensates people affected by the accident

Problems with nuclear laws

June 26, 2012

Nuclear laws have serious flaws

http://www.japantimes.co.jp/text/ed20120626a1.html#.T-sqsJFIwpU

The Diet on June 20 enacted a law to establish a nuclear regulatory commission. If the new body is established, it will end the current system, in which the authorities promoting nuclear power generation and the authorities regulating it are virtually integrated in the form of the trade and industry's Nuclear and Industrial Safety Agency. The Nuclear Safety Commission of the Cabinet Office, which proved to be almost useless in advising the government during the darkest days of the Fukushima nuclear crisis, will also be abolished. But the law contains problematic clauses that could overshadow efforts to ensure the safety of reactors and uphold Japan's principle of limiting the use of nuclear power to non-military purposes.

The original bill included a clause that the life span of a reactor will be limited to 40 years in principle, and that in exceptional cases it may be extended once for a total of 60 years. But in consultations among the Democratic Party of Japan, the Liberal Democratic Party and Komeito, it was agreed that a new five-member regulatory commission will be empowered to review the 40-year principle. If the commission members have close ties to the nuclear power establishment, they could emasculate the 40-year principle, thus hampering efforts to end Japan's reliance on nuclear power. It must be remembered that the No. 1 reactor of the stricken Fukushima No. 1 nuclear power plant was more than 40 years old, and in fact had been scheduled to be shuttered, but an extension was granted in the weeks before the earthquake and tsunami struck.

The Diet must approve the appointments of the commission members. It is vital that the government appoints members who have no ties with the nuclear establishment. Any efforts by the establishment to influence the appointments must be stopped.

Another problem with the law is the presence of a clause stating that the safety of nuclear power must also be ensured for the sake of the "security" of the nation. A similar clause was inserted into the Atomic Energy Basic Act, which takes precedence over the newly enacted law. In the Diet, it was explained that the clause was inserted because the new commission will do the work related to the International Atomic Energy Agency's safeguard measures. But the use of the word "security" leaves room for stretching the meaning of the clause, thus theoretically leaving the possibility of allowing Japan to use nuclear power for military purposes. The insertion of the clause was carried out in near-secrecy. The law should be revised to rule out any possibility of using nuclear power for military purposes.

Call for transparency - Give up nuclear power, say shareholders

June 28, 2012

Utility shareholders meet / Nuclear power decried; TEPCO's de facto nationalization OK'd

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120627005756.htm

De facto nationalization of Tokyo Electric Power Co., which will receive a capital injection of 1 trillion yen in public funds, was approved at its regular general shareholders meeting Wednesday in Tokyo.

TEPCO and eight other power utilities that own nuclear power plants held their annual shareholders meetings across the nation on the day, with shareholders demanding the companies ensure management transparency and give up nuclear power.

At the Yoyogi No. 1 Gym in Shibuya Ward, Tokyo, TEPCO's shareholders meeting began at 10 a.m. According to the company, 4,390 stockholders were at the meeting as of 1 p.m., while more and more shareholders continued arriving at the venue even after the meeting was convened.

The management submitted at the meeting proposals related to amendments to its articles of incorporation, which are necessary to receive the 1 trillion yen capital injection from the government.

Any change to the articles stipulating the company's basic rules must be approved, in principle, by more than two-thirds of shareholders in an extraordinary resolution at a shareholders meeting.

The proposals were passed in the afternoon, formally approving the virtual nationalization of the utility.

At the beginning of the meeting, Chairman Tsunehisa Katsumata once again apologized for the crisis at the utility's Fukushima No. 1 nuclear power plant.

"From all the members of the board, we offer sincerest apologies for the incident. Determined to make a fresh start, we'd like to thoroughly streamline the company, make compensation payments over the damage due to the crisis [following the March 11 earthquake and tsunami] and maintain a stable electricity supply for consumers to recover the public's trust," the chairman said.

The power company explained its decision to receive the capital injection of 1 trillion yen from the government's Nuclear Damage Liability Facilitation Fund as part of its comprehensive business rehabilitation program.

At the meeting, a TEPCO official explained the decision, saying, "To complete compensation, decommission damaged reactors and maintain a stable supply of electricity, while avoiding a situation of liabilities exceeding assets, it is absolutely necessary for the company to drastically improve its financial structure."

The company also submitted at the meeting the lineup of 11 new board members, including incoming Chairman Kazuhiko Shimokobe, who formerly headed the fund's management committee, and incoming President Naomi Hirose, who is currently managing director.

Tokyo Vice Gov. Naoki Inose attended the meeting to represent the Tokyo metropolitan government, now TEPCO's largest shareholder.

Inose submitted four proposals, including one in which the metropolitan government calls for the power company to ensure management transparency.

In explaining the proposals, Inose said, "TEPCO should disclose information related to the process of raising electricity rates and secure management transparency," and demanded the company thoroughly cut costs.

In addition to the proposals, Inose expressed opposition to the idea that Katsumata, who was slated to resign as chairman Wednesday after the shareholders meeting, become a "shayu" (corporate friend).

He also demanded the sale of Tokyo Denryoku Byoin, a hospital in Shinjuku Ward, Tokyo, that TEPCO workers use.

With a general shareholder submitting an emergency motion to replace Katsumata with Inose as the meeting's chairman, the atmosphere at the meeting was tense from the start, with some participants raising their voices angrily at the utility's management.

===

Hashimoto: Give up N-plants

Meanwhile, at Osaka's Umeda Arts Theater, a record 3,825 investors had already crowded into Kansai Electric Power Co.'s shareholders meeting as of 1 p.m.

Mayor Toru Hashimoto of the Osaka city government, which is the largest shareholder in KEPCO, said at the meeting: "If the current situation continues, KEPCO will collapse. The company hasn't explained enough about the risk to its future management."

Raising questions about management risks for nuclear power plants, among other issues, Hashimoto demanded KEPCO permanently shut down the nuclear power plants it owns as soon as possible. Similar questions were asked also by individual shareholders.

This is the first time in a decade for the nine power companies that own nuclear power plants to hold shareholders meetings on the same day.

More about Wednesday utilities meetings

June 28, 2012

Local governments turn their backs on utilities

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201206280080

THE ASAHI SHIMBUN

As key shareholders in electric power companies, local governments could not afford to ignore calls to move away from nuclear power.

The nation's nine regional utilities that operate nuclear power plants held annual shareholders' meetings on June 27.

What made the meetings different this year was the nuclear disaster in Fukushima Prefecture and growing public wariness about nuclear power generation amid conflicting signals from the government about energy policy.

A good number of local governments reversed long-standing positions to side with Tohoku Electric Power Co. at the company's meeting.

At issue in this case was the planned construction of the Namie-Odaka nuclear power plant, straddling the municipalities of Namie and Minami-Soma in Fukushima Prefecture, both of which were hard hit by severe radiation fallout last year.

The facility is to be built in the vicinity of the stricken Fukushima No. 1 nuclear power plant, operated by Tokyo Electric Power Co.

Construction work was set to begin in fiscal 2016, according to a Tohoku Electric blueprint drawn up before the Great East Japan Earthquake of March 11, 2011.

When a citizen group shareholder proposed canceling the project, seven local governments, including the Fukushima prefectural government and the host municipalities of Namie and Minami-Soma, gave their unqualified support. This represented a major turnaround in their positions.

"We have been calling for the abolition of all nuclear plants in the prefecture since we announced our program for reconstruction that included a shift from nuclear power generation last year," explained a prefectural official.

The Namie town assembly late last year decided to withdraw its 1967 resolution to co-host the facility. The Minami-Soma municipal assembly has also called for construction to be canceled.

But the prefectural government of Miyagi, which neighbors Fukushima Prefecture, the municipal government of Sendai, capital of Miyagi Prefecture, and some other local governments were opposed to the proposal. They are located further away from the planned site. In any event, the proposal was rejected.

A Miyagi prefectural official explained that the utility did not need to heed calls to include scrapping of the project in its articles of incorporation on grounds it is a one-off project.

Tohoku Electric serves northeastern Japan, the region devastated by last year's magnitude-9.0 earthquake that spawned giant tsunami and triggered the nuclear disaster.

Some shareholders wanted to know if the utility is ignoring the opinion of residents in Fukushima Prefecture, given that anything nuclear these days gives shudders to the local population.

"We would like to show a direction based on the central government's discussion of new energy policies," said Noriaki Abe, vice president of the utility. "Of course, we will take the views of local people into consideration."

At that point, the venue went into an uproar and a moderator had to ask the participants to be quiet.

In total, 67 anti-nuclear power and other shareholder proposals were submitted at the shareholders' meetings of seven utilities. Only Hokkaido Electric Power Co. and Hokuriku Electric Power Co. did not have to deal with such proposals.

Two-thirds support from shareholders with voting rights would have been required for the proposals to be adopted.
All the proposals were killed.

Most shareholders are financial institutions and businesses that have a large stake in the utilities.

The utilities had obtained proxy votes from leading shareholders beforehand, ensuring that the proposals would not get off the ground.

Twenty-eight proposals were submitted to Kansai Electric Power Co., the largest number among the nine regional utilities that held shareholders' meetings that day. It was attended by Mayor Toru Hashimoto of Osaka, the largest shareholder with a 9-percent stake.

Hashimoto presented 10 proposals, which included abolishing all the utility's nuclear plants as soon as possible.
"How will Kansai Electric respond if society is moving toward zero reliance on nuclear power?" Hashimoto asked.
Kansai Electric is more dependent on nuclear power generation than the other utilities.

The cities of Kobe and Kyoto, also shareholders of the utility, jointly called on the company to build a power supply system as soon as possible that is safe and sustainable and does not require nuclear energy.

The joint proposal received backing from 22 percent of shareholders.

At the meeting of Chubu Electric Power Co., a proposal to abandon nuclear power generation was also killed.

But Makinohara, a city within 10 kilometers of Chubu Electric's Hamaoka plant in Shizuoka Prefecture, took a clear stand this year to vote in favor. This was in sharp contrast to the blank vote last year. Shizuoka cast a blank vote this year.

The Tokyo metropolitan government urged TEPCO to improve its customer service and be more transparent about the process of raising electricity rates.

While 21 percent agreed to the metropolitan government's call for better service, only about 10 percent endorsed a proposal by other shareholders to give up nuclear power.

The metropolitan government has a 3-percent stake in TEPCO.

Naoki Inose, vice governor of Tokyo who attended the meeting, raised doubts about the soundness of having a regional utility.

"TEPCO tends to think lightly about its accountability to customers because it has long enjoyed the status of a regional monopoly," Inose said.

He accused TEPCO of not pushing nearly hard enough to restructure, referring to the company's decision to pass up paying bonuses only for this summer.

Inose compared the company's efforts with those of Resona Bank and Japan Airlines Co., which, like TEPCO, were bailed out with government funds and passed up paying bonuses three or four times in a row while they underwent rehabilitation.

He also called on TEPCO's management to disclose all data it used to decide on new electricity rates.

The utility raised the rate for business clients from April and plans to increase the rate for households this summer.
"We are making the proposals as the largest shareholder, a user that pays 50 billion yen ($632 million) a year and the administrator tasked to protect the lives of Tokyo residents," Inose said.

TEPCO continued to dismiss repeated calls to count the number of shareholders supporting the proposals after it moved on proceedings swiftly with approval for its own proposals from hundreds of pro-company shareholders in the front.

Tsunehisa Katsumata, the chairman of TEPCO who served as moderator, said, "We have an accurate grasp of the intention of leading shareholders."

Japan on mid- and long-term energy policy

June 30, 2012

Gov't energy council sets 3 options for energy and anti-global warming policy

http://mainichi.jp/english/english/newsselect/news/20120630p2a00m0na012000c.html

The government's Energy and Environment Council has worked out three scenarios for mid- and long-term energy and anti-global warming policy in 2030.

Scenario 1 calls for total abolition of nuclear power stations by 2030, while under scenarios 2 and 3 the ratio of atomic power to total power consumption in Japan would be lowered to 15 percent and 20-25 percent, respectively.

The panel's proposal states that under scenario 1, all the spent nuclear fuel would be buried. If Japan retains nuclear plants, spent nuclear fuel would be reprocessed or disposed of. In addition to reprocessing the total volume of such radioactive waste under the current policy, the proposal leaves the possibility of fully disposing of it or reprocessing some spent fuel while dumping the reminder.

However, the panel's proposal would not allow the public a direct say in how spent fuel would be dealt with if Japan maintains some nuclear power generation, leaving the decision to the government.

At the request of the panel, the Cabinet Office's Japan Atomic Energy Commission (JAEC) reviewed the nuclear fuel recycling project in light of the government's commitment to reduce dependence on nuclear power, made after the outbreak of the Fukushima nuclear crisis.

JAEC has recommended that some spend nuclear fuel be recycled and the remainder disposed of if scenario 2 is adopted.

However, the Energy and Environment Council neither incorporated this view in its latest proposal nor ruled out the possibility that all radioactive waste will be recycled.

State Minister for National Policy Motohisa Furukawa told a news conference, "The government will release its nuclear fuel recycling policy when it determines the ratio of atomic power" to be retained.

Regarding power sources, Japan would temporarily rely on nuclear stations to make up for a shortage of electric power in the short term, even if Japan rids itself of atomic power by 2030.

The ratio of renewable energy sources such as hydraulic power to the total power consumption would be increased from 10 percent in 2010 to 35 percent by 2030, and thermal power plants would make up for any shortage.

Under scenario 2, no nuclear plants would be set up and all reactors would be decommissioned after 40 years in operation. If scenario 3 is adopted, new nuclear power stations would have to be built or some existing reactors would be replaced.

By 2030, the amount of greenhouse gas emissions would decrease 23 percent from 1990 levels under scenarios 1 and 2, and 25 percent under scenario 3. By 2020, greenhouse gas emissions could be cut by 0 to 11 percent, forcing Japan to retract its pledge to the international community that it would slash such emissions by 25 percent by that year.

The panel estimated that Japan is required to invest 80 to 100 trillion yen in energy saving measures by 2030, increasing monthly household electricity bills by 2,000 to 11,000 yen by that time.

It's up to the people of Japan to decide

July 4, 2012

Editorial: Japan's energy future must be decided by its people

http://mainichi.jp/english/english/perspectives/news/20120704p2a00m0na012000c.html

The people of Japan must soon choose one option from among three mid- and long-term energy policy scenarios -- including levels of reliance on nuclear power ranging from zero to 25 percent -- announced recently by the government's Energy and Environment Council. The government is expected to adopt one of them by the end of August based on a national debate, and map out an "innovative energy and environment strategy" based on it.

It will be a crucial choice that will determine the future of Japan. It is necessary to hold calm discussions on the issue and draw a conclusion that will convince every member of the public. To that end, it is indispensable for the government to provide accurate information such that the Japanese people can judge each option on its merits, and to hold discussions that will reflect the popular will.

Under scenarios 1, 2 and 3, the ratio of atomic power to total power consumption in Japan would be lowered to 0 percent, 15 percent and 20-25 percent, respectively, by 2030. Depending on the degree of Japan's dependence on nuclear power, the council estimated how far greenhouse gas emissions could be reduced, how much electricity charges would need to be raised and how much the country's GDP would be impacted.

However, since each estimated figure has a wide range, the scenarios have not clearly shown how much effect a reduction in nuclear power would have on Japan's economy and the livelihoods of consumers, making it difficult for people to choose between the three options. We urge the council to provide more detailed and understandable information by explaining the basis for its calculations, the specific effects of a reduction in nuclear power on various fields, and other clarifications.

The government views Scenario 2 as the most realistic option because it calls for a mid-level reduction in atomic power and meshes with government policy to shut down reactors after 40 years of service. However, as the government is supposed to work out its new energy and environment policy based on national debate, it must not lead public opinion into supporting the scenario it favors.

As part of national debate on Japan's future energy and environment policy, the government will hold its first so-called deliberative poll, ask members of the general public to submit their opinions and hold information sessions on the issue across Japan. In deliberative polls, randomly selected members of the public are surveyed on specific issues and invited to participate in debate sessions. Afterwards, they are queried again to see how their opinions have changed. This method, which makes it possible to tap a wide range of views from those who would not usually voice their opinions, is reportedly effective in getting a detailed view of public sentiment.

In the past, many town meetings on specific policy issues and hearings on nuclear power policy have been criticized as unfair, as their organizers apparently attempted to lead public opinion with staged questions and stacked audiences. The management of the government's deliberative poll on energy and environment policy will be left to the discretion of a third-party panel to be set up shortly. The results of the survey will not win public trust unless the government ensures transparency through appointing appropriate experts to the panel and disclosing in full how the poll will operate.

Questions remain as to the three scenarios themselves. Even if Scenario 2, which calls for a reduction in Japan's reliance on atomic power to 15 percent, is adopted, the ratio could be further reduced if some nuclear plants must be decommissioned for safety reasons before they hit 40 years in operation. None of the scenarios posit an energy and environmental vision for beyond 2030.

Regarding how to deal with spent nuclear fuel, scenarios 2 and 3 leave all possible options open, including full recycling.

This is a good opportunity for members of the general public to proactively choose their nation's policy. They should ask the government to clarify what they do not fully understand, and **make a feasible choice that will guarantee Japan's energy security and protect the environment on a long-term basis.**

More details about the new regulatory N-agency

Criteria for N-agency personnel revealed

http://www.yomiuri.co.jp/dy/national/T120703004843.htm

The Yomiuri Shimbun

The government will adopt strict criteria on the selection of a chairman and members of a new regulatory commission for nuclear plant safety, which could be established as early as August, according to a government guideline.

According to the guideline, revealed Monday, those who have received more than 500,000 yen a year in remuneration for lectures, consultancy or other services from a single power firm in the three years prior to the commission being established, cannot be named to the commission.

The guideline also does not allow anyone who was an employee or an executive of a firm related to the nuclear industry, including power firms and equipment manufacturers, to be on the commission.

Members of the commission are required to disclose the amounts of donations that went toward their personal research or to a laboratory to which they belong from companies related to the nuclear industry for the three years previous to the commission being established.

Members of the commission must also disclose names of industry-related companies that hired students of their laboratories and the number hired in the previous three years.

A bill to create the commission, which passed the Diet in June, and its additional resolutions prohibit executives and employees of power firms and other nuclear industry-related companies from being named to the commission.
As commission members must have a high degree of autonomy, the government decided to use stricter selection requirements than the new law called for.

The government plans to nominate a chairman and commission members, with an eye on experts on nuclear reactors or radiation protection in line with the criteria, and submit a personnel proposal to the Diet this month.

Test run at Rokkasho plant

July 4, 2012

Tests to reprocess radioactive waste begin
http://www3.nhk.or.jp/daily/english/20120704_26.html

A nuclear fuel reprocessing plant in Japan has restarted tests to prepare radioactive waste.

On Wednesday, test operations mixing radioactive wastewater with glass to make nuclear waste resumed at a plant in Rokkasho Village, Aomori Prefecture.

The plant is a reprocessing facility that takes spent nuclear fuel and extracts plutonium for use in the nuclear process again.

A test run by the plant was suspended 3 and half years ago after repeated failures.

The trial run had had technical difficulty mixing radioactive wastewater and glass as planned, and this forced it to be postponed.

The plant operator, Japan Nuclear Fuel, resumed the test run last month.

The reprocessing plant plays a key role in promoting the government's nuclear policy of recycling spent nuclear fuel. But due to the Fukushima Daiichi nuclear disaster the government is reviewing the nuclear fuel-cycle policy.

The review is expected to reach a conclusion this summer.

Fukui gov't in favour of sticking to nuclear power

July 8, 2012

Fukui Pref. wants central gov't to keep nuclear plants

http://mainichi.jp/english/english/newsselect/news/20120708p2g00m0dm003000c.html

FUKUI (Kyodo) -- The Fukui prefectural government called on the central government Saturday to continue to treat nuclear power as an indispensable source of electricity when deciding on the nation's future energy policy in the wake of the Fukushima No. 1 Nuclear Power Plant disaster.

The western Japan prefecture on the Sea of Japan coast made the call in a package of recommendations to the state ahead of requests to be made by central government ministries and agencies in the summer for their budgets for fiscal 2013 starting next April 1.

''It is necessary for the state to be responsible in maintaining the vitality of areas hosting (nuclear power plants) that have contributed to the nation's energy policy and supported the Japanese economy,'' Fukui Gov. Issei Nishikawa wrote at the beginning of the recommendations.

Fukui also sought increased subsidies to the prefecture to help ease its burdens as a nuclear plant host and prop up the local economy. Fukui hosts 14 reactors, the most among the nation's 47 prefectures.

Victory of Kagoshima governor

July 9, 2012

Kagoshima governor wins 3rd term, beats antinuclear challenger

http://mainichi.jp/english/english/newsselect/news/20120709p2g00m0dm019000c.html

KAGOSHIMA, Japan (Kyodo) -- Kagoshima Gov. Yuichiro Ito won a third four-year term in Sunday's gubernatorial election, according to final returns, defeating an antinuclear challenger after campaigning on a platform of conditionally allowing the restart of idled reactors at a local nuclear plant.

Ito has urged the government to ensure the safe resumption of operations at the two-reactor Sendai plant in Satsumasendai, while pledging to freeze a plan to build a third reactor at the plant during his tenure, even though he had given it the green light in 2010, amid heightened public concern about nuclear safety in the wake of last year's Fukushima disaster.

The election was the first in a prefecture hosting a nuclear plant since the July 1 restart of a reactor at the Oi nuclear plant in Fukui Prefecture, the first reactivation since the last of Japan's 50 commercial reactors was suspended in early May in the aftermath of the March 2011 disaster at the Fukushima Daiichi nuclear plant.

"I would rather refrain from using the phrase that a policy for the reactivation (of a nuclear reactor at the Sendai plant) has been supported," Ito, 64, said after the election. "I'll draw a conclusion" by carefully taking necessary steps, he added.

During the campaigning in the southwestern prefecture, Ito also said he would eliminate nuclear energy in the future.

Challenger Yoshitaka Mukohara, the 55-year-old president of a publishing house and secretary general of an antinuclear civic group, had pledged to block the restart of the plant operated by Kyushu Electric Power Co. and seek the scrapping of the reactors as quickly as possible.

Ito was backed by the local chapters of major parties, including the ruling Democratic Party of Japan and the main opposition Liberal Democratic Party, while Mukohara was supported by antinuclear activists and the Japanese Communist Party.

New regulatory commission to start early September

July 11, 2012

New nuclear body 'to be launched in September'

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120710004041.htm

The government plans to launch a new regulatory commission for nuclear safety on Sept. 3, along with a nuclear regulatory agency that will act as the commission's secretariat, according to informed sources.

The government will submit to the Diet proposals on the five members of the commission, including a chairman, with the aim of obtaining approval within this month, the sources said.

While the envisaged commission will be an external organ of the Environment Ministry, it will be granted a high degree of independence from the government as defined in Article 3 of the National Government Organization Law.

The new commission will compile new safety standards for nuclear power plants, taking over this role from the Nuclear and Industrial Safety Agency of the Economy, Trade and Industry Ministry.

It will also oversee the reactivation of nuclear reactors other than the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture. The No. 3 reactor resumed full operations earlier this week and the No. 4 reactor will resume operations later this month.

The government originally planned to inaugurate the new commission on April 1. However, there was a delay because laws relevant to the new commission only passed the Diet in June due to difficulties in negotiations between the ruling and opposition parties.

To secure a high degree of neutrality within the nuclear safety administration, the government has made conditions for the selection of its members. For example, executives or employees at utilities and other firms involved in the nuclear industry in the last three years before the commission's establishment cannot become a member.

The government is now selecting candidates for the commission. If the selection process or the passage of bills in the Diet run into problems, the commission's launch will likely face further delays.

Japan's energy future left to a deliberative poll?

July 11, 2012
Yoroku: Japan's energy future too important to be left to experimental polling method

拡大写真
http://mainichi.jp/english/english/perspectives/news/20120711p2a00m0na002000c.html

Once upon a time, in ancient Athens, state policy was decided not by elected representatives, but by a great assembly of all eligible citizens. Five hundred of these citizens were also chosen by lot for the Bouletai, or council, which spent time deliberating the issues facing Athens and drawing up bills for the assembly's consideration.

In the modern world, a small-scale version of this selection by lot and the group deliberation that was such an important part of Athenian democracy is being resurrected by U.S. academics in the form of deliberative polls.

In a deliberative poll, respondents are chosen at random to answer questions on relevant issues, just as in a regular opinion poll. Unlike a regular poll, however, the process doesn't stop there. Respondents are invited to a weekend event where they are given detailed information about the issues at hand, hold discussions with experts and politicians, and debate various points of view. At the end of the weekend, the respondents are asked the same survey questions again and, according to the Center for Deliberative Democracy at Stanford University, "The resulting changes in opinion represent the conclusions the public would reach, if people had (the) opportunity to become more informed and more engaged by the issues."

Deliberative polls have been conducted in the U.S., Britain, Australia and Denmark, and have recently been attracting attention in Japan as well. Specifically, deliberative polling is set to be used to help choose between one of three options presented by the government for Japan's energy future -- a weighty issue in the wake of last year's meltdowns at the Fukushima No. 1 nuclear plant.

Though the government is aiming to make a final decision by the end of August this year, this is no simple three-option choice. The issue is complicated, with questions such as what percentage of Japan's energy output should be nuclear intertwined with future electricity prices and carbon dioxide emissions. This must all be considered very carefully, and in this light, the turn to deliberative polling seems abrupt. The technique may have been tested by local governments and other organizations, but on this issue the stakes are far higher. We are talking about nothing less than putting the future of Japan in the hands of deliberative polling, a move akin to suddenly sending an experimental car on a cross-country trip thousands of kilometers long.

There are probably misgivings among researchers, too, over the use of deliberative polling. Last month, over 20 experts with experience in deliberative polling submitted a position paper to the government. In it, the experts pointed to a number of problems with the government's polling plans, including failure to present methods for choosing participants fairly and preventing their views from being steered in a particular direction, and an untenable schedule.

In the democracy at ancient Athens, only men were allowed to sit in the citizens' assembly or become members of the Bouletai council. Women, slaves and foreigners were all excluded. In other words, the Athenian system deviated from the democratic spirit from the very beginning.

By the same token, even if the idea behind deliberative polling is a just one, problems could arise in its implementation. If the deliberations are tainted with suspicions of exclusion and undue influence, they will only breed greater distrust. ("Yoroku," a front-page column in the Mainichi Shimbun)

Serious "brain drain" of nuclear engineers in Japan

July 16, 2012

SENTAKU MAGAZINE

Nuclear engineers ditching Japan for a bigger paycheck

http://www.japantimes.co.jp/text/eo20120716a2.html#.UARcHpFIwpV

Although Japan is reputed to be one of the most technologically advanced nations in nuclear power generation, it now faces a serious "brain drain" as some of its highly experienced nuclear engineers are lured to work in other countries for much better remuneration than they could hope to receive at home.

On June 21, Hitachi Ltd., a Japanese industrial giant, won a ¥400 billion contract to construct a nuclear power station in Lithuania, on the heels of a similar deal by a consortium of Hitachi, Toshiba Corp. and Mitsubishi Heavy Industries Ltd. to build two nuclear power stations in Vietnam.

In Japan, public opinion has been increasingly against nuclear power generation since the March 11, 2011, accidents at Tokyo Electric Co.'s Fukushima No. 1 nuclear power plant.

But Japan is one of the few countries that have accumulated the technology and knowledge needed for a wide range of things related to nuclear power plants, ranging from planning, designs, manufacturing and operation to maintenance and inspection of nuclear power plants. No corporations other than the Japanese trio of Hitachi, Mitsubishi and Toshiba have the expertise to do these things on their own.

One government official has lamented, however, that there has been a serious brain drain of nuclear engineers from Japan. Indeed, he says, huge sums of money are being offered to lure Tepco nuclear engineers to countries like South Korea and China, which are trying to compete with Japan as exporters of nuclear power equipment, and Abu Dhabi of the United Arab Emirates, which is intent on financing the introduction of nuclear power with the oil money it has accumulated.

"I have been told that annual remuneration being offered by those countries to Japanese engineers range between ¥50 million and ¥60 million a year per person," the official says.
Some major headhunting and consulting firms have reportedly organized special project teams to entice nuclear engineers of Tepco and other Japanese power companies to work outside of the country for higher wages.

According to one headhunting consultant, annual pay equivalent to ¥50 million a year is a "global standard" for engineers specializing in nuclear energy-related technology. In Australia, he says, specialists working at liquefied natural gas plants earn an average of ¥50 million or more a year. "I wonder why those sent there from Japanese companies work for about ¥10 million a year without complaining."

He also says, "With their esteem and wages likely to go down further in Japan, it would be only logical for Japanese nuclear engineers to move to (non-Japanese) employers who offer ¥60 million a year."

In the years that followed the 1979 Three Mile Island and 1986 Chernobyl disasters, which were dubbed the "winter era of nuclear power," Japan vigorously pushed the policy of constructing new nuclear power plants and accumulated valuable know-how for building nuclear power plants. This resulted in making

Japan the only country in the world equipped with the know-how to operate the two main types of nuclear power reactors — the pressurized water reactor (PWR) and the boiling water reactor (BWR).

Technologically less advanced countries acquire skills and knowledge from more advanced nations through "reverse engineering," in which they import state-of-the-art products through dummy companies then disassemble them to imitate their designs and structures. But this method does not work in the case of nuclear reactors.

Although the physical structure of a reactor may be imitated in this way, it is impossible to acquire the highly sophisticated know-how needed to operate and maintain a reactor. That's why some countries are anxious to lure well-qualified nuclear engineers with extensive experience at nuclear power stations in Japan.

Nuclear power generation is made possible by the combination of such components as a pressure vessel, precision piping, a generator, a heat-resistant turbine and a facility to dispose of radioactive materials — all requiring highly advanced precision engineering.

Japanese corporations have excelled in every one of these areas. Hitachi, Mitsubishi and Toshiba have built up broad experience as general contractors for nuclear power plant construction. Nobody comes close to Japan Steel Works Ltd. and IHI Corp. when it comes to designing and manufacturing pressure vessels, while Organo Corp., another Japanese firm, is a dominant force in building facilities for disposing of water from reactors.

And it has been the engineers of Tepco and other power companies in Japan who have accumulated the know-how to operate nuclear power plants using nuclear power plant components that incorporate the most advanced technology.
Vietnamese Prime Minister Nguyen Tan Dung is among the Asian leaders who have expressed the hope of benefiting from the experience of Japanese nuclear engineers, who must have learned a lot from the dreadful situations at Fukushima, such as the meltdowns of nuclear fuel cores from overheating, and melt-through, in which molten nuclear fuel pierced the bottom of a pressure vessel.

Even since the Fukushima nuclear accidents, there has been little change in the global trend of making nuclear power the primary source of energy.

As of 2011, there were 431 nuclear power plants in the world, with the combined capacity to generate 365.72 million kW of electricity, accounting for 5 percent of global primary energy sources, according to statistics released by BP.

On top of this, more than 200 new nuclear power plants are scheduled to be completed by 2030 and the market size of nuclear power generation is likely to exceed ¥120 trillion within the next 20 years.

Even in the United States, which leads the world with 104 nuclear power plants, President Barack Obama regards nuclear power as an essential means of ensuring energy security and preventing global warming.

China and India plan to build 80 and 70 new nuclear power stations, respectively, by 2020. If disposal of radioactive wastes is taken into consideration, the size of the market related to nuclear power generation will easily surpass ¥150 trillion.

Meanwhile, Japan from this year will face a difficult task decommissioning old reactors that are more than 40 years old

.

To fulfill its responsibility to future generations of Japanese, Japan must secure a sufficient number of expert engineers who will carry out the decommissioning of old reactors.

As the decommissioning of the Fukushima reactors damaged by the Level 7 accident, the worst on the International Nuclear Event Scale, is unexplored territory, Japan cannot afford to allow a brain drain of its nuclear engineers.

Efforts to expose the responsibility of Tepco, which is trying to make a social comeback, must not slacken.

At the same time, the nation should squarely look at the serious energy security crisis bearing down on it.

This is an abridged translation of an article from the July issue of Sentaku, a monthly magazine covering Japanese political, social and economic scenes.

Opinion piece about future demand for nukes

Tuesday, July 17, 2012

ENERGY SYMPOSIUM

Global demand for nuclear power remains high

Emerging powers seek more energy; U.S. nuclear revival may hinge on natural gas prices

http://www.japantimes.co.jp/text/nb20120717d1.html#.UAVKSpFIwpU

By TAKASHI KITAZUME
Staff writer

Despite the Fukushima nuclear power plant disaster that hit Japan last year, the global appetite for nuclear energy remains largely unchanged as emerging economic powers are set to account for much of the growth in worldwide electricity demand in the coming decades, a **U.S. think tank** expert said at a recent seminar in Tokyo.

The United States also has not wavered from its recent moves to resume construction of nuclear power plants for the first time since the Three Mile Island accident in 1979. However, the future of the U.S. nuclear power industry will hinge on various other factors, including price competition with domestically produced natural gas, Jane Nakano said.

Nakano, a research fellow with the energy and national security program at the Center for Strategic and International Studies, was speaking at the seminar organized by the Keizai Koho Center on June 13 to discuss the global prospects for nuclear energy and U.S. energy policy.

Before the Fukushima accident in March 2011, about 30 countries around the world operated over 440 nuclear power reactors, which accounted for 14 percent of global electricity generation. The nuclear power industry has seen steady growth, with about 50 commercial reactors coming online over the past 15 years, Nakano said.

The real story behind the growth, she said, is China, Russia, India and some other fast-growing economies. "Today, about 65 reactors are under construction, and about 40 percent of them are being built in China alone," she said.
Nakano said the Fukushima plant meltdowns and the radiation fallout "did not cause major changes to the level of interest in nuclear energy" worldwide, except in Japan.

Several countries, including Germany, Italy and Switzerland, decided to phase out their nuclear power generation or adopt a no-nuclear policy after Japan's nuclear crisis.

Nakano pointed out, however, that the high-profile German case was a reversion to the country's decision made in 2000 to phase out nuclear power, which had been reversed just a few years ago by Chancellor Angela Merkel. Italy had no nuclear power facilities but planned to build ones, and the no nuclear vote was seen more as a public vote against the policies of then Prime Minister Silvio Berlusconi, Nakano said.

Among countries that have had sustained interest in nuclear energy, including nations that do not currently have their own reactors but have been in talks to build ones, the Fukushima incident did not seem to have a major impact on their demand for nuclear energy, Nakano said. That should not come as a surprise given that a major part of the demand comes from developing countries, where growth in energy needs is much stronger than in mature economies, she said.

Energy consumption by rich countries that belong to the Organization for Economic Cooperation and Development was surpassed by non-OECD economies for the first time in 2007, Nakano noted. Global energy consumption is forecast to rise by 50 percent by 2035, and 85 percent of the growth is estimated to come from developing countries experiencing rapid economic growth, "where the population is still rising and the interest is growing among the public for modern conveniences," she said. And these countries are interested in nuclear power because growing energy consumption usually comes with rising emissions of greenhouse gases, she added.

Along with such shifts in the global energy demand landscape come the changes on the suppliers' side of the market, where countries such as South Korea and China are having a growing presence, Nakano said.

South Korea's successful bid in 2009 to supply four reactors to the United Arab Emirates was made in a "Team Korea" approach that involved many domestic suppliers and full government support. Nakano also said it is "a matter of when, not if, China will become one of the established suppliers of nuclear reactors in the global scene."

"The rise of these new suppliers pose challenges to traditional suppliers because many of (the latter) are mature economies whose home markets do not have the same type of thirst for electricity compared with developing countries. So the competition is becoming more and more fierce in the third-party markets such as Vietnam, Jordan and Turkey," she said.

Meanwhile, the United States has not had any new nuclear reactors built since the Three Mile Island accident. "It has become too expensive as an investment to build one," and due to regulatory uncertainty given the updates to safety regulations, "many other fuels have become more favored," Nakano said.

In recent years, however, policies have been put in place to support the nuclear power industry, including introduction of a simplified process for issuing permits for construction and operation of new reactors, as well as federal government loan guarantees and tax credits, she noted.

In 2010, about a year prior to the Fukushima accident, roughly $8 billion in loan guarantees was awarded for two new reactors. Following the disaster in Japan, President Barack Obama and his administration quickly expressed their support for the U.S. nuclear industry, and in February this year construction and operation permits were issued for the two power stations in Georgia and South Carolina, she said.

Still, construction of new reactors in the U.S. faces an uphill battle, "but not because of Fukushima," Nakano observed.
"Given the current serious deficit issues the government has, it is unlikely that the federal loan guarantee would be sustained at a strong level in the next couple of administrations, whoever gets elected," she said.

The price of natural gas — a major competitor to nuclear power in the U.S. energy mix — has come down quite sharply in recent months, Nakano said. And current debate in Congress suggests that there is "very little chance for the U.S. to have either cap-and-trade or carbon tax" plans to cut carbon dioxide emissions for at least the coming decade, and without these mechanisms in place, "nuclear power will have a harder time economically vis-a-vis natural gas," she observed.

Out of the 104 nuclear reactors in operation in the U.S. today, the operational life of 50 has so far been extended to 60 years. But there are movements in some states to reconsider the life extension of reactors beyond 40 years, and if there are no additional life extensions, "about one-third of nuclear power generation capacity will disappear in the U.S. by 2035," she said, adding that that is a "possibility given the low price of natural gas."

In recent years the U.S. has experienced a sharp increase in domestic production of shale gas, aided by new exploration technology and economically attractive gas prices that encouraged investments, Nakano said.

Shale gas accounted for a mere 5 percent of natural gas production in the U.S. five years ago, but that has increased to 30 percent today and is estimated to rise further to 45-60 percent by 2035, she noted. The "shale revolution" could result in natural gas accounting for a much bigger part of power generation in the U.S. — and U.S. export of domestically produced natural gas, she said.

Meanwhile, Akihiro Sawa, an executive senior fellow with the 21st Century Public Policy Institute and a former trade ministry official, said at the same seminar that he sees contradictions in the ongoing discussions in Japan on the future of the energy mix in the country following the Fukushima disaster.

An advisory panel to the Ministry of Economy, Trade and Industry has proposed four options for Japan's future energy mix, and the government is set to compile a new energy policy this summer after soliciting public comments on the options.

The options presented by the panel in May call for the government to seek a society in which nuclear power represents zero percent, 15 percent, or 20 to 25 percent of the nation's electricity provision by 2030, compared with 26 percent in fiscal 2010. All of the panel's options call for increasing renewable energy use to between 25 and 35 percent by 2030.
The government's energy policy prior to the Fukushima disaster stated the government would seek to increase reliance on nuclear energy to 45 percent of total supply by 2030 through the construction of new reactors.

Sawa said that if the government is trying to reduce the reliance on nuclear energy, the focus should be on energy policy, whose objective is to secure steady supply of energy sources, both in volume and economic terms.

If Japan is to make up for the termination or reduction of nuclear power generation, renewable energy would not normally be the primary option because it's still expensive and supply volume is small, so the priority should be how much can be secured through increased thermal power generation and at what cost, he said.

Renewable energy would be a priority option if the objective is to reduce emissions of carbon dioxide from energy production, while thermal power would be the primary option if the objective is to secure a steady energy supply at low cost, he said. Still, all the scenarios being contemplated seems to focus on increasing renewable sources to make up for the cuts in nuclear energy, which appears to contradict the objective of what the government is trying to do, Sawa said.

Rengo on the dependence on nuclear energy

July 18, 2012

Japan's main labor group to pursue end to dependence on nuclear power

http://mainichi.jp/english/english/newsselect/news/20120718p2g00m0dm039000c.html

TOKYO (Kyodo) -- Japan's biggest labor organization has drafted an energy policy that pursues the eventual end to the nation's dependence on nuclear energy, sources close to the matter said Tuesday.

The Japanese Trade Union Conference, which is known as Rengo and has supported the ruling Democratic Party of Japan, has thus shifted from its acceptance of new nuclear plant construction plans in response to the March 2011 Fukushima nuclear disaster.

Rengo Chairman Nobuaki Koga has vowed to eventually push for a society free from dependence on nuclear energy.

The draft policy, made available to Kyodo News, tolerates the DPJ government's recent decision to restart some nuclear power plants despite fears about their safety.

The government should make such decisions in consideration of the impact on citizens' lives, industrial operations and employment, the draft says.

It cites relevant residents' consent, the general public's acceptance and the enhancement of safety as preconditions for restarting nuclear plants.

The draft policy points out that energy supply constraints and fears about electricity charge hikes have made it difficult for companies to maintain domestic employment.

Japan should effectively use existing power generation facilities and adopt realistic energy conservation measures to support employment, it says.

The draft also says the government should secure technologies and human resources for decommissioning nuclear reactors and cleaning up radioactive contamination in preparing for nuclear plant accidents.

Tanaka to head new regulatory authority?

July 20, 2012

Gov't to tap Shunichi Tanaka for new nuclear body chief

http://mainichi.jp/english/english/newsselect/news/20120720p2g00m0dm076000c.html

TOKYO (Kyodo) -- The government plans to appoint Shunichi Tanaka, an expert of radiation physics and a former member of the country's key panel involved in setting nuclear policies, as the head of the new nuclear regulation authority, sources close to the matter said Friday.

The plan needs to win the approval of the Diet for official nomination but the procedure hit a snag as opposition parties refused to hold a meeting scheduled on Friday morning, during which the government was expected to propose the appointment to the parliament, after the candidate's name was reported by media in advance.

Tanaka, 67, is originally from the city of Fukushima and has engaged in efforts to clean land in Fukushima Prefecture contaminated by massive quantities of radioactive substances leaked due to the Fukushima Daiichi nuclear power plant disaster last year.

Because he is the former vice chairman of the Japan Atomic Energy Commission and has served as the president of the Atomic Energy Society of Japan, an academic society, some may oppose the appointment from the viewpoint that he has been part of the "nuclear power village," a close-knit community of bureaucrats, utilities, and academics with vested interests in promoting atomic power.

The government is also planning to tap four others as members of the new regulatory body -- Kenzo Oshima, former ambassador to the United Nations, Kunihiko Shimazaki, the head of the Coordinating Committee for Earthquake Prediction, Kayoko Nakamura of the Japan Radioisotope Association, and Toyoshi Fuketa of the Japan Atomic Energy Agency.

The government aims to launch the new entity in early September, hoping that the organization will contribute to **restoring shattered public confidence in nuclear regulations** following the Fukushima nuclear crisis, which resulted in the meltdowns of three reactors at the plant.

To ensure the neutral position of the regulators, the government has set certain qualifications for becoming a member of the new body, such as not admitting people who have worked for nuclear power plant operators or related organizations as employees or executives over the past three years.

The government decided to revamp the current nuclear regulatory setup after the Nuclear and Industrial Safety Agency came under fire for lacking teeth, as it is under the umbrella of the Ministry of Economy, Trade and Industry, a promoter of nuclear power.

The new regulatory body will be placed under the Environment Ministry but its independence is supposed to be guaranteed legally.

LDP angered by media report of nominations

July 21, 2012

Leak delays N-regulator nominations / Govt shelves candidate list amid LDP ire

The Yomiuri Shimbun
http://www.yomiuri.co.jp/dy/national/T120720006379.htm

The government postponed Friday its submission to the Diet of a list of nominees for a nuclear regulatory commission to be established in September.

The Liberal Democratic Party was angered that the five-person list, which includes a nomination for the commission's chairman, was reported in advance by the media.

The government hopes the nominees will be accepted and is planning to submit the list to the Diet next week or later.
It wants to appoint Shunichi Tanaka, 67, an advisor for the Research Organization for Information Science and Technology, to the post of the commission's chairman.

On Friday morning, the government planned to present the list at a meeting of lawmakers representing both houses of the Diet.

But some news organizations, including The Yomiuri Shimbun, Nihon Keizai Shimbun and NHK revealed all or some of the nominees.

The government postponed the list's submission due to LDP anger over the media reports.

A senior LDP member in the House of Councillors said: "We'll ask the government why the list was reported in advance by the media. We can't accept the government's actions in this situation."

Committees on the administration of the two houses have set a rule that if the media reports on appointments before they are approved by lawmakers, the personnel must be rejected by the Diet.

But the two houses' committees agreed that the nomination of the nuclear regulatory committee would be exempt from the rule.

The agreement was made to avoid delays in the establishment of the regulatory committee, which will be at the core of the nation's nuclear safety policy.

New Komeito Secretary General Yoshihisa Inoue said at a press conference, "Setting aside the news reports, our basic stance is that our party will make judgments on each of the nominees."

He indicated the party does not intend to ask the government to change the nominees it has selected.

The government plans to nominate Kayoko Nakamura, 62, head of a project team of Japan Radioisotope Association; Toyoshi Fuketa, 54, deputy head of the Nuclear Science and Engineering Directorate of the Japan Atomic Energy Agency; Kenzo Oshima, 69, a former Japanese ambassador to the United Nations; and Kunihiko Shimazaki, 66, head of the Coordination Committee for Earthquake Prediction.
===
Unnecessary opposition

By Horoshi Yumoto / Yomiuri Shimbun Staff Writer

The nuclear regulatory commission will be in charge of important decisions such as whether to reactivate reactors in nuclear power plants.

If the LDP refuses to accept the nominee submission, it could result in the delay of the commission's launch, which would harm the nation's interests.

Members of the commission must have a high level of expertise.

But those who were board members or employees of electric power companies or other businesses related to nuclear energy, as well as people who earned 500,000 yen or more over a 12-month period from a single nuclear-related company in the past three years, are not allowed to be listed as candidates.

Despite the limited range of candidates, the government carefully selected nominees and obtained their consent.
While the LDP is entitled to question the qualification of the nominees, it has cited the media reports that named the government's selection as a possible reason to refuse the list.

The LDP may be placing too much emphasis on its pride by being unreasonably opposed to the government's nomination.

Media groups reported on the nomination in advance because the decision about the commission members is highly public.Therefore, media groups decided that the information should be made public as soon as possible.
Excessive criticism by a political party could lead to restrictions on news reports.

In 2007, both ruling and opposition parties set a rule that personnel decisions needing Diet approval would not be approved if the nomination was reported by the media in advance.

The Democratic Party of Japan and the LDP previously agreed that personnel decisions for the commission would be exempt from this rule.

The rule should be abolished as quickly as possible because it can lead to bias in deciding on personnel and may result in restrictions on news reporting.

More delays?

July 22, 2012

Opposition's refusal may delay N-plant restarts / Personnel proposal must pass Diet soon to avert possible power shortage in winter months

Yuichi Suzuki and Koichiro Ashikaga / Yomiuri Shimbun Staff Writers
http://www.yomiuri.co.jp/dy/national/T120721002522.htm

The formation of a new administrative body in charge of regulating nuclear power will likely be further delayed due to objections from opposition parties against media reports on the government's personnel proposals for the body.

On Friday, the government postponed submitting a list of nominees for the nuclear regulatory commission to the Diet after opposition parties, especially the Liberal Democratic Party, objected that the list has been reported in the media before submission.

The government plans to launch the commission on Sept. 3. If the postponement leads to a delay in launching the commission, it would inevitably slow the commission's evaluations on restarting nuclear power plants. In the worst-case scenario, power shortages may occur and adversely affect the public.

On Friday, Koriki Jojima, Diet Affairs Committee chairman of the ruling Democratic Party of Japan, met with his LDP counterpart, Fumio Kishida, to persuade the LDP not to oppose the personnel proposal being submitted to the Diet.

"At this stage, it's difficult to make a new personnel proposal from scratch," Jojima said.

Angered by the media reports on the personnel proposal, some opposition members have demanded the list be scrapped. The government and ruling parties are wary of such dissent becoming dominant in opposition parties.

The chairman and other members of the nuclear regulatory commission are required to have a high level of expertise. The government has also set strict criteria in choosing the candidates to exclude people involved in private companies, government officials and scholars who have promoted nuclear power--members of what is dubbed the "nuclear village."

The conditions included barring people who have worked at nuclear-related companies, such as electric power companies, in the past three years regardless of whether they were ordinary employees or executives. Another condition excluded those who have received 500,000 yen or more in annual remuneration from a single nuclear-related company in the past three years.

According to sources, the government believes it would be difficult to launch the nuclear regulatory commission in September if it has to make a new personnel proposal, so it plans to submit the original proposal to the Diet next week. It includes Shunichi Tanaka, 67, an advisor for the Research Organization for Information Science and Technology, as a candidate for chairman of the commission, Kayoko Nakamura, 62, head of a project team at the Japan Radioisotope Association, and three others.

The government is trying to launch the regulatory commission in September to establish a system capable of managing the nation's nuclear regulations, such as deciding on restarting nuclear power plants by winter, when electricity demand rises.

If the Diet approves the personnel proposal, future commission members will be able to prepare a list of nominees for a nuclear regulatory agency that will act as the commission's secretariat. The government expects such preparations will take about a month after the Diet approves the personnel proposal.

===

Govt wary of power crisis

The first major task of the nuclear regulatory commission will be to evaluate the restart of nuclear power plants following the reactivation of the Nos. 3 and 4 reactors at the Oi nuclear power plant in Fukui Prefecture earlier this month.

The first nuclear reactor expected to be evaluated by the commission is the No. 3 reactor at the Ikata nuclear power plant in Ehime Prefecture, as it is the only suspended reactor that went through the Nuclear and Industrial Safety Agency's assessment of first-round stress tests. The power plant is operated by Shikoku Electric Power Co., while the Oi power plant is run by Kansai Electric Power Co.

There are also calls to restart the Nos. 1 and 2 reactors at Tomari nuclear power plant, operated by Hokkaido Electric Power Co.

However, it is expected to take about 10 months for the nuclear regulatory commission to draw up new safety standards on nuclear power plants. There is a possibility that the commission will adopt the government's temporary standards, but it will be the commission's prerogative to decide the process to restart nuclear reactors.

"It is difficult to predict how long the evaluation [of restarts] will take," a source close to the government said.

Any delay in approving the personnel proposals will lead to postponements of nuclear power plant restarts and ultimately may adversely affect the public.

A supplementary clause in the law to establish a nuclear regulatory commission stipulates that if the Diet does not take a vote on a personnel proposal within 10 days after the government submits it, the prime minister can appoint the commission's chairman and four other members.

However, the appointments have to be approved by the Diet afterwards and the move could end up fueling the anger of the opposition parties.

According to sources, the currently prevailing opinion in the government is to "appease" opposition parties to obtain their support for the initial personnel proposal.

Naoto Kan - A plan to reduce nuclear plants to zero

July 22, 2012

Lawmakers in Japan outline denuclearization bill
http://www3.nhk.or.jp/daily/english/20120722_10.html

Former Japanese prime minister Naoto Kan and other governing party lawmakers have announced an outline of a bill that would end Japan's reliance on nuclear energy by 2025.

The draft outline says nuclear power generation could lead to infinite damages in the event of an accident. It adds that lack of final disposal measures will end up leaving future generations piles of radioactive waste.

It calls for establishing alternative power sources and reducing the number of operating nuclear power plants to zero.

The draft also calls for promotion of solar, wind, and other sources of renewable energy to cut carbon dioxide emissions.

The outline also mandates the central government to create jobs in communities that host nuclear plants.

The secretary general of the governing Democratic Party, Azuma Koshiishi, has been asking Kan to compile a plan on future energy sources.

The former prime minister said he intends to **seek support within his party and that he wants to submit the bill with support from the opposition.**

Public hearings on energy future in West Japan

July 23, 2012

Zero option draws favor as government reactor meetings shift to west Japan
http://www.japantimes.co.jp/text/nn20120723a3.html#.UA0wH6BIwpU

By ERIC JOHNSTON
Staff writer

OSAKA — The central government-sponsored public hearings on Japan's energy future moved to west Japan on Sunday, with the majority of designated speakers and attendees favoring either a complete withdrawal from nuclear power by 2030 or a near halving of the nation's reliance on it.

About 140 people attended the hearing, part of a nationwide series sponsored by the central government. Officials said they received 318 comments directly and by mail from its Kansai region poll on three possible energy futures.

Of these, 211 people voiced support for abolishing atomic power completely by 2030. Another 40 said they favored cutting Japan's reliance on it to 15 percent.. Nuclear energy accounted for 26 percent of the nation's electric power in 2010.

The remaining 67 favored relying on nuclear for 20 to 25 percent of Japan's electricity needs.

Of the 11 who spoke at the hearing, six favored zero reliance, while three backed 15 percent and two 20 to 25 percent. Two speakers were women and both supported the zero option.

"Lots of people have said they do not want to rely as much on nuclear power and we want to reduce the amount as much as possible," said national policy minister Motohisa Furukawa in his opening remarks.

The Osaka hearing took place following intense criticism of earlier meetings in Sendai and Nagoya, where utility representatives were selected to speak. The two speakers in Osaka who favored the 20 to 25 percent scenario repeatedly stressed that they had no connections to either utilities or nuclear power-related firms.

Among the participants, who were from Osaka as well as surrounding prefectures, a clear majority favored ending reliance on nuclear power, loudly applauding the six speakers who variously explained why Japan should, and could, be nuclear-free by 2030.

Also, two speakers who favored the 15 percent option criticized the way the central government did its calculations for the three scenarios.

One from Kyoto said the forecasts presented for energy usage and cost lacked very basic data, such as population projections for 2030 and how the demography of a simultaneously aging and shrinking population would likely affect energy demand.

Denuclearisation vs economic growth

Choice must be made over contradictory options for vision of future

http://mainichi.jp/english/english/perspectives/news/20120723p2a00m0na020000c.html

The much-criticized government-hosted public hearings on energy policy do have their merits. They have managed to draw admissions from utility officials defending nuclear power, which has in turn triggered protest from anti-nuclear blocs, encouraging further debate.

Apparently, the government plans to prohibit power company employees from speaking at public hearings from here on forward. But what would be far more constructive than across-the-board restrictions would be to closely review the content of the remarks made by utility employees.

At public hearings held last week in Sendai and Nagoya, a ruckus ensued when members of the public objected to employees from Tohoku Electric Power Co. and Chubu Electric Power Co., respectively, being given the opportunity to speak.

Tohoku Electric received 100 complaints via phone and e-mail after a ranking official voiced a pro-nuclear position, while Chubu Electric received 802 after one of its employees likewise expressed pro-nuclear views. Chubu Electric subsequently posted an apology on its website.

So what was the comment made by Chubu Electric's nuclear energy division head that drew such ire from the public?
"(In the case of Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant disaster), no one has died from any direct effects of radiation. I don't think this situation will have changed five or 10 years from now. This is an indisputable fact, based on epidemiological data."

Such remarks and criticisms against such remarks have emerged repeatedly since last year. Indeed, there have been no deaths as a direct result of radiation exposure. But the statistics cannot be used to draw the conclusion that there are and will be no impact of internal exposure to radiation.

In the introduction to the latest edition of his book, "Chernobyl Shinryo-ki" (Records of my Chernobyl medical practice), Akira Sugenoya, the mayor of the Nagano prefectural city of Matsumoto and a surgeon who treated thyroid cancer patients in Belarus, writes: "The fatality rate may not have been high statistically, but in reality, there were children suffering from illness, and some who even lost their lives to it. ... Armchair analysis does not get at the pain of losing lives."

Of the government's public hearings in 11 cities, those in five have already been held. They are broadcast live on the Internet, and video footage is uploaded on the website of the government's National Policy Unit (NPU). Few people seem to be accessing them, however, and it's not surprising. The first half of the hearings are comprised of comments from the NPU minister and bureaucrats, and the meetings in general do not proceed smoothly.

However, following the video footage allows us to pick up pieces of the bigger picture that fail to make media reports. As it turns out, the Chubu Electric employee's comment was a part of his bigger message that happiness cannot exist without economic growth.

Among the other comments he made include: "What is the real damage sustained from the Fukushima crisis? I think it's the instances of economic repercussions on people's safety and lives, including loss of homes and jobs from the designation of no-go zones, and consumers' rejection of agricultural products due to the establishment of excessive safety standards."

He also said: "I believe that if the economy tanks, and corporations lose their global competitiveness, we will experience a crisis that far exceeds the one in Fukushima."

Hats off to the man, who, amid a public backlash, expressed his beliefs with his face and name exposed. But his argument that a bigger tragedy awaits if Japan does not operate its nuclear plants is going too far. The conviction that everything will fall into place as long as the money keeps flowing, is questionable. As for the notion that happiness is impossible without economic growth, it's probably shared by the establishments of all major economies.

Meanwhile, many of the opinions put forth by members of the public who participated in the hearings flew in the face of such a "happiness theory."

"Why is economic growth a given? Why, when our population is on its way to decline, and our working population is set to shrink even more rapidly, do we need to increase the products and services available in the country? Is a society of mass consumption and mass production -- in which what we want at any given time is available everywhere -- a society of spiritual wealth?" a university student from Tokyo at the Nagoya hearing said to applause.

Do we choose denuclearization over economic growth, or economic growth over denuclearization? Does it all boil down to money, or does it not? The debate over what constitutes true happiness is undoubtedly a demand made on us by history. (By Takao Yamada, Senior Expert Writer)

Despite the two reports on the disaster, Gov't is very slow to respond

July 24, 2012

Editorial: New nuke disaster report cue for Japanese people to join energy debate

http://mainichi.jp/english/english/perspectives/news/20120724p2a00m0na004000c.html

Why did the Fukushima nuclear disaster happen? Was there nothing that could have been done to prevent it from worsening, from spewing radioactive material over the Japanese landscape? And what lessons should we be learning from all this?

It has now been more than a year and four months since the meltdowns at the Fukushima No. 1 nuclear plant. On July 23, a commission appointed by the government to investigate the catastrophe released its final report, and there are plenty of important findings in its pages. However, though the commission interviewed 772 people for a total of 1,479 hours -- on top of the over 900 hours of interviews a Diet investigative committee conducted with 1,167 people -- we still don't have the full story, and it's impossible to say all the Japanese people's doubts have been addressed.

First of all, we still don't know exactly what happened in the disaster, primarily because high radiation levels around the ruined reactors make direct inspection problematic. It is, however, a shame that a re-evaluation of conditions could not be performed.

Furthermore, discrepancies remain between the investigative reports released so far. Points of disagreement include whether there was time to use data from the SPEEDI system for predicting the diffusion of radioactive material, and whether the March 11 earthquake damaged vital plant equipment before the tsunami hit and knocked out all power. These are both questions that have a direct bearing on

future accident response measures as well as evaluating the risks presented by other nuclear reactors in the country, and cannot be left unanswered.

In the end, even after the reports issued by the Diet committee and the government-appointed commission, the investigative process remains only half-done. The government, the Diet and plant operator Tokyo Electric Power Co. (TEPCO) must all continue their search for the causes of the disaster. As such, a permanent investigative committee must be established, one with complete independence from the government and whatever administration is in power at a given time.

On the other hand, the government-appointed commission's report does spell some things out very clearly. For instance, had TEPCO created a precise and well-prepared accident response plan in advance, the disaster at the plant and the damage it caused could have been constrained.

One reality that can't be pushed aside is that TEPCO's accident prevention policies were insufficient. Furthermore, the utility's tsunami defense and sever accident response measures were lacking in the extreme. The government commission concluded that TEPCO's response to the unfolding disaster was clumsy, and this, too, was because the utility was underprepared.

It's hard to lay blame on the workers actually at the plant when the meltdowns occurred. TEPCO, however, is deeply responsible for what unfolded there, having spent years prioritizing business concerns over ameliorating the risks of a major nuclear catastrophe. TEPCO's own report on the Fukushima disaster was one giant excuse from beginning to end, and the utility should redo its investigation while keeping the conclusions of the Diet and government committees firmly in mind.

The government, however, does not escape blame for the disaster. The government is tasked with regulating the nuclear industry, and yet the regulators were essentially captured by the regulated, doing the power companies' bidding. The Diet committee called the Fukushima meltdowns a "man-made disaster," and it's fair to say that the electric utilities and the government were "accomplices" in bringing it about.

Furthermore, TEPCO did not have a monopoly on ineptitude during the first days of the crisis. The government's disaster management was riddled with problems. Added to the well-documented stumbles within the prime minister's office was the nearly perfect uselessness of the Nuclear and Industrial Safety Agency (NISA) and the Nuclear Safety Commission, supposedly made up of experts who can inform and advise the prime minister during a nuclear crisis.

The government commission also looked into the events at Futaba Hospital, finding that the way the facility was evacuated raised the risks of rescuing the weakest of its patients too late. In the end, many of

the hospital's patients died in one of the most heartbreaking incidents of the nuclear disaster's early days. The Futaba Hospital case was, however, one among many instances of confusion and mayhem during the evacuation of the area around the stricken plant. A plainly deficient evacuation plan paired with atrocious information distribution to the evacuation zone meant that not only were large numbers of people forced to relocate several times, but many were also unknowingly subject to higher risks of radiation exposure. This is food for thought, indeed.

What we can't quite get our heads around is that, even though the Diet and government-appointed investigative committees have pointed out so many important issues, the Cabinet of Prime Minister Yoshihiko Noda along with the entire Diet are being very slow to respond. We do not see any serious attempt on the part of either to take the problems presented seriously, and this is a serious problem in itself.

There are a great many measures that need to be taken right now, such as alterations to the emergency situation chain of command, the appointment of a public information officer, and a system to get vital facts to crisis-stricken areas quickly and efficiently. Guards against an accident with the spent fuel rod pools at the Fukushima No. 1 plant fall into the same immediately necessary category.

However, we can see no substantive progress on any of these essential measures. If this is simply because government figures assume no disaster on a scale comparable to March 11 and the Fukushima meltdowns will strike again anytime soon, then the government is being dangerously overoptimistic. On the same note, we also have serious doubts about the government allowing the restart of two reactors at the Oi nuclear power plant in Fukui Prefecture before the results of the investigations were released.

Furthermore, the government must build new policies based on the two investigative committees' conclusions so far, and it must do so quickly. To this end, the government must deliberate on the two reports together in the Diet, talk out the discrepancies between them, and decide on its policy responses. Once those policies are in motion, the government must also reveal to the Japanese public exactly how much progress is being made in their implementation. It would be best to create an organization tasked with this information sharing.

The government is now mulling three scenarios for Japan's energy policy all the way up to 2030, and is using an intensive survey method to gauge public opinions on the issue to help it make a final decision. We at the Mainichi Shimbun intend to run an editorial series on what challenges need to be overcome and measures taken to choose the best policy.

As a starting point to that discussion, we propose that our readers have a look at the investigative committee reports on the Fukushima disaster. After experiencing nuclear calamity, what energy policy is most desirable? The risks of nuclear power are at the very center of that question.

Though the investigative reports are both enormous, anyone can download and read through them. The Diet committee report is probably the easier of the two to read, as it states its conclusions very clearly. While the government-appointed committee's report may be tougher-going, it does have the upper hand as far as detailed analysis goes. We hope that all of you will consider reading the reports your "summer homework" and discuss what you find with those around you. Together, we should be able to find the key to Japan's future.

July 24, 2012(Mainichi Japan)

How bad was the impact of sea water on Homaoka reactor No.5?

July 25, 2012

Seawater inflow accident could lead to decommissioning of Hamaoka nuke reactor

http://mainichi.jp/english/english/newsselect/news/20120725p2a00m0na006000c.html

An expert panel to the government will start considering whether to decommission a reactor at the Hamaoka Nuclear Power Plant in Shizuoka Prefecture after assessing possible damage from a seawater inflow accident last year, it has been learned.

The move comes after the nuclear plant operated by Chubu Electric Power Co. was suspended at the government's request on May 14 last year out of consideration for potential quake damage. Shortly after the suspension, **an estimated five metric tons of seawater gushed into the plant's No. 5 reactor due to a malfunction.**

"There are no such precedents in the world in which a large volume of seawater made its way into the reactor core," said an official with the government's Nuclear and Industrial Safety Agency (NISA). "There are possibilities that nuclear fuel rods have eroded, and we need to carefully look into the repercussions (of the seawater inflow)."

The expert meeting will be convened on July 25 to determine whether the nuclear complex can be reactivated after such a large amount of seawater covered an extensive area including the No. 5 reactor. Because nuclear reactors are mainly made of metal prone to corrosion by saline matter, the No. 5 reactor may likely face decommission in the worst-case scenario.

In the wake of the nuclear disaster at the Fukushima No. 1 Nuclear Power Plant in Fukushima Prefecture in March last year, a large volume of seawater was injected to cool down its No. 1 through No. 3 reactors after freshwater ran short, leading plant operator Tokyo Electric Power Co. to later decide to decommission the reactors.

Chubu Electric, however, is reluctant to decommission the Hamaoka nuclear plant's No. 5 reactor. "The seawater that reached the reactor had low saline concentrations, and decommission is not necessary," said a Chubu Electric official, suggesting that the utility will only repair and replace any necessary equipment.

In the Hamaoka plant's accident in May last year, a pipe holding coolant seawater ruptured inside a condenser, prompting the leaked seawater to circulate in the No. 5 reactor. Chubu Electric estimates that some 400 tons of seawater leaked in the facility, of which about five tons reached the reactor.

The utility has been investigating the impact of the seawater leakage on all affected equipment. In March this year, several holes believed to have been made due to corrosion were found inside a tank holding emergency coolant water for a reactor. Furthermore, screws of devices to maneuver control rods were found to be covered with rust the following month, prompting the utility to file a report with NISA. The utility will wrap up its investigation on the facility by the end of this year before drawing up a final report.

During the expert meeting on July 25, attendants will carefully review the current conditions of the No. 5 reactor based on Chubu Electric's report to NISA. The discussion will be taken over by a nuclear regulatory commission to be launched in September, where the validity of the final report to be complied by Chubu Electric will be determined.

Yamaguchi gobernatorial election and nukes

July 29, 2012

Voting starts in Yamaguchi governor's race, focus on nuclear plant

http://mainichi.jp/english/english/newsselect/news/20120729p2g00m0dm043000c.html

YAMAGUCHI (Kyodo) -- Voting in the Yamaguchi gubernatorial election started Sunday, with attention focused on the planned construction of a nuclear power plant in the western Japan prefecture.

The election is a de facto two-man race between prominent renewable energy proponent Tetsunari Iida, 53, who calls for scrapping plans to build a nuclear plant in Kaminoseki, and former senior bureaucrat Shigetaro Yamamoto, 63, who claims he will suspend the plan in the wake of events at Fukushima Daiichi nuclear plant.

Yamamoto, a former official at the Land, Infrastructure, Transport and Tourism Ministry backed by many municipality leaders, is seen as having the upper hand over Iida, who has sought to garner support from unaffiliated voters by running as an independent.

The two other contenders aiming to succeed retiring Gov. Sekinari Nii are former prefectural government official Shigeyuki Miwa, 53, and Tsutomu Takamura, 38, a former Democratic Party of Japan lower house member.

Voters have also focused on the stance of each candidate regarding the unloading of the Osprey military aircraft at the U.S. Marine Corps' Iwakuni Air Station in the prefecture. Before deployment at the Marines' Futenma base in Okinawa, the United States is hoping to start test flights of the Ospreys in late August around Iwakuni.

Safety concerns over the deployment exist among residents in Okinawa and Yamaguchi prefectures.

Election results are expected to be known later in the day.

Fukushima problems not to be resolved soon

July 30, 2012

Editorial: Fukushima nuke crisis opportunity to consider Japan's future energy policy

http://mainichi.jp/english/english/perspectives/news/20120730p2a00m0na014000c.html

A year and four months have passed since the outbreak of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant. Many evacuees have been exhausted from their prolonged lives away from their homes, and still have a long way to go before they can return to their neighborhoods.

Work to decontaminate areas tainted with radioactive substances leaking from the crippled power station is not going well and the re-designation of evacuation zones has not progressed as planned. If a serious accident occurs at any nuclear plant, extensive areas around the power station are affected by serious damage over a long period. We must face this reality as we try to reduce Japan's reliance on nuclear power.

The government adopted a basic policy on the restoration of Fukushima at a Cabinet meeting earlier this month. It is natural that the government recognizes the restoration of Fukushima Prefecture as one of the most important tasks and pledges to set aside the necessary funds for such efforts over a long period. The basic policy also calls for steady progress in work to decontaminate affected areas, with the long-term goal of reducing additional exposure to radiation, excluding radiation existing in nature, to below 1 millisievert a year.

Since more than 30,000 children have been forced to evacuate due to health concerns, decontamination is an urgent task. However, demonstration experiments conducted by the government have shown that decontamination methods employed by the government are not as effective in reducing radiation levels in highly contaminated areas as expected. Almost no progress has been made in decontaminating forests.

A growing number of local bodies in disaster-hit areas have commissioned general contractors and other businesses to perform decontamination work. National and local governments have no choice but to slowly but steadily make efforts toward decontamination.

What is worrisome is that little progress has been made in the construction of temporary storage sites for radioactive waste. No negotiations have been held on the national government's request that such a site be built in the Futaba County of Fukushima Prefecture. It is no easy task to gain local communities' consent for the plan, and the government cannot just indefinitely postpone the construction of such a site. The national government is urged to exercise leadership in going ahead with the plan.

Those who have been forced to evacuate their neighborhoods affected by the nuclear crisis should receive reasonable amounts of compensation and receive help to steadily put their lives back on track in order to ensure the restoration of areas affected by the nuclear disaster.

After consulting with the local governments concerned, the national government has recently worked out and unveiled the standards for calculating the amounts of compensation for real estate and household articles in evacuation zones.

The government is now reclassifying evacuation zones into "hard-to-return zones," "restricted residency zones" and "evacuation order lifting preparation zones." However, if evacuation orders are not lifted within six years from the outbreak of the nuclear disaster, residents will receive full compensation for their real estate. Local residents basically appreciate the standards, which allow them to estimate the amount of compensation they will likely receive and decide whether they should aim to return home at an early date or move to other areas.

The adoption of the compensation standards is expected to offer a breakthrough in the re-designation of evacuation zones. Tokyo Electric Power Co., the operator of the Fukushima No. 1 nuclear plant, should sincerely and quickly pay compensation to those affected by the nuclear crisis.

The Fukushima Prefectural Government is aiming to transform itself into a body that does not rely on nuclear plants. In the basic policy on Fukushima's restoration, the central government shows a plan to set up a key facility to promote the introduction of renewable energy in the prefecture. Both the national government and the general public are called upon to continue supporting Fukushima in the future.

Beware of those independent voters

July 30, 2012
Major parties shaken by independent gubernatorial candidate's strong showing

http://mainichi.jp/english/english/newsselect/news/20120730p2a00m0na019000c.html

On July 29, former senior bureaucrat Shigetaro Yamamoto, backed by the Liberal Democratic Party (LDP) and New Komeito, beat out rival Tetsunari Iida and two other candidates to become the next governor of Yamaguchi Prefecture. This was not, however, just any gubernatorial election.

The 53-year-old Iida, who campaigned on an anti-nuclear power platform, made a serious challenge for the governorship **without the support of any major political party** with a strong appeal to independent voters. And although he lost, Iida has sent tremors through not only Yamaguchi Prefecture, which is known as the "kingdom of conservatism," but all of Japan, and sparked dread in the ruling Democratic

Party of Japan (DPJ) over what angry independent voters will have in store for them come the next general election.

"This battle was a good one," Iida told supporters on the night of July 29 after garnering over half the independent vote. "We gave the LDP and New Komeito a run for their money, even in this kingdom of conservatism. We've created a bridgehead for tomorrow."

Iida, chief of the NPO Institute for Sustainable Energy Policies, was the brains behind Osaka Mayor Toru Hashimoto, who leads the Osaka Restoration Association. Total voter turnout in the gubernatorial election reached just 45.32 percent, and the 63-year-old Yamamoto carried the day with the backing of so-called block voters -- members of organizations who all agree to vote the same way. However, Iida's strong showing illustrates the public's growing criticism of the policies of the established parties, particularly over nuclear power.

While Yamamoto, a former senior official with the Land, Infrastructure, Transport and Tourism Ministry, ran from a generally pro-nuclear power position, he did shift direction somewhat by coming out in favor of freezing plans to build a nuclear power plant in the prefectural town of Kaminoseki. Iida has demanded the power plant plan be cancelled outright. On the deployment of the U.S. Marine Corps' new Osprey MV-22 aircraft, meanwhile, Yamamoto has come out against allowing them to be unloaded at the U.S. Marine base in the city of Iwakuni. Yamamoto's predecessor Gov. Sekinari Nii had also protested to the national government over unloading of the aircraft.

During the campaign, however, Yamamoto did his utmost to avoid dwelling on nuclear plants and Ospreys, both issues under the jurisdiction of the national government, relying instead on block voters to get him into the governor's chair. In the last half of the campaign, with Iida getting larger in his rearview mirror, Yamamoto moved to tighten control over these block voters, working full-tilt with his LDP and New Komeito backers and industry groups to cement his lead.
According to an exit poll by the Mainichi Shimbun and Tys TV Yamaguchi, 76 percent of pro-LDP voters cast their ballots for Yamamoto, while 85 percent of New Komeito supporters did the same. Some 53 percent of independents, however, voted for Iida, as against only 28 percent who backed Yamamoto.

The exit poll also showed that the nuclear power issue was not enough to bring Iida victory.

Regarding the plan for the new reactors in Kaminoseki, 44 percent of voters said it should be cancelled entirely, 26 percent were in favor of a freeze, and just 11 percent wanted the reactors to be built. Some 68 percent of the pro-reactor respondents voted for Yamamoto, while 57 percent of those in favor of cancelling the new plant voted for Iida.

However, only 17 percent of voters said that the nuclear plant issue was most important in how they cast their ballots, well behind "character and gubernatorial qualities," the most common answer at 49 percent. Meanwhile, even among those in favor of scrapping the nuclear plant plans, 31 percent voted for Yamamoto.

The exit poll was conducted at 37 polling places, with 2,467 voters responding.

Public opinion more and more in favour of "zero percent" option

August 2, 2012
70 percent of citizens willing to attend policy hearings support zero-percent nuclear option

http://mainichi.jp/english/english/newsselect/news/20120802p2a00m0na016000c.html

About 70 percent of Japanese citizens who wanted to attend government-sponsored hearings aimed at sampling public opinion on the country's future energy mix voiced support for an option to cut the country's dependence on nuclear power to zero by 2030.

Nevertheless, there are still many officials within the government who are cautious about breaking dependence on nuclear energy completely because they are concerned about the impact of power shortages and soaring utility rates on business activities and people's livelihoods. Therefore, it is hard to predict whether and how "public opinion" expressed at such policy hearings and elsewhere will be reflected in the government's policy decision.

The government has held policy hearings at 11 locations across the country since mid-July to sample public opinion on three options it set for nuclear energy's share of total power generation in 2030 -- zero percent, 15 percent, or 20-25 percent.

When the Mainichi Shimbun asked those people who wanted to attend public hearings at eight venues which option they would express their support for, 70 percent of them picked the "zero percent" option, followed by 11 percent for the "15 percent" option, and 17 percent for the "20-25 percent" option. Most of the citizens who voiced support for the zero percent option at the hearings expressed concerns about the safety of nuclear power in the wake of the crisis at the Fukushima No. 1 Nuclear Power Plant. As to the other two options, many of the supporters expressed their concern about power shortages and skyrocketing electricity rates.

There was confusion over the handling of the hearings. Two senior officials of power companies expressed their support for nuclear power generation at hearings in Sendai and Nagoya, respectively, sparking bitter criticism of the credibility of the forums. Then, the government hastily decided to remove people linked to the power industry from the lists of speakers at such hearings. With the exception of the hearing held in Fukushima, the same number of speakers had been set for each option, but in the face of lingering criticism, the government decided to allocate a larger number of speakers for the "zero percent" option than the other two options at the fourth hearing and thereafter.

There are only two hearings left -- one in Takamatsu, Kagawa Prefecture, and the other in Fukuoka, Fukuoka Prefecture, on Aug. 4. Furthermore, the government is to conduct a telephone poll of randomly-selected citizens, followed by a deliberative opinion survey with some of the respondents to the telephone poll participating on Aug. 4 and 5 to deepen discussions on the issue. In addition, the Cabinet Office will use its website to collect "public comments" until Aug. 12.

In light of the "national debates," the government will start to map out the country's first energy policy since the outbreak of the Fukushima nuclear crisis. Out of consideration for the impact on domestic employment and the economy, the government has deemed the "15 percent" option as the most likely choice, but it is becoming increasingly difficult to ignore the prevailing opinion in favor of the "zero percent" nuclear option. Therefore, the government will be hard pressed to make a convincing decision.

Ozawa and his party on nuclear power

August 2, 2012

Ozawa vows to abolish all nuclear power plants within 10 years

http://mainichi.jp/english/english/newsselect/news/20120802p2g00m0dm070000c.html

TOKYO (Kyodo) -- Political heavyweight Ichiro Ozawa said Wednesday that his new party will aim to abolish all nuclear power plants in Japan within 10 years.

His remarks suggested the party Ozawa launched in July, People's Life First, will try to attract public attention with a general election looming by stressing policy differences on nuclear power with Prime Minister Yoshihiko Noda, whose government recently approved allowing two nuclear reactors to resume operating.

At a press conference to announce the new party's policy goals, Ozawa also vowed to pursue decentralization and to strive to stop the government from raising the sales tax rate while the Japanese economy is still in a deflationary slump.

Ozawa left the ruling Democratic Party of Japan early last month in protest at Noda's consumption tax hike proposal.

The 70-year-old former DPJ leader, nicknamed the "Shadow Shogun" for the influence he has wielded within several ruling parties, had argued the tax hike plan reneges on the DPJ's policy pledges in the 2009 general election through which the party came to power. Ozawa is credited with being instrumental in the DPJ's ascent.

The Nagasaki Peace Declaration & nukes

August 1, 2012

Nagasaki Peace Declaration will not call for end to nuclear power

http://mainichi.jp/english/english/newsselect/news/20120801p2a00m0na002000c.html

NAGASAKI -- While focusing mainly on seeking an end to nuclear weapons, the Nagasaki Peace Declaration this year will, like last year, call for a change in energy policy but stop short of seeking an end to nuclear power, it has been learned from an outline released by Nagasaki Mayor Tomihisa Taue on July 31.

According to the outline, the declaration, to be made at a peace ceremony on Nagasaki's bombing anniversary of Aug. 9, will deal with the current situation surrounding nuclear weapons and increased international discussion on the inhumanity of nuclear weapons. The declaration is also planned to cover the importance of peace education, call on the national government to better support A-bomb victims, mourn the victims of the bombings and express a resolution for an end to nuclear weapons.

In reference to the Great East Japan Earthquake, the declaration is planned to call for "a society where people are not threatened by radiation" and urge the government to make clear the country's energy situation.

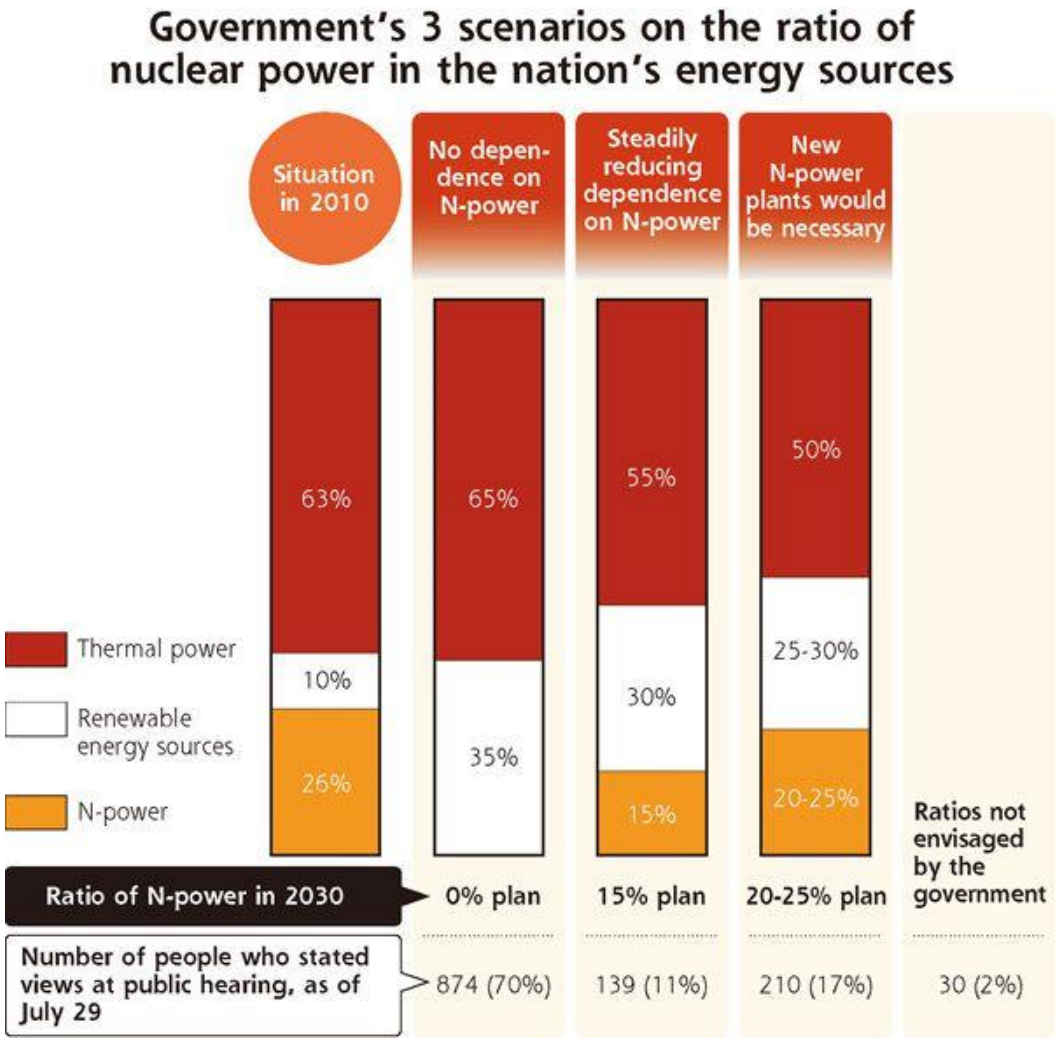
"This year's declaration is based on last year's declaration that called for a change to renewable energy," Taue said.

No nukes, but how?

August 3, 2012

Hearings yet to clarify alternatives to N-power

Takeo Miyazaki and Ryosuke Yamauchi / Yomiuri Shimbun Staff Writers
http://www.yomiuri.co.jp/dy/national/T120802006110.htm



While demands to eliminate nuclear power have prevailed at public hearings, the hearings have yet to tackle ways to secure a sufficient electricity supply to maintain the nation's economic vitality.

The government held a public hearing in Fukushima on Wednesday to discuss the possible ratio of nuclear power in terms of the nation's electricity generation in 2030.

"Although all nuclear plants, except for the one in Oi, have been suspended, we are managing to weather the situation this summer, too," said a participant who had taken refuge in Fukushima following the crisis that began at the Fukushima No. 1 nuclear power plant in March last year.

"If there's a power shortage, we can turn off the TV," said another participant, a company employee from Fukushima.
Thirty people expressed their opinions at the hearing. Almost all called for national denuclearization.

Residents of Fukushima Prefecture and those who had evacuated outside the prefecture due to the nuclear crisis were invited to express their views at the hearing. There were about 20 more participants in Fukushima than at similar hearings held at other locations. The Fukushima hearing also lasted 4-1/2hours, an hour longer than originally planned.

The government thought it necessary to hear the opinions of people, especially those from Fukushima Prefecture, who had been affected by the nuclear crisis before determining the nation's future energy policy.

"Of all the hearings, this is the most important. I'll listen to all participants sincerely," said Goshi Hosono, minister in charge of nuclear power policy, in the hearing's opening remarks.

"We should decommission all the reactors as soon as possible. I hope [the government] will gather all knowledge regarding renewable energy sources," a woman from Date in the prefecture said, drawing applause from the crowd.
In contrast, a man from Fukushima said, "As we can't manage to secure sufficient power, I think we should [restart reactors] for a limited time or under certain conditions." His remarks were met with boos and jeers.
===
No-nuke plan favored

Starting in mid-July, the government has held a series of public hearings on the matter in major cities, including Saitama, Sendai and Nagoya.

Among the 1,253 people who applied to speak at the hearings, 70 percent called for no nuclear power, while 11 percent favored a plan in which nuclear power accounts for 15 percent of power generation in 2030. Another 17 percent backed an option to have nuclear power account for 20 to 25 percent.

The government is also soliciting public opinions through the Internet, among other venues, until Aug. 12. So far, about 80 percent of survey respondents support complete denuclearization.

Public hearings will also be held in Fukuoka and Takamatsu on Saturday. Additionally, the government plans to conduct a telephone survey and will hold discussions with some respondents this weekend in Tokyo.

===

Feasibility is key

The scenario in which nuclear power accounts for zero percent of power generation means the ratio of renewable energy sources, such as solar and wind power, will have to increase to 35 percent. This plan would also be dependent on thermal power, which would account for the remaining 65 percent.

Currently, renewable energy sources, excluding hydraulic power, account for about 1 percent of power generation. Increasing this would be no easy task. Should the nation become reliant on thermal power, electricity charges could soar depending on factors such as increases in natural gas prices.

Many participants at the Fukushima hearing expressed high hopes for renewable energy, but stopped short of suggesting possible measures to help eco-friendly energy sources become more widely used.

"People really don't understand the difficulty in promoting a wider use of renewable energy sources," a source close to the government said.

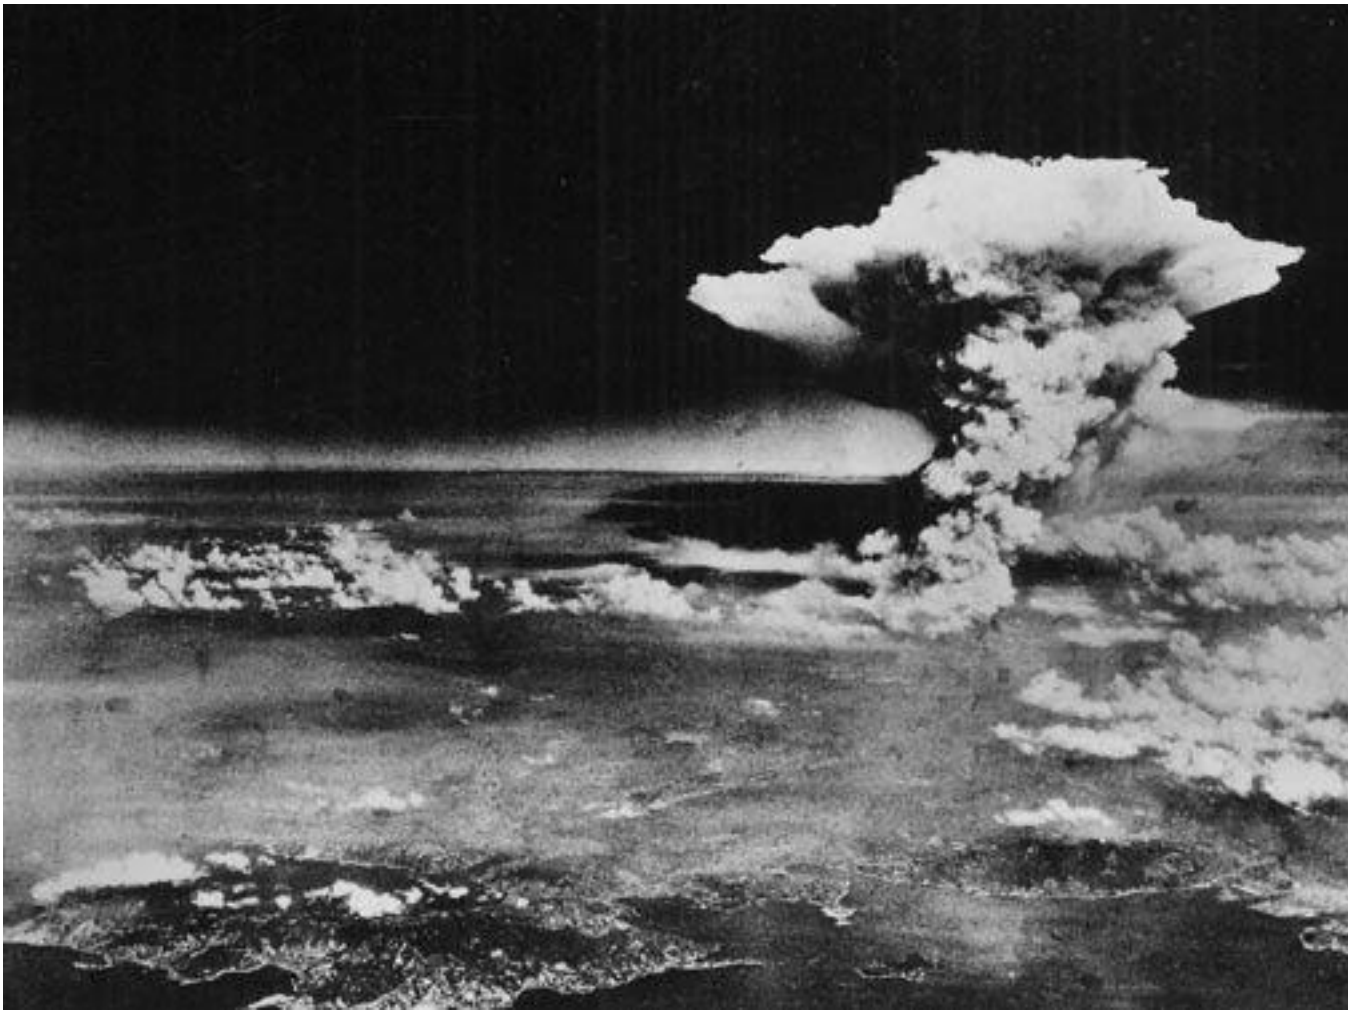
However, it remains unclear as to what extent public opinion will affect the government in formulating a national energy policy.

A company employee at the Fukushima hearing was skeptical, saying, "I'm afraid this [hearing] is only intended to let people vent their frustrations"

Nuclear weapons as a deterrent?

Friday, Aug. 3, 2012

Now should we become Death, destroyer of worlds? : A mushroom cloud rises above Hiroshima about an hour after the "Fat Man" A-bomb dropped by U.S. forces detonated above the city Aug. 6, 1945. U.S. ARMY VIA HIROSHIMA PEACE MEMORIAL MUSEUM / AP



Nuclear arms advocates get bolder amid energy debate

http://www.japantimes.co.jp/text/nn20120803f1.html

By YURI KAGEYAMA
AP

The contentious debate over atomic energy is also bringing another question out of the shadows: Should Japan retain the possibility of making atomic weapons — even if only as an option?

Hot zone: The reactor 4 building at the Fukushima No. 1 nuclear plant is in ruins on March 24 last year. AIR PHOTO SERVICE / AP

It may seem surprising in the only country to have ever come under nuclear attack, particularly as it prepares to mark the 67th anniversaries of the Hiroshima A-bombing on Aug. 6 and that of Nagasaki three days later. The government officially renounces nuclear weapons, and the vast majority of citizens oppose them.

But as the nation weighs whether to phase out atomic energy generation, some conservatives, including certain influential politicians and analysts, are becoming more vocal about their belief that Japan should at least not rule out producing a nuclear arsenal in the future.

The two issues are intertwined because nuclear power plants can develop the technology and produce the fuel necessary for such weaponry, as highlighted by concerns that allegedly civilian atomic energy research in Iran is masking a bomb program, as was the case in North Korea.

"Having nuclear plants shows to other nations that Japan can make nuclear arms," ex-Defense Minister Shigeru Ishiba told AP.

Ishiba stressed that Japan isn't about to start making nuclear weapons. But, he said, with North Korea widely thought to be developing nuclear warheads, the nation needs to assert itself and say it can also make them — although it is choosing not to.
Such views make opponents of nuclear weapons nervous.

"A group is starting to take a stand to assert the significance of nuclear plants as military technology, a view that had been kept below the surface until now," says "Fukushima Project," a book published by several experts with antinuclear leanings.

Adding to their jitters, the Diet amended the 1955 Atomic Energy Basic Law in June, adding the term "national security" to people's health and wealth as reasons for the possible uses of nuclear technology.

"The recognition that both nuclear issues must be addressed is heightening in Japan" and the link between the two is "becoming increasingly clear," said Hitoshi Yoshioka, professor of social and cultural studies at Kyushu University.
Yoshioka is part of a government panel investigating the nuclear disaster. The meltdowns at the Fukushima No. 1 power plant have called into question the future of atomic energy in Japan, in turn raising concern among some nuclear weapons advocates.

Most proponents don't claim — at least not publicly — that Japan should possess nuclear weapons. Rather, they argue that their mere ability to serve as a deterrent increases the country's diplomatic clout.

The issue dates to the 1960s. Historical documents released in the past two years show that the idea of developing nuclear arms was long talked about behind the scenes, despite repeated denials by successive

governments. The papers were obtained by NHK in 2010 and more recently by AP under a public records request.

In a previously classified 1966 document, the government outlines how the threat of China going nuclear made it necessary it too to consider the option, though it concluded that the U.S. nuclear umbrella rendered such a move unnecessary at the time.

In minutes of meetings from 1964, 1966 and 1967, government officials weigh the pros and cons of signing the Nuclear Nonproliferation Treaty, which means forgoing the nuclear option. Japan acceded to the accord in 1970.

The government denials continued even after former Liberal Democratic Party Prime Minister Yasuhiro Nakasone, who was in office from 1982 to 1987, wrote in his 2004 memoirs that, as director of the now-defunct Defense Agency, he had ordered a secret study of the nation's nuclear arms capability in 1970. The study concluded it would take five years to develop nuclear armaments, but Nakasone decided that they weren't needed, again because of U.S. protection.

After breaking the LDP's half-century grip on power, the Democratic Party of Japan in 2010 reversed the past denials and acknowledged that discussions on the issue had indeed taken place.

Given the secretive nature of the matter to date, former diplomat Tetsuya Endo and others are suspicious about the addition of "national security" to the atomic energy law in June. Backers of the amendment say it refers to protecting nuclear plants from terrorists. If that is the case, opponents ask why the phrasing inserted wasn't "nuclear security" instead of "national security."

Japan has 45 tons of separated plutonium, enough to produce several bombs of the magnitude dropped on Nagasaki — equivalent to roughly 21 kilotons of TNT. Its overall plutonium stockpile of more than 150 tons is one of the world's largest, although considerably smaller than those of the U.S., Russia and Britain.

Tokyo Gov. Shintaro Ishihara, an outspoken conservative, has repeatedly stated that Japan should flaunt the nuclear arsenal option to boost its diplomatic leverage. Ex-LDP Prime Minister Shinzo Abe, whose roughly one-year stint started in September 2006, voiced similar sentiments, but in a more subdued tone.

The Yomiuri Shimbun made a rare mention of the link between nuclear energy and weapons in an editorial defending atomic energy last year, saying Japan's plutonium stockpile "works diplomatically as a nuclear deterrent."

That kind of talk worries Tatsujiro Suzuki, vice chairman at the Japan Atomic Energy Commission. Himself an opponent of proliferation, Suzuki said that developing a nuclear arsenal is a decades-old ambition for some politicians and bureaucrats.

"If people keep saying (that atomic energy) is for having a nuclear weapons capability, that is not good," Suzuki said. "It's not wise. Technically it may be true, but it sends a very bad message to the international community."

The need for cutting-edge energy-saving technology

August 3, 2012

Editorial: Gov't must power up energy efficiency strategies

http://mainichi.jp/english/english/perspectives/news/20120803p2a00m0na001000c.html

As the government works out a new energy strategy following the outbreak of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant, it is under pressure to promote both power conservation and economic growth.

The three scenarios for Japan's new energy policy place the ratio of atomic power to Japan's total electric power generation as of 2030 at zero percent, 15 percent and 20-25 percent, respectively. They are based on the assumption that power consumption across the country will decrease 10 percent from 2010 levels by that time.

All members of the public as well as businesses are required to save energy to both reduce Japan's reliance on atomic power and cut back on greenhouse gas emissions. The impact of such energy-saving efforts on Japan's economy can be minimized through technological innovation that increases energy efficiency. If innovative energy-saving technology is developed, it will contribute to economic growth. Government assistance in such efforts is indispensable.

In all three scenarios, the ratio of atomic power to Japan's total electric power generation lies below the 26 percent mark seen in 2010 -- prior to the outbreak of the Fukushima nuclear crisis.

If power generation at thermal power plants is increased to make up for a power shortage as a result of cutting down on the country's dependence on atomic power, then carbon dioxide emissions will rise. The promotion of renewable energy, such as solar power and wind power, and energy-saving measures will therefore play an important part in helping prevent global warming.

Electric power is indispensable in our daily lives. The appropriate use of electric power, such as that for air conditions to protect the health of people during a heat wave, should not be reduced. The important question is how to effectively slash energy consumption without adversely affecting people's lives.

Japan has become the world's most advanced country in terms of saving energy as a result of efforts that both the government and the private sector have made since the 1973 oil crisis. By 2009 Japan's gross domestic product had increased by 2.3 times from the level seen in 1973, but its energy consumption was just 1.3 times higher. Japan has managed to achieve both energy conservation and economic growth.

Industries, in particular, succeeded in reducing energy consumption by 15 percent over that period as a result of technological innovation and the streamlining of their operations. Business leaders have pointed out that industries cannot reduce their energy consumption any further, with one comparing additional energy conservation requests to "wringing out a dry towel." The Japan Business Federation (Nippon Keidanren) and other business organizations have criticized the government's requirement that businesses further cut their use of energy, as it could hinder economic growth.

However, development of cutting-edge energy-saving technology would not only create new domestic demand but also create new opportunities for Japanese businesses on the international market. Industries are urged to proactively develop such technology.

For example, batteries that store a massive amount of electric power at night -- when the demand for power declines -- then release the power during the daytime are effective in increasing the efficiency of electric power use. Developing compact and high-capacity batteries is an urgent task. The technology of such batteries could be applied to electric vehicles, contributing to Japanese automakers' international competitiveness.

The spread of smart grids, which utilize information technology to adjust electric power supply to the appropriate level, is also believed to be a key to increasing the efficiency of electric power use.

The government should support these efforts to boost energy efficiency through regulatory reform and financial assistance with the ultimate goal of substantially reducing energy consumption while spurring economic growth.

Gov't in favour of 15% option

August 4, 2012
the same info in the Mainichi Daily News of August 3 (based on the Kyodo news) but with a different title: "Gov't appears closer to supporting 15% nuclear dependence rate"

15% nuclear option backed

http://www.japantimes.co.jp/text/nn20120804x2.html

Kyodo

As the government sounds out the public about Japan's nuclear options, the intermediate option of reducing the nation's dependence on atomic energy to 15 percent by 2030 is winning favor.

If the government's policy to "basically" limit the service life of reactors to 40 years is strictly adhered to, as stated recently by Shunichi Tanaka, the candidate to head the new nuclear regulatory authority, their number will fall to 20 from 50 by 2030.
If the remaining reactors operate at 80 percent of capacity and no new ones are built, nuclear power would account for 15 percent of Japan's total energy supply. In fiscal 2010, the figure stood at 26 percent.

"We should strictly check nuclear reactors and not allow those beyond 40 years old to operate," Tanaka, a former vice chairman of the Japan Atomic Energy Commission, told members of the Lower House Steering Committee on Wednesday.

Given that the 15 percent option can be achieved simply by decommissioning reactors once they reach the 40-year limit, Environment Minister Goshi Hosono also has indicated his support, calling it a base scenario.

The government had planned to compile a new energy policy this month after holding public meetings nationwide to gather opinions on three scenarios for nuclear energy use by 2030: zero, 15 percent, and 20 to 25 percent. **But in the face of growing criticism that it is drafting the policy too hastily, it may delay an announcement beyond August.**
The 20 to 25 percent scenario — favored by the power industry — requires new reactors and would do little to change Japan's reliance on atomic energy from levels seen before last year's meltdowns at the

Fukushima No. 1 plant. It may also face strong public opposition as protests against nuclear power snowball.

Meanwhile, abolishing atomic energy altogether is expected to raise household electricity bills following the launch in July of a system requiring utilities to purchase all power generated from solar and other renewable energy sources at preset premiums, with permission to pass the costs onto consumers.

Households that usually pay ¥10,000 per month could see bills more than double, given that they could be paying as much as ¥11,000 more by 2030 if nuclear power is scrapped completely, the government said. The hike compares with an estimated increase of up to ¥8,000 for both the 15 percent and 20 to 25 percent options.

Kenji Yamaji, a professor emeritus at the University of Tokyo, said he supports the 20 to 25 percent scenario because nuclear power can contribute to Japan's energy security and economy, as well as efforts to combat global warming, in a well-balanced manner.

"Once the fuel is loaded, nuclear power plants can operate more than a year without a refill," Yamaji said. "By maintaining nuclear power generation, (Japan) can also gain an upper hand during price negotiations when buying fossil fuel from overseas."

Hiroshi Takahashi, a research fellow of the Fujitsu Research Institute, disagrees.

"Although nuclear power had a certain role to play during the transition period from fossil fuels to renewable energy, it has already fulfilled that function," he said.

Noting that the Fukushima crisis underscored Japan's inability to deal with a nuclear catastrophe on its own, Takahashi said the nation should make better use of renewable power because it has abundant geothermal energy sources and considerable potential to harness wind power at sea.
He said Japan should boost its energy self-sufficiency rate by increasing its use of clean energy.

Gov't will take into account people's opinion but how ?

Sunday, Aug. 5, 2012

Nearly 70% of Japanese who wanted to attend hearings on nuclear power hoped to discuss its complete abolition

Kyodo
http://www.japantimes.co.jp/text/nn20120805a6.html

FUKUOKA — Around 70 percent of citizens who wished to air their views on the future of nuclear power at public hearings held by the government wanted to discuss its complete elimination, officials said Saturday.

A series of 11 hearings, each in a different city, have been staged all around the country since July 14 to give the public an opportunity to express their opinions about the government's three options regarding the role nuclear power should play in Japan's new energy policy. The final forums held Saturday in Fukuoka and Takamatsu, Kagawa Prefecture.

Under the three options, the percentage of electricity to be generated through nuclear power by 2030 was set at zero, 15 percent, and 20 to 25 percent.

The government said Saturday that of the 1,542 citizens who wanted to take part in the hearings after being contacted by its officials, some 1,447 hoped to voice their thoughts about atomic energy.

Of the 1,447, some 983 people, or 68 percent, wanted to speak either for or against the complete abolition of nuclear power by 2030, according to the organizer of the hearings, the industry ministry's Agency for Natural Resources and Energy.

The majority wished to speak in support of scrapping all atomic energy generation, while 11 percent wanted to talk about the 15 percent option and 16 percent of them about the 20 to 25 percent option, the agency said. Five percent wanted to challenge all three options.

The 1,447 did not include anyone from the city of Fukushima, even though it was one of the 11 venues selected for the hearings. The prefecture hosts the crippled Fukushima No. 1 power plant, which suffered three catastrophic reactor meltdowns in March 2011.

Meanwhile, the government on Saturday began a two-day public survey in Tokyo on the country's new nuclear energy policy.

The government said it will take into account the results of both the public hearings and the Tokyo survey while formulating its energy and environmental policies, **although it has yet to explain exactly how it intends to incorporate the findings.**

Deliberative polling on Japan's energy future

August 6, 2012

Participants, experts discuss energy priorities, mix

New hearing held to gauge nuke sentiment

http://www.japantimes.co.jp/text/nn20120806a1.html

By AYAKO MIE
Staff writer

The government continued to solicit public opinion on nuclear energy policy over the weekend by holding a discussion-oriented polling session in Tokyo involving about 300 citizens from across the country.

This is the first time the government has used "deliberative polling," a type of poll developed by Stanford University to bring together a cross section of individuals to discuss an issue by themselves and with experts in order to gauge the opinion of a well-informed electorate, to develop national policy.

However, it's still unclear to what extent the results will be incorporated.

The 286 participants in the two-day forum, conducted by Keio University, were selected from among 6,849 people randomly polled by phone across the country. Unlike the 11-city tour of government-sponsored hearings that wrapped up on Saturday, utility employees were not deliberately excluded from speaking and their participation could not be confirmed.

The participants in the deliberative poll were surveyed three times, including before and after the weekend discussions.
In an initial phone survey in July, they were asked to prioritize the most important aspects of their power supply, such as stability, safety, cost or impact on the environment.

They were also asked which of the government's three scenarios they prefer for nuclear energy dependence by 2030: zero percent, 15 percent, or 20 to 25 percent.

The purpose of the sessions was to deepen the understanding of the energy debate through discussions. The participants were able to question nuclear experts on the issues and were polled before and after the two days of talks and question-and-answer sessions.

Keio and Stanford professors will study the results to determine the changes in their opinions. The results will be released later this month.

In two 90-minute sessions, 20 groups discussed the key elements of Japan's energy resources and their preference on the energy mix. Safety and securing a stable supply were the dominant issues, interspersed with critical comments aimed at the government and Tokyo Electric Power Co., the operator of the crippled Fukushima No. 1 nuclear power.
"We should think what's most important in our lives," said one female participant, who says she supports the zero percent scenario. "Lax safety measures are threatening our lives, and I want to have clear evidence that nuclear power is safe."

Some questioned the appropriateness of even raising the issues of safety and supply in same discussion.
"I understand our lives are important, but the cost will go up if we give up on nuclear energy, and it will drive more businesses to shift overseas," said a male participant. "These should not be debated on the same level."
Others complained of the difficulty of making an informed decision on the proper energy mix without full and accurate information from the government regarding its reserves of natural resources.

"When we were children, we were told that we will exhaust petroleum in 40 years, but we still have it," said a male participant. "I would like to have the real numbers."

After the discussion session, each group was given an opportunity to ask one question to experts on nuclear power and energy policy. But some of the participants criticized the responses as vague or contradictory.

"After the Fukushima accident, the government is trying to brace for unpredictable accidents," said Akira Yamaguchi, a nuclear engineering professor at Osaka University, when asked if Japan's nuclear power is really safe. "The government's standard will be in line with global standards."

Other experts disagreed. "The disaster prevention measures have not been implemented," said professor Hitoshi Yoshioka of Kyushu University, who served on a government panel investigating the Fukushima accident.

But experts admitted they were unsure how Japan could achieve a 35 percent dependency rate on renewable energy in the event that nuclear power generation is abolished altogether. "Every energy source has pros and cons," said Kazuhiko Ogimoto, a professor in energy system integration at the University of Tokyo. "We have to think in the context of the time frame as well, and it takes time to achieve 35 percent dependence on renewables."

The deliberative poll was part of the government's effort to encourage a national debate on Japan's energy future.
The previous 11 government-sponsored public hearings, which wrapped up on Saturday, were harshly criticized for how they were carried out, such as with the participation of employees of the energy industry.

The government is seeking public opinions until Aug. 12 via email, fax and regular mail.

After the two-day forum, some participants reported that their stance had not changed significantly but that it was a good learning opportunity.

"I am still against nuclear power, but I realized that it's really hard to achieve zero nuclear dependency," said Shizuyo Araki, 74, who attended from Sapporo. "But I can't believe everything the government says, either."

Many were skeptical of the government's effort. Even though the government is slated to compile the policy by the end of August, it has not declared how it will use the thousands of comments collected or if it can meet the deadline. "I do not know how much of the public's opinion will be reflected," said Yasukimi Sato, 45, from Okayama Prefecture. "My bet is they are going to use us as an excuse that they've heard us out when they decided on a scenario other than zero percent."

Noda ready to consider abolition of nukes?

PM Noda vows to examine possibility of zero nuclear dependency

http://mainichi.jp/english/english/newsselect/news/20120806p2g00m0dm068000c.html

HIROSHIMA (Kyodo) -- Prime Minister Yoshihiko Noda said Monday he will instruct his Cabinet members to consider what kind of challenges the government could face if it decided to reduce Japan's dependency on nuclear power to zero.
It is the first time that Noda has referred to the possibility of eventually abolishing all nuclear power plants in the country in the future.

He appears to be paying attention to public opinion, with growing numbers taking part in the antinuclear demonstrations outside his office every Friday, which have drawn tens of thousands of people in recent weeks.

"We believe we should aim to reduce dependency on nuclear power over the medium to long term," Noda told a press conference after attending the annual peace ceremonies in Hiroshima commemorating the U.S. atomic bombings of the city in 1945.

Opposition to nuclear energy is increasing especially after Noda's government decided in June to reactivate two nuclear reactors at the Oi power plant in Fukui Prefecture for the first time since Japan suffered its worst nuclear crisis at the Fukushima Daiichi complex last year.

The government said that about 70 percent of the Japanese citizens who expressed a desire to speak at government hearings on the future of nuclear power supported the so-called zero option. A series of hearings in 11 cities was held from July 14 through Saturday.

Noda has reiterated that the resumption of power plants is necessary for the time being to avoid power shortages. The Nos. 3 and 4 nuclear reactors at the Oi plant on the Sea of Japan coast have already been restarted.

The premier, meanwhile, suggested at the press conference that more time could be needed before the government maps out its new energy and environment strategy, which it had initially planned to finalize by the end of August.
"Nationwide discussions need to be deepened," Noda said.

Noda to examine issues to end nuclear dependence

http://www3.nhk.or.jp/daily/english/20120806_28.html

Japan's Prime Minister Yoshihiko Noda says he'll ask his ministers to clarify what issues lay ahead if the country should end its dependence on nuclear energy.

Noda told reporters in Hiroshima on Monday that he wants to see a thorough discussion on the matter, rather than rushing to reach a conclusion.

He indicated that he won't insist on sticking to the government's initial target of the end of this month in deciding the country's new energy policy.

The government has been holding public hearings nationwide as it reviews its energy policy in the wake of last year's accident at the Fukushima Daiichi nuclear plant. The participants discussed 3 options for the ratio of nuclear power reliance in 2030 -- zero percent, around 15 percent, or between 20 to 25 percent.

Many of them voiced support for the zero-percent option.

Nuclear energy accounted for nearly 30 percent of Japan's total power generation before the accident.

Never again

Noda stresses on nuclear-free world in Hiroshima

http://www3.nhk.or.jp/daily/english/20120806_18.html

Prime Minister Yoshihiko Noda says Japan needs to teach younger generations about the horrors of nuclear weapons. He also says it is time for Japan to end its dependence on nuclear energy.

Noda was speaking at a ceremony in Hiroshima marking the 67th anniversary of the US atomic bombing of the city.

In the speech, Noda said people should not forget the tragedy of the nuclear attacks and never let it happen again. He renewed his pledge to observe Japan's Constitution with an aim to abolish nuclear weapons and establish global peace.

He also pledged to stick to the country's 3 principles of not allowing the production, possession and entry of nuclear arms into Japan.

He said as the only country attacked by nuclear weapons, Japan has a responsibility to educate the world

about the dangers of such weapons.

He said Japan can fulfill that responsibility by passing the memories of the nuclear attacks on to younger generations and to people in other countries. He said the government will support the efforts in all possible ways.

He also said the government is determined to clean up districts contaminated in last year's nuclear accident at the Fukushima Daiichi plant. He said the government will do all it can to rebuild infrastructure so that residents can return home as soon as possible.

He said the government will reduce its dependency on nuclear energy and promote renewable energy over the long term so that people can feel more comfortable about the country's energy mix.

Phasing out of nuclear power not so bad, after all...

August 8, 2012

Nuclear-free not bad for economy: Edano

AFP-Jiji, Jiji
http://www.japantimes.co.jp/text/nn20120808a4.html

Industry minister Yukio Edano waded into the national debate on energy policy Tuesday, saying the nation could phase out nuclear power by 2030 without hurting the world's third-largest economy.

"We can do it," Edano told reporters in Tokyo when asked what the impact of Japan ditching its stable of nuclear reactors would be. Most have been shut down.

"I don't think the zero scenario is negative for Japan's economy. On the contrary, it can create growth as efforts to develop renewable energy and improve energy-efficiency could boost domestic demand," he added.

Tokyo ushered in new rules last month that require utilities to buy all electricity produced from renewable sources, including solar and wind power, at above-market rates for two decades, to stoke "green" power investment.

Edano meanwhile also said he opposes Prime Minister Yoshihiko Noda's plan to meet with an antinuclear citizen's group.

Such a meeting between the prime minister and a specific organization may send the wrong signal in terms fairness and transparency, Edano said.

The nation has a system in place that all citizens can participate in, Edano said, citing recent hearings the government held in 11 cities to glean public opinions about energy policy.

The state has refrained from listening directly to any specific group, including business lobbies, about energy policy, Edano said.

According to sources, Noda plans to hold talks as early as Wednesday with the Metropolitan Coalition Against Nukes, a citizen's group that holds antinuclear rallies every Friday outside the prime minister's office.

Edano's comments come as the government pursues a new energy strategy in light of the Fukushima atomic crisis, which led, directly and indirectly, to the shutdown of all 50 of the nation's nuclear reactors. Two were restarted last month on Noda's recommendation.

Noda has pledged to deliver a new energy policy by the end of 2012, with options ranging from cutting nuclear altogether by 2030 to nuclear power accounting for about one-third of Japan's electricity — the level before the Fukushima disaster struck.

Under the zero-nuclear scenario, government-chosen experts have forecasted Japan's economic growth could fall between 1.2 and 7.6 percent by 2030.

2030 no target year under the new energy policy

August 10, 2012

Edano says Japan will not stick with 2030 energy target year

http://mainichi.jp/english/english/newsselect/news/20120810p2a00m0na014000c.html

Economy, Trade and Industry Minister Yukio Edano says a new energy and environment policy under consideration will not set 2030 as a clear-cut target year for reduced nuclear energy dependency despite overwhelming public support for the so-called zero option.

Edano, appearing on a program on the Internet, said Aug. 9 that the government of Prime Minister Yoshihiko Noda has not decided to set 2030 as a target year under the new energy policy.

The government has presented three options regarding nuclear power in its new energy policy --- zero percent, 15 percent and 20-25 percent. Although a majority of people are in favor of the zero option, they differ over when Japan should end its reliance on nuclear energy.

After the Internet program, Edano told reporters the government has debated the issue based on the current energy policy which calls for boosting the nation's dependence on nuclear energy to 53 percent in 2030 from about 26 percent in 2010. He said the government will not stick with the 2030 target.

The current policy was formulated well before the Great East Japan Earthquake and tsunami triggered the crisis at the Fukushima No. 1 Nuclear Power Plant in March last year.

The industry minister expressed hope that the Noda government will decide on the proposed new energy policy before the House of Representatives will be dissolved for a general election,referring to a three-way agreement among the ruling Democratic Party of Japan, the largest opposition Liberal Democratic Party and New Komeito party to seek a public mandate.

Public response extremely strong

August 12, 2012

Japanese government receives over 50,000 comments from public on future of nuclear power

Kyodo
http://www.japantimes.co.jp/text/nn20120812a4.html

The government has received more than 50,000 comments from the public on the future of nuclear power, officials said Saturday, as the Fukushima meltdowns generated high interest in the nation's new energy policy.

The government on July 2 started to solicit the public's opinions on its three proposed atomic energy scenarios by 2030, and about 52,300 comments had been submitted as of Friday. The campaign will end next Sunday.

The public's response has been exceptionally strong, given that a total of more than 1,000 comments is usually considered high when the government canvasses opinion on its policies.

National policy minister Motohisa Furukawa on Wednesday will announce the final number of comments, which the government intends to publicly disclose.

The government's three options for nuclear power as a proportion of Japan's total energy generation by 2030 are zero, 15 percent, or 20 to 25 percent. Atomic energy supplied 26 percent of the nation's electricity in fiscal 2010.

The government also held public hearings in 11 cities on the three nuclear scenarios from mid-July to early August. About 70 percent of those who expressed a desire to voice their opinions at the events were in favor of the complete elimination of nuclear power, the government said earlier.

How much nuclear energy?

August 14, 2012
NHK poll: Opinions split on nuclear power
http://www3.nhk.or.jp/daily/english/20120814_11.html

An NHK poll shows that public opinion is mixed when it comes to deciding how much Japan should depend on nuclear power as a source of energy.

NHK conducted the poll over the weekend and received responses from 1,046 people.

The respondents were asked to choose from 3 options the government has presented for the nation's

dependence on nuclear energy as of 2030 -- zero percent, around 15 percent, or between 20 and 25 percent.

The results show that 36 percent favor the zero option -- up 2 points from last month, while 39 percent chose the middle option -- a drop of one point. 15 percent of respondents chose the highest option, up 3 points from last month.

Nuclear power accounted for roughly 26 percent of Japan's energy supplies before last year's nuclear disaster. The government is now reviewing its energy policy and seeking public input on the nation's nuclear dependency.

The NHK poll also asked respondents whether they trust the government's attempt to confirm the safety of the US military's Osprey transport aircraft.

The tilt-rotor aircraft is due to be deployed in Okinawa soon, but its record of accidents has touched off safety concerns across Japan.

The poll showed that 69 percent lack confidence in the Japanese government's attempt to have experts independently examine the Osprey's safety, while 25 percent said they trust the government.

Funds required for direct disposal of radioactive waste

August 14, 2012
METI wants research fund for burying spent nuclear fuel in budget draft

http://mainichi.jp/english/english/newsselect/news/20120814p2a00m0na009000c.html

The Ministry of Economy, Trade and Industry (METI) will seek to incorporate research funds for burying spent nuclear fuel without processing it into the fiscal 2013 budget draft, ministry sources said.

METI has decided to prepare radioactive waste for burying as the possibility of such direct disposal is growing as part of a major change in Japan's energy policy. If realized, it will be the first time for the ministry to allocate funds relating to the direct dumping of radioactive waste from the state budget.

The government has promoted a nuclear fuel cycle project in which spent nuclear fuel will be reprocessed, plutonium and other materials will be extracted and the remaining fuel will be then used to power nuclear reactors.

However, the government has been forced to review the project as Japan's policy of promoting nuclear power has come under fire following the outbreak of the Fukushima nuclear crisis in 2011.

As part of a review of Japan's energy policy, the government has offered three scenarios on the ratio of atomic power to Japan's total electric power generation as of 2030 -- zero percent, 15 percent and 20-25 percent. Under the zero percent scenario, all the existing spent nuclear fuel would be dumped because reprocessed fuel cannot be used. Under the 15 percent and 20-25 percent scenarios, the government would consider both reprocessing and burying of such radioactive waste.

Therefore, under all of these scenarios, the government would be required to consider **burying spent nuclear fuel without reprocessing such waste.**

In July, the Cabinet Office's Japan Atomic Energy Commission urged ministries and agencies concerned to incorporate funds in the fiscal 2013 state budget draft to develop technology for dumping radioactive waste.

In response, METI has deemed it necessary to study the examples of dumping radioactive waste in Sweden, Finland and other countries as soon as the government adopts its new energy policy.

DPJ pledges to phase-out nuclear

August 14, 2012
DPJ vow for next poll: a nuclear phaseout

Role for Kan urged to draft pre-election energy goals

Kyodo
http://www.japantimes.co.jp/text/nn20120814a1.html

Prime Minister Yoshihiko Noda's party is arranging to make a nuclear phaseout a key policy pledge in the next general election, sources in the Democratic Party of Japan said.

The DPJ's plan comes amid widespread opposition to the continued use of nuclear energy. Noda has drawn strong public protests over his recent decision to approve the restart of two reactors at the Oi power plant in Fukui Prefecture, the first reactivations since all of the country's reactors went offline amid the Fukushima nuclear disaster that started last year.

Many DPJ lawmakers fear the ruling party, via the restarts, signalled to the public that it is keen on using nuclear power when this is not the case, a senior party member said Sunday.

DPJ members said earlier this month that the DPJ will set up a panel to discuss the potential pledge for the House of Representatives election, which Noda said last week will take place "soon."

The panel will probably be headed by DPJ policy chief Seiji Maehara. Some DPJ lawmakers say former Prime Minister Naoto Kan, who has taken an increasingly antinuclear stance since the crisis started at the Fukushima No. 1 plant during his watch, should become an adviser to the new body.

To government is weighing three options for a new energy mix by 2030, including having nuclear power provide zero percent of Japan's total energy, or 15 percent, or between 20 and 25 percent. The state has also held hearings to gauge public opinion, which has strongly come out in favor of the first option.

60% against nuke power

jiji

Over 60 percent of the Japanese public thinks the country should give up nuclear power, a recent Jiji Press survey said.

About half of the respondents opposed restarting the dozens of idled nuclear reactors.

The survey covered 1,211 men and women 20 or older across the country between July 6 and 16.

In face-to-face interviews, respondents rated their attitudes toward various issues related to nuclear energy on a scale of zero to 10, with 5 meaning "neither agree or disagree."

Of the respondents, 62.6 percent opposed the use of nuclear energy, giving scores between zero and 4, with 17.8 percent saying they think Japan should idle all nuclear plants immediately.

By contrast, 9.7 percent assigned scores between 6 and 10 suggesting that Japan should continue using nuclear.

The results of the survey, the ninth by the news agency on national nuclear power use since May 2011, showed parallels with the previous surveys.

The poll was the fourth of its kind since March on sentiment toward restarting reactors halted chiefly for routine checks.
In the survey, 50.5 percent opposed resumption, with scores below 5. The figure dropped 8 percentage points from the March survey. About a fifth, or 21.4 percent, gave zero support for restarts.

Japan and nuclear weapons

August 15, 2012

Japan playing nuclear roulette

http://www.japantimes.co.jp/text/eo20120815a2.html

By KEVIN RAFFERTY
Special to The Japan Times

HONG KONG — J. Robert Oppenheimer, one of the prominent fathers of the atomic bomb, had read the Bhagavad Gita, and when he saw the first test of the weapon, he quoted the terrifying line from the Hindu scripture: "Now I am become Death, destroyer of worlds." It is hard to imagine the horror of the dropping of the atomic bomb on Hiroshima 67 years ago. It seared the sky and instantaneously wiped much of the city and tens of thousands of people, and left a trail of misery that continues today, but which should not be forgotten.

Sadly, leading Japanese politicians today seem to have forgotten the lessons of the war and its savage end. Powerful politicians are hard at work trying to scrap Article 9 of the Constitution — which renounces war — and some of them want to go all-out to build a Japanese nuclear weapon.

What are they thinking about? It beggars belief that a country that has suffered so much, first from being the only victim of nuclear war, and then from bungling over the use of nuclear energy, should be contemplating building nuclear weapons.

It is almost a game of Chinese roulette. Japan does not know how to cope with the rise and rise of an increasingly assertive and muscular China. It is also obviously concerned about nuclear-armed North Korea that is wont to making bellicose threats in spite of its small size and its impoverished economy. But Chinese roulette is more suicidal than the Russian version: If Japan built nuclear weapons for first-strike

capability against an overbearing China, it would be committing national suicide; second-strike, or retaliatory, capacity might be too late if China had done its job properly. Using nuclear weapons against North Korea, whatever the provocation, seems unthinkable.

That is without considering the suicidal economic costs. France and the United Kingdom have discovered that keeping up with the latest nuclear weapons technology is prohibitively expensive. For already heavily indebted Japan, it could be the final straw to economic ruin.

Any decision to build nuclear weapons would be a red rag to China, far more serious than the Tokyo government or Japan buying the Senkaku Islands. Even so, hawkish Japanese politicians claim that flaunting the bomb option will give Japan greater diplomatic clout.

The nuclear option is very much part of shadow politics, going on outside the public arena, but linked to the obvious reluctance of the government and bureaucrats to give up nuclear energy. Japan has years of expertise in production of nuclear energy, but, even so, it is questionable, especially in the light of the lessons of the Fukushima disaster, whether any part of a country sitting on so many earthquake fault lines is safe to host a nuclear plant.

However, the ability to produce nuclear power gives obvious material and technological advances toward weapons production. Former Defense Minister Shigeru Ishiba, from the opposition Liberal Democratic Party, said, "Having nuclear plants shows to other nations that Japan can make nuclear weapons."

"Fukushima Project," a book by anti-nuclear experts, claims that, "A group is starting to take a stand to assert the significance of nuclear plants as military technology, a view that had been submerged below the surface until now." In June, without fanfare, Japan's Diet changed the 1955 Atomic Energy Basic Law to add "national security" as a reason for using nuclear technology along with people's health and wealth.

The debate on Article 9 of Japan's Constitution has also been going on largely behind closed doors. The LDP sees itself as poised to sweep Prime Minister Yoshihiko Noda's fractious government from power. It is demanding early elections as the price for supporting Noda's controversial doubling of the consumption tax.

The party has been busy designing a nationalist campaign that, according to The Economist, "looks likely to border on emperor-worship." In April the LDP published proposals for a constitutional amendment, which would eviscerate Article 9, the key to Japan's peace Constitution. Article 9 famously renounces war and the threat or use of force as a means of settling international disputes.

Its second paragraph pledges that Japan will not maintain land, sea or air forces or other war potential. Some supporters of the peace clauses agree that the time has come to revise Article 9, especially given that Japan's Self-Defense Forces are armed forces in all but name and defense spending of $61 billion makes Japan the world's fifth or sixth largest in the global league, vying with France. The Self-Defense Forces have also contributed, controversially, to international peacekeeping efforts.

So there is a plausible case that the new realities be recognized and careful limitations and strict rules and conditions be set. Professor Craig Martin set out the arguments for updating Article 9 without destroying it in The Japan Times recently. **The essential core of the first paragraph of Article 9 should be preserved as Japan's contribution to humanity.**

The danger is that Japan's rightwing will set the terms of the debate and provide a *fait accompli* of a changed constitution and a new more militaristic agenda. You can see how the approach will be made. China is growing daily more assertive, undoubtedly true. Japan is highly vulnerable, also true. But a bright guy facing a bully needs to use brains, not to slug it out and get mashed up. Japan should be making friends, especially in the Asian region. It should also try to disarm the bully by friendship and point out — also undoubtedly true — that no one wins in a fight, least of all in the 21st century when the miseries of war would threaten the whole world's existence.

The bigger danger, ultimately for Japan itself, is that this small island country, highly dependent on the outside world for essential imports and for exports that provide jobs and economic growth, seems unable to see itself as the rest of the world does — largely irrelevant — and lives in its own bubble world. It should be a matter of concern, for example, that South Koreans hate Japan more than they hate the North Korean regime, that there is visceral hatred in China toward Japan.

Small island nations often have an undue pride in their own insular superiority. The U.K. is similar. But the U.K. recognizes that there is an alien world out there and you have to be active in knowing what goes on and sometimes to make concessions and occasionally sacrifice cherished interests for the greater good. The U.K.'s failure to engage Europe wisely, pretending to be aloof and not part of the eurozone problems, is costing its economy dearly.

But Japan, apart from exporters at the sharp economic end, who are increasingly taking their factories abroad, seems to wish the world outside does not exist. You can see this tragically any day on the state broadcaster NHK, which seems totally ignorant of the rest of the world.

As a small example, the main morning news of NHK on Aug. 9 devoted its first 19 minutes to the Olympics, with seven minutes for Japan's judo golds, a minute about Usain Bolt, before celebrating Japan's javelin thrower who failed to qualify for the finals, its decathlon competitor in 26th place and the vital women's field hockey match between Japan and South Africa to decide who comes ninth. Then there was a preview of the Japan-U.S. women's soccer final. There was no mention of the achievements of China or the United States, or of the world outside the Olympics.

The BBC on the same day started with the medal battle between China and the U.S., went to Jamaica to ask about the culture that produced Bolt, celebrated Japan's judo golds and found time to report on mayhem in Syria.

At 20 minutes after the hour, NHK went on to the intense political fight over the consumption tax and, very briefly, after 30 minutes, to the people of Nagasaki waiting to commemorate the dropping of the second atomic bomb on Aug. 9. Lest Japan forget: War in the 21st century would be tantamount to national suicide.

Enough power without nukes

August 21, 2012-08-21

Power use falls; reactors unneeded

July saw 6.3% drop in demand despite heat amid efforts to save

http://www.japantimes.co.jp/text/nn20120822a3.html

By JUN HONGO
Staff writer

Sales by 10 major power utilities in July dropped by 6.3 percent due to a decline in demand, the Federation of Electric Power Companies of Japan has revealed.

But while efforts to cut down electricity use by households and the business sector are paying off, some say the numbers prove that last month's reactivation of two reactors at Kansai Electric Power Co.'s Oi nuclear plant in Fukui Prefecture may have been unnecessary.

"Electricity utilities may be opting to restart their nuclear reactors since they are cheaper than thermal power plants," Hideyuki Koyama, executive director of Mihama no Kai, which opposes Kepco's nuclear power use, told The Japan Times.

"The data are solid proof that Japan can supply enough electricity even without any nuclear power generation," he stressed.

The federation said Monday that overall electricity use in July dropped 6.3 percent compared with the same month last year. Nine out of 10 utilities reported a decline in sales, with the exception being Tohoku Electric Power Co., where recovery from the March 2011 disasters is making progress.

Rolling blackouts are to be implemented if necessary this summer in the Kansai region and Kyushu, but so far none has been needed.

The decline in electricity demand also came even though higher than average temperatures were recorded nationwide last month, according to the Meteorological Agency.

In announcing the restart of the two Oi reactors, Prime Minister Yoshihiko Noda in June warned that it was aimed at supporting the economy and the public's livelihood. His appeal was validated at least in the Kansai region, where electricity demand would have surpassed supply levels during peak hours had the reactors remained offline.

But pundits say that instead of relying on nuclear power, Kepco could have easily covered any shortage by requesting neighboring electricity utilities, which had an oversupply, to provide backup.

"Reactivation of the reactors was decided considering the cost and profits of the electricity utilities," Mihama no Kai's Koyama said. "But under the circumstances, nuclear plants should be shut down for the safety of the public."

Zero nukes by early 30's?

August 21, 2012
Gov't panel considers completely eliminating nuclear power plants by early '30s

http://mainichi.jp/english/english/newsselect/news/20120821p2a00m0na017000c.html

The government's Energy and Environment Council is considering setting a goal of shutting down all nuclear plants by the early 2030s, government sources said.

The move is in response to growing public calls for the total elimination of atomic power, and is also aimed at spurring technological innovation in renewable energy such as sea-based wind-power generation and solar power generation.
However, there are many challenges to reducing Japan's dependence on atomic power to zero, and the business world would likely voice stiff opposition to the policy.

The government has worked out three scenarios on the ratio of atomic power to Japan's total electric power generation in 2030 -- zero percent, 15 percent and 20-25 percent -- following the outbreak of the March 2011 Fukushima nuclear crisis.

However, Economy, Trade and Industry Minister Yukio Edano said the government will not stick to the 2030 deadline. "We haven't drawn a line on the year 2030," he said in a TV program.

The government had earlier been considering an option to end the use of atomic power in 2040, which Foreign Minister Koichiro Gemba revealed during a speech in Fukushima in late July.

Government officials have since been backtracking on the proposal, saying, "a plan that surfaced before an official announcement cannot be used," according to a senior government official.

Behind the move are growing public calls for the total abolition of nuclear power. During public hearings held at 11 locations across the country, about 70 percent of those who applied to attend the gatherings said they support the option to completely eliminate atomic power by 2030. Moreover, demonstrations in front of the Prime Minister's Office in protest against the reactivation of nuclear plants have shown no sign of ending.

Calls for the elimination of nuclear power are also growing even among members of the ruling coalition including Naoto Kan, who was prime minister when the nuclear crisis broke out.

Prime Minister Yoshihiko Noda cannot ignore these calls as he is supposed to dissolve the House of Representatives "sometime soon" for a snap general election and the ruling Democratic Party of Japan (DPJ) is scheduled to hold its next presidential election in September.

Noda underscored the need to consider specific challenges to reducing Japan's reliance on atomic power to zero by 2030. "We need to consider challenges to cutting down Japan's dependence on nuclear plants to zero," he told a news conference in Hiroshima on Aug. 6.

Later in the day, the prime minister instructed four Cabinet ministers concerned, including Edano and State Minister for National Policy Motohisa Furukawa to consider challenges to reducing Japan's reliance on atomic power to zero.
Specifically, shutting down of all nuclear plants could result in a sharp rise in electricity charges and cause companies to transfer their factories overseas in the short run.

In the mid- and long-term, energy consumption must be substantially slashed and renewable energy made available at low costs. Moreover, experts must be trained to decommission and dismantle nuclear reactors.

The government is aiming to spur technological innovation by clearly showing the deadline for eliminating nuclear power.
However, there are no prospects that stable renewable energy will be made available at low prices. "Solar power is expensive while wind power is unstable," says a government official.

Under the government's scenario of eliminating nuclear power by 2030, energy consumption would be reduced by 22 percent from 2010 levels, and the ratio of renewable energy including hydraulic power to Japan's total power generation would be raised to 35 percent from 10 percent in 2010. However, this scenario is based on the assumption that the introduction of solar power would be promoted even if it requires households and businesses to shoulder a heavy financial burden with the goal of installing solar panels at 12 million households.

Stiff opposition to the complete elimination of nuclear power persists within the DPJ-led government.

The DPJ intends to coordinate views on Japan's basic energy policy at its newly established energy and environment research panel by early September.

Therefore, the government's compilation of its energy and environment strategy will be delayed from the end-of-August deadline.

Minister seeks zero dependence on nuclear power
http://www3.nhk.or.jp/daily/english/20120821_23.html

National Policy Minister Motohisa Furukawa says he's aiming for zero dependence on nuclear power for Japan when drawing up a new energy policy.

Furukawa said on Tuesday that the government must face up to reality and think hard how to reduce the country's dependence on nuclear power.

He said he will set up a panel of experts on Wednesday to analyze the volumes of public opinion the government has received on the country's future dependence on nuclear power. The government has held public hearings as it reviews its energy policy in the wake of last year's nuclear disaster.

Furukawa added that he shares the view held by many Japanese that the government should create a society without nuclear power plants.

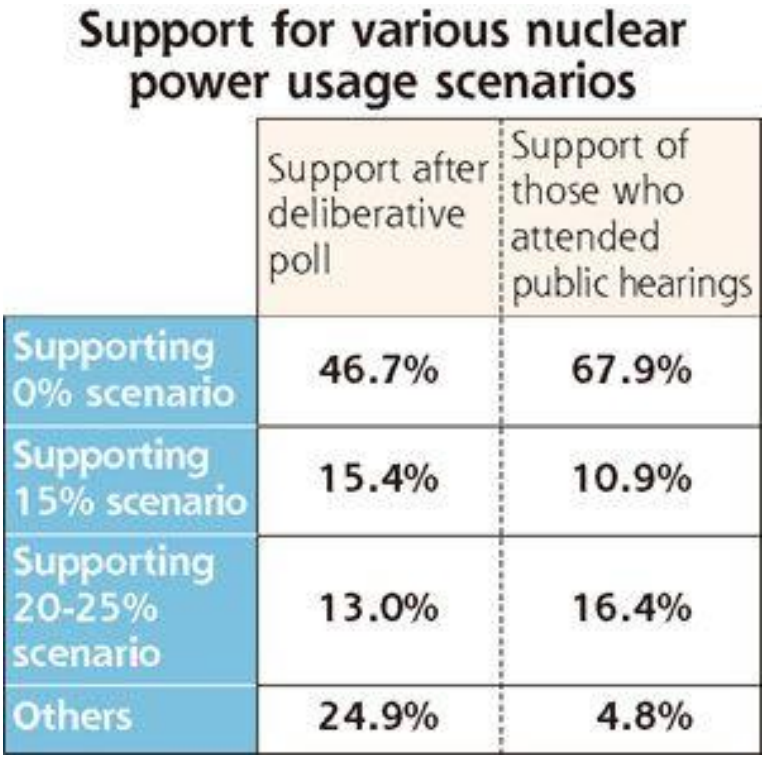
Zero nuke option favored by almost 50%

August 23, 2012

Poll: Nearly 50% favor zero nuclear power scenario

http://www.yomiuri.co.jp/dy/national/T120822004329.htm

The Yomiuri Shimbun



Support for various nuclear power usage scenarios

	Support after deliberative poll	Support of those who attended public hearings
Supporting 0% scenario	46.7%	67.9%
Supporting 15% scenario	15.4%	10.9%
Supporting 20-25% scenario	13.0%	16.4%
Others	24.9%	4.8%

The government's executive committee, which conducted a deliberative opinion poll on mid- and long-term energy policies in April and May, said Wednesday that 46.7 percent of respondents supported a scenario in which nuclear power generation would cease.

In the poll, which asked about the percentage of energy to be generated by nuclear power as of 2030, the largest portion of respondents favored the zero percent scenario among three presented by the government.

The choice was followed by 15.4 percent who favored a 15 percent supply scenario and 13 percent who favored a scenario with a supply percentage between 20 percent and 25 percent.

Those who favored the zero percent scenario were nearly 70 percent of participants in earlier public hearings and other occasions in which attendees voluntarily gathered.

But the percentage of zero percent scenario supporters did not reach 50 percent in the deliberative poll.

The poll surveyed 285 randomly selected people from among 6,849 who responded to prior telephone surveys.

The participants gathered in Tokyo and participated in the deliberative poll, which comprised group discussions and interpellation with experts.

The government committee analyzed the results of telephone surveys and three questionnaires taken before and after the deliberative poll.

In the telephone surveys, 32.6 percent supported the zero percent scenario. But the percentage increased before and after the deliberative poll.

The percentage of supporters of the 15 percent scenario fell 2.8 percentage points after the deliberative poll. The percentage of supporters of the 20 percent to 25 percent scenario did not markedly change before or after.

Among those who favored the zero percent scenario after the deliberative poll, 96.2 percent cited safety as the reason.

Among supporters of the 15 percent scenario, 88.6 percent cited a stable energy supply as the reason for their choice. Of those who chose the 20 percent to 25 percent scenario, 89.2 percent cited the same reason.

===

Questions over legitimacy

By Ryosuke Yamauchi / Yomiuri Shimbun Staff Writer

The result of the deliberative poll, along with results of prior public comments and public hearings, will be considered by the government in setting mid- and long-term energy policies to be compiled by the end of this month.

The deliberative poll aimed to obtain an informed public response the objectivity of the public as the randomly selected people were asked for their opinions after sufficient discussions and explanations.

However, it remains doubtful whether the poll result can be seen as a neutral "public opinion."

The participants in the deliberative poll are viewed as being highly interested in the nuclear power issue. Some of the participants said after the discussions that the debates were influenced by those who spoke more loudly than others.

The government committee explained that the reason the percentage of zero percent scenario supporters increased was that safety measures and other tasks were made clear.

The government should carefully consider effects on the economy and maintaining technological capabilities. They also must consider business groups that have voiced concerns.

It cannot be wise to decide important policy decisions, which will affect the future of the nation, through popular vote.
(Aug. 23, 2012)

August 22, 2012
Poll finds half want nuclear-free energy policy
http://www3.nhk.or.jp/daily/english/20120822_19.html

Nearly 50 percent of respondents to a government survey say they want to completely get rid of nuclear power generation in 2030.

The "deliberative polling" study was conducted earlier this month. Randomly chosen participants took part in discussions and question-and-answer sessions with nuclear experts. The polls were conducted

before and after the debates. It is believed that deliberative polling allows participants to address an agenda more deeply than ordinary polls.

The views of 280 participants were collected before and after the debates. Respondents were asked how much of Japan's total energy supply should be generated by nuclear power in 2030: zero percent, about 15 percent, or 20 to 25 percent.

Forty-six-point-seven percent of the respondents said after the debates that Japan should completely get rid of nuclear power. That figure represented an increase of 14 percentage points from before the debates.

Fifteen-point-four percent of respondents said after the debates that nuclear power should account for 15 percent of total energy generation. That was down more than one percentage point. Those who support a 20 to 25 percent share of nuclear energy stayed unchanged at 13 percent.

Asked what they consider to be the most important factor in formulating energy policy, 76.5 percent cited ensuring safety. Forty-point-four percent said a stable supply of energy, and 16.1 percent cited costs.

The government plans to assign a panel of experts to analyze the results and consider how to incorporate the findings into a new set of energy policies.
Aug. 22, 2012 - Updated 06:29 UTC (15:29 JST)

Gov't poll shows about 50% want to end Japan's nuclear reliance

http://mainichi.jp/english/english/newsselect/news/20120822p2g00m0dm029000c.html

TOKYO (Kyodo) -- A government opinion poll on Japan's future energy policy showed Wednesday that nearly 50 percent of respondents want to end Japan's atomic power generation by 2030, a far larger portion than those supporting more gradual reductions of nuclear reliance.

The outcome of the "deliberative polling" survey showed that the more participants were informed on energy issues, the greater their support for reducing Japan's nuclear reliance to zero by 2030.

It is the first time the government has conducted an opinion poll on the future role of nuclear power since last year's Fukushima Daiichi nuclear power plant disaster.

Keio University professor Yasunori Sone, who headed the committee organizing the survey, said at a press conference that a large portion of participants hoped the country would withdraw from nuclear power generation despite "knowing that they (would) have to confront a rise in (electricity) costs as a result of an increase in reliance on renewable energies, and a change in lifestyle."

To assess the numerous opinions it received through the survey and other methods, the government held its first meeting with the experts the same day as it plans to have the results reflected in a new energy policy that it has been working on.

But with some quarters of the ruling Democratic Party of Japan and the business circle opposed to the idea of abandoning nuclear power generation, it is still uncertain if the government will come up with an energy policy that clearly seeks the end of the nuclear power.

In addition to the deliberative polling, the government solicited opinions from the public via fax and the Internet, and held opinion sessions nationwide over the past month or so, asking for people's opinion on how reliant Japan should be on nuclear power by 2030.

The government-proposed options are zero percent, 15 percent and 20 to 25 percent of total power generation -- compared with 26 percent in 2010.

Of a total of 89,124 comments the government solicited between July 2 and Aug. 12, the government said it has so far created a tally of about 7,000 and found about 90 percent supportive of zero nuclear reliance.

National policy minister Motohisa Furukawa said at the opening of the meeting with the experts that the nation's energy policy used to be compiled through consultations with experts. But this was the first time for the government to work in a way that reflected public opinion in formulating an energy policy.

"We'd like to analyze the opinions we received fairly and neutrally, while ensuring transparency," he said.

The deliberative polling involved a two-day discussion event through Aug. 5 among some 290 randomly selected people, whose opinion was checked three times -- before, during and after the debate.

The poll showed that the portion of people who attach paramount importance to safety increased from 67 percent in the first survey to 76.5 percent in the third and final survey, higher than those who seriously regard energy security and cost issues, said the survey organizing committee.

Meanwhile, the percentage of people who supported the zero nuclear reliance option stood at 32.6 percent in the first survey. It increased to 41.1 percent in the second survey after participants were asked to study distributed materials, and rose again to 46.7 percent in the third and final survey.

The percentage of those who preferred the 15 percent option started off at 16.8 percent and ended at 15.4 percent, while those who supported the 20 to 25 percent option showed little change and ended at 13 percent.

Numbers

August 23, 2012

90 percent of public submissions favor zero nuclear power plants

http://mainichi.jp/english/english/newsselect/news/20120823p2a00m0na010000c.html

About 90 percent of public comments solicited by the government over the nation's future energy policy support the abolition of nuclear power, an analysis of the data released Aug. 22 has shown.

The results of the analysis were reported Aug. 22 at a meeting to review public debate. Of the 89,124 submissions from the public, the government analyzed about 7,000 of them. It found that 81 percent favored immediate abolition of all nuclear power plants, while 8.6 percent favored a shift to a society free of nuclear plants in stages. Altogether, about 4 percent of people said they either supported or permitted nuclear power.

The government will announce statistics on the remaining submissions, numbering about 80,000, once the data has been compiled.

"Rather than interpreting the results numerically, we should focus more on qualitative analysis and the paths leading toward people's views," a member of the review panel commented. Another member said, "Two months of public debate is insufficient for careful deliberation of the issue."

The review gathering will discuss how to utilize public comment and views obtained through deliberative polling in the future. The review of public comments will be reported to the government's Energy and Environment Council with a view to have the outcome reflected in a the nation's new energy and environment strategy.

No more dependancy on nukes, says Furukawa

August 22, 2012

Energy policy chief inclined toward nuclear-free Japan

Jiji, Kyodo
http://www.japantimes.co.jp/text/nn20120822a4.html

The nation's new energy policy goal should be to no longer depend on nuclear power, national policy minister Motohisa Furukawa said Tuesday.

Furukawa told reporters this means Japan would have to embark on a broad quest to become totally nuclear-free. His comments could spark a backlash because he chairs the government panel that this month must unveil the nation's future energy mix.

His remarks came as he announced the government will convene a meeting of experts Wednesday to study public opinions it collected during the course of hearings on the future use of atomic power. Furukawa said the government will reflect the results when drawing up a plan that will wean Japan off nuclear power.

But Environment Minister Goshi Hosono cautioned against immediately ending Japan's reliance on atomic power, warning that doing so would lead to a decline in the number of nuclear experts, who are needed to deal with the decades-long work of scrapping the crippled reactors at the Fukushima No. 1 power plant.

"Unless we have the knowledge of how to maintain such technology (for decommissioning), we can't simply say that we will be able to abandon nuclear power generation," said Hosono, who is also nuclear disaster minister.

He also stressed the need to consider the risks of relying too much on fossil fuels amid the unstable Middle East situation.

The government is stepping up efforts to compile its new energy policy in light of the Fukushima nuclear crisis, which sparked public fears over the safety of dozens of reactors.

As part of its policymaking process, the government held public hearings nationwide and solicited comments on three options for reducing reliance on nuclear energy: zero percent, 15 percent and 20-25 percent by 2030, compared with 26 percent in 2010.

The expert meetings from Wednesday will study the public opinions amassed.

Gov't responsible for disposal of nuclear waste

Editorial: Gov't responsible for progress on decommissioning of nuclear reactors

http://mainichi.jp/english/english/perspectives/news/20120822p2a00m0na006000c.html

The national government has come under mounting pressure to launch a full-scale project to decommission, dismantle and decontaminate nuclear reactors amid national debate on decreasing Japan's reliance on nuclear power.

Even if Japan maintains the current ratio of atomic power to its total power generation, the number of nuclear reactors that must be decommissioned will steadily increase as those currently in operation are aging. It is necessary for the central government to proactively improve and accumulate technologies and know-how to safely and efficiently decommission nuclear reactors.

The government has decided to decommission nuclear reactors after 40 years have passed since the beginning of their operations in principle. Throughout the world, more than 400 nuclear reactors are in operation, and aging reactors, mainly those in developed countries, will need to be decommissioned one after another in the near future. One cannot help but wonder whether Japan is prepared to do this.

The reactors at the Japan Atomic Power Co.'s Tokai plant are the only commercial reactors in Japan that are in the process of being decommissioned. The reactors are Japan's first commercial reactors that began operations in 1966. The plant was shut down in 1998 and work to decommission the reactors got under way in 2001. According to the plan, the decommissioning process will be completed in 2020.

However, there are serious challenges to the work. The burial site for radioactive waste generated as a result of the dismantling of the reactors has not been determined yet.

Since radiation levels are high in the reactor core and the equipment around it, the operator of the plant will wait about 10 years for the radiation levels to decline sufficiently before dismantling the reactor core. Until then, the plant operator will remove equipment situated away from the reactor core. However, full-scale work to remove the reactor core and equipment near it, which is scheduled to begin in 2014, cannot be launched until a disposal site for radioactive waste stored in these areas is secured.

This is reportedly due to Japan Atomic Power's internal regulations. However, unless the radioactive waste disposal site is secured, the work to decommission the reactor could stop.

In accordance with the government's policy, in principle electric power companies must take responsibility for decommissioning their own nuclear reactors. However, the government should be responsible for selecting radioactive waste disposal sites and their management, considering the safety of such sites and the need to gain consent from local residents.

In particular, if the burial of radioactive waste from nuclear reactor cores, which is supposed to be stored and properly managed 50 to 100 meters below ground for 300 to 400 years, is left to the discretion of private companies, local residents will feel uneasy and never accept it.

Decommissioning nuclear reactors requires special know-how such as radiation management. The government should consider ways to strategically accumulate technologies, such as fully using the experiences gained from decommissioning the Tokai power plant for other nuclear plants. Once Japan establishes a competitive edge in this field, Japanese firms will benefit from demand for such technologies that is expected to grow overseas.

However, Japan cannot accumulate such necessary experiences unless it solves problems involving the disposal of radioactive waste domestically. If the government evades its responsibility for disposing radioactive waste by postponing the decision or leaving the matter entirely to the private sector, other developed countries will overtake Japan in the nuclear reactor decommissioning business.

Abolition of nukes the new goal ?

August 25, 2012

Japan to include zero nuclear power goal in new government policy

Kyodo
http://www.japantimes.co.jp/text/nn20120825b7.html

The Democratic Party of Japan-led government may set as its new mid- to long-term energy policy the goal of abolishing nuclear power, due to the heightened public safety concerns since the triple-meltdown crisis started last year at the Fukushima No. 1 atomic plant, sources said Friday.

The government may unveil the new energy policy possibly early next month at a ministerial meeting, and lay out a timetable for ending nuclear power, including procedures for decommissioning the nation's reactors.

The government has shifted its stance toward adopting the zero nuclear power goal, given the strong urging of the public. The change may also be an effort to prevent the future of nuclear power from being a campaign issue in the next general election.

Given calls to maintain nuclear power in some quarters, the government is also expected to set a clause that will allow regular reviews of policy goals.

Due to the Fukushima nuclear crisis, the government has scrapped the previous energy policy that aimed to increase the nation's reliance on atomic energy, and has been working to create new goals.

Gov't cannot ignore its own surveys

August 24, 2012

Editorial: Gov't must respect public's readiness for zero dependence on nuclear power

http://mainichi.jp/english/english/perspectives/news/20120824p2a00m0na002000c.html

In exploring a new energy policy, the government has used several different survey methods to feel out the public's take on the ratio of atomic power to Japan's total electric power generation in the year 2030.

Results from public hearings in 11 cities across the country, as well as public comments and deliberative polls, have shown that **supporters of "zero dependence" on nuclear power comprise the largest group.**

The results don't necessarily accurately reflect the views of the entire Japanese public. Those who attended hearings and submitted public comments wanted to make their opinions known, and although participants eligible for deliberative polls were chosen randomly, those who actually attended the deliberations were there because they wanted to be there. We must keep in mind that the results of these surveys are skewed.

Still, the fact that the government has opened itself to a range of input from the public is worthy of praise. Prime Minister Yoshihiko Noda made an additional step by meeting with anti-nuclear activists on Aug. 22. Let us hope that he takes to heart the public's fervent hope for zero nuclear dependence.

It is now important for the government to gain an in-depth understanding of the public's views by analyzing the reasons behind the opinions, taking into account the characteristics of each survey method.

For example, the purpose of deliberative polls -- as opposed to standard public opinion polls -- is to sound out public opinion through in-depth discussion. They entail tracking shifts in opinions as participants take part in small group discussions and question-and-answer sessions with experts. Through this process, the number of participants supporting "zero dependence" increased, and those for "15-percent dependence" decreased.

The deliberative poll was not without its shortcomings; reference materials for the discussions were wanting, and the experts were ill-prepared. The age brackets and sex of the participants were also skewed. Still, it is significant that through deliberation, the number of "zero dependence" supporters rose.

A 15-percent ratio of nuclear power to Japan's total electric power generation is expected in 2030 if a requirement to decommission reactors after 40 years is instituted for all currently existing nuclear reactors. The government had believed this scheme to be the most promising, but such a policy fails to clarify whether the government is moving toward a future of zero-dependence, or maintaining nuclear power at current levels. The public views such ambiguity with suspicion.

Another fact that emerged from deliberative polling -- and one that the government must take seriously -- is that **the guarantee of safety is a higher priority for participants than a stable power supply or the cost.**

It is problematic that the government has yet to indicate how it will incorporate the survey results into its policy making process. It must show us what messages it has received from the people, and how it will overcome the obstacles we face in reducing dependence on nuclear power. To take the politically responsible route, **the government must set down a clear road map.**

The results of deliberative polling are said to indicate that the public is ready to accept higher costs and changes in lifestyles if the government decides on a policy of bringing nuclear dependence down to zero. It is time for the government to show that it, too, is ready.

"Women more concerned about nuclear power than men"

August 27, 2012

Gov't explores opinion differences on nuclear power by age, gender

http://mainichi.jp/english/english/newsselect/news/20120827p2g00m0dm086000c.html

TOKYO (Kyodo) -- The Japanese public's opinion on nuclear power varies according to age and gender, the government reported Monday following its second meeting with a panel of energy policy experts.

In efforts to derive a new energy policy following the March 2011 Fukushima nuclear disaster, the government has held public hearings nationwide as they look at how they can reflect public opinion in Japan's energy policy.

Among those who attended the public hearings, a larger percentage of people in their teens and 20s preferred maintaining nuclear power's share of electricity generation at 20-25 percent in 2030 than those in other age groups.

While all age groups preferred reducing the nuclear share to zero by 2030, the idea of retaining some nuclear power generation appears to have gained a greater level of support from the teens and 20 year olds, who will form the core of the working generation in 2030. This is due to their concern that a sharp reduction in nuclear power would affect electricity fares and the stability of power supply, analysts said.

During the hearings, the government implemented a poll and solicited comments on three options it presented for nuclear energy's share of total electricity generation in 2030.

The three options are zero percent, 15 percent and 20-25 percent, compared with 26 percent in 2010.

The public hearing sessions showed that the percentage of people who prefer the 20-25 percent option stood at 18.7 percent among those in their teens and 20s, higher than 17.6 percent among those in their 40s and 50s and 15.2 percent of those in their 60s or older.

The government also said the surveys showed that women are more concerned about nuclear power than men, but that fewer women and young people utilized the opportunities to convey their opinions to the government, compared with men and older people.

The government will hold its third meeting with the experts Tuesday.

Most Japanese want to do away with nukes

August 29, 2012

Government acknowledges most Japanese favor nuclear-free society

Kyodo
http://www.japantimes.co.jp/text/nn20120829a3.html

The government said Wednesday in a draft report that public consultations on the future of nuclear power show that most people favor doing away with all reactors.

In formulating a new energy policy following the Fukushima nuclear disaster, the government has held public hearings nationwide, conducted a poll and solicited comments via the Internet and through other means.

People were asked their views on the degree that Japan should rely on nuclear power by 2030.

The were zero percent, 15 percent or 20 to 25 percent of total power generation, compared with 26 percent for nuclear power in 2010.

The report presented by the government Wednesday at the third meeting to analyze the results of the surveys with a group of experts states: "We can say with certainty that a majority of citizens want to achieve a society that does not rely on nuclear power generation."

However, to also states: "On the other hand, opinions vary on the speed to realize it."

The report, after being finalized through discussions with the experts, will be submitted to a ministerial meeting in charge of formulating the new energy policy, a government official said.

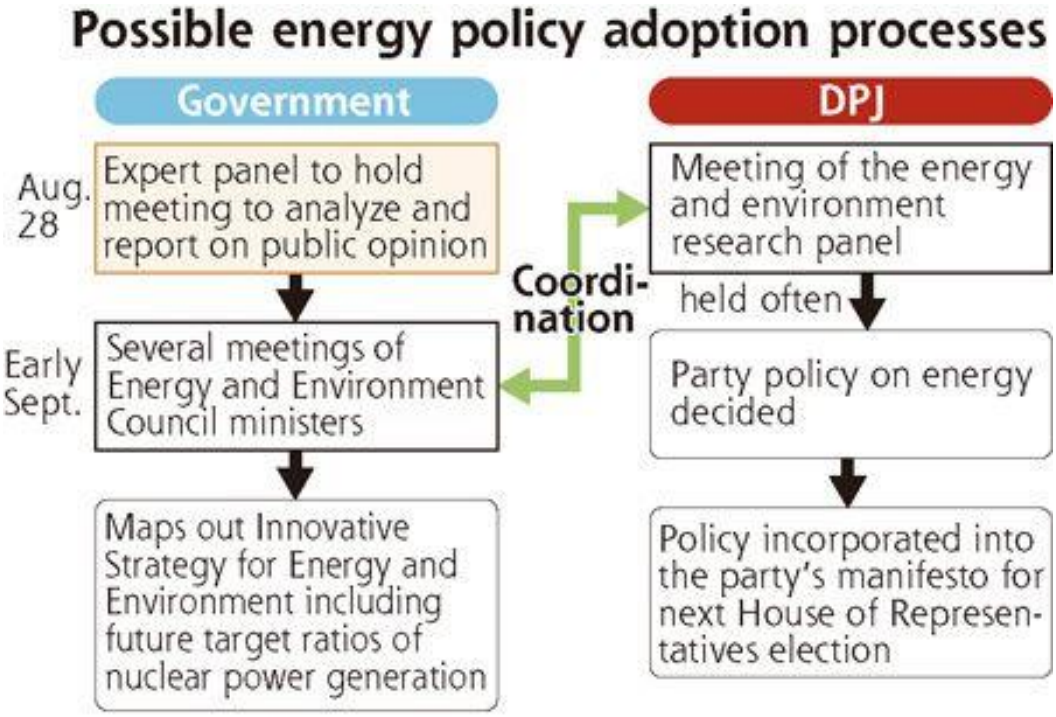
Gov't and DPJ divided over nuclear future

August 30, 2012

Opinion remains divided on energy plan

http://www.yomiuri.co.jp/dy/national/T120829004685.htm

The Yomiuri Shimbun



Opinions are divided among the government and the Democratic Party of Japan over the nation's nuclear policy, and even Cabinet ministers have different sentiment to each other.

Motohisa Furukawa, state minister for national policy, said, "A major direction [of public opinion] is that the majority want denuclearization."

The comments show Furukawa's willingness to move toward forming a consensus to abolish Japan's nuclear dependency in 2030.

Sources said Economy, Trade and Industry Minister Yukio Edano, Furukawa and Goshi Hosono, state minister for nuclear power policy and administration, met in Tokyo on Monday to discuss a basic policy on the percentage of Japan's power supply in 2030 that will come from nuclear sources.

Unofficial meetings dubbed the "three plus two," which included the three ministers, Yoshito Sengoku, acting DPJ Policy Research Committee chairman and Tsuyoshi Saito, deputy chief cabinet secretary, were held intermittently in August.
Edano was scheduled to leave Japan early Wednesday for an international conference, making the Monday meeting one of the best opportunities for the attendees to make a decision.

While Furukawa and Edano were willing to decide that the nation's nuclear dependency in 2030 be reduced to zero, Hosono was cautious and remained opposed. "It would be difficult to secure human resources and technology necessary to operate nuclear reactors" if the government decided to abolish nuclear power, Hosono said.

Sengoku reportedly refused to take part in the meeting because he wanted to avoid a hasty decision. Sengoku has been critical of abolishing nuclear power because of fears this would adversely impact the Japanese economy.
As Edano is scheduled to return to Japan on Friday night, the meeting's conclusion is likely to be made early September.

During August several policy panels were established.

For example, the government conducted a deliberative opinion poll to learn the public's choice from among three scenarios about the amount of nuclear power used in the country in 2030. This ranged from zero percent to 30 percent of the nation's total power generation. The government hastily created a panel of experts at Furukawa's initiative to analyze public opinion on the matter.

Last Thursday, the DPJ created an energy and environment research committee chaired by Seiji Maehara, the chairman of the party's Policy Research Committee.

As the dissolution of the House of Representatives and a subsequent general election becomes more likely, various research forums and places where opinions can be presented were created "to justify policy decisions," said a senior government official.

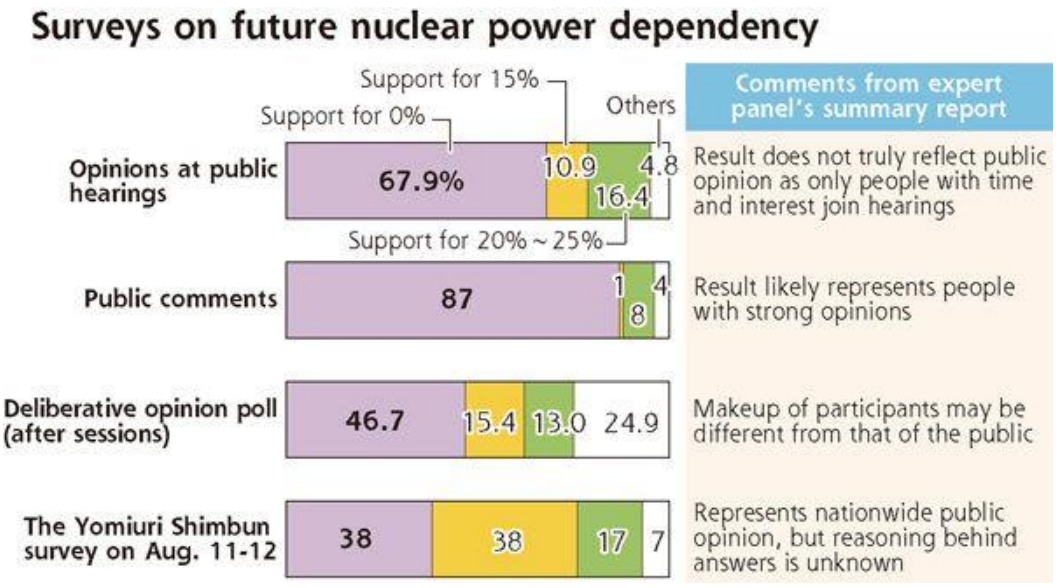
The DPJ is divided with some members pushing for denuclearization and others wanting to create a policy that prioritizes securing stable energy resources.

The future of nuclear power : A very tricky question

Panel avoids tough nuclear power questions / Report refrains from policy suggestions; some members say they needed more time for discussions

http://www.yomiuri.co.jp/dy/national/T120829004315.htm

Ryosuke Yamauchi and Hironori Kanashima / Yomiuri Shimbun Staff Writers



A summary report by a government panel of experts that analyzed recent public polls on future nuclear power dependency refrained from making concrete suggestions on a future energy policy, but said most people want to move away from nuclear power.

The government plans to use the report to compile its "Innovative Strategy for Energy and the Environment" by the end of the current Diet session on Sept. 8.

However, as opinions within the government and the ruling Democratic Party of Japan remain divided over an energy vision, it is unlikely the government will settle on a target proportion of nuclear power in power generation.

The panel, chaired by Motohisa Furukawa, state minister in charge of national policy, compiled the summary report after its eight members, including experts on opinion polls, discussed the matter in three meetings.

The report, compiled Tuesday, concluded, "At least a majority of the public wish to realize a society that isn't dependent on nuclear power."

However, it avoided outlining a clear direction in the country's energy policy among the three scenarios of nuclear power dependency in 2030--zero, 15 percent or 20-25 percent.

The panel's report was based on 90,000 public comments and opinions gathered at hearings in 11 locations as well as a deliberative opinion poll. It also analyzed 1,300 responses to questionnaires and opinions from industry groups to clarify main issues on the matter.

In the report, the panel took a reserved stance toward a plan to achieve zero dependency by 2030, saying it remains a question how early denuclearization should be realized, even though the majority of the public support the policy.

At one panel meeting, the government showed results of a survey conducted by an Internet company, covering about 1.27 million people. According to the results, about 30 percent of people in their 20s and younger consider it unnecessary to reduce nuclear power dependency if safety is enhanced. Only about 20 percent of people in their 50s or older agreed, indicating stronger support for maintaining nuclear power among younger generations.

Asked whether nuclear dependency should gradually be reduced to zero, about 65 percent of female respondents said yes, while only 53 percent of male respondents said they agreed.

===

Politicians to make final decision

The panel's report pointed out that a majority of the public support zero dependency because of a growing "distrust in policy-making processes on nuclear policy and anxiety over the safety of nuclear power generation."

The report also noted that many people who support "zero dependency" also promote renewable energy and are willing to accept increased power costs. People with other opinions tended to emphasize the need to secure human
resources and technology for nuclear power generation, as well as concerns over stable energy supply and costs.

Furukawa said: "We carried out the analysis with fairness, neutrality and transparency. Politicians, who are representatives of the public, will make a final decision."

However, some officials criticized the panel, with a senior official of an economy-related government body saying: "We were already aware of those points of contention. Did we really need such panel meetings?"

Members of the panel also voiced concern, with one saying three meetings was insufficient to discuss such an important issue, and that it was merely an ad hoc panel.

Despite such criticism, the panel fulfilled its role in cross-analyzing various opinions and surveys on the power issue. Some Cabinet members have suggested a political decision should be made as soon as possible.

15% dependance by 2030 before complete elimination of nukes

September 2, 2012

Zero option for nuclear power may be added to revamped energy plan

Jiji
http://www.japantimes.co.jp/text/nn20120902x3.html

Eliminating dependence on nuclear power is expected to be part of the government's revamped energy policy, officials say.

Prime Minister Yoshihiko Noda will reveal the new policy to his ministers after making a formal decision this month, government officials said Saturday.

According to the officials, the government will make the 15 percent option its interim target for nuclear power dependence in 2030 before completely eliminating it from electricity generation at an unspecified date.

Shooting for 15 percent dependence by 2030 was expected to be the goal of the new energy policy, but given the feedback compiled from weeks of public hearings and a deliberative opinion poll, the government now thinks it necessary to clarify that Japan will become nuclear-free because the majority of the public favors the zero-percent option.

The zero option will be part of the innovative energy and environmental strategies to be adopted at the ministerial meeting, the officials said.

The new energy policy will require the government to conduct progress reports on efforts to reduce nuclear dependence every five years starting in 2015.

The upcoming policy paper will also state the numerous difficulties Japan is expected to experience in pursuing the goal, such as how to expand the use of renewable energy and permanently dispose of spent nuclear fuel, they said.
Noda plans to call on all citizens to cooperate in achieving the target, they added.

As for decommissioning the nation's reactors, the paper will state that the government is to "strictly apply" the basic 40-year age rule for shutdowns.

Other options under consideration include termination of the commercialization program for "fast-breeder" reactors and of research on the experimental Monju prototype in Tsuruga, Fukui Prefecture.

As for the all-important nuclear fuel cycle, the government is actually discussing scaling down its reprocessing and recycling pursuits.

How much investment to replace nukes?

September 4, 2012

¥50 trillion for renewables needed to end nuke power
http://www.japantimes.co.jp/text/nn20120904x1.html

Kyodo

The nation will have to invest at least ¥50 trillion in renewable energy by 2030 if nuclear power is completely phased out, the government estimated Tuesday.

It also predicted that households would see their monthly energy bills, including gas and other sources, nearly double if the phaseout goal is to be reached by 2030, rising to as high as ¥32,243 on average, compared with ¥16,900 in 2010.
These estimates were presented at a meeting to discuss future energy policy that was attended by national policy minister Motohisa Furukawa and other key members of the Cabinet.

Prime Minister Yoshihiko Noda has asked his Cabinet to outline the challenges if Japan decides to go completely nuclear-free.

Furukawa said the government will finish drawing up the new energy plan "by the end of this week or early next week."
Lawmakers on the energy and environment panel of the ruling Democratic Party of Japan met separately in an effort to compile their recommendations on the new energy policy.

Members of the panel, which is headed by DPJ policy chief Seiji Maehara, exchanged views on drafted recommendations that urge the government not to allow construction of new nuclear plants and to eventually abandon atomic power.

But they remain divided over the target date for achieving that goal.

Furukawa said the government intends to compile the new energy plan after taking into account the ruling party's recommendations coming possibly later this week.

Under the phaseout scenario, the nation's energy to be generated from solar, wind and other renewable sources would need to rise to 350 billion kwh in 2030 from 106 billion kwh in 2010 to cover the loss of nuclear power.

If reliance on nuclear power is reduced to 15 percent in 2030, the government said, ¥40 trillion in investments would probably be needed to increase output from renewable energy sources to 300 billion kwh. In that case, the average monthly household energy bill would probably rise to as high as ¥29,290, the government said.

The government also pointed out that even if nuclear power is taken off the board, disposing of the spent nuclear fuel stored in Aomori Prefecture and at the nation's nuclear plants will remain a pressing question.

Before the Fukushima disaster, the national policy goal was to reprocess all spent nuclear fuel and reuse the extracted plutonium and uranium as reactor fuel. If the government ends atomic power generation, there would be no point in pursuing fuel recycling.

Aomori has been calling on the government to maintain the fuel-recycling policy. The government noted that a decline in the nation's nuclear power-related technologies and human resources specializing in the field also needs to be considered if atomic power is to be abandoned.

Ridding Japan of nuclear power: Difficult task ahead

September 6, 2012

Editorial: Nuclear power must go, and we need a plan to make it happen

http://mainichi.jp/english/english/perspectives/news/20120906p2a00m0na003000c.html

The government's new energy policy, including the weighty question of what percent of Japan's generating capacity will be nuclear, is close to completion. With the nation's energy future all the way up to 2030 on the line, we must point out that nuclear power brings with it a host of problems, from reactor safety to used fuel disposal. As such, a nuclear-free future is most desirable, and the government must make its goal the elimination of atomic energy in this country.

Ridding Japan of nuclear power will be painful, both for industry and citizens. That being so, the government must lay out a clear and realistic path to eliminating atomic energy and do all it can to earn the people's trust and support.

The government has already revealed plans to decommission reactors once they've been in service for 40 years. If no new reactors are built to replace them, by 2030 nuclear plants will be producing just 15 percent of Japan's electricity, and by 2050 it will drop to zero. However, the end of nuclear power generation could well come earlier than that, as reactors could be decommissioned before they turned 40 if they failed to meet safety standards or other operational requirements.

Meanwhile, our dependence on nuclear power could be reduced a notch with the broader adoption of electricity-saving measures and technologies, and renewable energy sources such as wind, solar, tidal and geothermal. With these options available, we call on the government to push these alternative energy sources and clearly indicate its will to work to end atomic power generation as soon as possible.

Before the Fukushima nuclear disaster began last year, reactors were providing some 30 percent of Japan's electricity. To say we will go from that to zero is indeed a policy shift of revolutionary proportions, and of course it's easy to imagine there will be difficulties along the way.

For example, what would happen to industry and to our daily lives if the government allowed electricity rates to rise to as much as double current prices? Certainly the blow would be a tough one to absorb, especially for the industrial world, and would likely invite a further hollowing-out of domestic manufacturing. To prevent this bleak scenario from becoming a bleak reality, the government must spark price competition among power companies by introducing a truly free domestic energy market, as well as secure cheap fuel sources such as North American shale gas.

Meanwhile, the problem of what to do with spent nuclear fuel is becoming all the more urgent. The very raison d'etre of Japan's nuclear fuel cycle program, which was supposed to underpin the operation of reactors in this country, is falling to pieces. If the nuclear fuel cycle program is indeed dead, then we can no longer delay answering the question of what to do with all Japan's spent fuel, massive amounts of which now languish in "mid-term storage" at nuclear stations and at the Rokkasho Reprocessing Plant in Aomori Prefecture.

At the Rokkasho plant alone, there are some 3,000 metric tons of spent fuel collected from across the country. One might term this poisonous stockpile the bill we are leaving to our descendants for the cost of maintaining our cushy lifestyle. We cannot run away from this challenge. If the government indeed declares it will aim for a nuclear-free Japan, then as part of that it must set about disposing of the country's nuclear waste once and for all.

The ruling Democratic Party of Japan (DPJ) and the government in general have begun final deliberations on Japan's energy future. The outcome we fear most is that the government will raise the nuclear-free banner and then do nothing. With a general election approaching, the parties must not turn this issue into just another work of political theater. This policy will determine the future of our country, and must be treated with the gravity it merits.

For Japan to rid itself of atomic power, nothing short of a revolution in society and economics is needed, and to make that happen the government must have the agreement of the nation -- including industry. As such, we call on the government to produce a concrete and persuasive policy laying out how Japan will realize its non-nuclear future.

Keeping nukes more expensive than phasing them out completely

September 6, 2012
Eliminating all nuke power cheapest option: Softbank's Son

http://www.japantimes.co.jp/text/nn20120906x3.html

By ERIC JOHNSTON
Staff writer

Softbank CEO and renewable energy advocate Masayoshi Son said Thursday that **choosing nuclear power as either 15 percent or 20 to 25 percent of the total energy mix by 2030 would actually mean marginally higher electricity costs than phasing it out completely.**

Speaking at an international symposium sponsored by the Japan Renewable Energy Foundation, the organization he founded last year, Son said his foundation's calculations take into account a number of factors the government's three energy scenarios for 2030 appear to have avoided.

The government, in its two scenarios that call for some nuclear power, didn't sufficiently consider the **insurance costs of the aftermath of an accident,** Son said.

"There are also costs related to running a nuclear power plant past 40 years, decommissioning costs and the question of what to do with the nuclear waste," he said. "Have all of these costs been factored into the costs of nuclear power plant operations?"

According to his group's calculations, the cost of generating electricity under the zero percent option would be ¥13.2 per kwh. If the 15 percent scenario is chosen, the cost would be between ¥12.6 and ¥13.4, and the 20 to 25 percent scenario would mean a cost of ¥12.6 to ¥13.9.

However, Son noted that regardless of which scenario is chosen by the government, it's going to mean a drastic increase in the amount of renewable energy used.

"In each scenario for 2030, the target for renewables is between 30 and 35 percent. So, even under the zero nuclear scenario, we are going to have to provide more than 30 percent of our energy with renewable sources by 2030," he said.

To reach that goal, the key will be developing the potential of renewable energy and making sure there is an interconnected grid for transmitting it, as well as breaking the utilities' monopoly on the grid, a goal Son has pushed hard for since announcing in spring 2011 his plans for a series of huge solar parks and wind farms to replace nuclear power.

"Real competition between energy producers is needed, so that the energy they offer is delivered on an improved transmission system operated by a neutral operator who gives all competitors equal opportunities to transmit their electricity," said Tomas Kaberger, executive board chairman of Son's energy foundation.

Son said he believes Japan could become the world's third-largest user of solar energy and that Hokkaido and Kyushu have huge potential for wind-generated power. To reach that goal, he said, the question is not

about a lack of resources but getting power to consumers as efficiently as possible, and that means integration of the current regional grids into a unified national delivery system.

New nuclear emergency center not ready

September 10, 2012

Transfer of nuclear emergency center delayed
http://www3.nhk.or.jp/daily/english/20120910_10.html

The emergency operations center of Japan's new nuclear regulatory commission will not be ready when the body is inaugurated later this month.

The government plans to set up the nuclear watchdog by the end of September.

It is a replacement for the Nuclear and Industrial Safety Agency, which is part of the Ministry of Economy, Trade and Industry. The ministry has promoted nuclear energy development.

Most of the staff and functions of the new commission are to be moved from the ministry's offices in the Kasumigaseki district to a building in Roppongi around the middle of this month.

But, the emergency operations center will remain in Kasugimaseki for some more months. The center has a system that tracks the current conditions of nuclear reactors across the county. It also has telephone hot lines to the Prime Minister's official residence and the offices of prefectures with nuclear plants.

A preparatory office of the new commission says the moving delay will not cause problems as staff members can get back to Kasumigaseki within 30 minutes in the event of an emergency.

Professor Emeritus Hirotada Hirose of Tokyo Woman's Christian University says it is critical to collect data and act immediately in a nuclear emergency, and that it's not clear if all staff can actually turn up in 30 minutes. He says the delay in moving indicates the government has not fully absorbed the lessons from last year's accident at the Fukushima Daiichi nuclear plant.

No consensus - Gov't puts off energy policy deadline

September 11, 2012

New energy policy deadline extended

Kyodo
http://www.japantimes.co.jp/text/nn20120911a5.html

The government put off setting a new energy policy, originally planned for Monday, due to difficulties in forming a consensus.

The decision comes after business circles opposed a goal presented last Thursday by the Democratic Party of Japan to end all dependence on nuclear power in the 2030s as the key component of the new policy.

It might take time before an agreement is reached within the government on whether to indicate a specific time frame for ending nuclear power, as opinions are sharply divided. Some DPJ members also want to avoid making the issue a focal point in the party's Sept. 21 presidential election.

Future of nuclear waste

September 12, 2012
same Kyodo information as in the Mainichi article below
Scientists sound alarm on plan to bury nuclear waste

http://www.japantimes.co.jp/text/nn20120912a3.html

Kyodo
An organization representing the nation's scientists called on the government Tuesday to drop its plan to dispose of spent nuclear fuel and other high-level radioactive waste deep underground, saying the risk of geological-based problems is too high.

The Science Council of Japan proposed keeping the waste in "temporary safe storage" sites during a moratorium that could last hundreds of years while efforts are made to establish a safe way to dispose of the lethal substances.

The council compiled the proposal in response to a request by the Atomic Energy Commission to look into the current efforts to select a final repository for high-level radioactive waste — a situation that is currently in a stalemate.

"Based on current scientific knowledge, we cannot determine a geological formation that would be stable for hundreds of thousands of years. . . . And thus the best possible option is temporary storage," said Harutoshi Funabashi, a professor at Hosei University involved in working out the proposal.

"This does not mean postponing the problem irresponsibly to the future. It is to secure time to find ways to more appropriately handle the matter," he said.

During the moratorium period, the country should promote research on the stability of geological layers and improve the ability to store the waste more safely.

Funabashi said the proposal can be applied if the government maintains or gives up on its current program to reprocess spent fuel from nuclear power plants for recycling.

Under the current plan, fuel reprocessing would produce vitrified high-level radioactive waste, which is to be placed in a final disposal site more than 300 meters underground after being stored for about 30 to 50 years for cooling.

September 11, 2012

Experts advise overhaul of nuclear disposal policy
http://www3.nhk.or.jp/daily/english/20120911_18.html

An organization of Japanese science and technology experts says the government's nuclear waste disposal plan needs to be overhauled.

Science Council of Japan President Takashi Onishi presented the organization's proposal to Japan Atomic Energy Commission Chairman Shunsuke Kondo on Tuesday.

The council was asked in 2010 to review the government plan, which called for burying highly radioactive nuclear waste more than 300 meters underground, where it would remain for tens of thousands of years.

The plan has been stymied since being enacted in 2000, due to opposition from candidate burial sites.

The council's proposal says in view of the accident at the Fukushima Daiichi nuclear power plant, it is inappropriate to select disposal sites without social consent over nuclear policies. It also stresses that since Japan is prone to seismic and volcanic activity, there are limits with current technology to determining sites that will remain stable for tens of thousands of years.

The council says the government should brace itself for an overhaul of the current plan. It suggests temporarily storing highly radioactive waste for decades to hundreds of years either above or underground. It says during this time, technological development and public consensus should take place.

Scientists council calls for review of nuclear waste disposal method

http://mainichi.jp/english/english/newsselect/news/20120911p2g00m0dm080000c.html

TOKYO (Kyodo) -- An organization representing scientists in Japan on Tuesday called on the government to review its plan to dispose of spent nuclear fuel and other high-level radioactive waste deep underground, citing the geological uncertainties regarding the current method.

The Science Council of Japan also proposed keeping the waste at what it calls "temporary safe storage" sites during such a moratorium period for several decades to hundreds of years while seeking to establish the final disposal method.

The council compiled the proposal in response to a request by the government's Atomic Energy Commission to look into the current efforts to select a final repository site for high-level radioactive waste, which are at a stalemate.
"Based on the current scientific knowledge, we cannot determine a geological formation that would be stable for periods of hundreds of thousands of years...And in that case the best possible option is temporary storage," said Harutoshi Funabashi, a professor at Hosei University who was involved in working out the proposal.

"This does not mean postponing the problem irresponsibly to the future. It is to secure time to find ways to more appropriately handle the matter," he added.

The waste in temporary storage, either located underground or in a facility above ground, should be placed in such a way that it can be recovered, the council said.

During the moratorium period, the country should promote research on the stability of geological layers and improve the ability to store the waste more safely.

Funabashi said that the proposal can be applied in the event of either the government maintaining or giving up the current policy to reprocess used fuel from nuclear power plants for recycling.

Under the current plan, fuel reprocessing would produce vitrified high-level radioactive waste, which is to be placed at a final disposal site more than 300 meters underground after being stored for about 30 to 50 years for cooling.

A process to solicit local governments to host the repository site is ongoing, but not much progress has been seen.

The government is currently reviewing the country's energy policy in the wake of the Fukushima Daiichi nuclear power plant disaster, which has raised questions about continuing to expand nuclear power generation.

TEPCO's underlying reasons for own task force

Tepco reforms seen as reactor restart bid

Task force boss: Safety push not part of Niigata plant image boost

http://www.japantimes.co.jp/text/nn20120913a1.html

Kyodo

Tokyo Electric Power Co. said it has set up teams to reform its nuclear division, a move viewed by some as laying the groundwork for the restart of idled reactors amid the disaster at its Fukushima No. 1 power plant.

The teams include a supervisory panel consisting of former U.S. Nuclear Regulatory Commission Chairman Dale Klein and management consultant Kenichi Omae among others, as well as a task force headed by Tepco President Naomi Hirose to implement the reform steps.

"The mission of this task force is to build an organization for nuclear plant management that has the world's highest level of safety awareness and technical ability," Hirose told a news conference Tuesday at the company's head office.
The panel will work with another project team that will study investigative reports released by a government-appointed committee and other entities on the Fukushima crisis.

Tepco will compile by the end of the year specific plans to reform its nuclear division, which has been criticized for lacking transparency, Hirose added.

He denied the purpose of the teams is to ensure the restart of the utility's idled reactors at the seven-reactor Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture but suggested that carrying out reforms would be a minimum requirement to seek the OK to bring its reactors online.

"We are aware that restarting the reactors would not be allowed by the people in Niigata unless we properly do these things," Hirose said.

The need to restart idled reactors was stipulated in a 10-year comprehensive special business plan for Tepco, which is struggling to compensate victims of the nuclear disaster and pay rising fuel costs for thermal power generation to make up for the halt in nuclear power.

Restarting reactors is not an easy task for utilities amid strong public nuclear safety fears. The Niigata complex was halted by a strong quake in 2007, and in 2003 as part of an overall Tepco reactor shutdown amid a scandal over falsified safety inspections.

Meanwhile, Tepco disclosed 600 new photos taken after the Fukushima plant was struck by the huge quake and tsunami on March 11, 2011, which triggered the three meltdowns at the site.

The pictures include images of evacuation scenes, flooded power source rooms, and reactor buildings shortly after the hydrogen explosions. Tepco said it asked other firms working with the utility to submit photos if any of their employees had taken them at the time.

Tepco spokesman Junichi Matsumoto said it took 18 months to disclose these pictures because they had to be checked carefully to make sure they did not violate nuclear security.

US worried

September 13, 2012

U.S. official airs concern about Japan's nuclear phaseout policy

http://mainichi.jp/english/english/newsselect/news/20120913p2g00m0dm037000c.html

WASHINGTON (Kyodo) -- U.S. Deputy Energy Secretary Daniel Poneman has voiced concern about Japan's new energy policy, which aims to abolish nuclear power generation in the 2030s, a Japanese ruling party lawmaker said Wednesday.

In a meeting Tuesday in Washington with Seiji Maehara, policy chief of the Democratic Party of Japan, Poneman urged Japan to make efforts to minimize the negative impact from possible abandonment of atomic energy by Japan, Maehara told reporters.

Maehara said **such a concern is understandable as Japan's policy shift toward a phaseout of nuclear energy means a change to the existing nuclear energy cooperation between Tokyo and Washington.**

He also said he got the impression Poneman understood to some extent the energy policy shift in Japan given the devastating nuclear disaster last year and the desire of many Japanese for a society without nuclear power.

Last efforts to finalise energy policy - End of nukes in the 2030's

September 13, 2012
Japan to aim for nuclear phaseout in 2030s: draft energy policy

http://mainichi.jp/english/english/newsselect/news/20120913p2g00m0dm038000c.html

TOKYO (Kyodo) -- The Japanese government is contemplating setting a target to abolish nuclear power generation in the 2030s under a new national energy policy, in light of the Fukushima nuclear crisis last year, according to a draft of the policy obtained by Kyodo News on Wednesday.

"We will devote all policy resources to achieving zero nuclear power generation in the 2030s," the draft said.

The draft said Japan will begin research on directly disposing of spent nuclear fuel, suggesting a shift in the current policy of reprocessing all spent nuclear fuel and reusing the extracted plutonium and uranium as reactor fuel.
The draft also said the government will keep its word not to make Aomori Prefecture, which has accepted facilities for the reprocessing of nuclear fuel and storage of radioactive waste under the current nuclear fuel recycling plan, a final disposal site.

It added that the government will review Japan's new energy policy, which may be finalized this week, every year through 2015 and every three years afterwards.

The government has been struggling to balance the pros and cons of nuclear power. The review of the energy policy is intended to give consideration to the concerns of some local governments, as well as the United States, over the possible phasing out of nuclear power generation by Japan in the 2030s, government officials said.

In the wake of last year's Fukushima disaster, the government has been working to create a new national energy strategy as the current policy, which calls for increased reliance on nuclear power, is no longer tenable.

The Democratic Party of Japan, headed by Prime Minister Yoshihiko Noda, has proposed that the government set a goal of completely eliminating nuclear power generation in the 2030s in the new policy.

On Wednesday, Noda, Chief Cabinet Secretary Osamu Fujimura and other relevant ministers discussed how to address the concerns of local governments that are still willing to keep nuclear facilities as well as the United States, with which Japan has a civilian nuclear cooperation pact.

Noda also sent his special adviser Akihisa Nagashima and Hiroshi Ogushi, a parliamentary secretary at the Cabinet Office, to Washington to explain the new policy.

Under the plan, the government has listed 10 areas in which it will review energy policy, including Japan's relations with the international community and local cooperation on hosting nuclear facilities.

The draft said the government would transform the Monju prototype fast-breeder nuclear reactor in Fukui Prefecture into a research reactor.

To achieve a society that does not rely on nuclear power, Japan plans to limit the operation of existing reactors to up to 40 years since they first went online and not allow utilities to build new ones, according to the draft.

In the meantime, Japan will use existing nuclear reactors if they are confirmed as safe by the Nuclear Regulation Authority, it said.

Japan will also consider providing new support to local governments that have hosted nuclear plants for many years and receive subsidies to that end, the draft said.

The government is making last-ditch efforts to finalize the energy policy on Friday.

September 12, 2012

Zero-nuclear policy ready for inclusion in new energy and environment strategy

http://mainichi.jp/english/english/newsselect/news/20120912p2a00m0na014000c.html

The government has entered the final stage of incorporating a zero-nuclear policy into a new energy and environment strategy that is expected to be determined as early as the end of this week, government sources have revealed.

The zero-nuclear policy is to stipulate halting the operations of all nuclear power stations in Japan by the 2030s, and comes in response to mounting calls among the public for eliminating all nuclear reactors in the country in the aftermath of the disaster at the Fukushima No. 1 Nuclear Power Plant.

The sources said the government has apparently informed Aomori Prefecture -- host to the Rokkasho Reprocessing Plant for a nuclear fuel cycle and a staunch opponent of a nuclear-zero policy -- of the outlines of the new energy policy and presented it with alternative regional promotion measures to make up for the drastic policy change and to minimize adverse effects on local economies.

The government will make a formal decision on the new energy and environment strategy at an Energy and Environment Council meeting to be convened as early as the end of this week.

After the ruling Democratic Party of Japan (DPJ) made policy proposals on Sept. 6 that "all necessary policy and resources will be devoted to achieving the zero-nuclear policy goal by the 2030s," the industrial circle and Aomori Prefecture fiercely opposed the plan, prompting the government to push back the date for the final decision on the new energy policy from Sept. 10 to the end of this weekend at the earliest.

Government sources said Aomori Prefecture is still strongly concerned that the zero-nuclear policy would lead to the abandonment of the nation's nuclear fuel cycle policy and is apparently reluctant to show understanding of the new policy anytime soon. The government is poised to seek the prefecture's understanding by drawing up outlines of new pump-priming measures in lieu of nuclear fuel reprocessing and dispatching Cabinet ministers there after finalizing the new energy strategy, the sources said.

The government is also making fully fledged coordination with the U.S. government over the new energy and environment strategy after Washington showed a strong interest in Japan's atomic energy policy.

At a press conference on Sept. 10, Prime Minister Yoshihiko Noda clearly stated that the government will abide by the three DPJ-proposed principles on the country's future nuclear policy -- no new or additional construction of nuclear reactors; the strict application of the 40-year limit to the operation of existing reactors; and only reactors that were confirmed to be safe by the nuclear regulatory commission will be allowed to be reactivated. Several senior government officials admitted on Sept. 11 that "the prime minister's position won't change."

The government is further intending to gain Cabinet approval of the new energy and environment strategy. Under the current legal system, the country's energy policy is required to be reviewed every three years. The energy policy is also subject to modification if the regime changes after the next House of Representatives election.

New head for the new nuclear regulatory agency

September 13, 2012

Ex-MPD chief to head N-agency

The Yomiuri Shimbun

Katsuhiko Ikeda

The government has decided to appoint Katsuhiko Ikeda, a former superintendent general of the Metropolitan Police Department, as the founding director of the nuclear regulatory agency that will serve as the new nuclear regulatory commission's secretariat, government sources said.

The government is set to approve the appointment at a Cabinet meeting as early as Friday to launch the commission and the agency next Wednesday, the sources said Tuesday.

Ikeda, 59, headed the National Police Agency's Security Division and the MPD's Security Bureau before serving as the superintendent general of the MPD from January 2010 to August 2011.

The new agency will be tasked with promptly dealing with any accident at a nuclear power plant. By nominating Ikeda as the agency's first director general, the government aims to boost its crisis management capability, observers said.

Shunichi Tanaka, a former acting chairman of the Japan Atomic Energy Commission of the Cabinet Office, who was recently tapped as the commission's head, will formally designate Ikeda for his new post, the sources said.

As for the agency's deputy director, the government will likely name Hideka Morimoto, who heads the Cabinet Secretariat's Office for the Preparation of Nuclear Safety Regulatory Organization Reform, the sources added.

In relation to the appointments, Goshi Hosono, the nuclear disaster management minister, met Tanaka as part of preparations to launch the commission.

He asked Tanaka to ensure that the new commission will listen to the opinions of various people, especially those who are critical about nuclear power.

Reprocessing to go on? (2)

Govt to continue N-fuel recycling program

http://www.yomiuri.co.jp/dy/national/T120913004237.htm

The Yomiuri Shimbun

The government plans to stick with its policy of supporting the reprocessing of spent nuclear fuel as part of a fuel recycling program for the time being, it has been learned, although this appears to contradict the goal of ending nuclear power generation by the 2030s.

The fuel policy will be part of the new energy and environment strategy to be released Friday, according to sources.

A copy of the final draft of the document seen by The Yomiuri Shimbun says, "The government will fulfill its responsibilities concerning nuclear nonproliferation and the peaceful use of nuclear energy with respect to the international community, and continue with fuel reprocessing in line with the previous policy."

The strategy contains a commitment to discontinue all nuclear power plants by the 2030s. However, without running nuclear reactors, the reprocessing of spent fuel to extract plutonium, which is done mainly in Aomori Prefecture, would be unnecessary.

How the new energy policy would tackle the issue has been a focus of attention.

A reprocessing plant run by Japan Nuclear Fuel Ltd. in Rokkasho, Aomori Prefecture, currently stores about 2,900 tons of spent nuclear fuel from nuclear plants nationwide.

The prefectural government has said it would send the spent fuel back to the plants if the government discontinued the fuel recycling program. Nuclear power plants would have a difficult time running without a place to store nuclear waste.
The draft of the policy appears to support contradictory goals--the Democratic Party of Japan's proposal to do away with nuclear power, and a vow to continue reprocessing nuclear fuel.

The government plans to submit legislation based on its new energy strategy, but political observers foresee the bill receiving a cool welcome by opposition parties.

The final draft also advocates effectively giving up on the troubled Monju project, an experimental fast-breeder reactor of the Japan Atomic Energy Agency in Tsuruga, Fukui Prefecture.

The strategy allows for an option in which Monju could be used to study how to reduce the radioactive waste in spent nuclear fuel, and then be decommissioned.

The final draft proposes that the government will use all policy measures available to idle all the nation's nuclear plants by the 2030s, that nuclear plants will be utilized until then if their safety can be confirmed, that there will be no new construction of nuclear power plants or nuclear reactors, and that the nuclear fuel reprocessing project will be reviewed through discussions with the relevant international organizations and other countries.

Aomori Prefecture rejects nuclear waste, eyes continued reprocessing

http://mainichi.jp/english/english/newsselect/news/20120914p2a00m0na007000c.html

When it comes to nuclear fuel reprocessing and the fate of the nuclear fuel cycle that has emerged during discussion on Japan's future nuclear policy, the Aomori Prefectural Government stands firm on the issue.

"There is no policy to follow other than reprocessing. We will have them keep their promises," an Aomori Prefectural Government official said firmly, calling on the government to uphold its nuclear fuel cycle policy.

Aomori Prefecture is the location of the Rokkasho nuclear reprocessing plant, whose future is swayed by Japan's nuclear fuel cycle policy. The prefectural government and the village of Rokkasho have signed memorandums with the central government and Japan Nuclear Fuel Ltd., which operates the plant, stating that Aomori Prefecture will not be made a final disposal area for nuclear fuel, and if reprocessing becomes difficult, then spent nuclear will be transported outside the facility.

If the government withdraws from nuclear fuel reprocessing, Aomori Prefecture intends to send the spent nuclear fuel held at Rokkasho back to the nuclear power plants from which the fuel came. Furthermore, it plans to forbid the transportation of spent nuclear fuel destined for reprocessing to an interim storage facility that is being constructed in the prefectural city of Mutsu.

Behind the prefecture's strong stance is a sense of crisis over the possibility of the prefecture becoming the final disposal site for nuclear waste that has no other place to go.

At a meeting in January this year to decide on the outline for the government's new nuclear power policy, Aomori Gov. Shingo Mimura fiercely protested that it was totally unacceptable to assume that things would somehow work out if the spent nuclear fuel in Aomori Prefecture was left there. All the same, it remains a fact that reprocessing has reaped precious finances for local bodies in the prefecture. As of fiscal 2011, the prefecture had received 233.4 billion yen in grants in connection with the use of land for nuclear fuel cycle and nuclear power plant facilities.

Japan Nuclear Fuel Ltd. is the biggest company in the prefecture, employing about 1,400 people from Aomori Prefecture. As of fiscal 2010, it had issued contracts worth 509.5 billion yen for local companies. Rokkasho Mayor Kenji Furukawa has commented that if reprocessing ended, the future of the town would be threatened.

The Ministry of Economy, Trade and Industry on Sept. 12 continued providing working-level explanations on the issue to Aomori Prefecture and other bodies.

In addition, Akihisa Nagashima, a special adviser to Prime Minister Yoshihiko Noda on foreign affairs and security, and Hiroshi Ogushi, a parliamentary secretary at the Cabinet Office, visited the United States for talks with the U.S. government, which has expressed strong interest in Japan's nuclear energy policies.

Chief Cabinet Secretary Osamu Fujimura told a news conference on Sept. 12, "We are carefully explaining the transition in current discussion (to U.S. officials)."

Japan officially phasing out nukes by 2040

source AFP

Japan to phase out nuclear energy by 2040
http://www.google.com/hostednews/afp/article/ALeqM5itoWMYYjAPxOjvzw-BKoFC4T-kGg?docId=CNG.ead5e98eea75b0c7d9d8538a8cbc9386.3a1

By Harumi Ozawa (AFP) – 6 hours ago

TOKYO — Japan on Friday said it planned to phase out nuclear power over three decades in an apparent bow to public pressure after last year's Fukushima disaster, the worst atomic accident in a generation.

The disaster-struck country would work to cut its use of nuclear energy to zero by 2040 by eventually shutting down its stable of reactors, which once supplied resource-poor Japan with about one-third of its energy.

"The government will introduce every possible policy resource that would enable nuclear power generation to be at zero during the 2030s," the paper said.

The move would bring resource-poor Japan into line with Italy, Switzerland and Germany, which has said it will wean itself off nuclear power by 2022, and comes amid regular vocal protests against nuclear power.

Tokyo's new energy policy calls for shutting down reactors that are more than 40 years old, not building any new nuclear reactors and only restarting existing reactors if they pass standards issued by a new regulatory agency.

Ahead of a general election expected this autumn, nuclear energy has become a hot issue in Japan with regular protests that sometimes attract tens of thousands of people calling for it to be ditched.

The decision on Friday comes about 18 months after a huge tsunami swamped reactor cooling systems at the Fukushima Daiichi plant, sparking meltdowns and radiation leaks in the worst atomic accident since Chernobyl in 1986.

In the months that followed, all of Japan's working reactors were shut down for routine safety checks, with only two of them ever having been restarted, and those in spite of strengthening anti-nuclear public opinion.

Japan is now heavily dependent on Middle East oil and has been forced to ramp up its imports to make up the energy shortfall since the accident.

Last week, Prime Minister Yoshihiko Noda's ruling Democratic Party of Japan (DPJ) said Japan should aim to cut nuclear power and released a policy paper that recommended the country make greater use of renewable energy, and take further energy saving measures, including the use of smart metering.

It also said Japan should develop resources in nearby waters and look to cheaper procurement of liquefied natural gas and other fossil fuels, including shale gas.

At the same time the country's powerful business lobbies have worked hard to push for a restart of shuttered reactors, fearing power shortages.

Germany last year said it would shut down its 17 nuclear reactors by 2022, while in Italy, a referendum rejected any resumption of nuclear energy generation, which was halted after the 1986 disaster at Chernobyl.

Switzerland has approved plans to close its five reactors by 2034. However a number of Asian countries are pushing ahead with expanding their nuclear programmes.

A rather murkey strategy

September 13, 2012

Internal contradictions on nuclear power hobble Japan's new energy strategy

http://mainichi.jp/english/english/features/news/20120913p2a00m0na014000c.html

In the final version of the new national energy and environmental strategy set for release this week, the government will officially make it its mission to end nuclear power in Japan by the 2030s. At the same time, however, the plan will preserve Japan's nuclear fuel cycle program -- the long-running project to reprocess spent nuclear fuel into mixed plutonium-uranium MOX fuel for reuse.

The badly delayed nuclear fuel cycle program, centered on the Rokkasho fuel reprocessing plant in Aomori Prefecture, underpins the continued operation of nuclear reactors in Japan. **In other words, the government has included two obviously contradictory parts -- and all the confusion that entails -- in its strategic framework.**

The inclusion of both a zero-nuclear target and the continuation of the fuel cycle in the energy strategy has its roots in government concern for pro-nuclear local governments hosting fuel cycle facilities, including the village of Rokkasho and Aomori Prefecture.

The reasons for these local governments' resistance to a zero-nuclear future are fairly obvious. If Japan goes nuclear-free, MOX fuel production will no longer be needed and, as Rokkasho and Aomori Prefecture have pointed out with some ire, may be stopped.

As such, both the village and prefecture have said, they may refuse to accept any new spent nuclear fuel and could go so far as to send the stock already in their jurisdictions back where it came from. With spent fuel pools filling up at plants across the country and nowhere else to put it, the move could "quickly make nuclear power generation impossible" in Japan, said Economy, Trade and Industry Minister Yukio Edano recently.

Spent nuclear fuel is extremely hot and extremely radioactive, and **at present there is 2,919 metric tons of it sitting in cooling pools at the Rokkasho plant. What's more, the Rokkasho pools have a capacity of 3,000 tons, and the only other storage pools in Japan are the ones at each nuclear plant -- and these, too, are nearly out of space.**

According to materials produced by the Japan Atomic Energy Commission in May this year, if reactors are restarted and the Rokkasho plant starts returning the spent fuel in its pools, many nuclear plants on the receiving end would soon go over their maximum storage capacity and have to shut down.

Specifically, Kyushu Electric Power Co.'s Genkai plant would have to go off-line this fiscal year, followed by Japan Atomic Power Co.'s Tokai No. 2 plant in fiscal 2013, and Tokyo Electric Power Co.'s Kashiwazaki-

Kariwa plant and Chugoku Electric Power Co.'s Shimane plant in 2014. The plant with the longest operational life in such circumstances would be Tohoku Electric Power Co.'s Higashidori plant, which would have to shut down in fiscal 2027.

On Sept. 7, the Rokkasho village assembly adopted a text declaring that should Japan abandon the nuclear fuel cycle project, Rokkasho would not accept MOX fuel returned from Britain and France, where some of Japan's spent conventional nuclear fuel was shipped for reprocessing. Though a municipal resolution, the text demonstrated how the nuclear waste issue might spawn international disputes.

And so the government decided to avoid the vital question of what to do with the project, instead stuffing it into its long-term energy strategy together with a promise to ditch nuclear power as a whole. Will the cobbled-together nature of the new energy policy inspire trust, or will it rather draw widespread suspicion and doubt? As things stand, the latter is all-too possible. (By Hiroshi Hisata, Tokyo Business News Department)

New energy strategy draws criticism from all sides

September 14, 2012

No-nuke plan official, quick to draw flak

Policy called poll ploy to save DPJ, hit by fuel cycle foes, Keidanren

http://www.japantimes.co.jp/text/nn20120914x1.html

By KAZUAKI NAGATA and ERIC JOHNSTON
Staff Writers

Prime Minister Yoshihiko Noda's Cabinet on Friday officially adopted a new long-term energy strategy that calls for elimination of nuclear power dependency by the end of the 2030s, but the new goal quickly came under fire from experts, antinuclear activists and lobbying groups.

Critics said the new energy vision lacks critical details of how to achieve the target and will still maintain the existing nuclear fuel recycling program, which they say is a major contradiction with the zero-nuclear goal.

The Democratic Party of Japan-led government is advocating the zero-nuclear policy only because it is desperate to curry favor with voters ahead of the next Lower House election, in which the party is now expected to suffer a crushing defeat, they said.

Polls conducted by major media companies have indicated a majority of the public wants to end reliance on nuclear energy sometime in the future.

"I think the DPJ and the government just wanted to set a 'zero' goal because a general election is coming up," said Takeo Kikkawa, a professor at Hitotsubashi University and an energy policy expert.

"The decision to approve this new energy strategy is premature," said Kikkawa, who has taken part in a panel under the industry ministry to discuss the long-term energy strategy.

The government also indicated the zero-nuclear policy could be revised, depending on such factors as progress in the development of renewable energy and public opinion.

The new energy vision doesn't discuss crucial details in abolishing nuclear power, including likely electricity rate hikes following the termination of reactors, how to increase renewable energy and how to win the consent of local governments that host nuclear facilities.

The new energy vision states the government will maintain the existing program to recycle uranium and plutonium fuels after it was argued that the recycling program is needed to keep consuming plutonium for peaceful purposes and prevent proliferation of nuclear materials.

Consideration was also given to the prefectures still eager to maintain facilities related to the recycling, the government said.

Keeping the recycling program in place "is proof that the current government is not serious about phasing out nuclear power," argued antinuclear activist Aileen Mioko Smith of the Kyoto-based group Green Action.

Kikkawa said if the government wants to really end nuclear energy, it needs to be more concrete about how to deal with the expected challenges, including how to get local governments, such as Fukui and Aomori prefectures, to give up atomic facilities that have been long lucrative cash sources.

Hiromasa Yonekura, chairman of the powerful Keidanren business association, said Thursday he called Noda and told him that the zero scenario is unacceptable because the resulting higher electricity fees will hurt businesses and the economy.

"The ruling parties should not be swayed by elections. They should think about the future of this country," he said.

A contradiction in terms?

September 16, 2012

basically the same information three times
Japan OKs proceeding with nuclear plants already under construction

http://mainichi.jp/english/english/newsselect/news/20120916p2a00m0na006000c.html

AOMORI (Kyodo) -- Japan has no plans to stop the construction of nuclear plants that have already received government approval, industry minister Yukio Edano said Saturday.

The minister of economy, trade and industry made the remark only a day after the government endorsed a new energy policy pledging to try to phase out atomic power generation in the 2030s, following last year's Fukushima nuclear disaster.

"I am not considering changing (construction plans for) nuclear power plants for which the industry ministry has given the go-ahead," Edano said during his talks with local leaders in the northeastern city of Aomori.

Before the crisis at the Fukushima Daiichi plant, the government had authorized the construction of **two nuclear power plants in Aomori Prefecture and one reactor in Shimane Prefecture.**

Under the new energy policy, the government has decided not to allow utilities to build new reactors while limiting the operation of existing reactors to 40 years. Should the government finally endorse the

operation of Electric Power Development's new Oma nuclear plant in Aomori Prefecture, the plant could run until the middle of the 2050s.

Following Edano's remark, Electric Power Development Co. said the Oma plant "plays an important role in the stable supply of electricity and the nuclear fuel cycle," adding that the company will "do all it can to make a safer plant."

Chugoku Electric Power Co. said that a third reactor being built at its nuclear plant in Shimane Prefecture should not be recognized as a new plant, which the government has pledged not to build under the new energy policy.

Edano told reporters after the meeting with the leaders, including Aomori Gov. Shingo Mimura, "The fact that the government has already permitted the construction carries significant weight."

Edano said approval of the newly established Nuclear Regulation Authority would be necessary to start operating these plants.

Local leaders of Aomori hosting nuclear fuel cycle facilities, meanwhile, expressed doubts over the government's new energy policy, with Mimura indicating concerns about how the zero-nuclear power policy will affect public and industrial activities.

"Will the government be able to promise to secure a stable electricity supply for future generations?" he asked Edano during their talks, which were open to the media.

Under the new policy, the government also decided to keep seeking the recycling of all spent nuclear fuel for reuse while aiming to end nuclear power generation.

Given this, Mimura urged Edano to clarify the future of the nuclear fuel-cycle policy and how to deal with spent nuclear fuel and plutonium that is extracted during reprocessing.

Junichiro Miyashita, mayor of Mutsu where the construction of a temporary storage facility for spent nuclear fuel is under way, said it is contradictory to have a zero-nuclear society while maintaining reprocessing.

New reactor projects still on: Edano

http://www.japantimes.co.jp/text/nn20120916a2.html

Kyodo

AOMORI — Construction of new nuclear plants will be allowed if the government has already approved the projects, trade minister Yukio Edano said Saturday.

The minister of economy, trade and industry made the remark just a day after the government endorsed a new energy strategy that pledges to phase out atomic power by the 2030s.

"I am not considering changing (construction plans for) nuclear power plants for which the industry ministry has given the go-ahead," Edano said in talks with local leaders in Aomori.

He was referring to the already authorized plan for Electric Power Development Co. to build a nuclear plant in Oma, Aomori Prefecture.

Under its new energy policy, the government said it will not allow utilities to build new reactors and will limit the runs of the existing ones to 40 years. Should the government ultimately back the Oma plant project, it could run until the mid-2050s.

The Ministry of Economy, Trade and Industry has also OK'd plans to build a new Tokyo Electric Power Co. plant, also in Aomori, and a third reactor for Chugoku Electric Power Co.'s plant in Shimane Prefecture.

Edano said after the meeting with the leaders, including Aomori Gov. Shingo Mimura, "The fact that the government has already permitted the construction carries significant weight."

Edano also said the approval of the newly established Nuclear Regulation Authority will be necessary to start these plants.

Local leaders in Aomori, where nuclear fuel-cycle facilities are located, voiced misgivings over the new energy policy, with Mimura questioning how the zero-nuclear policy will affect public and industrial activities.

"Will the government be able to promise a stable electricity supply for future generations?" he asked Edano at the talks.
Under the new policy, the government plans to continue the program to recycle all spent nuclear fuel for reuse, while also aiming to end atomic power.

Given this, Mimura urged Edano to clarify the future of the fuel-cycle policy and how the nation will deal with spent nuclear fuel and the plutonium that is extracted during reprocessing.

Junichiro Miyashita, mayor of Mutsu, where a temporary storage facility for spent fuel is being built, said a zero-nuclear society and reprocessing are incompatible.

September 15,2012

Construction of Oma nuclear plant to be continued

http://mainichi.jp/english/english/newsselect/news/20120915p2g00m0dm065000c.html

Public support of phasing-out essential

Editorial: Public must back Japan's goal of ending nuclear power in 2030s

http://mainichi.jp/english/english/perspectives/news/20120915p2a00m0na004000c.html

The government has officially set a target of ending Japan's reliance on nuclear power plants by the 2030s. Both the government and members of the general public must be firmly determined to achieve this goal.

The goal is part of the government's new energy and environmental strategy, released on Sept. 14. It is of great significance that the government has reversed its atomic power promotion policy in the wake of the outbreak of crisis at the Fukushima No. 1 Nuclear Power Plant.

Still, specific measures incorporated in the strategy to overcome various challenges in achieving zero nuclear power are still half-baked. The government needs to draw up a clear road map toward the achievement of the goal so that it will not end up being just a slogan to attract voters for the next general election, set to be held within a year.

The new strategy calls for the early realization of a society not dependent on nuclear plants for power, and establishes three basic principles: strictly enforcing the regulations under which nuclear reactors must be decommissioned after 40 years in service; allowing the reactivation of idled reactors only after their absolute safety is confirmed; and refraining from setting up new reactors. It calls for the injection of all policy resources to ensure that all nuclear power stations will be shut down by the 2030s.

The adoption of the new strategy should be highly appreciated, as the government has settled the dispute over whether nuclear power should be eliminated or promoted, an issue that split public opinion. The decision was based on thorough national debate. Every member of the public must now show determination in upholding this decision and achieving the goal, taking on responsibility for Japan's future.

To that end, the government must minimize any hardship that the policy change lays on the public and present specific measures to achieve the goal in an effort to win understanding from society.

However, the new strategy delays compilation of specific measures to achieve the zero-nuclear power goal, which is problematic. Further problems are highlighted by the government's decision to continue the nuclear fuel cycle project, in which spent nuclear fuel is processed, and plutonium is extracted from the radioactive waste and used for fast-breeder reactors.

Japan already possesses a massive amount of plutonium -- enough to produce approximately 4,000 atomic bombs. One cannot help but wonder what Japan would do if it stockpiled plutonium further despite its goal of getting rid of nuclear power by the 2030s. The decision to continue the nuclear fuel cycle project was made to show consideration to Aomori Prefecture, which stores a huge volume of spent nuclear fuel as an interim measure, as well as to the United States, France and Britain, which are involved in Japan's nuclear fuel cycle project.

Tokyo should take the opportunity to review the fuel cycle project at an early date, show its determination to solve problems involving the final disposal of radioactive waste, and win understanding from Aomori Prefecture and other relevant parties.

The government should speed up its efforts to show how it will inject policy resources to achieve a zero nuclear power society.

The promotion of renewable energy and stepped-up efforts to save electric power and other forms of energy are indispensable in ending Japan's dependence on nuclear power. We urge the government to quickly carry out regulatory reform and work out measures to help develop technology toward that end.

If electric power charges increase sharply, it will deal a serious blow to Japan's economy. To trim a rise in electricity bills, it is essential to introduce a market mechanism into the electric power industry. The government intends to draft a plan to reform the electric power supply system, such as full liberalization of electric power retailing and the proposed separation of electric power generation and transmission. The government should work out a system to promote competition in the industry that will not destabilize electric power supply, learning from overseas examples.

Needless to say, the goal of a society that does not depend on nuclear power could end up a pie in the sky without understanding and cooperation from the public. The government is obligated to present convincing measures to achieve the goal of ending Japan's reliance on nuclear power for present and future society.

Gov't ambiguous and contradictory policy

September 18,2012

Ambiguous new nuclear policy

http://www.japantimes.co.jp/text/ed20120918a1.html

The government on Sept. 14 announced a new-long term energy policy that stated the government "will mobilize all available policy resources to reach 'zero operation' of nuclear power plants in the 2030s" to "realize as soon as possible a society that does not rely on nuclear power." The announcement shows that the people can, by publicly expressing their desires and coming together as one voice, pressure the government into ending reliance on nuclear power generation. Still, the people need to remain vigilant as **the government's policy is ambiguous and contains contradictions.**

The new policy is not a clear commitment to end Japan's reliance on nuclear power in the 2030s. In fact, even under the policy, Japan will still rely on nuclear power for about 15 percent of its total electricity in 2030, a goal which the government earlier tried to make people accept.

Of Japan's 50 nuclear power reactors, only the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant are currently online. If the government, the power industry, other industrial sectors and the household sector make a serious effort, including further cutting their electrical use, Japan should be able to end its reliance on nuclear power at an earlier date. Many people are willing to pay higher electricity bills entailed by reduction and ending of nuclear power generation.

Businesses should look at the withdrawal from nuclear power generation as an opportunity for investment and innovation. Investment is needed for development of new technologies to promote renewable energy, improvements in power transmission lines to link green energy sources to end users, development of a smart grid and construction of alternating current cycle conversion facilities for two-way transmission of electricity produced in western Japan (60 cycles per second) and eastern Japan (50 cycles).

Under the new policy, a 40-year operation limit will be imposed on each reactor. But the relevant law allows a 20-year extension if certain conditions are met. It is not certain what specific policy the Nuclear Regulatory Commission will take. Keeping a strict watch over the government and the NRC is called for. Trade and industry minister Yukio Edano said that the three nuclear power plants now under construction will not be abandoned. This means that they will remain online at least into the 2050s.

The biggest contradiction in the policy is continuation of the nuclear fuel cycle to extract plutonium and uranium from spent nuclear fuel to make new nuclear fuel. Current agreements with Aomori Prefecture, which houses nuclear fuel cycle-related facilities, say that if the nuclear fuel cycle policy is abandoned, nearly 3,000 tons of spent nuclear fuel stored there must be returned to nuclear power plants. The agreements have forced the government to continue the policy. Technologies for the nuclear fuel cycle and for the permanent storing of high-level nuclear waste have not been established. There are **moral reasons as well, such as the mess we will leave for future generations**. The logical conclusion is that Japan should end the nuclear fuel cycle. Spent nuclear fuel storage at most nuclear power plants is already filling up and will reach capacity in the not-so-distant future, so there is even stronger reason to end nuclear power generation at an earlier date.

Nuclear fuel cycle not to be given up

September 18, 2012

FUEL CYCLE

Vicious nuclear fuel cycle proving difficult to break

http://www.japantimes.co.jp/text/nn20120918i1.html

By KAZUAKI NAGATA
Staff writer

Under the government's new energy strategy, announced last week, Japan will aim to end its reliance on nuclear energy during the 2030s. But the public was quick to spot a contradiction, as the strategy states that the nation's contentious nuclear fuel cycle policy will remain intact.

Why wouldn't the government decide to give it up at this point? Following are questions and answers about Japan's nuclear fuel cycle policy:

What is the nuclear fuel cycle?

The nuclear fuel cycle describes the stages the fuel goes through in its lifetime. Fuel that is only used once has an open nuclear cycle, whereas fuel that undergoes reprocessing is described as having a closed cycle. Since Japan must import practically all of its energy resources, it opted to pursue a closed cycle for its nuclear program.

The idea is to reprocess spent fuel by extracting the key materials, uranium and plutonium, and reuse them to generate power. Nuclear fuel is mainly made of uranium isotopes 235 and 238. The uranium 235 produces the fissile energy, while the uranium 238, which makes up the bulk of the fuel, produces plutonium, another fissile element, through the fission process.

Spent fuel usually contains a small amount of uranium 235 that can still generate fission. By extracting the uranium 235 and the plutonium and combining them with uranium 238, a fresh source of fuel can be produced.

When reprocessed fuel is used in a special type of reactor called a fast breeder, which uses sodium instead of water to cool the fuel, it increases the amount of plutonium in the fuel, allowing it to be extracted once the fuel is spent and reused.

In theory, a closed nuclear fuel cycle can produce fuel for hundreds of years.

What are the advantages of Japan's fuel cycle?

The fact that great amounts of energy can be produced through continuous recycling is attractive to resource-poor countries like Japan.

Some experts also say that since Japan is the only country without nuclear weapons to gain approval from the international community to sustain a nuclear fuel cycle, it would be unwise to get rid of such an intangible asset.

Another benefit is that reprocessing can reduce the amount of high-level radioactive waste produced by nuclear power plants — and the space needed to store it — by about half.

How successful has Japan been in developing its fuel cycle?

More than half a century has passed since the government committed to setting up the cycle in the 1950s, but implementation has dragged on for decades.

Fast-breeder reactors, while experimental, are a crucial piece of the plan. Japan has been betting on the Monju, a prototype fast breeder in Fukui Prefecture run by the Japan Atomic Energy Agency, to pave the way. Since it was built in 1991, however, the Monju has run into several problems, including a major fire triggered by a sodium-coolant leak that was later the subject of a coverup attempt. When sodium reacts with water, it catches fire.

Monju has never reached full-scale operation despite the ¥960 billion or so the government has poured into it.

In addition to fast breeders, reprocessing facilities are another key part of the cycle. But a reprocessing plant in Rokkasho, Aomori Prefecture, another experimental facility run by the Japan Nuclear Fuel Ltd., has experienced several problems in its quest for full operations and has cost more than ¥2 trillion so far.

Rokkasho is also building a plant to make MOX, an alternative reprocessed fuel made of mixed uranium oxides and weapons-grade plutonium that is designed for fast-breeder reactors.

Opponents of nuclear power have been pressuring the government to give up its fuel cycle quest in light of the prolonged failures of these two facilities.

Was the nuclear fuel cycle expected to take this long to set up when the policy was drafted?

No. According to the long-term nuclear power policy Japan compiled in 1961, a fast-breeder reactor was to be developed and in engaged in practical use by the late 1970s. That now looks unlikely to happen until the 2050s.

Hiroshi Tasaka, who was a special adviser to Prime Minister Naoto Kan during the Fukushima crisis, said it is obvious that the bureaucrats who drafted the fuel cycle plan were uninformed about the feasibility of the project.

In the planning stages, it is often difficult to say a project is scientifically impossible, but that doesn't necessarily mean it's feasible, said Tasaka, who has a doctorate in nuclear engineering and is a professor of business at Tama University.

"Seeing that the plan has been delayed this long, it means the policymakers didn't thoroughly examine its feasibility or that it is too difficult to achieve because of technological challenges. . . . I think it's a combination of both factors," Tasaka said.

On an NHK program about the fuel cycle in June, a former bureaucrat involved in the initial stages of drafting the fuel cycle policy said that because the United States was already developing a fast-breeder reactor for research in the 1950s, officials believed it would soon be put into practical use.

Meanwhile, professor Minoru Takahashi of the Tokyo Institute of Technology, an expert on fast-breeder reactors, said that Japan has the knowhow to build fast breeders for commercial use but that its safety technology needs further development before it can pass public muster.

Why isn't the government terminating the fuel cycle project if it is officially abandoning nuclear power?

In June, a panel set up by the Japan Atomic Energy Commission said that if the government decides to end the nation's reliance on nuclear power, there won't be any need to reprocess spent fuel and it should all be disposed of.

But it's not that easy. The central government is having difficulty winning over governments in areas that host all the facilities built for the cycle, especially Fukui and Aomori prefectures. These areas stand to lose huge government subsidies if the fuel cycle spigot is turned off.

Moreover, Aomori is concerned the central government may end up choosing it as a final disposal site for high-level radioactive waste because much of the nation's spent fuel is already sitting in storage at the Rokkasho facility.

The new energy policy states that the central government will keep its promise not to make Aomori a final disposal site.
Since the Rokkasho facility isn't running full bore yet, Japan has been shipping spent fuel to French and British facilities for reprocessing. The high-level radioactive waste produced as a byproduct is usually shipped back to Japan with the fuel. Both countries have called on Japan to make sure it will still be taken back.

The new energy strategy also gives consideration to the international community by saying the recycling program must be maintained to keep consuming plutonium for peaceful purposes and prevent nuclear materials from proliferating.

If the government ever decides to end the fuel cycle project, what would happen to the spent fuel?

Japan currently has about 14,200 tons of spent fuel and 29.6 tons of plutonium. Before the Fukushima disaster, it is estimated that the nation's reactors were producing 1,000 tons of spent fuel a year and were on course to exhaust all available storage space within six years.

If the fuel cycle is abandoned, the spent fuel would most likely be stored hundreds of meters underground and perpetually monitored because materials like plutonium remain dangerous for tens of thousands of years. The problem is, Japan hasn't found anywhere to build a permanent repository because no municipality will host it.

"The question of where to dispose of high-level radioactive waste has not been solved since I was a student (back in the 1970s)," said Tasaka, who researched high-level radioactive waste disposal methods for his doctoral thesis.
The waste eventually has to go somewhere, but Fukushima will make it incredibly difficult to find a spot.

If the Fukushima crisis hadn't occurred and the nuclear plants had kept their noses clean for another decade or so, it might have been possible to convince a municipality to host the final disposal site, Tasaka said. The disaster, however, has basically shattered those hopes, he said.

Given how difficult it is just to get municipalities to store lightly tainted tsunami debris from Tohoku, it will be challenging to find a site for storing high-level radioactive waste, Tasaka said.

Japan's new energy policy exposed to IAEA

September 18, 2012

Japan details new energy plan at IAEA conference
http://www3.nhk.or.jp/daily/english/20120918_06.html

Japan detailed its new energy policy to the UN nuclear watchdog on Monday.

Senior vice foreign minister Ryuji Yamane told the annual conference of the International Atomic Energy Agency that Japan plans to reduce the country's dependency on atomic power to zero.

The conference began Monday in the Austrian capital of Vienna.

Yamane said Japan will increase its use of green energy to lessen its reliance on nuclear power.

The government says it aims to achieve zero reliance on nuclear energy by the 2030s. But the senior vice minister hinted at flexibility over the schedule, saying the road to zero reliance may not be a straight one.

In a separate meeting, Japanese officials discussed a new regulatory body to be launched on Wednesday.

The Nuclear Regulatory Commission will be independent from the industry ministry which oversees the current regulatory body.

Confirmation of contradiction

September 18, 2012

Nuclear plants under construction to continue
http://www3.nhk.or.jp/daily/english/20120918_20.html

The government will allow construction of nuclear plants that have already been started to continue, despite its recent ban on new plant projects.

The government's new energy policy limits nuclear reactor operation to 40 years, and bans construction of new plants or additional reactors.

Chief Cabinet Secretary Osamu Fujimura said on Tuesday that the ban does not apply to nuclear plants currently under construction. But he said the final decision is up to the nuclear regulatory panel.

Fujimura was referring to plants whose construction has already started in Aomori Prefecture, northern Japan, and Shimane Prefecture, western Japan.

Under the watchful eye of IAEA

September 19, 2012

IAEA to watch govt's N-plant deactivation
http://www.yomiuri.co.jp/dy/national/T120918003183.htm

VIENNA (Jiji Press)--The International Atomic Energy Agency will closely watch Japan's implementation of its new target of realizing a society without any active nuclear power plants in the 2030s, IAEA Director General Yukiya Amano said Monday.

Amano made the remark at a meeting with Ryuji Yamane, a parliamentary senior vice foreign minister, according to government officials.

Three reactors to be scrapped (maybe)

Govt to scrap 3 N-reactors in Mihama, Tsuruga
http://www.yomiuri.co.jp/dy/national/T120918003826.htm
The Yomiuri Shimbun

The government has decided to decommission three nuclear reactors at Japan Atomic Power Co.'s Tsuruga power plant and Kansai Electric Power Co.'s Mihama power plant, both in Fukui Prefecture, on the basis that nuclear reactors should not operate for more than 40 years.

This is the first time the government has mentioned decommissioning specific nuclear reactors after adopting its "innovative energy and environmental strategy," which aims to stop operations at all nuclear plants in the 2030s, last week.

"On the principle [of the 40-year rule], we're going to decommission [the reactors]," Chief Cabinet Secretary Osamu Fujimura said at a press conference Tuesday. The reactors Fujimura referred to were the **No. 1 reactor at the Tsuruga plant and the Nos. 1 and 2 reactors at the Mihama plant.**

The government's strategy stipulates it will strictly adhere to the rule limiting operations at nuclear reactors to 40 years. However, the decision of whether to actually decommission the reactors will be made by the nuclear regulatory commission, which is scheduled to be launched Wednesday.

Operations began at the Tsuruga plant's No. 1 reactor in March 1970. The Mihama plant's Nos. 1 and 2 reactors began operating in November 1970 and July 1972, respectively.

At present, the three reactors are the only ones in Japan that began operating more than 40 years ago.

Construction at Electric Power Development Co.'s Oma nuclear plant in Oma, Aomori Prefecture, and the No. 3 reactor at Chugoku Electric Power Co.'s Shimane nuclear power plant in Matsue has been suspended since the Great East Japan Earthquake last March.

Fujimura indicated the government would approve resuming construction of these facilities, saying, "The government won't call off construction permits or take back approval for building plans at nuclear reactors currently under construction."

===
3 reactors sit above crush zone

Additionally, the three nuclear reactors and other buildings at the two plants are **located right above a crush zone,** which experts have pointed out may be an active fault.

The Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency ordered JAPC and KEPCO to conduct additional drilling research on the plants' premises.

Within the next five years, six other nuclear reactors in the nation will exceed the 40-year operation limit.

September 19, 2012

Govt. defends new energy policy

http://www3.nhk.or.jp/daily/english/20120919_37.html

The government is defending its decision to endorse a new energy policy without approving a document compiled by relevant ministers that calls for halting all nuclear reactors sometime in the 2030s.

National Policy Minister Motohisa Furukawa said on Wednesday that the new policy lays a clear course while retaining the flexibility to deal with any eventuality.

He said the Cabinet took into consideration that the new policy will be used as the basis for future environmental and energy measures. He stressed that the Cabinet had not changed the contents of the ministers' proposal.
Sep. 19, 2012 - Updated 08:49 UTC (17:49 JST)

Govt. approves new energy policy
http://www3.nhk.or.jp/daily/english/20120919_27.html

The Japanese government has approved its new energy policy, based on a proposal to halt all of Japan's nuclear reactors sometime in the 2030s.

A Cabinet meeting on Wednesday debated the proposal compiled by relevant ministers last Friday.

The meeting approved the proposal, which calls for consulting host municipalities and the international community on whether to continue nuclear power generation. But they didn't approve the document itself.

Some in Japan's business sector oppose halting nuclear power generation.

The United States, which signed a civilian nuclear pact with Japan, has also expressed concern.

Prime Minister Yoshihiko Noda said earlier that the government should come up with a strategy that has a stable direction but also r**emains flexible.**

Observers express doubt that Japan will really phase out nuclear power in the 2030s, as the Cabinet is suggesting it wants to respond flexibly to future changes in circumstances.

Cabinet fails to OK new nuclear strategy

Deadline for abolishing atomic energy by 2030s not endorsed

http://www.japantimes.co.jp/text/nn20120919x4.html

Kyodo, Jiji

In a shocking reversal, the Cabinet on Wednesday failed to approve the government's new energy policy by watering down its main goal — the elimination of Japan's reliance on nuclear energy by the 2030s — in a document needed to confirm the full power of its endorsement.

The document that the Cabinet signed off on stirred speculation that it gave special consideration to big business and governments that benefit from hosting nuclear facilities, the main entities opposed to the zero option.

The endorsement document, which the government put up for the Cabinet's official decision Wednesday, drops the 2030s deadline for eliminating atomic energy and states that the government will hold talks with local governments and the international community based on the policy and "implement (the policy) by conducting ongoing studies and review."

The full document on the government's new energy strategy was meanwhile attached to the approval document as "reference material."

The government usually takes up major bills and other important issues with the entire Cabinet to ensure the result will be endorsed as a "Cabinet decision" — signaling that future Cabinets will also be held responsible for the decisions approved. If major issues are only "reported to the Cabinet" or "acknowledged by the Cabinet," however, they are considered less binding than official "Cabinet decisions."

The turnabout came after the government's new energy strategy was reported to Tuesday's meeting of the national strategic council, which consists of several private-sector experts opposed the zero-nuclear policy.

Of the five private experts on the council, three were absent from Tuesday's meeting. But Japan Association of Corporate Executives Chairman Yasuchika Hasegawa, who was in attendance, requested that the council scrap the plan to abandon nuclear power, saying it was strange.

Nobuaki Koga, president of the Japanese Trade Union Confederation (Rengo), also questioned the strategy.
Internal affairs minister Tatsuo Kawabata said the government still needed to explain the principle behind the strategy.
The government, however, claimed Wednesday that it was still sticking to the new policy, with trade minister Yukio Edano telling a news conference that its full content was "authorized" by the Cabinet because the decision says the government will take actions "based on" the strategy.

The new energy strategy announced Friday states that Japan will devote all policy resources to end nuclear power in the 2030s.

Edano did not clarify why the strategy itself was not included in the Cabinet document, saying only that there are "several ways" to handle the government's decision-making at Cabinet meetings.

Nuclear disaster minister Goshi Hosono separately said it was "a better way to go through such decision-making as we still have various uncertain factors."

Business lobbies have grown more vocal in their criticism of the nuclear-free goal, fearing that giving up atomic power will lead to electricity rate hikes that will adversely affect the economy.

Not so difficult to follow

September 19, 2012

Business leaders criticize gov't nuclear power phaseout policy

http://mainichi.jp/english/english/newsselect/news/20120919p2g00m0bu039000c.html

TOKYO (Kyodo) -- Leaders of Japan's major business groups on Tuesday criticized the government for setting a target of completely phasing out nuclear power in the 2030s, warning that such a move will seriously affect the economy.

It is rare for leaders of the three business groups, including the Japan Business Federation, the nation's most influential business lobby, to jointly hold a press conference to oppose a specific policy.

The business leaders said it would become difficult for Japanese companies to keep jobs in the country, as the phaseout policy would lead to higher electricity prices. They added that the target had been set without thorough study.
"It is extremely regrettable that our voices were not heard at all," Hiromasa Yonekura, chairman of the Japan Business Federation, known as Keidanren, told the news conference in Tokyo. "We strongly urge the government to re-create a responsible energy strategy from scratch."

The Japanese government decided Friday that the nation will seek to phase out nuclear power completely sometime in the 2030s, approving a big shift in national energy policy following the Fukushima Daiichi nuclear plant disaster triggered by the March 2011 earthquake and tsunami.

Yonekura hinted that he may consider resigning from the government's national strategy council, where he serves as a private-sector member, saying, "I will consider various means," when asked whether he will continue in the post. Yonekura did not attend a meeting of the council held Tuesday.

At the press conference, Tadashi Okamura, chairman of the Japan Chamber of Commerce and Industry, said he is "utterly unconvinced" by the government's plan as it fails to clarify solutions for alleviating the burden on people from the phaseout or show a path toward realizing a high level of energy saving.

The group "wants the plan to be created after a strict investigation that comprehensively assesses safety, stable supply and security of energy, as well as measures to deal with global warming," Okamura said.

Yasuchika Hasegawa, chairman of the Japan Association of Corporate Executives, echoed the view, saying the government's decision will destabilize energy supply in Japan, an island country which is poor in energy resources such as fossil fuels and cannot receive electricity from other countries.

"It is important to secure mixes of various electricity sources as much as possible," Hasegawa said, adding that Japan also needs to contribute to the development of safe and effective nuclear power generation by utilizing its cutting-edge technology.

In Osaka, Shosuke Mori, chairman of the Kansai Economic Federation, also expressed opposition to the policy, saying, "We strongly urge (the government) to withdraw it immediately."

At a news conference, Mori said a rise in electricity charges stemming from increased fuel costs to make up for nuclear power generation would lead to an "industrial decline," and demanded the government hold thorough discussions and study on the energy policy.

Still trying to understand

September 19, 2012

Gov't stops short of approving no-nuclear power policy at Cabinet meeting

http://mainichi.jp/english/english/newsselect/news/20120919p2a00m0na015000c.html

The government stopped short of approving the innovative energy and environment strategy, which calls for an end to Japan's reliance on nuclear power by the 2030s, at a Cabinet meeting on Sept. 19.

Instead, the Cabinet adopted a statement that Japan will "put the strategy into practice in a flexible manner while constantly verifying and reviewing it" and "hold responsible discussions on the strategy with local governments hosting nuclear plants as well as the international community to win understanding from the public."

The government plans to draft a road map toward expanding the use of renewable energy and specific measures to prevent global warming by the end of this year.

At a news conference on Sept. 19, State Minister for National Policy Motohisa Furukawa emphasized that the government's policy remains unchanged.

"In the past, the Cabinet approved a policy in a similar way. We've never changed the direction of the new strategy," he said.

He made the remarks in an apparent reference to a previous Cabinet's adoption of a statement saying that the government respected the atomic power policy outline instead of endorsing the outline itself.

However, the statement fails to mention the goal of eliminating atomic power stations, representing a back-down in the government stance to pursue a society that does not rely on nuclear power in the wake of the outbreak of the Fukushima nuclear crisis in March 2011.

The government made the decision apparently to show consideration to the business world that opposes the total elimination of nuclear power.

Hiromasa Yonekura, head of the Japan Business Federation (Nippon Keidanren), had criticized the government on Sept. 18 for not taking into account the business world's opinions on the issue in working out the innovative energy and environment strategy. "The government didn't listen to the business world's views at all," he said. Yonekura had even threatened to resign as a member of the government's national policy council in protest.

However, the latest decision appears to have convinced him. "I guess the goal (of ridding Japan of all nuclear plants by the 2030s) has been effectively retracted," he said.

At a meeting of the Energy and Environment Council on Sept. 14, the government for the first time incorporated the goal of ending Japan's use of nuclear power by the 2030s in its new energy policy.

However, there are some inconsistencies in the government's policy on nuclear power.

The strategy calls for the continuation of the nuclear fuel cycle project, in which plutonium is extracted from spent nuclear fuel and used for fast-breeder reactors, to show consideration to Aomori Prefecture that hosts a spent nuclear fuel reprocessing plant. This is despite the fact that the project would be unnecessary if Japan were to get rid of all its nuclear plants.

Furthermore, Economy, Trade and Industry Minister Yukio Edano said the government will allow the construction of J-Power's Oma Nuclear Power Plant and the No. 3 reactor of Chugoku Electric Power Co.'s Shimane Nuclear Power Plant to continue. However, the new policy clearly states that no new nuclear plants should be built.

If these plants are built, they can be operated until the 2050s in accordance with the government's policy of decommissioning all nuclear reactors after 40 years of operation. This contradicts the goal of shutting down all nuclear power stations by the 2030s.

September 20, 2012

Govt fails to OK zero N-target document

http://www.yomiuri.co.jp/dy/national/T120919004464.htm

The Yomiuri Shimbun

The government decided Wednesday to refrain from approving a document on its new energy strategy, virtually shelving its target to halt operations at all nuclear power plants in the 2030s.

After adopting an innovative energy and environmental strategy last week aimed at reducing its reliance on nuclear energy to zero, the government came in for a barrage of criticism from the United States and municipalities hosting nuclear power plants.

Under the circumstances, the government apparently sidestepped the issue by having the Cabinet only approve a future policy regarding the new energy strategy.

The Cabinet ministers at the meeting agreed to "have responsible discussions with related municipalities and the international community on the matter regarding the new strategy, and flexibly carry out consistent verification and reexamination, while gaining public understanding."

The phrase calling for "zero nuclear power plants operating in the 2030s" was not included in the policy approved at the meeting.

In explaining the shift in position, Motohisa Furukawa, state minister in charge of national policy, said similar decisions had been made in the past.

As examples, Furukawa cited the Japan Atomic Energy Commission's policy outline and the council for regulatory reform's report on various proposals.

Chief Cabinet Secretary Osamu Fujimura defended the latest move by saying it was not aimed at making the contents of the new strategy obscure.

The policy approved at the meeting is aimed at dealing with energy policies later, he said.

However, Goshi Hosono, state minister for the nuclear crisis, indicated the government avoided approving the document because there is a possibility it may change its policy.

"There are various uncertain factors [in future energy measures]. As the government needs to face the issues firmly, flexibly and humbly, I think the way it was approved today was desirable," Hosono said.

In addition to the zero nuclear target, the new strategy offers three principles including strict adherence to a plan to limit nuclear reactor operations to 40 years.

The other principles call for nuclear power plants to resume operations only after the nuclear regulatory commission confirms their safety, and prohibit the construction of new reactors and the expansion of existing facilities.

"A mere reference material"

September 20, 2012

Editorial: Failure to approve new energy strategy defies calls to scrap nuke power

http://mainichi.jp/english/english/perspectives/news/20120920p2a00m0na009000c.html

The Cabinet's decision not to adopt the innovative energy and environment strategy has raised serious doubts about the administration's determination to end Japan's reliance on nuclear power by the 2030s.

The Cabinet of Prime Minister Yoshihiko Noda stopped short of adopting the strategy that calls for the elimination of nuclear power by the 2030s and instead approved a statement that the government will put the strategy into practice while constantly reviewing it in a flexible manner. In other words, the Noda administration regards the new strategy as mere reference material.

Since the government is not legally bound by the strategy, the policy of ending Japan's dependence on atomic power could be considerably watered down. The Noda administration should be aware of the gravity of the decision to get rid of nuclear plants it had made following national debate, and show its determination to achieve that goal.

A policy can be established as a Cabinet decision only after it is approved at a Cabinet meeting. Successive Cabinets are bound by all policy decisions made at Cabinet meetings unless they are revised. However, the Noda Cabinet's decision not to approve the strategy has raised doubts about whether it is committed to implementing the anti-nuclear move.

When the compilation of the new strategy was in its final stage, the Cabinet appeared to hesitate over its details.

The Noda administration declared that it will pursue a society without nuclear power in response to public opinion calling for the elimination of nuclear plants following the outbreak of the crisis at the tsunami-stricken Fukushima nuclear plant. Still, it chose to continue the nuclear fuel cycle project, in which plutonium is extracted from spent nuclear fuel and is used for fast-breeder reactors, out of consideration for Aomori Prefecture, where a massive amount of such radioactive waste is stored as an interim measure, as well as the United States, Britain and France, which have cooperated in the project.

The government had intended to seek legislation to implement the new strategy, but the plan was deleted in the final stage.

Despite these moves, the government retained its goal of getting rid of all nuclear plants in a reversal of its policy of promoting atomic power.

However**, the Cabinet abandoned adopting the new strategy bowing to stiff opposition voiced by local governments hosting nuclear power stations, the business world and the United States.**

While the government has watered down its policy of seeking to get rid of nuclear power, moves have emerged that could lead to continued dependence on nuclear power.

Although the strategy confirms that no new nuclear reactors will be built, Economy, Trade and Industry Minister Yukio Edano gave the green light to the resumption of construction work on two nuclear reactors, which had been suspended since the outbreak of the Fukushima nuclear crisis. In accordance with the policy of decommissioning nuclear reactors after 40 years in operations, the new reactors can be operated until the 2050s, which is contradictory to the goal of ending Japan's reliance on atomic power by the 2030s.

It is true that numerous challenges, including securing alternative power sources and preventing electricity charges from surging, must be overcome to get rid of all nuclear plants. It is only natural that opposition has been voiced to such a policy because the government has not shown how to overcome these challenges.

These challenges were pointed out during deliberations at the Advisory Committee for Natural Resources and Energy that lasted for six months as well as during national debate. Based on these discussions, the Noda Cabinet adopted the no-nuclear power policy.

As such, the government should adopt the new strategy at a Cabinet meeting. It should then work out specific measures to overcome challenges and ask the public for understanding and cooperation.

We urge Prime Minister Noda to clearly explain how to keep consistency between a series of revisions made to the strategy shortly before it was announced and the policy of ending Japan's dependence on nuclear power, and show his determination to achieve such a goal.

The 19th postponement of Rokkasho

Rokkasho N-fuel plant completion delayed

http://www.yomiuri.co.jp/dy/national/T120919004612.htm

AOMORI (Jiji Press)--Japan Nuclear Fuel Ltd. has decided to postpone the completion of its spent nuclear fuel reprocessing plant in the village of Rokkasho, Aomori Prefecture, by one year to October 2013, Japan Nuclear Fuel President Yoshihiko Kawai said Wednesday.

Kawai explained the plan to Ikuo Sasaki, vice governor of Aomori, during their meeting at the prefectural government office here. The company will report it to the central government shortly.

At a press conference, Kawai said the delay in the plant's completion is expected to increase the total project cost by about 110 billion yen. This is the 19th postponement.

German hand extended over nuke phase-out

German minister hopes for talks with Japan over nuclear phase-out

http://mainichi.jp/english/english/newsselect/news/20120920p2g00m0dm002000c.html

BERLIN (Kyodo) -- German Environment Minister Peter Altmaier expressed a desire Wednesday to begin consultations with Japan on abolishing atomic power generation, following the compilation of an energy strategy by the Japanese government that includes a plan to terminate nuclear power in the 2030s.

After the March 2011 accident at the Fukushima Daiichi Nuclear Power Station in Japan, Germany decided to end nuclear power generation by the end of 2022. Tokyo and Berlin have so far been holding working-level talks on renewable energies and other related issues.

Altmaier suggested that this framework be upgraded for him and Japanese Environment Minister Goshi Hosono to hold direct talks.

Speaking to foreign media, Altmaier said Germany "has already exchanged notes with Japan on various occasions." Given the drawing up of Japan's new energy strategy, he said that "the counterpart ministers should hold talks."

He stopped short of providing the timing and other specifics of such dialogue, saying arrangements are needed with the Japanese government.

German Chancellor Angela Merkel also expressed at a news conference Monday that Germany wants to strengthen cooperation with Japan over issues including the development of renewable energy and efficient power use.

A hopeful sign

September 21, 2012

Experts who value nuclear power plunged by 30 percent after Fukushima disaster

http://mainichi.jp/english/english/newsselect/news/20120921p2a00m0na019000c.html

HIROSHIMA -- Nuclear energy experts who believe nuclear power generation is valuable plunged by 30 percent following the Fukushima nuclear disaster, a survey by the Atomic Energy Society of Japan (AESJ) has shown.

The survey, reported at an AESJ meeting held at Hiroshima University on Sept. 20, is part of an annual awareness survey conducted by the society's expert panel on some 500 randomly selected urban residents and around 600 AESJ members. The latest survey compared the results from January 2011 and January 2012.

Asked whether nuclear power would be useful in their everyday lives 20 years from now, the ratio of experts who clearly answered it would be useful sharply plunged to 50.1 percent after the Fukushima disaster from 79.5 percent prior to the nuclear catastrophe.

Regarding a sense of security toward nuclear energy, the ratio of citizens who answered they feel "insecure" jumped to 70.8 percent after the Fukushima disaster from 49.8 percent prior to the crisis. The same poll on experts showed a surge to 17 percent from 5.3 percent prior to the disaster.

The percentage of citizens who believe that Japan should continue to use nuclear energy also dropped to 20.6 percent in the post-disaster survey from 43.8 percent in the pre-disaster poll. The same question on experts showed a decrease from 95.5 percent prior to the crisis to 85.4 percent after the disaster.

Those who support the idea of putting priority on the development of and nurture of human resources for renewable energy rather than the technological development of nuclear power rose to 79.4 percent among surveyed citizens from 59 percent prior to the nuclear disaster, and doubled among experts from 13.1 percent before the disaster to 26.9 percent.

"Nuclear energy experts are upset after experiencing a nuclear disaster. They are apparently trying to rethink the safety and value of nuclear power generation," said Kansai University professor Shoji Tsuchida, a member of the survey team.

What is the plan, M. Noda?

September 23, 2012

Japan's nuclear phaseout: Is it all smoke and mirrors?

http://www.japantimes.co.jp/text/fe20120923sh.html

By STEPHEN HESSE

On Sept. 14, Prime Minister Yoshihiko Noda's administration announced that Japan would end nuclear-power generation by 2040. Five days later his Cabinet failed to endorse the new policy; but on the same day, Sept. 19, Trade Minister Yukio Edano insisted that the government would still act "based on" the plan.

Confused? Here in Japan it seems everyone is.

Phasing out nuclear power is a not bad idea. On the contrary, it's the only reasonable and rational choice for Japan: a nation on the Pacific Rim of Fire where continuous seismic activity is a given; a nation where politicians, government bureaucrats and utility executives are so cozy that the citizens' interests are never the first priority; a nation rich in alternative-energy potential, including wind, solar, hydro, geothermal and oceanic.

And since no one is truly happy with Noda's plan, some might argue that this proves it is a reasonable compromise among competing interests. But ambiguity in laying out Japan's 21st-century energy policy is simply bad politics, and will likely accelerate Noda's fall from the political stage.

In a Sept. 15 article, the New York Times quoted Tetsunari Iida, director of the Institute for Sustainable Energy Policies — which supports an end to nuclear power and the adoption of renewable energies — saying: "It's trickery with words and numbers. The zero number might be symbolic politically, but in reality, it holds little meaning."

In the opposite corner stands Keidanren, Japan's powerful business federation, which is pro-nuclear. Keidanren Chairman Hiromasa Yonekawa termed the plan "unrealistic and unreachable."

"Industrial circles, which have been doing everything possible to maintain the level of employment, can never approve such a policy. It's a total contradiction to the government's growth strategy," a Yomiuri Shimbun editorial on its Sept. 15 English website quoted Yonekawa as saying.

Clearly, the country's two major daily newspapers, the Asahi and the Yomuri, are taking opposite sides in this battle — but both are critical of the plan.

"It was extremely irresponsible of the government to set out a 'zero nuclear power' policy without illustrating the details of how the nation is supposed to secure a stable supply of electricity," said the pro-nuclear Yomiuri. "Such a sloppy, immature scheme is totally unworthy of a national energy policy," the paper lamented.

The Asahi was more charitable, but still displeased.

"We welcome the government's decision, which is based on the fact that many Japanese are seriously concerned about the magnitude of the problems with nuclear-power generation. That said, the government cannot yet claim that it has offered a clear road map toward a future without nuclear power," that paper chided.

"The new energy strategy adopts three principles to realize that vision: Idled reactors will be restarted only if they are judged to be safe by a new nuclear regulatory commission; a 40-year limit on the lifetime of reactors will be strictly applied; and no new nuclear reactors will be built.

"But simply applying a legal lifespan of 40 years to the existing reactors would leave 20 reactors in operation in January 2030, and five reactors would be still on line even in 2040," the Asahi pointed out.

In the 18 months since the explosions and three meltdowns at the Fukushima No. 1 nuclear power plant, a majority of Japan's citizens and increasing numbers of politicians have come to support a non-nuclear future for the nation.
Seemingly intent on wooing this anti-nuclear majority, the Noda camp has proposed a vague no-nukes policy — but one that Noda himself does not fully support.

"The prime minister has not changed his opinion that nuclear power plants are important," notes the Yomiuri on Sept. 16, quoting a Noda aide.

But the same Yomiuri article cited a senior ministry official as saying, "(The strategy) is full of contradictions and can't be explained in a logical manner."

In an effort to make no enemies, Noda has made no friends. He and his supporters have crafted a proposal that has many Japanese hoping for zero nuclear power by 2040, or sooner, and their opponents scrambling to find loopholes that will allow nuclear-power generation to remain up and running decades beyond that date.

And since those who drafted the proposal have ensured that there is plenty of wiggle room to restart, to build and to extend the life of reactors in Japan, no one can fully embrace Noda's plan because no one knows where it will lead over the next 30 years.

Far better to be decisive and clear, as the German government has been with its stated intention and plan to make the country nuke-free by 2020.

Obviously many in the Keidanren wouldn't be happy if the Japanese declared a policy similar to Germany's, but at least the business sector would be able to invest in alternative energy sources with confidence, knowing that the government will not make random policy changes over the next three decades.

Beyond the Tokyo government's muddled policymaking, however, there is little doubt how Japanese residents feel about their own energy future.

An Asahi Shimbun public opinion poll conducted in early August found that 79 percent of respondents had either "not much confidence" (50 percent) or "no confidence" (29 percent) in the government's safety measures regarding nuclear power. Only 1 percent of the respondents declared themselves as having "great confidence" in those measures, while 18 percent expressed "some confidence."

Asked how much hope they placed in renewable energies such as solar and wind power, 12 percent of respondents said "not much hope." Significantly, however, 54 percent expressed "some hope," while 29 percent replied with "great hope."

Meanwhile, the same Asahi poll also asked respondents whether they felt that the national debate regarding nuclear-power production and future energy policy has been sufficient.

Just 10 percent felt the debate had been "sufficient," while 81 percent replied it had been "insufficient."

Japan's friends overseas, too, are confused and concerned — except perhaps Germany, which is likely wondering why Japan has taken so long to move toward the non-nuclear option, which Germany did in the spring of 2011 soon after the Fukushima explosions and meltdowns.

Britain, France and the United States are actively involved in the business of nuclear power, and all are closely tied to Japan's nuclear industry. Britain and France reprocess spent nuclear-fuel materials from Japan's reactors, separating uranium and plutonium from the spent fuels and returning these, and the remaining wastes, to Japan. Now these two nations are concerned that Japan's new policy direction might mean they are left holding Japan's lethal wastes.

According to media sources, even before Noda's 2040 plan was made public, Sir David Warren, the British ambassador to Japan, visited Chief Cabinet Secretary Osamu Fujimura to seek assurances that Japan intends to pick up canisters of its radioactive waste that sit waiting for shipment to Japan.

It has also been reported that the French ambassador, Christian Masset, will officially request that Japan promise to repatriate nuclear wastes.

Even France, which depends more heavily on nuclear power than any other nation, with 78.8 percent of its electricity coming from nuclear reactors, is having a change of heart.

On the same day Japan announced its new policy, French President Francois Hollande announced that France would begin to reduce nuclear-power generation, dropping to 50 percent by 2025.

But problems related to Japan's nuclear-fuel cycle don't end there.

Once wastes reach Japan, they are placed in a temporary storage facility in Aomori Prefecture, which presents Japan with another conundrum — namely, if it gets out of the nuclear-power business, what will become of its growing stockpile of high-level nuclear wastes that were supposed to be reprocessed and reused as nuclear fuel?

Noda's plan vaguely foresees maintaining the nuclear-fuel cycle, but to no purpose if nuclear-power generation is brought to an end. Having never agreed to become the final resting place for thousands of tons of deadly nuclear materials, Aomori officials are livid.

Nor has any other prefecture agreed to provide permanent storage of wastes, whether uranium or plutonium, which is not surprising given that deep underground storage remains the most commonly touted option worldwide — and subterranean Japan is rife with grinding tectonic plates, volcanic activity and shearing faults.

With ripples of worry, confusion and frustration rolling out in all directions from Tokyo, one can only wonder what the Noda administration was thinking and why they announced a plan prior to any consultation with domestic officials and foreign friends.

One of the clearest indications that Noda's 2040 plan was served half-baked is the fact that Noda's Cabinet was surprised when the U.S. government voiced serious concerns regarding Japan's tentative steps toward the zero option.
Failing to keep the U.S. informed — its closest ally and partner in nuclear-technology development — shows a startling lack of political acumen if indeed Washington got the same version of the story as the rest of us.

Here, skepticism is justified. It has been reported that U.S. officials were told the Noda plan simply suggests that Japan will pursue the zero option — but it does not mean that Japan has made a final decision to stop using nuclear power.
So let's cut the political obfuscation, Mr. Noda. Japan has been patient for 18 months and is tired of waiting. Take a stand and tell us: ***What is* Japan's plan for its energy future?**

Double-dealing?

September 23, 2012

The endorsement that wasn't

http://www.japantimes.co.jp/text/ed20120923a1.html

The Noda Cabinet on Wednesday failed to endorse its new energy strategy announced five days before, which said that Japan will mobilize all available policy resources to achieve "zero operation" of nuclear power plants in the 2030s.

People will wonder what was the purpose of the government announcing the new strategy and suspect that it was only designed to get votes for the ruling Democratic Party of Japan in the coming Lower House election. What happened was deceptive.

The Cabinet's failure to endorse the new strategy could result in scrapping the zero-nuclear goal declared by it.

In the Cabinet decision, the new nuclear energy strategy is only treated as reference material. The decision only says that, in reference to the new strategy, the government will hold talks with local governments concerned and the international community, and will carry out future energy and environment policy while getting people's understanding and flexibly and incessantly reviewing and re-examining the strategy.

Prime Minister Yoshihiko Noda said in a TV program on Wednesday night that the goal to end Japan's reliance on nuclear power generation in the 2030s has not been changed. He also said that although four or five reactors will be online in the latter half of the 2030s in accordance with a 40-year limit on the operation of reactors, there is the possibility that these reactors may be decommissioned earlier with the spread use of renewable energy.

But given the Cabinet's failure to endorse the new strategy, his determination for the zero-nuclear goal appears suspect.

On Sept. 15, trade and industry ministry Yukio Edano said three nuclear power plants under construction will not be abandoned, hinting that they will remain online at least into the 2050s.

It is clear that the Noda Cabinet has succumbed to the pressure from local governments hosting nuclear facilities and from the United States, Britain and France, which are helping Japan with its nuclear fuel cycle.

Japan is commissioning the reprocessing of spent nuclear fuel, the main part of the cycle, to Britain and France. The new strategy also says that Japan will continue to push the nuclear fuel cycle. This contradicts the pursuit of the zero-nuclear policy and means that the government will pour a large amount of public money into projects that will not be needed.

Plutonium will also continue to pile up, causing a nuclear proliferation problem.

Chief Cabinet Secretary Osamu Fujimura said that how to implement the nuclear-zero policy will be entrusted to an advisory panel on energy policy for the trade and industry minister.

One wonders how such a panel can push nuclear-zero policy. Mr. Noda should take concrete actions to dispel suspicion that he is **double-dealing** and is not serious about ending Japan's reliance on nuclear power generation.

Don't build new reactors, says Edano

September 26, 2012

Gov't to urge power companies to withdraw plans to build nuke reactors

http://mainichi.jp/english/english/newsselect/news/20120926p2a00m0na016000c.html

The government is planning to urge power companies to voluntarily withdraw plans to build new nuclear power plants whose construction has not started, Minister of Economy, Trade and Industry Yukio Edano has revealed in an interview with the Mainichi Shimbun.

"The government's Innovative Strategy for Energy and the Environment has a certain binding force on nuclear power and the energy industry," Edano stressed during the interview on Sept. 25, referring to the government's zero-nuclear policy set to be achieved by the 2030s.

"We will examine whether the government will have power companies take voluntary responses in light of the government strategy or if any legislative measures are necessary," Edano said.

The government's energy and environment strategy clearly stipulates that "no new or additional nuclear reactors will be constructed" in accordance with the zero-nuclear policy, which seeks to halt the operations of all nuclear plants in Japan by the 2030s.

According to the Agency for Natural Resources and Energy, there are currently plans to build nine new nuclear reactors, including those in Aomori, Fukui and Shimane prefectures. Edano had earlier demonstrated his willingness to permit the continuation of three of those reactors, including the No. 3 reactor at the Shimane Nuclear Power Station.

However, the minister had not clarified how to handle the six remaining reactors whose construction is yet to be started -- including the No. 3 and No. 4 reactors at the Tsuruga Power Station in Fukui Prefecture and the No. 1 and No. 2 reactors at the Kaminoseki Nuclear Power Plant in Yamaguchi Prefecture. Utilities have already applied with the government for permission to construct reactors after obtaining approval from local municipalities.

Edano's latest remarks during the interview indicate that no new commencement of construction of nuclear reactors will effectively be permitted in order to achieve the zero-nuclear policy.

Ohma plant can be completed

September 28, 2012

J-Power to finish building Ohma nuclear plant
http://www3.nhk.or.jp/daily/english/20120928_25.html

A Japanese power company is likely to resume construction of a nuclear plant in northern Japan by the year-end.

Electric Power Development Company, also known as J-Power, started building the plant in Ohma Town, Aomori Prefecture, in 2008 with the goal of starting operation in November 2014. But the work was suspended after the nuclear accident at the Fukushima Daiichi plant in March last year.

J-Power decided to resume construction after the government compiled its new energy policy on September 14th. The new strategy allows work to continue on plants already under construction, while trying to end Japan's reliance on nuclear power by the 2030s.

Industry minister Yukio Edano visited Aomori Prefecture on September 15th. He told Governor Shingo Mimura that the Ohma plant could be completed.

J-Power plans to inform local municipalities of the decision next week.

The Ohma plant must pass a new safety standard to be drawn up by the Nuclear Regulation Authority before it can begin operation. The regulatory body was launched on September 19th.

NRA chairman Shunichi Tanaka says the company is better off resuming construction after undergoing screening based on the new standard. But he said it's the firm's decision to make, and he won't be asking it to wait.

Two other nuclear plants were already under construction before the March 11 disaster -- one in Aomori and another in Shimane, western Japan.

Should government look after nukes?

September 29, 2012

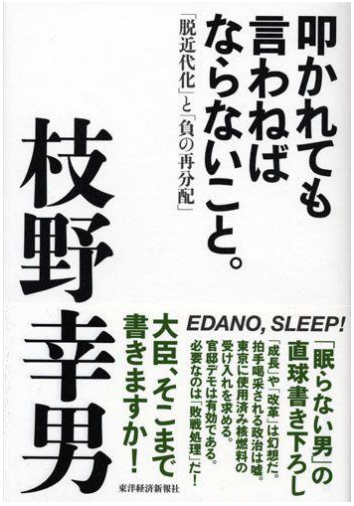
Edano's new book says government should run nuke plants

http://www.japantimes.co.jp/text/nn20120929a8.html

Kyodo

In a book published Friday, trade and industry minister Yukio Edano proposes that nuclear reactors be run by the state instead of utilities so the government can take the lead in creating a nuclear-free society.

Power of the pen: Industry minister Yukio Edano's book is titled "Tatakaretemo Iwaneba Naranai Koto ("What I Must Say Even if I Were to be Criticized)." KYODO



"Practically speaking, I see no alternative but to have nuclear plants run by the state," Edano says in his book "Tatakaretemo Iwaneba Naranai Koto" ("What I Must Say Even if I Were to be Criticized"), obtained Thursday.

Edano says in the 240-page book that atomic energy generation can't be left in the hands of the private sector, partly because of the overwhelming money required to compensate victims of major accidents.

But if nuclear power plants were managed by the state, the government would "have the unilateral power to decide on the operation of reactors and the timing of decommissioning them," Edano, who oversees the nuclear sector as economy, trade and industry minister, writes.

Edano notes that he personally hopes to "eliminate nuclear reactors as soon as possible," apparently to clarify his stance at a time when the government's new policy to phase out nuclear power by the 2030s has been amended by the Cabinet to override the deadline and give it lots of wiggle room.

His proposals call for experts to spend several years thoroughly assessing the safety level of all reactors nationwide, and urges that lowly ranked units be scrapped before they reach 40 years of operation — the period that the government set as their lifespan in the aftermath of the Fukushima nuclear crisis.

Japan would thus "move closer to zero nuclear power" generation, Edano argues.

End nukes as soon as possible

Industry Minister Edano says Japan must end nuclear use ASAP

http://japandailypress.com/industry-minister-edano-says-japan-must-end-nuclear-use-asap-3013823

By Adam Westlake / September 30, 2012 / No Comments

Taking a clear and adamant stance on the country's use of nuclear energy, Japanese Industry Minister Yukio Edano has said that nuclear power plants are too much of a risk, and they need to be shut down as quickly as possible. Edano feels that last year's Fukushima nuclear disaster, triggered by the March 11th tsunami, serves as more than enough proof that the price to pay for using nuclear power is far too high, especially for one of the world's most earthquake-prone countries. These opinions and more are shared in a book of Edano's policy views that was published on Friday.

As the government's primary spokesman during the unfolding of the Fukushima crisis, Edano feels nuclear power plants should be eliminated as soon as possible. His book is titled *Tatakaretemo Iwaneba Naranai Koto* ("Even if I get a beating, I must say this"). Like many, he thought the use of nuclear power

was a “masterpiece” of modern technology, but he has now come to the conclusion that Japan, with its population of 128 million, is not safe when that technology can succumb to natural disaster as easily as it did last year. While taking up his position whole-heartedly, he still admits that nuclear power cannot be eliminated immediately, it will take time to fight the “counteraction” and deal with the “debts” that the country’s use has created.

The other important message coming from Edano is that the monopoly in Japan’s power industry must be brought to an end. Interestingly he says that nuclear reactors should be run by the government as opposed to utilities, because the private sector cannot be trusted to work towards a nuclear-free country. He feels this would help speed up the phasing out of nuclear power, and be more beneficial for the promotion and development of renewable energies. While the Japanese government was seen as ready to adopt a long-term energy policy that would see the use of nuclear power brought to an end by the 2030s, that plan was amended by a recent Cabinet vote that gives it a much more vague deadline.

Full-scale public discussion should be launched

September 30, 2012

Gov't must iron out inconsistencies in nuclear strategy through true public discussion

http://mainichi.jp/english/english/perspectives/news/20120930p2a00m0na003000c.html

The government's Innovative Strategy for Energy and the Environment, which envisions an end to nuclear power by the 2030s, has now been compiled. However, the strategy's retention of the nuclear fuel cycle that has been a mainstay of the nation's energy policy to date has exposed inconsistencies, and it has drawn fire from both proponents and opponents of nuclear power.

The problems that the government shelved in the past as it advanced under the myth that nuclear power was safe have now erupted all at once. Rather than leaving the issue solely in the hands of nuclear power experts, politicians and bureaucrats, the government should take this opportunity to launch true, full-scale public discussion.

On Sept. 14, Prime Minister Yoshihiko Noda suggested that the government's Energy and Environment Council could revise the energy and environment strategy in the future, stating, "It's all the more irresponsible to make determined decisions when dealing with an uncertain future." The Cabinet decided against adopting the new strategy on Sept. 19, merely categorizing it as reference material. This has left its status enshrouded in uncertainty -- though it is supposed to be the backbone of the nation's energy policy.

In July and August, the government arranged "public discussion" on the nation's nuclear policy through public hearings and deliberative polling, asking residents for their opinions on the nation's future energy policy. In this discussion, public support for a zero nuclear power policy was predominant. In compiling the outcome of the discussion, State Minister for National Policy Motohisa Furukawa commented, "The public majority favors the realization of a society free from reliance on nuclear power plants."

In June the government outlined three options for the ratio of nuclear power generation to the total amount of electricity generated in 2030: zero percent, 15 percent, and 20-25 percent. For each of the options, it presented ratios of renewable energy and thermal power to total power generation, and probed the effects on the economy. Though it suggested that power costs could double under a zero nuclear power policy, many members of the public supported that option. Keio University professor Yasunori Sone, who headed the committee in charge of deliberative polling, said this suggests that people are prepared to shoulder the cost of implementing a zero-nuclear policy.

However, cost is not the only issue the public faces.

What is to become of the nuclear fuel cycle under which plutonium is extracted from spent nuclear fuel and used for fast-breeder reactors. The government decided that under a zero nuclear power option, it would directly dispose of spent nuclear fuel -- without reprocessing it. For the 15 percent and 20-25 percent options, it simply said it would handle the decision-making process in the event that either of those options was selected. In adopting such a stance, it has effectively removed the future picture of the nuclear fuel cycle from public debate.

A Cabinet Secretariat official explained that decisions on the future of the nuclear fuel cycle were not suited to public discussion, as there was a need to "carefully consider the relationship with local bodies" where nuclear fuel cycle facilities are located.

The cost of failing to hold in-depth debate on the nuclear fuel cycle surfaced during the compilation of the energy and environment strategy. A proposal from the ruling Democratic Party of Japan (DPJ) compiled ahead of the formation of the new strategy set a target of zero dependence on nuclear power plants in the 2030s.

This provoked a backlash from the Aomori Prefectural Government and other local bodies that have accepted spent nuclear fuel on the premise of reprocessing it under the nuclear fuel cycle. The bodies suggested that if the cycle were abandoned, then they would send the spent nuclear fuel back where it came from. If that were to happen, the pools for spent nuclear fuel at the nation's nuclear power plants would quickly fill up, and the operation of nuclear plants would have to be halted before the 2030s.

On the other hand, if the reprocessing of spent fuel is allowed to continue under a zero nuclear policy, then Japan's stockpiles of plutonium will grow. As plutonium can be used in nuclear weapons, this could raise concerns in international society that Japan is intending to arm itself with nuclear weapons.

Attempts to balance the ideal of a zero nuclear society with the reality of nuclear waste that has no place to go have resulted in phrases in the energy and environment strategy and the government's statements since the adoption of the strategy becoming rife with inconsistencies. While stating that it will aim for zero reliance on nuclear power plants, the government maintains that it will continue to reprocess fuel -- a process based on the premise of operating nuclear power plants. Furthermore, if the rule of strictly applying a 40-year limitation on the operation of nuclear power plants is allowed to stand together with a zero nuclear power policy, one would expect the construction of nuclear plants to be out of the question. Nevertheless, Minister of Economy Trade and Industry Yukio Edano has permitted continued construction of nuclear power facilities that power companies have already started to build.

The reason many residents have sought a society free of nuclear power is that they distrust the government in its rush to restart nuclear power plants and create a new energy policy when the safety of nuclear power plants remains uncertain.

Nuclear disaster minister Goshi Hosono has stated that the newly formed Nuclear Regulation Authority will rebuild Japan's battered nuclear safety regulations, but this rebuilding is yet to come. In that case, it was unreasonable, one could say, for the government to go deciding on a future energy policy at this stage. Still, I hold hope that widespread public knowledge about the inconsistencies will lead us in the right direction.

During my coverage of the compilation process for the new strategy from April this year, I felt uneasy seeing the large number of politicians who trumpeted support for zero dependence on nuclear power without looking at the actual situation. I, too, have hoped to see reduced dependence on nuclear power. But for this to happen, we must persistently pursue innovation in renewable energy technology and methods to handle nuclear waste.

It is the role of politicians, while promoting ideals, to look squarely at the actual situation, ask the public about the issues, and then make policy decisions. I hope that the government's current floundering will produce a preface for searching out plausible paths to a society free from nuclear power. ("As I See It" by Hiroshi Hisata, Tokyo Business News Department)

Japan must stop this "zigzagging" on energy policy

Monday, Oct. 1, 2012

THE VIEW FROM EUROPE

Flip-flop on no-nuclear energy policy bodes ill for the future of Japan

http://www.japantimes.co.jp/text/nb20121001ve.html

By JOCHEN LEGEWIE
Special to The Japan Times

On Sept. 14, the Japanese government presented to the public a new national energy strategy. This long-awaited plan included as its focal point the objective of eliminating nuclear power by the end of the 2030s. Less than a week later, however, Japan's hopes for a nuclear-free world were dashed. In the face of strong opposition from the business community, municipalities and prefectures that host nuclear reactors and fuel reprocessing plants, and from the United States, Great Britain and France, the government decided to backtrack on its initial aspirations.

The Cabinet eventually approved the new energy plan on Sept. 19, but only by dropping the core reference to the 2040 deadline in a separate document attached to override the plan. In other words, Japan has gone back to the drawing board on whether to let nuclear power stay in its energy mix.

This **zigzagging on policy** has left many in and outside Japan scratching their heads. Both proponents and opponents of nuclear energy are equally frustrated because neither group's concerns are being properly reflected by the government's wavering course. The worst long-term damage, however, is probably being caused by the shaken belief that Japan has a predictable future in energy.

The announcement of the new energy strategy on Sept. 14 was filled with contradictions and ambiguities. While aiming to close nuclear power plants by the end of the 2030s, the strategy allows work on plants already under construction to continue. It also calls for shutting down all reactors but continuing the reprocessing of spent fuel. Likewise, the goal of tripling electricity output from renewable energy sources

by 2030 sounds hollow because the government does not offer any plans for generating the funding required to do so.

In addition to these factual contradictions, members of Prime Minister Yoshihiko Noda's Cabinet have been making inconsistent remarks over the past weeks. While the government told Fukui Gov. Issei Nishikawa on Sept. 13 that it was planning to shut down the Monju fast-breeder reactor, science and technology minister Hirofumi Hirano told Nishikawa five days later that research and development activities at Monju would continue.

Chief Cabinet Secretary Osamu Fujimura even told a news conference on the morning of Sept. 17 about plans to decommission three nuclear reactors in Fukui Prefecture — only to retract the remarks later that afternoon.

On the evening of Sept. 23, Noda emphasized on TV that "abandoning nuclear power is a target that will not be undermined." However, trade minister Yukio Edano offered a clarification, admitting, "Whether we can become nuclear-free by the 2030s is not something to be achieved only by policymakers. It also depends on the will of electricity users, technological innovation, and the international environment for energy in the next one or two decades."

What remains for the time being represents a temporary victory by the formidable coalition of pronuclear interest groups. But as long as unpredictability and immature communications continue to shape energy policy and public perception at home and abroad, there will be no real winner.

Japan is in desperate need of a more serious debate on its energy future. The government should take the lead in creating a proper framework and timeline for this debate. It must bring to the table representatives from all ends of society, including the growing group of outspoken nuclear opponents.

In May, I argued here that Japan should borrow a page from the book of the German government. Right after the Fukushima disaster, the German government installed the so-called Ethics Commission, made up of famous and highly respected individuals from academia, the church and other parts of society, including a business representative, to discuss the nation's future nuclear policy.

Japan needs to develop its own approach in a political environment that lacks a history of long-term public discussion of nuclear power as Germany had, and which faces significant differences with Germany in terms of geography, geopolitics and other conditions.

But it is clear that Japan cannot afford to keep zigzagging on energy policy much longer. If it continues, the fears of both sides in the nuclear debate might come true.

On the one hand, the continued unpredictability in policy will likely make energy-intensive businesses leave Japan. It will effectively dampen any further exports of nuclear technology while preventing the development of a strong new industry around renewable energies at the same time. It will even worsen relations with the U.S. and other Western allies that want Japan to stick with nuclear power but most of all request planning security.

On the other hand, if nuclear energy stays, it might lead to another major accident in Japan and thus — combined with above — result in the worst thinkable overall scenario.

Facts and perceptions need to be taken into the equation as well. There are many ways to do so. One would be to start an annual international summit to discuss the challenges and solutions to the energy questions of today and tomorrow. The obvious annual date would be March 11, with a venue either in Fukushima or Sendai.

The Japanese government owes it to its people, and also to the international community, to take the lead in addressing nuclear and other energy issues in a proactive and sustainable way. If it did so, it might even be perceived as leading in a responsible way.

What is to become of the Atomic Energy Commission?

October 2, 2012

Atomic panel quits nuclear policy work
http://www3.nhk.or.jp/daily/english/20121002_19.html

A government panel in Japan is calling off work to formulate a new policy outline on nuclear energy. Drafting the outline was the Atomic Energy Commission's main duty for more than 50 years.

The commission met on Tuesday and decided to disband a conference of experts that had been reviewing the outline since 2010.

In response to last year's Fukushima nuclear accident, the government in September announced future nuclear energy policy would be decided by a ministerial conference on energy and the environment.

Commission members told the meeting that given the new energy policy, the commission's role would have to change.

Some said they regretted having to disband a conference of nuclear experts.

The Atomic Energy Commission has been formulating nuclear energy guidelines about once every 5 years since 1956. The task has been regarded as the commission's most important duty.

Observers say the commission -- a key proponent of nuclear power -- will now come under wholesale review. They say disbanding the organization is among the possible options.

The government's new energy policy calls for all resources available to be invested in efforts to realize a country free from nuclear power in the 2030s. But the policy also allows for a conditional restarting of existing nuclear plants and continued recycling of nuclear fuel.

Even ministers don't see eye to eye on govt's energy policy

October 2, 2012
New ministers trade barbs over Japan's controversial energy strategy

http://mainichi.jp/english/english/newsselect/news/20121002p2g00m0dm024000c.html

TOKYO (Kyodo) -- New Cabinet ministers on Monday traded barbs over the government's recently compiled energy strategy, which is criticized for being inconsistent because it aims to phase out nuclear power generation by the 2030s without terminating a long-standing policy to recycle spent fuel.

Science minister Makiko Tanaka, known for her outspokenness, called the strategy "very contradictory," but national policy minister Seiji Maehara hit back over her remarks, saying she may have been speaking "roughly."

Continuing the policy to reprocess spent fuel and reuse extracted plutonium and uranium as reactor fuel is seen as reflecting the government's consideration of the repercussions on local governments that host related facilities and on the United States, which has close ties with Japan over nuclear businesses.

"The policy intends to pay utmost respect to the stakeholders that have cooperated (with the fuel recycling policy) and to take time for discussion to resolve problems...so I think calling it contradictory is a bit rough," Maehara told a press conference.

By retaining Yukio Edano as the economy, trade and industry minister, who was involved in crafting the strategy, the government indicated that there is no change in its stance to seek to break away from atomic power generation in the wake of the Fukushima Daiichi nuclear power plant disaster last year.

But the pathway toward realizing that goal appears to be unclear by the government's announced intention to continue the fuel recycling program and to allow construction to continue of reactors which already received the approval of authorities.

No nukes in Kaminoseki

October 5, 2012

Edano says no to Kaminoseki nuclear plant project
http://www3.nhk.or.jp/daily/english/20121005_23.html

The head of Japan's industry ministry says it will not allow a power company to start building a nuclear plant in Yamaguchi Prefecture, western Japan.

At a news conference on Friday, Yukio Edano referred to a plan by the Chugoku Electric Power Company to build the plant in Kaminoseki Town.

He said the government's new energy policy rules out new construction of nuclear plants, and that Chugoku Electric's plan is subject to this principle.

The policy adopted last month centers on a pledge to try to end Japan's reliance on nuclear power in the 2030s.

But the government says power companies can restart ongoing plant construction that has been suspended since last year's nuclear disaster in Fukushima.

Edano also said plants that have been offline since the disaster could restart if the nation's new nuclear regulator confirms their safety.

He said that under the policy, plants deemed safe by the Nuclear Regulation Authority are to be used as an important power source.

The position appears to contradict remarks made by the authority's chief Shunichi Tanaka on Wednesday. Tanaka said that although the regulator will judge plant safety, the government and power companies should ultimately seek local consensus before deciding whether to resume plant operations.

What will happen in Yamaguchi?

October 6, 2012

Gov't not to allow new nuclear plant in Yamaguchi: Edano

http://mainichi.jp/english/english/newsselect/news/20121006p2g00m0dm014000c.html

TOKYO (Kyodo) -- The Japanese government will not allow the construction of a new nuclear power plant in Yamaguchi Prefecture, western Japan, in line with its policy of not endorsing the building of new reactors, industry minister Yukio Edano said Friday.

The construction of the nuclear complex by Chugoku Electric Power Co. in the town of Kaminoseki is "subject to the principle of not constructing new reactors," the minister of economy, trade and industry told a press conference.
Despite Edano's remarks, Chugoku Electric filed an application Friday afternoon with the Yamaguchi prefectural government to extend its license, effective for three years and due to expire midnight Saturday, to reclaim the planned construction site.

The utility's application appears to be aimed at advancing construction of the plant at a time when the government's new energy strategy has not been officially adopted.

The government of Prime Minister Yoshihiko Noda decided last month not to allow the construction of new reactors under a new energy policy that aims to end nuclear power generation in Japan in the 2030s. But the Noda Cabinet refrained from officially approving the strategy.

The prefectural government is set to examine the utility's application for around a month but is unlikely to approve extension of the license, sources close to the matter said.

Edano said he had not been informed of the request filed by Chugoku Electric.

In October 2008, Chugoku Electric secured the license from the Yamaguchi prefectural government to landfill the plant construction site in the town on the coast of the Seto Inland Sea, beginning reclamation work in October 2009.

But due to opposition from residents of an island 4 kilometers from the planned nuclear plant site, there has been little progress on construction.

The work came to a halt after the Fukushima nuclear disaster erupted in March last year, following requests from the governments of Yamaguchi Prefecture and Kaminoseki.

Nuclear plants account for 8 percent Of Chugoku Electric's total power generation, the lowest level among Japan's 10 regional utilities excluding Okinawa Electric Power Co., which does not operate a nuclear power plant.

Chugoku Electric President Tomohide Karita has expressed readiness to build the new nuclear power plant, citing the need to supply power stably and tackle climate change.

In December 2009, the utility filed a request with the central government to build two nuclear reactors at the planned Kaminoseki complex, but the state is yet to grant permission.

Utilities hold on to nuclear reactor plans despite minister's remark

http://mainichi.jp/english/english/newsselect/news/20121006p2g00m0dm049000c.html

TOKYO, (Kyodo) -- Economy, Trade and Industry Minister Yukio Edano has made it clear the government will not allow construction of the Kaminoseki Nuclear Power Station planned by Chubu Electric Power Co., underscoring its policy of prohibiting new nuclear power reactors, except those already being built.

But with the policy lacking any legal basis to stop construction, the power company does not appear to be giving up on its preparations. With a general election looming, the utility also appears to be hoping for the formation of a pro-nuclear government that could overturn the no-reactor policy.

After a Cabinet meeting Friday, Edano told reporters, "If any action is taken by Chubu Electric, I will consider a response that will account for it," a remark widely taken to mean he is determined to check any moves for pushing ahead with the construction of the Kaminoseki plant in Yamaguchi Prefecture.

Under a new energy strategy worked out in September, the government of Prime Minister Yoshihiko Noda decided to phase out nuclear power generation in the country in the 2030s and not to allow the construction of new reactors.

A total of 12 reactors are currently planned at new or existing nuclear power stations in Japan. Construction has not yet started at nine of them. They include two reactors at Kaminoseki, a new plant, and two additions at Japan Atomic Power Co.'s existing Tsuruga Power Station in Fukui Prefecture.

Meanwhile, permits were issued for the remaining three reactors in line with the law for regulations on nuclear reactors and materials, with construction of them having already started.

But work has been suspended since March last year when much of the nation's nuclear power infrastructure was halted after the Great East Japan Earthquake crippled the Fukushima Daiichi Nuclear Power Station.

The government is accommodative of allowing the resumption of construction for the three facilities -- Electric Power Development Co.'s Ohma Nuclear Power Plant in Aomori Prefecture, the third reactor at Chubu Electric's Shimane Nuclear Power Station in Shimane Prefecture, and the first reactor at Tokyo Electric Power Co.'s Higashidori Nuclear Power Station.

The prospects of work restarting appear dim at Higashidori, however, because Tokyo Electric is focusing its efforts on keeping its Fukushima Daiichi plant stable.

Despite the industry minister's remark of not allowing construction of Kaminoseki, power companies are reluctant to give up their plans. "We would like to move forward with an unflagging resolve," an official of Japan Atomic Power has said of the company's reactor plan.

Chubu Electric, meanwhile, requested an extension Friday of a reclamation permit at a site planned for the Kaminoseki plant. The utility issued a comment containing the nuanced suggestion that the government has not necessarily decided to stop the construction of the plant. "While the government is engaged in deliberations, (the request for the permit) is intended to keep the status quo for the time being," it said.

Against the backdrop of these utility officials' thinking is perhaps a lack of concrete measures by the government to terminate plans for the reactors altogether.

Issuing a permit for building a nuclear power plant and authorization of a construction schedule have been shifted to the Nuclear Regulation Authority, created in September as a unit of the Environment Ministry, in an overhaul of the government's setup for overseeing the nuclear power industry.

The authority has indicated that it will strictly assess the safety of reactors. Chairman Shunichi Tanaka said, "We stand on a position of withholding any judgment that may have policy implications," a remark suggesting there may be some room left for the government to approve construction of the nine reactors.

The government has also stopped short of solidifying its new energy strategy by issuing a Cabinet decision which would have made the strategy binding even after a government change.

Electric utilities are apparently hoping that the government would make a turnaround and approve reactor construction if the Liberal Democratic Party takes power. Many LDP lawmakers are known to be reluctant to accommodate a policy of eliminating nuclear power.

Host communities of the planned reactors, meanwhile, will likely face a financial pinch as they have been recipients of huge subsidies for the promotion of nuclear power.

The town of Kaminoseki, for instance, has written a budget of around 4.2 billion yen for fiscal 2012 that began April 1. Of that amount, roughly 1.3 billion yen is financed by nuclear subsidy payments.

In the face of imminent financial difficulty, a town official expressed hope for some other measures to be taken for the town's finances. "We have cooperated with the national program for 30 years, and we hope consideration be given to our stand."

Chief Cabinet Secretary Osamu Fujimura at a news conference Friday provided his take on Chubu Electric's request for an extension of the reclamation permit. "I took it to mean they need time to make coordination with various local stakeholders."

Nukes expansion by "fait accompli"?

October 8, 2012

Nuclear industry steamrolls on

http://www.japantimes.co.jp/text/ed20121008a1.html

The government's Sept. 14 new long-term energy policy of "mobilizing all available policy resources to reach 'zero operation' of nuclear power plants in the 2030s" contains various contradictions, including the continuation of efforts toward an operational fuel cycle that makes new nuclear fuel from spent fuel (after extracting plutonium and uranium).

Focus on this cycle likely assumes that today's nuclear power plants will continue operating. It will also result in the accumulation of surplus plutonium, an ingredient of nuclear weapons.

The 40-year limit to be imposed on the operation of a nuclear power plant under the policy is another contradiction. The day after the policy was announced, trade and industry minister Yukio Edano said that suspension of the construction of three nuclear power plants would be lifted. This means that these plants' reactors will remain online at least into the 2050s. Mr. Edano's statement soon had an effect. On Oct. 1, Electric Power Development Co. (J-Power) resumed construction of its Oma nuclear power plant in Oma, Aomori Prefecture.

This is the first case of nuclear plant construction resuming since the accident at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Work on the Oma plant started in May 2008, but was suspended when the massive earthquake hit the Pacific coast areas of the Tohoku region on March 11, 2011.

Given the 40-year operation rule, the resumption of the construction of the Oma plant clearly contradicts the government's policy of ending nuclear power generation in the 2030s. J-Power President Masayoshi Kitamura made it clear that completion of the Oma plant will be in the middle of 2016 at the earliest, at least 1½ years later than scheduled (November 2014).

The government should put itself on an unambiguous zero nuclear path, as desired by a majority of the public.

Recent developments, including the resumption of the construction of the Oma plant and the Noda Cabinet's failure to officially endorse the new long-term energy policy, hint at the possibility that the government and the power industry will try to continue and expand nuclear power generation by *fait accompli*.

After the Fukushima nuclear crisis, the government decided to expand the urgent protective action planning zone in the event of a severe nuclear power plant accident from the traditional 8-to-10-km radius from a nuclear power plant to a 30-km radius.

Hakodate City, within 30 km of the Ohma nuclear power plant, is against the resumption of the plant's construction and plans to file a lawsuit to stop it. The plant will be the world's first nuclear power plant that will operate solely using MOX fuel (containing a blend of plutonium and uranium).

Since the Nuclear Regulatory Commission has not yet worked out new, post-Fukushima safety standards for nuclear power plants, it must be asked why J-Power has decided to resume construction now.

Jizo as Japan's guide

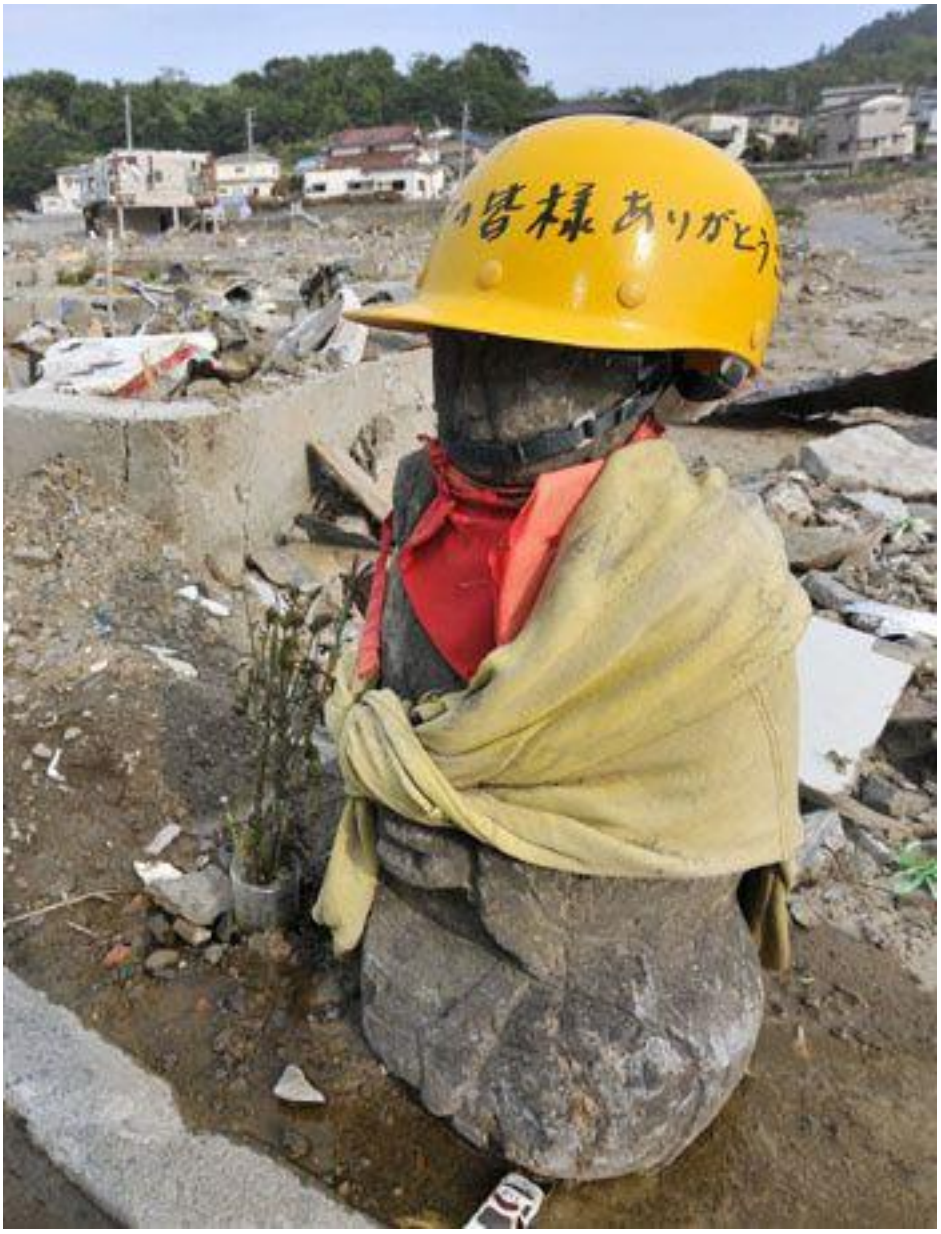
October 9, 2012

Let Inoue's antinuclear Jizo, forged in Hiroshima, guide Japan's future

http://www.japantimes.co.jp/text/fl20121009hn.html

Dear Prime Minister Yoshihiko Noda,

Man for the moment: A statue of Jizo, protector of children and travelers, stands at a roadside in the town of Onagawa, Miyagi Prefecture, three months after the March 11, 2011, disasters. A message on his helmet reads "Thank you, everyone."
KYODO



Around the time of the recent anniversaries in Hiroshima and Nagasaki, I began reading writers' accounts and treatments of the atomic bombings. I came across Hisashi Inoue's play "The Face of Jizo."

Inoue was born in Yamagata Prefecture. In some of his other works he dealt with the issue of Tohoku people who moved to Tokyo in desperate search of work.

He first got the idea to write "The Face of Jizo" in the early 1960s when he was working for NHK and was sent to Hiroshima for a summer to cover the antinuclear movement. The play did not premiere until 1994. Inoue died on April 9, 2010.

The play is about a young woman, Mitsue, who survived the Hiroshima bombing but feels conflicted and guilty that she lives while her family and friends perished. Due to this emotional state she is unable to move forward.

Her father, Takezo, was amongst those close to her who died. Takezo's ghost visits Mitsue and encourages her to move on with her life. Specifically, he urges her to let herself fall in love with Kinoshita, a young academic who expresses an interest in Mitsue. Takezo also relays to his daughter her responsibility to tell the next generation about the horrors of the bomb, so that humanity does not repeat history.

Takezo is a manifestation of Jizo, the Buddhist deity known as the protector of children. The title of the English translation alludes to a scene in which Mitsue recognizes the similarity between a Jizo statue with half its face melted away and her father's face that was burnt by the bomb. Thus, an antinuclear message runs through the story that employs a symbol advocating for the protection and wellbeing of children.

These two points bring to mind the disturbing news reports that I've been reading this summer. Namely, the reopening of schools that were not too long ago inside the designated evacuation zone around the Fukushima No. 1 nuclear plant. Children's safety should be the No. 1 priority in this situation. But instead of taking precautions, Japan is still pushing to export nuclear power in Southeast Asia, in areas critics believe are susceptible to natural disasters.
In regards to nuclear weapons, a decision has been made to revise the Atomic Energy Basic Law with an added new principle stating that nuclear power will "contribute to national security," which some claim will pave the way for the nuclear armament of Japan.

As mentioned above, Jizo is believed to look after children, and Inoue fashioned a unique antinuclear Jizo. Statues of Jizo are the most prevalent Buddhist iconography found in contemporary Japan. They are placed just about everywhere — on roadsides, mountain paths, riverbanks, seashores and, of course, inside temple precincts.

I think, Prime Minister, that these statues serve well as constant reminders for government officials and society as a whole to act responsibly and keep in mind the generations to come. Being everywhere, they cannot be avoided, just like the issues right in front of us cannot be ignored.

Japan is at a crossroads and we are all wondering which way she will choose to proceed. The other popular role of Jizo is as the guardian of travelers. Will Inoue's antinuclear Jizo be allowed to serve as Japan's guide?

JASON BARTASHIUS
Kyoto

Japan faces important challenges - Nuke phase-out "irresponsible" says Abe

October 10, 2012

Abe lambasts Noda's nuclear phaseout plan as "irresponsible"

http://mainichi.jp/english/english/newsselect/news/20121010p2g00m0dm027000c.html

TOKYO (Kyodo) -- Main opposition Liberal Democratic Party leader Shinzo Abe on Tuesday lambasted the government of Prime Minister Yoshihiko Noda for its plan to phase out the nation's nuclear power plants in the 2030s as "irresponsible."

Abe's remarks were aimed at rebuilding a close relationship with Japan's most influential business lobby, which has argued that the policy would lead to higher electricity prices and deal a serious blow to the broader economy.

"Responsible action is necessary. We'll reduce the percentage of nuclear power plants, but we don't hold the view that we'll reduce (dependency on nuclear energy) to zero," Abe told a meeting with business leaders, including Hiromasa Yonekura, chairman of the Japan Business Federation, known as Keidanren.

Yonekura in a rare move met with the newly elected opposition leader before having talks with Noda, who reshuffled his Cabinet just last week in the run-up to the next general election, which must be held by next summer.

At the outset of the meeting, Yonekura said, "Our country is facing many important challenges, such as overcoming deflation and reviewing our energy policy."

Regarding foreign policy, Yonekura said Japan's tensions with China and South Korea have been rapidly growing and that the deteriorating relations between Japan and China "have been significantly affecting" Japanese business activities.

Abe responded, "In diplomatic negotiations, it is most important to build consensus through close talks on politics and economy."

The LDP is trying to gain support from the business world ahead of the next general election. Abe vowed Tuesday to bolster the nation's flagging economy, saying, "We have to obtain a strong economy to restore Japan."

But the leading opposition party is opposed to Japan's entry into the U.S.-led Trans-Pacific Partnership free trade talks that Keidanren wants the government to join, blurring the outlook of their ties.

LDP Vice President Masahiko Komura and Secretary General Shigeru Ishiba were also present at the meeting.
Later Tuesday, Ishiba said at a press conference that Abe plans to meet the other opposition parties on Thursday and hold a meeting of all opposition leaders, as he looks to coordinate efforts to force Noda to dissolve the House of Representatives.

In August, Noda, former LDP chief Sadakazu Tanigaki and Natsuo Yamaguchi, head of the LDP's ally the New Komeito party, agreed to enact legislation for a tax hike and social security reforms in exchange for a promise from Noda to call a general election "sometime soon."

Yonekura told reporters after meeting with Abe, "Cooperation between the ruling and opposition parties is necessary for policy decisions."

Unless Noda makes good on the promise with the two main opposition parties, he could face difficulties in steering proceedings in the Diet, Yonekura said, indicating he hopes that the premier will call a general election soon.
Opposition support is required for the government to secure passage of any legislation in the current divided Diet, in which the ruling bloc lacks a majority in the House of Councillors.

Noda, however, is believed to be delaying dissolution of the more powerful lower house as long as possible, given that public support for his Cabinet has fallen to below 30 percent, due in part to his unpopular move to double the 5 percent sales tax rate by 2015.

Japanese nuke industries need foreign business desperately

October 16, 2012

Lithuanian vote against nuke plants casts shadow on Japan reactor makers' strategy

http://mainichi.jp/english/english/newsselect/news/20121016p2a00m0na013000c.html

Lithuanians have voted against building new nuclear reactors in a non-binding referendum, forcing the likely contractor for the project Hitachi as well as Japan's two other major nuclear reactor makers to reconsider their strategy in vital foreign markets.

With the Japanese government aiming for the elimination of nuclear power in this country by the 2030s, foreign customers have become essential to the survival of the nuclear technology businesses at Hitachi, Toshiba Corp. and Mitsubishi Heavy Industries.

Reacting to the Lithuanian referendum, Hitachi on Oct. 15 stated that "the anti-nuclear project result is regrettable." Hitachi and the Lithuanian government reached a provisional agreement in March this year on the construction of an Advanced Boiling Water Reactor (ABWR)-based power plant. ABWRs are revised version boiling water reactors like those at the disaster-stricken Fukushima No. 1 nuclear plant, with the changes -- including the installation of an internal coolant pump actually inside the reactor pressure vessel -- focused on improved safety.

Under the plan for its nuclear power business released in June this year, Hitachi stated it was aiming to boost foreign sales to account for some 50 percent of total sales by fiscal 2020. The plan foresaw using the successful sale to Lithuania to leverage lucrative foreign nuclear technology sales and boost Hitachi's overall sales to some 360 billion yen annually -- more than twice the figure for fiscal 2011.

This month, however, the Lithuanian reactor agreement -- which had already been approved by that country's parliament in June -- was put to a referendum in tandem with parliamentary elections. In the wake of the election, it looks most likely that a coalition of opposition parties calling for a rethink of the Hitachi deal will form the next government.

"We will do our utmost to cooperate with the new parliament as needed," a Hitachi representative stated, but should the opposition group take power, it is very possible that Lithuania could reconsider the entire reactor agreement. What's more, Lithuania is unlikely to be an isolated case. A zero-nuclear policy is gaining traction world-wide, and the ground beneath Japan's reactor makers' global sales strategy could shift significantly.

Meanwhile the nuclear unit of Toshiba, an affiliate of United States nuclear reactor maker Westinghouse Electric Co., is shooting for sales of 1 trillion yen in fiscal 2017 through deals in Turkey and other nations. Mitsubishi Heavy Industries, too, is hunting down foreign clients, partnering with France's Areva on the

development of a mid-sized 1.1 million kilowatt-capacity reactor and shooting for a plant contract in Jordan. Mitsubishi Heavy is projecting fiscal 2014 sales of 400 billion yen for its nuclear business -- 1.6 times the amount for fiscal 2010.

Hitachi, Toshiba and Mitsubishi Heavy, however, are not the only competitors in what could be a shrinking global market. South Korea, Canada and China are also bidding on the Turkish contract coveted by Toshiba, while Mitsubishi is facing a Russian challenge in Jordan. Both Toshiba and Mitsubishi Heavy are sure to be watching the Lithuanian situation carefully.

So what's the score with nuclear power?

October 17, 2012

Give nuclear power a larger role

http://www.japantimes.co.jp/text/eo20121017sf.html

By SHINJI FUKUKAWA

Roughly a year and a half after the Great East Japan Earthquake, the Japanese government at a Cabinet meeting on Sept. 19 adopted its basic policy on new energy and environment strategies crafted as a response to the Fukushima No. 1 Nuclear Power Plant accident. The government had initially intended to give Cabinet endorsement to the "Innovative Energy and Environment Strategy" adopted earlier by Cabinet ministers concerned, which called for ending nuclear power plant operations by the end of 2030s.

Faced with strong objections from business circles, certain Western governments and local governments hosting nuclear plants, however, the Noda Cabinet ended up issuing a vague statement saying that, on the basis of the strategy, it will hold "responsible discussions with local governments concerned and the international society and, while seeking public understanding, carry out (the strategy) with flexibility, constant examination and review." In the eyes of people, the conclusion appeared to reflect the government's wavering position on the issue.

Still, Prime Minister Yoshihiko Noda emphasized that he has not deviated from the policy of nuclear phaseout by the end of 2030s, and his Democratic Party of Japan will likely stick to that position to maximize its chances in the next general election, to be held "in the near future."

I have several doubts about the plan itself. In the first place, the plan fails to take into account changes in the global energy structure. In fact, the Fukushima nuclear accident raised strong doubts about Japan's previous policy course, which attempted to resolve the problems of energy shortage and global warming through the expanded use of nuclear energy. Following the Fukushima accident, Germany, for example, made a decision to phase out nuclear power generation by 2022.

The International Energy Agency (IEA), however, predicts that the world's energy demand will grow by about one-third from the current level over the 2010-2035 period. It points to the need to ensure an adequate energy supply through an appropriate mix of natural gas, atomic power and renewable sources to cope with an estimated increase in demand for oil as automobile usage rises in emerging economic powers such as China and India.

In the United States and Canada, efforts to exploit vast shale oil and shale gas deposits are mounting. Some people suggest the U.S. will become a key energy supplier, which in turn would help it achieve an economic revival. Despite the presence of these resources, the U.S., given the global energy outlook, has not changed its policy of maintaining nuclear power generation. France at one point considered reducing its dependence on nuclear power, but in recent years has deepened its technological confidence in nuclear energy. China, South Korea and Taiwan, for their part, are stepping up efforts to improve safety of nuclear power as a key pillar of a low-cost energy supply.

The world's energy structure is thus moving in a direction different from what is being envisioned by the Japanese government. Under such circumstances, it seems obvious that Japanese industries will be at a disadvantage in the global economic competition.

Second, the plan gives no consideration to the need for an optimum structure of energy supply. Nobody disputes the idea of raising the nation's reliance on renewable energy sources, but the problem is that renewable sources cost more than fossil fuels and nuclear power, and are less stable in terms of output because they will be subject to changes in natural conditions.

To compensate for these problems, development of new technologies will be needed, such as more powerful batteries or the smart city. This will require huge investments and a long period of development. Even if more efficiency is achieved in energy use, fossil fuel prices will remain high due to finite resources.

The government, the Diet, the private sector and Tokyo Electric Power Co. have so far tried to determine the causes of the Fukushima plant accident, but their analyses have not been able to fully expose what actually triggered the disasters. Still, because there is extensive international cooperation on nuclear safety taking place, it is possible that Japan's nuclear power plants will be able to operate safely. Therefore, it is possible to create an optimally varied energy structure. Its wordings aside, the energy plan of the government and the DPJ takes an essentially conservative position.

Third, the government has taken a populist approach in the process of formulating the policy. In the process, the government created three scenarios — in which Japan's reliance on nuclear power in 2030 will be either zero percent, 15 percent or 20-25 percent — and solicited opinions from the public. In a debate-style opinion survey held as part of the effort, 46.7 percent of the people polled favored the "zero" scenario, 15.4 percent picked the "15 percent" course and 13 percent favored the "20-25 percent" choice. The result suggested that much of the general public rejected the dependence on nuclear power due to safety concerns.

A country's energy policy is built on multiple components and should therefore have flexibility. If those in power sound out public opinion solely on nuclear energy, which is just one component of the policy, and on the basis on that make a decision on the energy policy as a whole, their very existence as politicians would be called into question.

Energy policy constitutes the basis of economic management, industrial activities and stable living conditions. The new policy of the government and the ruling party could weaken Japan's industrial competitiveness, lower its growth potential, increase unemployment and raise the cost of living. My hope is that the government's plan will be put to a serious review in the next Lower House election.

Shinji Fukukawa, formerly vice minister of the Ministry of International Trade and Industry (now the Ministry of Economy, Trade and Industry) and president of Dentsu Research Institute, is senior advisor for the Global Industrial and Social Progress Research Institute in Tokyo.

Passing the buck on nuclear power

http://www.japantimes.co.jp/text/ed20121017a1.html

The government's irresponsible attitude toward nuclear power generation is becoming clear. It seems that the government does not want to pursue concrete steps to reduce and eventually end the nation's reliance on nuclear power despite its new long-term energy policy under which it is supposed to utilize all the available policy resources to achieve "zero operation" of nuclear power plants in the 2030s. This attitude is exemplified by its readiness to accept the resumption of the suspended construction of new nuclear power plants. Because a 40-year operation limit will be imposed on nuclear power plants, the resumption of the construction of those plants means that they will remain online at least into the 2050s.

On the other hand, it seems that the government does not want to be involved in any political decisions concerning the restart of existing nuclear power plants, which in the future will have to pass the new post-Fukushima safety standards that are being drawn up by the newly established Nuclear Regulatory Authority. The NRA is expected to finish writing the new safety standards, which will subject even existing nuclear power plants to the latest technological progress, by July 2013.

At present only two of Japan's 50 nuclear power reactors are online. Clearly the government does not want to make decisions that will anger the majority of citizens who want Japan to phase out nuclear power. There is the possibility that even while the government refrains from making any concrete decisions in either direction, the power industry will restart nuclear power plants one after another. **This will be a typical example of faits accomplis being achieved in the absence of responsible actions by the government.**

NRA Chairman Shunichi Tanaka has made it clear that the job of the NRA is only to determine whether individual nuclear power plants meet the safety standards and that a decision on whether to approve the restart of particular nuclear power plants on the basis of such factors as supply and demand of electricity and economic considerations should be made by power companies owning nuclear power plants or by a government ministry or agency in charge of energy policy. He apparently fears that the NRA will be exposed to political pressure, including from the power industry, if it has to make a decision related to the restart of specific nuclear power plants.

In response to Mr. Tanaka's statement, Chief Cabinet Secretary Osamu Fujimura reiterated a provision in the new long-term energy policy that nuclear power plants whose safety is confirmed will be utilized as an important source of electricity for the time being. He also said that a ministerial conference like the one held in restarting the Oi reactors in Fukui Prefecture will not be held in the future to approve the restart of a particular nuclear power plant.

Given the government's attitude, it is very likely that nuclear power plants will be restarted only if they pass the NRA's scrutiny and power companies get approval from local governments concerned. The central government's current policy of passing the buck will only deepen the public's suspicion over its nuclear power policy.

Japan refuses to make nuclear weapons illegal

October 19, 2012

Japan will not join initiative put before U.N. to make nuclear weapons illegal

http://www.japantimes.co.jp/text/nn20121019a6.html

Kyodo

Japan will not join an initiative led by 16 countries at the United Nations to make atomic weapons illegal, out of concern it would affect Tokyo's security arrangement under the U.S. nuclear umbrella, government sources said Thursday.

The 16 nations drafted a statement for submission to the First Committee of the U.N. General Assembly that calls on all states to "intensify their efforts to outlaw nuclear weapons and achieve a world free of nuclear weapons," and asked Japan to endorse it earlier this week.

The 16 countries include Austria, Chile, Costa Rica, Denmark, Holy See, Egypt, Indonesia, Ireland, Malaysia, Mexico, New Zealand, Nigeria, Norway, the Philippines, South Africa and Switzerland.

Japan, the only country to have ever come under nuclear attack, isn't backing the initiative because the delegitimizing of atomic weapons would contradict its reliance on the extended U.S. nuclear deterrence, the sources said.

The National Defense Program Guidelines, which were last updated in 2010, say that "as long as nuclear weapons exist, the extended deterrence provided by the United States, with nuclear deterrent as a vital element, will be indispensable."

In the draft joint statement on the humanitarian dimension of nuclear disarmament, a copy of which was obtained by Kyodo News, the 16 countries said they are "deeply concerned about the humanitarian consequences that any use of nuclear weapons would have."

Referring to "the horrific consequences" of the use of nuclear arsenals, made clear by the suffering caused by the U.S. atomic bombings of Hiroshima and Nagasaki in 1945, the 16-nation group said the only way to guarantee that such weapons are never used again is "the total, irreversible and verifiable elimination of nuclear weapons."

As members of NATO, Norway and Denmark are also under the U.S. nuclear umbrella.

At a preparatory committee meeting in Vienna for the Nuclear Nonproliferation Treaty Review Conference this spring, the 16 nations issued a similar statement. But they did not request Japan's support for the document at that time, according to the sources.

Blame it all on complacency and corruption?

The case for nuclear power

http://www.japantimes.co.jp/text/eo20121023gc.html

By GREGORY CLARK

The Fukushima No. 1 nuclear plant disaster has made Japan reconsider the role of nuclear power in its future. But for some reason we hear little about the non-disaster at the nearby Onagawa nuclear plant. What did not happen at Onagawa during the March 11, 2011, earthquake and tsunami events could be much more relevant to Japan's nuclear power future than what happened at Fukushima.

The ocean-facing Onagawa plant was considerably closer to the earthquake epicenter off the Tohoku coast than was the Fukushima plant — 130 km versus 180 km. Earthquake and tsunami destruction in the area was far worse; the nearby town of Onagawa and city of Ishinomaki had over 4,800 people killed or missing. But the plant and its three reactors came through virtually unscathed; it even provided refuge for those fleeing the destruction in surrounding villages.

Onagawa survived thanks to basic commonsense. Its 14.7 meter sea wall was designed to protect it from the worst anticipated tsunami. Its strong foundations allowed it to survive a one-meter earthquake-caused site subsidence; a subsequent IAEA inspection group was amazed at the lack of structural damage. Enough of its various electricity power sources survived to allow it to pump in the water needed to put all its reactors into cold shutdown. Somehow this plant operated by the regional Sendai-based Tohoku Electric company was able to survive better than the Fukushima No. 1 plant run by the elitist Tokyo Electric Power Co.

Tepco's failings have already been listed in the several reports on the 3/11 disaster, in particular its arbitrary dismissal of a tsunami danger warning made only four years before the event. Some also like to blame earthquake damage. But the Onagawa plant survived the same earthquake. So too did the Fukushima No. 2 plant; Japanese engineers now have the skills to make nuclear plants reasonably earthquake proof.

Tepco's ability to brush off tsunami warnings has to be blamed on the bureaucratic complacency and *amakudari* corruption that seems to affect most large business and government organs in Japan, especially when they are based in Tokyo. All of Tepco's vice presidents and many of its other top people over recent years have been amakudari implants from government ministries, with little knowledge of nuclear power.

Media studies on Onagawa's survival give much of the credit for Onagawa's survival to the late Yanosuke Hirai, a former Tohoku Electric vice president. He had checked past tsunami records and forced through the decision to build the sea wall higher than originally planned. Earlier he had saved a large Niigata thermal plant built on soft ground from destruction in the powerful 1964 earthquake there, by insisting the plant be built on caisson foundations.

Interviews with former subordinates show a man with a strict sense of responsibility who realized that bureaucratic regulations alone would not guarantee safety. He resembled Kotaku Wamura, the former mayor of the small Tohoku fishing port of Fudai, who, remembering the damage from previous tsunami, battled bureaucratic and cost-cutting opposition to build the 15.5 meter seawall and floodgate. Fudai alone was saved from the destruction that wiped out all other fishing ports in the area.

Meanwhile what had been going on at Tepco? Despite the record of very destructive tsunamis along the Tohoku coast for centuries and even in recent years, the Fukushima No. 1 plant had been placed near sea level, protected only by a 5.7 meter seawall. The engineer involved has revealed that Tepco had decided it could save construction costs that way.

Hirai pointed out that nuclear plant construction should not be left to the electric companies. Inevitably they would compromise safety by trying to cut costs. Today people call for increased regulation and government control. But that is unlikely to improve things. In Japan's collectivist society it is too easy for the regulators to collude with the people they are supposed to regulate. A tight exclusivist nexus develops and is impervious to criticism. Besides, and as Hirai pointed out, regulators tend to concentrate on rules rather than contingencies.

If Japan decides to stay with nuclear power — and the arguments in favor are strong — then it should study how France goes about selecting and training the people for its very successful government-controlled Electricite de France nuclear-power subsidiary. True, France has the advantage of a better educated and rounded elite. But the key to EDF's success is its autonomy; its status comes not from its balance sheet or bureaucratic power but from its ability safely to service 75 percent of France's electricity needs. It even manages to service Italy and Germany, which are rejecting nuclear power.

Rejecting nuclear power means Japan will miss some of the technological and safety advances that nuclear power-committed societies like France and China will enjoy. But that is not all. Scientists agree that hydrogen fusion is the safe power source of the future. In the International Thermonuclear

Experimental Reactor committee set up to decide location for the first experimental fusion plant Japan has already lost out to France. And now in the wake of the Fukushima disaster a Japanese advisory panel has called on the government to cut funding for the international project altogether. Japan's current nuclear power allergy is understandable. But does it really need to drop out of the race to fusion power?

A world free of nuclear weapons?

October 23, 2012

Japan shies away from 16-nation plan to outlaw atomic weapons

http://www.japantimes.co.jp/text/nn20121023a5.html

Kyodo

The government on Monday said it will not join an initiative launched by 16 members of the United Nations calling for efforts to outlaw nuclear weapons because it would affect Japan's security alliance with the United States.

A statement drafted by countries including Switzerland and Norway seeking efforts to outlaw nuclear weapons is slated to be submitted to the First Committee of the U.N. General Assembly in New York as early as Monday.

"We have decided to refrain from participating" in the initiative, Senior Vice Foreign Minister Kazuya Shinba told a news conference, adding that it "isn't necessarily consistent with our country's national security policy."

A senior Foreign Ministry official said it is "indispensible to ensure deterrence under Japan-U.S. security arrangements, including (that provided by) nuclear weapons, if you take Japan's security environment into account."

The draft statement, a copy of which was obtained by Kyodo News, calls on all states to "intensify their efforts to outlaw nuclear weapons and achieve a world free of nuclear weapons."

Nukes a "n"cessary evil"?

October 23, 2012
JAL Chairman Inamori backs nuclear energy as necessary evil

http://mainichi.jp/english/english/newsselect/news/20121023p2a00m0na006000c.htm

Kazuo Inamori, chairman emeritus of Japan Airlines Co. (JAL), says a society free of nuclear power is ideal, but Japan needs to rely on nuclear plants for the time being to maintain and improve its high-level lifestyle.

Despite a great desire and hope that Japan should end nuclear power generation in the 2030s, Inamori said nuclear power is a "necessary evil" for the country, where in the past much nuclear data and problems such as nuclear waste have been hidden from the public.

Inamori, 80, who founded Kyocera Corp. and also helped establish KDDI Corp., said he has championed solar energy but has found that solar energy is unlikely to become a major player in domestic power production.

"Unfortunately and sadly, nuclear energy is a necessary evil that we must deal with," he told an Oct. 23 news conference at the Foreign Correspondents' Club of Japan (FCCJ). The chairman added that with regard to nuclear power, which has come under public scrutiny in the wake of the disaster at the Fukushima No. 1 nuclear plant, "everything should be disclosed to the public honestly."

One of Japan's most prominent business leaders, Inamori also elaborated at the news conference on how he and his JAL team revived the former national flag carrier after assuming the chairmanship in January 2010. JAL has been successful in rehabilitating itself though such factors as Inamori's services without remuneration and the establishment of a management philosophy to change the bureaucratic nature of the airline's leadership structure. The welfare of employees has also been prioritized as JAL has emerged from its collapse in 2010 to be relisted on the Tokyo Stock Exchange in September this year.

Inamori further stated that Kyocera's philosophy is a good fit in China, where the ceramics maker has three factories and several thousand employees. None of the employees joined recent anti-Japan protests over the Senkaku Islands dispute, he added. (By Shiro Yoneyama, Staff Writer)

Do you have doubts?

Doubts cast over Japan nuclear phase-out

By Jonathan Soble in Tokyo
October 23, 2012 2:26 pm

It has only been a month since Japan declared that it would close down its nuclear industry by the end of the 2030s, but already a contentious plan to complete several partially built reactors is sowing doubts about the government's commitment to the radical policy shift.

The facilities – stretching from the northern tip to the southwestern part of the country – were approved years before the triple meltdown in Fukushima in March last year, but construction had been frozen following the disaster. The decision over their fate is seen as a test of just how serious Japan is about abolishing an industry that had been the source of 30 per cent of its electricity.

In the weeks since the nuclear phase-out was announced, Yukio Edano, industry minister, has said three approved but unfinished reactors are exempt from a central provision of the phase-out policy, under which no new plants will be built. Electric Power Development, the utility that owns one of the facilities, responded by saying it plans to resume work this year, with an eye to beginning electricity production some time after 2014.

Iida Tetsunari, a leading anti-nuclear activist, called the decision "insincere politics" that was "clearly against the principle" of ending nuclear power. The Mainichi newspaper, a national daily, said: "Many people must surely feel as though they've been tricked by a fox."

Some sceptics had already dismissed the phase-out announcement as empty pre-election rhetoric. The target date was vague, and within days the cabinet of Yoshihiko Noda, prime minister, backtracked over implementation. Under pressure from pro-nuclear business groups, it resolved to act "flexibly" and with "constant verification and revision" – hedges that might keep the nuclear industry in business indefinitely.

It remains unclear exactly how many new reactors might be completed in practice. One of the three approved units, at Higashidori nuclear station, located on the remote northern tip of Japan's main island, is owned by Tokyo Electric Power, the disgraced and financially crippled operator of the Fukushima plant.

Construction is only about 10 per cent completed, and Tepco's problems make prospects for a resumption dim, according to government officials and analysts.

Electric Power Development's facility, in the village of Oma not far from Higashidori, is about 40 per cent finished, while the most advanced, Chugoku Electric's Shimane plant in southwestern Japan, is more than 90 per cent built and was supposed to have started operating this year.

Chugoku has not revealed its plans for the facility, but has been consulting local politicians over restarting work.

In theory, it is possible to reconcile finishing the plants with the gradual phase-out envisioned by the new energy policy. Japan has 50 reactors already in service, and they are to be used while the country develops alternative energy sources such as solar and wind power. Supporters of the partially built plants argue that they will contain the latest, safest technology, and scrapping them now would mean writing off the tens of billions of yen already sunk into construction.

However, Kenichi Oshima, a nuclear policy expert at Ritsumeikan University, says uncertainties about the future cost of operating nuclear plants in Japan weaken the economic case for more atomic power. "There will be more costs for safety upgrades, and no one knows what kind of insurance system is going to be put in place. These things will make a big difference to generating costs."

Since it takes about 40 years for a reactor to recoup its initial building costs, switching off the new plants in the 2030s, around two decades before the end of their normal operating lifespans, would mean accepting major investment losses – something a future government might be unwilling or unable to impose on utilities. "Basically, building these reactors would mean reversing the nuclear phase-out," Mr Oshima says.

Allowing Oma and Shimane to go ahead could also open the door to more plants being built. Nine other reactors were in various stages of planning before Fukushima, and while the government has said they will not be constructed, some pro-nuclear local leaders have continued to push.

The governor of Fukui prefecture, a western area with a big nuclear industry, has recently stepped up lobbying for two planned reactors in his jurisdiction that had been close to receiving final approval before the accident. Higashidori's village council has appealed for construction on its reactor to resume over fears for the local economy.

The phase-out plan could recede even further if Mr Noda's Democratic party of Japan is ousted in an election early next year, which polls suggest is likely. The opposition Liberal Democrats nurtured the nuclear industry for decades when they were in power, and are more sceptical towards renewable energy.

The main roadblock to building could come from other local governments. Towns and villages that host nuclear plants receive generous state subsidies and tend to support the industry, even after Fukushima, but their unsubsidised neighbours are often less keen.

In northern Japan, the mayor of Hakodate city, located across a narrow strait from Oma on the island of Hokkaido, has threatened to sue to prevent construction from resuming. On a visit to Tokyo to complain to the government this week, he told reporters: "The decision to permit construction is based on a pre-Fukushima safety myth."

Why Japan shouldn't drop nukes

Gov't hits deadlock over energy plan as experts cite inconsistencies in nuclear stance

http://mainichi.jp/english/english/newsselect/news/20121026p2a00m0na015000c.html

The government's efforts to draw up a new basic energy plan in the wake of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant have come to a deadlock.

Economy, Trade and Industry Minister Yukio Edano is eager to complete the plan by the end of this year to make it an important point of contention during the upcoming House of Representatives election. However, an experts' panel on energy has refused to deliberate on the plan, saying the government's policy is so unclear that they cannot discuss it.

The work to draw up the new energy plan remains up in the air as lawmakers from the ruling Democratic Party of Japan (DPJ) are split between those seeking to eliminate nuclear power by the 2030s and those promoting nuclear energy.

The government was to draw up the basic energy plan based on its Innovative Strategy for Energy and the Environment, which was worked out in September and proposed the shutdown of all nuclear plants in the 2030s.

However, the Fundamental Issues Subcommittee of the Advisory Committee for Natural Resources and Energy pointed out on Sept. 18 that there were inconsistencies in the strategy. Specifically, the subcommittee recognized the government's intention to approve the operations of nuclear plants already under construction while at the same time seeking to get rid of nuclear power stations by the 2030s as problematic.

Akio Mimura, chairman of the subcommittee, declared that it would not deliberate on the new basic energy plan until the inconsistencies were eliminated. "The government's strategy lacks consistency. Its goal is vague," he said. Since then, the panel has not held a meeting.

The Innovative Strategy for Energy and the Environment is equivocal as it appeals to both pro- and anti-nuclear power legislators within the ruling party.

Edano had emphasized that the strategy is consistent, but has failed to provide a convincing explanation to Mimura.

Still, Edano, who wants to make the zero nuclear plant policy a major campaign issue at the next general election, has told his aides that he wants to make sure that the basic energy plan will be completed within this year.

"I'd like you to coordinate views among party members on the basic plan and pressure the panel to open deliberations," he recently told DPJ policymakers, but the policymakers did not take any action.

A DPJ legislator said he believes DPJ Policy Research Committee Chairman Goshi Hosono blocked the move.

"Hosono is skeptical of eliminating all nuclear plants because it could have negative impacts on the economy. So he apparently didn't negotiate with panel members to open deliberations," the legislator said.

Edano told a news conference on Oct. 19 that he will convene the subcommittee in the near future to deliberate on the basic plan. However, even if such a meeting is held, there is no prospect that discussions on the details of the plan will progress.

One of the panel members reacted coolly to the move.

"The party appears to be trying to incorporate a 'zero nuclear plant policy' into the basic plan as a kind of catch phrase for its election campaign. But it's impossible to work out the details of something that's unclear," the member said.
Speculation is spreading within the government that Mimura intends to boycott any panel meeting until the largest opposition Liberal Democratic Party regains control of the government following the next lower house election and the government resumes its pro-nuclear power policy. 'Fresh Currents' charts the way to, and from, Fukushima

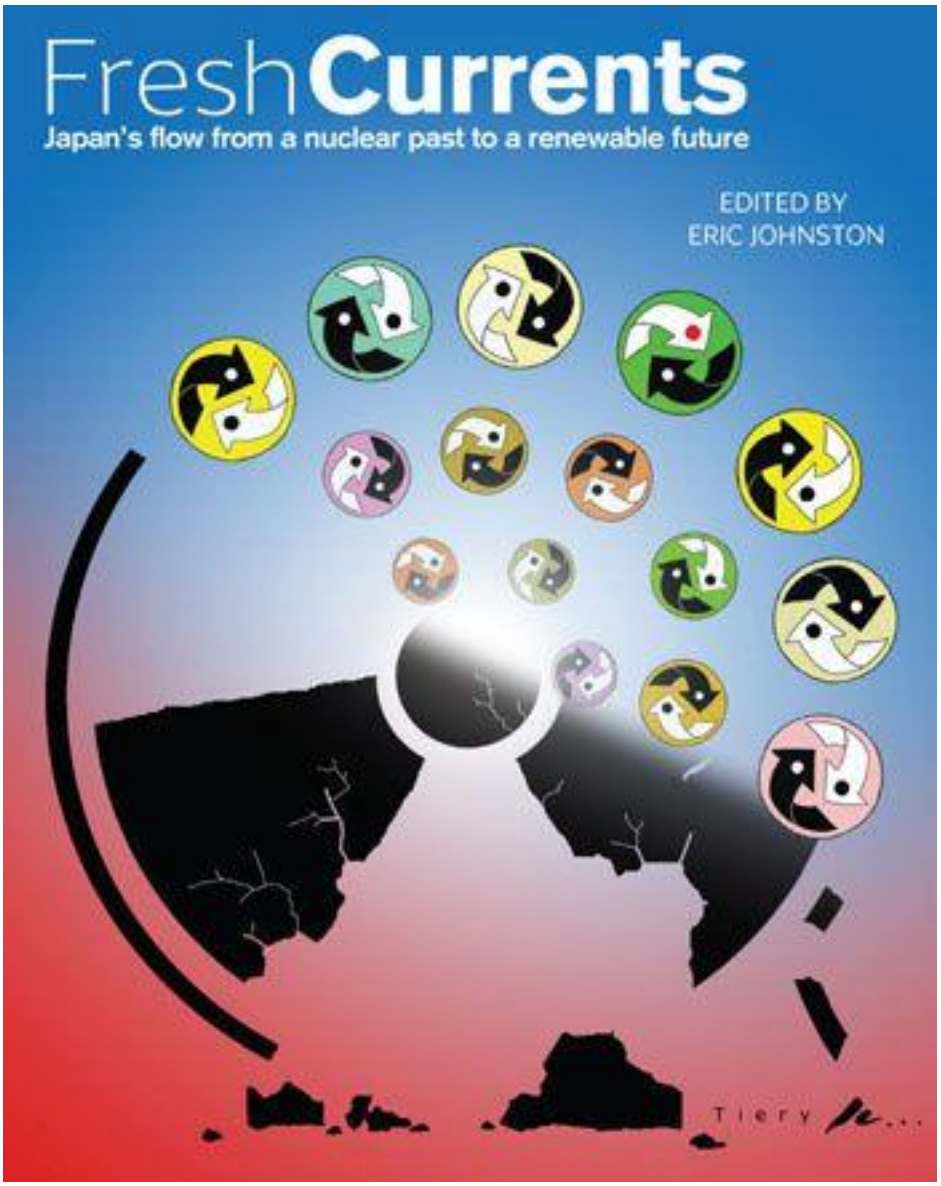
By STEPHEN HESSE
http://www.japantimes.co.jp/text/fe20121028sh.html

This month's column is about a book that is very much more than just a book: It is a work of art, a labor of love and a realizable dream of a better future for Japan. But I'm getting ahead of myself ...

Labor of love: This work, whose cogent words are accompanied by beautiful visuals, presents in the clearest of terms a realizable, much-improved future for Japan. It is the fruit of a Kyoto Journal team effort by more than a dozen volunteer writers and others. COVER DESIGN BY TIERY LE...



A fortnight ago, on Oct. 12, Tokyo Electric Power Company's internal-reform task force admitted that the ongoing disaster triggered by the March 11, 2011, Great East Japan Earthquake at the Fukushima No. 1 nuclear power plant it operates was avoidable and that necessary "preparations were not made in advance."

Sadly, human error, acts of nature, and combinations of the two will always be to blame for tragedies that leave us pondering, "Why? "What if?" "If only ..."

In the lyrical wisdom of Elvis Costello, as a track title on his 1979 album "Armed Forces" cautions, "Accidents Will Happen."

Given this immutable truth, Japan has limited options regarding its energy future: To accept the status quo and the cronyism that taints its government-industry relations, leaving energy policy in the hands of those who prioritize political gain; or to pursue national energy security that puts a priority on safety and on sharing the costs and benefits, financial and technological, across all of the nation's regions and residents.

In a nutshell, Japan can either remain nuclear, with all the dangers that portends for these islands perched on the Pacific Rim of Fire — or it can pursue policies that foster and reward dramatic increases in energy conservation and efficiency and the development of alternative energies that are safe and widely decentralized.

Japan's feed-in tariff (FIT) system for renewable energy sources adopted in July is a step in the right direction, at last offering competitive compensation to those who invest in and develop alternative-energy sources. But it needs to be buttressed with a comprehensive framework of incentives that stimulate research and long-term investment.

Kyoto University Professor Shinya Yamanaka's recent award of the Nobel Prize in Physiology or Medicine confirms that world-class researchers are hard at work in Japan — but cutting-edge science isn't cheap. Japan must provide far more financial support for university research. In addition, it is essential that it puts in place long-term policies that allow corporations to invest with confidence in R&D, knowing their commitments will pay off.

In fact, if Japan can manage to muster the political will to act, this nation already has the options and ideas it needs, many of them laid out in that new book to which I so fulsomely referred, which is both a compilation of policy insights and suggested viable solutions to the energy fix Japan is in.

"Fresh Currents: Japan's Flow From a Nuclear Past to a Renewable Future" is a visual and intellectual smorgasbord, a compilation of eye-opening articles, insightful interviews, useful charts and graphs — and stunning artwork and photographs.

The book is a Kyoto Journal team effort by more than a dozen volunteer contributors, mostly foreigners, under the similarly voluntary editorial eye of long-standing JT writer and reporter Eric Johnston. I call it a labor of love because both the writing and the wonderful visuals make it clear that those involved care as much about this nation as anyone.

Perhaps the best place to begin is the back cover of the book, which carries a quote from Indian environmental activist Vandana Shiva. Her words capture the essence of why "Fresh Currents" is so timely and essential:

"Fukushima has raised, once again, the perennial questions about human fallibility and human frailty, about hubris and man's arrogance in thinking he can control nature. The earthquakes, the tsunami, the meltdown(s) at Japan's nuclear power plant are nature's reminders of her power. ... Alternatives to nuclear energy are a thousand times more abundant and a million times less risky. To push nuclear plants after Fukushima is pure insanity."

"Fresh Currents" began taking shape soon after 3/11 and has been financed with donations collected via an indiegogo.com fundraising campaign last summer.

As Kyoto Journal Editor John Einarsen explains, "The myth that nuclear power can deliver us from the long-term hazards of fossil fuels has been shattered. Renewable energy, long dismissed as impractical, is being given serious reconsideration. Japan can and must take advantage of this opportunity to rethink and refocus its energy strategies. Doing so, Japan will set an example for the world to follow."

Following an introduction by Johnston, "Fresh Currents" is divided into two sections: "How We Got Here" and "The Way Forward."

"Even as Japan's nuclear-power industry trumpeted the end of the need to develop further energy sources," Johnston writes, "others in Japan, and around the world, were still asking: Is there a better tool to generate electricity, one that is cheaper, more easily accessible and safer? Might that energy be in the form of solar, or wind, or geothermal, mini-hydro or biomass? Or some other energy source we humans just haven't yet been able to imagine? In short, is there another, better way to build a secure energy future?"

Readers of the book will not be surprised to find that the answers to these questions are resoundingly affirmative, but this is almost beside the point.

"Fresh Currents" is a captivating work because it tells the story of Japan's energy journey — past, present and future — through the eyes of some of Japan's most observant writers, thinkers and activists.

Each section of the book opens with several pages titled "Facts & Figures" that offer pause for thought. Here are some examples:

- Amount of plutonium Japan has in storage internationally: more than 35 tons.
- Number of simple nuclear warheads 35 tons of plutonium could arm: 5,000.
- Japan's current installed nuclear-generation capacity: 46.15 gigawatts (GW).
- Japan's potential offshore wind-energy capacity: 1,600 GW.

The first essay in the collection, also by Johnston, looks back at the history of nuclear power in Japan, from Hiroshima to Fukushima. This, however, is not the version you will find in ministry-approved textbooks.

"Less than a decade after World War II ended in August 1945, Japan was moving forward with plans to harness nuclear power for its growing electricity needs," Johnston's opening paragraph states. It continues: "Despite the horrors of the atomic bombings of Hiroshima and Nagasaki, a well-coordinated propaganda campaign that played on people's hopes for a better life — and their fear of losing it all for want of electricity — would lead Japan, one of the world's most quake-prone countries, to build over 50 nuclear power plants. How this happened is a tale of secret wartime efforts by Japanese nuclear scientists, a right-wing nationalist who would dominate Japanese politics for nearly half a century, a media tycoon who worked with the CIA, a flamboyant pilot with a talent for self-promotion, Japan's most popular — and corrupt — postwar prime minister, and the collective hubris of what became known as the nuclear power village."

So, from the start of "Fresh Currents," there's a clear warning to readers that truth is indeed as strange as fiction.
Freelance writer and frequent JT contributor David McNeill then plunges into the present with a passionate and moving piece on the people of Tohoku and their efforts to endure adversities that few of us can even imagine.

"Can Tohoku recover?" asks McNeill, noting that the region may even mirror whether Japan can set itself back on its feet.

"Inevitably, the question leads to an even more fundamental one: What sort of country does Japan want to be? The nation's epic industrialization drive seems to have run out of steam. Its dream of energy self-sufficiency lies in ruins. Its population is aging and declining. Japan's squabbling political leadership seems powerless to stop the nation's slide down the economic league tables. By 2050, Japan may no longer even be considered a developed nation," he observes without hesitation.

Soon after, Eriko Arita, a JT staff writer, takes a disquieting look at Japanese media restraint with regard to criticism of the nuclear-power industry, touching on her own experience while working at national broadcaster NHK of its "self-restraint" regarding criticism of nuclear power in Japan.

Other highlights include an interview with Aileen Mioko Smith, one of Japan's most respected and experienced antinuclear activists, and a transcript of comments made in Tokyo at the Foreign

Correspondents' Club of Japan by freelance journalist Tomohiko Suzuki, who has written about links between laborers at nuclear power plants and the yakuza.

On the bright side, freelance writer and frequent JT contributor Winifred Bird is there with an upbeat story on the potential for decentralizing Japan's energy supply through a move toward local generation and consumption.

As well, landscape artist and Kyoto Journal contributing editor Brian Williams shares encouraging research in a piece titled "The Promise of Alternative Energy," which draws on the work of Dr. Mark Z. Jacobson and Dr. Mark A. Delucchi, of Stanford University and the University of California, Davis, respectively.

"By 2030, Jacobson and Delucchi envision wind fulfilling 50 percent of global energy demands ... solar accounting for 40 percent, geothermal and hydroelectric making up 8 percent, and waves and tidal sources providing the remaining 2 percent," notes Williams.

"Fresh Currents" also includes a guide to Japan's new FIT system (Johnson); an article on dams and less damaging alternatives (Jane Singer, an associate professor in the Graduate School of Global Environmental Studies at Kyoto University); a piece on the potential for smart grids in Japan (Richard B. Dasher, executive director of the Center for Integrated Systems at Stanford); and an introduction to the engaging environmental activism of a Buddhist priest (Jonathan Watts, an Asia-specialist journalist and writer).

Even if you don't live in Japan, "Fresh Currents" has something profound to offer. As the Kyoto Journal's Einarsen notes, "The writings in 'Fresh Currents' explore Japan's path forward from Fukushima to a renewable energy future — and why this is important, wherever you live."

In short, "Fresh Currents" is more than a book: It is a piece of living history that crystallizes the threshold upon which we stand today.

"Fresh Currents" can be downloaded free. It is also available from good bookstores, priced ¥2,000. For more details, including news updates, visit: www.freshcurrents.org. Stephen Hesse is a professor in the Law Faculty of Chuo University. He can be reached at stevehesse@hotmail.com.

What future for Japan ?... And for us

from Kyoto Journal

Fukushima has raised, once again, the perennial questions about human fallibility and human frailty, about hubris and man's arrogance in thinking he can control nature. The earthquakes, the tsunami, the meltdown at Japan's nuclear power plant are nature's reminders of her power… Alternatives to nuclear energy are a thousand times more abundant and a million times less risky. To push nuclear plants after Fukushima is pure insanity.

What is really going on with the Japanese energy policy?

Tuesday, Oct. 30, 2012

Vox populi: People stage a rally calling for the abolition of nuclear power in July at Tokyo's Hibiya Park. SATOKO KAWASAKI

FYI

ZERO NUKE POLICY

Behind the no-nuclear option

New energy policy seen as political fig leaf, given option for reversal

By MASAMI ITO
Staff writer

The triple-meltdown crisis that began last year at the Fukushima No. 1 power plant jarred the public out of its complacent attitude toward nuclear power and every other assurance made by the government and Japan Inc.

Suddenly, thousands of people were fleeing their homes in the fallout zones, possibly never to return again, as everything from fish to meat to rice and water joined the list of contamination threats.

Overnight, the public developed a collective voice. Housewives, professors, students, salarymen, seniors from all walks of life stood up to demand an end to Japan's dependence on atomic power, and its dangers.

People came from across the country to participate in rallies each Friday night outside the prime minister's office to raise this chorus.

Then finally last month, Prime Minister Yoshihiko Noda and his Democratic Party of Japan-led government announced the nation would embark on a quest for alternative, green, sustainable forms of energy and rid Japan of nuclear power by the 2030s.

But the new policy, besides not being etched in stone, has drawn criticism for being ambiguous, unrealistic, a quick kowtow for votes — and a way to keep the door back to nuclear power ajar.

What are the key points of the new energy strategy?

The government adopted the "Innovative Strategy for Energy and the Environment" on Sept. 14 to learn from the Fukushima crisis and fundamentally change the nation's course away from atomic power.

The main pillar would be the complete shutdown of all reactors by the 2030s. To achieve this, the government laid out three major goals: to limit the working life of reactors to 40 years, to only restart reactors that have been given stamped as safe by the new Nuclear Regulation Authority, and to ban the construction of new nuclear plants.

The government pledged to cover the nation's energy needs by diversifying its sources and tripling its use of renewable power by 2030, advancing the use of thermal power generation, and securing a steady supply of inexpensive fossil fuels. It also vowed to slash electricity consumption to 100 billion kwh in 2030 from 1.1 trillion kwh in 2010 and promote energy-saving measures to the entire public.

What prompted this zero-nuclear goal?

Public opinion.

The government was initially reluctant to renounce atomic energy, which before Fukushima was the source of about 30 percent of the nation's electricity, because of the difficulty of winding down its vast investment in it.

There is also strong resistance from the business community because of the extra costs associated with alternative energy and concerns that the shift would damage Japan Inc.'s competitiveness.

The business community and the government remain deeply invested in nuclear power.

But the overwhelming public opposition prevailed.

Over the summer, the government collected public comments on three possible scenarios for nuclear energy use by 2030 — zero percent, 15 percent, or 20 to 25 percent.

Although experts noted that opinionated people were the most inclined to respond to the polls, about 90 percent of the some 89,000 responses chose the zero percent option.

"I think the government is still reluctant to get rid of nuclear power completely, but it was forced to listen to the public because of the unprecedented number of responses," said Hideyuki Ban, codirector of the antinuclear Citizens' Nuclear Information Center. "The people's strong voices and action pushed the government to include the word zero."

The DPJ hopes the hedged proposal will win over voters in the next Lower House election to boost its bleak prospects.

What will happen to reactors under construction?

The government plans to let three reactors in the midst of construction to be completed.

They are reactor 3 at the plant in Matsue, Shimane Prefecture, a reactor at the plant in Oma, Aomori Prefecture, and reactor 1 at the plant in Higashidori, Aomori Prefecture.

The Shimane reactor is 93.6 percent finished, the Oma unit 37.6 percent and the Higashidori reactor 9.7 percent, but work on each was halted after March 11. Earlier this month, the Oma reactor became the first to resume construction.

If the government truly aims to end nuclear power, why is the atomic fuel-recycling program continuing?

This continuation cuts to the heart of the ambiguity, experts say. The new strategy clearly states that the reprocessing of spent nuclear fuel will proceed.

The recycling extracts uranium and plutonium from spent fuel for reuse as a hybrid fuel in reactors. If all the reactors are done away with, Japan will have an large plutonium stockpile sitting around with nothing to do.

"It is a complete contradiction. If Japan is going to get rid of nuclear power, it doesn't need to recycle spent fuel anymore," Ban of CNIC said.

Other experts see the continuation of recycling as a way to placate the communities that host the facilities and who now worry that their government subsidy spigot will suddenly be shut off.

This is particularly true in regard to Aomori Prefecture, where communities hosting reprocessing facilities have lashed out at what they call an abrupt about-face by the government. They stand to lose vast state funds if the fuel cycle is terminated.

Could the no-nuclear goal be reneged on in the future?

Yes. The Cabinet failed to officially endorse the new strategy, which means that future governments won't be obliged to uphold it.

The Cabinet instead adopted some kind of a rider statement that said the government would hold discussions with regional governments and the "international community" on the new energy policy "by constantly reviewing and re-examining policies with flexibility."

The conservative Liberal Democratic Party, the largest opposition force, has already stated it will drop Noda's no-nuclear goal. The LDP was the main promoter of nuclear power during its decades-long reign in

the postwar period and the prime provider of its seed funds. It is now aiming to return to power in the next Lower House election.

When that election is held, nuclear power will be one of the top issues, according to the DPJ's Seiji Maehara, minister in charge of national strategy. "I am aware that the LDP has a different opinion and I believe (nuclear power) will be one of the major issues in the next general election," he said in a recent interview with The Japan Times and other media.

"I think it is important to let the people choose for themselves," he said, reminding voters that they should keep the parties' positions in mind.

Why is the United States concerned about the new goal?

One reason is that if Japan drops nuclear power but continues to extract plutonium from fuel, it will raise proliferation fears, which Washington is strongly concerned about.

Japan was allowed to introduce commercial atomic power in line with a bilateral accord with the U.S. The accord, revised in 1988, also stipulates that the U.S. give advance consent to allow the reprocessing of spent fuel and the extraction of plutonium at the Rokkasho facility in Aomori Prefecture.

Media reports suggest that Washington pressured Tokyo into fudging the Cabinet's official endorsement of the no-nuclear goal to provide some wiggle room in the policy.

It also wants Japan to continue importing its nuclear technology in light of the decades-long ban it placed on new nuclear power plant construction after the Three Mile Island incident in 1979, said Ban of CNIC.

"The U.S. doesn't want Japan to stop using atomic energy. If Japan withdraws, America's export plans could fall through," Ban said. "Japan's new strategy could negatively affect the U.S."

How will the new policy affect Japan's vow to cut greenhouse gas emissions by 25 percent?

In 2009, then Prime Minister Yukio Hatoyama pledged at the U.N. General Assembly that Japan would reduce greenhouse gas emissions by 25 percent from 1990 levels by 2020.

Fukushima, and the public outcry, derailed this plan, which at the time was still based on the ever-expanding nuclear power program in Japan, which it wanted to cover 50 percent of its energy needs.

In speech in October, Noda effectively retracted the 25 percent pledge.

"Our country will devote maximum power to creating an energy-saving society and expanding reusable energy.
"But at the same time, despite such efforts, it will be difficult to control the amount of carbon dioxide emissions that we had planned to cover through atomic energy," Noda said.

Of the inhumanity of nuclear weapons

November 7, 2012

Hiroshima mayor seeks explanation from gov't over anti-nuke statement snub

http://mainichi.jp/english/english/newsselect/news/20121107p2a00m0na002000c.html

Hiroshima Mayor Kazumi Matsui visited the Ministry of Foreign Affairs on Nov. 6 and submitted a document to Foreign Minister Koichiro Gemba seeking an explanation as to why the government did not agree to a recent statement by 34 countries to work toward outlawing nuclear weapons.

Matsui believes that the declaration matches Hiroshima's goal of eliminating nuclear weapons. Meanwhile, Nagasaki Mayor Tomihisa Taue had earlier asked the government to sign the document.

The statement was jointly released on Oct. 22 at the United Nations General Assembly First Committee by countries including Switzerland, Norway and Thailand. It denounced nuclear weapons as inhumane and held that, "All states must intensify their efforts to outlaw nuclear weapons and achieve a world free of nuclear weapons."

According to the Hiroshima Municipal Government, Mitsuru Kitano, head of the Foreign Ministry's Disarmament, Non-proliferation and Science Department, who received the document from Matsui, said, "We have no objection over the inhumanity of nuclear weapons," but also said, "However, at this stage we cannot agree to the contents of the statement."

Taue wrote, "As the site of an atomic bombing, we feel it is very unfortunate that our country, which was on the receiving end of nuclear weapons, is not among those agreeing to the statement. From the view of nuclear weapons' inhumanity, Japan should lead a new approach to a world free of them."

Nuke debate next elections's most explosive issue

November 6, 2012

uesday, Nov. 6, 2012

Nuke policy to drive next election

http://www.japantimes.co.jp/text/nn20121106f3.html

Jiji

The biggest issue in the next Lower House election will be whether Japan aims to stop using nuclear power, former national policy minister Satoshi Arai said in a recent interview.

The Liberal Democratic Party, the top opposition force, "is starting to say that zero dependence on nuclear power is unrealistic," said Arai, former chairman of the ruling Democratic Party of Japan's project team working to bring the Fukushima nuclear crisis under control.

The administration of Prime Minister Yoshihiko Noda has put forward a strategy aimed at reducing reliance on nuclear energy to zero in the 2030s, although his Cabinet failed to endorse the strategy.

If the LDP — which promoted nuclear power during its postwar reign of nearly five decades — returns to power, the zero policy will be scrapped, Arai said.

Because the LDP has backed Noda's increase in the consumption tax, that is not expected to be a major issue in the general election. However, Arai said, the debate over scrapping or continuing the use of nuclear power will be the election's most explosive issue.

Arai lamented the Noda administration's failure to adopt the zero-nuclear strategy at a Cabinet meeting, saying this has given a negative impression about its commitment to reducing the country's dependence on nuclear power to zero in the 2030s.

Arai said the biggest discrepancy in the national nuclear policy lies in the way the country pushed ahead with atomic power without completely developing the nuclear fuel cycle program.

"Without the nuclear fuel cycle, there will be no place for spent nuclear fuel," Arai said, noting that capacity for storing the fuel at most nuclear plants will be exceeded in five to six years.

Asked who should make the decision to resume operations at halted reactors, Arai said the newly established Nuclear Regulation Authority should initially judge the safety of individual reactors after they draw up evacuation plans for accidents.

The authority should make decisions from the technical and safety standpoints, Arai said, but "the final decisions should be taken by political leaders, who reflect public opinion."

A new life for a 50-year old science fiction book

November 9, 2012

Yoroku: An alternative view of nuclear-equipped humanity

http://mainichi.jp/graph/2012/11/09/20121109p2a00m0na002000c/001.html

In the novel "Utsukushii Hoshi," by Yukio Mishima, four members of an affluent family who see a flying saucer come to believe they are aliens from different planets. Amid the Cold War between East and West, the family members, hiding their backgrounds, launch a peace campaign to prevent nuclear war breaking out between the United States and the Soviet Union.

The science fiction novel, published by Shincho Bunko, came out exactly 50 years ago. This year, it has reportedly started to sell again, thanks to the efforts of a major bookstore in Tokyo. In January, the bookstore created an advertising panel for the book, picking up on the novel's reference to radioactive materials, cesium, half-lives and other terms connected with warnings about the dangers of nuclear testing. This sparked the interest of people whose awareness of such issues has been heightened by the Fukushima nuclear accident.

Later, the publisher prepared a paper advertising wrapper for the book, exclaiming, among various phrases, that "Mishima foresaw a Japan intimidated by radiation!" Officials also prepared store advertising slogans, and the novel started steadily registering sales from around this spring, leading to new editions.

In the novel, a second group besides the family whose members say they are aliens appears, and a fierce argument is waged over the future of humanity. Is it permissible for humans to continue living? What is civilization? The aliens' view of mankind is fairly objective.

The uneasiness that emerges through the turn of events trickles through to current times, in which mankind has acquired nuclear energy. The weighty question of whether humans are worthy to use nuclear energy continues to reverberate.

Since the Great East Japan Earthquake and tsunami, people have at least started to think about their daily way of life in fundamental terms. At times, there may be significance in thinking about the future of the world and in humanity in the same way an alien outside this world might see the situation. ("Yoroku," a front-page column in the Mainichi Shimbun)

Japan & the nuclear arms issue

November 11, 2012

Nuclear arms abolition is impossible: Osaka Mayor Hashimoto

http://mainichi.jp/english/english/newsselect/news/20121111p2g00m0dm002000c.html

HIROSHIMA (Kyodo) -- Outspoken Osaka Mayor Toru Hashimoto said Saturday in Hiroshima, attacked with an atomic bomb in 1945, that it is impossible to abolish nuclear weapons and that Japan is "peace-addicted."

"It would impossible, given the current international political situation" to abolish nuclear weapons, Hashimoto, also head of Nippon Ishin no Kai (Japan Restoration Party), said. "Japan is a little bit peace-addicted. Who can abolish nuclear weapons even if Japan is eager to achieve it?"

He was visiting the city as part of campaigning for his party, which is seeking to form a "third force" to take on the ruling Democratic Party of Japan and main opposition Liberal Democratic Party in the run-up to the next lower house election in cooperation with hawkish former Tokyo Gov. Shintaro Ishihara.

Hashimoto also indicated to reporters that he would accept the entry of nuclear weapons into Japan, currently banned under the country's "three non-nuclear principles," saying, "It could be possible as Japan is protected under the nuclear power of the United States."

If nuclear weapons are actually being brought in, "we need to open it up to the public for debate," he said.
The three principles prohibit Japan from possessing, producing or introducing any nuclear arms into its territory.
"We basically need to adhere to the principles, but we should not lie about the entry of nuclear arms in terms of security," Hashimoto said.

Earlier this month, Hashimoto said his party would not allow Japan to possess nuclear arms, while accepting debate about it.

TEPCO's customers to be able to choose their source of energy

November 10, 2012

TEPCO customers to have choice of renewable energy: president

http://mainichi.jp/english/english/newsselect/news/20121110p2a00m0na011000c.html

Tokyo Electric Power Co. (TEPCO) customers will have a choice of paying for renewable energy or power from conventional sources, TEPCO President Naomi Hirose told the Mainichi Shimbun during a Nov. 9 interview.

Under the new pricing system, customers who want to support renewable energy will be able to opt to buy electricity from such sources starting in fiscal 2014, when the utility's Higashi Izu wind power station in Shizuoka Prefecture with a total output of some 18,000 kilowatts goes online.

It is the first time for a major power company in Japan to introduce such a pricing system aimed at promoting renewable energy. Because renewable energy generation costs up to four times more than thermal and other conventional energy, power bills will be heftier for its consumers. The utility also plans to use the proceeds for renewable energy investment.

"Even if the power rate is higher, I believe there will be customers who want to buy renewable energy," Hirose said, referring to rising calls for renewable power in the wake of the disaster at TEPCO's Fukushima No. 1 nuclear plant.

As renewable power output is limited, TEPCO will initially sell renewable energy only to corporations and organizations, not to households. If the number of clients who prefer renewable energy increases, the utility will apply the system to households as well by adding wind and megasolar plant capacity.

TEPCO is also considering purchasing electricity generated at megasolar plants developed by trade and other companies and selling it to regular households. The move is likely to lure new entrants to the renewable energy market.

According to the Ministry of Economy, Trade and Industry, the United States and Germany have similar systems giving customers the choice of purchasing renewable energy, leading to the expansion of renewable power sources in those countries.

In anticipation of criticism that it is unfair for those against nuclear power to be forced to pay heftier bills, TEPCO will likely be urged to reduce renewable energy costs.

Hiroshima Mayor vs Osaka Mayor Hashimoto

November 14, 2012

Hiroshima mayor complains about Hashimoto's remark on nuclear arms

http://mainichi.jp/english/english/newsselect/news/20121114p2g00m0dm085000c.html

HIROSHIMA (Kyodo) -- Hiroshima Mayor Kazumi Matsui on Wednesday complained about Osaka Mayor Toru Hashimoto's recent remark that it is practically impossible to eliminate nuclear weapons.

"The remark may be by a person who has not understood the realities of the atomic bomb catastrophe," Matsui told a news conference. "If he knows the realities, it would make a difference."

Hashimoto, who has attracted media attention by launching a new political party called Nippon Ishin no Kai, made the remark in the atom-bombed city of Hiroshima on Tuesday, coming under fire from Hiroshima Prefecture Gov. Hidehiko Yuzaki.

Matsui told the press conference that politicians including U.S. President Barack Obama have been calling for eliminating nuclear weapons.

The demand for elimination represents "Hiroshima's deep-rooted, important wish emerging from its real experiences," he said. "I want to take various opportunities to urge Hashimoto to look at the realities of the atomic bomb catastrophe."

In his complaint about Hashimoto's comment on Saturday, Gov. Yuzaki called on Hashimoto to improve his knowledge.

Hashimoto reacted to Yuzaki's complaint in a brief meeting with reporters Wednesday in Osaka, asking Hiroshima Prefecture and city to explain how they would become political players in dealing with the nuclear powers.
"Nothing will change simply with the assertion to eliminate nuclear weapons," he said.

Kepco's worries

November 16, 2012

Reactors vital to Kansai area this winter, Kepco claims

By KAZUAKI NAGATA
Staff writer
http://www.japantimes.co.jp/text/nn20121116f2.html

What would happen if the two working reactors at the Oi power plant — Japan's only reactors brought back online since the Fukushima meltdowns last year — are shut down because of a suspected active fault under their critical equipment?

According to Kansai Electric Power Co., the Kansai region would suffer severe electricity shortages this winter because demand is projected to far exceed the utility's capacity to generate power through other means.

Kepco estimates that the peak demand this February will be 25.37 million kw, while the firm now has a maximum supply capacity of 26.42 million kw — including the Oi reactors.

Without the Oi plant, the capacity drops to 21.96 million kw, or 13.4 percent under its capacity to meet peak demand, Kepco says, because it would lose 2.36 million kw from the two Oi reactors and 2.1 million kw from pumped-storage hydroelectric stations that are charged by electricity from the Oi plant during off-peak nighttime hours.

A pumped-storage hydroelectric plant generates electricity by letting pumped water in a higher reservoir rush through a turbine into another, lower reservoir.

The water is pumped mainly by using nuclear power at night when power demand is low.

Some experts, however, question Kepco's estimates for its supply capacity, saying power purchased from other firms would let it tide over any shortfalls.

Hideaki Matsui, a senior energy expert at the Japan Research Institute, is one such expert.

Matsui said Kepco could get more electricity from independent power producers around Kansai as well as regional utilities elsewhere in Japan. He also pointed out that Kepco's supply could be increased by postponing regular inspections of some its thermal power units.

Kepco's estimates include getting about 4.6 million kw from other sources, including independent power producers and firms with in-house generators. The estimates, however, do not include help from fellow regional utilities.

A Kepco spokesman said depending on the situation, the utility could buy more power from independent producers and will also ask other utilities if they can spare some power.

On Oct. 30, Kepco told the government that if five other utilities in western and central Japan helped out to the point where their own reserves fell to around 3 percent, Kepco would only be 1.7 percent under peak demand.

Kepco also said the No. 3 unit at its Kainan thermal power plant is scheduled for a regular checkup starting Jan. 11, but this might be postponed if the Oi reactors are turned off.

Kepco has already postponed regular checks of some of its thermal units amid the nuclear moratorium.

An uncertain future for all energy plans

November 16, 2012

Energy measures left up in the air
http://www3.nhk.or.jp/daily/english/20121116_45.html

Japan's economic policy is not the only thing that is facing an uncertain future. So are plans for energy.

In September, the government mapped out new energy measures. They included the termination of nuclear power generation by the 2030's.

The government was also planning to come up by year end with a framework for introducing renewable and other forms of alternative energy.

Final decisions on these matters are made at meetings of the National Policy Minister, the Economy, Trade and Industry Minister and by other cabinet officials.

But it's now unclear whether such meetings will be held by the end of the year.

In addition, debate on the country's comprehensive basic energy plan has been shelved. The plan was expected to address future electricity needs.

DPJ to pursue elimination of nukes, says Noda

November 17, 2012

Noda vows to take steps to boost economy, eliminate nuclear plants

http://mainichi.jp/english/english/newsselect/news/20121117p2g00m0dm001000c.html

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda said Friday that his Democratic Party of Japan will continue to take measures to boost the economy and pursue policies to eliminate all nuclear power plants in the country by the 2030s.
Noda, who dissolved the House of Representatives the same day, also promised that his party will move forward talks on free trade pacts, including the U.S.-led Trans-Pacific Partnership, "while protecting what we should protect."

Speaking at a press conference, the prime minister said he dissolved the lower house for a general election on Dec. 16 to fulfill a promise to the main opposition Liberal Democratic Party and its ally the New Komeito party.

In August, Noda, then LDP chief Sadakazu Tanigaki and New Komeito head Natsuo Yamaguchi agreed on a deal to enact legislation to double the 5 percent sales tax rate by 2015, the prime minister's key policy goal, in exchange for a promise from Noda to call a general election "sometime soon."

Vowing to overcome the country's prolonged deflation and prop up the economy, Noda said the government will work closely with the Bank of Japan.

Noda also criticized recent remarks by LDP chief Shinzo Abe on the BOJ's monetary policy, saying they could undermine the central bank's independence.

On Thursday, Abe expressed hope that the BOJ would set its key policy interest rate below zero, urging the bank to stimulate lending even by keeping the interest rate below zero.

Japan's national security linked with nuclear power

Dossier 11

Nuclear Power and Japan's National Security
http://www.yomiuri.co.jp/adv/wol/dy/opinion/society_121119.htm

Tetsuo Arima
Professor, Faculty of Social Sciences, Waseda University

On May 7, 1957, one and a half months before making a visit to the U.S., Prime Minister Nobusuke Kishi presented his theory on the constitutionality of nuclear arms as a means of self-defense before the House of Councilors Cabinet Committee, as follows:

Nobusuke Kishi: The various weapons that are used under the term “nuclear weapons”… are considered unconstitutional simply by virtue of the fact that they are called “nuclear weapons”… However, that is not necessarily the case… The spirit of our Constitution is, ultimately, self-defense, and so it stands to reason that equipping ourselves with one of the powers included under the right of self-defense is permissible

under our current interpretation of the Constitution. (From the website "Search System of the Minutes of the Proceedings of the National Diet" [Kokkai Kaigiroku Kensaku Shisutemu])

Why did Kishi make such an assertion at this point in time? It was because the purpose of his visit to the U.S. was to pave the way for the revision of the Japan-U.S. Security Treaty (hereafter referred to as "Security Treaty").

The Security Treaty, which had been signed at the same time as the San Francisco Peace Treaty, was just as disadvantageous for Japan as the unequal treaties at the end of the Tokugawa era. Japan had been forced to accept demands to put an end to the Allied occupation.

Despite the fact that U.S. forces were not under any obligation to defend Japan, the treaty allowed them to station troops anywhere they liked and did not place any restrictions on them, even with regard to bringing nuclear weapons into the country. In addition, the treaty had no expiration date and could not be annulled by the Japanese side.

Kishi wanted to revise the treaty to make it more equitable. Under the revision, Japan would provide the U.S. with a number of military bases, while the U.S. would withdraw most of its ground forces from Japan. The U.S. would not be allowed to bring in nuclear weapons that could entangle Japan in a nuclear war. The treaty would be set to expire ten years after the date of the revision, and the two countries would be able to renegotiate and renew the treaty every ten years.

The problem with Kishi's proposed revision was that a considerable portion of the U.S. ground troops would be withdrawn, leaving Japan almost entirely defenseless and vulnerable to threats from China and the Soviet Union. These two countries had formed an alliance in 1950, and the Soviet Union posed a special threat due to its possession of nuclear weapons.

Kishi thus asserted that nuclear armament was permissible for the purpose of self-defense, even under the existing Constitution. Indeed, the revision Kishi had planned would not have been feasible had he not made this assertion.

The U.S. was deeply shocked by Kishi's speech on the constitutionality of nuclear arms. In fact, the CIA launched a full-scale investigation of Japan's nuclear-arms capability after Kishi returned to Japan. The following quote summarizes the findings of a CIA intelligence report dated July 26, 1957:

One capable U.S. government official believes that if Japan succeeds in using the uranium recent reports say it has been storing as fuel for a nuclear reactor, it will be able to produce nuclear weapons by 1967 without the assistance of other countries. The Japanese are making every effort to remove any impediment (meaning report of Japan's uranium stockpile, author's notes are parenthesized hereinafter) standing in their way. The Japanese government has been rapidly advancing domestic and international programs in order to secure a sufficient amount of uranium to pursue a major nuclear power program free of the restrictions imposed by the U.S. and the U.K. on their use of nuclear byproducts (such as plutonium) related to the export of nuclear fuel from those countries.

(…)

If the Japanese receive an unlimited supply of nuclear fuel and successfully produce their own nuclear

power plants, they will obtain nuclear material (plutonium) that can be used for nuclear weapons. If the nuclear reactor they use is a British Calder Hall type reactor or a reactor that uses natural uranium, it will provide them with a massive supply of nuclear material. (From a U.S. State Department document in the U.S. National Archives II)

Matsutaro Shoriki, then Chairman of the Atomic Energy Commission (as well as Chairman of the National Public Safety Commission) under the Kishi administration, had been pushing forward plans to install a Calder Hall nuclear power plant from Britain, despite the opposition of the U.S. government. Thus, Kishi's theory on nuclear arms for self-defense was not just a castle in the air.

The U.S. government was forced to make a choice between accepting the revision of the Security Treaty or allowing Japan to develop nuclear arms. They chose the former option. After the passage of several other events, the Security Treaty was revised in 1960.

Japan's first nuclear power plant, the Tokai Power Station, began operation in 1966. Once the plant was producing about 50 kilograms of plutonium per year, the U.S. put pressure on Japan to join the Nuclear Non-Proliferation Treaty (NPT) in order to limit Japan's nuclear-arms capability. The Japanese Prime Minister at that time, Eisaku Sato, ordered researchers to examine whether Japan should join the treaty or continue developing its nuclear arms. (Sources documenting this history include a classified document of the Cabinet Intelligence and Research Office, *Basic Research on Japan's Nuclear Policy* [Nihon no Kakuseisaku ni kansuru Kisoteki Kenkyu])

As a result, Japan decided to stop developing nuclear arms for the time being and continue receiving nuclear fuel from the U.S., working to meet the country's burgeoning electricity demands and achieve economic prosperity through the generation of nuclear power. Japan signed the NPT in 1970, although the ratification of the treaty in the National Diet dragged on for years afterward to the irritation of the U.S. government. Japan officially joined the treaty in 1974, after it had regained possession of Okinawa and renewed diplomatic relations with China.

Japan's national security is thus intimately bound up with nuclear power. Nuclear power generation has provided Japan with more than just electricity. In a post-3.11 Japan, we need to identify the ways in which these two factors are interconnected and think about how we can improve the relationship between them.

Ishihara on the "simulation" of nuclear arms as a deterrent

November 20, 2012

Nuclear 'simulation' swagger is coupled with sympathy for Tibetans, call for defense buildup

Ishihara rattles saber against China

By NATSUKO FUKUE
Staff writer
http://www.japantimes.co.jp/text/nn20121120x3.html

Shintaro Ishihara, the new head of Nippon Ishin no Kai (Japan Restoration Party), remained true to his China-hawk form Tuesday by saying Japan should "simulate" possessing nuclear arms as a deterrent to Beijing.

Ishihara's remark during a news conference at the Foreign Correspondents' Club of Japan in Tokyo, is likely to ruffle feathers both at home and abroad, especially amid the territorial row with China over the Senkaku Islands.
"It's high time Japan made simulations of possessing nuclear arms," Ishihara said. "That would become a form of deterrent" against China's possible military encroachment.

The 80-year-old former Tokyo governor also said the defense budget should be increased while dealing with China in a "calm but resolute manner."

"We need to say no to China when necessary because I don't want Japan to be like Tibet, which has fallen under Chinese power," said Ishihara, who coauthored the best-selling essay "The Japan That Can Say No" in 1989 with late Sony cofounder Akio Morita. The book urges Japan to become more assertive in international affairs.

"I feel so sorry for the Tibetan people," he said.

Ishihara repeatedly referred to China as "Shina," the name often associated with Japan's military occupation during the war, instead of "Chugoku," the Japanese word for the country.

"Shina is not a negative word. And for Japanese, Chugoku means Hiroshima and Okayama" — the Chugoku region in western Honshu, he said.

Ishihara asserted that most Japanese agree with him that Japan should deal with China in a calm but assertive manner when conflict arises.

The platform of Nippon Ishin no Kai, which was founded by Osaka Mayor Toru Hashimoto, states the party will urge China to agree to bring the Senkaku dispute to the International Court of Justice for a ruling on which country has sovereignty over the rocky islets long held by Japan.

Ishihara said defense spending, now limited to 1 percent of the national budget, should be boosted.
"I think the skills of the Japanese military industry are high," he said, voicing his personal view. "Why not boost the ability of (the nation's) self-defense?"

Ishihara said he basically supports the U.S.-led Trans-Pacific Partnership free-trade talks but then added "he cannot forgive" the U.S. promotion of genetically modified food. The TPP is opposed by farmers who fear it would lead to a flood of cheap, imported produce after tariff barriers are removed.

He said the government should not rush to abandon nuclear power and instead calculate how the economy would fare without such energy. "Hashimoto and I agree that we should do such calculations," he said.

Hashimoto had advocated abandoning nuclear power by the 2030s and had earlier said his party would pursue this goal. But in consideration of Ishihara's stance, he did not include this in the joint statement issued Saturday when his party absorbed Ishihara's four-day-old group.

Ishihara: Japan should consider nuclear arms
http://www3.nhk.or.jp/daily/english/20121120_31.html
Shintaro Ishihara, the leader of a newly formed opposition party, says Japan should study the procedures and impacts of possessing nuclear arms, in case the country decides to acquire such weapons.

The former Tokyo governor, who recently took the helm of the Japan Restoration Party, was speaking to

foreign correspondents in Tokyo on Tuesday.

Ishihara said countries that lack nuclear arms have only a very weak voice in today's world. He said that, in his personal view, Japan should simulate cases in which it possesses nuclear weapons, and this would work as a deterrent.

He said the question of whether or not the country should go nuclear can be decided after that.

Ishihara also referred to the proposed trans-Pacific free trade agreement.

He said that, in principle, he supports Japan's joining the negotiations.

He added, however, said that it is dangerous to fully liberalize trade, since some items, such as genetically modified foods, should not be allowed to enter the Japanese market. He said the United States is trying to sell such foods to Japan

Anti-nuke advocates unite!

November 21, 2012

Anti-nuclear power advocates aim for Diet majority
http://www3.nhk.or.jp/daily/english/20121121_38.html

Politicians advocating an end to nuclear power generation in Japan have agreed to join forces to aim for a combined majority in the Lower House election next month.

About 20 lawmakers from People's Life First, the Social Democratic Party, the Democratic Party and others met in the Diet building on Wednesday.

They were joined by about 60 members of citizens' groups campaigning against nuclear power.

People's Life First Acting President Kenji Yamaoka said at the meeting that while 7 in 10 people in Japan oppose nuclear power, 7 in 10 Diet members support it.

Yamaoka said that what politicians are doing is worlds apart from people's wishes.

He called on voters to vote for candidates advocating an end to nuclear power so that like-minded lawmakers will win a majority in the chamber and possibly form a coalition government.

All political parties must show their hand clearly

November 23, 2012

Editorial: Parties must show voting public concrete vision for Japan's energy future

http://mainichi.jp/english/english/perspectives/news/20121123p2a00m0na012000c.html

With the future of Japanese society resting largely on whether or not nuclear power is abandoned, nuclear and energy policy is a major point of controversy in the upcoming general election.

Even now, 20 months after the outbreak of the disaster at the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co. (TEPCO), at least 160,000 people are living as evacuees. Workers at the site continue their efforts to bring the crisis under control**, with no end in sight.** Decontamination of areas tainted by radiation is far from completion, and **low-level radiation exposure among residents is a constant concern.**

Building additional nuclear reactors is out of the question, now that the potential for such massive disasters has become obvious. Even if we approve the reactivation of existing reactors for the time being -- given that they clear strict risk evaluations -- the only choice for Japan, now that it's clear how much the dangers posed by seismic activity had been underestimated, is to start shutting reactors down.

It is our hope that each party will propose responsible energy policies that take this reality into consideration.

The ruling Democratic Party of Japan (DPJ) says the goal of phasing out nuclear power by the 2030s will be incorporated into its manifesto. However, the party's declaration lacks persuasiveness as it has thus far failed to reveal a clear roadmap toward achieving that goal. Some doubt the party's sincerity after the Noda Cabinet chose not to endorse the policy.

We have continued to propose that each nuclear reactor should be assessed and ranked for decommissioning priority based on set criteria. We want to see a schedule for phasing out nuclear power that includes the implementation of such methods. This is a task that should be carried out not just by the DPJ but also by other parties, such as New Komeito, that are calling for the elimination of nuclear power.

Meanwhile, the Liberal Democratic Party (LDP) says in its campaign platform that it will decide on an optimal combination of energy sources for Japan within the next 10 years. This represents a mere postponement of a real decision, and does not show whether the party is aiming for the abandonment of nuclear power or continued adherence to old policy.

The ongoing nuclear disaster broke out against a backdrop of loose safety regulations and the dominance of the "nuclear village" -- referring to the cozy ties between pro-nuclear politicians, bureaucrats, academics and industry -- and the LDP bears some responsibility for allowing it all to go unchecked. With that in mind, the party should demonstrate a clear stand on nuclear energy.

The Japan Restoration Party has backed off its original anti-nuclear stance, and now pledges to "create rules, including safety standards." It's only natural that voters view the party as having sacrificed its nuclear policy in order to join hands with pro-nuclear advocate and former Tokyo Gov. Shintaro Ishihara. Is there any reason voters should put their support behind such flip-flopping?

Whether the decision is made to abolish nuclear power or to keep it, many pending issues remain.

One is the problem of spent nuclear fuel. The DPJ has contradicted itself by calling for a zero-nuclear policy on the one hand, while on the other making clear its intention to continue the reprocessing of spent nuclear fuel. This is likely an attempt by the party to avoid stepping on the toes of municipalities hosting nuclear facilities and the U.S., with whom Japan's relationship comes deeply laced with security issues.
It's not yet clear how the DPJ will incorporate its stance on the nuclear fuel cycle into its campaign manifesto, but it must stick to a clear anti- or pro-nuclear position. Other parties, such as the LDP, should also offer specific party lines in order to allow for a reexamination of policies that were heretofore in place as a result of real decisions being postponed.

Another major issue in the election will be how each party positions the national government's responsibility for nuclear power.

First, there is the question of additional assistance for the rehabilitation of TEPCO. The utility, which under current law is required to take sole responsibility for the payment of disaster damages, has requested additional financial assistance from the government, saying that compensation amounts are too heavy for one private company to bear.

If TEPCO cannot cover the cost of damages through its efforts alone, the national government -- which bears responsibility for having promoted nuclear power as a national policy -- must shoulder some of the burden. The national government footing some of the cost, however, means that the Japanese public is footing the cost. As such, the public will not approve of an easy bailout. We want to hear each party's views on the national government's share of responsibility that incorporate what has been learned from past nuclear policy.

We must also take a close look at parties' attitudes toward electric power system reform, considering how much of an impact it would have on people's lives.

In order to reduce Japan's dependence on nuclear power, alternative sources of energy must be secured. High hopes have been pinned on renewable energy sources such as solar and wind power in the mid to long term. However, until the use of such power sources becomes widespread, we must rely mainly on thermal power generation, which comes with high fuel costs.

Both renewable and thermal energy will result in mounting costs. If those costs are directly tacked on to electricity costs, not only will it increase the burden on household finances, there's a chance it could hurt the competitive edge of Japanese manufacturing in the international market.

To keep power costs low, it is essential to implement reforms that encourage new companies to enter the electricity business and promote competition among utility giants.

The DPJ administration has announced its plans to work toward the liberalization of electricity retail sales, including power for private households, and the separation of generation from distribution. It's a valuable policy line that would promote competition. Meanwhile, it's unclear if the LDP, which in the past opposed liberalized retail sales of electricity, is prepared to implement reform.

Nuclear and energy policy are directly linked to issues such as the stable supply of power, burden of cost and energy security, and have a great impact on the lives of Japanese citizens. Are the various parties aspiring to a shift toward a low-energy society, or a return to life before the nuclear disaster? They must reveal the future they envision and the steps to get there for the public to decide for themselves.

Nuke policy important even for Tokyo election

November 22, 2012

Nuclear policy splits parties into 2 camps for candidates in Tokyo governor race

http://mainichi.jp/english/english/newsselect/news/20121122p2a00m0na009000c.html

The country's future nuclear policy is forcing political parties to back either of two key candidates in the Dec. 16 Tokyo gubernatorial election -- Tokyo Vice Gov. Naoki Inose and Kenji Utsunomiya, former president of the Japan Federation of Bar Associations.

While nine people have declared their candidacies for the top post of Japan's capital, most political parties are throwing their weight behind either Inose, 66, or Utsunomiya, 65. The People's Life First (PLF) party, headed by conservative politician Ichiro Ozawa, the Japanese Communist Party (JCP) and the Social Democratic Party (SDP) have decided to support Utsunomiya, while the main opposition Liberal Democratic Party (LDP), New Komeito, the Japan Restoration Party (JRP) and Your Party are backing Inose. Because of the ongoing whirlwind political realignment ahead of the Dec. 16 general election, it was not easy to clearly see each party's nuclear policy. But with the official campaign for the Tokyo gubernatorial election set to kick off within a week, each political party's nuclear policy has become clear.

The three parties backing Utsunomiya have separately pledged to phase out nuclear power within specific timeframes. The four political parties supporting Inose, on the other hand, have not made such specific policy commitments. The ruling Democratic Party of Japan (DPJ) is likely to allow its members and supporters to vote freely for any of the candidates.

According to sources familiar with the issue, there were arguments within the PLF against its decision to join hands with the JCP and the SDP in supporting Utsunomiya. But after the merger between the JRP and the Sunrise Party, which were far apart over nuclear policy, Ozawa himself was quoted as saying, "Under the current political situation in which 'third force' parties are forging an unprincipled alliance, it is complete nonsense that anti-nuclear groups are at odds with one another."

The Tokyo Seikatsusha Network, an affiliate of a consumer group, and the political organization Green Party, as well as other groups that advocate zero-nuclear policy, are beginning to join forces to back Utsunomiya. Akihiro Hatsushika, who left the DPJ to join Green Wind, a new political party launched on Nov. 15, is said to be planning to attend a ceremony to open Utsunomiya's campaign office on Nov. 22.

When Inose declared his candidacy for the Tokyo gubernatorial race at a news conference on Nov. 21, he did not make his position clear over nuclear policy although he stressed the need to promote the use of renewable energy. An LDP lower house lawmaker from Tokyo said, "Nuclear policy does not fit in as an issue for the gubernatorial election in Tokyo where there are no nuclear plants."

Toshiaki Eto, a professor at Yamanashi Gakuin University, said, "It is a significant move in which political parties go beyond ideological differences to get together and cooperate on important policies. Energy policy has been an important policy issue for elections since the Great East Japan Earthquake." He added, "Conversely, it could become a message from the Tokyo gubernatorial election to the House of Representative election that 'the nuclear issue is important.'"

Japan must diversify energy sources

November 24, 2012

ENERGY SEMINAR

For energy security, Japan urged to diversify sources

http://www.japantimes.co.jp/text/nb20121124d2.html

By TAKASHI KITAZUME
Staff writer

Japan needs not only to maintain a diverse energy mix — including nuclear power — but also diversify the ways of securing imported fuel in the face of the changing global supply-demand structure, a former executive director of the International Energy Agency said at a recent seminar in Tokyo.

The Democratic Party of Japan-led government's plan to seek a phaseout in nuclear power lacks the perspectives of energy security for the country and fails to address international concerns such as the possible impact of a Mideast turmoil on oil supply, or the effects of rapidly growing energy consumption in countries like China and India, said Nobuo Tanaka, currently an associate at the government-affiliated Institute of Energy Economics.

Tanaka was speaking at a seminar on energy security organized by the Keizai Koho Center on Oct. 30.

In the wake of the triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, which followed the massive earthquake and tsunami on March 11, 2011, all but two of Japan's nuclear reactors remain shut down. Prime Minister Yoshihiko Noda's Cabinet announced a plan in September to seek to phase out nuclear power generation by the end of the 2030s.

Without nuclear power, Japan will inevitably have to import more oil, natural gas and coal in addition to increasing power generation through renewable sources such as solar and wind, Tanaka said. This will cause a triple problem of rising costs, reduced security and greater emission of greenhouse gases, he noted.

Japan's nuclear disaster has prompted Germany to reverse its position and announce a phaseout of its nuclear power generation by 2022. One way for Germany to achieve that would be importing more

natural gas, but it is also connected to neighboring countries through regional power grids, which would enable the country to buy electricity, for example, produced at nuclear power plants in France, Tanaka pointed out.

Germany turned from a net energy exporter to a net importer in March last year, but European countries maintain a collective security system in energy supply through a regionwide power grid network as well as gas pipelines, he said. Japan, for its part, does not even have a nationwide network of power lines and its still divided by the 50 hertz/60 hertz differences in eastern and western Japan, he noted.

Crude oil prices are not expected to come down in the future with the rising demand from emerging powers, Tanaka said. Meanwhile, if a crisis emerges over Iran's nuclear program and Tehran blocks crude supplies through the Straits of Hormuz, the current oil stockpiles by IEA members will be able to supply global demand for only two or three months, he said.

In case the crude oil prices should spike to double the current level, Japan is estimated to quickly lose its current account surplus and the deficit could run as high as ¥12 trillion if its nuclear plants remain shut down, Tanaka said.

Expectations are high for increases in natural gas supplies worldwide with the shale gas revolution in the United States and development of unconventional types of gas in other countries, but Tanaka said that the market will not ease substantially because there will also be huge demand particularly in countries like China.

Meanwhile, export capacity of Southeast Asian countries, including Indonesia, Malaysia and Brunei, which have long been major suppliers of liquefied natural gas (LNG) to Japan, is forecast to decline as these rapidly growing countries need to supply rising consumption at home, he said.

Japan will need to diversify its sources of natural gas imports, including the purchase of shale gas from the U.S. as well buying more from Russia by building gas pipelines, he said. Russia today accounts for 9 percent of natural gas and 4-5 percent of oil that Japan imports, and increasing imports from Russia will also help Japan reduce its dependence on supplies from the Middle East, he noted.

Meanwhile, another speaker at the seminar, Robert Dujarric, director of the Institute of Contemporary Asian Studies at Temple University's Japan Campus in Tokyo, urged Japan to set a goal of minimizing demand for fossil fuels as sources of its energy supply from security viewpoints, given the geopolitical risks involving many of the world's oil producers.

A logical course for Japan would be to invest more in research and development on efficiency in renewable and non-traditional energy sources, Dujarric said. "Energy is a challenge for Japan but it is also an enormous opportunity for Japan" to develop a path for "thriving in a lower fossil fuel environment" with its energy-efficiency technologies, he said.

On the other hand, a zero-nuclear policy will lead to higher fossil fuel prices by pushing up demand for oil and gas as alternative energy sources, along with exacerbating the global warming problems, he said.

The need for a diverse mix in energy supply as the foundation of energy security was also echoed by Akihiro Sawa, an executive senior fellow with the 21st Century Public Policy Institute, who spoke at another seminar on energy issues organized by the Keizai Koho Center on Nov. 5.

Japan was heavily dependent on oil imports as a fuel for its electricity generation when it was hit by the First Oil Crisis in 1973. After its economy was severely affected by the supply disruptions and sharp increase in oil prices, the nation responded by diversifying its sources of power generation more to nuclear and natural gas, Sawa pointed out.

Even with the huge investments, it took decades for the share of nuclear energy in Japan to reach the roughly 30 percent it had before the Fukushima crisis, gradually reducing the reliance on oil, he said.

While the zero-nuclear scenario assumes a sharp increase in the share of renewable energy, it would similarly take decades for renewable sources — whose research has indeed been continued since the days of the 1970s oil crises without much success in terms of securing a substantial volume of power generation — to make up for the gap left by ending nuclear power, Sawa noted.

Japan's current basic energy plan, which was set in 2010 by the same DPJ-led government then under Prime Minister Yukio Hatoyama, called for increasing the share of nuclear power to 53 percent and that of renewables to 19 percent by 2030.

This plan, created for the purpose of achieving Hatoyama's call for reducing Japan's greenhouse gas emissions by 25 percent from the 1990 levels by 2020, in itself was problematic in that relying more than half of Japan's power supply on a single source — nuclear — would result in severe nationwide supply disruptions in case problems emerge in nuclear reactors, just as the oil supply was disrupted during the 1970s oil crises, he said.

New no-nukes party?

November 26, 2012
Shiga governor mulls new no-nuclear party

Move might rally others unwilling to bend on 'third force' objectives

http://www.japantimes.co.jp/text/nn20121126x1.html

Kyodo

OTSU, Shiga Pref. — Shiga Gov. Yukiko Kada is considering founding a new political party with the key goal of phasing out nuclear power, sources said Monday.

Although Kada didn't make it official when she met the press in Otsu in the afternoon, her reported move to create a new party ahead of the Dec. 16 Lower House poll quickly drew attention from other small parties that aren't fitting into the major "third force" that has been evolving around Nippon Ishin no Kai (Japan Restoration Party) led by ex-Tokyo Gov. Shintaro Ishihara and Osaka Mayor Toru Hashimoto.

Ichiro Ozawa, the ex-Democratic Party of Japan kingmaker who now heads Kokumin no Seikatsu ga Daiichi (People's Life First), is reportedly trying to sound out Kada about forming a new force by merging his party and other small forces that oppose restarting any reactors and are against the sales tax hike and Japan's participation in the Trans-Pacific Partnership free-trade accord.

Ozawa left the option open Monday for a possible tieup with Kada's planned party, telling reporters, "If she launches a new party and calls for an alliance, we will decide on our moves based on the policy of the new party."

Another small party led by Nagoya Mayor Takashi Kawamura and veteran lawmaker Shizuka Kamei is also considering teaming up with Kada, separate sources said. The Kawamura-Kamei force is also antinuclear, antitax and anti-TPP.

Shiga Prefecture could be easily tainted by radioactive fallout if any of the several reactors in neighboring Fukui are hit by meltdown, thus Kada's move just about a week before the start of official campaigning for the Dec. 16 Lower House poll adds a new twist to the equation.

The sources said Kada hopes to call on legislators and others who back her goals to join her party and to run it without relinquishing the governorship.

Ozawa's and Kawamura's parties are also reportedly eyeing a tieup and want the Green Wind Party that was formed this month by defectors from the ruling coalition, including Kuniko Tanioka, to join. By making all these moves, small parties hope to differentiate themselves from Nippon Ishin, which is pushing increasingly conservative policies now that Ishihara is at the helm.

Anti-nuclear parties seek unity before election
http://www3.nhk.or.jp/daily/english/20121126_24.html

Anti-nuclear minority parties in Japan are seeking to unite for next month's Lower House election. Some of them are looking to an anti-nuclear governor to head a new party that would assemble all like-minded forces.

Three parties in the opposition bloc, including People's Life First, are considering seeking the cooperation of Governor Yukiko Kada from Shiga Prefecture.

Kada argues that nuclear policies should be the focal issue in the upcoming election, because it is the first election after the nuclear accident at the Fukushima Daiichi plant. Sources close to her say she is willing to work on a campaign against nuclear power.

Some within these minority parties say they should join a new party if she forms one.

Japan to keep to its pledge regarding greenhouse gas reduction

November 27, 2012
Japan won't retract pledge to cut greenhouse gas emissions by 25%
http://mainichi.jp/english/english/newsselect/news/20121127p2a00m0na001000c.html

DOHA, Qatar -- Japan has decided not to retract its international pledge to cut its greenhouse gas emissions by 25 percent from 1990 levels by 2020, as the 18th session of the United Nations Climate Change Conference (COP18) kicked off here in the Qatari capital on Nov. 26.

Japan will make a formal decision at a committee meeting of its Cabinet members concerned on Nov. 27. Although the Doha climate conference is set to discuss a new global deal to replace the Kyoto Protocol, Japan could weaken its influence in the upcoming negotiations by keeping the unattainable target intact.

The Doha conference on the U.N. Framework Convention on Climate Change is gearing up for final talks on measures to combat global warming in a second commitment period of the Kyoto Protocol as its first commitment period expires before the end of this year.

Abdullah bin Hamad al-Attiyah, chairman of the Qatari Administrative Control and Transparency Authority, who presides over the Doha climate conference, urged delegates from around the world to strive to reduce the effects of global warming and ensure the safety of future generations.

In 2009 -- before the outbreak of the Fukushima nuclear crisis -- then Prime Minister Yukio Hatoyama made an international pledge on behalf of the Japanese government to cut the country's greenhouse gas emissions by 25 percent from 1990 levels by 2020. That pledge was made on the assumption that more nuclear reactors would be built in the country in the future. But because of the disaster at the Fukushima No. 1 Nuclear Power Plant, Japan's emissions target has become increasingly difficult to achieve.

In September, the government drew up the "Innovative Strategy for Energy and the Environment" aimed at phasing out nuclear power by the 2030s. But the government postponed its decision on the ratio of nuclear power in relation to the country's total power generation for 2020. The Ministry of the Environment had planned to thrash out a new greenhouse gas emissions target by the end of this year, but it became unclear whether a new target could be set anytime soon because Prime Minister Yoshihiko Noda dissolved the House of Representatives earlier this month for a snap election set for Dec. 16.

Furthermore, the government said in its strategy that it would aim at reducing greenhouse gas emissions by an estimated 5 to 9 percent from 1990 levels by 2020. According to these figures, Japan won't be able to reduce greenhouse gas emissions by 25 percent from 1990 levels even if it buys emissions credits from other countries.
Noda said in October that it would be difficult to achieve the target.

However, the government has no plans to withdraw its international pledge, saying it will carefully consider the matter while keeping in mind the possible impact on international negotiations. A government official said, "If we were to announce a plan to lower the target, we would take nothing but a huge bashing. There is no merit in doing that." Nevertheless, the government has not come up with specific measures to achieve the target.

Hashimoto - Disappointing on nuke policy

November 27, 2012

Voters' choice: Fukushima town crowd disappointed by Hashimoto's weak anti-nuclear stance

Toru Hashimoto gives an outdoor talk in Aizuwakamatsu, Fukushima Prefecture, on Nov. 27. (Mainichi)
拡大写真
http://mainichi.jp/english/english/newsselect/news/20121127p2a00m0na009000c.html

FUKUSHIMA -- Japan Restoration Party (JRP) acting leader Toru Hashimoto gave an election campaign speech on the streets of Aizuwakamatsu, Fukushima Prefecture, on Nov. 27 for the first time since the outbreak of the Fukushima nuclear disaster, eliciting hope from voters in his ability to get things done, but disappointment over his party's apparent retreat from its strong anti-nuclear stance following its merger with the short-lived Sunrise Party.

Among the onlookers who turned up to listen to Hashimoto as light snow fell in the area was a 72-year-old farmer from the Fukushima Prefecture town of Aizubange.

"I want an end to nuclear power plants, so I came to listen to his nuclear power plant policies," the 72-year-old said in front of the JRP's campaign office at the foot of Iimori Hill in Aizuwakamatsu. However, referring to the hill's history as the scene where members of the Byakkotai teenage samurai unit committed suicide during the Boshin War of 1868-69 that played a part in the restoration of Imperial rule, he added, "I've got mixed feelings about 'Restoration' (in the party's name) in a place watched over by the Byakkotai."

The JRP office announced that about 800 people turned up to hear Hashimoto, but to reporters, the number appeared to be between about 200 and 300.

Hashimoto attracted the attention of residents at the start of his 17-minute speech by stating, "We don't see Aizu as an opponent" -- an apparent reference to the region's history of victimization over the course of the Meiji Restoration. He went on to address criticism in the media that his party had stopped trumpeting a "zero nuclear" policy since its merger with former Tokyo Gov. Shintaro Ishihara's Sunrise Party.

"Our way of thinking hasn't changed one bit," he said, adding, "None of the other parties have provided concrete plans."
However, some residents remained cautious.

"He's a good speaker, but what he says doesn't differ that much from other politicians," said a 72-year-old woman from Aizuwakamatsu who turned up. Commenting on the party's anti-nuclear policies, she added, "It's probably all for the election."

A total of 2,850 people who evacuated from the Fukushima Prefecture town of Okuma following the outbreak of the disaster at the Fukushima No. 1 Nuclear Power Plant now live in Aizuwakamatsu. One 60-year-old evacuee who listened to Hashimoto's speech commented, "It's a shame he didn't get down to the details (of the nuclear issue) in his overview. I wanted him to provide a numerical target for eliminating nuclear power plants. He didn't touch on how to deal with Fukushima -- which could be due to the gap

between his enthusiasm for major cities and for regional areas. He was stressing his ability to get things done. I'll have to wait a bit to see how that turns out, but I hope he does well."
Another woman in her 60s who lives in a temporary housing complex about 1 kilometer away from where Hashimoto spoke commented, "I'm worried about cuts to welfare and so on. The flip side of his ability to get things done is the fear of not knowing what he'll do. I want to calmly assess the situation," she said.

On Nov. 26, Hashimoto spoke for over an hour at a hotel in the city, but it was only during the last six minutes of his talk that he touched on the JRP's nuclear policies. Though the talk was dubbed a "town meeting," there was no chance for participants to ask questions.

The debate on nukes

November 29, 2012
Editorial: In-depth discussions needed on nuclear power
http://mainichi.jp/english/english/perspectives/news/20121129p2a00m0na010000c.html

The founding of a party opposing nuclear power is likely to fuel further debate on whether Japan should rely on such an energy source.

Shiga Gov. Yukiko Kada has founded the Japan Future Party on an anti-nuclear power platform and a few other small parties, including the People's Life First Party, led by political kingpin Ichiro Ozawa, are set to join the new group.

Since a departure from dependence on nuclear power is the core of the Japan Future Party's platform, key points of contention during the campaign for the upcoming House of Representatives election have become clearer. All political parties should boldly respond to the challenge by the new party and actively debate the issue of nuclear power and Japan's future energy policy.

The integration of anti-nuclear power forces, triggered by the establishment of the Japan Future Party, came all of a sudden as attention had been focused primarily on the moves of the Japan Restoration Party (JRP) among parties aiming to form a third political force.

The People's Life First Party, which has nearly 50 legislators, promptly decided to disband itself to amalgamate with the new party, while members of the now defunct Genzei Nippon (Tax Cut Japan), which had initially sought to join hands with former Tokyo Gov. and now JRP leader Shintaro Ishihara and his allies, are set to team up with Kada.

One cannot help but wonder about the role of political parties as disbanding and integration continue prior to the Dec. 16 general election.

Still, the significance of the new party making the issue of nuclear power the most important point of contention and fielding candidates in the lower house race should not be underestimated.

Kada explained that she set up the new party to represent voters who want to end Japan's reliance on nuclear power, saying, "There's no other political party that such voters can cast their ballots for."

The direction of Japan's energy policy should be the focal point at issue during the lower house race, considering lessons learned from the Fukushima nuclear disaster.

Therefore, voters will strictly scrutinize the new party's specific plan to achieve "departure from dependence on nuclear power" and its feasibility. Kada said the new party will aim to shut down all nuclear power stations in Japan by 2022. This is more thorough than the DPJ's goal of ending Japan's reliance on atomic power by the 2030s.

In order to wipe away suspicions that the merger is aimed solely at attracting votes, the Japan Future Party needs to work out standards for reactivating idled nuclear reactors and show how to solve problems involving the nuclear fuel cycle project, as well as a road map toward the introduction of renewable energy and prospects for the costs of future power generation.

It goes without saying that the new party must also show the entire picture for its diplomatic and domestic policies. A group that opposes the consumption tax increase and Japan's participation in the Trans-Pacific Partnership (TPP) will merge with the Japan Future Party, but if the new party only opposes government policies, it cannot fulfill its responsibilities as a political party.

Ozawa, a former DPJ leader, reportedly played a key role in founding the Japan Future Party. Since Kada intends to stay on as Shiga governor, whether the party can prevent a two-tier power structure will be called into question. The party also needs to show who will be its candidate for prime minister and the government framework it pursues.

It is highly likely that the third political force separate to the two main parties will be split basically into the Japan Future Party, the JRP and Your Party. These parties should show clear direction so that they can play a key role in political realignment and actively compete in the campaign for the lower house election.

Debate over nukes only just starting

November 29, 2012

Parties battling over nuclear policy

http://www3.nhk.or.jp/daily/english/20121129_11.html

Japan's political parties are stepping up debate over the country's nuclear policy in the run-up to next month's Lower House election.

Shiga Prefectural Governor Yukiko Kada launched a new anti-nuclear party on Wednesday. She is joined by 49 lawmakers from the opposition People's Life First party.

Kada told reporters that her party aims to phase out nuclear power by 2022, by creating a program to improve energy efficiency and to separate power generation from power distribution.

The ruling Democratic Party has pledged efforts to achieve zero reliance on nuclear power in the 2030s, and that it would allow only reactors confirmed safe by the Nuclear Regulation Authority to restart.

The opposition Communist and Social Democratic Parties want all nuclear plants shut down.

The main opposition Liberal Democratic Party has pledged to establish the best energy mix for Japan within 10 years. It says it would be irresponsible to decide now whether to eliminate nuclear power, considering its impact on people's lives and the economy.

The LDP also says it will decide within 3 years whether to restart the country's nuclear reactors.

Among the so-called third force movement, the Japan Restoration Party, whose leader is former Tokyo governor Shintaro Ishihara, advocates zero reliance on nuclear power, and calls for cutting off power grids from existing power companies to encourage participation of new distributors.

Your Party wants full liberalization of the power industry, which it claims would result in the shutdown of all nuclear plants in the 2020s.

The deputy head of the Japan Restoration Party, Toru Hashimoto, has voiced skepticism about the nuclear phase-out policy of Kada's new party.

Hashimoto said the new party's claims are largely the same as his party's, but Japanese politicians today cannot achieve what they've said.

Elections and nukes

November 30, 2012

Poll platform revised to pursue new Constitution

Nippon Ishin qualifies nuclear phaseout goal

http://www.japantimes.co.jp/text/nn20121130a1.html

By NATSUKO FUKUE
Staff writer
Nippon Ishin no Kai (Japan Restoration Party), the "third force" emerging as a serious challenger to the political status quo, unveiled a watered-down version of its election platform Thursday devoid of a definitive road map for phasing out nuclear power.

Instead, the party merely stated in a separate document that nuclear power plants are to "fade out by the 2030s" — the same goal that Prime Minister Noda's Democratic Party of Japan has included on its platform.

When Nippon Ishin founder and Osaya Mayor Toru Hashimoto agreed to merge parties with pronuclear former Tokyo Gov. Shintaro Ishihara's short-lived party in late November, Nippon Ishin's nuclear phaseout clause disappeared, prompting speculation the omission would become permanent.

The platform released Thursday also contains a provision for drafting a new Constitution — apparently a concession from Hashimoto, now the party's deputy leader, to the more experienced Ishihara, the unabashed nationalist responsible for escalating the Senkaku dispute with China and Taiwan.

When asked why his party won't present a clear-cut time frame for eliminating nuclear power, Hashimoto said it would take several years to come up with a detailed road map.

"The bureaucrats are the ones who would map out a road map," Hashimoto told a news conference. "Politicians are the ones who show" which direction policies should take, he said, implying that setting a time frame wasn't his party's responsibility.

Ishihara has said the amount of energy the economy actually needs must be calculated before making such a decision. Hashimoto expounded on that.

"Ever since the accident (at the Fukushima No. 1 plant) happened, we have had to re-examine" our energy policy, but "what matters most is whether we can actually realize (a nuclear phaseout)," he said.

The move came a day after Shiga Gov. Yukiko Kada officially formed Nippon Mirai no To (Japan Future Party) and said its primary aim will be to phase out nuclear power by 2022.

Nippon Ishin's diluted platform states it will aim to create a nation not reliant on nuclear power, set stricter safety standards and promote the liberalization of the electricity market.

It also says it will promote participation in the Trans-Pacific Partnership free-trade talks but oppose them "if it would be against the national interest."

TPP entry is also a DPJ goal.

Nippon Ishin also pledged to draft a new Constitution and ease restrictions on arms use by Self-Defense Forces personnel during peacekeeping missions.

SDF personnel are allowed under the Peacekeeping Operation Law to use weapons only in legitimate self-defense situations. They are forbidden from using arms, for instance, to rescue fellow citizens or counter attacks on other countries' troops.

Before merging with Ishihara's party, Nippon Ishin advocated halving the size of the Lower House to 480 members and limiting their responsibilities to such fields as diplomacy, but Thursday's platform softened that goal to a reduction of 30 to 50 percent.

It also proposed a rule change for the Upper House that would lift the ban on councilors concurrently holding Diet and local government posts — a change that would allow Hashimoto, for instance, to run in the Upper House election next summer while still being Osaka's mayor.

Highlights of the party's platform

Nippon Ishin no Kai (Japan Restoration Party) will:

Create a Japan-initiated Constitution, as the current one was imposed by the United States after World War II.

Raise the consumption tax to 11 percent and make it a local tax.

Participate in negotiations for the Trans-Pacific Partnership but leave open the possibility of withdrawing if the free-trade pact goes against Japan's interests.

Set a monetary policy agreement between the government and the Bank of Japan as part of price-stabilizing measures.

Scrap the rule that bans governors and mayors from doubling as Upper House lawmakers.

Ban politicians from accepting corporate donations while promoting a system to encourage individuals to contribute.

Party leaders debate nuclear energy

http://www3.nhk.or.jp/daily/english/20121130_11.html The leaders of 10 Japanese political parties took part in an online TV debate on Thursday. They exchanged opinions on nuclear energy policies in the run-up to next month's general election.

Prime Minister Yoshihiko Noda, the head of the governing Democratic Party, said Japan obtained nearly 30 percent of its energy from nuclear power before last year's March 11th disaster. He said it will be impossible to achieve zero dependency immediately or even in 10 years.

The head of the main opposition Liberal Democratic Party, Shinzo Abe, said stable and low cost power supplies helped Japan to achieve high economic growth.

Abe said the decision on whether to restart nuclear reactors that are now offline should be made in the next 3 years. He said he wants to study the optimal balance of energy sources for the country over the next 10 years.

Yukiko Kada, who leads the newly launched Tomorrow Party, said her party wants to end the use of nuclear power in 10 years. She said she will promote the development of renewable energy sources, and work on energy-saving measures for the entire country.

The New Komeito party's Natsuo Yamaguchi said existing nuclear plants should undergo thorough safety inspections. He said the public's approval will be needed to restart nuclear reactors.

Kazuo Shii of the Japanese Communist Party said his party will make the immediate end of nuclear power a reality.

Yoshimi Watanabe of Your Party said increasing competition in the power industry through drastic deregulation should prompt utilities to give up nuclear power, resulting in zero nuclear dependency in the 2020s.

The Social Democratic Party's Mizuho Fukushima said she hopes to win public support to end nuclear power generation. She said her party will oppose the restarting of nuclear reactors.

Muneo Suzuki of New Party DAICHI said his party will work to end the use of nuclear power. He said constructing natural gas pipelines from Russia and building storage facilities in Hokkaido can provide ample energy sources for Japan.

Yasuo Tanaka of New Party Nippon said thermal and hydraulic power generation can cover Japan's energy needs.
Shozaburo Jimi of the People's New Party said nuclear reactors whose safety has been confirmed by the

Nuclear Regulation Authority should be allowed to resume operations.

The leaders of the Restoration Party and the New Renaissance Party did not participate in the debate.

The Restoration Party says it will promote the separation of electricity generation and distribution along with other measures to reduce Japan's dependency on nuclear energy.

The New Renaissance Party says it wants to develop renewable energy sources, and will end nuclear power generation in the near future.

Mitsubishi-Hitachi collaboration

MHI, Hitachi to mull tie-up over nuclear business
http://www3.nhk.or.jp/daily/english/20121130_18.html

Two major Japanese plant makers, Mitsubishi Heavy Industries and Hitachi, are considering expanding their collaboration amid heating competition in emerging markets.

On Thursday, the 2 companies announced a plan to launch a thermal power joint venture in January 2014. Mitsubishi Heavy Industries or MHI will own 65 percent of the new company, Hitachi will own the rest.

In the news conference, the heads of 2 makers referred to further collaboration. MHI President Hideaki Omiya said he wants to have a tie-up in nuclear plant business after the issue is settled over reactivation of domestic nuclear plants that are now offline.

Hitachi President Hiroaki Nakanishi echoed that they will explore for the best way for collaboration.

The 2 makers are already collaborating in hydropower, railway and other infrastructure businesses mostly in emerging markets.

Ishihara's party in trouble

December 3, 2012

ELECTION 2012

Ishihara nuke flip-flop puts party in crisis

http://www.japantimes.co.jp/text/nn20121203a3.html

By ERIC JOHNSTON
Staff writer

OSAKA — With the kickoff of the Dec. 16 Lower House election campaign just one day away, Nippon Ishin no Kai (Japan Restoration Party) is in chaos after party leader Shintaro Ishihara declared Friday that he would revise a promise to abolish nuclear power by the 2030s.

The former Tokyo governor's declaration is adding to a growing sense in and outside the party that the decision to merge with Osaka Mayor Toru Hashimoto's party was a mistake.

At a debate involving 11 party leaders Friday, Ishihara surprised everyone when he said he would revise its promise to phase out nuclear power.

The staunchly pronuclear Ishihara has long had differences on this issue with party founder Toru Hashimoto, who pushed for abandoning atomic power by the 2030s before joining forces with Ishihara last month.

Nippon Ishin's No. 3 man, Ichiro Matsui, said in Osaka later Friday that the party's manifesto would not be revised.
"The manifesto was announced in front of everybody, including Ishihara and Hashimoto. It's the decision of Nippon Ishin no Kai," Matsui said, even as he admitted that parts of it were not fully explained to Ishihara.

Other parties lost no time in attacking Nippon Ishin. "Changing your basic policy every day like it's a daily lunch special is, from the viewpoint of other political parties, a problem. It's not something that will be accepted because it's Ishihara," said Jun Azumi, deputy secretary general of the Democratic Party of Japan.

Finally, Hashimoto responded to Ishihara's statement Sunday by saying the party "aimed" to see nuclear power abolished by the 2030s, but that there would be no revision to the manifesto wording.

He also conceded that if stringent safety conditions were met it would be possible to restart the existing nuclear reactors.

"If the world's highest safety standards are in place, along with a system to check the reactors, and a method of disposing of spent nuclear fuel is established, a restart is possible," Hashimoto said on a TV program Sunday.

But perhaps worse for Nippon Ishin than the nuclear tussle is the growing number of people calling on Hashimoto, publicly and privately, to lead the party back to its roots by cutting ties with Ishihara.

Former trade minister Shigeaki Koga, formerly a close adviser to Hashimoto, spoke for many in the party when he said on his Twitter account that Hashimoto needs to admit he shouldn't have joined forces with Ishihara and his allies.

What place for nuclear power?

December 2, 2012

Party leaders butt heads over N-power vision / Discussions draw out key differences in campaign pledges over future of nuclear energy dependence

Hiroshi Yumoto and Osamu Kawakami / Yomiuri Shimbun Staff Writers

http://www.yomiuri.co.jp/dy/national/T121201003190.htm

Heads of 11 political parties staged heated discussions Friday on key issues facing the House of Representatives election, including nuclear power generation and negotiations on the Trans-Pacific Partnership framework.

The debate was held at the Japan National Press Club in Chiyoda Ward, Tokyo, and came against the backdrop of a looming lower house election this month.

Regarding the place of nuclear power in the country's future energy policy, most parties called for "abolition" of nuclear power, "graduation from" nuclear power or "denuclearization" in their campaign pledges.

Major policy statements by heads of 4 political parties at Nov. 30 debate

	Prime Minister Yoshihiko Noda (DPJ head)	LDP President Shinzo Abe	Nippon Ishin no Kai head Shintaro Ishihara	Nippon Mirai no To head Yuichi Kato
Nuclear power/energy issues	As for [the party's] future direction, we decided in a Cabinet meeting to fully utilize policy resources toward the goal of ending use of nuclear power in the 2030s. We'll steadily move toward implementing that decision.	We'll build a society that does not depend on nuclear power, but a responsible political party does not speak lightly about reducing it to zero.	It's [only] a sort of desire if [people talk about] such things as keeping a certain percentage [of nuclear power] or completely ending [its use] without thinking about how energy should be allocated. We'll consider whether we should weed out nuclear power through trials simulating [the country's future energy composition].	We'll "graduate from" nuclear power, which contaminates the Earth and deprives people of their homes. We'll aim for graduation in 10 years.
Economic and fiscal policies	We'll set the price increase target at 1% for the time being. We'll sow the seeds of high-growth fields such as medical services and agriculture, forestry and fisheries industries instead of pork-barrel projects.	We'll set the inflation target at 2% in place of the Bank of Japan's conventional monetary easing policies. We aim at ending deflation, correcting the yen's strength and setting up growth strategies.	[The Tokyo metropolitan government] has managed to reconstruct its fiscal condition as a result of introducing external auditing.	Our basic policy will be to expand domestic demand. We'll enhance women's ability to work and make use of their sensitivity and ideas.
Trans-Pacific Partnership agreement	Japan will become a greater trading nation. The stance on protecting national interests will be key in [discussing] the TPP.	We'll analyze the issue while making related announcements. We'll deal with the issue while closely examining whether it will be possible to overcome [the condition] of abolishing all tariffs without any exceptions.	"Made no comments. [At the Foreign Correspondents' Club of Japan on Nov. 20, Ishihara said: "We're basically for [the TPP]. We've not opposed to free trade. However, there are some fields that are unacceptable."	We're opposed to opening [the market] without limits. We can't help but be cautious about [opening certain fields] that could impinge upon our social systems, such as medical and insurance services.

However, the Liberal Democratic Party stopped short of clearly pledging to end nuclear power dependence. "If you take this problem seriously, you shouldn't mince words," LDP President Shinzo Abe said sarcastically about other parties' stances to halt nuclear power.

He then flatly rejected the argument that the country should use such renewable energy sources as solar and wind power in place of nuclear. "We can't rely on renewable energies that haven't been developed yet," Abe said.

What makes the LDP's campaign pledge unique is the emphasis on "responsibility for people's livelihood," so as not to cause undue suffering to society due to power shortages and other problems while aiming at realizing a society and economy not dependent on nuclear power.

Specifically, the LDP campaign pledge stated the party would determine whether to resume operation of all nuclear reactors in the country within three years; and establish a sustainable "best mix of power sources" within 10 years.

===

Noda: Listen to society

But Prime Minister Yoshihiko Noda, leader of the ruling Democratic Party of Japan, outright rejected Abe's remarks as being out of touch with society's wishes.

"The public is determined to end nuclear power dependence and the operation of nuclear reactors. We should sincerely accept [such a sentiment] and promote feasible policies and measures [toward that

end]," Noda said. The DPJ states in its manifesto for the upcoming lower house election that it aims to achieve "zero nuclear power generation" in the 2030s.

Meanwhile, Noda said there is no option but to continue a nuclear fuel reprocessing program. "We need technology and human resources to decommission nuclear plants," he said.

However, if the government touts a policy of denuclearization, it will be difficult to attract human resources for nuclear power-related research, observers said.

Nippon Mirai no To (Japan future party) advocates the country "graduate from" nuclear power generation, with an eye toward eventually abolishing all nuclear power plants.

However, the stances of both the DPJ and Nippon Mirai no To both leave the path to the future ambiguous.
"To begin with, we must 'graduate from' nuclear power generation, which contaminates the Earth and deprives people of their homes," Mirai no To leader Yukiko Kada said.

The party said it aims to abolish nuclear power generation within 10 years. Kada cited reducing the total power consumption as a concrete measure toward zero nuclear power dependence. Household electricity consumption has doubled in the past 20 years.

On this basis, Kada said the party will make efforts to develop renewable energy and make more efficient use of fossil fuels.

===
Intraparty division exposed

During the discussions, Nippon Ishin no Kai (Japan Restoration Party) revealed intraparty disagreement over nuclear policy.

In its platform, the party states as a policy example that "existing nuclear plants would fade out by the 2030s." However, Ishin no Kai leader Shintaro Ishihara launched into his view about maintaining them, saying, "Abolishing all nuclear plants is a sort of desire."

When asked about the term "fade out," he said, "What do you mean by 'fade out?'" then added: "That's not true. I had the pledge corrected."

As Ishin no Kai acting leader Toru Hashimoto has already said he favors denuclearization, the party used the term "fade out" to paper over differences between Ishihara and Hashimoto, the party's poster boys, according to observers.

Ishin no Kai Secretary General Ichiro Matsui denied Ishihara's remark that the term "fade out" had been "corrected."
"The party's leader and acting leader confirmed [the term] together and announced the party's platform. It was the party's decision," Matsui told reporters Friday in Osaka.

===
Abe TPP stance unclear

In Friday's debate between political party leaders, both Noda and Abe failed to clarify their parties' stances on the Trans-Pacific Partnership free trade issue, probably because both parties have conflicting internal opinions.

"Will [the LDP] step on the gas or put on the brake?" Noda asked rhetorically about the issue. "I can't see [the party's stance]. Please give me a clear answer."

Noda pressed Abe hard to clarify the LDP's stance on participation in the TPP talks.

Abe hit back, saying: "Eliminating tariffs without exceptions is tantamount to saying we must give up our tariff autonomy. Why wasn't there any prior coordination [between Tokyo and Washington]? Because the DPJ-led administration has ruined the relationship of trust in the Japan-U.S. alliance."

Abe insisted that if the Japan-U.S. alliance had been firm, the government could have made prior arrangements with the U.S. side to ensure exceptions in farm and other products concerning the elimination of tariffs.

However, Abe's rebuttal only gave the impression he was evading Noda's question.

Noda, for his part, also backed away from earlier expressions of determination to participate in the TPP talks and sounded more in line with the DPJ's campaign pledges, which use the expression "the

government will determine" whether Japan will participate in the TPP talks. During Friday's debate, Noda did not deviate from the party's manifesto.

Meanwhile, Kada clearly showed her opposition to Japan's participation in the TPP talks. "We must be cautious about the TPP, which could have an unwelcome impact on Japan's social systems, which have created peace of mind among the people about such things as the medical and insurance systems," Kada said.

Some observers believe Kada made the statement out of consideration for the anti-TPP stance of former DPJ leader Ichiro Ozawa, who is expected to join Kada's party by disbanding his own People's Life First party.

Ishihara did not refer to the TPP issue in the debate. Hashimoto supports TPP participation, but Ishihara has been cautious about the issue. Some observers said Ishihara did not refer to the issue in the debate because his views on the issue differ from those of Hashimoto.

It won't be easy to eliminate nukes

December 3, 2012

Nuclear power issue no easy nut to crack, but parties must have solid plan to try

http://mainichi.jp/english/english/perspectives/news/20121203p2a00m0na012000c.html

Depending on how the public's views change in the days leading up to the House of Representatives election, the newly formed Tomorrow Party of Japan (TPJ) and Japan Restoration Party (JRP) could come away with a significant number of seats and even participate in the next administration.

The TPJ is slamming on the gas toward the abandonment of nuclear power, while the JRP has stepped on the brakes. They appear to be heading in opposite directions, but they've taken a similar approach in bringing in ready-made leaders for battle.

Putting aside how long it will take, it does not look like it will be easy for either party to eliminate nuclear power. The party leaders' public image and smooth talk alone will not be enough to surmount the three massive obstacles of Aomori Prefecture, Britain and the United States.

Like the TPJ and JRP, the Democratic Party of Japan (DPJ) initially set off with a mishmash membership, and while imperfect, united and took on the challenge of eliminating nuclear power. It was, however, struck down by the following three obstacles.

First, there was Aomori Prefecture, where the nation's only facilities capable of reprocessing spent nuclear fuel generated by nuclear power plants are located. If Japan were to adopt a national policy toward eliminating nuclear power, Aomori Prefecture said it would no longer accept spent nuclear fuel inside its borders.

Why not? If spent nuclear fuel continued to be transported to Aomori even as fuel reprocessing became unnecessary due to the abandonment of nuclear power, Aomori would turn into a nuclear waste disposal site. Hence, Aomori made it clear it would not accept spent nuclear fuel if the country institutes a denuclearization plan. If that were to happen, however, municipalities hosting nuclear power plants would face the problem of turning into nuclear waste disposal sites themselves.

Because there was nowhere to put dangerous waste, leaders turned a blind eye to the problems and risks and continued running a shoestring operation. The DPJ was unable to change this perilous structure.

Britain was another obstacle that the DPJ faced. Japan commissions Britain and France to reprocess spent nuclear fuel. The high-level radioactive waste generated is set to be transported to an interim disposal site in Aomori Prefecture starting at the end of this year. If a non-nuclear policy were adopted and Aomori refused to take in any nuclear waste, ships carrying the nuclear waste would not be able to leave Britain.

This urgent state of affairs was precisely why the Noda administration was forced on Sept. 19 to announce the contradictory policy of continuing spent fuel reprocessing even as it aimed for zero nuclear power. According to inside sources, Cabinet members only realized this quandary a couple weeks prior to the decision.

Finally, there was protest against continued nuclear fuel reprocessing from the U.S., which is extremely sensitive to nuclear proliferation. If not to use in nuclear reactors, what, it asked Japan, could the purpose of plutonium generated through spent fuel reprocessing be, besides the production of nuclear weapons? I don't know whether the U.S. argued that a non-nuclear-but-continued-reprocessing policy taken by Japan would undermine the united front against Iran and North Korea, but in any case, it has urged Japan to continue operating its nuclear reactors.

The above three factors resulted in the Noda administration's toning down of its zero nuclear policy. The administration was able to present its vision on the future of renewable energy and an economic revitalization strategy, but failed to get at the root destabilizing domestic and foreign industries and military foundations. And it's questionable whether the TPJ or JRP will be able to accomplish what the DPJ has failed to do.

There is little ambiguity in the TPJ's arguments. However, the public has just witnessed how a once-fresh DPJ administration failed to live up to its heartfelt vows.

Meanwhile, as the JRP has broadened its appeal, its arguments have become cloudier. Acting party leader Toru Hashimoto has called for the abandonment of nuclear policy, while party leader Shintaro Ishihara has called a zero nuclear policy "absurd." How much more muddled can a party line get?

To be fair, collaboration between the Liberal Democratic Party (LDP) and New Komeito also has its inconsistencies, and not only in its views toward the establishment of a national military. The LDP has not addressed nuclear power at all, while New Komeito is calling for its abandonment.

Regardless of who takes the reins of government, it will not be easy to carry out reforms that shake Japan's industrial foundations and the international management of nuclear materials. It's not a matter that can be dealt with by closing one's eyes to the fundamental issues and worrying about electricity costs. This is an election in which we must come to understand the seriousness of the problem of nuclear waste. (By Takao Yamada, Expert Senior Writer)

Phasing-out nukes just a "springboard for discussion"?

December 3, 2012

Nuclear power phase-out is not a campaign promise: Hashimoto

http://mainichi.jp/english/english/newsselect/news/20121203p2a00m0na016000c.html

Osaka Mayor Toru Hashimoto said Dec. 2 that phasing out nuclear power by the 2030s is a springboard for discussion and is not a campaign promise of the Japan Restoration Party (JRP) for the Dec. 16 general election.

Appearing on private TV programs, Hashimoto, deputy chief of the JRP, also said his party will approve the restarts of idled nuclear reactors if these reactors meet safety standards and other conditions.

The JRP spelled out a nuclear phase-out by the 2030s as one of its policy examples incorporated in documents attached to an election campaign platform the party released Nov. 29.

But during a debate with 10 other party leaders on Nov. 30, JRP leader and former Tokyo Gov. Shintaro Ishihara took issue with the nuclear phase-out and said he will change it.

Hashimoto, appearing on a TV Asahi news program, stressed the importance of the election campaign platform and said politicians are not tasked with setting a target year for abandoning nuclear power. He added that a time frame and a road map should be set by bureaucrats and experts.

During a Fuji TV news program, Hashimoto said it will be possible to restart nuclear reactors if Japan draws up safety standards of the highest level in the world, puts a strict checking system in place and decides on ways to handle spent nuclear fuel.

What are they saying exactly?

December 3, 2012

Third force' leaves nuclear issue unclear / Mirai no To, Ishin no Kai party executives contradict themselves, one another in policy statements

The Yomiuri Shimbun

http://www.yomiuri.co.jp/dy/national/T121202003699.htm

Statements by Nippon Mirai no To head Yukiko Kada over restart of nuclear reactors

April 6	"I don't understand why [the central government] is in a hurry to reactivate" reactors. (To reporters at the Shiga prefectural government office)
June 6	"The restart of nuclear reactors should be limited to times when power supplies are tight." (In the "renewed proposal for nuclear policies for national understanding," released jointly with Kyoto governor)
Nov. 27	"[Japan] will lose its dignity as a nation if it promotes nuclear policies merely for the sake of economic efficiency, and ignores its heavy responsibility for the Fukushima accident." (At a press conference to announce the party's launch)
Nov. 28	"We'll bring the number [of reactors] to zero as soon as possible. We envisage [realizing this goal] in 10 years, or by 2022." (In a TBS program)
Dec. 1	"We'll [approve the reactivation of reactors] when the Nuclear Regulation Authority guarantees their safety and the government insists reactivation is necessary." (In a YTV program)
	"There are a number of extremely difficult conditions for [allowing] the restart of reactors, just like passing a thread through the eye of a needle. It's so difficult, and there is no need to do that." (To reporters in Tokyo)

Statements by Nippon Mirai no To (Japan future party) and Nippon Ishin no Kai (Japan Restoration Party) on nuclear energy have sown confusion, exposing the policy ambiguities of "third force" parties hurriedly put together ahead of the House of Representatives election.

Campaigning for the lower house election is set to officially kick off Tuesday, to be followed by voting on Dec. 16.

The day before announcing the party's campaign pledges Sunday, Nippon Mirai no To head Yukiko Kada made a controversial statement suggesting the party would approve the restart of nuclear reactors but later corrected the comment.

The party's campaign pledges called for completely decommissioning nuclear reactors within 10 years and freezing the consumption tax hike law.

Yet on a YTV program that aired Saturday morning, Kada suggested conditionally approving the restart of nuclear reactors.

She said the party would approve reactivation if safety were ensured and the government insisted reactivation was necessary, assuming that the Nuclear Regulation Authority set new safety standards.

But she corrected her statement later the same day, saying it had been misleading.

"There are a number of extremely difficult conditions to [allow the restart of reactors], just like passing a thread through the eye of a needle," she said. "It's very difficult, and there's no need to do it [restart reactors]."

After Kada's comments had been reported by the media, a number of messages were posted on Mirai no To websites.
"I want the party to promise us not to allow reactivation," one message said. "If you make this point ambiguous, it will make it difficult for us to see the difference from other parties."

Another one said: "Don't approve reactivation. Without that pledge, the party will no longer be Mirai no To."
If Nippon Mirai no To's image as a pro-denuclearization party dwindles, it will undoubtedly diminish the party's strength.
Kada corrected her statement by announcing the party's opposition to reactivation. In addition, she pledged to halt the operation of reactors Nos. 3 and 4 of Kansai Electric Power Co.'s Oi nuclear power plant. "If we are in power, we will suspend the reactors to ensure safety," she said.

Yet it cannot be denied that Kada's stance on nuclear power still remains unclear. Immediately after the YTV program, she told reporters, "There are many problems, such as ensuring a stable energy supply," implying the possibility of reactivation.

Mirai no To was launched under the banner of denuclearization. Its members include members of People's Life First, the party founded by Ichiro Ozawa, and another party touting tax cuts while opposing the Trans-Pacific Partnership framework and the use of nuclear energy.

The party was established by Shizuka Kamei, a former state minister in charge of financial and postal affairs, and former Agriculture, Forestry and Fisheries Minister Masahiko Yamada and others.

Mirai no To deputy head Yuko Mori, who is close to Ozawa, said Saturday: "Our party's policy on nuclear power is almost identical to [that of] People's Life First. It will never be possible for us to approve reactivation."

Such inconsistent remarks among party executives have led observers to point out that party members have failed to sufficiently reconcile their policies.

Nippon Ishin no Kai also is losing its way regarding the same issue.

At a debate among party leaders at the Japan National Press Club on Friday, Ishin no Kai head Shintaro Ishihara indicated that nuclear reactors were necessary. He also expressed his intention to review the party's lower house election campaign pledge on nuclear power, which stipulates that existing nuclear reactors will be phased out by the 2030s.

On Saturday, however, party Secretary General Ichiro Matsui denied plans to review the pledge to reporters in Kyoto.
Prime Minister Yoshihiko Noda, who heads the ruling Democratic Party of Japan, was critical of the confusion within Ishin no Kai.

"Their policies and philosophies were hurriedly created, so they have to use different points to appeal to voters every day," Noda said in his street speech in Sapporo on Saturday. "Be careful not to be deceived by such confusing statements."

===
Mirai launch initiated by Ozawa

Meanwhile, it came to light that Ozawa was actually the one who initiated the launch of Nippon Mirai no To, though he will not officially join until later.

On Saturday, Kada held talks with Ozawa in Tokyo with reporters in attendance.

As to the party's launch, Kada said that it first began when Iwate Gov. Takuya Tasso asked her to meet Ozawa at the end of September. "I didn't imagine at all [launching a new party]," she said.

When Kada asked Ozawa why he approached her, Ozawa replied: "I always thought you had potential."
When asked by reporters if she decided to form the party because she had been invited to by Ozawa, Kada said, "Yes."
===
Yamada named deputy head

Nippon Mirai no To decided Saturday to appoint Tetsunari Iida, a special adviser to the Osaka prefectural and city governments, as acting head of the party.

Former agriculture minister Yamada and former lower house member Tomoko Abe were appointed as deputy heads, in addition to Mori.

Ozawa and Kamei did not take executive posts.

Future of nukes a key point in coming election

December 5, 2012

Fukushima key stumping ground as campaign starts

Kyodo
http://www.japantimes.co.jp/text/nn20121205a1.html

The fate of the nation's nuclear power program, its long-struggling economy, the sales tax hike, and recent strained ties with China and South Korea will be key points for voters to consider in the Dec. 16 Lower House election, for which official campaigning started Tuesday.

Opinion polls suggest the election will bring an end to the Democratic Party of Japan's three-year rule and see the Liberal Democratic Party, which the DPJ ousted in the 2009 election, re-emerge as the strongest force, albeit without a majority.

With 12 parties vying for the 480 Lower House seats, the focus has turned to the role unaffiliated voters will play in determining the outcome of the poll and what kind of ruling coalition will be subsequently formed.

The 12 parties range from the right to the left, some vowing to end nuclear power, or merely suggesting this as a vague long-term goal. Their platforms also include pledges to shore up an economy mired in deflation, and boost relations with China and South Korea that have soured over isle disputes, or else boost Japan's military, via a change in the Constitution, to deal with any perceived threats to its territory.

Defense policy has gained greater focus in the election since North Korea announced plans to launch a rocket midmonth.

The general election will be the first one since 2009, when the DPJ, now headed by Prime Minister Yoshihiko Noda, in a landslide win ended over 50 years of almost continuous LDP rule.

Locations in Fukushima Prefecture, which continues to deal with the fallout from the Fukushima No. 1 nuclear plant disaster and mass social upheaval, were visited by various party leaders starting their campaigns.

"The question in this Lower House election is whether we can move forward with what we should do or whether we turn back the clock to the old politics," Noda said in a stump speech in front of JR Iwaki Station in the prefecture, alluding to the LDP, which ushered in Japan's nuclear power program and the past regulators the industry developed cozy ties with.
The city is located 40 km south of the plant, which suffered three reactor-core meltdowns in March 2011.

Election boards nationwide acknowledged 1,294 people who filed their candidacies to vie for the 300 single-seat constituencies.

The LDP, headed by ex-Prime Minister Shinzo Abe, was still considered the front-runner in a weekend telephone poll carried out by Kyodo News, with a support rate of 18.4 percent.

If the LDP regains power in the first general election since the quake-tsunami disaster hit last year, the hawkish Abe will presumably become the seventh prime minister in six years. He was the first of the previous six with a short-lived stint.
"It is the LDP that will protect the beautiful land" of Japan, Abe said in the city of Fukushima in front of several hundred people. "We are aiming to regain power."

The poll showed 41.5 percent of voters have yet to decide which party to support, indicating their ballots will largely affect whether the LDP can form a coalition government only with its pacifist ally, New Komeito, which is backed by the major lay Buddhist organization Soka Gakkai, or have to find other partners.

The fledgling "third forces" — Nippon Ishin no Kai (Japan Restoration Party) and Nippon Mirai no To (Tomorrow Party of Japan) — have thus drawn attention.

Nippon Ishin was founded in September by Osaka Mayor Toru Hashimoto and is now headed by outspoken former Tokyo Gov. Shintaro Ishihara, 80.

Hashimoto, who made a speech with Ishihara, said, "It is not a pipe dream to change the shape of the nation."

Nippon Mirai was formed last week by Shiga Gov. Yukiko Kada, who opposes nuclear power. The party quickly joined forces with Kokumin no Seikatsu ga Daiichi (People's Life First) headed by ex-DPJ don Ichiro Ozawa and other small parties.

"We are aiming for a society that will not depend on nuclear power," Kada said in the village of Iitate, Fukushima Prefecture, which is located outside the no-entry zone but was ordered by the government to evacuate all residents immediately after the meltdown crisis started during high levels of radioactive fallout.

UN adopts Japan-led initiative

December 4, 2012

UN General Assembly adopts non-nuclear resolution
http://www3.nhk.or.jp/daily/english/20121204_09.html

The UN General Assembly has adopted a resolution calling for the abolition of nuclear arms. The document also urges North Korea to halt its nuclear development.

The resolution was co-sponsored by 99 countries, with Japan taking the initiative.

In a vote on Monday, the resolution was backed by a strong majority of 174 nations, including nuclear powers --- the United States, Britain, France and Russia.

North Korea was the only dissenter, while 13 nations abstained, including China and Iran.

The resolution urges UN member states to take effective steps to achieve a world without nuclear arms, and to uphold the Nuclear Non-Proliferation Treaty.

It also stresses the importance of placing sanctions on North Korea for what is widely perceived as a failed missile launch in April, in breach of UN Security Council resolutions.

The resolution strongly urges the North to abolish all nuclear-related arms and halt its nuclear development.

The move comes as North Korea has announced another plan to launch what it calls a satellite-carrying rocket later this month.

Japan's UN representative says it is significant that the international community has urged the North to abandon its nuclear and missile programs, and to adhere to past resolutions.

The difficult road to nuclear phase-out

December 4, 2012

Road to zero-nuclear Japan a rocky one

http://mainichi.jp/english/english/newsselect/news/20121204p2a00m0na034000c.html

On Sept. 14 this year, the administration of Prime Minister Yoshihiko Noda decided on an energy and environmental strategy that would see the last nuclear reactor in Japan shut down in the 2030s. The very next day, however, Minister of Economy, Trade and Industry Yukio Edano was in Aomori Prefecture, assuring Gov. Shingo Mimura that construction of J-Power's Oma nuclear power plant near Honshu's northern tip would be allowed to continue.

If the Oma plant, now about 40 percent finished, runs for its full 40-year projected lifespan, it won't be shut down for good until the 2050s -- a timeframe obviously inconsistent with the Sept. 24 decision.

Five days later, the government put that decision on ice, with the Cabinet opting instead to "implement a flexible energy policy while carrying out constant verification and review of the issue," as the single-page policy declaration read. The Noda administration's retreat from a true zero-nuclear policy was swift indeed.

The turning point actually came on Sept. 2, when the prime minister met with nearly his entire Cabinet at his official residence. Arrayed on the table in front of the ministers were documents detailing the obstacles to a non-nuclear Japan. Chief among them were the nuclear fuel cycle program, based in Aomori Prefecture and including the Oma plant, and cooperation with the United States on nuclear technology issues.

"So the public mood has pushed the issue this far," one person who attended the meeting later commented. "Well, now we have all the facts in front of us, and at least we know how difficult this really is." Someone from Noda's inner circle added, "Our projections were too optimistic. If someone called us too slow to understand what's involved here, they wouldn't be wrong."

The prospect of high electricity prices and the continued hollowing out of domestic industry certainly weighed on the ministers' minds that day, but **it was fuel reprocessing and a stern admonition from the United States that changed the Noda administration's course on nuclear power.**

At the beginning of September, before the energy and environment policy announcement, U.S. Ambassador to Japan John Roos visited Chief Cabinet Secretary Osamu Fujimura at the prime minister's office. The American diplomat was there to deliver a message from U.S. Secretary of Energy Steven Chu, a telegram that called on the Japanese government to make a "prudent" decision on nuclear energy. The language of the message was restrained, but its aim was clear.

Secretary Chu visited Japan in March this year, and during a meal with Motohisa Furukawa, then Minister of State for National Policy and chair of the government's energy and environment committee, he told Furukawa that the U.S. was concerned about what effect Japan's next steps would have on the energy policy of its neighbors.

If Japan did move to denuclearize, the price of oil and gas would likely spike and prompt Russia, China and other regional powers to beef up their nuclear power programs. Nuclear power development in North America and Europe, meanwhile, had been on a downward trend since before the Fukushima nuclear disaster. What worries Chu **is the prospect of Russia and China becoming the world leaders in nuclear technology** and hobbling the efforts of the U.S., Japan and Europe to create an international system to manage that technology.

According to a senior Foreign Ministry official, the creation of an international system to manage nuclear technology and materials "is a core U.S. policy, which would crumble if Japan withdrew its cooperation. The impact on the Japan-U.S. relationship would far outstrip the recent trouble over the U.S. military's deployment of MV-22 Osprey aircraft."

In 1970, Japan's first commercial light-water reactor went online, supplying power to the Kansai region. The No. 1 reactor at the Tsuruga nuclear plant was designed and built by U.S. engineering giant General Electric. In the intervening 42 years, GE's nuclear reactor business has been absorbed by Hitachi, while another major U.S. reactor maker, Westinghouse, has been brought under the Toshiba umbrella. **In other words, the U.S. nuclear technology business is dependent on Japan, making Chu nervous about Japan dropping nuclear power even as it continues in the U.S.**

It's not just Japan's greatest foreign ally that's crying foul, however. Aomori Prefecture, with its host of nuclear facilities including the Rokkasho Reprocessing Plant -- the lynchpin of Japan's nuclear fuel cycle project -- was incensed at the proposal to abandon nuclear power, believing that the prefecture would end up a radioactive waste dump for the entire country as the nuclear industry wound down.

The nuclear fuel cycle program was initiated to create a more efficient nuclear industry by reprocessing spent fuel rods from Japan's nuclear plants into mixed-oxide fuel -- a combination of plutonium and various oxides of uranium -- for use in both conventional and specially designed reactors. Though not quite recycling, it did promise to reuse much of Japan's spent fuel.

The project has yet to get off the ground, as malfunctions and other problems have so far caused 19 delays at the Rokkasho plant, which cost more than 2 trillion yen to build but has yet to go into full operation. This "dream energy source," with its promise of yet more fuel drawn from expended fuel burning in super-efficient fast-breeder reactors, has so far been just that: a dream.

While the fuel "cycle" is already failing to live up to its very name, an end to nuclear power would instantly transform all the spent uranium already within Aomori's borders waiting to be reprocessed into miracle fuel into plain old nuclear waste. Much of that spent fuel is even now sitting in pools at the Rokkasho plant, and the Aomori Prefectural government has promised to send it back to the power stations from where it came should Japan go zero-nuclear.

Should the prefecture go through with its threat, the spent fuel pools at the power stations would fill to overflowing, and nuclear power generation would have to stop.

Additionally, Japan's reprocessing efforts -- both at home and that contracted out to plants in France and Britain -- have yielded 45 metric tons of plutonium, enough to build 4,000 Nagasaki-sized atomic bombs. Japan's anti-nuclear weapons stance cleared the way for the United States to recognize Japan's fuel reprocessing operation in the Japan-U.S. Nuclear Cooperation Agreement -- the only such instance in all the U.S's nuclear technology treaties.

However the agreement will come up for revision in 2018, and negotiations for its successor must begin within the next two years. There is no chance that the U.S., a hardline anti-proliferation nation, would allow a country to hold massive quantities of plutonium for no specific purpose.

If reprocessing stops, Japan will have to bury its spent fuel underground. Finding a disposal site, however, will be a Herculean task. National discussion on the issue would be a must, but in a government-backed public opinion study on energy and environmental strategy in June this year, the topic was excluded from consideration.

The result of all this is that the Democratic Party of Japan (DPJ)-led administration pledged to end nuclear power in Japan by the 2030s, but also to keep the reprocessing program going. According to one source involved in the formation of the government position, this apparently contradictory policy came about because "we'd decided we would have a strategy ready by September, and there was no time for debate."

What answers do the 12 parties contesting the Dec. 16 election have for these problems?

The DPJ election manifesto states, "We will re-evaluate the status of nuclear power from the point of view of necessity. On direct nuclear waste disposal (underground in Japan), we will take responsibility for the issue and express our direction." The largest opposition Liberal Democratic Party (LDP) manifesto says that "discussions will be held on basic energy policy, and we will examine the future of the issue with all seriousness."

The newly-minted Tomorrow Party of Japan (TPJ), meanwhile, is calling for an immediate halt to reprocessing, and favors a "dry storage" option -- encasing the spent fuel in metal and storing it in a cool place -- for used fuel rods. The Japan Restoration Party (JRP) -- also facing its first national election -- has a "spent nuclear fuel" entry in its manifesto, but no concrete policy proposals.

On the overall issue of nuclear power, all the parties except for the LDP, JRP, People's New Party and New Renaissance Party have pledged to eliminate nuclear power at some point. If one or some of these anti-nuclear parties form the next government, they will be faced with the same extreme pressures that presented such a barrier to the Noda administration's initial zero nuclear pledge.

Making sure that the end to nuclear power does not become just another election slogan to be disposed of after the votes are counted will test voters' powers of observation.

3,6% more CO2 than in the 1990s

December 7, 2012

Carbon emissions up 3.9% amid reactor halt

http://www.japantimes.co.jp/text/nn20121207n1.html

Bloomberg, Jiji

Japan's greenhouse gas emissions for the year that ended March 31 rose 3.9 percent from the year before on increased use of fossil fuels by power utilities after the Fukushima meltdowns effectively led to the shutdown of all but two atomic reactors.

Excluding carbon credits earned by offsetting greenhouse gas output overseas, emissions increased to 1.307 billion metric tons in the 12 months, or 3.6 percent higher than 1990 levels, according to Environment Ministry figures released Wednesday.

Under Kyoto Protocol targets set in 1997, Japan committed to cut its greenhouse gases by 6 percent from 1990 in the period from 2008 to 2012, when the accord's first term expires. The ministry's announcement came as talks involving envoys from more than 190 countries in Doha on future cuts in emissions appear headed for stalemate.

The ministry said that taking into account the absorption of carbon dioxide by forests and carbon credits earned, Japan cut emissions by an average of 9.2 percent from 2008 to 2011.

"It is not impossible to achieve the goal" of a 6 percent reduction, Kentaro Doi, a ministry official in charge of climate change, said at a press briefing in Tokyo.

However, nuclear plants — which emit virtually no greenhouse gases — provided about 30 percent of Japan's electricity before Fukushima No. 1 power station experienced three reactor core meltdowns in March 2011. The government subsequently shut down all 50 of the nation's commercial reactors for safety checks, and only restarted two. The public has meanwhile staged mass demonstrations against restarts.

As a result, the country's nine utilities that rely on atomic energy were forced to turn to power plants fired by gas, oil and coal to keep the world's third-largest economy running. The companies are facing a bill of around ¥6.8 trillion for fuel this fiscal year, almost double that in the 12 months before the Fukushima disaster started.

Also Wednesday, the National Institute for Environmental Studies said it has calculated more accurate estimates for global carbon dioxide emissions and removal by using observation data from the Ibuki satellite.

Data collected by the satellite contributed to improving the accuracy of estimates for areas with few ground-based observatories, the institute said. The government-affiliated entity plans to boost the accuracy of its estimates further and utilize them for policymaking on global warming.

The latest estimates covered emissions between June 2009 and May 2010. Parts of Asia, including Japan and China, were found to have posted the largest amount of net emissions in January 2010, when they totaled 305 million tons in carbon equivalent.

The Ibuki greenhouse gas observation satellite, developed jointly by the institute, the Environment Ministry and the Japan Aerospace Exploration Agency, was launched in January 2009.

Election & nukes

December 7, 2012

Editorial: Parties must present concrete plans on future of nuclear power

http://mainichi.jp/english/english/perspectives/news/20121207p2a00m0na008000c.html

The Dec. 16 House of Representatives election will be the first since the Fukushima nuclear disaster began in March last year. In the interim, Japan has been through two summers of power saving, proving that the country can in fact get by with its nuclear reactors idle. There has certainly been an effect on people's lives and on the economy, but considering the severity of the nuclear disaster, it is impossible to think of building more reactors. The only choice now, in fact, is to reduce nuclear power.

How can Japan rid itself of atomic energy? The parties contesting the upcoming election must show us in concrete terms how they will answer that question. And at the forefront of that question is what they would do about restarting Japan's 48 idle nuclear reactors.

The newly-minted Tomorrow Party of Japan (TPJ)'s plan is a bold one. The TPJ election manifesto promises to stop all nuclear reactors, and that every nuclear plant in Japan would be decommissioned by 2022. The party would also promote the adoption of renewable energy technology as a way to help support local industries and boost employment. We can understand the TPJ's intentions, but widespread adoption of renewable energy will take time and money, and the party has not presented any solid measures addressing this fact.

The TPJ manifesto states that the government would prevent electricity prices from spiking by subsidizing electric companies for the first three years of the program through a bond issue. In the end, however, won't this just dump the cost of the switch away from nuclear energy on the taxpayer? The TPJ must explain to the voters that the party's plan won't be financially painless, and the same goes for the other parties advocating an instant zero-nuclear policy.

The ruling Democratic Party of Japan (DPJ) has pledged an end to nuclear power by the 2030s, but has also said it will approve reactor restarts that meet Nuclear Regulation Authority (NRA) safety standards.

We have called on the government to rank every reactor in Japan on a risk scale, and to decommission the facilities in order from highest-risk to lowest. Even if the government approves restarts, if those approvals are based solely on the judgment of the NRA, progress to a zero-nuclear society will come into question.

In terms of overall energy policy, the government must take responsibility for deciding whether reactor restarts are necessary, and then prioritize restarts of only the very safest plants. Of course, one major precondition for this is the completion of disaster preparedness plans.

The largest opposition Liberal Democratic Party (LDP), which spent its many years in power promoting nuclear energy, has pledged to create "an energy structure with the best mix of power sources within 10 years." Has the party not reflected at all on the Fukushima nuclear disaster? On the safety of reactor restarts, the LDP has taken the same stance as the DPJ, stating it would base any decisions on NRA safety evaluations. The LDP has not, however, shown any intention of ditching nuclear power.

The new Japan Restoration Party (JRP) promised in its manifesto to "create a developed world-leading and nuclear-free energy structure." The party has not, however, stated what it would do on the question of reactor restarts. Moreover, the party says its policy examples, which state existing atomic power generation would "fade out" by the 2030s, is not a campaign promise. The JRP, along with the LDP, appears to be trying to avoid making the issue of whether Japan should end its reliance on atomic power a point of contention in the election campaign.

The end of nuclear power in this country is an issue tied closely to industrial sector reform and a re-evaluation of the Japan-U.S. security guarantee. The political parties must not simply compete over timing or try to prevent the issue from emerging as a point of contention. We voters must watch them carefully to see which party is ready to present specific and convincing energy plans.

Election & nukes

December 7, 2012
Addressing the nuclear power issue

http://www.japantimes.co.jp/text/ed20121207a1.html

The Dec. 16 Lower House election will be the first national-level election held since the 3/11 disasters, including the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. As if to show their concern over the plight of people whose lives have been disrupted by the nuclear catastrophe and to stress the importance of Japan's future policy on nuclear power generation, leaders of four parties gave their first campaign speeches in Fukushima Prefecture on Tuesday.

Prime Minister Yoshihiko Noda of the Democratic Party of Japan (DPJ) spoke in Iwaki; Liberal Democratic Party (LDP) leader Shinzo Abe, in Fukushima City; Nippon Mirai leader Yukiko Kada, in the village of Iitate; and Social Democratic Party chief Mizuho Fukushima, in Aizu Wakamatsu.

Because 160,000 local residents are still forced to live away from their homes due to radioactive contamination, Japan is quake-prone, nuclear waste storage facilities in Japan have little room to accept additional waste and technologies to allow the safe, permanent storage of high-level radioactive waste don't exist, attempts to bring a large number of nuclear reactors back online are likely to cause environmental and ethical problems. On the other hand, forces calling for the eventual abolition of nuclear power generation should realize that many technological and political hurdles must be overcome before they can achieve their goal. Above all, they must develop convincing proposals.

The LDP calls for checking the safety of all nuclear power plants over the next three years. Mr. Abe says that plants whose safety is confirmed should be brought online.

The Japan Restoration Party at one time said nuclear power generation would "fade out" by the end of the 2030s. But its deputy chief, Toru Hashimoto, now says that it is impossible to specify a timeline to end nuclear power generation, and blasts parties that specify such timelines. The Japan Communist Party and the Social Democratic Party call for the immediate closure of all nuclear power plants. The DPJ, Komeito and Your Party call for eventually ending Japan's reliance on nuclear power.

Nippon Mirai has adopted as its party slogan "graduation from nuclear power" in 10 years and makes fairly concrete proposals, such as putting a cap on the total amount of spent nuclear fuel, constructing a dry storage facility to keep such fuel for 100 years, and dividing Tepco into three different entities: one to generate electricity, one to provide compensation for victims of the nuclear crisis and one to deal with decommissioning Fukushima No. 1.

Concrete ways to promote green energy and facilitate the entry of small power generation entities into the electricity market must be developed. But political parties calling for the end of nuclear power generation must also be prepared to adeptly deal with foreign countries that oppose such a move. For example, the United States opposes the stockpiling of plutonium extracted from spent nuclear fuel in Japan if there's no prospect of it being reused as fuel as a result of Japan halting its nuclear fuel cycle project.

Parties should not call for the abolition of nuclear power generation just to win votes. They must present realistic proposals.

No party has told voters how they would achieve a nuclear-free Japan

December 14, 2012

INTERVIEW: Hiroshi Kainuma/ Parties should debate what going 'nuclear-free' entails

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212140077

THE ASAHI SHIMBUN

In Japan's first national election since the disaster at the Fukushima No. 1 nuclear plant, almost all parties are espousing the abolition of nuclear energy—in pledges ranging from firm promises to vague ambitions.

But one academic accuses them of a significant omission: **No party has told voters exactly how they would achieve it.**
Hiroshi Kainuma is a junior researcher at Fukushima University's Fukushima Future Center for Regional Revitalization.

He is the author of " 'Fukushima' theory--the birth of a nuclear village," a 2011 book based on a thesis he wrote as a graduate student of sociology at the University of Tokyo.

The 28-year-old hails from Fukushima Prefecture. He says even before the disaster, people there, as elsewhere in rural Japan, were struggling with a slumping economy and limited access to health care and social support. And, he says, consultations on the future of nuclear power must take account of their interests.

Excerpts from the interview follow:

Question: Many parties are championing the abolition of nuclear power. What is your take on that?

Answer: Parties have always conducted campaigns knowing that the general public wants to "reset" something. Examples from the past decade include postal reform and child-rearing allowances. The recent chorus of calls to abandon nuclear power is another. Each party heard it and promised to meet it, but omitted details of how they would achieve it. I am afraid that voters cannot tell if the parties have detailed blueprints for achieving it.

Q: Which issues have parties failed to discuss?

A: All parties, including the main opposition Liberal Democratic Party, agree that Japan should review its reliance on nuclear energy and promote renewables. But most of them have failed to work out how to get by until renewable energy is fully available. They have merely promised to promote renewable energy. This is because they want to avoid facing a rise in carbon dioxide emissions, an inevitable outcome if they pledge to get through the period relying on fossil fuels.

I see **deception** there. They don't mention the trade deficits that would balloon as a result of increased imports of fossil fuels. Nor, for similar reasons, do they discuss the program to recycle spent nuclear fuel. **We need to end the situation in which parties ignore challenges because they cannot agree on solutions and merely talk about performing a "reset" in society.** Fundamental questions will remain unsolved if all that happens is they are repackaged.

Q: What do you think are the questions posed by nuclear power?

A: German sociologist Ulrich Beck says society used to distribute wealth and today it distributes risk. This is true also of nuclear power. The central government distributed risk to rural regions in exchange for alleviating poverty there, unconsciously imposing burdens on a vulnerable area.

We must confront this. In order to engage in substantial debate, we need to create an environment in which a party can declare: "We will dispose of contaminated soil and wreckage with these steps … Although other parties are avoiding the question, we will take this approach."

Q: How do people in Fukushima Prefecture see this election?

A: They understand that there is nothing for them merely on the parties' platforms. It is as if they have been given a restaurant menu which contains nothing appetizing. So they will go back to a place they are familiar with.

Q: On Dec. 4, four separate party leaders kicked off their campaigns for the Lower House election in Fukushima Prefecture, calling for the promotion of renewables.

A: People would suffer again if they simply switched from dependence on one failed energy to another. They know that solar power plants or floating wind turbines would not create as many jobs as hoped and that they could prove a bad investment.

People are fleeing Fukushima Prefecture, not because of fear of radiation, but because of a lack of jobs and the collapse of the health-care and welfare systems. Local communities were suffering from ailing industry, a declining birthrate and rapidly aging society long before the quake, tsunami and nuclear accident of March 2011. **But politicians tried to address those difficulties with the logic of central government: either by pumping in money or encouraging free competition.** These approaches only stalled finding solutions and meant the disasters, when they took place, had a more painful impact. The problems are still being ignored today.

Surprising visits from US diplomats (to Fukushima)

December 14, 2012

Voters' choice: U.S. diplomat sounds out political parties in Fukushima

http://mainichi.jp/english/english/newsselect/news/20121214p2a00m0na004000c.html

FUKUSHIMA -- United States Embassy staff recently made unusual visits to the local chapters of the ruling Democratic Party of Japan (DPJ) and the main opposition Liberal Democratic Party (LDP) to sound them out about their campaigns.

"What differences are there between the national party headquarters and the Fukushima prefectural chapter?" was one of the questions cast by the pair of embassy staffers, a first secretary of the Political Section and a Japanese employee. The two visited the offices on Dec. 5, the day after the campaign for the Dec. 16 House of Representatives election officially started, according to the local chapters and other sources.

The on-site information gathering is apparently aimed at grasping the campaigning trends in the prefecture -- where damage from the Fukushima nuclear disaster is still plaguing farmers, businesses and residents -- as well as the nuclear policy to be adopted by the next administration.

"It's surprising that a U.S. diplomat has come this far to a local region like here," said one official who received their visit.

In total, the embassy staff visited at least four locations -- the prefectural chapters of the DPJ and the LDP in the city of Fukushima, as well as the campaign offices of two candidates running on the LDP and Tomorrow Party of Japan (TPJ) tickets, respectively. Appointments were made via telephone before their visits.

According to the LDP's Fukushima chapter, the embassy staff were especially interested in policy differences between LDP headquarters in Tokyo and the Fukushima chapter, and asked why the latter was advocating the decommissioning of the Fukushima No. 2 Nuclear Power Plant. The staffers also said they would report their findings to the U.S. government.

Regarding the chapter's opposition to Japan's participation in the Trans-Pacific Partnership (TPP) free trade negotiations, the embassy staff told the LDP chapter that Washington is promoting the TPP and asked them if anti-TPP policy was an election ploy. In response, senior LDP chapter officials admitted to the policy difference with party headquarters, and explained local sentiment toward nuclear power and economic damage from harmful rumors about agricultural products.

The embassy officials also showed interest in the growing public support for the so-called "third political force" including the TPJ and the Japan Restoration Party.

At one of the campaign offices, the embassy staff reportedly remarked that the Japanese society is leaning toward the right and took a photo of a Shinto altar used to pray for election success.

An official representing the U.S. Embassy's Information Office said, "We have regular contacts with those in the Japanese political sphere, but we withhold from commenting on individual diplomatic exchanges."

Kazuya Sakamoto, a professor at Osaka University, said, "It is unusual for U.S. embassy officials to visit election offices in such local regions, and their visit is proof that the U.S. government believes public sentiment in Fukushima is important. While the U.S. is maintaining and promoting nuclear power and the TPP, it is apparently trying to find out how Japan's new administration will balance national and local interests, and to determine what stance the U.S. should take toward the new government."

Nukes key point in Japanese first election since 3/11

December 15, 2012

Nuclear energy a key issue as Japan goes to polls

http://ajw.asahi.com/article/behind_news/politics/AJ201212150039

THE ASAHI SHIMBUN

Japan goes to the polls Dec. 16 to shape key policies—including the future of nuclear energy—in the first nationwide election since last year's devastating earthquake and tsunami and subsequent nuclear disaster.

Social security, another key election issue, will also be on the minds of voters.

Prime Minister Yoshihiko Noda cited the future of nuclear energy as a top campaign issue when he dissolved the Lower House on Nov. 16 for a snap election.

"The election will ask the nation whether to choose a party that will reduce nuclear power to zero or a party that will continue the past energy policy," he told a news conference.

Noda's ruling Democratic Party of Japan promised to suspend all nuclear reactors by the end of the 2030s.

Your Party, a small opposition party, said it will halt all reactors by the end of the 2020s, and New Komeito, another opposition party, said it aims to do the same "as soon as possible."

Still, the three parties all plan to allow idled reactors to be brought back online before the nuclear-free goal is achieved.
The Tomorrow Party of Japan, on the other hand, will not approve the reactivation of those reactors.

The anti-nuclear party, formed days before the official campaigning period started on Dec. 4, said it will decommission all reactors within 10 years to "graduate from nuclear power generation."

The Japanese Communist Party and the Social Democratic Party both promised to suspend all reactors immediately.
The main opposition Liberal Democratic Party and the newly formed Japan Restoration Party are cautious about moving away from nuclear power.

The LDP has effectively postponed a decision on nuclear energy, promising only to "establish the best mix of sustainable electricity sources within 10 years."

The party, which promoted nuclear energy for decades before it lost power in 2009, is leading the DPJ in opinion polls. It will likely maintain its past energy policy if it returns to power.

LDP President Shinzo Abe has criticized calls for a nuclear phaseout "irresponsible."

And though the Japan Restoration Party said in a party document that "nuclear power generation at existing reactors would fade out by the 2030s," pro-nuclear party leader Shintaro Ishihara said he will review the expression. Acting party leader Toru Hashimoto, who once advocated scrapping nuclear power, also said the document is not part of the official campaign platform.

All 50 nuclear reactors were taken offline after triple meltdowns at the Fukushima No. 1 nuclear plant, which was struck by the Great East Japan Earthquake and tsunami on March 11, 2011. Only two reactors have since been restarted.
About 160,000 people have not been able to return to their homes in Fukushima Prefecture 21 months after the nuclear crisis unfolded.

How to fund social security programs has emerged as another key election issue because legislation to double the consumption tax rate to 10 percent by October 2015 was enacted in August.

The Noda administration argued that the hike is necessary to cover the nation's snowballing social security costs and gained cooperation from the LDP and New Komeito.

Social security spending, which amounts to 26 trillion yen ($311 billion), or 29 percent of the 90-trillion-yen government budget for fiscal 2012, is expected to increase by 1 trillion yen each year.

On Dec. 16, voters will elect representatives to the 480-seat Lower House, 300 in single-seat districts and 180 in proportional representation constituencies.

A total of 1,504 candidates, a record under the current Constitution, are running for seats, with 907 registered both for single-seat and proportional representation constituencies.

THE ASAHI SHIMBUN

Even anti-nuclear voters have voted for the LDP

December 17, 2012

Exit poll: Anti-nuclear votes spread across the board

http://ajw.asahi.com/article/behind_news/politics/AJ201212170097

THE ASAHI SHIMBUN

Ballots cast by people who advocate scrapping nuclear power ended up being spread among the various parties, meaning that anti-nuclear entities failed to gain seats, an Asahi Shimbun exit poll shows.

The Asahi Shimbun approached voters nationwide who had cast their ballots in the Dec. 16 Lower House election to find out if they supported "scrapping nuclear power immediately, "gradually phasing out nuclear power altogether" or "not pursuing zero nuclear power."

Fourteen percent chose scrapping nuclear power immediately, and 64 percent picked gradually phasing out nuclear power altogether.

Voters opposed to nuclear power cast ballots across a wide range of parties in the proportional representation system.
This was because parties other than the Liberal Democratic Party advocate a break with nuclear power to a certain extent.

Fifteen percent of the respondents said they do not want to pursue zero nuclear power.

The LDP has been a strong supporter of nuclear power. Yet, the party was supported by 16 percent of those who said they want to scrap nuclear power immediately, and 28 percent of those who said they supported gradually phasing out nuclear power altogether. **This suggests voters made choices based also on issues other than on nuclear energy.**

Of those who do not want to pursue zero nuclear power, 43 percent voted for the LDP.

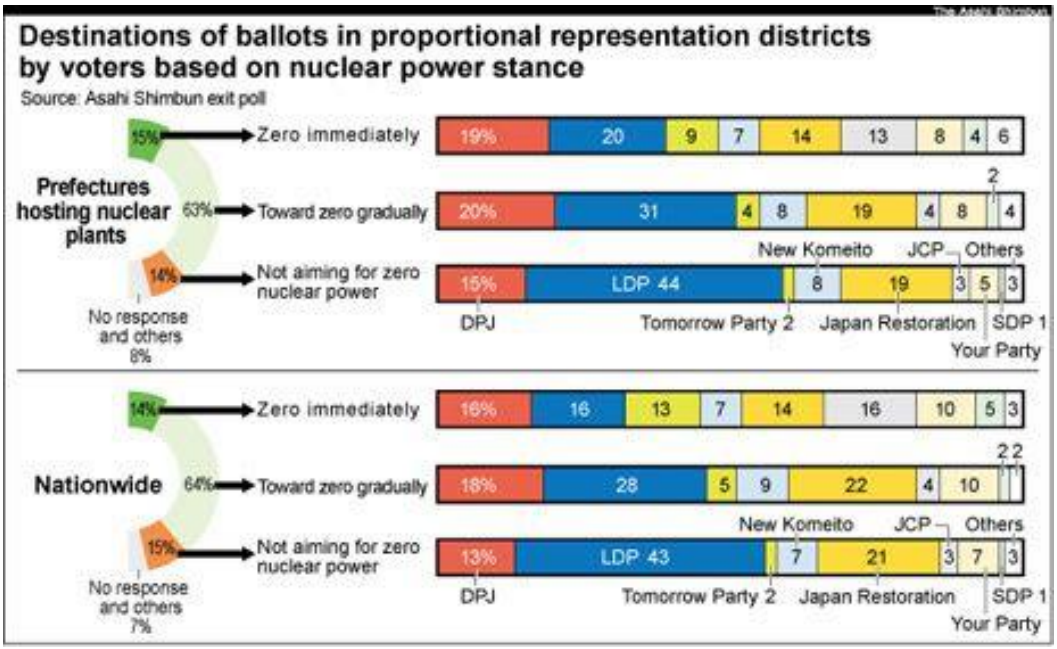
In 13 prefectures hosting nuclear plants, voters showed a similar tendency. But 20 percent of those who favor scrapping nuclear power immediately and 31 percent of those who support gradually phasing out nuclear power altogether voted for the LDP. The rates were higher than the nationwide averages.

As for single-seat constituencies, the LDP got votes nationwide from 41 percent of those who support a gradual phasing out of nuclear power altogether, and 47 percent of those in the prefectures hosting nuclear plants who gave the same answer.

The Democratic Party of Japan garnered votes from 24 percent and 26 percent of such voters, respectively.
Higher percentages of people who want a gradual reduction of nuclear power voted for the LDP in the single-seat districts than in the proportional representation constituencies.

That was likely because "third force" parties that advocate a break with nuclear power fielded candidates in a limited number of single-seat districts.

The 13 prefectures hosting nuclear power plants are Aomori, Miyagi, Fukushima, Ibaraki, Niigata, Shizuoka, Ishikawa, Fukui, Shimane, Ehime, Saga and Kagoshima prefectures, and Hokkaido



Voter voices: No choice but to vote for pro-nuclear party

http://mainichi.jp/english/english/newsselect/news/20121217p2a00m0na029000c.html

AIZUWAKAMATSU, Fukushima -- As a cold rain fell outside, victims of the Sept. 11 disasters huddled against the cold to come vote on the morning of Dec. 16 at a temporary office set up for the town of Okuma in a government building here.

Eri Kusano, 33, a disaster evacuee who lives in the city, voted for the Liberal Democratic Party (LDP) even though she was not a supporter of that party. She explained her reasoning: "Things might get better than they were with the Democratic Party of Japan (DPJ)." She also said, though, "If I hadn't been asked by a friend to vote for the LDP, I wouldn't have minded submitting a blank vote." Her husband, a nuclear power plant employee, lost his job after the disaster. She also works and helps support her family of three children, but the future is uncertain.

Okuma remains completely evacuated even now. The town government has decided not to return for five years, and it is seeking the quick setup of a temporary out-of-town community from the national government. Kusano asks of the new national administration, "More important than getting rid of nuclear power plants is recovery of disaster areas. I also want them to work on the unemployment problem."

In a temporary housing community in neighboring Aizumisato was Kazumi Hayakawa, 71, an evacuee from Naraha, who voted for the LDP this time after voting for the DPJ last time. "There was no other party worth voting for," he says.

Hayakawa's peaceful life was taken from him by the nuclear disaster, and his 74-year-old brother suffered a stroke at an evacuation shelter and is still hospitalized. He says he felt resistance to voting for the LDP, but more than that he felt,

"We were betrayed by the DPJ, whose policies were only words." He doesn't know when he will be able to return to his old home, and he doesn't think that the pace of disaster-area recovery can easily be quickened. However, he hopes that the new administration will "move forward with things steadily."

Voter voices: Nuclear power needed to survive

http://mainichi.jp/english/english/newsselect/news/20121217p2a00m0na026000c.html

The Mainichi spoke to some owners of small-scale factories in Tokyo's Ota Ward to learn what motivated them in this past election.

Katsuaki Kikuchi, 67, owner of Miyagiseiko, a machinery processor, voted for the Democratic Party of Japan (DPJ) in the previous House of Representatives election but changed his support to the Liberal Democratic Party (LDP) this time.

His previous vote for the DPJ was because of doubts over expanding national debt under the LDP and a feeling that two powerful parties were needed, like in the United States government. However, he says, he was disappointed by the DPJ's handling of the Futenma base relocation issue and its inability to fulfill its campaign promises.

"The DPJ still needs to brush itself up," he says.

After the economic crisis of 2008, his factory's sales for 2009 fell around 70 percent compared to the previous year. He has around 20 employees and will lose competiveness against foreign companies if electricity prices rise due to the halting of nuclear plants. He chose the LDP partly because it didn't propose an end to nuclear power.

Last year, his business finally recovered, but worsened Japan-China relations over the Senkaku Islands dispute have halted his exports to China. He says he hopes for "stabilized diplomacy" from the new administration.

Keiji Fukuoka, 81, who owns the metal processing factory Michizuka Seisakusho Co., says he felt the DPJ "just attracted the people's attention with policies that they couldn't really accomplish," and returned his support to the LDP.

"If (the government stops the nuclear power plants and) blackouts happen, corporations will flee overseas and employment will suffer," he says. "We must allow corporations to survive," by keeping power prices down through running nuclear plants, he says.

TPJ's Kada vows to move forward after anti-nuclear platform fails election test

http://mainichi.jp/english/english/newsselect/news/20121217p2a00m0na012000c.html

After a poor showing at the polls during Dec. 16's House of Representatives election, Tomorrow Party of Japan (TPJ) leader Yukiko Kada expressed determination to press forward with her party's anti-nuclear message.

"It was unfortunate that I couldn't make the voters' desperate cries to end nuclear energy heard. But I won't give up. I will move forward," Kada told reporters at a Dec. 16 news conference at a vote-tallying center in Tokyo's Chiyoda Ward.

"Voters' number one priority as they cast their ballots was a stable economy and employment, rather than nuclear energy policy," Kada said of her party's performance. Kada appeared weary during the news conference, occasionally missing questions from the assembled reporters.

Nuclear future - What to expect from the LDP

December 17, 2012

Future of nuclear power in Japan fuzzier with LDP win

http://mainichi.jp/english/english/newsselect/news/20121217p2a00m0na022000c.html

While the House of Representatives election manifesto of the victorious Liberal Democratic Party (LDP) does call for an end to a "reliance" on nuclear power, it notably avoids using the term "zero-nuclear" so prominent in the pledges of other parties.

Rather, **the LDP promises to decide on the reactivation of idled reactors "within three years," and to "establish the best mix of energy sources for Japan within 10 years,"** effectively putting off a final decision on the nuclear issue for quite some time. Compared to the "end to atomic power in Japan by the 2030s" promised by outgoing Prime Minister Yoshihiko Noda and his Democratic Party of Japan (DPJ), the LDP's pledges weaken the drive to end nuclear dependence.

Regarding the restart of Japan's 50 reactors, the LDP promised to "give absolute priority to the expert opinions of the independent Nuclear Regulation Authority," or NRA. The NRA will set new safety standards in July next year, and is not expected to do any reactor inspections before then. That is, it is very unlikely any idled reactors will be reactivated before next year's peak power consumption period in mid-summer.

Meanwhile, the LDP has also promised to keep Japan's nuclear fuel cycle project going for the long term, a pledge shared with the DPJ. Abe has furthermore indicated he is in favor of continuing development of fast-breeder reactors -- reactors specially designed to burn the mixed-oxide plutonium-uranium fuel produced by the fuel cycle program.

Abe has also not ruled out building new reactors. Opposition from local governments and other parties, however, prompted a senior Ministry of Economy, Trade and Industry official to say the LDP "probably won't move on the new reactors issue until after the House of Councillors election next summer."

Abe set to transform energy, foreign and monetary policies

December 17, 2012
http://ajw.asahi.com/article/behind_news/politics/AJ201212170077

THE ASAHI SHIMBUN

Japan is expected to reverse course to scrap nuclear power, and take a stronger stand in international disputes under a government led by Shinzo Abe, whose Liberal Democratic Party swept back to power in a Lower House election Dec. 16.

During campaigning, Abe condemned a pledge by the Democratic Party of Japan to shut down the nation's nuclear power plants within three decades as "irresponsible."

The LDP built up Japan's reliance on nuclear power. It was a strong promoter of the industry while it held power for decades until losing an election in 2009.

The party has said it will "reach a conclusion on restarting reactors within three years." The Abe administration is expected to approve firing them up one by one, as and when the Nuclear Regulation Authority certifies them to be safe.
Japan's 50 nuclear reactors were shut down following the disaster at the Fukushima No. 1 nuclear power plant in March 2011. Two have since restarted.

Electric utilities have provided substantial institutional support for the LDP. They have argued for prompt reactor restarts, citing the burden of buying additional fuel for thermal power plants.

"The LDP is closer to our way of thinking," Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan, has said.

Meanwhile, the DPJ government planned to cancel--by withholding approval for--the construction of nine proposed reactors which currently exist only on paper.

The planned reactors include one in Kaminoseki, Yamaguchi Prefecture, where the pro-nuclear camp is confident it will win approval. "The tide will change when Abe becomes prime minister," one representative said.

Over the long term, the LDP will likely maintain nuclear energy. In its campaign platform, the party said it will "within 10 years determine the best ratios of sustainable electricity sources."

The future of nuclear energy is expected to be outlined in the Abe administration's basic energy plan, a declaration of its mid- to long-term energy policy.

The DPJ government planned to draft a basic energy plan in December which would have included its goal of pulling the plug on nuclear power by the end of 2030s. That ambition is now expected to be reviewed.

Also uncertain is the future of reforms to weaken the virtual monopolies of regional utilities and to promote the use of renewable energy.

The DPJ government planned to compile proposals in December for how to separate the power generation and transmission functions of regional utilities and to liberalize the electricity retail industry.

But the LDP has been reluctant to reform the electricity sector in view of opposition from its support base there.
"Under an LDP government, a policy change is unavoidable," a senior industry ministry official said.
…… (Tough on China… Pressure on the Central Bank)

THE ASAHI SHIMBUN

The "nuclear village" can smile again

Optimism rises in 'nuclear village' after LDP's victory

http://ajw.asahi.com/article/behind_news/politics/AJ201212190048

THE ASAHI SHIMBUN

The smiles have returned to the “nuclear village.”

After more than a year of soaring costs, sinking profits and doubts about future operations, the electric power industry gladly welcomed the Liberal Democratic Party's return to power.

The Dec. 16 Lower House election campaign was filled with promises to phase out nuclear power, including the outgoing Noda administration’s call to shut down all nuclear reactors by the 2030s.

Such promises were not included in the platform of the LDP, long supported by the electric power industry. Its overwhelming victory in the election is expected to reverse the anti-nuclear course that was set in motion after the Fukushima nuclear disaster last year.

"The energy strategy that plans to halt all nuclear reactors by the 2030s poses an excessively great challenge," Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan, said in a statement released Dec. 17. "We ask the new administration to review it."

Yagi, also president of Kansai Electric Power Co., emphasized that nuclear power is a key energy source for Japan.
"It is important for our country to simultaneously diversify energy sources, including nuclear power, and achieve a stable energy supply, environmental protection and economics," he said.

Japan's 50 nuclear reactors were shut down after the disaster at the Fukushima No. 1 nuclear power plant in March 2011. Only two have been brought back online.

Utilities have argued for prompt reactor restarts, citing the burden of buying additional fuel for their thermal power plants.
"After a change in government, they will listen to our opinions," a senior Kansai Electric Power official said.

Investors share the industry's optimism.

Stock prices of the nation's 10 regional electric utilities all climbed on Dec. 17 after the LDP's victory.

The stock of beleaguered Tokyo Electric Power Co., operator of the Fukushima No. 1 plant, soared by more than 30 percent from Dec. 14 to its daily price limit. Kansai Electric Power's stock also temporarily reached its daily limit.
Investors expect the LDP administration will approve restarts of idle reactors, which would improve the finances of the utilities.

"It is premature to expect that nuclear reactors will be restarted in one go, but at least the risk of electric utilities being forced to decommission new reactors has diminished," an official at a major securities house said.

Senior LDP officials have already made remarks in line with expectations in the industry, which forms the core of the so-called "nuclear village," along with pro-nuclear bureaucrats and scientists.

Akira Amari, chairman of the LDP's Policy Research Council, stressed the need to restart reactors on a TV program broadcast Dec. 16.

“The biggest factor behind Japan’s growing trade deficits is the ballooning cost of natural gas imports,” Amari said. “Reactivating the reactors whose safety is confirmed by the Nuclear Regulation Authority will prevent Japan from depleting its wealth.”

The LDP said in its campaign platform that it will decide on reactor restarts within three years based on the results of NRA safety inspections. The party’s basic stance is that it will approve restarts as long as the NRA declares the reactors safe.

But the restart of the No. 2 reactor at Japan Atomic Power Co.’s Tsuruga plant in Fukui Prefecture remains in doubt. An NRA team that inspected the site this month cited a high likelihood that a seismic fault running beneath the No. 2 reactor building is active.

Japan Atomic Power has challenged the NRA’s assessment.

The LDP also said it will decide within 10 years on the proportion of nuclear power and other energy sources, including renewables, aiming for the "best mix of sustainable electricity sources."

During a Dec. 16 news conference after the election, LDP Secretary-General Shigeru Ishiba said although many parties called for the abolition or reduction of nuclear power in Japan, voters after all supported the LDP’s approach with its time frame of three years and 10 years.

The LDP plans to carefully study the situation before reaching any final conclusions on a basic energy plan to determine a mid- to long-term energy policy.

Japan’s energy policy is reviewed every three years.

The Democratic Party of Japan planned to compile a new plan in December, including its goal of halting all reactors by the 2030s, but the new government is expected to review that proposal.

Reforms of the electricity sector, such as plans to separate the power generation and transmission divisions of electric utilities and liberalize electricity retailing, have also become uncertain.

The DPJ government planned to draft reform proposals by the end of the year, but these changes could be stalled if the new government heeds calls from the electricity industry.

Wishful thinking?

December 19, 2012
Editorial: No turning back the clock on nuclear policy

http://mainichi.jp/english/english/perspectives/news/20121219p2a00m0na015000c.html

The Democratic Party of Japan (DPJ), running on a zero-nuclear policy pledge, was soundly defeated in the Dec. 16 election by the Liberal Democratic Party (LDP), which criticized the DPJ stance as "irresponsible." That doesn't mean, however, that anyone wants to return to a nuclear-dependent society.

In its House of Representatives election manifesto, the LDP promised to establish an economic and social structure that does not rely on nuclear power. LDP ally New Komeito's call for a "prompt-as-possible" shift to zero nuclear power, moreover, cannot be overlooked.

A change of course in energy policy has been explored by listening to various public voices following the outbreak of the Fukushima nuclear disaster last year. That progress cannot simply be tossed aside and the whole process sent back to the drawing board. The ongoing crisis broke out against a backdrop of nuclear policy and legal regulation promoted by past DP administrations. The new administration must use the lessons learned from this experience as a launch pad to confront the public's appeals for the abandonment of atomic power in Japan.

New Komeito pledged during the election campaign that it would establish a sustainable energy framework within the next 10 years. But putting off a decision on the ratio of nuclear energy to other sources for 10 years can prevent investment and research and development from identifying a clear direction. The party also calls for the full-fledged adoption of renewable energy and promotion of energy-saving measures for three years, but without a clear vision of the energy society it wants to build, corporations and the public will find it difficult to commit to such measures.

Realistically speaking, it appears implausible that the reactivation of Japan's idled nuclear reactors will go smoothly. The active fault investigations being conducted by the Nuclear Regulation Authority (NRA) have highlighted the inadequacy of surveys conducted by power companies and assessments by regulatory bodies in the past. Re-inspections of all nuclear power plants are unavoidable.

By next summer, the NRA is set to lay out new safety standards that will include backfit provisions requiring existing nuclear facilities to meet the latest safety criteria. This is likely to mean many nuclear facilities will need large-scale renovations to stay in operation. Moreover, the revised Regulations of Nuclear Source Material Law, which stipulates that as a general rule nuclear reactors should be decommissioned after 40 years of service, must not be ignored. That reactor numbers will fall is self-evident from these factors, and we must squarely face policies that presuppose our reduced dependence on nuclear energy.

There is a risk of protest against the NRA's harsh assessments, but the LDP has made it clear that it is ready to entrust nuclear safety to the agency's expert opinion. It was the LDP and New Komeito that pushed for the establishment of the NRA as a highly independent extra-ministerial body, and they must not take any action that would infringe upon that independence.

Finding a strategy for the nuclear fuel reprocessing cycle is unavoidable in dealing with Japan's nuclear policy. The LDP has postponed any definitive decisions, but changing policy direction becomes harder the longer it is put off. The fuel reprocessing cycle has reached an impasse. Let's hope that the new government works toward breaking away from the cycle, using New Komeito's calls to abandon the Monju Fast Breeder Reactor in Fukui Prefecture as a foothold.

Abe and the ban on new reactors

December 22, 2012

Incoming leader repeats pledge but links any move to policy on future energy mix

Abe hints at scrapping reactor ban

http://www.japantimes.co.jp/text/nn20121222x1.html

Kyodo

TABUSE, Yamaguchi Pref. — The head of the Liberal Democratic Party repeated Saturday that he will reconsider revoking the ban on construction of new nuclear reactors when he takes office next week.

Shinzo Abe, who is all but assured of becoming the nation's next prime minister on Wednesday, made the remarks in Tabuse, Yamaguchi Prefecture, hinting he could abandon the policy, which is aimed at reducing the nation's dependence on nuclear power in light of the dangers presented by the Fukushima meltdowns.

"We'd like to review how to think about the issue nationwide," Abe said at a news conference in Yamaguchi on Friday. He returned to his constituency Friday evening and visited the grave of his father, former Foreign Minister Shintaro Abe, and his grandfather, Nobusuke Kishi, before returning to Tokyo on Saturday evening.

Abe, who is set to become the nation's seventh prime minister in six years on Wednesday, said the new government will consider whether to allow power companies to build new reactors in line with his party's goal of determining the country's future energy mix within the next 10 years.

The ban on new reactors was part of an energy strategy crafted by Prime Minister Yoshihiko Noda's government in September, after three reactor cores melted at the Fukushima No. 1 power plant in Fukushima Prefecture in March 2011.

The strategy also said Japan will aim to phase out nuclear power in the 2030s, but that goal is widely expected to be retracted after the change in government following the Democratic Party of Japan's bruising defeat in Sunday's general election.

Currently, three reactors are under construction and nine more are at the planning stage.

Construction of new reactors could get go-ahead from new government

http://ajw.asahi.com/article/behind_news/politics/AJ201212220046

THE ASAHI SHIMBUN

YAMAGUCHI--Shinzo Abe said his administration should review a freeze imposed by the outgoing government on the construction of new nuclear reactors.

The Liberal Democratic Party chief was speaking Dec. 21 to reporters in Yamaguchi Prefecture, where he holds a Lower House seat.

"The DPJ administration took a decision, but I want to review it," Abe said.

In the aftermath of the disaster at the Fukushima No. 1 nuclear plant last year, the government of the Democratic Party of Japan decided to withhold approval for new reactors—with the exception of a handful already under construction—and furthermore to shut down all nuclear power reactors by the 2030s.

The LDP swept to an overwhelming victory in a Lower House election Dec. 16, but its platform was vague on the question of nuclear policy. The party promised only to "decide within 10 years on a sustainable 'best mix of power generation' for the future."

Abe is expected to be named prime minister in coming days.

At the Dec. 21 news conference, Abe stressed his intentions.

"The party's direction has been set. We will consider what our position is on the construction of new reactors in the future," he said.

As for giving existing nuclear reactors the green light to power up again, Abe said, "We will make a decision within three years, after the Nuclear Regulation Authority has established new rules."

Abe repeats need to review policy of not allowing new nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20121222p2g00m0dm007000c.html

TABUSE, Japan (Kyodo) -- Japan's next prime minister, Shinzo Abe, reiterated Saturday that he will reconsider the current government's policy of not allowing utilities to build new nuclear reactors.

Abe, head of the Liberal Democratic Party who is set to become the new premier on Wednesday, made the remarks to reporters in Tabuse, Yamaguchi Prefecture, hinting that he could jettison the policy aimed at reducing dependence on nuclear energy following last year's Fukushima disaster.

Abe has said the new government will judge whether to allow power companies to build new reactors in line with his pronuclear party's stance of determining the country's future energy mix within the next 10 years.

The principle of not allowing the construction of new reactors was included in an energy strategy crafted by Prime Minister Yoshihiko Noda's government in September in the wake of the disaster last year at the Fukushima Daiichi nuclear power station.

The strategy also said Japan will aim to phase out nuclear power in the 2030s, but the goal is widely expected to be retracted by the new government following Noda's Democratic Party of Japan's crushing defeat in Sunday's general election.

Currently, three reactors are under construction and nine more are being planned to be built in Japan.

Changing direction on nuclear policy

December 27, 2012
Abe administration to overhaul nuclear, monetary policies

http://ajw.asahi.com/article/behind_news/politics/AJ201212270051

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe will drastically shift the direction Japan takes in monetary and fiscal affairs, and will likely overturn a pledge by the outgoing administration to pull the plug on nuclear power.

In addition, Abe is expected to strengthen Japan's alliance with the United States and try to repair ties with China.
The government of the Democratic Party of Japan declared it would shut down all nuclear reactors by the 2030s. Abe condemned the policy as "irresponsible."

There is now a strong possibility of Japan retaining nuclear power, and Abe has additionally indicated a readiness to allow nuclear reactors halted last year to fire up again. The widespread shutdown was one response to the accident at the Fukushima No. 1 nuclear power plant following last year's Great East Japan Earthquake and tsunami.

"Once the Nuclear Regulation Authority creates stricter rules, we will decide over a period of three years whether operations can resume," Abe said at a news conference late on Dec. 26, the day he formally established his Cabinet.
He added, "We will also have to consider how we are to meet demand for electricity in the short term. There is the danger of a further hollowing out of the domestic manufacturing sector."

The Nuclear Regulation Authority is not expected to compile new safety standards until after July 2013, which means any decision on resuming operations could likely only be made after the Upper House election in the summer.

During negotiations with coalition partner New Komeito, the LDP overruled New Komeito's demand that Japan go nuclear-free. And the wording in the coalition agreement was toned down to state the aim of reducing "dependence on nuclear energy as much as possible."

This lack of a specific target could allow Japan to maintain its dependence on nuclear energy indefinitely.

But a more symbolic issue concerns whether the new government will approve the construction of new reactors.

During his first news conference Dec. 27, incoming economy minister Toshimitsu Motegi said it would take "a major political decision" on whether or not to allow construction of nine reactors that currently exist only at the planning stage.
"We will not immediately be declaring 'yes or no,' but we will collect experts' opinions in order to make a major political decision in the future," he told reporters.

The DPJ government decided to withhold permission for construction of the nine units. Among them is the Kaminoseki plant in Yamaguchi Prefecture planned by Chugoku Electric Power Co.

However, Abe indicated at a Dec. 21 news conference that he would leave the question of new construction undecided for now.

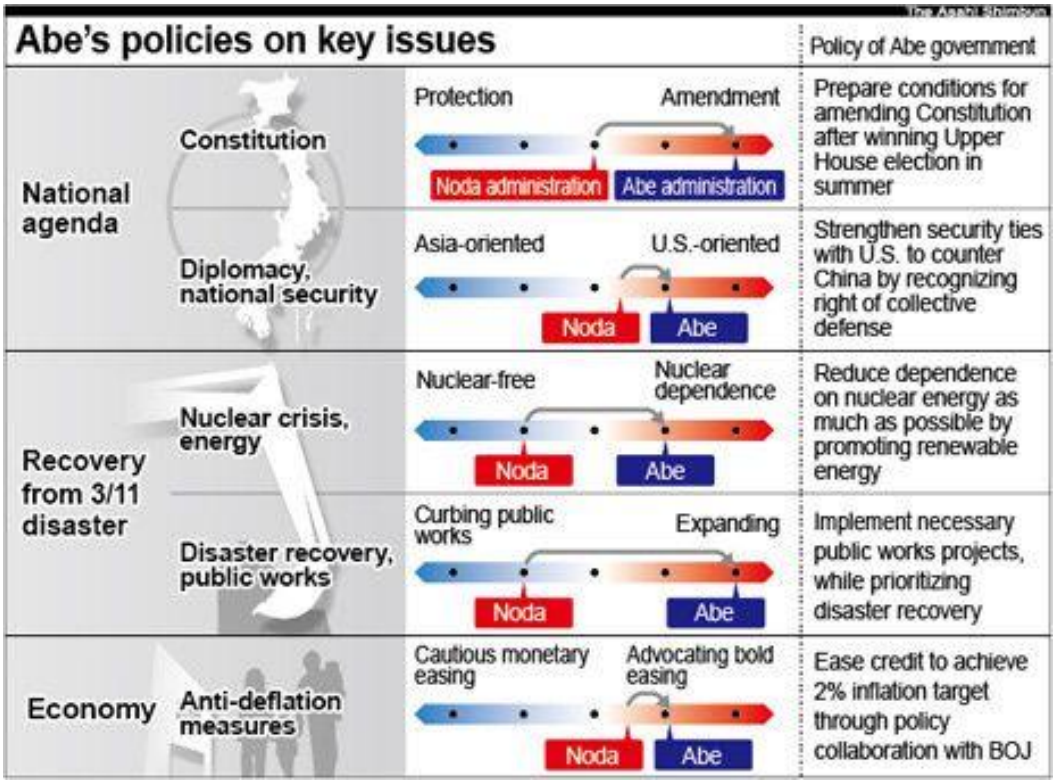
Meanwhile, personnel appointments point to a greater say in policy by senior former civil servants who in the past walked in step with the LDP in promoting nuclear energy.

One of Abe's new aides is Takaya Imai, a former deputy director-general of the Agency for Natural Resources and Energy. Imai served as an administrative aide during Abe's first stint as prime minister.

Named as an administrative aide this time is Tadao Yanase, deputy director-general of the Economic and Industrial Policy Bureau at the Ministry of Economy, Trade and Industry.

Both Imai and Yanase were involved in nuclear policy when they worked at METI.

[...]



(No-)Nuke policy will be reviewed

December 28, 2012
Abe government questions 'no nuke' future hours after taking office

http://ajw.asahi.com/article/behind_news/politics/AJ201212280059

THE ASAHI SHIMBUN

The Abe administration is moving swiftly to distance itself from the nuclear-free society envisioned by its predecessor.

Early on Dec. 27, hours after Shinzo Abe formed his Cabinet, his economy minister, Toshimitsu Motegi, said the government would review the Democratic Party of Japan administration's ban on building new nuclear reactors that currently exist only on the drawing board.

Plans exist for nine such reactors. Additionally, construction is already under way on three further reactors, which the DPJ said can continue.

Motegi was speaking at his first news conference after assuming office. His declaration calls into question the DPJ's pledge to shut down all nuclear reactors by the 2030s—and perhaps pushes back the deadline indefinitely.

The DPJ aimed to meet the target by preventing construction of new reactors and by decommissioning existing ones as they reached the end of their standard 40-year service life. This would result in a gradual decrease from the current total of 50 reactors.

Because Motegi has opened the door to possible construction of new reactors, that scenario is now unlikely.

But it remains unclear whether coalition partner New Komeito will consent to the Liberal Democratic Party's plan to restore dependence on nuclear energy.

New Komeito called for a nuclear-free future as it campaigned for seats in the Lower House election. The coalition agreement with the LDP calls for reducing dependence on nuclear energy "as much as possible."

During a televised discussion Dec. 22, New Komeito leader Natsuo Yamaguchi said it would be a bad idea at the moment to approve building new reactors.

"That is something that would not likely win public understanding," he said.

Appearing on the same TV program, Shigeru Ishiba, the LDP secretary-general, countered, saying construction was possible. But Yamaguchi said such a decision should only be taken after much caution.

Meanwhile, Motegi's comment pleased advocates of nuclear power and angered those opposed, especially in Fukushima Prefecture, which is still a long way from recovering from the accident at the Fukushima No. 1 nuclear power plant last year.

"That is only to be expected," said Yasuchika Hasegawa, chairman of the Japan Association of Corporate Executives, reacting to Motegi's comment. He added, "It was still too early to be setting any kind of deadline and such a definitive statement should not have been made."

Local leaders whose localities already have nuclear reactors were generally pleased that further construction is now possible.

"Next year will be a good one," said Kazuharu Kawase, mayor of Tsuruga, Fukui Prefecture, which hosts a number of plants. They provide significant local employment.

Japan Atomic Power Co. plans to build two new reactors at its Tsuruga plant, adding to two already there. Initial plans called for the No. 3 reactor to enter service in 2017, and the No. 4 reactor in 2018.

Municipal government officials did not hide their disdain for the DPJ government and were clearly waiting for the LDP to take the reins of power once again.

There is now the possibility of construction beginning at the Kaminoseki plant in Yamaguchi Prefecture, a project which has polarized the town since it was first proposed in 1982.

One advocate is municipal assembly member Tetsuo Nishi, 65.

"I am reassured by the statement, which gives us hope," he said.

But on Iwaishima island, 4 kilometers from the planned site, a group of residents remains steadfastly opposed.

"Does the LDP want to once again torment the residents of Iwaishima?" asked 35-year-old Takashi Yamato. "We will continue our fight until it retracts the decision."

Choichi Ujimoto, 62, is a local organic farmer.

"Our 30-year struggle will continue," he said. "Since we cannot ask older residents to strive harder, it is us who must lead the cause now. We will show that we can make a living even without revenues associated with the nuclear plant."

The town of Namie, Fukushima Prefecture, today remains all but deserted. It lies close to the Fukushima No. 1 nuclear plant.

Residents still cannot return, and yet Tohoku Electric Power Co. has plans to build a new nuclear plant right there—at Namie.

"I cannot accept the idea of building a new plant when no clear explanation has been made of the cause of the nuclear accident," said Namie Mayor Tamotsu Baba.

"Does this mean the suffering has not been understood? Or is it a sign that the accident has already been forgotten?" Baba said.

Motegi says N-policy must be reviewed

http://www.yomiuri.co.jp/dy/national/T121227003553.htm

Jiji Press

New industry minister Toshimitsu Motegi said the policy to reduce the nation's reliance on nuclear power to zero in the 2030s, espoused by the previous government led by the Democratic Party of Japan, needs to be reviewed.

It is impossible for Japan to abandon its nuclear fuel cycle policy anytime soon, he also said at a news conference after the launch of the Cabinet of new Prime Minister Shinzo Abe on Wednesday.

"We will do all we can to ensure a stable power supply so that domestic economic activities won't be affected," Motegi said.

The government will take responsibility for restarting idled nuclear reactors once their safety is confirmed by the Nuclear Regulation Authority, he added.

Currently, only two of the nation's 50 nuclear reactors are operating. The two--the Nos. 3 and 4 units at Kansai Electric Power Co.'s Oi nuclear power plant--resumed operations in July. They are the first to have been restarted since the outbreak of the crisis at the Fukushima No. 1 nuclear plant.

December 27, 2012

Abe administration puts plans to end nuclear power by 2030s under review

http://mainichi.jp/english/english/newsselect/news/20121227p2a00m0na014000c.html

The administration of Prime Minister Shinzo Abe is poised to review plans to shut down all nuclear power plants by the 2030s, as promised by the Democratic Party of Japan (DPJ)-led administration, the new trade minister said.

"We need to review the policy," Economy, Trade and Industry Minister Toshimitsu Motegi told a news conference after a Cabinet meeting on Dec. 27.

Motegi also said the government will resume operations at idled nuclear plants on condition that it wins understanding from local communities.

"The government will decide to reactivate nuclear plants under its own responsibility if they are confirmed safe," Motegi said.

The minister said the government will give the green light for the continuation of the construction of J-Power's Oma nuclear plant and the No. 3 reactor at Chugoku Electric Power Co.'s Shimane plant, which has already started.

Moreover, Motegi declared that the new administration will scrap the DPJ government's decision not to approve the construction of any new nuclear reactors.

"We'd like to make a political decision after we accumulate sufficient specialized expertise," he said.
In Japan, three nuclear reactors are under construction while there are plans to build nine others.

Approval of the construction of new reactors means the LDP-led government will utilize several nuclear power stations in the mid- and long-term.

Meanwhile, the minister ruled out the possibility of abandoning the nuclear fuel cycle project, in which spent nuclear fuel is to be reprocessed and reused for nuclear reactors.

Erase every decision from the previous gov't

December 28, 2012

Zero-nuclear policy, Kono Statement in the sights

Abe Cabinet signals big changes ahead

http://www.japantimes.co.jp/text/nn20121228a1.html

By MASAMI ITO
Staff writer

Prime Minister Shinzo Abe's Cabinet got down to work Thursday dismantling various policies of the previous administration, including the zero-nuclear target, and musing on a review of the 1993 Kono Statement, an apology for the coercion of women into sexual slavery during the war.

Industry minister Toshimitsu Motegi stated that the new government would review the Democratic Party of Japan's plan to completely abandon atomic power as an energy source by the 2030s. He also hinted the Liberal Democratic Party-led government would permit the construction of new reactors.

"It is not about making a 'yes' or 'no' decision right now, but a major political decision will be made in the future after collecting expert opinions," Motegi told reporters early Thursday, hours after he was appointed.

Pressured by a vociferous nationwide call to abandon nuclear power, then-Prime Minister Yoshihiko Noda and his DPJ-led government adopted a zero-nuclear policy in September. The decision was adamantly opposed by Keidanren, the nation's largest business lobby and a strong supporter of the LDP, which has welcomed the Abe government's intention to change course.

"The previous government's policy to stop all active nuclear reactors by the 2030s needs to be reviewed," Motegi said.

Abe has repeatedly stated that the LDP would take 10 years to come up with the "best energy mix," indirectly suggesting his government intends to maintain reliance on atomic energy despite the meltdowns at the Fukushima No. 1 nuclear power plant, which forced thousands of residents to flee and contaminated many of the prefecture's resources, from fish to vegetables to water, with radiation.

Motegi's comment was the first from Abe's Cabinet to clearly broach the subject of reviewing the zero-nuclear policy.

Also potentially up for review, if Abe has his way, is the 1993 statement [....]

The LDP is back in power for the first time in 39 months after voters bounced the DPJ in the Dec. 16 general election. Abe himself walked away from the prime ministership in 2007, when Cabinet scandals, a plummeting support rate and health problems overwhelmed him. Every leader since has lasted roughly a year at the top.
On Wednesday night, after his official reappointment as the nation's leader, Abe said he was older and wiser, and expressed confidence he could rule better this time.

Pro-nukes are back

December 29, 2012
Pro-nuclear bureaucrats back in the picture under Abe

http://ajw.asahi.com/article/behind_news/politics/AJ201212290056

December 29, 2012
THE ASAHI SHIMBUN

The Liberal Democratic Party wasted little time restoring the influence of the pro-nuclear industry ministry to move away from the nuclear-free society envisioned by the previous government.

Soon after new Prime Minister Shinzo Abe established his Cabinet on Dec. 26, moves were quickly made that elated ministry officials who had been kept on the defensive since the March 2011 accident at the Fukushima No. 1 nuclear power plant.

Even before he was named prime minister, Abe indicated the direction he would take concerning the nation's energy policy. And LDP members expressed confidence that the party's landslide victory in the Dec. 16 Lower House election had given them the go-ahead from the public to pursue nuclear power generation.

On Dec. 21, Abe visited Yamaguchi Prefecture, which he represents, to pray at the graves of relatives, including his father, Shintaro, a former foreign minister.

At a news conference at the Yamaguchi prefectural government building, Abe said he would review the decision of the Democratic Party of Japan-led government to halt new construction of reactors, opening the door for the possible construction of a nuclear plant at Kaminoseki in the prefecture.

Standing by Abe's side was Takaya Imai, a former deputy director-general of the Agency for Natural Resources and Energy, which comes under the jurisdiction of the Ministry of Economy, Trade and Industry. Imai was an administrative aide during Abe's first stint as prime minister.

A day after the LDP's election victory, Imai was removed from the deputy director-general's post and was appointed a policy aide to Abe, giving the ministry veteran greater influence over a much wider policy area.

When Naoto Kan was prime minister during the DPJ government, Imai was involved in exporting nuclear plant technology to Vietnam. When the administration of Prime Minister Yoshihiko Noda was moving toward resuming operations at the Oi nuclear plant in Fukui Prefecture this past summer, Imai served as a liaison with local government officials.

METI officials chose Tadao Yanase, deputy director-general of the Economic and Industrial Policy Bureau, as administrative aide to Abe this time around. Yanase was involved in compiling a plan for the promotion of nuclear energy in 2006, when he headed the Nuclear Energy Policy Planning Division.

Because past LDP governments worked closely with the ministry to promote nuclear energy, the return to power by the LDP provides the opportunity for the new administration to again promote nuclear power generation.

One reason the LDP is easily overturning the DPJ's nuclear policy is because the DPJ administration did not put much muscle behind its pronouncements. No Cabinet approval was given for seeking a nuclear-free society--and that objective was not clearly included in the new energy basic plan or any laws passed by DPJ administrations.

The LDP's coalition agreement with New Komeito includes a reduced dependence on nuclear energy as much as possible. But there is no telling how long that pledge will stand up.

The DPJ government, which began discussing future nuclear policy in spring this year, was never really a strong advocate of a nuclear-free society.

At one time, a consensus was developing to reduce the ratio of nuclear energy generation to 15 percent from the approximately 25-percent level before the Fukushima nuclear accident. In May, Goshi Hosono, who was state minister in charge of handling the nuclear accident, said the 15-percent level would be one starting point for discussions.

The DPJ government only started mentioning a nuclear-free future after seeing public sentiment turn against nuclear power in light of the Fukushima accident.

At public hearings held in 11 locations around Japan this summer, about 70 percent of participants wanted a nuclear-free future. A deliberative opinion poll found close to half of participants in favor of such a future.
Weekly protests in front of the prime minister's office drew thousands of citizens voicing their opposition to nuclear energy.

Although no Cabinet approval was given, the DPJ did include in its new energy strategy the goal of halting all nuclear reactor operations by the 2030s.

LDP officials say their election victory represented a change in public opinion.

"Rather than a nuclear-free nation, what was supported was a move to decide on the future of nuclear energy after discussing the issue for periods of between three to 10 years," Shigeru Ishiba, the LDP secretary-general, said.

At his first news conference after becoming industry minister, Toshimitsu Motegi said he would review the DPJ proposal to end operations at all nuclear reactors by the 2030s. He said future political decisions would be made about whether to allow construction to start on nine planned reactors.

Abe, at his first news conference after becoming prime minister on Dec. 26, spent much of the time explaining his economic policies but made no mention of Japan's nuclear policy.

Exit polls conducted by The Asahi Shimbun on Dec. 16 found that 78 percent of respondents favored either an immediate or gradual move toward a nuclear-free society, much larger than the 15 percent who opposed such moves.

Motegi and the LDP came under fire over the new administration's nuclear policy on a Dec. 28 television program.

"The reason why God returned the LDP to control of government was because He wanted you to clean up the mess you made of nuclear policy," singer Akihiro Miwa told the industry minister.

Having been exposed to radiation when the atomic bomb was dropped on Nagasaki on Aug. 9, 1945, Miwa criticized the Abe administration's stance of seeking to resume operations at nuclear reactors before any decision had been made on the final disposal site for spent nuclear fuel.

However, Motegi did not back down.

"There already is spent nuclear fuel," Motegi said. "That major problem will remain regardless of whether or not we resume operations at nuclear reactors."

No nuclear power "in the short-, medium- or long term"

December 28, 2012
Editorial: LDP must not overturn zero-nuclear policy

http://mainichi.jp/english/english/perspectives/news/20121228p2a00m0na005000c.html

Newly appointed Economy, Trade and Industry Minister Toshimitsu Motegi has announced that he "will make a political decision" over additional construction of nuclear reactors "after accumulating sufficient expert knowledge."

His remarks suggest that the new Liberal Democratic Party (LDP)-led government will upend its Democratic Party of Japan (DPJ) predecessors' policy against reactor construction, and hint that it may even green-light new reactors. Motegi has also clearly stated that the previous administration's move to end nuclear power in Japan by the 2030s will be reviewed.

The minister's position is, however, a far cry from implementing the coalition agreement between the LDP and New Komeito, which advocates a maximum possible reduction in Japan's dependence on nuclear power.

During its campaigns for the Dec. 16 House of Representatives election, the LDP pledged to work out a sustainable energy mix within the next 10 years, without mentioning how the party will handle nuclear energy in the medium- and long-term. If the LDP is to use its landslide election victory to grease the rails for an immediate examination of new reactor construction, we will see it as a variation on the iron fist in the velvet glove, except the cold metal being concealed is "promotion of nuclear power." The metaphor is all the more apt as public sentiment is set so firmly against atomic energy.

The nuclear disaster at the Fukushima No. 1 nuclear plant has demonstrated the grave consequences of a severe accident and the danger of hosting nuclear plants in this quake-prone country, on top of the government's shoddy nuclear regulation in the past.

Those factors were the very reason why most of the participants in public hearings and deliberative polling conducted by the government this past summer called for zero nuclear power, and why no party in the recent general election advocated a complete embrace of nuclear power -- not even the LDP. We cannot tolerate any move by the LDP to disregard everything said thus far and venture additional reactor construction. New Komeito has good reason to be concerned that the government would not be able to gain public support for more reactors.

For the time being, the main focus will be on whether to reactivate existing reactors suspended in the wake of the Fukushima meltdowns. The new administration led by Prime Minister Shinzo Abe is looking to put those reactors back online after their safety has been confirmed by the new Nuclear Regulation Authority (NRA). Doing so will not be easy.

The NRA is scheduled to have new nuclear plant safety standards drawn up by July next year, including strengthened earthquake and tsunami countermeasures, as well as countermeasures against severe

accidents like the Fukushima disaster. Preparing additional measures will require time, and some reactors may face decommissioning if they fail to meet the new standards.

The recent series of on-site surveys by the NRA on active fault lines running under the nuclear plants have raised questions over the legitimacy of surveys and safety screenings conducted by power companies and government regulators in the past. The new administration will also need to examine how to gain understanding from local governments hosting nuclear plants.

For example, the Hakodate Municipal Government in Hokkaido is opposed to restarting construction of Electric Power Development Co. (J-Power)'s Oma Nuclear Power Plant in Aomori Prefecture across the Tsugaru strait. It appears unlikely reactor restarts will work out the way the new administration desires.

We call on the government to seek out an energy policy that will not force us to rely on nuclear power in the short-, medium- or long-term.

Abe's energy challenges (short video)

Video on NHK "On Air" (December 28, 2012)

Abe's energy challenges

http://www3.nhk.or.jp/nhkworld/english/movie/feature201212282204.html
Will the public agree?

December 31, 2012

Abe expresses support for construction of new nuclear plants

http://mainichi.jp/english/english/newsselect/news/20121231p2a00m0na002000c.html

Prime Minister Shinzo Abe expressed support for the construction of new nuclear plants in an interview with TBS on Dec. 30 -- on condition that the government wins public understanding on the issue.

"New nuclear plants would be completely different from the old ones from 40 years ago like the Fukushima No. 1 Nuclear Power Plant, which caused an accident. We'll approve the construction of new plants while getting the people's understanding on these differences," he told the television broadcaster.

At a news conference on Dec. 21, Abe had hinted he was willing approve the construction of new plants when he said he "would like to reconsider" the Democratic Party of Japan (DPJ)'s policy of generally not approving new construction.
In his interview, Abe stated, "The people are uneasy about how we will deal with our current power demands, and that's why those who carelessly touted an end to nuclear power plants failed to receive the people's trust (in the Dec. 16 House of Representatives election)."

Economy, Trade and Industry Minister Toshimitsu Motegi said at a news conference on Dec. 27 that the administration intends to approve the continued construction of J-Power's Oma Nuclear Power Plant and the No. 3 reactor at Chugoku Electric Power Co.'s Shimane Nuclear Power Plant. On starting construction of new nuclear plants, he said, "We would like to make a decision on that after accumulating sufficient expert knowledge."

There are nine planned nuclear reactors in Japan whose construction is pending. Most are advanced boiling water reactors or advanced pressurized water reactors that incorporate safety and efficiency improvements into their original designs.

If construction of new reactors is approved, it will put an end to the DPJ's policy of having no active nuclear reactors by the end of the 2030s. On Dec. 29, Abe stated that he would not immediately make the DPJ policy his own administration's policy -- showing a clear intention of turning aside from the path of "ending dependence on nuclear plants."

However, part of the agreement between the ruling Liberal Democratic Party and New Komeito on their governing coalition is that they will "reduce dependence on nuclear power plants as much as possible." New Komeito is opposed to the construction of new nuclear plants.

Three nonnuclear principles not revisable?

December 31, 2012
Altering nonnuclear principles not on the table, Kishida says
http://www.japantimes.co.jp/text/nn20121231a4.html

By MIZUHO AOKI

Staff writer

The Cabinet of Prime Minister Shinzo Abe is not considering revising the three nonnuclear principles that forbid the possession, manufacture or storage of nuclear weapons on Japanese soil, new Foreign Minister Fumio Kishida says.

In a group interview with the media recently, Kishida said the Cabinet is not discussing relaxing the principles so that U.S. ships can carry nuclear arms when visiting Japanese ports. In July last year, a report by the Liberal Democratic Party's national strategy office advocated altering the three principles to "2½."

"The three nonnuclear principles are very important rules that previous Cabinets have valued," said Kishida, 55, who was appointed foreign minister on Wednesday. "This should be kept in the future. We are not having a discussion on a revision."

Unlike Abe, the former state minister for Okinawa and Northern Territories affairs is not regarded as a hawk. In fact, his appointment is viewed by some as an effort by Abe to placate foreign governments.

"I know that Abe's Cabinet is considered rightwing or hawkish. But we have to explain (to the public that) there is a positive side as well, such as to execute things that we must do as a nation," Kishida said.

"But I think it is also important to show our breadth . . . and show a sense of balance," Kishida said, adding he hopes to help bring balance to the Cabinet.

However, he showed no compromise on the Senkakus dispute with China, insisting that the islets in the East China Sea are historically, and by international law, part of Japan.

He also emphasized that it was important to keep the lines of communication open with China to avoid any incidents.

Since Japan purchased three of the five Senkaku islets from their Saitama-based owner in September, Chinese vessels have been cruising near or inside Japan's territorial waters around the disputed islets, which are called Diaoyu in Chinese. On Dec. 13, a Chinese state-owned plane breached Japanese airspace for the first time on record near the islets.

On the issue of nuclear weapons, Kishida, a native of Hiroshima Prefecture, said he wants to work toward abolition.

Noting that the Nonproliferation and Disarmament Initiative, a 10-country coalition formed in 2010, will be holding ministerial-level talks in Hiroshima in 2014, Kishida said he wants to use the opportunity to improve cooperation with other nations.

As for the Trans-Pacific Partnership, Kishida said the LDP remains opposed to entering into negotiations as long as they are premised on abolishing all tariffs without conditions.

"If the prime minister visits the United States sometime soon, I presume (they) will touch on the TPP issue," Kishida said.

As for joining The Hague Convention against child abductions by estranged parents, Kishida only said that relevant parties will be looking into the matter.

In March 2011, the DPJ government decided to prepare to ratify the 1980 Hague Convention on Civil Aspects on International Child Abduction.

"It is embarrassing that Japan can't even have discussions about this issue due to confusion at the Diet," Kishida said.
The government submitted draft legislation for joining the convention to the Diet in March, but it has been shelved due to confrontation between the ruling and opposition camps.

A graduate of Waseda University, Kishida worked at the defunct Long-Term Credit Bank of Japan before starting his political career as a secretary to his father in 1987. Kishida won a seat in the Lower House in 1993.

No great surprise

December 30, 2012

UPDATE: Abe maintains plan to review nuke-free policy

http://ajw.asahi.com/article/behind_news/politics/AJ201212300016

THE ASAHI SHIMBUN AND WIRE REPORTS

FUKUSHIMA NO. 1 NUCLEAR POWER PLANT--Newly installed Prime Minister Shinzo Abe reiterated his intention to review his predecessor's plan to eventually phase out nuclear energy on Dec. 29 after he visited the tsunami-devastated Fukushima No. 1 nuclear plant.

"We bear a position of responsibility, which is different from (the stance of our predecessor) that tried to immediately realize, as a government policy, mere hope for eliminating nuclear power plants," Abe told reporters after his visit to the crippled plant.

Donning protective gear, Abe took a bus tour of the plant--site of the worst nuclear accident since the 1986 Chernobyl disaster--and greeted workers at its emergency operations center in Okuma town on Japan's northeastern coast.

A massive earthquake and tsunami on March 11, 2011, swamped parts of the Fukushima plant, disabling backup systems and triggering radiation-spewing meltdowns that forced tens of thousands of people to flee. The disaster triggered massive protests against atomic energy and widespread public distrust in nuclear plant operators and regulators.

Japan's nuclear reactors were suspended for checks after the Fukushima meltdowns, and only two of the country's 50 reactors are currently online.

During his visit to the Fukushima plant's operations center, Abe urged employees of the plant's embattled owner, Tokyo Electric Power Co., to persevere as the company works to clean up radiation released by the accident and safely close the plant permanently.

"Your courage is what brings hope to Japan,'' Abe told workers at the center. "Yet, we still face a great challenge--an unprecedented challenge in human history to working towards decommissioning the plant in such scale.''

The previous government, led by the rival Democratic Party of Japan, had pledged to phase out nuclear power by 2040 by retiring aging reactors and not replacing them.

But Abe's Liberal Democratic Party, which regained power in elections this month, says it plans to spend 10 years studying the best energy mix for the country. Abe has said he may reconsider the previous government's decision to stop building reactors.

The relatively favorable stance toward resuming operations of more nuclear plants has won favor among business leaders worried about power shortages and rising costs; since the Fukushima disaster, Japanese imports of costly liquefied natural gas have soared.

It's unclear, however, if that would win the approval of the government's Nuclear Regulation Authority, which is drawing up new, compulsory safety standards and checking some plants for potential trouble from geologic faults that could compromise safety in case of earthquakes, which are common in this seismically active country.

Can LNG be an alternative?

January 2, 2013

LNG gains political value as Japan's needs soar

Alaska looks to be key source if pipeline plan goes through

http://www.japantimes.co.jp/text/nn20130102x1.html

By ERIC JOHNSTON
Staff writer

OSAKA — With Japan's nuclear power future clouded by discoveries of active faults near atomic plants in Fukui and Aomori prefectures, liquefied natural gas has become a critical resource and an area of great potential for strengthening relations with the United States.

From the frozen wilderness of Alaska's North Slope to Louisiana and the Gulf Coast, American LNG reserves have increasingly drawn interest from Japan since the March 2011 megaquake and tsunami. With all but two of the nation's 50 nuclear reactors shut down, Japan has seen LNG imports surge.

In fiscal 2011, LNG imports reached about 83.2 million metric tons (mmt), up 18 percent from the previous year. For fiscal 2012, which ends this March, total LNG imports are expected to reach 90 million mmt.

Japan's LNG came from 17 countries in 2011, but almost two-thirds were from four countries: Malaysia (19 percent), Australia (18 percent), Qatar (15 percent) and Indonesia (12 percent). Alaska, the only place in the U.S. where LNG exports are currently allowed, along with eight other countries, accounted for just 7 percent of last year's imports.
That is likely to change within the next decade.

Last year, then-Prime Minister Yoshihiko Noda and U.S. President Barack Obama discussed drastically increasing LNG exports to Japan.

Obama said that while the U.S. was still discussing its energy policy, Japanese energy security is considered important to bilateral ties.

Japanese firms have a specific interest in Alaska's North Slope, where there are plans to build a 1,280-km natural gas pipeline to the southern coast. The North Slope contains about 35 trillion cu. feet of proven gas reserves.

"Alaska's natural gas would provide a comparatively clean, sustainable, and entirely reliable energy source to our friends in Japan. Alaska's natural gas resources do not present the concerns and controversies surrounding natural gas exports from the Lower 48," Alaska Sen. Lisa Murkowski, who is vice chairwoman of a group of U.S. and Japanese lawmakers, said in a letter to Obama in late April, just before his meeting with Noda.

In 2011, Japan received eight shipments of Alaskan LNG, totaling 15.27 billion cu. feet.

Shipments went to utilities in Tokyo or the Kansai region.

"Alaskan LNG has many advantages for Japan, starting with cost. Not only is the gas cheap, but so is transportation. It only takes about a week for the tankers to arrive in Japan" says Kojiro Abe, trade representative for Alaska's Japan office. "America's political stability compared to some other LNG suppliers, and the safety of the sea lane from Alaska to Japan is a huge advantage as well."

Resources Energy Inc., a Japanese consortium, has already opened an office in Alaska. Members include Japan Petroleum Exploration Co., Idemitsu Kosan Co., Nippon Oil and Energy Corp., Mitsubishi Gas Chemical Co., and Nippon Telephone and Telegraph Corp.

The consortium hopes to have North Slope gas flowing to Japan as early as 2019 by building an LNG plant in the southern part of the state.

There are two major hurdles that must be overcome, however.

First is a pipeline. While it would be constructed beside a current oil pipeline and thus be logistically easier than plowing through virgin territory, who would pay for the project is a matter of ongoing discussion among Japanese, U.S. and international firms interested in the project, as well as the U.S. government.

The second issue is legal and political. A section in the 1976 Alaska Natural Gas Transportation Act says that if North Slope gas exports to countries other than Canada and Mexico exceed 1 million cu. feet a day, the U.S. president must ensure such exports will neither diminish the total quantity or quality, nor increase the total price of energy stores available to the U.S.

But Japanese and American firms are increasingly confident the U.S. government will allow greater exports.

In addition to Alaska, Japan hopes to buy up to 30 million metric tons per year of LNG from terminals in Louisiana, Texas, and Maryland. Last summer, Osaka Gas Co. and Chubu Electric Power Co. announced they'd signed contracts with a Texas firm to liquefy 4.4 million tons annually of LNG that will start arriving in Japan from 2017, assuming the final approvals are granted by mid-2013, as expected.

U.S. law also says private companies seeking to export LNG to a country without a free-trade agreement with the U.S., that includes a specific clause about exporting natural gas, must get approval from the U.S. Department of Energy for each shipment.

For a U.S. ally like Japan, approval is almost automatic.

But the DOE can deny permission if it determines such exports violate the "public interest." U.S. congressional opponents of LNG exports have used this stipulation to argue that sending large quantities of LNG outside the country will drive up prices domestically.

In addition, Alaskan environmentalists argue that a new natural gas pipeline will damage its environment.

Last month, however, a DOE-sponsored report concluded that exporting LNG could be good for the U.S. economy, even if gas prices go up.

"Benefits that come from export expansion more than outweigh the losses from reduced capital and wage income to U.S. consumers, and hence LNG exports have net economic benefits in spite of higher domestic natural gas prices," the report said.

Japan's quest for more U.S. LNG also has the support of influential Washington insiders.

In an August report, the Center for Strategic and International Studies recommended the U.S. begin to export LNG from the Lower 48 states by 2015.

"The U.S. should not resort to resource nationalism. As part of the security relationship, the U.S. and Japan should be natural resource allies as well as military allies. This area of cooperation remains insufficiently developed," the CSIS report said.

Back to nukes?

January 3, 2013

A cautious return to nuclear power

Though public is wary, new LDP-led government backs resumption of reactors, plant construction

http://www.japantimes.co.jp/text/nn20130103f2.html

By MIYA TANAKA
Kyodo

Japan appears to be heading toward a gradual revival of nuclear power generation under a new government supportive of retaining it, but the outlook for the industry in 2013 is unclear, with antinuclear sentiment still lingering among the public amid the disaster at the Fukushima No. 1 atomic plant.

The new government led by the Liberal Democratic Party has already signaled that it has no intention of following in the footsteps of the Democratic Party of Japan government, which was overthrown after the

Dec. 16 election, when it comes to energy policy. The DPJ government aimed at phasing out nuclear power by the 2030s.

"We need to reconsider the previous government's policy of seeking zero operations of nuclear plants," Economy, Trade and Industry Minister Toshimitsu Motegi told a press conference shortly after assuming the ministerial post.

He also said that completely giving up Japan's spent-fuel recycling policy, which would lose its role if nuclear power generation ends, is "currently not an option," and that the government backs the resumption of reactors as long as they are deemed safe by the Nuclear Regulation Authority, the new atomic watchdog.

The remarks are likely to encourage utilities, which have been desperate to restart idled reactors to boost their business. The minister's words also leave open the possibility of allowing utilities to install new reactors that have been planned but are not yet under construction.

But the nuclear industry is not necessarily optimistic about its prospects due to the huge impact the Fukushima crisis has had on the public.

"The LDP won (the Dec. 16 general election), so will nuclear power be pursued? I don't think things are as simple as that," Takuya Hattori, president of the Japan Atomic Industrial Forum, told reporters, adding that the industry would lose more public trust if it returns to business as usual.

"The point is whether the nuclear industry can show how deeply it regrets the Fukushima accident and how far it will change itself," said Hattori, a former executive vice president of Tokyo Electric Power Co.

2012 was tumultuous for Japan's nuclear plant operators. From May, the country experienced a period without nuclear power for the first time in decades, as reactors that had been operating before the nuclear crisis started went offline for mandatory routine maintenance and were unable to be restarted without first undergoing "stress tests."

Two reactors in western Japan were reactivated in July after clearing provisional safety standards created by the government amid massive antinuclear rallies, which drew some 200,000 people near the prime minister's office in Tokyo at one point, according to the organizers.

In addition to such a harsh climate of public opinion about atomic power, utilities may also face more headwinds now that the NRA is gearing up to assess the safety of reactors in the quake-prone country.

Recently, the NRA has suggested it will be tough with utilities, warning that geological faults under two plants are likely to be active, assessments that will significantly affect the prospects for restarting the two plants' reactors.

Motegi said the government will "respect" the safety assessments made by the independent NRA and added that reactors will not be allowed to restart unless they clear the new safety standards, which the NRA plans to craft by July to prevent a recurrence of the Fukushima crisis.

Tadahiro Katsuta, an associate professor at Meiji University who is a member of a panel tasked by the NRA with devising the standards, said that "high bars" are expected to be set for utilities.

But he also said he feels the plant operators are determined to meet the requirements at any cost and that there is no guarantee that the NRA can maintain its current tough stance against the companies.

"You don't know in what form pressure could be (exerted) on the NRA commissioners. Public opinion (skeptical about nuclear power) could also be a factor that is affecting them now, so if people start to become mum on the issue, the NRA's stance could change," Katsuta said.

Some political experts said the new government is expected to carefully consider how to handle the nuclear issue, especially before the House of Councilors election, expected in July, because explicitly taking a pronuclear stance could trigger a public backlash.

"The LDP's landslide victory in the Lower House election may have made some ruling party lawmakers think there is less risk of pushing for the resumption of reactors. But they could still take a cautious approach until they win the Upper House election, opting to do what they really want to after that," said Koichi Nakano, a political science professor at Sophia University.

Japan and the price of uranium

January 5, 2013

Uranium rebound seen as Japan considers reactor restarts

http://www.japantimes.co.jp/text/nb20130105n2.html

By BEN SHARPLES
Bloomberg

MELBOURNE — Uranium is poised to rebound from a second annual decline as Japan considers restarting its atomic plants almost two years after the start of the Fukushima disaster and China pushes ahead with the world's biggest nuclear building program.

The price of the fuel for immediate delivery may average $55 a pound (0.45 kg) in 2013, according to the median of five analyst estimates in a Bloomberg News survey conducted last month. The nuclear fuel slipped 14 percent to an average of $48.72 in 2012 and traded at a three-year low of $40.65 in November, data compiled by Bloomberg show. It was $43 a pound on Jan. 3.

A revival in demand from Japan is raising the prospect that supplies of the radioactive metal will shrink at the same time as **China continues with a project to increase its nuclear power capacity at least fivefold by 2020.** That's a boost for uranium producers such as Perth, Australia-based Paladin Energy Ltd. It's also a blow to exporters of liquefied natural gas, including Qatar and Australia, which have helped fill Japan's power shortage since the earthquake and tsunami that triggered the three meltdowns at the Fukushima No. 1 plant in March 2011.

"The biggest pressure on price at the moment is not necessarily the downgrade to demand since Fukushima, it's this massive inventory overhang," said Joel Crane, vice president of research at Morgan Stanley in Melbourne. "Should the Japanese government give the green light to restarts, that overhang is instantly gone and that will be very positive for prices."

The uranium forecasts for 2013 ranged from $45 to $62.60 a ton [shouldn't it be per pound?] in the Bloomberg survey conducted from Dec. 10 to 19. That compares with a three-year high of $73 in February 2011, according to data from Roswell, Georgia-based Ux Consulting, which advises the nuclear industry.

The price plunged as low as $49.75 a ton in March 2011 after the offshore 9.0-magnitude earthquake rocked Japan. The subsequent tsunami damaged reactors at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant, releasing

radiation and causing the evacuation of 160,000 people. After the disaster started, the nation's 50 workable commercial reactors all started to go offline for routine and more rigorous safety checks, and

countries from China to France re-evaluated their nuclear policies. Germany meanwhile said it would close all of its facilities.

Japan's 10 regional utilities generated or purchased 2.4 percent of their electricity from nuclear plants in November, down from 27 percent in February 2011. The nation's installed nuclear capacity is 46,148 megawatts at its 50 operable plants. Fossil-fuel plants accounted for 73 percent, up from 50 percent.

Speculation that uranium demand will rebound has grown since Dec. 16, when the Liberal Democratic Party won the general election by a landslide. The previous administration, led by the Democratic Party of Japan, which ordered the shutdowns, planned to phase out nuclear power by the end of the 2030s. The LDP was ousted in 2009, two years before Fukushima, after ruling for all but 10 months since 1955 and driving the national development of atomic energy.

The new government plans to establish a variety of sources for electricity generation within 10 years and will review the plan to exit nuclear power, trade minister Toshimitsu Motegi said Dec. 28.

"We can't say for sure that Japan will be free of nuclear power by the 2030s," Motegi said at a news conference in Tokyo. "We will make our decisions based on technological findings and not with prejudgment."

The government and the utilities face heavy public opposition to nuclear power amid concern that some plants are at risk of earthquake damage. All but two of the nation's operable 50 reactors remain idled since Kansai Electric Power Co. resumed two units at its Oi plant in Fukui Prefecture in July.

The restart of the reactors is going to be "fairly slow" and is unlikely to be completed this year, capping uranium price gains, according to Thomas Neff, a physicist and uranium-industry analyst at Massachusetts Institute of Technology in Cambridge, Massachusetts.

"It's probably 2015 before you are going to get any strong demand signals sent to the market," Neff said Dec. 28. "There's no particularly good reason to think that it's going to go up in the next year."

Japan Atomic Power Co.'s Tsuruga plant in Fukui and Tohoku Electric Power Co.'s Higashidori plant in Aomori Prefecture may be sitting on active geological faults, teams of scientists working for the Nuclear Regulation Authority said last month. Kepco is conducting additional checks after a team from the new nuclear regulator delayed a decision on whether a fault under its Oi plant is active. Utilities aren't allowed to construct reactor buildings and other important facilities above an active quake fault.

Tens of thousands of nuclear power opponents held weekly protests outside previous Prime Minister Yoshihiko Noda's official residence last year. A government-backed public forum found in August that 47 percent of participants favored cutting nuclear power to zero, while newspaper polls in the last 18 months showed support for ending atomic power in Japan.

But the new prime minister, Shinzo Abe, said Dec. 26 that the government will await new safety standards before deciding whether to restart the idled reactors. The NRA has said it will announce the rules in July, and Abe hinted some of the reactors may be restarted in the next three years if they meet the tougher safety standards.

"The uncertainty around Japan is holding prices back," Jonathan Hinze, a senior vice president at Ux Consulting, said in an emailed response to questions last month. "The number one thing to help the price recover even more is additional Japanese reactor restarts."

Stockmarket investors have been betting that the resumptions will occur and boost uranium demand just as China pushes on with plans to build at least 26 new reactors. At the same time, analysts are predicting a drop in the price of LNG as Japan's utilities seek to reduce their eletricity-generation costs by switching back to nuclear.

Paladin, which operates two uranium mines in Africa and has exploration assets in Australia, rose 22 percent in Sydney in the two days through Dec. 18. Energy Resources of Australia Ltd., whose Ranger mine in the Northern Territory produces about 10 percent of the world's mined uranium, advanced 13 percent over the same period. Australia has the world's largest known deposits of the fuel, according to the World Nuclear Association.

"The uranium price and Paladin would benefit from a restart of Japanese reactors," UBS AG analysts, including Glynn Lawcock in Sydney, said in a Dec. 17 report as the bank upgraded its rating on the stock to "buy" from "neutral." "The latest change in government puts the restart one step closer, in our opinion, albeit timing remains unclear."

Kansai Electric's shares rose 18 percent in Tokyo, the most since at least 1974, the day after the LDP returned to power. The company plans to restart reactors 3 and 4 at its Takahama nuclear plant after July, it said in a Nov. 26 statement. Tepco, which surged 33 percent on Dec. 17, aims to restart all seven reactors at its Kashiwazaki Kariwa plant between this April and September 2015, according to a business plan announced in May.

China has 14 reactors operating and the new ones planned, accounting for more than 40 percent of the plants being built globally, may increase the nation's capacity to 60 gigawatts by 2020, according to the World Nuclear Association.

Not a surprise

January 8, 2012

_No5 / News in Brief

More Than 50% Of Local Leaders Back Japan Nuclear Restarts

http://www.nucnet.org/all-the-news/2013/01/08/more-than-50-of-local-leaders-back-japan-nuclear-restarts

Policies & Politics
8 Jan (NucNet): More than half of the communities in Japan that host nuclear power plants are in support of reactors being restarted as long as their safety is assured by the government, a newspaper survey says.

The 'Yomiuri Shimbun' survey, published yesterday, shows that 54 percent of the 135 communities hosting nuclear plants would approve of restarts. The newspaper said 28 percent of the respondents did not express a position, while only 18 percent said they would not support the restart of nuclear units.

When asked to choose conditions for restarting nuclear reactors – a question for which multiple responses were allowed – 50 of the 66 mayors interviewed said central government should make a final decision, while 42 said the consent of local governments was called for. Thirty-seven said a consensus among local residents was necessary.

The newspaper said the percentage favour of reactor restarts suggests that the prolonged suspension of nuclear reactors has "seriously affected local economies" because nuclear power generation is a key local industry for many of the municipalities.

The survey was carried out in December 2012 among the mayors of 135 cities, towns and villages within a 30-kilometre radius of a nuclear plant, designated as priority areas for implementing measures to respond to a nuclear disaster.

The 'Yomiuri Shimbun' said Japan's Nuclear Regulatory Authority (NRA) expanded the radius for priority areas – in which residents would be told to stay indoors or be evacuated outside the area to avoid health hazards in the event of a nuclear accident – from eight to 10 kilometres to 30 kilometres when it issued new disaster management guidelines in October 2012.

The expanded zones cover 135 municipalities in 21 prefectures, up from 45 municipalities in 15 prefectures under the previous guidelines.

The newspaper quoted one mayor as saying the operation of nuclear reactors should be resumed because it would help “rejuvenate industry”.

All but two of the country’s nuclear 50 commercial nuclear reactors remain offline after the March 2011 Fukushima-Daiichi accident. All restarts must first be approved by the recently formed NRA.

Japan’s new Liberal Democratic Party (LDP) prime minister Shinzo Abe said for the first time last week that his government will endorse the construction of new nuclear power plants.

Mr Abe said the Japanese people are worried about having sufficient electricity in the immediate future. He said parties that called for a shift away from nuclear energy were therefore “not trusted” in the recent election

An emerging nuclear order

January 12, 2013

World's second nuclear age

http://www.japantimes.co.jp/text/eo20130112a1.html

By PAUL BRACKEN

NEW HAVEN, Connecticut — North Korea's launch of a long-range missile in December was followed by a flurry of global condemnation that was almost comical in its predictability and impotence. The launch underscored a larger reality that can no longer be ignored: The world has entered a second nuclear age. The atomic bomb has returned for a second act, a post-Cold War encore. This larger pattern needs to be understood if it is to be managed.

The contours of the second nuclear age are still taking shape. But the next few years will be especially perilous, because newness itself creates dangers as rules and red lines are redefined. This took at least 10 years in the first nuclear age, and this time may be no different.

In the Middle East, South Asia and East Asia, old rivalries now unfold in a nuclear context. This has already changed military postures across the Middle East. Part of the Israeli nuclear arsenal is being shifted to sea, with atomic warheads on diesel submarines, to prevent their being targeted in a surprise attack. Israel also is launching a new generation of satellites to provide early warning of other countries' preparations for missile strikes. If Iran's mobile missiles disperse, Israel wants to know about it immediately.

Thus, the old problem of Arab-Israeli peace is now seen in the new context of an Iranian nuclear threat. The two problems are linked. How would Israel respond to rocket attacks from Gaza, Lebanon or Egypt if

it simultaneously faced the threat of nuclear attack by Iran? What would the United States and Israel do if Iran carried its threat to the point of evacuating its cities, or placing missiles in its own cities to ensure that any attack on them would cause massive collateral damage?

Pakistan has doubled the size of its nuclear arsenal in the last five years. Its armed forces are set to field new tactical nuclear weapons — short-range battlefield weapons. India has deployed a nuclear triad — bombers, missiles and submarines — and in 2012 tested an intercontinental ballistic missile, giving it the ability to hit Beijing and Shanghai. India almost certainly has a multiple warhead in development, and has also launched satellites to aid its targeting of Pakistan's forces.

In East Asia, North Korea has gone nuclear and is set to add a whole new class of uranium bombs to its arsenal. It has rehearsed quick missile salvos, showing that it could launch attacks on South Korea and Japan before any counter-strike could be landed.

China, too, is shifting its nuclear forces to mobile missiles and submarines. These weapons can be put on alert in a way that would be highly visible to U.S. satellites and the global media. Thus, the Chinese can easily "nuclearize" a crisis with the U.S. or anyone else. They do not have to detonate a nuclear weapon, but only alert adversaries to the dramatic increase in the political stakes and dangers of a showdown.

Russia, not wanting to be left out of the act, has recently staged the largest nuclear exercises in decades to remind everyone that it remains a serious nuclear player, too.

These individual developments are troubling. But they cannot be understood in isolation from the larger multipolar system of major powers that is forming. To a great extent, this is a nuclear multipolar system: **Possessing nuclear weapons contributes to a country's global status as a major power.**

To see this, consider the following question: When was the last time that the U.S. or anyone else seriously proposed that India sign the Nuclear Non-Proliferation Treaty (NPT) — that is, that India give up the Bomb. Given America's economic problems and looming defense cuts, as well as growing Chinese power, there is no longer even a remote possibility that this demand will be made.

India has become an accepted, legitimate member of the nuclear club, the **fiction of the NPT** notwithstanding. It is even less likely that China or Russia would disarm for the sake of a nuclear-free world.

But the most urgent problem stems from the breakdown of major countries' one-time nuclear monopoly and the empowerment of smaller countries like North Korea, Pakistan, Israel and, quite possibly, Iran. A new set of rules for diplomacy, military strategy and arms control is needed to stabilize this emerging nuclear order. Pretending that it does not exist is not a strategy.

Paul Bracken, a professor of management and political science at Yale University, is the author of "The Second Nuclear Age."

TEPCO's bidding plan

January 14, 2013

Tepco's power bidding plan raises warming concerns

http://www.japantimes.co.jp/text/nn20130114a3.html

Kyodo

Tokyo Electric Power Co. plans to start a bidding process next month to secure long-term electricity supplies from thermal power sources.

The plan is generating concern in some quarters about the effect on greenhouse gas emissions because the system implies the sole use of coal — a major source of the carbon dioxide emissions thought to be driving global warming.
Some experts also question Tepco's presumed need to increase power generation beyond fiscal 2019. This is because the population of its service area is expected to shrink.

Since thermal power plants emit large volumes of carbon dioxide over the course of several decades, building new ones could waste much of the public's efforts to save power since the March 2011 core meltdowns crippled Tepco's Fukushima No. 1 power plant.

Consumers may also have to shoulder the cost of building the costly facilities.

Tepco, the nation's largest utility, was effectively placed under state control in July to prevent its demise from the nuclear crisis. Its new business plan calls for securing an additional 2.6 million kw of electricity supply from fiscal 2019 to 2021.
Financially crippled by the Fukushima disaster, Tepco plans to bid for extra power from suppliers building new generation facilities, instead of building new plants of its own.

The bidding process is expected to start in February and the suppliers are expected to be selected by this summer.
One of the issues drawing attention is the conditions for the bidding, which limit the per kilowatt power generation costs to just ¥9.53. This low threshold effectively limits all fuel choices to coal.

While relatively cost efficient, coal is known as a major carbon dioxide generator. According to the Environment Ministry, the most advanced coal-fired plant discharges more than twice as much carbon dioxide as a gas-powered plant when generating just 1 kwh.

Tepco says it is planning to curb emissions by purchasing carbon credits from other entities to offset the expected rise in discharges. But it will have a lot more to offset if coal is picked in place of cleaner-burning natural gas, for instance.

The utility has formulated a short-term plan to boost power supplies to offset shortages caused by closing all its nuclear plants in light of the Fukushima disaster following the Great East Japan Earthquake almost two years ago.
A government source, however, questioned the need for the long-term plan.

"**This coal-fired thermal power project has nothing to do with electricity demand for the immediate period and toward the future, and there should be no need to boost supplies by 2.6 million kilowatts,"** the official said.
Tepco is assuming a sharp rebound in power sales, which slumped in the aftermath of the 2011 disasters. It even thinks demand will bounce back to prequake levels in 2020.

Since the disasters, however, businesses and households have been reducing power use amid repeated blackout threats from the government and the utility. In the meantime, electricity generated by renewable sources, such as solar and wind power, have been growing thanks to a system that obliges utilities to buy that energy at fixed prices.
It is also projected that the population of the Kanto region, which includes Tokyo and adjacent prefectures — Tepco's core service area — will peak around 2015.

Tepco says that its demand forecast is based on the government's projections for gross domestic product and that it also took the public's power-conservation efforts into account.

"Perhaps they overestimated their projection because Tepco will collapse unless they devise a plan to boost sales by assuming growth in demand," the government source surmised. "At the end of the day, consumers will end up paying for the cost of unnecessary capital investments."

If Tepco's plan is adopted as is, it will have a serious impact on the greenhouse gas balance.

According to an Environment Ministry estimate, even factoring in what Tepco is trying to cover with its emissions quota, there will be a net increase of around 9 million tons of carbon dioxide per year.

This is far greater than the roughly 5.4 million tons of carbon dioxide emissions estimated to have been trimmed in fiscal 2011 via power-saving or other efforts that reduced household power demand.

The government has set a long-term goal of reducing greenhouse gas emissions substantially by 2050. A power-plant normally has a life of around 30 years. If one is built under Tepco's long-term plan, it will be running at least until around 2050 and serve as an impediment to achieving the government's goal.

It could also invite criticism from other countries where people are engaged in discussions on promoting measures to reduce the impact of global warming under the framework of the international convention on climate change.

Some countries have voiced opinions that industrial economies like Japan have not come up with convincing goals for emission cuts despite being the creator of the Kyoto Protocol.

Japan has also lost credibility among developing economies after indicating that it will refuse to honor emission requirements under the Kyoto Protocol after this year.

With Tokyo even considering lowering the medium-term goal of cutting 25 percent of emissions by 2020, if Japan is planning to increase coal-fired power generation, it may draw even stronger criticism.

"If we don't change infrastructure for energies now, we will see a large volume of emissions continue toward the future, and decisions in the next few years will be crucial," said Kimiko Hirata, of Kiko Network, an environmental conservation group. "If we allow coal-fired thermal power generation, we will be considerably narrowing the path for curbing emissions toward the future."

Readers offer some advice to Abe

Advising Abe on the wisdom of a nuclear restart

Readers offer some advice to the new prime minister on the contentious issue of nuclear power in post-3/11 Japan.

Gambling with future generations

Dear Prime Minister Shinzo Abe,

Although I have taught classes related to Japan at the university level for years, I am embarrassed to admit that I was unable to answer a recent question posed by one of my students. Given your well-known interest in traditional Japanese cultural values, not to mention your ability to influence the future direction of this country, I write hoping you might be able to assist me.

By way of background, my classes on Japanese culture always emphasize the role that *senzo sūhai* (ancestor veneration) plays in Japanese society. I find this topic of great interest to Western students, perhaps because their knowledge of their own ancestors is typically limited to two or three generations of their family.

It was in this context that a student recently asked me: "Why do the Japanese seem so indifferent to the fate of those who come after them, i.e., their descendants, when, on the other hand, they show such gratitude to those who came before them?

Needless to say, I was surprised by this question and responded, "What makes you think the Japanese aren't interested in the welfare of their descendants?"

"Well," the student continued, "if the Japanese were so interested in their welfare, why would they allow their government to endanger their descendants for 100,000-plus years by bequeathing them thousands of tons of highly radioactive and toxic spent fuel?"

I responded, "The Monju fast-breeder nuclear plant in Fukui Prefecture is designed to dispose of radioactive waste."

"I know, but I recently read a newspaper article that said this plant is still in testing mode after 30-plus years in the making. And didn't former National Policy Minister Seiji Maehara tell a Diet panel in November of last year: 'We have been aware of the two crucial problems. One is the fuel cycle: The fast-breeder (reactor) is not ready. The other is the back-end (waste disposal) issue. They have never been resolved.'

"Before leaving the U.S.," the student said, "I began to research this issue and discovered that the U.S., France and Germany have all abandoned plans to build fast-breeder reactors due to cost and safety concerns. What makes you believe Japan will succeed when all these other countries have failed? And anyway, **shouldn't these critical issues be solved before, not after more nuclear waste is created** by restarting now idle reactors, let alone constructing new ones?"

"You have a good point," I replied, "but even if a fast-breeder reactor ultimately proves unfeasible, the Japanese could still bury the spent fuel in a safe, underground repository somewhere, couldn't they?"

"Perhaps, but the question is where such a repository would be located? The U.S. recently abandoned plans to store such waste at Yucca Mountain in Nevada because they discovered the area was subject to earthquakes, not to mention the danger of water infiltration that could lead to radiological contamination of the ground water.

"Doesn't Buddhism, an important religion in Japan, teach that everything in the universe is in a state of flux? Given this, why should any of us think there is a location somewhere that can be guaranteed safe for the next 10, 50 let alone 100,000-plus years?"

"Well . . ." I started to reply but then I stopped. At that point, Prime Minister, I must honestly admit that I didn't know how to respond. And my consternation only increased when the student added: "In today's Japanese language class we learned the word *shison* to designate one's descendants. Why is it that only ancestors are venerated or respected in this country? Don't shison, representing the very future of the Japanese people, deserve to be respected as much as those who came before? If so, isn't shison sūhai, i.e., descendant veneration, just as important, if not more important, than ancestor veneration?"

Prime Minister, I recognize that, as a foreigner, my knowledge of Japanese culture is still incomplete. Let me therefore ask how you would have responded to this student?

Additionally, given that no other country in the world knows how to safely store nuclear waste for thousands of years, will you nevertheless endanger countless generations of Japanese through continued reliance on nuclear power?

BRIAN A. VICTORIA
Kyoto

Don't pander to radiation phobia

Dear Prime Minister Shinzo Abe,

For the sake of Japan, and for the sake of the world, I implore you to consider the issue of nuclear power in the spirit of moderation and reason, and resist efforts by the antinuclear lobby and elements of the media to promote fear and panic.

The most false and distressing of the efforts is the attempt to conflate the peaceful use of nuclear power with the terrible atomic bombings of Hiroshima and Nagasaki at the end of World War II. The events are incomparable, as is clearly showed by the human cost. On the one hand, over 100,000 people were killed by the Hiroshima blast. On the other, nobody has been proven killed or injured by the Fukushima nuclear accident itself.

Yet an extraordinary example of this propaganda was published in The Japan Times' Hotline to Nagata-cho column on Oct. 9 ("Let Inoue's antinuclear Jizo, forged in Hiroshima, guide Japan's future" by Jason Bartashius). The article, incredibly, decried the reopening of schools within the former evacuation zone, protesting at the temerity of people wanting to return to their homes, reform their communities and start the rebuilding of their lives. The author, who didn't deign to offer anything as prosaic as radiation measurements, implied that the children going to the schools would suffer the same fate as the children of Hiroshima 68 years ago!

It is well-known that low dose radiation is of zero or negligible risk to humans, yet the unwarranted fear of radiation is destroying the future of Japan.

A clear example is the Nuclear Regulation Authority's decision to expand the evacuation zone around nuclear power plants to 30 km, massively compounding unnecessary fear and sending municipalities nationwide into a frenzy of useless planning. Was it not enough that 573 people died because of unnecessary and panicked evacuation after the Fukushima accident, including dozens of elderly patients simply abandoned in hospital, some to die a degrading death?

Not only that, but the NRA is now proposing to expand the definition of an active earthquake fault line to one that has moved within the last 400,000 years, thus putting into doubt the restarting of nuclear plants all over the country. Is it really possible that humans could be so foolish as to curtail a vital economic activity at a given site because of the hypothetical risk of an earthquake every 400,000 years?

The linking of the use of nuclear weapons with 2011's accident at Fukushima is specious. It is also unethical. Yet ironically, there is a useful lesson to be learned in this attempt at conflation by the antinuclear lobby. It reveals the real source of public antinuclear sentiment: an unconscious equivalence of nuclear power with the destructive terror of nuclear weapons.

Never mind that when considered rationally, nuclear power is the safest large-scale source of energy available to humanity. Never mind that nuclear energy is incomparably healthier than energy produced by fossil fuels, or that it is vastly cheaper and more reliable than renewable energy, or that it produces close to zero carbon dioxide emissions. Never mind those things, because at some deep level of the public's unconscious, nuclear power equals terrible danger.

Mr. Prime Minister, the government has the right and indeed the duty to make decisions based on science and reason, and not be swayed by the irrational. The fear of radiation is a phobia that defies reason, and rather than pander to this fear, Japan should recognize the advantages of nuclear power and continue its steady expansion.

The benefits are undeniable and the bulk of the criticism it attracts is simply ill-founded. To paraphrase the words of American liberals, reality has a nuclear power bias.

MICHAEL RADCLIFFE

Yokohama

Take medical advice into account

Going nuclear again?: Prime Minister Shinzo Abe (center) inspects Tokyo Electric Power Co.'s emergency operation center at the crippled Fukushima No. 1 nuclear power plant in Okuma, Fukushima Prefecture, on Dec. 29. His ruling Liberal Democratic Party has pledged to review the previous Democratic Party of Japan government's plans to phase out nuclear power. AP

Dear Prime Minister Shinzo Abe,

In addition to the fear of thyroid cancer, for years to come many Fukushima parents will be plagued with the worry that their children may develop bone tumors or leukemia from exposure to strontium-90 (Sr90). A beta-radiating isotope difficult to detect with gamma cameras or Geiger counters, Sr90 is another invisible enemy possibly present in the environment due to the nuclear crisis at the No. 1 plant.

Like calcium, ingested Sr90 accumulates in bones. Also, it accumulates in teeth from fetal growth to the age of five. Dr. Martin Walter, a Swiss physician and member of the International Physicians for the Prevention of Nuclear War (IPPNW), is planning to measure the Sr90 levels in Fukushima children's baby teeth.

Baby teeth collected this past year will be incinerated and dissolved in chemicals to ascertain how much Sr90 was in the environment before the nuclear disaster began. Teeth collected in the coming years will offer a means to judge how much Sr90 was emitted from the No. 1 plant when compared to the

measurements of teeth collected in 2012. Martin intends to collect the baby teeth of Fukushima children for the next five to 10 years.

Sr90 is not found naturally in the environment. Nuclear weapons and power plants are its only sources. Baby teeth studies in the United States ultimately helped lead to the banning of atmospheric testing of nuclear weapons.

From 1945 to 1963 the U.S. tested 206 nuclear weapons in the atmosphere. In 1959, the Baby Tooth Survey was launched by the Greater St. Louis Citizens' Committee for Nuclear Information and the dentistry schools at Washington University in St. Louis and St. Louis University, with Dr. Louise Reiss as director. Over the course of 12 years nearly 320,000 baby teeth were collected. According to The New York Times, "The study ultimately found that children born in St. Louis in 1963 had 50 times as much strontium-90 in their teeth as children born in 1950 — before most of the atomic tests."

The findings of Reiss' study came to the attention of President John F. Kennedy and were presented before a Senate committee in June 1963. Two months later, on Aug. 5, the U.S., Soviet Union and Britain signed the Partial Test Ban Treaty. Reiss had played a role in convincing world leaders to ban the testing of nuclear weapons in the atmosphere.

In recent decades similar tests have been conducted to determine how much Sr90 is being emitted into the atmosphere by nuclear power plants. Here in Japan, Yuko Nishiyama, a Fukushima mother and activist, is helping Walter collect the teeth. Nishiyama evacuated Fukushima city in March 2011. She first relocated temporarily in Tokyo and then chose to move to Kyoto with her daughter, where she started a support group for evacuees.

"I want people to know that this is something we'll have to worry about," Nishiyama has said.

Prime Minister, we implore your administration to take into serious consideration the concerns of the international medical community when deciding the country's future nuclear policy. Government officials must also bear in mind the anxieties of Fukushima parents when determining how they should be compensated and supported.

Nukes good enough for Japan's neighbours

January 15, 2013

Meeting on nuclear power generation in SE Asia

http://www3.nhk.or.jp/daily/english/20130115_30.html

Japanese businesses showcased their nuclear power plants and newest safety features at an international conference on nuclear power generation systems in Southeast Asia.

About 300 government and corporate officials from around the world gathered in the Malaysian capital of Kuala Lumpur on Tuesday to discuss the advantages and challenges associated with nuclear power plants.

At the conference, officials from Malaysia and Indonesia reported that, despite strong anti-nuclear public sentiment after the Fukushima disaster, nuclear power remains a dominant option for rapidly growing economies with surging demand for energy.

In their corporate displays, Japan's **Hitachi and Mitsubishi Heavy Industries** introduced nuclear plants and related facilities.

Mitsubishi Heavy Industries official Satoru Ishimoto says his company offers plants with unparalleled safety that make the best of the lessons Japan learned from the nuclear accident.

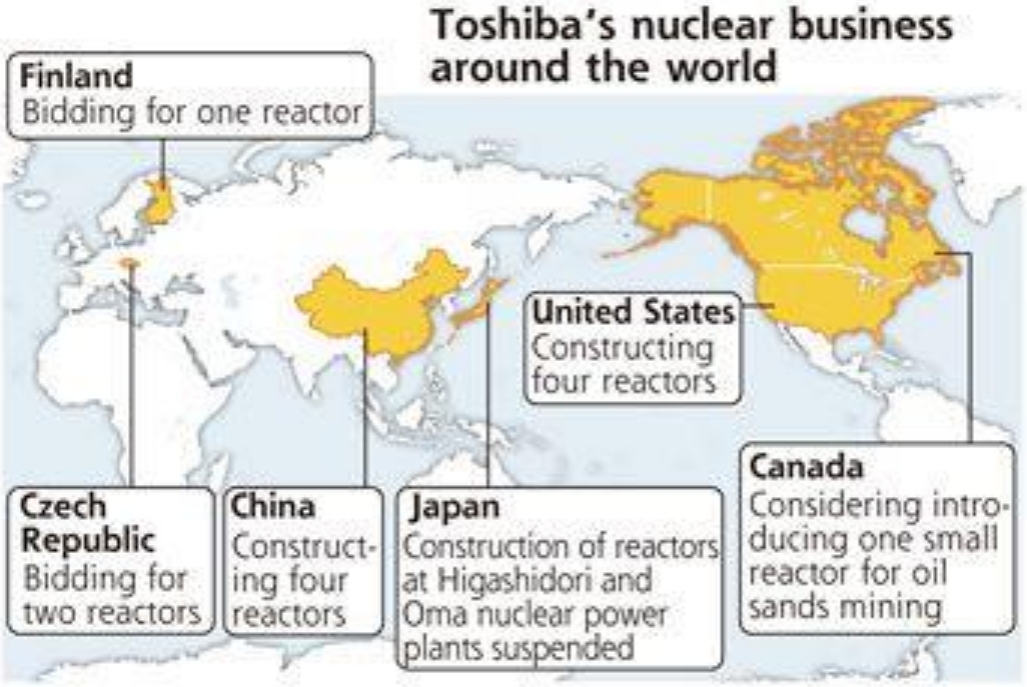
Japanese manufacturers are in fierce competition with foreign rivals for contracts to build power plants in Southeast Asian countries.

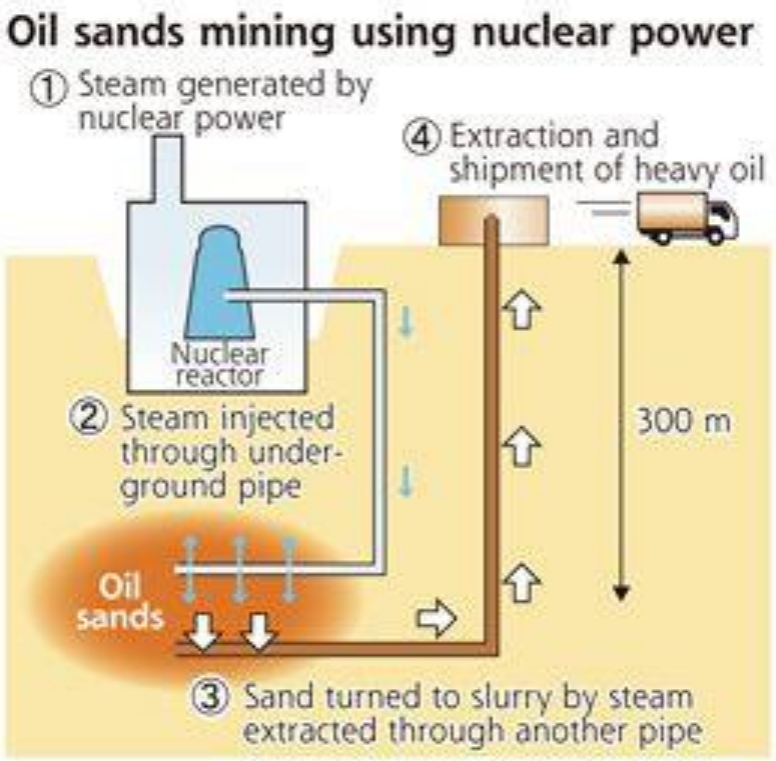
Thank you Toshiba?

January 16, 2013
Toshiba developing small N-reactor / Reactor to be used to mine oil sands in Canada; initial operation by 2020 eyed

http://www.yomiuri.co.jp/dy/business/T130115004424.htm

The Yomiuri Shimbun





Toshiba Corp. has been developing a small nuclear reactor for mining oil sands at the request of a firm engaged in such mining projects in Alberta Province, Canada, and aims to begin operating the reactor by 2020, it has been learned.

As the situation regarding the construction of new nuclear power plants and reactors in Japan remains unclear, Toshiba's move will likely attract attention as an effort toward utilizing the nation's nuclear technology in fields other than power generation.

Oil sands are sandstone deposits which contain a viscous form of petroleum, and can be used as petroleum-based fuel. Compared with oil fields, it has so far been difficult to develop oil sands. However, technological advances have led to the promotion of oil sands development in Venezuela and Canada. Canada is said to have about 100 oil sands deposits totaling about 170 billion barrels--the equivalent of about 100 years' worth of petroleum consumption in Japan.

===

Generating steam

The output of Toshiba's new small reactor will be 10,000 kilowatts to 50,000 kilowatts, about 1 percent-5 percent that of a regular nuclear reactor, according to the sources.

Steam generated in the reactor will be sent to strata located at a depth of about 300 meters, where oil sands are found, to turn the sand into slurry. The slurry will then be extracted from the strata using a separate pipe.

To ensure the reactor's safety, Toshiba reportedly plans to construct a nuclear reactor building underground, while the building itself will be equipped with an earthquake-absorbing structure.

The firm has completed a basic design for the reactor and has already started approval procedures for construction in the United States. After getting the official go-ahead from the U.S. government, Toshiba will then undergo safety checks in Canada.

Currently, oil sands are mined using boiler-generated steam. However, as this method requires natural gas to fuel the boilers, it is necessary to transport the gas as needed. Also, carbon dioxide emissions from burning natural gas is seen to be a problem.

By contrast, the planned small reactor would not require refueling for up to 30 years after construction or release any carbon dioxide. Furthermore, nuclear reactors would also be cheaper should the general price of natural gas increase.

===

Other purposes

Toshiba also plans to use the small reactor for purposes other than oil sands mining, the sources said.

For example, the firm is considering using it at desalination plants, which convert seawater into freshwater, or as a power source for electrolysis equipment to produce hydrogen for fuel battery-powered vehicles.

Usually, constructing a small reactor costs between 50 billion yen and 100 billion yen, less than 20 percent the cost of building a regular reactor. This would make the new reactor easier to introduce in frontier areas. Therefore, Toshiba has been working in Alaska and municipalities in northern Canada to introduce its small reactor as a small-scale power station.

To gain the understanding of local residents, Toshiba will disclose information about its small reactor to locals and carefully explain its safety to them.

===

Influencing Toshiba's growth

Sales for Toshiba's nuclear business stands at about 600 billion yen, 10 percent of the firm's overall sales. As the firm considers its nuclear business as a core part of its future growth, Toshiba plans to increase sales to 1 trillion yen by fiscal 2017.

Currently, Toshiba is constructing eight regular reactors in the United States and China, and is expected to receive orders in the Czech Republic and Finland. The firm aims to receive orders for 39 reactors by March 2018.

While Toshiba has received orders for reactors at Oma and Higashidori nuclear power plants, both in Aomori Prefecture, construction has been suspended since the Great East Japan Earthquake in March

2011. While Prime Minister Shinzo Abe has expressed his support for building new reactors, there is still no prospect for resuming construction of these reactors.

Meanwhile, international competition for reactor orders has been intensifying as Chinese and South Korean firms increase their presence in the market. Under these circumstances, Toshiba also hopes to develop new markets by diversifying uses for nuclear reactors and enhancing its competitiveness in the industry.

Gov't won't drop reprocessing

January 18, 2013
Industry minister to continue nuclear fuel cycle policy

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301180037

THE ASAHI SHIMBUN

The government will continue pursuing its nuclear fuel cycle policy, an expensive and problem-plagued recycling project whose future was in doubt under the previous administration.

"The significance (of the policy) will not change. We will continue it as a national policy," industry minister Toshimitsu Motegi told Shingo Mimura, the governor of Aomori Prefecture, on Jan. 17.

Under the program, spent nuclear fuel is reprocessed for reuse in nuclear reactors.

In Aomori Prefecture, a nuclear fuel reprocessing plant is under construction in Rokkasho and an intermediate storage facility is being built in Mutsu. Operations have yet to get under way in the reprocessing facility because of a series of mishaps.

"I think construction will steadily progress toward completion," Motegi said.

Before being dumped from power in December, the Democratic Party of Japan adopted a policy to phase out nuclear power by the end of the 2030s. That pledge raised questions about the future of the nuclear cycle policy and if Aomori Prefecture would be stuck with high-level radioactive waste from the reprocessing procedures.

"We will strictly keep the promise (not to make Aomori Prefecture a final disposal site)," Motegi told Mimura.

Abe should at least listen to public opinion with regards to nukes

January 24, 2013

Stay on the nonnuclear path

http://www.japantimes.co.jp/opinion/2013/01/24/editorials/stay-on-the-nonnuclear-path/#.UQFjyPL1tEs

Members of the Abe Cabinet have repeatedly hinted that the government will change the policy on energy and electric power set by the Democratic Party of Japan government. Trade and industry minister Mr. Toshimitsu Motegi said the government will review the DPJ government policy of ending in the 2030s the nation's reliance on nuclear power generation when the Abe administration writes a new, long-term basic policy on energy.

The DPJ adopted the zero nuclear power policy after hearings and deliberative polls were held nationwide. During the campaign for the Dec. 16 Lower House election, the Liberal Democratic Party said only that it would make a decision on whether to restart nuclear reactors within three years. At the very least, therefore, the Abe government should listen to public opinion on nuclear power generation if it tries to change the current policy.

If Japan increases the weight of renewable energy sources in an attempt to reduce or end its reliance on nuclear power, electricity rates may rise, causing difficulty for consumers and enterprises. But if one considers the huge costs incurred by the 3/11 accident at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, which forced hundreds of thousands of people to evacuate — including some 160,000 people who still can't return to their homes — and the fact that decontamination of vast areas of land is proceeding far slower than hoped, it doesn't make any sense to continue nuclear power generation in this quake-prone country.

In addition, if nuclear power plants resume operation, storage facilities for spent nuclear fuel will soon be full, and there is no technology that can guarantee the long-term safe storage of highly radioactive nuclear

waste. Deep underground disposal of such waste poses serious environmental and ethical problems for future generations. Nobody can know the durability — in 100, 1,000 or 10,000 years — of the materials used to encase high-level radioactive waste stored in geological layers.

It is unrealistic to go back to the situation that prevailed before the Fukushima disaster. Given the prevalence of earthquakes, the government should end its traditional policy of establishing large-scale power plants, nuclear or nonnuclear, in depopulated areas, and instead promote a policy of establishing many small-scale power plants utilizing green energy sources across the nation in combination with smart grids, so that electricity will be transmitted in a stable and efficient manner.

The government also should reform the electricity market by removing the electricity distribution function from the hands of major power companies. That would make it easier for new power generating entities to enter the market and thus increase competition.

As a short-term policy, the government and power companies should increase use of liquefied natural gas at thermal power stations since LNG produces less greenhouse gas than other fossil fuels. But power companies must strive to decrease import prices by engaging in tough negotiations with LNG suppliers and buying from a broader range of suppliers.

Decommissioning too much for TEPCO. Gov't springs in

January 25, 2013

Abe vows gov't to take lead in scrapping Fukushima reactors

http://mainichi.jp/english/english/newsselect/news/20130125p2g00m0dm024000c.html

TOKYO (Kyodo) -- Prime Minister Shinzo Abe vowed Thursday that his government will take the lead in efforts to scrap the crippled reactors at Tokyo Electric Power Co.'s Fukushima Daiichi nuclear power plant.

"The state will be at the forefront" of such efforts, Abe said in an interview with Kyodo News at his office, adding that it is "impossible" for the plant operator to work alone toward decommissioning the plant's reactors.

The premier underscored the crucial need for scrapping the reactors "without further delay" to advance efforts in rebuilding Fukushima Prefecture, which hosts the crippled plant.

The Fukushima nuclear disaster following a massive earthquake and tsunami in March 2011 resulted in core meltdowns of three reactors. The government and TEPCO expect decommissioning work to take up to about 40 years.

Have the Japanese change their minds on nukes?

February 4, 2013

56% back review of zero-nuke policy, 47% favor TPP: Mainichi poll

http://mainichi.jp/english/english/newsselect/news/20130204p2a00m0na016000c.html

For Prime Minister Shinzo Abe, whose Cabinet now enjoys an approval rating of over 60 percent, his energy policy including nuclear power, and Japan's possible participation in negotiations over the Trans-Pacific Partnership (TPP) free trade pact, are among vital issues that could make or break his administration.

In a nationwide Mainichi Shimbun survey taken on Feb. 2 and 3, 56 percent of respondents expressed their support for Abe's plans to review a policy promulgated by the previous Democratic Party of Japan (DPJ) government to end nuclear power generation within the 2030s. Thirty-seven percent were against a review of the policy.

Abe declared during a plenary session of the House of Representatives on Jan. 30 that his government will review the zero-nuclear policy from a clean slate. The latest poll found that 73 percent of supporters of the ruling Liberal Democratic Party (LDP), of which Abe is president, were in favor of the proposed review, as were 56 percent of supporters of its coalition ally, New Komeito. Overall, 67 percent of Abe Cabinet supporters back the review.

Call for liberalisation of power sector

February 10, 2013

METI panel wants utilities monopolies to end by 2020

Biggest postwar shakeup would let homes shop for cheapest supplier
Kyodo

http://www.japantimes.co.jp/news/2013/02/10/national/meti-panel-wants-utilities-monopolies-to-end-by-2020/#.URdzv_L1tEs

An industry ministry panel will propose a set of power industry reforms to the government that would enable households to select electricity suppliers from 2016 and force utilities to separate their energy generation and transmission businesses between 2018 and 2020.

The measures, which would represent the most significant postwar changes to the electricity industry, are intended to create a more competitive market by allowing new entrants to participate, ending the 10 utilities' regional monopolies, which the March 2011 natural and nuclear catastrophes proved were vulnerable.

Based on the proposals by the panel of experts Friday, the Ministry of Economy, Trade and Industry plans to submit a bill to revise the electricity business law during the ongoing Diet session.

As a result of the so-called unbundling of the industry, competition would be promoted in the power generation and retail sectors while the transmission and distribution networks, which have been under the strict control of the regional utilities, will become more accessible so various players can enter the market.

But uncertainties remain about whether the reforms will proceed as envisioned, given the reluctance voiced by the major utilities to divide their energy generation and transmission operations by splitting up subsidiaries.

According to a report agreed on by the panel, the reform process would commence with the creation around 2015 of an independent entity that would be placed in charge of coordinating power supply and demand nationwide. In the next stage, new entrants would be allowed into the household electricity retail market roughly in 2016, making it possible for consumers to start shopping for the cheapest power suppliers.

The need for a greater choice of power suppliers was recognized following complaints that consumers in the Kanto region centering on Tokyo had no option but to accept Tokyo Electric Power Co.'s electricity rate hikes last year, because the operator of the wrecked Fukushima No. 1 nuclear complex is struggling to finance mounting fuel costs for its thermal power stations.

As for the final stage of the reform, the 10 regional utilities would separate their power generation and transmission businesses around 2018 to 2020. The panel has proposed a "legal unbundling" method under which utilities would be required to turn their transmission sectors into separate companies.

The current pricing system for households, in which utilities pass on personnel expenses and other costs to their customers, should also be scrapped when power generation and transmission are separated, or at a later date, according to the report.

Japan started to liberalize its electricity market in the 1990s, allowing businesses to supply power to major utilities and large-lot users such as companies. But the process was only partial and new entrants

accounted for just 3.6 percent of the electricity sold to large-lot users in fiscal 2011, amid high costs to access the existing power grid.

Meanwhile, the retail market for households is still dominated by the regional utilities.

At the panel meeting, the Federation of Electric Power Companies of Japan said the time frame for achieving the separation of energy generation and transmission “is tough at the moment,” citing deteriorating business conditions due to the prolonged shutdown of all but two of the country’s commercial nuclear reactors because of the Fukushima disaster.

But many panel members urged the utilities to back the reforms, with one expert stressing that unbundling is crucial since it would enable the country to efficiently tap a variety of power sources, including renewable energies, amid electricity shortage concerns.

Bad sign

Gov't needs to determine early whether to resume reactors

http://mainichi.jp/english/english/newsselect/news/20130211p2g00m0bu074000c.html

TOKYO (Kyodo) -- A senior lawmaker of the ruling Liberal Democratic Party said Monday it is necessary for the government to determine whether to resume nuclear plant operations at an early date.

"The economy will eventually stall in terms of energy cost" as long as most nuclear reactors remain idled, Hiroyuki Hosoda, executive acting secretary general of the LDP, said in his speech in Matsue, Shimane Prefecture. "It is needed to determine their resumption by securing their safety."

He also said, "Power companies will face capital deficits in around three years if their reactors remain idled, and the basis of their existence will be affected."

Currently, only two reactors of Kansai Electric Power Co.'s Oi plant are online among Japan's 50 commercial reactors amid widespread suspension of operations resulting from the nuclear disaster at the Fukushima Daiichi complex.

On Japan's participation in the Trans-Pacific Partnership negotiations, Hosoda expressed caution, saying it was likely the eventual terms of the negotiations would be "unacceptable" to Japan, with the United States leading the rulemaking of the Pacific-wide free trade talks. Japan "needs to consider (participation) in a cautious manner," he said.

The LDP pledged during campaigning for the Dec. 16 House of Representatives election that Japan would not join the negotiations for as long as they were premised on the elimination of all tariffs without exception.

Ministries don't agree on Japan energy future

February 12, 2013

Sparks fly over power plants / 2 ministries at odds over building new coal-fired plants

http://www.yomiuri.co.jp/dy/business/T130210002630.htm

Tadaaki Inoue / Yomiuri Shimbun Staff Writer

The debate over whether to promote construction of new coal-fired power plants has intensified as two ministries have taken opposing positions on the issue.

The Environment Ministry holds a negative view of the plan in light of environmental concerns, including the fact that coal emits more greenhouse gases than liquefied natural gas and other energy sources.

The Economy, Trade and Industry Ministry, on the other hand, has been promoting the plan to help offset the anticipated increase in fuel costs due to the long-term suspension of nuclear power plants.

The Environment Ministry asked METI last month to postpone a planned bid by Tokyo Electric Power Co. to purchase electricity generated by outside thermal power plant operators, and the matter is being discussed by the two ministries, sources close to the deal said.

To make up for a future power supply shortage, the utility announced in November a plan--starting from July 2019--to purchase electricity generated at thermal plants to be built by power wholesalers.

Environment Minister Nobuteru Ishihara said Tuesday after a regular Cabinet meeting that his ministry is reviewing the utility's power purchase plan from the viewpoint of curbing greenhouse gases without creating complications.

Economy, Trade and Industry Minister Toshimitsu Motegi insisted on holding the tender as planned during a news conference the same day, saying, "Coal-fired power generation has a vital role in maintaining a stable electricity supply and economic efficiency."

Coal thermal power costs about 9 yen per kilowatt-hour, compared to 22 yen per kWh for oil-fired plants and 10 yen per kWh for LNG-fired plants.

However, the amount of carbon dioxide emissions discharged by coal-fired plants is said to be double that of LNG-fired plants.

Therefore, it may be difficult to obtain approval to construct new thermal plants after undergoing an environmental impact assessment by the Environment Ministry.

Prime Minister Shinzo Abe's administration plans to review the former Democratic Party of Japan-led government's policy of reducing greenhouse gas emissions from 1990 levels by 25 percent by 2020, but has yet to set a new goal.

Since the latter half of last year, the two ministries have made efforts to coordinate their views on the construction of new coal-fired plants. But TEPCO's plan to soon start accepting bids from outside thermal power plant operators has intensified the confrontation between the two ministries.

To help compensate for power supply shortages caused by the planned decommissioning of four reactors at its Fukushima No. 1 nuclear power plant, the utility will procure the necessary 2.6 million kilowatts from outside vendors starting in 2019.

As the bid ceiling was set at 9.53 yen per kilowatt-hour, it appears that it will be difficult for power generators other than coal-fired plant operators to take part.

A plan has emerged to hammer out a compromise through discussions by deregulation and other government panels if coordination efforts between the two ministries fail.

Don't change the power system, says industry boss

February 16, 2013

Power industry boss: Proposed reform threatens nuclear power generation

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302160054

By KENTARO UECHI/ Staff Writer

Proposed sweeping reforms of the electric power industry would deprive utilities of so much revenue that they would be incapable of operating nuclear facilities they own now or plan to in the future.

That warning was issued Feb. 15 by Makoto Yagi, head of the Federation of Electric Power Companies of Japan. He is also president of Kansai Electric Power Co.

Yagi was referring to a proposal compiled Feb. 8 by a panel of experts with the Ministry of Economy, Trade and Industry that was described as “the most sweeping reform of the electric power industry in postwar years.”

The panel recommended as part of key elements of the reform that power transmission and distribution be separated from regional utilities within five to seven years so that these operations are undertaken by their subsidiaries.
The idea is to allow suppliers of renewable energies to have fair access to power transmission and distribution networks owned by the utilities.

Under the existing setup, utilities have monopolized power generation and transmission, as well as distribution, stifling competition. Many new suppliers found themselves at a great disadvantage in trying to find customers.
In response, Yagi raised doubts about the soundness of the proposed overhaul of the industry.

"It has yet to be ascertained if a stable supply of inexpensive electricity will be secured," he said. "The proposed reform will not necessarily benefit our customers."

He and many utility executives fear the proposed reform would result in a sharp drop in profits, which would make it harder for them to finance the operation of nuclear power plants.

Nuclear power stations are costly to maintain and building new facilities represents a huge investment for a utility.

Yagi also called for restarts of reactors which have been idled since the nuclear disaster at the Fukushima No. 1 plant nearly two years ago.

"Nuclear plants should be utilized to provide a stable and inexpensive power supply," he said.
Many utilities have sought government approval to raise electricity rates, saying imports of fossil fuels to reactivate thermal power plants are hitting their bottom lines.

Manipulation, fight for influence, subsidies - a divided society

Nuclear dispute shapes fight over future of fading town

by Jeff Kingston

http://www.japantimes.co.jp/culture/2013/02/17/books/nuclear-dispute-shapes-fight-over-future-of-fading-town/#.USHnBPL1tEs

HARD TIMES IN THE HOMETOWN: A History of Community Survival in Modern Japan, by Martin Dusinberre. University of Hawaii Press, 2012, 247 pp., $55 (hardcover)

This superbly told tale about the waxing and waning fortunes of Kaminoseki town over the past four centuries presents some interesting local counterpoints to the more familiar national narrative.

Kaminoseki, a port on the Inland Sea in Yamaguchi Prefecture, was a vibrant trading hub in the Tokugawa Period, but suffered decline from the late 19th century against the backdrop of national modernization.

Why read about some moribund backwater in nether Honshu? Because, as Martin Dusinberre writes, "to understand how people lived with everyday decline in modern Kamonoseki is to begin to understand the hopes and hard times of small communities across the world." This saga sheds light on how a community has responded to the changing world around it and how these forces have shaped its evolution, identity and cohesion.

After World War II, Kaminoseki enjoyed a brief recovery, but after the shift from coal to imported oil, it has been a losing battle. While the economic miracle of the late 1950s and 1960s was a national success story, the energy revolution transformed the shipping industry and eroded the port's commercial niche. The town's gathering troubles, including job losses, outmigration of the young and an aging population, are a familiar story all over rural Japan. This richly detailed account vividly conveys how this malaise played out over time and what it meant to successive generations.

Dusinberre, a former teacher on the Japan Exchange and Teaching (JET) Program, draws on a cache of local archival materials and extensive interviews to provide a unique and compelling view into the family feuds, class resentments and political maneuvering that animate this ailing community.

Kaminoseki's story is especially fascinating now because Prime Minister Shinzo Abe is from Yamaguchi and he is already weighing in on one of the town's long-standing battles. Abe's sudden chance at redemption as a political leader five years after his humiliating ouster represents a stunning reversal of fortune that, among other things, signals the revival of the town's divisive nuclear power project.

Dusinberre masterfully recounts the ins and outs of this three-decade-long local confrontation over hosting a nuclear reactor. Local nuclear advocates argue this is the only way to revive the town.

Following the 2011 Fukushima debacle, however, the governor of Yamaguchi suspended the Kaminoseki project and prospects for resumption looked bleak. While opponents felt vindicated by exposes regarding Tepco's numerous safety blunders, advocates saw the meltdowns as a major setback for their plan to cash in on nuclear subsidies and jobs. But now Abe and the Liberal Democratic Party are busy promoting nuclear energy despite polls showing 80 percent favor phasing it out.

Desperate leaders in Kaminoseki are gung-ho for reactors because **the potential risks of nuclear power are deemed less than the certain risks of economic oblivion.**

"Hard Times in the Hometown" helps us understand just how divided the community is between pro- and anti-nuclear campaigners, as **both sides are convinced that the other just doesn't get it.**

Readers learn how Chugoku Electric and town leaders connived to launch the project and overcome strong local opposition. The utility's "subtle manipulation" of civil society groups in Kaminoseki, "meant

that an ordinary citizen's pronuclear decision was as likely to be based on social, political, and even historical obligation as it was on a clear grasp of atomic energy issues." While economic incentives were a powerful inducement, Dusinberre argues that social bonds between citizens and town elites may have been more important in orchestrating approval for hosting the reactor.

Pronuclear advocates were not leaving things to chance. Prior to the 1987 mayoral election, scheduled on the one-year anniversary of the Chernobyl disaster, the town's population "miraculously" increased. A police investigation revealed that the pronuclear lobby had fraudulently registered nonresidents as local citizens, including employees of Chugoku Electric. Despite such tawdry revelations, the pronuclear candidate won re-election, but faced sustained and angry protests. The discord also turned violent as rightwing thugs came and assaulted antinuclear activists.

Iwaishima, an island that was merged into Kaminoseki, has a commanding view of the proposed reactor site and is a hotbed of opposition. Anyone associated with the pronuclear camp is subject to *murahachibu* (ostracism), including merchants and a Shinto priest. Tourist maps of the island actually omit a historic shrine because the priest is a pronuclear advocate. Parishioners ex-communicated their priest in venting their collective fears about nuclear energy and frustration with their powerlessness in the face of political shenanigans.

Dusinberre found that "the pronuclear minority included not just elected councilors but men who stood at the hub of social, economic and ritual networks." It is tempting thus to read into the reactor opposition an anti-elite movement, but the situation is more complicated. One of the key leaders of the antinuclear group was also a member of the island's elite families. Apparently, he was miffed that nuclear advocates had not sought his support. So he funded the antinuclear movement and enjoyed his sudden power as a leader to be reckoned with. Oddly, he confided, it was a matter of saving face, not atomic energy.

In assessing how atomic power led to community fission, the author explains the **importance of "entirely unrelated battles being fought through the framework of the nuclear dispute."**

Jeff Kingston is the director of Asian Studies at Temple University, Japan campus.

Liberalise the electricity market?

February 19, 2013

Editorial: Concrete measures needed to implement true electricity reforms

http://mainichi.jp/graph/2013/02/18/20130218p2a00m0na011000c/001.html

A report on electricity system reforms compiled by a panel of experts for the Ministry of Economy, Trade and Industry has outlined plans to fully liberalize the electricity retailing market in Japan and separate electricity production at major power firms from power transmission and distribution, specifying times for achieving the changes.

The plans bring Japan a step closer to electricity system reforms designed to transform regulations and market monopolies into liberalization and competition. Officials must now put their heads together and make concrete plans for a system to improve services and restrain electricity prices.

The government report states that full liberalization of the retailing market for home electricity will be implemented in three years' time, and that the separation of power transmission and distribution will be carried out in five to seven years. If electricity retailing is liberalized, home users will be able to purchase electricity produced by major utilities located in other areas, as well as new forms of electricity produced by market newcomers. This should spur competition between power companies, and produce a more convenient system for users.

To ensure fair competition, companies must be able to freely use the transmission and distribution networks held by major utilities. Separation of power generation and transmission is one step to boost the neutrality of such facilities and help secure fairness.

Previous plans to fully liberalize the electricity market in Japan, presented under the previous administration of Prime Minister Shinzo Abe, were derailed by resistance from major power companies and Abe's own Liberal Democratic Party (LDP). There is greater opposition to separation of power generation and distribution -- which would pressure major utilities to make organizational changes -- than to mere liberalization.

As the latest report provides targets for implementing reforms, it can be considered a step forward. These plans are expected to be legislated in the near future. Officials must not backtrack on the plans when they are screened by the ruling government parties.

Of course, there are outstanding issues to be addressed, such as how to ensure a stable supply of electricity and make sure electricity prices on remote islands and depopulated areas are kept to a reasonable level. Careful preparation is needed to overcome these issues and ensure that electricity users benefit from the changes.

Noteworthy in the government is the mention of establishing two new bodies. The first is a "wide-area grid organization." This body would facilitate arrangements within power companies to transmit and distribute electricity from areas with power surpluses to areas facing power shortages, and create plans for maintaining national power transmission and distribution networks. It would play a vital role in ensuring a stable supply of electricity and preserving infrastructure. We want to see legislation giving this organization a powerful measure of authority in its dealings with major utilities.

The second body is a "regulatory organization" to ensure the effectiveness of reforms. It will check the extent of liberalization of electricity retailing, neutrality in the power transmission and distribution sectors, and activity within the electricity wholesale market.

Past reforms failed to draw newcomers into the market because the system lacked a means to verify market fairness. Officials may create a spectacular system, but poor operation will only water it down. Electricity reforms must not go down the path of allowing former government bureaucrats to parachute into high-profile jobs through the practice of "amakudari."

We call on the government to make sure the new bodies and their internal organizations are effective, thereby preventing the reforms from turning out to be nothing more than a pie in the sky.

Nuke company selling uranium back

February 21, 2013

Japan Atomic Power takes rare step to sell uranium for loan payment

http://mainichi.jp/english/english/newsselect/news/20130221p2g00m0dm033000c.html

TOKYO (Kyodo) -- A Japanese nuclear power company has taken the rare step of selling some of its uranium for the use of nuclear reactor fuel, apparently to raise money to use to repay loans amid its faltering business conditions, sources close to the matter said Wednesday.

Japan Atomic Power Co. apparently moved to secure money to repay loans due in April, amid uncertainty over when it can resume operating its three idled reactors in the wake of the nuclear disaster at the Fukushima Daiichi complex.
Tokyo Electric Power Co. is also considering taking similar action as it continues to face funding difficulties following the nuclear crisis at its Fukushima complex, the sources said.

It is rare for a Japanese power company to sell uranium because the material is essential for the operation of nuclear plants and its suppliers are limited.

According to the sources, uranium, which could be diverted to military use, is procured in principle under long-term contracts. Japanese utilities import it mainly from overseas suppliers, including those in Canada.

While an official of Japan Atomic Power declined to disclose to whom it sold the uranium, it is likely the company returned it to the seller.

A senior official of a major utility said the move was an exceptional option because it likely meant selling the uranium for less than the import price.

Japan Atomic Power sells electricity to its major shareholders, which include Tokyo Electric and Kansai Electric Power Co. Although its electricity output has fallen to zero, it continues to receive "basic charges" paid by major utilities.

According to the sources, Japan Atomic Power plans to pay back 40 billion yen in loans by selling uranium and streamlining. As for another 100 billion yen in loans, major utilities are expected to continue guaranteeing payments beyond April.

In another blow to Japan Atomic Power, a panel of experts appointed by the country's nuclear regulator has agreed that a geologic fault running directly underneath a reactor at the company's Tsuruga plant is likely to be active.

The judgment, if officially endorsed by the five-member Nuclear Regulation Authority, could leave Japan Atomic Power with no option but to scrap the reactor in Fukui Prefecture.

In quake-prone Japan, plant operators are not allowed to build reactors directly above active faults.

Fukushima tourism "à la Chernobyl"?

February 21, 2013
Group wants Fukushima plant preserved for Chernobyl-style tourism

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302210058

By YUTAKA SHIOKURA/ Staff Writer

Seven young intellectuals are seeking support for their proposal to preserve the crippled Fukushima No. 1 nuclear plant as a tourist site carrying a cautionary message for future generations.

They believe Japan must decide soon what it wants the plant to look like 25 years from now, and they hope to stimulate discussion of that through magazine articles and Twitter exchanges based on their "tourism" suggestion.

"If we are to keep the memory alive, we should not tear the plant down," said Hiroki Azuma, a professor of philosophy at Waseda University. "The plant would serve us better as a tourist site that people from around the world can visit and where they can learn from history."

The group also includes sociologist Hiroshi Kainuma and architect Ryuji Fujimura. All are unusual in that they are younger than 50 years old and are trying to push a radical proposal.

They suggest, for example, that the plant considers bidding for UNESCO World Heritage status, something already held by the Hiroshima Peace Memorial as the site of the world's first atomic bombing.

Currently, the plant is in a state of cold shutdown. However, many areas remain largely off-limits because of heavy radioactive contamination. Twenty-five years from now, decommissioning and decontamination work should be fairly advanced.

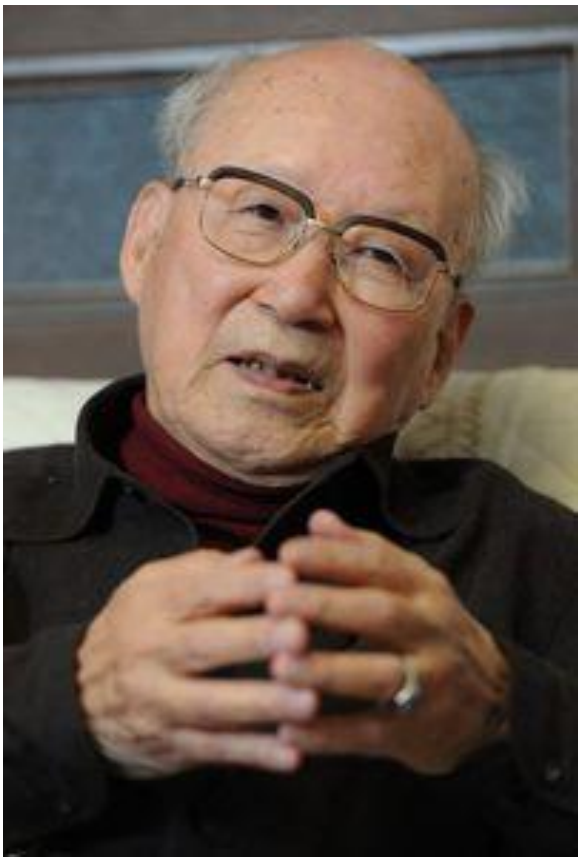
The group notes that these days tourists from around the world are visiting the Chernobyl plant in Ukraine, where a reactor exploded in 1986.

But the group admits public reaction has been divided.

Some welcome the proposal as "interesting," while others condemn it as "unscrupulous" or "tasteless."
The members met in February in Tokyo to discuss the proposal in detail, such as what tourists should be encouraged to see at the plant and nearby.
One person involved stressed the need to secure a venue that shows conditions at the plant before the disaster struck and what life was like for residents of Fukushima Prefecture prior to the March 11, 2011, Great East Japan Earthquake that generated towering tsunami.
Another warned against using the word "resort," on the grounds that something so lighthearted would probably draw opposition.
In October, the group traveled to the region to canvas residents of the city of Minami-Soma. Part of the city lies within the mandatory exclusion zone.
It found that they, too, had mixed reactions to the proposal.
Some welcomed it. One resident called it "an idea we could not have come up with."
But others said the disaster remains too raw and immediate to talk about easily.
"They are still trying to bring the plant under control and to decontaminate it," protested one resident.
The group plans to continue its dialogue with people in affected areas.

Shuntaro Hida on nuclear deterrence

February 25, 2013
Hibakusha: A-bomb victim doctor warns nuclear deterrence ineffective



Shuntaro Hida responds to an interview with the Mainichi Shimbun in Saitama. (Mainichi)

拡大写真

http://mainichi.jp/english/english/features/news/20130225p2a00m0na010000c.html

SAITAMA -- Shuntaro Hida, 96, who was a doctor at the Hiroshima Military Hospital when the U.S. military dropped the atomic bomb on Hiroshima on Aug. 6, 1945, has witnessed close-up how a nuclear bomb takes the lives of human beings. He was making a house call about 6 kilometers away from the bomb's hypocenter when the blast took place, and was exposed to radiation. He then scrambled to help the many who had been injured.

This experience became the foundation for Hida's life. As a survivor himself, he has treated over 6,000 hibakusha patients, putting his life on the line for the abolition of nuclear power.

When Hida saw news reports at his home in Saitama's Urawa Ward that North Korea conducted its third nuclear test on Feb. 12, he was struck afresh that as long as nuclear weapons continued to exist on this planet, there would always be countries like North Korea.

Pointing out that North Korea's repeated nuclear tests demonstrate the limitations of nuclear deterrence, Hida says, "There will be more countries who think that having nuclear weapons will give them an upper hand in foreign diplomacy. Unless the U.S. and other countries that currently possess nuclear weapons abolish them, humankind will not be able to escape from the fear of nuclear weapons."

Following the end of World War II, Hida opened clinics for low-income patients in Tokyo and Saitama Prefecture. Patients would come to the clinics having heard rumors of a hibakusha doctor, and once Hida asked his nurses to leave the consultation room, they would begin to open up about their experiences as survivors, their abnormal physical symptoms, and their desperate plight.

The bomb had slowly sucked the lives out of people who had barely survived the bombing after torturing them for five to 10 years. By the time Hida read a paper written by an American researcher on internal exposure and learned the true brutality of the atomic bomb, 30 years had passed since the bomb was dropped.

Why did research on the effects of radiation fail to make significant progress in Japan? Hida answers, "Because the U.S. went to great lengths to cover everything up."

Under the post-World War II occupation, Japanese doctors were strictly forbidden to record symptoms exhibited by hibakusha patients or conduct related research. The U.S. government, meanwhile, set up the Atomic Bomb Casualty Commission (ABCC) in Hiroshima and Nagasaki and studied hibakusha and the genetic consequences of radiation exposure, but did not administer any treatment.

The medical treatment of hibakusha -- or lack thereof -- showed that military affairs were considered a priority over human life. Whenever military affairs take priority, the people are forced to make sacrifices. This was something that struck Hida last October in Okinawa, where he was giving a lecture. He saw first-hand the U.S. military's MV-22 Osprey aircraft being deployed to U.S. Marine Corps Air Station Futenma in Ginowan, Okinawa Prefecture, despite protests from local residents.

拡大写真

"No matter how strongly Okinawan residents say 'No,' the U.S. refuses to listen," he says. "It's as if Japan's a colony."

In January, Hida resumed his speaking engagements, from which he had taken a break for a month due to chronic back problems.

"It's not OK to sacrifice 10 people for the happiness of 1,000. We must not sacrifice even one life," he says. This conviction is what pushes him forward. (By Fusajiro Takada, Fukuyama Bureau, photo by Masaru Nishimoto)

(This is the final installment of a five-part series.)

Difficult to balance growth and safety

Survey: 45% of local leaders want nuclear phaseout; 35% say reactors are needed
February 25, 2013
THE ASAHI SHIMBUN
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302250121

Fewer than half of prefectural and municipal leaders near nuclear plants believe nuclear power should be phased out in Japan, reflecting the struggles of communities in balancing economic growth and safety, a survey showed.

Only four of the 156 local leaders surveyed by The Asahi Shimbun said Japan does not need nuclear power plants.

Fifty-five, or 35.2 percent, of the leaders said nuclear plants are necessary in Japan. Specifically, nine said they think "nuclear plants will continue to be necessary into the future" and 46 said they are "necessary for the time being."

The survey cover 21 prefectural governments and 135 municipalities located within 30 kilometers of nuclear power plants.

"They are necessary until new power sources that will resolve the issues of global warming and economic efficiency become available," said Jitaro Yamaguchi, the mayor of Mihama, Fukui Prefecture, where the Mihama nuclear plant is located.

Kazuhiko Yamashita, the mayor of Ikata, Ehime Prefecture, home to the Ikata nuclear plant, said, "We should utilize nuclear plants that are confirmed safe and make efforts not to slow down economic activities."

Twenty-six of the local chiefs did not comment or provide valid responses.

Among the 71 leaders, or 45.5 percent, who said "nuclear plants should be phased out," four said nuclear power should be abandoned within 10 years. Eleven said the phaseout period should be completed within 20 years, while eight said Japan should be nuclear-free within 30 years.

Others in favor of a nuclear phaseout did not give a preferred time frame.

Kagoshima Mayor Hiroyuki Mori said Japan should denuclearize itself "when civilian life and economic and industrial activities become insusceptible (to the change)."

The four leaders who said nuclear plants are unnecessary in Japan were the leaders of Misato in Miyagi Prefecture, Wajima in Ishikawa Prefecture, Iki in Nagasaki Prefecture, and Shohei Kitamura, the mayor of Fujieda, Shizuoka Prefecture.

"Given that Japan could overcome the electricity shortage during summer, it is doubtful whether (nuclear plants) are really necessary" Kitamura said.

Shizuoka Prefecture is home to the Hamaoka nuclear plant, which is believed to be at risk of being hit by a towering tsunami up to 19 meters high following the long-expected earthquake along the Nankai Trough southwest of Tokyo.

Among all 11 local government leaders in and near Shizuoka Prefecture, nine, including Kitamura, said "nuclear plants should be phased out" or are "not necessary."

The 71 leaders who want a phaseout of nuclear energy include the chiefs of four municipalities that host nuclear plants. They are the mayors of Futaba and Tomioka in Fukushima Prefecture, Tokai in Ibaraki Prefecture, and Kashiwazaki in Niigata Prefecture.

"The central government should reveal the risks of nuclear plants to the public and decide whether to abandon nuclear power generation through a referendum," said Yoshifumi Sekiguchi, the mayor of Tokamachi, Niigata Prefecture, located within 30 km of the Kashiwazaki-Kariwa nuclear plant.

Fukui Prefecture has 13 commercial nuclear reactors, the most in Japan. The mayors of Echizen city, Echizen town and Sabae city, all in the prefecture, said "nuclear plants should be phased out."

The survey asked about Prime Minister Shinzo Abe's plan to drop the "zero nuclear power generation policy" that was adopted by his predecessor, Yoshihiko Noda, in light of the disaster at the Fukushima No. 1 nuclear plant in 2011.

Sixty-six, or 42.3 percent, of the local leaders said they "fully support" or "generally support" Abe's policy.

"The Hamaoka plant and other plants located in regions at higher risk should not be restarted," said Shigeki Nishihara, the mayor of Makinohara, Shizuoka Prefecture. "But if they are confirmed safe and we win the consent of residents, we can accept temporary operations."

Abe intent on restarting nuclear plants

February 28, 2013

Abe vows to restart Japan nuclear reactors in policy speech

http://mainichi.jp/english/english/newsselect/news/20130228p2a00m0na014000c.html

Prime Minister Shinzo Abe gave the first governmental policy speech of his second administration before the House of Representatives on Feb. 28, declaring his intention to restart Japan's nuclear reactors as soon as they were judged safe.

"We will create a new culture of safety under the aegis of the Nuclear Regulation Authority (NRA), and restart reactors confirmed safe," Abe told the regular Diet session, his wording straying slightly but significantly from his Liberal Democratic Party (LDP)'s coalition agreement with New Komeito stating that restart decisions would be left to NRA experts.

On the hot-button issue of Trans-Pacific Partnership (TPP) free trade talks, meanwhile, Abe said that "the government will be responsible for deciding whether Japan will join," hinting quite strongly that he wished to participate in the currently 11-nation negotiations.

Abe kicked off his speech with a quote from famed Meiji writer and intellectual Yukichi Fukuzawa, "We shall each one of us become independent, and thereby build an independent nation," and the prime minister's remarks returned repeatedly to the theme of "independence."

On foreign relations and the Japan-United States security guarantee, Abe said that "revisions to the U.S. force structure in Japan will continue based on bilateral agreement," and indicated he wished to see the controversial U.S. Marine Corps Air Station Futenma in Okinawa relocated soon. Furthermore, to enhance the deterrent effect of the Japan-U.S. alliance, Abe said "Japan will take an even greater role," hinting at a continued push for constitutional reform allowing Japan the right to collective self-defense.

Also on security, Abe referred to a Jan. 30 incident in which a Chinese warship locked its fire control radar onto a Japan Maritime Self-Defense Force vessel and called on China to exercise self-restraint in the waters around the disputed Senkaku Islands.

"I call for Japan and China to return to the starting point of our relationship based on strategic mutual benefit," he said, adding that he hoped to meet Chinese Communist Party General Secretary Xi Jinping for one-on-one talks.

With an eye to Japanese participation in TPP talks -- staunchly opposed by Japan's farming cooperatives -- Abe advocated an "aggressive agricultural policy" that would "create an agricultural sector with great hope for the future." Furthermore, "we will support companies that give more of their profits back to their employees," he said.

Abe also visited the subject of disaster reconstruction in the areas hit by the March 2011 earthquake and tsunami, saying, "We will speed up recovery. The Reconstruction Agency will adjust in real ways to the special problems of each district." Regarding Fukushima Prefecture, parts of which have been badly contaminated by the Fukushima No. 1 nuclear plant disaster, Abe stated, "We will expend every effort on decontamination, halting economically harmful fears, and bringing the people displaced by the disaster home."

On education, Abe said that the government would consider changing the so-called "6-3-3-4 system" -- six years of primary school, three each for junior high and high school, and four years of university -- as well as move ahead with anti-bullying measures proposed by a government education committee on Feb. 26.

Abe also addressed fears over consumption tax hikes set to go into force in April 2014, stating, "We will guarantee a stable source of government finances, and build a social welfare system based on balancing benefits and burdens."

"It is every legislator's duty to debate the issues constructively, and produce real results," Abe said. "Let us promote debate in the constitutional review committee, and deepen the national dialogue on reforming the Constitution."

Abe also delivered a general policy speech to open the current regular Diet session on Jan. 28. His Feb. 28 speech marks the first time the general remarks and the administrative policy speech have been delivered during the same Diet session in 39 years

Reprocessing dilemma looms as large as ever over Japan

March 2, 2013

Spent fuel reprocessing issue must be tackled head-on now

http://mainichi.jp/english/english/perspectives/news/20130302p2a00m0na005000c.html

The Innovative Strategy for Energy and the Environment released in September last year by the administration of then Prime Minister Yoshihiko Noda had a subtle, yet significant difference between the domestic version of the text and the English-language version geared for an overseas audience.

The Japanese version strategy can be translated as, "We will mobilize all policy resources ... as to enable zero operation of nuclear power plants in the 2030s."

Meanwhile, the English version says, "We will mobilize all policy resources ... as to even enable zero operation of nuclear power plants in the 2030s."

"To even enable zero" and "to enable zero" leave the reader with very different impressions.

According to an insider who was involved with the creation of the strategy, the "even" had been inserted to weaken the impact of the "zero" out of consideration for the U.S. There's no use criticizing a former administration's duplicity now, but the administration of Prime Minister Shinzo Abe faces the same dilemma today. Reprocessing of spent nuclear fuel looms over the administration.

The Noda administration's dilemma can be explained thusly: if nuclear reactors are abolished as per the government's stated goal, there would no longer be a need for nuclear fuel. However, Japan is in possession of a massive stock of plutonium, which it has extracted from spent fuel reprocessing, and for which it has no use besides fuel. For the U.S., which has expressed commitment to the nonproliferation of nuclear weapons, Japan's "zero-reactors" strategy was a touchy subject in light of Japan's large reserves of plutonium that could be used for nuclear weapons.

"We simply can't go on accumulating huge amounts of the very material, like separated plutonium, that we're trying to keep away from terrorists," U.S. President Barack Obama said at the Nuclear Security Summit held in South Korea last March. The statement could have been taken as a message directed at Japan.

To strike a balance between the irreconcilable -- a "zero-nuclear" policy appealing to the Japanese public, and a "zero surplus plutonium" policy that would put the U.S. at ease -- the Japanese government had no choice but to insert the "even" in its energy strategy.

As for the current administration, Prime Minister Abe told the Diet on Jan. 30 that the government would reduce Japan's nuclear dependence "as much as possible," implying that new construction of nuclear reactors was a possibility. The administration also plans to continue spent fuel reprocessing. As such, it may appear as though no dilemma exists for the Abe administration. But the truth is not so simple.

First, there's the question of where the reprocessed fuel will go. Within and outside its borders, Japan has approximately 30 tons of fissile plutonium, which is the equivalent of several thousand A-bomb blasts experienced in Nagasaki in 1945. If and when Japan Nuclear Fuel's Rokkasho Reprocessing Plant in Aomori Prefecture is completed and goes live, Japan's plutonium stock will increase by about 5 tons per year.

The Federation of Electric Power Companies of Japan (FEPC)'s plan for these reserves had been to fuel 16 to 18 pluthermal reactors in the country. However, included among those reactors was the No. 3 reactor at the stricken Fukushima No. 1 Nuclear Power Plant that is slated to be decommissioned, as well as the No. 2 reactor at the Japan Atomic Power Co.'s Tsuruga Power Station, where the possible presence of a geologic fault has been pointed out. In addition, seven more reactors will have been running for over 40 years by the year 2030. With the prospect of reactor restarts still murky, the plan has become a mere pie in the sky.

International opinion is another issue. Experts at the United Nations Conference on Disarmament Issues held in Shizuoka last month pointed out that plutonium stores were terrorist targets, and that operating a reprocessing plant would be ill-advised. According to a report released last year by the U.S.-based organization Nuclear Threat Initiative (NTI), Japan ranked 23rd in security out of 32 countries with weapons-usable nuclear materials, due to the massive quantities of plutonium in its possession. The revision deadline for the Japan-U.S. Nuclear Agreement, which approved spent fuel reprocessing by Japan on the condition that it would not generate surplus plutonium, is coming up in 2018.
"There's no question that the U.S. will demand to know what we plan to do with our plutonium," says a Japanese government insider.

Japan has three options. The first is to significantly increase the number of pluthermal reactors. The second would be to reduce the amount of reprocessing. And third, Japan could stop reprocessing altogether.

As mentioned earlier, the first option is not likely. We're left with options 2 and 3, but they would both result in spent fuel -- that had been meant to be reprocessed -- taking up space in storage vessels around the country that are already close to full. Once they do fill up, operating nuclear reactors is no longer possible.

I stand behind option 3. Let's use the plutonium that we already have as fuel for pluthermal reactors, and stop all reprocessing. For the time being, store the increasing volumes of spent fuel in metal containers, while prompt legal changes are made to allow it to be buried underground in the future.

Naturally, the electric companies that had counted on reprocessing will object to such a course of action. Aomori Prefecture, which hosts the reprocessing plant and has stored the spent nuclear fuel planned for reprocessing there, may send back the fuel to the respective power companies. Moreover, there's no doubt that the selection of burial sites for spent fuel will run into a myriad of problems.

The most mystifying thing about this whole thing is that politicians continue to turn a blind eye to the grave predicament we're in. Debates during the recent general election and deliberations in the

current session of the Diet barely touch upon the issue. Do they believe that someone will take care of it while they look the other way?

The reprocessing plant will be completed as early as this coming October. Whether the government goes through with reprocessing or not, will require the public's consent. We're at a time when we as a society must search for a way to pull ourselves out of this impasse. ("As I See It" by Shuichi Abe, Science and Environment News Department)

New survey on nuke restart

March 4, 2013

Japan's nuclear plants unlikely to restart operations this year: survey

Kyodo
http://www.japantimes.co.jp/news/2013/03/04/national/japans-nuclear-plants-unlikely-to-restart-operations-this-year-survey/#.UTRsuzf1tEs

Japan's nuclear power plants are unlikely to resume operations by the end of the year because of the time it will take to complete safety checks under the new regulatory framework, a survey of the nation's operators of atomic reactors showed Sunday.

Kansai Electric Power Co.'s Oi nuclear power station in Fukui Prefecture, which currently boasts the only two operational reactors in the country, is meanwhile scheduled to be suspended for an inspection in September, regardless of the new safety guidelines to be unveiled by the Nuclear Regulation Authority in July, according to the poll.

The survey, which canvassed nine regional utilities and Japan Atomic Power Co., also found that their financial burden is growing as they reinforce safety measures in response to the March 2011 meltdowns at the Fukushima No. 1 plant.

Power companies expect the cost of implementing the new standards to total at least ¥1.1 trillion, while Kepco alone said it will require ¥285.5 billion in the medium- to long-term, according to the survey.

But Kyushu Electric Power Co. was more upbeat, saying it could restart two of its reactors in July, providing the NRA swiftly completes the necessary safety inspections. All of the other nine companies polled declined to provide specific dates for restarting their atomic energy plants.

Although Shikoku Electric Power Co. said it aims to fire up its reactors at the earliest possible time, it has applied for government approval to hike household electricity rates based on the assumption that it will be able to restart its nuclear plant in Ikata, Ehime Prefecture, in July.

The Ikata facility is viewed as the best candidate to be granted approval to resume operations, as its reactors differ in design from those at the Fukushima No. 1 plant and it has enhanced earthquake-resistant facilities in the event of emergencies.

Still, a senior official at the Ikata complex said it will be “impossible to restart (its reactors) by year’s end” unless the NRA conducts its safety inspections more quickly.

NRA Chairman Shunichi Tanaka has pointed out that **atomic power plant safety checks have previously taken between six months and a year to complete, at the very minimum**. Although the nuclear watchdog is aiming to speed up the process, broader safety measures under the new standards are expected to make it difficult to complete the inspections by the end of December.

In the period since the 2011 quake-tsunami disaster sparked the Fukushima disaster, the nation has only had to cope with a complete suspension of nuclear power for about two months. All of Japan’s commercial reactors were idled between the halt of Hokkaido Electric Power Co.’s Tomari plant in May 2012 and the restart of the two units at the Oi complex that July.

Yoichi Funabashi on the nuclear disaster

March 8, 2013

LESSON FROM THE NUCLEAR DISASTER: Too much focus on laws and systems instead of true leadership

http://ajw.asahi.com/article/0311disaster/opinion/AJ201303080085

Award-winning journalist Yoichi Funabashi has spent much of the past two years trying to uncover the full story behind Japan's gravest national crisis of the postwar era: the reactor meltdowns at the Fukushima No. 1 nuclear power plant.

Renowned for his insightful reporting on national security and Japan-U.S. trade and foreign policy issues, Funabashi is a former columnist, diplomatic correspondent and editor in chief of The Asahi Shimbun.

He recently published a two-volume work titled "Countdown to Meltdown" (from Bungeishunju Ltd.) that describes the actions taken by the major players as they confronted the disaster triggered by the March 11, 2011, Great East Japan Earthquake.

As chairman of the Rebuild Japan Initiative Foundation, Funabashi established the Independent Investigation Commission on the Fukushima Daiichi Nuclear Accident, the only private-sector organization to take an in-depth look at how this unprecedented disaster unfolded.

The commission released its report in February 2012, but Funabashi wanted to gain a fuller understanding of what went through the minds of the individuals concerned as they grappled with the crisis.

A major difference from the commission's report was the inclusion in his book of the words and deeds of many U.S. officials interviewed by Funabashi. In total, close to 300 people in Japan and the United States were questioned, and many spoke on the record.

Over the course of more than 900 pages, Funabashi describes how meltdowns occurred at three of the Fukushima plant's reactors after all electricity sources and cooling systems were lost.

He goes on to describe the struggles that emerged between government officials, executives of Tokyo Electric Power Co., the Self-Defense Forces and central ministry bureaucrats in the immediate aftermath.

Added to the picture are the interactions with various counterparts in the United States that at times hindered rather than helped the situation, especially in the early stages.

In an interview with The Asahi Shimbun, Funabashi explained the purpose for writing the book and his assessment of what has changed since then.

***

Question: Your latest publication re-creates how the key individuals involved dealt with the Fukushima nuclear crisis. What are some of the key points that you wanted to present to readers?

Funabashi: I wanted to describe the essence of that crisis. I thought about whether it would be possible to do so by describing what the key players actually did.

I wanted to present an overall picture, much like a mosaic, by describing the various players and what they went through as the crisis unfolded. The people involved range from officials in the prime minister's office, those in the nuclear plant operation room as well as the emergency response headquarters on-site and those who were involved in evacuating residents.

Because looking into the cause of the accident is important, that was handled by the Independent Investigation Commission on the Fukushima Daiichi Nuclear Accident.

I also wanted to paint a bigger picture about the crisis by writing the stories about the many individuals who were involved.

Rather than say that such-and-such a person was good or that person was bad, I wanted to show that before the problem of radioactive fallout, everyone was weak like a baby because they were consumed by fear.

I believe the four nuclear safety inspectors failed to live up to their tasks. In the first chapter I wrote about inspectors fleeing the scene even as the emergency was unfolding.

Q: What was the major issue at question during the crisis?

A: That would be "in an emergency, can this nation put up a fight?" I was left with the feeling that the spirit, mettle and preparedness needed for such a battle also suffered a meltdown during the crisis. At the same time, I was not in a position to point fingers at people and criticize them. It was a reflection of Japan as a nation in the postwar era and its people, including all of us who lived through that era. While people may have enjoyed living through that time, the future will not be like that at all.

The governments of both Japan and the United States made every effort to protect their own people. In that vein, 20,000 Americans were sent to Japan to participate in "Operation Tomodachi."

In that situation, it was made clear that an alliance cannot be maintained unless Japan was a nation that was capable of protecting its own people.

For its part, it was only natural for the United States to think about protecting its citizens within the context of its own global strategy. Given the difficult circumstances, the United States acted admirably. But Japan also had to face the very important question of whether it had the mettle and preparedness to protect its own people.

That is the element that I most wanted to describe.

Q: The United States didn't entirely trust the Japanese government to take all the right actions. It thought the response should not be left solely up to Tokyo Electric Power Co., the plant operator, and that the Self-Defense Forces had to be brought into the picture. How serious were such considerations in dealing with the crisis?

A: An explosion hit the No. 3 reactor building at 11:01 a.m. on March 14, 2011. That caused the United States to realize that a far from normal situation was unfolding. At the same time, the United States began trying to gain a grasp of core temperatures and radiation levels by using Global Hawk surveillance aircraft as well as other aircraft to collect air samples. After a while, they also began monitoring radiation levels at lower altitudes.

Of course, no one knew what was happening in the cores, not Japan, not TEPCO nor the United States. However, the United States had the tools to monitor the situation from the air. Monitoring on the ground was also done by personnel with the U.S. Navy's Naval Reactors (responsible for safety and proper operations of the Navy's nuclear reactors). Those measurements were conducted at 15-minute intervals around the clock.

The gap between Japan and the United States in grasping the gravity of the situation was made decisive by the difference in monitoring capabilities. The United States quickly realized the situation was far more severe than Japan did. That led the United States to reach the conclusion that the SDF had to be used much earlier than the Japanese government realized. Japan was unable to decide whether the situation could be left entirely to TEPCO.

Japan also did not have a unit to handle an emergency situation of this scale. There was no legal definition of the primary task for the SDF of spraying water into the nuclear plants and storage pools for spent nuclear fuel. The government had to use extralegal measures to deploy the SDF. As a result, the actual spraying of water on March 17 got under way barely in the nick of time.

In terms of understanding the need for crisis management, the United States was certainly quicker off the mark.

Q: The United States faced problems in not knowing who to contact in the Japanese government to obtain reliable information. How would you evaluate the response by Japan?

A: Under the special measures law to deal with nuclear accidents, the Nuclear and Industrial Safety Agency (NISA) is legally supposed to serve as the secretariat. However, the head of the agency failed to function after being yelled at by Prime Minister Naoto Kan. There were many items that had to be taken care of, including sending officials to the local response headquarters and dealing with the barrage of media inquiries.

The local response headquarters also did not work smoothly.

Given these circumstances, politicians in the ruling Democratic Party of Japan felt they had to take the initiative in dealing with the crisis.

Kan also got into action. However, at first, it was not clear who was really in charge in the government for giving out orders.

For those reasons, the United States did not know if it had to obtain information at the accident site, through TEPCO headquarters or NISA.

When the United States thought the prime minister's office might have the information, it asked to be allowed to base officials there.

All of that added up to considerable frustration for the United States.

Q: However, Japan rejected that request to base officials at the prime minister's office on grounds it would violate Japan's sovereignty.

A: I felt Japan's argument was more convincing. It would be unthinkable if Japan made a similar request regarding the White House. Ambassador John Roos at that time became hyperactive because he was under pressure from so many quarters in Washington due to the inability to obtain information.

Q: Was there any possibility of the Japan-U.S. alliance falling into a crisis situation?

A: If the United States had closed its embassy, much like many other nations, and left Tokyo, it would have had incomparable significance. Japan would likely have been thrown into turmoil and left with the feeling that it had been abandoned in a time of emergency. That would have been a major blow to the Japanese public.

Would that have led to the end of the alliance? The issue is not as simple as that. But the trauma from such an event would have been considerable.

The Naval Reactors viewed the situation in a very pessimistic way because it is in charge of nuclear regulation for U.S. aircraft carriers. It would have been difficult even for the top U.S. Navy officer to argue for the importance of the alliance if the Naval Reactors had stated its case strongly.

Even Adm. Robert Willard, the U.S. Pacific Command commander, said at a White House meeting that in a worst-case scenario, the Navy might have to leave Yokosuka. That was how serious the situation was.

That would have been the first instance in the postwar era of the United States removing its troops based in Japan under enormous risk, a possibility that was never considered previously.

In the White House meeting, questions were raised about how difficult it would be from the standpoint of public sentiment and politically to have the U.S. troops return once they had decided to leave. The view was also raised that such a move would represent the beginning of the end of the alliance. The United States really struggled with that question because it was the first such instance in the postwar era.

Q: During the confrontation in the United States between the Navy and State Department, John Holdren, the president's science and technology adviser, entered the picture and decided on what course of action to take. Wasn't that very different from the situation in Japan?

A: That's right. During my interviews, I heard the opinion that there was no telling what would have happened if he had not gotten involved and skillfully led the discussion. In Japan, there is no equivalent post as science adviser to the president.

If one were to seek out someone with a similar position, it might have been Haruki Madarame, the head of the then Nuclear Safety Commission of Japan.

Unfortunately for him, however, after telling Kan that no explosion would occur at the No. 1 reactor, an explosion did actually happen. That led to an immediate drop in the appraisal of Madarame so he was unable to play the role of science adviser.

Because he was head of one agency involved in safety regulation, he also became wrapped up in bureaucratic turf wars. That prevented him from rising above the crisis, as Holdren did.
There is a real need for an independent adviser assisting the president through his expertise and by working solely in the interests of the president. That is because it involves making judgments based on scientific knowledge.

Q: Why was there such a gap in understanding between Japan and the United States over events that had unfolded at the Fukushima plant?

A: On the issue of whether there was water in the storage pool for spent nuclear fuel in the No. 4 reactor, the U.S. view was there was no water. In Japan, Ichiro Takekuro, a senior TEPCO official, also held the view there was no water. However, the official Japanese view was that as of the night of March 16, 2011, there still was water in the pool. That judgment was made on the basis of a photo taken of the pool from a SDF helicopter. The United States viewed the same photo and came to the conclusion that it did not see any water. There was that difference in views.

Although aerial monitoring can show what the temperature is over the pool area, it did not help in determining if there really was water in the pool. While the two sides did not always know what was occurring, the United States was much farther ahead in terms of around-the-clock monitoring to grasp what was happening on the ground.
While similar measurements were conducted by Japanese agencies, such as the science ministry, TEPCO and the Japan Atomic Energy Agency, the methods used were not uniform so there was a low capability for making a comprehensive appraisal. That led to the gap in understanding between the two sides.

Q: In the postscript of your book, you wrote that you wanted to shed light on the lack of independence on the part of Japan. The inability to think outside of the box by those involved in the nuclear energy sector was also evident. That all led to a wavering of the Japan-U.S. alliance. In the ensuing two years, has there been some change regarding that independence on the part of Japan?

A: In the report by the Independent Investigation Commission, the expression was used of "governance conducted by a village mentality and atmosphere."
In a sense, governance means the use and distribution of state power and authority in the most effective way to make the most use of social, human and economic resources to obtain a certain objective.

However, in the case of Japan, it often means only using homogeneous elements and eliminating what is considered heterogeneous. While it may stop short of not recognizing diversity at all, diversity is not always welcomed. Holding an independent viewpoint is not appreciated by others.
In conducting discussions, the conclusion is decided beforehand so that no one loses face. No one is satisfied unless everything is settled beforehand. That is the same for training exercises. There is a tendency not to conduct real training without a predetermined scenario which could lead to everyone being made uncomfortable.

In that way, no one loses face and no one's authority is disparaged. Everything is settled within a predetermined plan and everyone is thinking about everyone else. Risks are considered taboo and not brought out into the open. Risk is also not appraised independently. Because risk is only considered in a

way convenient to management and order, in the end, when it has to come into play, it is of absolutely no use.

Normally, there would be a need to incorporate a much more diverse set of viewpoints as well as heterogeneity, but in the past two years there has been almost no change in that respect.

For example, regarding where to store topsoil contaminated by radiation, while many people may feel in their hearts that it should be kept somewhere in Fukushima Prefecture, if that feeling is actually voiced, discussions quickly come to a halt because some will say that would further hurt and bully the residents of Fukushima.

What has not changed is the ability to minimize loss through a process of bringing out risk into the open, discussing the issues in an objective manner and setting priorities before deciding how to keep the loss at a minimum.

Q: There was failure to conduct real training exercises and SPEEDI (the System for Prediction of Environmental Emergency Dose Information) was not helpful. What lessons can be learned from that?

A: There may have been the acquisition of better hardware over the past two years, but there are still many shortcomings with regard to software. There are doubts as to how much specialization was really improved, as well as whether a command structure was decided on. In terms of enforcement of measures, not much has changed.

A true system to deal with crises has not yet been established.

For example, a major change might be possible if, in deciding to resume operations at nuclear plants, the decision was made to permanently base inspectors from the newly established Nuclear Regulation Authority at the plants and have them work together with officials of the plant operator when a crisis arose.

Another possibility would be to have those who would be actually manning the control rooms at the plants to inspect the new operation room and ask them if they would be satisfied that the changes incorporated would be sufficient even if earthquakes and tsunami led to a failure of the cooling system.

In the end, people will have to screen the changes proposed. Regardless of how skillfully the procedures, system and organization are put together, in the end it is people who determine if those factors actually work.

Those people who would handle operations at the control room should be asked if they feel satisfied that the changes will protect their safety and keep the plant under control.

That sort of thinking of asking the people who will actually use the procedures and systems to screen the changes is not currently found in Japan. Everything is about laws and systems.

But, in the end, it is about people and leadership.

Looking at municipalities in Fukushima Prefecture, those with true leadership have recovered to a much greater degree.

In order to respond effectively to a crisis, priorities have to be set and decisions made on what should be saved first. Only leadership is capable of achieving that. People will have to play central roles in screening whether proposed changes will really work.

However, I have doubts about the extent to which there have been changes in thinking along those lines over the past two years.

Areva to ship MOX to Japan - Recipient unknown

Source : The Globe and Mail

http://www.theglobeandmail.com/report-on-business/international-business/asian-pacific-business/areva-plans-first-nuclear-fuel-shipment-to-japan-since-fukushima/article9268609/?cmpid=rss1

Areva plans first nuclear fuel shipment to Japan since Fukushima

MARION DOUET AND RISA MAEDA

PARIS and TOKYO — Reuters

Published Monday, Mar. 04 2013, 3:41 PM EST

Last updated Monday, Mar. 04 2013, 3:44 PM EST

French energy group Areva said it was preparing to send nuclear fuel to Japan for the first time since the Fukushima disaster of March, 2011, a sign of possible restarts of idled Japanese reactors.

The shipment of mixed oxide fuel (MOX) is likely to be controversial in Japan, where public opposition to nuclear power and reactor restarts remains strong in the run-up to the second anniversary of the March 11, 2011 catastrophe.

The fuel will be shipped out of the port of Cherbourg in northern France in early April, according to Greenpeace, an anti-nuclear group. Areva officials declined to comment on the timing.

France's state-owned nuclear group, whose activities range from uranium mining and enrichment to reactors and waste recycling, said it was in talks with Japanese authorities to prepare a shipment, which had been delayed since the Fukushima meltdowns.

"We believe there could be half a dozen reactors which will restart at the end of 2013 (in Japan)," Areva chief executive officer Luc Oursel told a news briefing on Monday.

The long-ruling Liberal Democratic Party of Japan has returned to power and has said it will reassess the previous government's decision to abandon atomic power after Fukushima, the worst nuclear disaster since Chernobyl in 1986.

A 2011 MOX shipment was destined for Kansai Electric Power Co's Takahama nuclear plant west of Tokyo, Chubu Electric's Hamaoka and Tokyo Electric Power's Fukushima on the eastern coast, according to Greenpeace.

"We suspect that part of the shipment is destined to the same recipients," Yannick Rousselet, a Greenpeace official, said.

A spokesman at Kansai Electric said the company had no plans for any MOX fuel shipments at this time but confirmed it had been the intended recipient of the 2011 shipment from France.

Kansai Electric uses MOX fuel in the No. 3 unit at Takahama and has plans in place to start using the fuel in the No. 4 reactor there.

Chubu Electric spokesman Akio Miyazaki denied that the utility will be the recipient of the shipment. Chubu's sole nuclear plant is closed for upgrades to its tsunami defences.

A Tokyo Electric spokesman said the company had no MOX fuel shipment plan in 2011 and no plans to accept the fuel at this time.

Because MOX fuel contains around 7-per-cent plutonium, it is perceived as a national security threat, and special precautions are taken during transportation.

The Fukushima crisis prompted the gradual shutdown of all of Japan's 50 nuclear reactors until there were none left operating in May, 2012, leaving the country without atomic power for the first time since 1970.

Now two reactors at Kansai Electric's Ohi plant near Takahama are the only ones operating in Japan so far, and the country has had to resort to imports of fossil fuel to run power stations, pushing it into a record trade deficit.

The decision last June by the previous Democratic Party of Japan government to restart the two reactors weeks after the last full shutdown galvanized the previously dormant anti-nuclear movement, sparking the biggest demonstrations in decades and contributing to the party's downfall in elections in December.

Media surveys have shown a majority of Japanese want to abandon atomic energy by 2030, if not sooner, which makes it a risky proposition for the new government to restart even the reactors deemed safe.

Utilities and the government, however, are keen to reduce expensive oil and gas imports. Major manufacturers have also called on the government to restart idled nuclear plants.

People's voices on nukes

March 12, 2013

Tokyo: Do you support Japan abandoning nuclear power even if it means increases in electricity prices?

by Mark Buckton

http://www.japantimes.co.jp/community/2013/03/12/voices/tokyo-do-you-support-japan-abandoning-nuclear-power-even-if-it-means-increases-in-electricity-prices/#.UT72FzdD-jQ

Katsuyoshi Tanaka
"Beer sommelier," 28 (Japanese)
Even if it's true that electricity bills will rise, I don't agree with using nuclear power due to the simple fact that it is not 100 percent safe. And, whilst I don't have kids yet, I hope to be a father one day, and I don't want them to grow up in a nuclear-dependent world.
Keika Yu
Self-employed, 33 (Chinese)
I think we should try to decrease our reliance on nuclear power in the wake of what happened two years ago in Fukushima, but admittedly that is difficult to achieve overnight, and all at once, so a step-by-step approach is what's needed, in my opinion.
Terri Nii
Editor, 50s (American)
I think that a comprehensive, long-term [energy] plan is necessary. While nuclear power may be necessary in the short term, new technologies and the development of alternative energy sources should be explored for the medium and long term.
James Platte
Visiting researcher, 33 (American)
A nuclear phaseout could have significant negative effects on the economy, lead to increased fossil fuel imports and greenhouse gas emissions. I think Japan must strive for balance in its energy policy and not tend to extremes of all-in or all-out for any one source.
Azusa Yano
Housewife, 39 (Japanese)
I agree with going nonnuclear, but it would make my life a little more difficult when bills go up. But that is outweighed by my fear of future accidents. As there are still many people affected by the last accident, we should think of them and move toward cleaner energy quickly.
Ben Beech
Photographer/teacher, 34 (English)
I have become opposed to nuclear power after seeing the devastating effects of the 2011 disaster. But for a resource-poor, import-dependent country, nuclear power seems essential to boost the economy. I just hope the pronuclear Liberal Democratic Party puts safety first.

Will Gov't listen to the people's voices?

March 16, 2013

Anti-nuclear' voices are weak as government begins energy policy revision

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303160055

By MARI FUJISAKI/ Staff Writer

The government began work March 15 to overhaul Japan's energy policy. A panel discussed the value of alternative power sources but pointedly ignored a pledge by the previous government to pull the plug on nuclear power.

It was the first session in a series that brings together experts on a subcommittee of the economy ministry's Advisory Committee for Natural Resources and Energy, which aims by the end of this year to draft a new plan to meet Japan's future energy needs.

"The basic energy plan must clearly show the way toward obtaining a stable supply and lower costs," said Toshimitsu Motegi, minister of economy, trade and industry.

To that, a heckler from the public gallery shouted: "Don't forget to abolish nuclear power."

In 2012, the Democratic Party of Japan-led administration pledged to close all nuclear plants by the end of the 2030s. However, the current administration, led by the Liberal Democratic Party, believes such a move would be wrong.
It aims to abandon the target formally, and, in the short-term, to restart idled nuclear reactors. Both policies could serve as preconditions for the new basic energy plan.

Attitudes toward nuclear power have seesawed in the past couple of years. In June 2010, the DPJ, then a nuclear cheerleader, penciled in boosting atomic power to 50 percent of Japan's total generation by 2030.

Then the disaster at the Fukushima No. 1 nuclear power plant and public clamor for abolition forced the government to make a U-turn, pledging to phase out reactors by the end of the 2030s.

A change of government followed and since the immediate policy is to restart reactors, the subcommittee has no plans to discuss a target percentage for nuclear power in Japan's total energy supply. Nor will it enshrine such a figure in the basic energy plan.

Under the DPJ-led administration, the panel that held such discussions contained a fair number of nuclear skeptics. Broadly speaking, of 25 members of the committee on basic issues, eight were anti-nuclear.

But the Abe administration has tasked the talks to a different team: the general subcommittee, which has only two clearly anti-nuclear members. These are Kazuhiro Ueta, a professor of economics at the graduate

school of Kyoto University, and Kikuko Tatsumi, adviser to the Nippon Association of Consumer Specialists.

In the March 15 meeting, all the 15 members were heard discussing their general attitudes toward energy policy. Few of them called for the abolition of nuclear power.

Instead, many insisted that the subcommittee should consider energy from as broad a viewpoint as possible, including questions such as the possibilities of shale gas, a newly popular energy source in the United States, the potential of renewable energy, and the electricity savings.

Then one member broached the subjects the government seems to want to ignore.

"Nuclear power generation should be decreased as much as possible," said Takeo Kikkawa, a professor of business administration at the graduate school of Hitotsubashi University.

Yuko Sakita, a counselor on environmental issues, added: "The government should give itself the opportunity to listen to the people's opinions."

Ohi plant allowed to stay online till September

March 19, 2013

Oi N-plant to continue operations through Sept.

Jiji Press
http://www.yomiuri.co.jp/dy/national/T130319004241.htm

The Nuclear Regulation Authority said Tuesday that the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture are allowed, in principle, to continue operations until the next routine check in September.

Although nuclear plants in Japan are required to meet new safety standards, which will come into effect on July 18, before being restarted, the nuclear regulator gave the approval by showing its intention to start checking whether the reactors fall short of any of the new standards in April, when the outline of the standards is drawn up.

The two reactors at the Oi plant in the prefecture are the only nuclear reactors in operation in Japan.

Shunichi Tanaka, chairman of the nuclear regulator, said it may demand the reactors cease operations if serious problems are found.

The government decided to restart the two reactors in June 2012, before the new nuclear regulator was established, and they are therefore legally allowed to continue operations through September, the authority said.

The authority said it will carry out examinations of the two reactors under the new standards at the end of the next routine check.

It proposed starting the safety confirmation process once the new standards' outline becomes clear, because safety requirements are to be raised substantially.

In its implementation plans shown on the day for the new safety standards, the authority demands that nuclear plant operators complete installation of all facilities needed for countermeasures against severe accidents stipulated in the standards.

Ohi nuclear plant will stay online until Sept.

http://www3.nhk.or.jp/daily/english/20130319_19.html

Nuclear regulators say they will allow 2 power reactors in western Japan to continue operation until September. New safety guidelines will be introduced July.

The No. 3 and 4 reactors at Kansai Electric Power's Ohi plant have been the nation's only two reactors online since last August. They cleared the government's earthquake resistance safety test in 2011.

Legally, the utility can operate the reactors until the next regular inspection in September.

Attention is focused on whether the Nuclear Regulation Authority will apply the new safety guidelines to the 2 reactors in July.

At an NRA meeting in Tokyo on Tuesday, Chairman Shunichi Tanaka said after the planned regular inspections are completed the 2 operating reactors will be checked to see whether they meet the new safety requirements.

Early checkup of Ohi plant by NRA

March 21, 2013

Oi reactors to get early NRA check to stay on

Kyodo

http://www.japantimes.co.jp/news/2013/03/21/national/oi-reactors-to-get-early-nra-check-to-stay-on/#.UUofOTf1tEs

To keep the only nuclear plant now online from shutting down, the Nuclear Regulation Authority said Tuesday it will inspect Kansai Electric Power Co.'s Oi atomic facility in Fukui Prefecture according to new safety standards prior to their official July debut.

After a regular meeting at which the watchdog compiled a basic policy for the introduction of the reactor safety standards, NRA Chairman Shunichi Tanaka said the Oi plant's reactors 3 and 4 will be inspected possibly by April.

If no problems are found, the NRA will authorize their continued operation until September, when they have to undergo routine maintenance, Tanaka said.

The NRA may face criticism for giving special treatment to the Oi reactors. Safety checks at the 48 reactors currently idled will only start in July, when the new standards take effect. These checks are required before any reactor can restart.

Reactors 3 and 4 at the four-reactor Oi complex were restarted last July and are currently the only ones online among the 50 surviving commercial reactors in Japan. The 48 others remain shut down amid safety concerns stemming from the meltdown crisis at Tokyo Electric Power Co.'s Fukushima No. 1 power plant triggered by the March 2011 earthquake and tsunami.

Tanaka said the NRA thinks that reactors 3 and 4 at the Oi plant will clear most of the new safety standards. "We cannot deny the possibility that the reactors may not fulfill one or two items" under the new standards, but the NRA intends to closely examine them, he said.

Tanaka added that if the NRA were to require online reactors to shut down every time the regulatory body comes up with new safety standards, it would hinder efforts to introduce new standards based on the latest findings.

The new safety standards are expected to call for the facilities and equipment of offline reactors to undergo checks in two stages.

March 20, 2013

Regulator to check Oi reactors before safety standards take effect

http://mainichi.jp/english/english/newsselect/news/20130320p2g00m0dm005000c.html

TOKYO (Kyodo) -- Japan's nuclear authority suggested Tuesday it will check Kansai Electric Power Co.'s Oi nuclear power plant, currently the only one with online reactors in the country, according to new safety standards, prior to their introduction in July, to avoid suspension of the plant's operations.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said after a regular meeting at which the NRA compiled a basic policy for the introduction of the reactor safety standards that the Oi plant's No. 3 and 4 reactors in Fukui Prefecture will undergo safety checks possibly in April or later.

If no problems are found with the Oi reactors, the NRA will authorize their continued operation until September, when they have to undergo routine maintenance, Tanaka said.

The NRA may be criticized for giving special treatment to the Oi reactors because applications for safety checks at the 48 reactors that are currently idled will only start in July, when the new standards become effective. Safety checks under the new standards are required for all reactors to resume operation.

The Nos. 3 and 4 reactors at the four-reactor Oi complex were restarted in July and are currently the only ones online among the 50 surviving commercial reactors in Japan, operation of which was suspended

amid safety concerns following the nuclear crisis at Tokyo Electric Power Co.'s Fukushima Daiichi power plant triggered by the March 2011 earthquake and tsunami.

Tanaka said the NRA thinks that the No. 3 and 4 reactors at the Oi plant are able to clear most of the new safety standards, as countermeasures are being taken. "We cannot deny the possibility that the reactors may not fulfill one or two items" under the new standards, but the NRA intends to closely examine them, he said.

Tanaka added that if the NRA were to require online reactors to suspend operation every time the regulatory body comes up with new safety standards, it would hinder efforts to introduce new standards based on the latest findings.

According to the basic policy of the new safety standards, the facilities and equipment of offline reactors will undergo checks in two stages.

A foregone conclusion

March 20, 2013

Oi nuke reactors to stay online even when new safety standards take effect

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303200067

THE ASAHI SHIMBUN

Japan's nuclear authority said March 19 it will not order two reactors at the Oi nuclear power plant in Fukui Prefecture to be shut for screening when new safety standards, yet to be finalized, take effect in July.

All of the nation's 50 nuclear reactors were shut down after the meltdowns in Fukushima Prefecture triggered by the March 11, 2011, Great East Japan Earthquake and tsunami. The No. 3 and No. 4 reactors of the Oi plant, operated by Kansai Electric Power Co., are the only ones that have been reactivated.

The government's nuclear industry watchdog, the Nuclear Regulation Authority, is expected to screen the two Oi reactors under the new safety standards, but only after they are shut down in September for regular inspections. As a result, Kansai Electric will likely be able to keep the reactors operating this summer months when power demand peaks.

Offline nuclear reactors will only be allowed to restart after NRA screenings under the new safety standards.

A draft outline, which the NRA presented in late January, said the new standards will make it compulsory for power utilities to step up measures against grave accidents, earthquakes and tsunami.

The underlying idea is one of "back-fitting," which means existing nuclear reactors have to keep up with upgrades in safety standards if they are to be restarted.

The NRA's chairman, Shunichi Tanaka, made clear March 19 that the Oi reactors, the only ones operating in July, will be screened after they have finished regular inspections.

"Back-fitting must be one that can be put into operation without causing confusion as soon as the new standards come into effect," Tanaka said in a "personal proposal" that he presented to a regular NRA meeting, only four months ahead of the scheduled upgrading of the safety standards.

The decision to keep the Oi reactors running and not shut them down in July was reached to avoid setting precedent in which nuclear reactors would have to be taken offline each time new safety measures were required.

The NRA noted it is a general rule in other countries to allow a certain grace period for safety measures to be implemented.

Tanaka emphasized that his proposal is aimed purely at facilitating a smooth introduction of the back-fitting mechanism.

"Back-fitting would be impracticable without a grace period," he said. "The mechanism is a trump card in that it enhances the safety of nuclear reactors in Japan."

Tanaka's latest comments suggest he is backpedaling on the issue. In January, he said the NRA could order the Oi reactors to be shut down before September, saying it cannot treat them as exceptions.

The Abe administration has overturned the previous government's pledge to pull Japan out of nuclear power generation by the 2030s.

Power utilities have griped to the NRA that the creation of multiple safety mechanisms, which will be obligated under the new safety standards, will pose too much burden on them.

A senior NRA official denied that the lobbying had influenced the NRA's latest decision.

"The NRA's independence is guaranteed by law," the official said. "And Tanaka is not someone who is easily swayed."

Tanaka did say, however, the Oi nuclear reactors will undergo preliminary, advance inspections that will start around mid-April and last for three months. Those inspections will be designated an administrative procedure, not statutory screening, because the new safety standards will not have taken effect.

During a March 19 news conference, Tanaka emphasized the NRA could call for shutdowns of the Oi reactors if serious safety problems are found. But he did not specify the nature of such problems.

A senior Kansai Electric official was clearly thrilled by the NRA's decision.

"While we have made an array of requests (to politicians), I never expected they would come true so soon," the official said.

The power industry faced its darkest hour following the disaster at the Fukushima No. 1 nuclear power plant two years ago. But everything changed when Abe's pro-nuclear Liberal Democratic Party defeated the Democratic Party of Japan by a landslide in December's Lower House election.

The NRA remains a thorn in the side of the government. It has stood in the way of reactor restarts by pointing out the presence of possible active geological faults beneath nuclear plant sites and by demanding costly safety measures.

The power industry has waged an all-out offensive against the NRA, while stepping up its lobbying of LDP politicians.

"The LDP cannot likely afford to make any bold moves until the Upper House election in July," said one source in the Federation of Electric Power Companies of Japan. "The approval for Oi has virtually set the stage for the restarts of other reactors."

Local government leaders responded by calling for early safety screenings under the new standards.

The mayor of Oi, Shinobu Tokioka, called on the NRA to provide assurances that the reactors there will operate safely.

"Residents cannot have a peace of mind as long as they don't know if the new standards are being met," Tokioka said March 19.

"I only want thorough screenings," said Masaaki Fukui, mayor of Takashima in neighboring Shiga Prefecture.

Nuclear opponents in municipalities hosting nuclear plants criticized the NRA decision.

"The logic behind it prioritizes the economy over life," said Harumi Kondaiji, a 62-year-old anti-nuclear advocate and city assembly member of Tsuruga, Fukui Prefecture. The body is dominated by atomic energy proponents. "This marks the first step toward the erosion of public trust in the NRA."

"The situation is no different from the former Nuclear and Industrial Safety Agency's cozy relationship with the power industry," said Teruyuki Matsushita, a 64-year-old anti-nuclear activist who formerly served on the town assembly in Mihama, Fukui Prefecture.

Abe will make "comprehensive decision" on restart

March 24, 2013

Abe to comprehensively decide on restart of reactors in Japan

http://mainichi.jp/english/english/newsselect/news/20130324p2g00m0dm087000c.html

TOKYO (Kyodo) -- Prime Minister Shinzo Abe said Sunday he will make a "comprehensive decision" on whether to restart reactors in Japan, noting the need for nuclear power.

"I will decide after assessing the safety" of resuming the reactors, Abe told reporters during a visit to Koriyama, Fukushima Prefecture, to check on the progress of reconstruction in areas affected by the March 2011 earthquake, tsunami and nuclear disasters.

At the same time, the prime minister said, "Reconstruction will be hard without an inexpensive and stable source of power," vowing to dispel "harmful rumors" stemming from the nuclear disaster at the Fukushima Daiichi power plant.

Abe visited farmers in Koriyama, who have been hit by public concern over the radioactive contamination of their products, and the largely deserted shopping district of the town of Namie, also in Fukushima.

Receiving a request from Namie Mayor Tamotsu Baba for the swift restoration of infrastructure, Abe assured him that rebuilding work will be accelerated.

The entire town is currently designated as a no-go zone, but the boundaries of the restricted area will be redrawn April 1, with residents to be allowed to temporarily visit some parts during the daytime.

Abe also visited the town of Tomioka.

As a prime minister, Abe visited disaster-hit Iwate and Miyagi prefectures in February. He last visited Fukushima in December, just after he took office.

Japanese Plutonium

[I seem to remember that Japan has about 45 tons of plutonium. Who else deals with plutonium apart form utilities ?
These figures have to be checked]

March 26, 2013

Japanese power companies possessed over 26 tons of fissile plutonium at end of 2012

http://mainichi.jp/english/english/newsselect/news/20130326p2a00m0na006000c.html

Japan's 10 major power companies possessed a combined 26.5 tons of fissile plutonium as of the end of last year, the Federation of Electric Power Companies reported at a regular meeting of the Japan Atomic Energy Commission on March 26.
Companies are not likely to formulate plans covering the use of this plutonium anytime in the near future, the federation says. This is because there are no immediate prospects for restarting more nuclear reactors in Japan in the wake of the Fukushima nuclear crisis, and plans for pluthermal nuclear power generation using plutonium as fuel have run into difficulties.
The Federation of Electric Power Companies reported that Kansai Electric Power Co. possesses 8.7 tons of fissile plutonium, Tokyo Electric Power Co. has 8 tons, and Chubu Electric Power Co. has 2.6 tons. The figures include companies' overseas stocks of plutonium.
Fissile plutonium can also be used in nuclear weapons, and a surplus without designation of where it will be used could raise concerns in international society. The federation plans to introduce pluthermal systems at 16 to 18 nuclear reactors in the future.

Construction of new nuclear plant abandoned

March 28, 2013

Tohoku Elec. to cancel plan for new nuclear power plant in Fukushima

http://mainichi.jp/english/english/newsselect/news/20130328p2g00m0dm087000c.html

TOKYO (Kyodo) -- Tohoku Electric Power Co. said Thursday it has decided to cancel its plan to build a new nuclear power station in Fukushima Prefecture, where antinuclear sentiment gained ground in the aftermath of the nuclear disaster at the Fukushima Daiichi power plant.

Tohoku Electric had been preparing to build the Namie-Odaka nuclear power plant on a tract of land straddling the city of Minamisoma and the town of Namie, both in Fukushima Prefecture, on the Pacific coast.

This is the first cancellation by a Japanese utility firm of a plan to build a new nuclear power plant following the onset of the March 2011 nuclear disaster at the Fukushima Daiichi power plant operated by Tokyo Electric Power Co.

Tohoku Electric, which is based in Sendai, the biggest city in northeastern Japan's Tohoku region and the capital of Miyagi Prefecture, is expected to remove the Namie-Odaka plant construction project from its management program for fiscal 2013 starting April 1.

Tohoku Electric, which first unveiled the plan for the new plant in 1968, had been making efforts to acquire some 150 hectares, or 1.5 million square meters, of land in the two municipalities to build the Namie-Odaka plant, but faced difficulties.

The planned site was flooded by the huge tsunami following the magnitude 9.0 earthquake on March 11, 2011, that devastated many parts of northeastern Japan and has been designated an evacuation zone.

It is located some 10 kilometers north of the disaster-stricken Fukushima Daiichi plant, which is located in the towns of Okuma and Futaba, Fukushima Prefecture.

Following the disaster at the Fukushima Daiichi plant, the Fukushima prefectural government declared it was pulling out of nuclear power generation. The Minamisoma and Namie municipal assemblies have passed resolutions urging Tohoku Electric to call off its plan to build the Namie-Odaka nuclear power plant.

Tohoku Electric had planned to start construction in fiscal 2016, starting April 1 that year, of the plant's No. 1 reactor, which would be a boiling water-type reactor with an output capacity of 825,000 kilowatts.

Tohoku Electric is expected to retain a separate plan to build the No. 2 reactor at its Higashidori nuclear power plant in the village of Higashidori, Aomori Prefecture, on the northern tip of Japan's largest main island of Honshu.

Currently, Tohoku Electric operates two reactors -- one at the Onagawa nuclear power plant in the town of Onagawa, Miyagi Prefecture, and the other at the Higashidori plant, but they have been shut down in the aftermath of the Fukushima disaster.

Tokyo Electric, known as TEPCO, is also building a reactor at the Higashidori plant.

Tohoku Electric supplies electricity to six prefectures in northeastern Japan -- Aomori, Iwate, Akita, Yamagata, Miyagi and Fukushima -- plus Niigata Prefecture on the Sea of Japan coast.

Tohoku Electric to abandon planned nuclear plant in Fukushima

Kyodo

http://www.japantimes.co.jp/news/2013/03/28/national/tohoku-electric-to-abandon-planned-nuclear-plant-in-fukushima/#.UVPsoTf1tEs

SENDAI – Tohoku Electric Power Co. is planning to withdraw its plan to build a new nuclear plant in Fukushima Prefecture, local government sources said Thursday, in the first such move since the March 2011 nuclear disaster.

Tohoku Electric apparently decided it was impossible to go through with the construction plan amid strong local opposition following the triple meltdowns at the Fukushima No. 1 plant. The utility will exclude the plan from its supply plan for fiscal 2013 to be released later Thursday.

Tohoku Electric has been in the process of acquiring around 150 hectares of land in the town of Namie and Odaka Ward, Minamisoma, but has faced strong local opposition.

The construction site was flooded with tsunami after the Great East Japan Earthquake, and the area was designated as a no-go zone.

Since the nuclear crisis erupted the same month, Fukushima Prefecture has supported the phase out of atomic energy while the municipal assemblies of Namie and Minamisoma have passed resolutions to stop attracting nuclear power plants to the area, making it difficult for Tohoku Electric to proceed with the construction plan.

Japan's utility scraps nuclear plant construction

http://www3.nhk.or.jp/daily/english/20130328_28.html

A Japanese electric power company has officially scrapped a plan to build a new nuclear power plant near the site of the 2011 nuclear disaster in Fukushima Prefecture.

Tohoku Electric Power Company said on Thursday that it will cancel the construction of the Namie-Odaka plant that was to be built about 10 kilometers north of the crippled Fukushima Daiichi plant.

The project met strong opposition from local community assemblies following the nuclear accident at Fukushima Daiichi operated by Tokyo Electric Power Company.

Tohoku Electric disclosed in 1968 a plan to build the nuclear facility in part of Namie Town and the Odaka district of Minamisoma City on the Pacific coast.

The areas were hit hard by the earthquake and tsunami in 2011.

The president of Tohoku Electric, Makoto Kaiwa, conveyed the decision to Fukushima Governor Yuhei Sato on Thursday.

Kaiwa said that the construction is not appropriate given that many evacuees are still forced to live in temporary housing after the accident.

The governor said that the decision is absolutely natural in the current situation and urged the utility to make good use of the planned construction sites for the reconstruction of Fukushima.

Tohoku Electric Power supplies electricity to seven northern prefectures on Japan's main island of Honshu.

The utility has two nuclear power stations in Onagawa, Miyagi Prefecture and Higashidori, Aomori Prefecture. But they remain shutdown after the Fukushima disaster.

This is the first scrapping of a plan to build a nuclear power plant by a Japanese power company not directly involved with Fukushima Daiichi.

Scrapping Nuke plant project

March 29, 2013

Tohoku Electric scraps N-plant plans

http://www.yomiuri.co.jp/dy/national/T130328004281.htm

SENDAI (Jiji Press)--Tohoku Electric Power Co. announced Thursday it has decided to scrap a nuclear power plant project, the first domestic firm to do so since the nuclear crisis at Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant in March 2011.

The project, launched in 1968, called for building a nuclear power plant on a site straddling the towns of Namie and Minami-Soma, both in Fukushima Prefecture.

The area was contaminated with radioactive material from the TEPCO plant, which suffered an unprecedented triple meltdown following the Great East Japan Earthquake and tsunami. Due to the incident, the two municipalities shifted their stance toward the construction of the plant.

Tohoku Electric reached the decision at a board meeting Thursday, based on the judgment that it can no longer stick to the project given the strong opposition, officials said.

Another factor behind the decision may be that the planned site of the facility, called the Namie-Odaka nuclear plant, was submerged by tsunami after the March 2011 earthquake.

Tohoku Electric President Makoto Kaiwa visited Fukushima Gov. Yuhei Sato to inform him of the company's decision. "It is not appropriate" to push ahead with construction taking into consideration the concerns of local residents and the difficulty in realizing it in the planned location, Kaiwa told Sato.

Tohoku Electric had planned to build an 825,000-kilowatt plant. Construction was to begin in fiscal 2016 with operations slated to start in fiscal 2021.

North Korea to restart nuclear reactor

April 2, 2013

N.Korea may restart disabled nuclear reactor

http://www3.nhk.or.jp/nhkworld/english/news/20130402_31.html

North Korea says it is considering restarting the graphite-moderated test reactor at Nyongbyon. The reactor was disabled in 2008 under the six-party agreement.

Restarting the reactor could lead to North Korea extracting plutonium, which could be used in nuclear weapons.
Apr. 2, 2013 - Updated 05:39 UTC

North Korea vows to restart nuclear facilities

http://mainichi.jp/english/english/newsselect/news/20130402p2g00m0in042000c.html

SEOUL, South Korea (AP) -- North Korea vowed Tuesday to restart a nuclear reactor that can make one bomb's worth of plutonium a year, escalating tensions already raised by near daily warlike threats against the United States and South Korea.

The North's plutonium reactor was shut down in 2007 as part of international nuclear disarmament talks that have since stalled. The declaration of a resumption of plutonium production -- the most common fuel in nuclear weapons -- and other facilities at the main Nyongbyon nuclear complex will boost fears in Washington and among its allies about North Korea's timetable for building a nuclear-tipped missile that can reach the United States, technology it is not currently believed to have.

A spokesman for the North's General Department of Atomic Energy said that scientists will begin work at a uranium enrichment plant and a graphite-moderated 5 megawatt reactor, which generates spent fuel rods laced with plutonium and is the core of the Nyongbyon nuclear complex.

The unidentified spokesman said the measure is part of efforts to resolve the country's acute electricity shortage but also for "bolstering up the nuclear armed force both in quality and quantity," according to a statement carried by the official Korean Central News Agency.

Pyongyang conducted its third nuclear test in February, prompting a new round of U.N. sanctions that have infuriated its leaders and led to a torrent of threatening rhetoric. The United States has sent nuclear-capable bombers and stealth jets to participate in annual South Korean-U.S. military drills that the allies call routine but that Pyongyang claims are invasion preparations.

North Korea has declared that the armistice ending the Korean War in 1953 is void, threatened to launch nuclear and rocket strikes on the United States and, most recently, declared at a high-level government assembly that making nuclear arms and a stronger economy are the nation's top priorities.

The threats are seen as efforts to force policy changes in Seoul and Washington and increase domestic loyalty to young North Korean leader Kim Jong Un by portraying him as a powerful military force.

"North Korea is keeping tension and crisis alive to raise stakes ahead of possible future talks with the United States," said Hwang Jihwan, a North Korea expert at the University of Seoul. "North Korea is asking the world, 'What are you going to do about this?'"

North Korea added the 5-megawatt, graphite-moderated reactor to its nuclear complex at Nyongbyon in 1986 after seven years of construction. The country began building a 50-megawatt and a 200 megawatt reactor in 1984, but construction was suspended under a 1994 nuclear deal with Washington.

North Korea says the facility is aimed at generating electricity. It takes about 8,000 fuel rods to run the reactor. Reprocessing the spent fuel rods after a year of reactor operation could yield about 7 kilograms of plutonium -- enough to make at least one nuclear bomb, experts say.

Nuclear bombs can be produced with highly enriched uranium or with plutonium. North Korea is believed to have exploded plutonium devices in its first two nuclear tests, in 2006 and 2009.

In 2010, the North unveiled a long-suspected uranium enrichment program, which would give it another potential route to make bomb fuel. Uranium worries outsiders because the technology needed to make highly enriched uranium bombs is much easier to hide than huge plutonium facilities.

But experts say plutonium is considered better for building small warheads, which North Korea needs if it is going to put them on missiles. Analysts say they don't believe North Korea currently has mastered such miniaturization technology.

Scientist and nuclear expert Siegfried Hecker has estimated that Pyongyang has 24 to 42 kilograms of plutonium -- enough for perhaps four to eight rudimentary bombs similar to the plutonium weapon used on Nagasaki in World War II.

It's not known whether the North's latest atomic test, in February, used highly enriched uranium or plutonium stockpiles. South Korea and other countries have so far failed to detect radioactive elements that may have leaked from the test and which could determine what kind of device was used.

"North Korea is dispelling any remaining uncertainties about its intention for developing nuclear arms. It is making it clear that its nuclear arms program is the essence of its national security and that it's not negotiable," said Sohn Yong-woo, a professor at the Graduate School of National Defense Strategy of Hannam University in South Korea.

"North Korea is more confident about itself than ever after the third nuclear test," Sohn said. "That confidence is driving the leadership toward more aggressive nuclear development."

Akio Matsumura at the New York Academy of Sciences

What Did the World Learn from the Fukushima Nuclear Accident?

http://akiomatsumura.com/2013/03/crisis-and-opportunity-politics-in-japan-and-the-united-nations-2.html#comments

March 11, 2013

Akio Matsumura gave this speech at the conference "The Medical and Ecological Consequences of the Fukushima Nuclear Accident" sponsored by the Helen Caldicott Foundation and Physicians for Social Responsibility at the New York Academy of Medicine. You can read a translation in German here.

I would like to express my thanks to Helen and the New York Academy of Medicine for organizing this timely event.

I'd also like to take this opportunity to express my appreciation to the many participants who have worked so hard to increase the public awareness of the risks of Fukushima. In the realm of nuclear power, science must be linked to political action. And so we are here today.

I have worked at the United Nations and other international organizations in London and New York for 40 years, and I have organized and attended many international conferences, starting with the UN Population Conference in Bucharest, Romania, in 1974. Over the years we've discussed in public and private what you might consider the defining issues of the 20th century: population, environment, social economic issues, disarmament, women, children, and democracy.

But we never discussed how one accident in a nuclear power plant could affect our lives for several hundred years, or how we lack a permanent nuclear waste repository, one that could store our spent fuel rods for one hundred thousand (100,000) years. Discussions of political systems and human rights now seem shortsighted when compared to a potential nuclear disaster that could affect our descendants for perhaps twenty thousand years. Twenty thousand years. Twenty thousand years ago humans were building tools in the Stone Age. Can you imagine?

Politics in Japan

I worry about the growing risk to children who are being continually exposed to radiation. Many of these children will suffer from infectious diseases, and many will develop thyroid, lung, or breast cancers sometime in their lives. According to Helen, over one million people have died of these diseases as a result of the Chernobyl accident. Others here have said that Fukushima so far has emitted more radiation than Chernobyl.

In my two visits to Japan last year, I asked the party leaders I met their thoughts on the unstable state of the reactors and the thyroid cancer risks in children. Few had any idea of the spent fuel rods, or of their high levels of radiation, or that they sat one hundred (100) feet up in a damaged structure. Fewer still were thinking about public health.

Undoubtedly, some politicians are aware of the potential catastrophe of Reactor 4. However, they showed their surprise when I told them that Reactor 4 has ten times more Cesium 137 than Chernobyl released, and 5000 times what the Hiroshima bomb released seven decades ago. They couldn't hide their shock when I told them that all of the spent fuel assemblies at Fukushima Daiichi contain 85 times more Cesium than Chernobyl, and 50,000 to 100,000 times what was released on Hiroshima. I thank Bob Alvarez for making these important calculations. I knew we had found the right message when we shared the article on our blog and it was read more than 1 million times in just a few days. These same political leaders wondered why they had heard none of this from TEPCO.

Last April Ambassador Murata and I met with Osamu Fujimura, who held the powerful position of Chief Cabinet Secretary. He assured us he would convey our message to Prime Minister Noda before he met with President Obama on April 30. Both leaders might have discussed Fukushima at their private meeting, but the idea for an independent assessment team and international help for the disaster were not mentioned publicly.

This was a mistake. The government's first responsibility is the security of its citizens. But instead of reaching out to independent scientists they only consulted TEPCO, focusing on minimizing the public relations fallout instead of the nuclear radiation fallout. In any country, governments and industry will keep sensitive information close after a disaster, but Japan's actions have been near autocratic.

Mixed Messages

Because of the government's unwillingness to share accurate information, Japanese citizens must rely on a scrutinizing press corps for any useful information about the accident. Unfortunately, as with the politicians, I found the journalists in Japan to be complacent and clueless. There is an amazing disconnect in Japan between the reality of Fukushima and the fictional image that the public has in mind. The press has failed in their job to close this gap. Japanese reporters, with several exceptions, have refused to investigate or ask the hard questions about Fukushima. The New York Times' Tokyo Bureau Chief, Martin

Fackler, provides a thorough look at the media's club mentality and aversion to investigation in his excellent book Credibility Lost: The Crisis in Japanese Newspaper Journalism after Fukushima.

To be sure, the government has not made their job easy. TEPCO says when and what information will be released, like when the site would open to the press and when the long video of the accident would be released. The accuracy of government medical reports is in question. But without anyone to ask those questions, the public is left behind a smokescreen, operating on half-truths.

The public has lost sight of the most urgent needs with regard to Fukushima. Its efforts to end nuclear power in Japan are inspiring but miss the mark; the protests are the result of fear, frustration, and uncertainty. Prime Minister Abe will guide Japan forward with a continuing dependence on nuclear energy. He will continue to restart Japan's nuclear reactors. Of all the politicians I spoke with, he was the least receptive to my message of the danger for the country's children or of Reactor 4's spent fuel rods. I feel sad that we must wait for the sacrifice of tens of thousands of children to come to light for the public to realize the disaster at hand.

I am surprised that one group has not taken forceful action. The spiritual roots of Japan sit firmly with respect for the natural environment. The Shinto and Buddhist influences in Japanese life have bestowed a sacred importance on the country's natural beauty and resources. Japan's environment has not known a bigger threat than that presented by the four damaged reactors at Fukushima. The country's spiritual leaders should be active in refocusing the country's concern toward the ongoing risks.

Are We Doing Enough?

We can see that Japan is ill-equipped to handle the ongoing problems of Fukushima. But this is more than a Japanese problem. It has and will affect all of us.

Are we doing enough?

For the past two years I have been warning of the potential catastrophe of Reactor 4 and the cancer crisis awaiting our children. There are four major areas of concern that could cause a bigger disaster:

1. In reactors 1, 2 and 3, complete core meltdowns have occurred. Japanese authorities have admitted the possibility that the fuel may have melted through the bottom of the reactor core vessels. It is speculated that this might lead to unintended criticality (resumption of the chain reaction) or a powerful steam explosion – either event could lead to major new releases of radioactivity into the environment.

2. Reactors 1 and 3 are sites of particularly intense radiation, making those areas unapproachable. As a result, reinforcement repairs have not yet been done since the Fukushima accident. The ability of these structures to withstand a strong aftershock earthquake is uncertain.
3. The temporary cooling pipes installed in each of the crippled reactors pass through rubble and debris. They are unprotected and highly vulnerable to damage. This could lead to a failure of some cooling systems, causing overheating of the fuel, further fuel damage with radioactive releases, additional hydrogen gas explosions, possibly even a zirconium fire and fuel melting within the spent fuel pools.
4. Reactor No. 4 building and its frame are seriously damaged. The spent fuel pool in Unit 4, with a total weight of 1,670 tons, is suspended 100 feet (30 meters) above ground. TEPCO plans to remove the spent fuel rods in the coming years, but if there is another massive earthquake nearby, this may not be fast enough. If this pool collapses or drains, the resulting blast of penetrating radiation will shut down the entire area.

These plants represent unprecedented international security risks. I view this as a problem for human civilization.

Have I been overestimating the potential catastrophe? Your calculations tell me there is a much higher probability of another disaster than one might think. So why are we allowing ourselves to take such a large risk – allowing our future to depend solely on chance and the goodwill of TEPCO and the Japanese government?

And if another earthquake and further meltdown are indeed possible at Fukushima, I must ask what so many Japanese leaders have asked me: why does the United States stand by silently?

It's in the United States interest to take public action to prevent future disasters. High quantities of radiation reaching the West Coast would ruin our food crops. The geopolitical tension that would arise after such a disaster and ensuing evacuation would strain already difficult relationships in East Asia. And, finally, we are vulnerable to similar threats at home: a similar disaster could happen in the U.S. or elsewhere in the world with a nuclear reactor or temporary spent-fuel storage facility.

There are more than four hundred (400) nuclear power plants online today, more than one hundred of which are in the United States. Several sit near fault lines. Others are old. And then there are the twenty four temporary spent-fuel storage facilities, holding rods like those suspended above Reactor 4. Many are only warehouses. Building a nuclear power plant might be rocket science, but maintaining the function of cooling system is not. Yet these systems are so delicate and prone to failure. As we've seen in the last months at Fukushima, something as simple as the corrosion of pipelines can set off a meltdown. It's time we regard nuclear power plants and storage facilities as security risks. Nuclear security is not an issue where the president should lead from behind.

Steps for International Action

In the case of a nuclear accident here or in any other country, you can be sure the government and nuclear power industry's reactions will mirror Japan's. They will control all information and access to the nuclear site, claiming national security concerns.

The right to keep information from the public after a disaster must be a privilege for the government, not an expectation. We need to establish now what level of access is necessary for scientists and reporters and what level of government discretion is necessary for national security. We need a framework for this agreement.

For now, this burden lies with the investigators. And we are not well organized. Even outside of a disaster scenario, there is no link between scientists and politicians – this is true here in the United States too! I was shocked to learn in the past two years how much trouble our top scientists have when contacting senators and congressmen. I didn't find this to be the case twenty years ago.

A continuous and open line of communication between independent scientists, engineers, journalists, and politicians is essential to handling another nuclear disaster effectively.

I would like to ask all of you to persuade your government to share with the Japanese government your concern with the potential catastrophe and its international security and health issues.

I conclude with three proposals for international action:

5. A fact finding mission to Fukushima made up of a select group of lawmakers from the United States, Russia, Ukraine, Germany, England, France and Canada;
6. A special program established by UNICEF and the WHO to take extra measures to save the children who are being continually exposed to radiation in coming decades;
7. A mechanism for nuclear scientists and medical doctors to collaborate and develop new technologies and medicines to treat the illnesses associated with radiation exposure.

When Prince Charles of England spoke last year at the Rio +20 Conference he said with regard to climate change, "It is, perhaps, a trait of human nature to act only when the worst happens, but that is not a trait we can afford to rely on here." He could have been speaking about Fukushima.

I again praise Helen and the New York Academy of Medicine for coordinating this event.
I thank you very much for your attention.

Separating power generation and distribution - But when ?

April 3, 2013

Pressure from industry and LDP waters down power reform proposal

http://mainichi.jp/english/english/newsselect/news/20130403p2a00m0na013000c.html

The Cabinet approved a proposal April 2 to drastically overhaul the country's power system. The reforms would include the splitting of major utilities' power generation and distribution into separate companies, and the complete liberalization of electricity supply to low-volume users such as private households.

While this would bring down regional monopolies of major utilities over household supply, and likely bring electricity prices down through increased competition, there is a deep-rooted wariness toward such change within the power industry and the ruling Liberal Democratic Party (LDP), casting a shadow on whether reform that puts consumers first will actually be realized.

Meanwhile, Economy, Trade and Industry Minister Toshimitsu Motegi emphasized the positive effects that could be anticipated from power reform at a press conference April 2. "Reform will expand the range of choices for consumers. Ultimately, it will lead to the lowering of electricity prices."

Also on April 2, Prime Minister Shinzo Abe ordered that "the reform policy be implemented swiftly, without omission," at the Headquarters for Japan's Economic Revitalization.

The proposed reforms will help establish an environment conducive to non-major power generation companies to enter the market, thereby encouraging competition that will lead to the streamlining of power company management and lowered electricity prices.

By demonstrating a commitment to reform through the announcement of plans to completely liberalize power retail and splitting off major utilities' distribution divisions, Abe hopes to maintain support for his administration while reviving the Japanese economy.

In particular, the separation of power generation and distribution is a main pillar of the proposed reforms that major power companies have long opposed.

Because companies newly entering the power generation business do not have the facilities to distribute electricity to customers, they borrow such networks from the major utilities that do. However, there is deep-rooted discontent with the arrangement among the newer power generators, who argue that prices for using transmission networks are high and the manner in which they are set murky, and also that the major utilities cite insufficient transmission volume as a reason to prevent the newer companies from using the networks to their satisfaction.

As such, the current system in which power generation and transmission are carried out by the same utilities has been viewed as an impediment to the emergence of new power companies. A senior official at the Ministry of Economy, Trade and Industry says that separating power generation and transmission will allow the use of transmission networks by new businesses, and "eliminate barriers to competition."

There is no guarantee, however, that the reforms will unfold smoothly. Objections to the separation of power generation and distribution erupted at a March 18 meeting of the LDP's Economy, Trade and Industry Division. Some participants took an adamant stand against such a move, while others argued that it was an obvious attempt to push through with reforms at a time when major utilities have been forced to raise prices and don't have much of a say.

The administration originally indicated in its proposal that the submission of related bills would take place in 2015, but was forced to revise the phrasing to say it will "aim to submit (related bills) in 2015." Additionally, at a subsequent General Council meeting, party members demanded that the government fulfill four conditions, including putting its utmost efforts into restarting the country's nuclear reactors and stabilizing the finances of Tokyo Electric Power Co., operator of the stricken Fukushima nuclear plant.

In the backdrop of this resistance is the political power amassed by major power companies who have built up close ties with regional economies through massive capital investments. These major utilities opposed past debates on liberalization by arguing that threats to their finances due to increased competition could pose problems for the stable supply of electricity. By controlling the networks necessary in bringing power from the generators to consumers, and agreeing to "liberalize" to new power companies on conditions favorable to themselves, they have kept competition to a minimum.

Indeed, the market share of new power companies supplying electricity to corporations and factories -- for which liberalization has already taken place -- is a mere 3.5 percent. Moreover, there has been little effort on the part of major utilities to win over the customers of their competitors. One insider admits that major utilities want to avoid competition, saying, "If certain customers got lower prices, other customers would demand the same, and there would be no end to it."

Regarding when power generation and distribution would be separated, Motegi denied the administration had backed down from its original intent by changing the phrasing in its proposal, saying, "It will take place seven years from now. Whether or not we say we will 'aim' to accomplish it then makes no difference."

According to a senior METI official, however, subtle changes in the proposal can have significant effects on the extent and timing of reform. "The administration has retreated to a level where, if the separation of generation and distribution is overturned later, no one can complain about it."

Restart Fukushima No.2?

April 6, 2013

Abe says restarting Fukushima No. 2 plant not easy

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304060031

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe said on April 5 that it would be "difficult" to restart the idled Fukushima No. 2 nuclear power plant, located about 12 kilometers south of the disaster-stricken Fukushima No. 1 plant.

"Even if safety is secured (in the No. 2 plant), it is difficult to restart its operations without the understandings of local residents. It is not easy with evacuees still unable to return to their hometowns," Abe said at a Lower House Budget Committee.

Fukushima Governor Yuhei Sato and the Fukushima prefectural assembly are demanding that all four reactors at the No. 2 plant be decommissioned.

However, Abe did not give a clear answer on whether the plant should be decommissioned, saying only that it is an issue for the plant's operator, Tokyo Electric Power Co., to decide.

Also at the budget meeting, Minister of Economy, Trade and Industry, Toshimitsu Motegi, said: "Safety (of the No. 2 plant) will be judged by the Nuclear Regulation Authority from a professional and independent standpoint. But, given the feelings of the people in Fukushima Prefecture, it is difficult to consider (the restart of the plant) in the same way as other nuclear power plants."

Meltdowns occurred at the Fukushima No. 1 nuclear power plant after power

Energy independence

April 6, 2013

News Navigator: What is energy independence?

http://mainichi.jp/english/english/perspectives/news/20130406p2a00m0na002000c.html

The Mainichi answers common questions readers may have about energy independence.

Question: What is energy independence?

Answer: Energy independence is when an area produces at least the amount of energy that is used in that district. It means producing heat and energy with that area's resources, and not importing crude oil, coal, gas or other resources from other areas or countries. In Japan, the wholesale electricity market was freed up in 1995, allowing local energy producers to sell electricity to power companies. Some rural municipalities that have noticed that energy production can be profitable have focused efforts there.

Q: Why rural areas?

A: Because unlike urban areas, rural districts have broad access to renewable energy resources like solar, wind and biomass. Since the Fukushima No. 1 Nuclear Power Plant disaster, the debate on energy diversification has gained strength. In July last year, in order to encourage the development of renewable energy, the national government began a system of buying energy produced by corporations, individuals and local municipalities at high prices. Many municipalities have begun aiming to join the market to gain from this system.

Q: Are areas stricken by the Great East Japan Earthquake also trying to get involved with renewable energy?

A: In Higashimatsushima, Miyagi Prefecture, where over 1,000 people died in the disaster, the city government is proceeding with a plan to install light-passing solar panels over rice paddy fields to allow both rice-growing and energy production at the same time, as well as plans to use wind power and wood biomass. The plans are hoped to help with economic recovery from the disaster. Municipalities in Fukushima Prefecture are also working on recovery plans that incorporate renewable energy.

Q: What results are the municipalities hoping for?

A: If rural areas can produce the electricity they use, they will no longer have to pay power companies for it. They also hope to create jobs involving power generation. It could help stem population loss and bring more economic activity to the area.

Q: Is energy independence in urban areas possible?

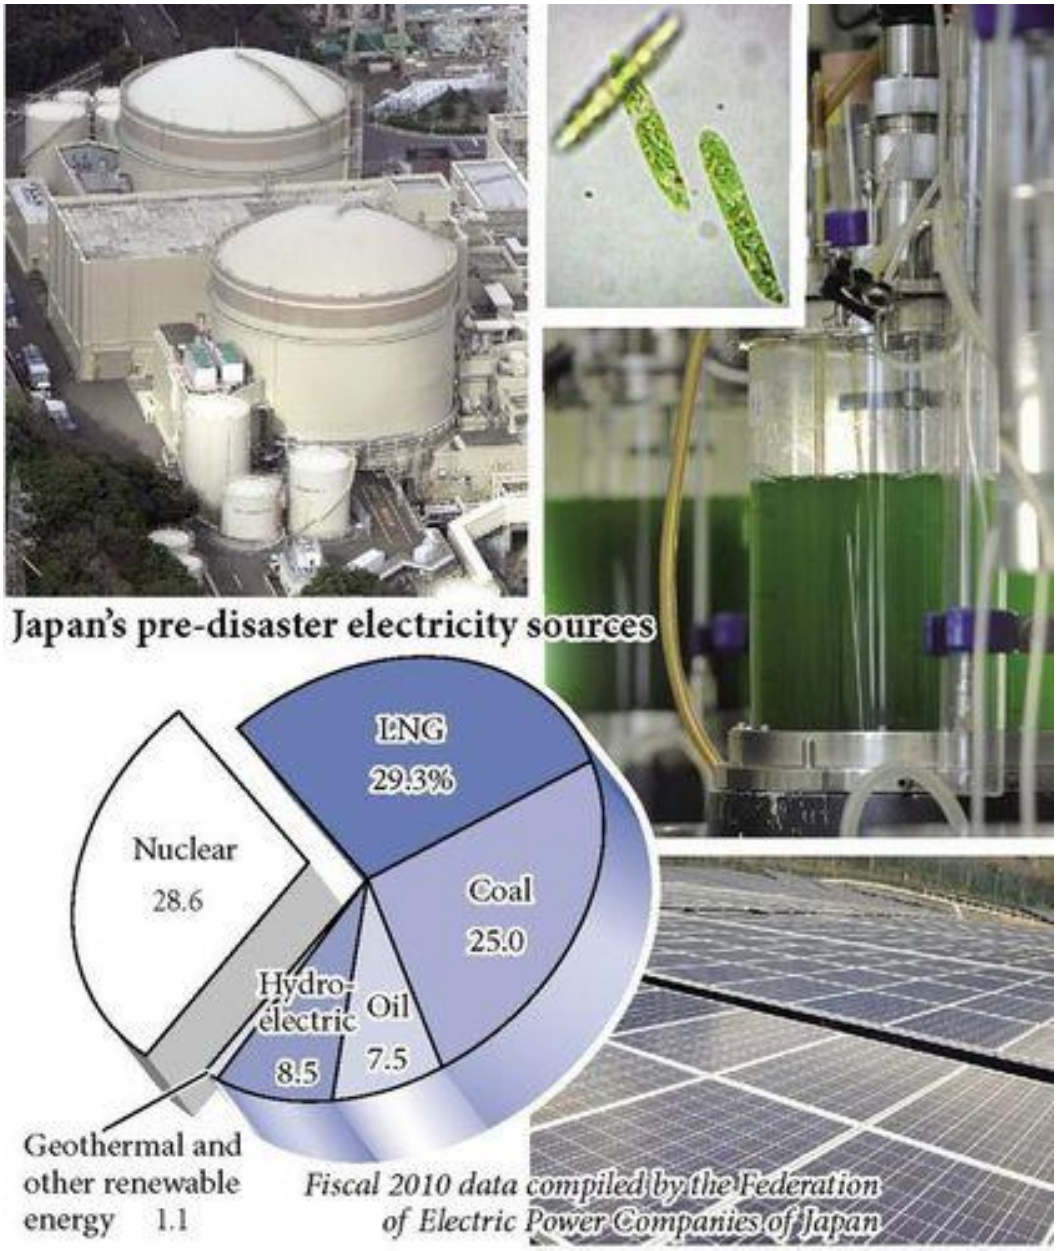
A: It would be difficult. Not all areas have populations and sizes well-suited to energy independence. For example, Chiyoda Ward in central Tokyo has only around 50,000 people at night, but due to the heavy presence of government buildings, offices and commercial structures, there are around 900,000 people there during the day. The energy needs of a major city are great and cannot be covered by renewable energy alone. (Answers by Seiya Tateyama, Business News Department)

Nukes are there to stay

April 8, 2013

Recharging Japan / Nuclear energy unlikely to be challenged anytime soon

http://the-japan-news.com/news/article/0000114862



The Yomiuri Shimbun

[Tetsuro Yamada and Koichi Yasuda / The Yomiuri Shimbun]

The following is the sixth installment of a series of articles exploring ways the nation's vitality can be increased.

Green water was slowly being mixed in experimental tanks on Okinawa Prefecture's Ishigakijima island.

What made the water green were euglena--single-celled microorganisms commonly found in puddles and ponds. Euglena are less than 0.1 millimeter long, but they photosynthesize extremely well in the strong sun on the island, doubling in number overnight.

The microorganism, cultivated on the island by Tokyo-based venture firm euglena Co., is in the spotlight for its versatility, as it can be used to make food, such as cookies, after being processed into powder. But some people are pinning their hope on the microorganism for a totally different reason--as a savior of Japan's energy supply. The oil extracted from euglena is very suitable as a biofuel.

However, large pools are required for mass production and, although it is technically possible to produce biofuel from euglena, it is unclear whether it is worth the cost.

As most of the nation's nuclear power plants remain idle following the crisis at the Fukushima No. 1 nuclear power plant, many people are talking about the future potential of various energy sources. There are growing public expectations for them, but it is unlikely they will suddenly become available.

Familiar examples are solar and wind power, which have proven unable to provide stable energy as they are dependent on weather conditions.

Before the Fukushima crisis, nuclear energy accounted for about 30 percent of the nation's electricity production. After the crisis, the country has become more dependent on thermal power to cover the loss of electricity produced by nuclear power. But importing more oil and natural gas for thermal energy production costs an additional 3 trillion yen annually. If this continues, it will be difficult to reduce the trade deficit, even if Japanese manufacturers and farmers become more competitive in the global market.

Japan faces a hard reality--to rejuvenate its economy, the nation has to use nuclear energy as well as fossil fuels, while seeking the best balance of energy sources.

"The longer nuclear power plants remain idle, the harder it becomes for us to maintain our technical know-how, and pass it on to future generations," said Takeharu Okano, general affairs chief at the Kitakyushu-based Okano Valve Mfg Co., a manufacturer of valves for nuclear power plants, which are able to withstand high temperatures and pressure.
Okano, 31, said orders for the inspection and maintenance of nuclear power plant valves have plummeted since the Fukushima disaster.

The Japan Atomic Industrial Forum hosts student job fairs every year. However, the number of companies taking part in February's fair dropped from 65 to 34 compared with before the Fukushima crisis. The number of students attending the fair also dropped sharply from 1,903 to 388.

If the nation's nuclear power plants remain shuttered, the nuclear industry will diminish rapidly along with people related to the industry, and eventually disappear. Can the nation confidently move in that direction?

"Experts are necessary to maintain nuclear power plants as well as decommission them. It's clear many countries, such as China, will continue building nuclear power plants," said Akihiro Sawa, executive senior fellow of the the 21st Century Public Policy Institute.

Sawa added, "It's unthinkable our country will abandon its nuclear power technologies and the personnel working in the field."

Peaceful use of atom to put the breaks on proliferation?

April 8, 2013

LDP secretary-general cites Japan's role as a non-nuclear model despite limitations

http://mainichi.jp/english/english/newsselect/news/20130408p2a00m0na015000c.html

Shortly after the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant in 2011, Shigeru Ishiba launched a special committee on overall energy policy as chairman of the then opposition Liberal Democratic Party's (LDP) Policy Research Council. The Mainichi Shimbun recently interviewed Ishiba, now LDP secretary-general, about a review of Japan's nuclear power policy.

Question: There was an impression that the special committee ended its mission without producing a final report.

Answer: Hmm, I don't think so. It may be that there was not enough time or the task got complicated as it approached a final phase. But at least it was a big step forward, considering the fact that we had previously avoided the issue.

Q: How do you see the LDP's responsibility?

A: There is no doubt that we promoted nuclear power plants. Nuclear power engineers have never said that nuclear power is totally safe, but I doubt if politicians shared that view. There are many things that we can reflect on. What are we going to do if a plane crashes into a nuclear power plant or a terrorist

attack occurs against one? I did not fully think about those possibilities while I was defense agency director general and defense minister. **When it comes to nuclear power, we should not say, "Beyond the scope of assumption," but should consider every possibility.**

Q: Is there any change in your views from immediately after the outbreak of the nuclear disaster and now?

A: There is no change. We are not in a position to activate nuclear power plants at any cost at all. We will reactivate nuclear power plants if they meet high-level safety standards and local residents develop a sense of safety.

Q: Is nuclear power necessary from a standpoint of potential nuclear deterrence?

A: Our logic is not that Japan should have nuclear power plants as a potential nuclear deterrence. We think nuclear power is important as a form of self-sufficient energy. Nuclear energy and the military are two sides of the same coin. I think there is no choice for Japan to be the only country without that option. By showing our deep insight that nuclear power can be used for peaceful means it may put the brakes on the proliferation of nuclear arms.

The Japanese government's view is that possessing nuclear weapons is not banned under the Constitution. I do not totally reject debate on the issue of Japan having nuclear arms, but I do not necessarily agree with such debate. If Japan has nuclear weapons, North Korea can have them and South Korea can have them, leading to a collapse of the Nuclear Non-proliferation Treaty (NPT). But the prospect that Japan is capable of possessing nuclear weapons is significant. Japan plays a key role in the world by demonstrating the fact that it can have nuclear weapons if it wants to but chooses not to possess such weapons. Japan cannot play such a role if we halt the nuclear power policy.

Q: Is a nuclear fuel cycle necessary? It does involve a considerable amount of plutonium.

A: Yes, it's necessary. Existing plutonium cannot be converted to nuclear weapons all of a sudden. Proper technology is necessary to downsize it for use on missiles. Japan has put in place a system to accept inspections (of the International Atomic Energy Agency) to the fullest extent possible, and if we maintain our current cooperation, there is no reason to harbor doubts about Japan.

Japan should promote nuclear disarmament

April 8, 2013
Japan should take leadership role on nuclear disarmament
http://mainichi.jp/english/english/perspectives/news/20130408p2a00m0na001000c.html

The Non-Proliferation and Disarmament Initiative (NPDI), which is comprised of 10 non-nuclear powers, including Japan, Australia and Germany, is set to hold a foreign ministerial conference in The Hague on April 9.

As the only country that has been bombed by atomic weapons, Japan has pursued the elimination of nuclear arms while relying on the U.S. nuclear umbrella. Because of such a dilemma, Japan has taken a pragmatic policy line of seeking to gradually reduce nuclear weapons. The NPDI is also characterized by its realistic approach.

Currently, there are approximately 20,000 nuclear weapons in the world. The Nuclear Non-Proliferation Treaty (NPT), which came into force in 1970, recognizes only five countries -- the United States, Russia, Britain, France and China -- as the sole nuclear powers, and aims to prevent the proliferation of such arms to other countries. About 190 countries have ratified the pact. Although it is a biased treaty, the NPT obligates the nuclear powers to reduce their nuclear arms. In the NPT regime, however, there is a wide gap between the five nuclear powers and members of the Non-Aligned Movement (NAM), which are demanding that nuclear powers set a clear deadline for arms reductions.

As such, the NPDI was set up in September 2010 on the initiative of Japan and Australia as a coordinator between the nuclear powers and the NAM. It has held a foreign ministerial meeting twice a year, and Hiroshima is scheduled to host one in the spring of next year.

At the April 9 meeting in The Hague, the foreign ministers of the 10 members of the NPDI are expected to draw up six working documents in preparation for the NPT Review Conference in 2015. The documents include one calling on the Comprehensive Nuclear Test Ban Treaty to come into force at an early date, one calling for the reduction of nonstrategic nuclear arms and another on how to reduce the role of nuclear weapons.

Such an approach has been criticized by some as being too lukewarm. However, the NPDI has been making strenuous demands that nuclear powers take effective measures to ensure the transparency of nuclear weapons despite the deadlock over nuclear arms reductions resulting from the conflict between nuclear powers and the NAM. The NPDI's approach should be appreciated.

However, questions remain about the Japanese government's nuclear disarmament diplomacy. Tokyo chose not to sign a statement calling for efforts to outlaw nuclear weapons, which 34 countries including

Norway and Switzerland jointly submitted to the U.N. General Assembly's First Committee on arms reductions in October last year. As to the reason, the government explained that Japan cannot say that nuclear arms are illegal since it relies on the U.S. nuclear deterrence. However, is this really the reason?

It is true that the security environment in East Asia is becoming increasingly serious as North Korea has recently test-fired a long-range ballistic missile and carried out a nuclear test and China is apparently stepping up its military buildup. Still, Japan's refusal to support even a statement that does not set any deadline and only calls for efforts to outlaw nuclear arms highlights its extremely passive stance toward nuclear disarmament.

Japan should promote flexible but tough nuclear disarmament diplomacy in which it takes the lead in efforts to achieve the ideal of nuclear disarmament while taking a pragmatic policy line. (By Chiyako Sato, Editorial Writer)

Policies should take people's opinion into account

April 10, 2013

LDP Fukushima chapter at odds with headquarters over nuclear policy

http://mainichi.jp/english/english/newsselect/news/20130410p2a00m0na013000c.html

FUKUSHIMA -- The Fukushima prefectural chapter of the ruling Liberal Democratic Party (LDP) remains at odds with LDP headquarters headed by Prime Minister Shinzo Abe over whether to scrap all of the 10 nuclear reactors in the prefecture.

At its regular convention in June 2011, the LDP Fukushima prefectural chapter endorsed its position "not to promote a nuclear power policy." At the LDP national conference of regional secretaries general and policy chiefs on Nov. 22, 2012 -- ahead of the start of official campaigning for the House of Representatives election -- the Fukushima prefectural chapter vowed to put a policy of "abandoning nuclear power generation and decommissioning all of the 10 nuclear reactors" at the top of its campaign platform for the general election. The LDP headquarters then approved of it.

Behind the prefectural chapter's move were bitter experiences top executives of the LDP Fukushima prefectural chapter experienced in the wake of the Fukushima nuclear disaster. When an explosion occurred at the No. 3 reactor at the Fukushima No. 1 Nuclear Power Plant on March 14, 2011, Kenji Saito, chairman of the Fukushima Prefectural Assembly, along with his colleagues, delivered relief supplies to the local chapter's Tsushima branch in Namie, about 28 kilometers from the troubled nuclear power complex. Residents there were taking shelter with just the clothes on their back, and Saito himself was in a

business suit. But Self-Defense Force (SDF) personnel standing by in more than 10 SDF vehicles were fully equipped with protective attire, masks and goggles against the threat of radiation.

Saito, 69, recalled his close friend and Namie Mayor Tamotsu Baba, 64, saying suspiciously at the time, "They have been dressed like that since they got here." It turned out later that the Tsushima district was in fact contaminated with high concentrations of radioactive materials. Saito, who had promoted nuclear power generation in the past, regrets the enormous trouble caused to the people of the prefecture and vows never to let anyone to build nuclear reactors again.

Meanwhile, Prime Minister Abe, 58, plans to re-examine the main opposition Democratic Party of Japan (DPJ)'s policy of phasing out the country's nuclear reactors by the 2030s. Goji Sakamoto, 68, who made a comeback as a lower house legislator after winning the December general election, said, "The prefectural chapter will draw up policies based on the actual circumstances of Fukushima. Because the people of the prefecture are in favor of abandoning nuclear power generation, it is natural that the prefectural chapter should come up with a policy of abandoning nuclear power generation."

Nonetheless, the central government has not made any decision on whether to decommission the Fukushima No. 2 Nuclear Power Plant or reactivate it, leaving the possibility of further controversy.

Acknowledging that he had not had in-depth discussions with LDP headquarters on the issue, Takao Hiraide, 56, secretary-general of the LDP Fukushima prefectural chapter and a Fukushima Prefectural Assembly member, voiced hope that the LDP headquarters will fall in line with the local chapter. "Naturally, I am convinced that Prime Minister Abe and Secretary General (Shigeru) Ishiba fully recognize the prefectural chapter's policy," he said.

Japan's nukes utilisation "negligible" in 2012

April 13, 2013

Nuke plant utilization rate fell to 3.9% in 2012

JIJI

http://www.japantimes.co.jp/news/2013/04/13/business/nuke-plant-utilization-rate-fell-to-3-9-in-2012/#.UWhWYUpsFEs

The utilization rate of nuclear power plants plunged another 19.8 percentage points in fiscal 2012 to a negligible 3.9 percent from the year before, setting a record low for the second straight year, industry data showed Friday.

It was the first time the annual rate has dipped below 10 percent since the commercial use of atomic reactors began in fiscal 1966, the Federation of Electric Power Companies of Japan reported.

The slide reflected the suspension of all but two reactors in view of the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 plant.

Of the country's 50 remaining reactors, all of which were taken offline following the Fukushima disaster, the only two approved for restarts are reactors 3 and 4 at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture. The two units were reactivated last July amid vehement public opposition.

The Nuclear Regulation Authority, the newly established industry watchdog, plans to start conducting checks on idled reactors to determine whether to permit them to resume operations once new safety standards take effect in July. Most units, however, are expected to remain offline for the time being.

The federation said the amount of electricity the nation's 10 major power companies generated and purchased from wholesalers in fiscal 2012, which ended March 31, fell 1.5 percent year-on-year to 923.6 billion kwh.

The figure dropped for the second year in a row thanks to power-saving efforts by households and businesses, as well as declining demand for industrial use.

While the amount of energy generated by nuclear plants nose-dived a staggering 84.2 percent to 15.9 billion kwh, the amount churned out by thermal power stations surged 9.2 percent to 666.7 billion kwh.

Among regional utilities, Tepco saw its electricity volume rise 3.0 percent, following a sharp fall the previous year because the 2011 Great East Japan Earthquake and tsunami knocked out its Fukushima No. 1 plant.

Separately Friday, the Environment Ministry said Japan's greenhouse gas emissions in fiscal 2011, which ran through March 2012, climbed 4.0 percent from the previous year to 1.308 billion tons of carbon dioxide. The rise mainly reflected the switch to thermal power generation while nuclear reactors were gradually shut down after the Fukushima meltdowns.

Compared to fiscal 1990, the base year for global emissions reduction efforts under the Kyoto Protocol, harmful gases in fiscal 2011 rose 3.7 percent. But after taking into account the absorption of carbon dioxide by forests and emission rights purchased abroad, the figure was down 4.0 percent from the base year, the ministry said.

According to the Kyoto Protocol, Japan must cut its annual emissions by 6 percent on average from the fiscal 1990 level during the fiscal 2008-2012 period. The ministry said that annual average emissions between the 2008 and 2011 fiscal years decreased some 9.2 percent from the base year.

At a news conference, Environment Minister Nobuteru Ishihara confidently told reporters that Japan is certain to achieve its numerical target.

Workers at Japan Steel on reduced hours

April 15, 2013
Source : Bloomberg
http://www.bloomberg.com/news/2013-04-15/japan-steel-works-falls-as-employees-take-time-off-tokyo-mover.html

Japan Steel Works Falls as Employees Take Time Off: Tokyo Mover

By *Masumi Suga - Apr 15, 2013 6:18 AM GMT+0200*

Japan Steel Works Ltd. (5631), a nuclear parts supplier for customers including Areva SA (AREVA), fell the most in two months in Tokyo trading after the Nikkei reported that workers at a plant will take time off as orders decline.

Shares slumped 5.6 percent to 489 yen as at 1:13 p.m. local time, set for the biggest drop since Feb. 5. Japan Steel Works was the biggest decliner among stocks listed on the Nikkei 225 (NKY) Stock Average.

About 500 workers, or 70 percent of the total workforce at the Muroran plant on Japan's northern island of Hokkaido, have accepted a proposal by the company to take about two days off a month for the six months starting mid April, spokesman Akito Aiuchi said today by telephone, confirming the Nikkei newspaper's report on April 13.

"The company's nuclear business in Japan will be tough for a while," Masayuki Otani, a Tokyo-based strategist at Securities Japan Inc., said by phone.

Japan Steel operates the only plant in the world capable of producing the central part of a nuclear reactor's containment vessel in a single piece, reducing the risk of a radiation leak. The Tokyo-based company has removed aged facilities and relocated some of its workers at the Muroran plant since the Fukushima disaster, President Ikuo Sato said March 13 in an interview.

A decision on whether to extend the time off plan beyond October will be made later by monitoring demand, Aiuchi said.

A (nuclear) deal here...

May 3, 2013
Abe signs nuclear energy agreement with UAE

http://ajw.asahi.com/article/economy/business/AJ201305030045

By TAKUYA SUZUKI/ Staff Writer

ABU DHABI, United Arab Emirates--Prime Minister Shinzo Abe has signed Japan's first nuclear energy agreement since the Fukushima catastrophe two years ago.

Abe signed the accord May 2 in Dubai with UAE Vice President Mohammed bin Rashid al-Maktoum.

"The Middle East is seeking nuclear energy as a new energy source. We want to provide Japan's safe and advanced nuclear energy technology," Abe said.

The two leaders also issued a joint statement calling for stronger bilateral relations over a wide range of topics, including politics and economics.

The UAE has plans to construct 12 reactors, and the Japanese government hopes the agreement will enable Japanese companies to win contracts for their construction.

Abe also told Mohammed, "We want to contribute toward stability in the Middle East in the form of renewable energy sources and energy conservation."

He then proposed holding strategic talks at the ministerial level between Japan and the six members of the Gulf Cooperation Council, including the UAE and Saudi Arabia. The UAE vice president agreed to the proposal.

The two leaders also agreed to begin preliminary discussions toward concluding an investment agreement between the two nations, and signed 12 documents related to such fields as medicine, education and culture involving both Japanese and UAE companies and organizations.

Japan, UAE sign nuclear agreement during PM Abe's visit

http://mainichi.jp/english/english/newsselect/news/20130503p2g00m0dm009000c.html

ABU DHABI (Kyodo) -- Japan and the United Arab Emirates signed a civil nuclear agreement Thursday during Prime Minister Shinzo Abe's visit to the oil-rich country, setting the stage for more sales of Japanese atomic technologies overseas.

It was the first bilateral nuclear agreement signed by Japan since the 2011 Fukushima nuclear crisis triggered by the devastating earthquake and tsunami.

"There are high expectations that Japan has a considerably high level of safety standards" after having experienced the Fukushima disaster, Abe told reporters in Abu Dhabi. "I want to provide Japan's safe and high-standard nuclear technologies."

Although the signing of the agreement was welcomed by the related industries, some critics said it is still premature to export Japan's nuclear technologies when the full facts of the Fukushima disaster are yet to be determined.

Among other issues, the two countries also agreed to enhance cooperation on the development of oil fields, maritime security and medical care, according to a joint statement issued after talks between Abe and United Arab Emirates Vice President and Prime Minister Sheikh Mohammed bin Rashid Al Maktoum in Dubai.

The two leaders discussed energy security at a time when Japan is hoping that the United Arab Emirates will continue to provide stable supplies of oil to the resource-poor country. A large portion of Japanese companies' oil rights in the United Arab Emirates expire after 2018.

Japan is eager to import energy resources at lower cost as most of its nuclear reactors remain offline, and demand for oil and liquefied natural gas has been growing for thermal power generation.

The signing of the pact took place amid efforts by Abe, who returned to the premiership last December, to generate economic growth by promoting exports of nuclear power technologies and other infrastructure systems.

Japan is also expected to sign a nuclear agreement on Friday with Turkey, the final leg of Abe's four-nation trip that also took him to Russia and Saudi Arabia.

In Saudi Arabia, Abe agreed with Crown Prince Salman bin Abdulaziz Al Saud to commence talks aimed at starting negotiations on a similar bilateral nuclear accord.

Prior to the latest signing, Japan had inked nuclear agreements with 11 countries, including the United States and Britain, as well as the European Atomic Community.
During his meeting the United Arab Emirates vice president, Abe requested the easing of import restrictions on Japanese food products that were imposed after the Fukushima disaster due to radiation concerns, according to a Japanese government official.
The vice president said in response that he would consider further easing of the restrictions as delicious Japanese foods are popular in Dubai, the official said.
Japan and the United Arab Emirates also signed a tax treaty as part of their efforts to facilitate mutual investment and economic exchanges.

May 2, 2013

Japan, UAE sign nuclear deal
http://www3.nhk.or.jp/nhkworld/english/news/20130502_35.html

Japan has concluded a deal with the United Arab Emirates to transfer nuclear power technology - its first since the Fukushima nuclear accident in 2011.

Japanese Prime Minister Shinzo Abe is visiting the Persian Gulf state on the third leg of a weeklong overseas trip.

After visiting a railway that Japanese companies helped build, Abe met UAE Vice President and Prime Minister Sheikh Mohammed bin Rashid Al Maktoum on Thursday.

Abe conveyed Japan's plan to hold ministerial-level strategic talks on a regular basis with 6 Gulf Arab states, known as the Gulf Cooperation Council. He also called for the start of working-level discussions with the UAE toward an investment agreement.

Abe said Japan can contribute to the country's energy supply. He pledged technology in the fields of energy conservation, renewables and nuclear power.

Mohammed replied the UAE wants to work with Japan in various fields and serve as a gateway to the Middle East and North Africa.

The 2 leaders concluded a nuclear deal, and agreed to promote bilateral investments and economic exchanges. They later attended the signing ceremony

A (nuclear) deal there

Japan, Turkey clinch nuclear energy deal

Kyodo
http://www.japantimes.co.jp/news/2013/05/04/national/japan-turkey-clinch-nuclear-energy-deal/#.UYPoYEpsFEs

ANKARA – Japan and Turkey reached a civil nuclear cooperation agreement Friday that will allow Japanese companies to export atomic power generation technology to the fast-growing nation.

The agreement was agreed on during Prime Minister Shinzo Abe's trip to Turkey, the last leg of a weeklong trip that also took him to Russia, Saudi Arabia and the United Arab Emirates.

On Thursday, Japan signed a nuclear cooperation pact with the United Arab Emirates, the first accord signed by Tokyo since the Fukushima nuclear meltdowns in March 2011.

In Saudi Arabia, Abe agreed with Crown Prince Salman bin Abdulaziz Al Saud to commence working-level talks aimed at starting negotiations on a bilateral nuclear accord.

Abe is eager to sell nuclear power technology despite the Fukushima nuclear crisis, which was declared "a man-made disaster," to boost economic growth.

The core meltdowns at the Fukushima No. 1 plant were triggered by a massive offshore quake that spawned giant tsunami which knocked out all power and cooling systems at the old and poorly protected plant.

Nuclear deterrence, did you say?

May 3, 2013
U.S. diplomat to visit Japan to discuss nuclear deterrence

http://mainichi.jp/english/english/newsselect/news/20130503p2g00m0dm046000c.html

WASHINGTON (Kyodo) -- A senior U.S. official will make a three-day visit to Japan from Monday to discuss nuclear deterrence, missile defense cooperation, and arms control and nonproliferation issues with officials of Japan's foreign and defense ministries, the State Department said Thursday.

On Tuesday, Rose Gottemoeller, acting undersecretary of state for arms control and international security, is scheduled to exchange views with experts and academics at a nuclear policy roundtable discussion hosted by the U.S. Embassy in Tokyo.

Following her trip to Tokyo, Gottemoeller will visit Seoul for two days from next Thursday to discuss nuclear deterrence and missile defense cooperation with South Korean officials, the department said.

Japan desperate for any kind of fuel

May 4, 2013

Japan's trade chief seeks foreign energy sources
http://www3.nhk.or.jp/nhkworld/english/news/20130505_03.html

Japan's energy situation is leading its trade minister to try to secure new sources of fuel.

Japan's liquefied natural gas imports have increased sharply since the nuclear accident in Fukushima two years ago. The surge is a major factor in the country's trade deficit.

Economy, Trade and Industry Minister Toshimitsu Motegi is visiting South America and the United States.

In his speech in Washington, he said he believes that the US government will soon approve exports of shale gas to Japan.

The US government restricts shale gas exports to countries that have not signed a free trade agreement with the nation.

During his visits to Colombia and Brazil, Motegi agreed with energy officials in the 2 countries to strengthen cooperation in energy sectors.

But he noticed that the South American countries lack the robust infrastructure to export oil and other energy resources to Asia.

Japan is competing with emerging economies where energy demand continues to expand.

The Economist on Japan's nuclear future

April 20, 2013

Japan's nuclear future

Don't look now

A series of mishaps comes at an awkward time for the government

Apr 20th 2013 | TOKYO |From the print edition

http://www.economist.com/news/asia/21576450-series-mishaps-comes-awkward-time-government-dont-look-now

FOR a few days last year it looked as if Japan would phase out nuclear energy entirely. After an earthquake and tsunami created a creeping nuclear catastrophe two years ago the Democratic Party of Japan (DPJ) said it would get the country out of nuclear energy by 2040. Although it quickly backtracked, almost all of Japan's 50 commercial reactors are still lying idle.

In February this year, Shinzo Abe, leader of the then incoming Liberal Democratic Party (LDP), said the new government would restart reactors after they passed a forthcoming set of new safety tests. The country's "nuclear village", a cosy bunch from industry and government, cheered. But now the stricken Fukushima Dai-ichi plant is starting to alarm the public once more. On April 15th the International Atomic Energy Agency (IAEA), a UN body, flew in to investigate a series of dangerous incidents.

A power outage in March left four underground pools that store thousands of the plant's nuclear fuel rods without fresh cooling water for several hours. A rat, it later emerged, had gnawed through a cable. Workmen laying down rat-proof netting caused another outage. Then this month regulators discovered that thousands of gallons of radioactive water had seeped into the ground; the plant's operator had installed a jerry-rigged system of plastic sheeting, which sprang leaks. The quantity of contaminated water has become a crisis in its own right, the manager has admitted. And now the pipes used to transfer water to safer storage containers are leaking too.

All this will further darken the public's view of nuclear power, says Hideyuki Ban, secretary general of the Citizens' Nuclear Information Centre in Tokyo, an anti-nuclear group, "because it looks like still more bungling". That is no mean feat.

Experts who examined the causes of the 2011 catastrophe reckon the LDP has paid too little attention to what went wrong. Kiyoshi Kurokawa, the chairman of a parliamentary investigation, says the country may be moving "too hastily back towards nuclear power, without fully regaining the trust of the Japanese public and the international community". Yoichi Funabashi, a former editor of *Asahi Shimbun* newspaper who headed a private-sector investigation, says it is unfortunate that the 2012 election, which brought the LDP back to office, did not include a proper debate about the future of nuclear energy.

Now the set of policies known as "Abenomics" is making a return to nuclear power ever more pressing. The LDP is expected to push hard to restart plants if it wins a crucial election for the upper house of parliament this summer. Mr Abe's focus on the economy has given greater say to the voice of business, including the big utilities whose plants are idle. Smaller firms clamour for cheaper power too.

Japan's broader economic future may be at stake. The trade deficit widened to 8.2 trillion yen ($83 billion) for the fiscal year 2012, nearly double the gap of 4.4 trillion yen in 2011, after decades of surplus. This leads to worries about the overall current-account balance; its deterioration could affect Japan's ability to keep funding its huge public debt domestically. A big cause is the cost of energy imported to fill the gap left by nuclear power. A weaker yen, the result of the central bank's radical loosening of monetary

policy, is further pushing up the price of imported oil and gas. “Of course the public would prefer to get rid of nuclear power, if it were economically possible,” says Toichi Tsutomu, an adviser to the Institute of Energy Economics Japan, “but people are realistic.”

Realistic or not, the public is still afraid of nuclear power. A nationwide poll in February found that around 70% of respondents wanted either to phase out all the plants, or to shut them down immediately. Opposition is likely to be strongest at the local level, as regions move to switch their reactors back on. This week an Osaka court ruled on a suit brought by local residents to have Japan’s only two operating reactors, at the Oi plant in Fukui prefecture, shut down. They lost, but their suit looks like only the first of many battles.

Abe's economic diplomacy

May 4, 2013

Abe pushes nuclear power, medical services in Middle East

http://ajw.asahi.com/article/behind_news/politics/AJ201305040051

THE ASAHI SHIMBUN

ANKARA—Prime Minister Shinzo Abe on May 3 wrapped up a four-nation tour highlighted by achievements in economic diplomacy, particularly in nuclear power and medical services.

“Japan has launched a full-fledged economic diplomacy,” Abe told a news conference in Ankara. “I will take the lead in helping (businesses) in a wide range of sectors expand abroad and drive Japan’s growth strategy.”

Leading a delegation of industry executives, the prime minister visited Saudi Arabia, the United Arab Emirates and Turkey from April 30 to May 3, following a trip to Russia.

Abe and Turkish Prime Minister Recep Tayyip Erdogan on May 3 signed a joint declaration that awards Japan exclusive negotiating rights on a new nuclear power plant in Turkey.

The plant in Sinop on the Black Sea will be built by a consortium led by Mitsubishi Heavy Industries Ltd. It will be Japan’s first export of a nuclear plant since the Fukushima nuclear disaster in 2011.

"Japan must be able to create perfect synergies with Turkey," a talkative Abe told a meeting of 250 Japanese and Turkish businesspeople in Ankara. "Nuclear plants are a prime example."

In the joint declaration, Abe and Erdogan confirmed that the two countries will conclude a nuclear energy agreement, a precondition for exporting nuclear-related technologies.

Energy issues were also high on Abe's agenda in other countries, including Russia, which Abe visited April 28-30.

Abe confirmed cooperation not only in oil development and supply but also in nuclear power with Saudi Arabia and the UAE, key oil and gas exporters for Japan.

"We can provide the world's safest nuclear technology as well as technologies on renewable energy," Abe said. "We also want to contribute to increasing energy supply capacity."

Japan signed a nuclear energy agreement with the UAE, the first since the Fukushima nuclear disaster. Japan hopes the accord will help Japanese companies secure a contract for the 12 new nuclear reactors planned by the UAE.

In 2009, South Korea edged out Japan in winning a contract for four reactors in the UAE under the initiative of President Lee Myung-bak.

Abe and Saudi Arabian Crown Prince Salman bin Abdulaziz also agreed to start working-level discussions on a nuclear energy agreement. Saudi Arabia plans 16 new nuclear reactors.

The medical sector was another target of Abe's economic diplomacy.

Japan agreed to expand cooperation with the UAE in dispatching doctors, exporting advanced medical equipment and opening a medical center that offers particle radiotherapy for cancer patients.

Abe also agreed to promote technological cooperation in medical services with Saudi Arabia.

Exports of medical technologies and nuclear power will form pillars of the growth strategy that Abe's administration will formulate in June.

Japan has been running an annual deficit of nearly 3 trillion yen ($30 billion) in the trade of medical equipment and medicine due to strict safety regulations and time-consuming screening procedures.

The government in January revived the regulatory reform council, which was abolished under the previous Democratic Party of Japan administration, and listed the medical sector as one of the priority areas.

Takao Yamada : Japanese nuke exports feel like "double-dealing"

May 6, 2013

Japan losing its moral compass with nuclear reactor exports

http://mainichi.jp/english/english/perspectives/news/20130506p2a00m0na002000c.html

For Japan to export nuclear technology is very strange indeed. The Fukushima No. 1 nuclear plant remains unstable more than two years after the March 2011 triple meltdown there, and the country's broader nuclear energy system is still incomplete. In fact, it is deficiencies in Japan's nuclear plants that have stalled reactor restarts.

And yet, we are about to sell our reactors to foreign nations.

Some people might say that if it's fine with the other country and it helps Japan, then why not sell them? I cannot agree. The virtuous thing to do would be to learn from our own experiences and consider the safety of Japan's friends, but the government's way of thinking does away with virtue. We must not become a rich but amoral nation.

The Fukushima nuclear disaster revealed that experts have no power when slotted into small pockets of a sprawling system. This society, which is so accustomed to peace and prosperity, exposes its weakness by failing to get to the root of a problem when push comes to shove. We saw prideful conceit and wishful thinking -- namely that our anxieties will all be solved by technological advancement -- pass unquestioned.

Over this Golden Week holiday, I finally finished reading Yoichi Funabashi's **"Countdown to Meltdown**." The two-volume work, which won the Oya Soichi Nonfiction Award in April, uses witness accounts to illustrate the deep cracks in postwar Japanese society, glimpses of which the public caught just after the Fukushima nuclear crisis began.

Funabashi is the former editor-in-chief of the Asahi Shimbun daily, and his reporting skills enjoy a very high reputation. What left the greatest impression as I read was how many of the people recruited to help clean up the nuclear mess saw the crisis as **a "lost war**." They spoke of the parallels between military history and their own experiences at Fukushima, and furthermore revealed that the causes of that "defeat" had yet to be remedied.

One of Funabashi's sources was responsible for trying to restore power to the stricken Fukushima plant in the disaster's opening phase, and had to dispatch workers to a high radiation area to do the work.

"I felt like I was sending men out on a kamikaze mission, except they would have no Zero fighter plane or even any fuel," the source told Funabashi.

Another source was a senior government official who watched in astonishment as the management of plant operator Tokyo Electric Power Co. (TEPCO) failed to respond to cries for help from those on site. It was like "Guadalcanal," the official said, referring to the long and bloody battle for that Pacific island that ended in catastrophic defeat for the Imperial Japanese Army in 1943.

According to the book, it was TEPCO's older engineers, some even retired, who stepped to the fore in the crisis. The younger staff members were uncomfortable with going beyond standard procedure, according to one technocrat's observations. This calls to mind how the loss of a veteran presence eventually destabilized the Imperial Japanese Army in the years after the Russo-Japanese War of 1904-05.

The Japanese government maintains something called the System for Prediction of Environmental Emergency Dose Information (SPEEDI), designed to forecast the spread of radioactive materials after a nuclear disaster. After the meltdowns, however, the government hid the SPEEDI data, worried that releasing the information would cause chaos. One marine meteorologist, referring to Tokyo Gov. Naoki Inose's book "Showa 16-nen Natsu no Haisen" (Japan's defeat in the summer of 1941), lamented that ignoring vital information had become a tradition.

In the spring of 1941, before Japan's attack on Pearl Harbor, the Cabinet of Prince Fumimaro Konoe asked some young, top-flight minds in government and the private sector to run a simulation of a wider Pacific war. The elite analysis group concluded that "Japan, with the advantage of surprise, will be victorious in the early stages. However, the war will go on and, as the Soviet Union will join the fight against us, Japan is certain to lose. We recommend avoiding war."
Then Army Minister Hideki Tojo, however, was having none of it.

"Gentlemen, I thank you for all your diligent research. Your conclusions, however, are mere armchair theory, and show that you do not appear to be thinking of the realities of war. In fact, no one thought Japan could win the Russo-Japanese War, but we did," Tojo stated, and he ignored the report.

Similar episodes since then have illustrated how helpless postwar Japan is, despite the country's emergence as a solid economic power built on a foundation of uninterrupted peace. The Fukushima disaster has made it clear that building nuclear reactors in Japan is to invite into our country a danger on par with war.

What's more, we have not rid ourselves of this danger. The government changed at the end of 2012, but plant operator TEPCO -- described by the safety chief at the Nuclear Safety Commission as "having a corporate culture in which it does things it's told to do only because it has no choice," and being "optimistic and inward-focused" -- is the same as ever.

I finished Funabashi's book and turned on the TV, and was greeted by the image of Prime Minister Shinzo Abe. He was in Turkey, announcing Japan had been given preferential negotiating rights for nuclear reactor exports to that country.
"We will share the lessons we've learned from the (Fukushima) disaster with the world," Abe was saying. So what is the greatest lesson we've learned from the Fukushima crisis? In my mind, it's that nuclear power has two faces. It can spawn great prosperity, but can sometimes also rob us of our nation's land.

Within Japan, we look upon the Fukushima meltdowns with disgust and are groping our way toward a non-nuclear future. In the Middle East, Japan treats nuclear power as a business, putting profit first. This looks **like a case of double-dealing**, and does not suit a country with such moral influence as the postwar "new country" of Japan.

Experts may feel OK over nukes but what about the people?

May 8, 2013

70% of nuclear experts still 'comfortable' with atomic power: survey

http://mainichi.jp/english/english/newsselect/news/20130508p2a00m0na007000c.html

Some 70 percent of nuclear energy experts with the Atomic Energy Society of Japan (AESJ) remain "comfortable" with atomic power, while at the same time public confidence in the technology remains low, a society survey has revealed.

The AESJ began the annual survey of its members in fiscal 2006, and of the general public in fiscal 2007. The fiscal 2012 survey, conducted in January and February this year, queried 500 randomly selected residents of the Tokyo region and 559 AESJ members at universities and in the private sector.

In the fiscal 2010 survey, 86.5 percent of AESJ members queried said they were either "comfortable" or "somewhat comfortable" with atomic power generation. In the fiscal 2011 survey -- conducted after the March 2011 Fukushima No. 1 nuclear plant meltdowns -- that figure dropped to 62 percent, but bounced back to 69.2 percent for fiscal 2012.

Meanwhile, only about 25 percent of the 500 members of the public agreed or somewhat agreed that Japan should keep using atomic power -- around the same rate as in the 2011 survey and half that of before the Fukushima nuclear disaster.

Asked if Japan should keep using atomic power, some 92 percent of AESJ members said yes -- 6.6 points higher than in the fiscal 2011 survey and close to the pre-disaster level of around 95 percent.

"The Liberal Democratic Party (LDP) included continuing atomic power in their election promises last year and won a huge victory, so I think nuclear experts might have regained some of their confidence in the technology," Kansai University professor of social psychology Shoji Tsuchida said of the survey results. "But it would be a mistake for them to think that the election results mean the public has signed off on nuclear energy."

Nuke restart enter LDP campaign

May 12, 2013

LDP to include campaign pledge calling for restart of nuclear reactors

http://ajw.asahi.com/article/behind_news/politics/AJ201305120048

By TOMOYOSHI OTSU/ Staff Writer

A confident Liberal Democratic Party will continue moving toward a return to operations at nuclear power plants around the nation by including the goal in its campaign platform for this summer's Upper House election.

The ruling party plans to include in its campaign the plank calling for resumption of nuclear reactor operations.

In the wake of the 2011 accident at the Fukushima No. 1 nuclear power plant, only two of Japan's 50 nuclear reactors are currently in operation, the No. 3 and No. 4 reactors of the Oi nuclear power plant in Fukui Prefecture.

In its campaign platform for the December Lower House election, the LDP only pledged to "seek a conclusion within three years" on whether to resume operations for other reactors.

However, the administration of Prime Minister Shinzo Abe has made it clear that it plans to allow the resumption of nuclear operations as long as the safety of the reactors is confirmed.

The change in the LDP platform will be in line with the stance taken by the Abe administration.

The party committee considering what to include in the campaign platform for the Upper House election in July will compile a comprehensive policy package in time for the meeting of policy chiefs of prefectural chapters scheduled for May 22. Important policy topics will be chosen from that package by the end of May for inclusion in the campaign platform.

Sources said the platform would focus on such issues as agricultural policy, measures to revitalize local economies and energy policy.

The comprehensive policy package will include wording on nuclear power generation that says "the central government will be responsible for the resumption of operations."

During Diet deliberations, Abe has said, "We will proceed with resumption of operations once safety has been confirmed."

That stance is a major reason behind the LDP's big push on nuclear policy in comparison to the campaign platform for the December Lower House election, which it won in a landslide to regain control of the government.

The party will stick with the same slogan of "recovering Japan" that was used in the Lower House election. The goal for the LDP and junior coalition partner New Komeito will be to gain a majority of seats in the Upper House to complete regaining total control of the government.

In a May 11 TV program, Sanae Takaichi, LDP policy chief, said, "The Upper House election will be about restoring a stable political environment."

May 11, 2013

'Abenomics' goes nuclear in campaign platform

LDP locks sights on reactors, Constitution

Kyodo
http://www.japantimes.co.jp/news/2013/05/11/national/ldp-locks-sights-on-reactors-constitution/#.UY5v90psFEs

A draft of the Liberal Democratic Party's platform for the upcoming election states that any reactors which clear the newly compiled safety criteria will be restarted — a move likely to upset antinuclear voters awakened by the Fukushima meltdowns in 2011.

The ruling LDP will vow to stimulate the economy, revise the pacifist Constitution and mend Japan's strained ties with China and South Korea in line with the intentions of Prime Minister Shinzo Abe, the party's president.

On nuclear policy, the government "will restart (reactors) under its own responsibility once it obtains the understanding" of local authorities and after the Nuclear Regulatory Authority judges them safe, the draft platform says.

Most of the nation's 50 commercial reactors, which were idled after the Fukushima nuclear disaster triggered by the March 2011 quake and tsunami, remain shut down. The LDP aims to determine within three years whether they can be restarted.

The loss of nuclear power has forced electrical utilities to **concentrate more on thermal power generation and crank up imports of fossil fuels**, weakening the nation's trade balance, as the aggressive monetary easing touted under "Abenomics" drives down the yen, making those purchases even more expensive.

The LDP, which returned to power in the Lower House election in December, will try to take full control of the Diet in the July election for the Upper House. The draft platform, which will be finalized later this month, contains about 300 policies […]

Not so simple for local communities

May 17, 2013

EDITORIAL: Tsuruga should be model for breaking free of nuclear energy

http://ajw.asahi.com/article/views/editorial/AJ201305170048

Keeping things as they are became practically impossible now that an expert panel has concluded that an active fault line runs directly under the No. 2 reactor of the Tsuruga nuclear power plant in Fukui Prefecture.

The panel is under the Nuclear Regulatory Authority, which was formed from a lesson of the March 2011 disaster at the Fukushima No. 1 nuclear power plant.

"What else can we say, but it is fortunate that no accident has occurred until now," a panel member said.

If the active fault moves and leads to a major accident, residents of Tsuruga city will be the first who will have to escape. Lake Biwako, which supplies water to the Kansai region, is only 40 kilometers away. Natural disasters strike without warning.

However, Tsuruga Mayor Kazuharu Kawase is opposing the panel's conclusion, saying it is not final. Some proponents of nuclear power generation in the local community say that if they can buy some time, the administration of Shinzo Abe, which supports restarting idled nuclear reactors, will come to the rescue.

The central government has been providing subsidies to local governments that host nuclear power plants. Some people disparagingly say Tsuruga is putting up resistance for money.

Let's stop and think. To aim at realizing a society that does not rely on nuclear energy, we need to squarely address serious impacts that the decommissioning of nuclear reactors may have on local communities that host them.

Tsuruga was once a thriving port city. But as the center of the economy shifted to Pacific coastal areas, it accepted four nuclear reactors to serve as the main pillar of the local economy.

However, the Fugen prototype advanced thermal reactor is in the process of decommissioning. After the Great East Japan Earthquake on March 11, 2011, prospects for restarting the aging No. 1 reactor at the Tsuruga plant remain dim. There are also no prospects for restarting the Monju prototype fast-breeder reactor after revelations of neglect in carrying out safety inspections. If the Tsuruga No. 2 reactor is also decommissioned, it is likely that Tsuruga will have no workable nuclear reactor for the first time in 43 years.

The local economy that takes for granted the presence of nuclear power plants will be shaken from its foundation. In particular, the impact on employment will be great. Of the approximately 68,000 people who live in Tsuruga, about 5,000 work at nuclear power plants and related facilities. Another 5,000 are also engaged in work such as the hotel industry, which is inseparable from nuclear power plants. When their families are included, tens of thousands of people rely on nuclear power plants to earn a living.

The impact on municipal finance is also serious. In exchange for hosting nuclear power plants, Tsuruga received a total of 50 billion yen ($489 million) in government subsidies. Including such revenues as fixed property taxes on nuclear plants, one-fifth of the city's budget is made up of nuclear industry-related income. The government subsidies are also used to cover part of the medical costs of citizens and labor costs of fire department employees.

While opposing the decision on the one hand, Tsuruga Mayor Kawase said, "Since it will take 30 to 40 years to decommission a nuclear reactor, a special company is needed for the process."

“One option is to disseminate technology to secure nuclear safety to the world,” he also said. If such a shift materializes, Tsuruga can be the model of a community that broke with nuclear power generation.

A local government that accepted the national policy of promoting nuclear energy is trying to sever its ties with nuclear power plants. How should the national government and power consumption centers such as the Kansai region support such attempts?

With so many nuclear power facilities, Tsuruga has been dubbed the “Ginza of nuclear power plants.” It is time we come up with the wisdom and various means of support to help Tsuruga cast off the nickname.

Decommissionning Tsuruga 2

May 17, 2013

Editorial: Lay the groundwork for decommissioning Tsuruga No. 2 reactor

http://mainichi.jp/english/english/perspectives/news/20130517p2a00m0na011000c.html

A panel of experts appointed by the government's Nuclear Regulation Authority (NRA) has concluded that an active fault lies just below the idled No. 2 reactor of the Tsuruga Nuclear Power Plant in Fukui Prefecture. Dissatisfied with the judgment, Japan Atomic Power Co. (JAPC), the operator of the power station, is poised to demand that the panel continue on-the-spot inspections and review its conclusion. However, it is highly unlikely that the panel will reverse its decision given the NRA's past discussions on the matter.

We would like to support the panel's conclusion from the standpoint of ensuring safety of nuclear power stations. NRA commissioner Kunihiko Shimazaki said, "It's lucky that there has been no accident at the reactor." It is inevitable for the reactor to be decommissioned. Spent nuclear fuel is stored at the No. 2 reactor building of the Tsuruga power plant. Even while operations at the reactor are suspended, the active fault could cause a serious accident.

Shortly after conducting an on-the-spot inspection of the plant in December last year, the panel of experts suggested that the crush zone just below the Tsuruga plant's No. 2 reactor was an active fault. However, JAPC argued that the expertise of the panel members was not well balanced and that the panel unilaterally deliberated on the matter. Even some members of the ruling Liberal Democratic Party (LDP) and local governments around the power station demanded that the crush zone be re-examined thoroughly and that discussions be held in a fair manner.

In response, the NRA held meetings to listen to opinions from other experts and to give JAPC an opportunity to counter the panel's judgment. Nevertheless, the panel did not reverse its conclusion.

JAPC complained that the judgment is not rational, but the NRA's stance to regard the crush zone as an active fault as long as it cannot rule out such a possibility is appropriate.

It is the JAPC that will decide whether to decommission the No. 2 reactor at its Tsuruga plant. Needless to say, the decommissioning of the reactor will have a far-reaching impact.

JAPC, a power wholesaler specializing in nuclear power generation, was founded jointly by nine major power suppliers and other entities, and owns three nuclear reactors -- the No. 1 and No. 2 reactors of the Tsuruga plant and the Tokai No. 2 nuclear plant in Ibaraki Prefecture. All these reactors have been idled and there are no prospects that any of them will be reactivated in the foreseeable future because of such factors as aging, the existence of an active fault on the premises and opposition from the local community.

Power companies that own nuclear plants have been accumulating funds to cover the costs of decommissioning and dismantling nuclear reactors, but JAPC has not yet saved enough funds to cover the expense of decommissioning its three reactors. Therefore, if the company were to decommission its reactors, it would certainly face a management crisis.

If that were to happen, power companies that have a stake in JAPC would be required to cover the losses incurred by JAPC, ending up in an increase in electricity charges. Such a situation could also spark calls for the reform of JAPC, such as a merger with another power supplier and transformation of JAPC into a company specializing in decommissioning nuclear reactors, and have a huge impact on the finances of local municipalities hosting JAPC nuclear plants and the regional economy.

The national government cannot evade its responsibility for issuing permission for the installation of the Tsuruga No. 2 reactor. The government should launch discussions on who should bear the costs of decommissioning the reactor and work out new measures to revitalize the local economy without relying on the nuclear plant in an effort to lay the groundwork for doing away with the reactor.

The government will enforce the new standards for regulating nuclear power stations in July, and aging nuclear plants will be also required to meet the standards. The NRA will continue to examine faults that exist on the premises of nuclear plants to see if they are active. There will certainly be other nuclear plants that will be forced to shut down. The decommissioning of the Tsuruga No. 2 reactor will serve as an important test for the future shutdown of many other nuclear reactors.

More nuclear talks

May 21, 2013

Japan looks to resume nuclear energy talks with India

Kyodo
http://www.japantimes.co.jp/news/2013/05/21/national/japan-looks-to-resume-nuclear-energy-talks-with-india/#.UZsuk0psFEs

Japan is considering resuming talks with India on bilateral cooperation in nuclear energy, the government's top spokesman said Monday.
"We have judged it sensible to negotiate an accord with India on nuclear cooperation," Chief Cabinet Secretary Yoshihide Suga told reporters.
Prime Minister Shinzo Abe is expected to promote exports of nuclear power plants to India under the accord when he meets Prime Minister Manmohan Singh on May 29 in Tokyo, sources close to the matter said.
The talks come amid widespread concern in Japan about the safety of nuclear power in light of the core meltdowns that took place at the poorly protected Fukushima No. 1 power plant when the March 2011 earthquake and tsunami hit.
Talks between the two countries were launched in 2010 but have been suspended since the disaster.
The Indian side has "expressed strong hope for a nuclear agreement with Japan even after the nuclear accident," Suga said. "As a country having experienced a disaster, (Japan) is responsible for contributing to the improved safety of atomic energy by sharing knowledge and lessons with the world."
As part of his strategy to boost the struggling economy, Abe is trying to promote exports of atomic and other infrastructure to the developing world.
Earlier this month, Japan concluded nuclear accords with the United Arab Emirates and Turkey during Abe's visits there.

May 20, 2013

Japan, India set to resume talks on nuclear energy agreement

http://ajw.asahi.com/article/behind_news/politics/AJ201305200076

THE ASAHI SHIMBUN
Japan and India are set to resume official negotiations on a nuclear energy agreement, which were suspended after the Fukushima nuclear disaster in March 2011, sources said.
Prime Minister Shinzo Abe and his counterpart, Manmohan Singh, are expected to include the policy to reopen talks on the agreement, a precondition for exporting nuclear-related technologies, in a joint statement at a summit meeting in Tokyo on May 29.
At a summit meeting in December 2011, the two countries confirmed they will make efforts to conclude a nuclear energy agreement, but only informal discussions have been held.

Japanese industry has been calling on the government to resume official negotiations so that Japanese-made nuclear reactors can be sold to India.
India is building five reactors and plans 18 more, according to the World Nuclear Association.
Abe is eager to conclude a nuclear energy agreement to strengthen relations with India and promote Japanese industry.
According to the sources, the government is considering including such expressions as "early conclusion of a nuclear energy agreement" in the joint statement.
Three rounds of official negotiations were held since 2010 before they were suspended due to the accident at the Fukushima No. 1 nuclear power plant following the Great East Japan Earthquake and tsunami.
In Japan, the only nation where atomic bombs have been dropped on the populace, concerns remain about providing nuclear-related technologies to India, which is not a signatory to the Nuclear Nonproliferation Treaty.
In 2010, Foreign Minister Katsuya Okada, of the then ruling Democratic Party of Japan government, suggested that Japan would suspend cooperation if India conducted a nuclear test.
He said India's nuclear disarmament and nonproliferation policy, such as ratification of the Comprehensive Nuclear Test Ban Treaty, would be an important condition for a bilateral nuclear energy agreement.

What about India joining the Non-Proliferation Treaty first?

May 25, 2013

EDITORIAL: Japan should ask India to join NPT first

http://ajw.asahi.com/article/views/editorial/AJ201305250025

The Japanese government has decided to restart talks with India to reach a bilateral nuclear cooperation agreement. The move is aimed at paving the way for exports of Japanese nuclear power technology to India.

India has developed nuclear weapons without becoming a party to the Nuclear Nonproliferation Treaty (NPT), a key international pact to prevent the spread of nuclear arms.

Japan, on the other hand, is a country which once suffered the ravages of nuclear attacks and has avowed to pursue the cause of the elimination of nuclear weapons under the NPT.

A nuclear cooperation agreement between Japan and India would further undermine the effectiveness and relevance of the NPT system.

Before negotiating such a deal, Tokyo should ask New Delhi to become a party to the NPT and sign the Comprehensive Nuclear Test Ban Treaty (CTBT).

Starting in June 2010, Japan and India held three rounds of negotiations over an agreement on bilateral civil nuclear cooperation. But the talks have been suspended since the 2011 Great East Japan Earthquake triggered disaster at the Fukushima No. 1 nuclear power plant.

Indian Prime Minister Manmohan Singh is slated to visit Japan in the coming week and hold talks with Prime Minister Shinzo Abe. The two leaders are expected to announce a restart of the nuclear talks in a joint statement they will release.

A total of 20 nuclear reactors are in operation in India, including some for military use. But most of them are small reactors made in India with domestic technology. The country is keen to import foreign technology to build large-scale nuclear power plants.

Since Japanese nuclear technology is used in large nuclear reactors made in the United States and France, it is difficult for India to import nuclear reactors from these countries unless it strikes a nuclear deal with Japan. To remove the obstacle to their exports of nuclear technology to India, Washington and Paris have been unofficially urging Tokyo to conclude a nuclear deal with New Delhi.

But this move raises serious concerns from the viewpoint of the NPT.

The NPT system is designed to limit the membership of the Nuclear Club to the five original nuclear powers of the United States, Russia, Britain, France and China while requiring them to make serious efforts toward nuclear disarmament. Other countries are allowed to receive foreign nuclear technology for peaceful use in return for refraining from possessing nuclear arms.

Supplying nuclear technology to India, which has run roughshod on the spirit of the NPT, would send out the message that countries can obtain nuclear technology even if they don't comply with the NPT.

Countries that are not parties to the NPT or have withdrawn from the treaty, such as India, Pakistan and North Korea, have carried out nuclear arms tests. Iran, an NPT signatory country, continued developing nuclear arms technology in the face of protests from the international community.

All these developments have worked to weaken the NPT system to an alarming extent.

Even so, Japan should not take any action that would push the NPT further down the road to ruin.

In 2008, in response to prodding by the United States, which wanted to export nuclear power technology to India, the so-called Nuclear Suppliers Group, which was then composed of 45 countries including Japan, approved an exception to the nonproliferation principles to allow India to receive nuclear power technology from other nations.

At that time, Japan's Foreign Ministry said the Japanese government maintained its official position that India should join the NPT at an early date as a non-nuclear power, and sign and ratify the CTBT quickly.

In protest against the start of negotiations between Japan and India for a nuclear deal, the 2010 Nagasaki Peace Declaration said, "a nation that has suffered atomic bombings itself is now severely weakening the NPT, which is beyond intolerable."

Japan, as the only country that has ever been struck by nuclear weapons, should remain unwaveringly committed to the principle of nuclear nonproliferation.

M.Abe as keen as ever on nukes

May 26, 2013

Abe to pledge nuclear plant restart in growth strategy

http://mainichi.jp/english/english/newsselect/news/20130526p2g00m0dm050000c.html

TOKYO (Kyodo) -- Prime Minister Shinzo Abe will clarify his government's plan to resume operation of idled nuclear power plants in a growth strategy to be compiled in mid-June, sources familiar with the matter said Saturday.

The draft energy policy to be included in the growth strategy states that steps will be taken to restart reactors judged safe for operation by the nuclear regulatory authorities, they said.

The government will pledge that it will make utmost efforts to ensure plant safety to gain support from municipalities hosting nuclear plants, the sources said.

The energy policy laid out in the growth strategy will be the government's official endorsement of Abe's plan to rely on nuclear power until the nation's final policy is made on nuclear energy use.

The growth strategy is one of the "three arrows" of Abe's economic policies aimed at pulling Japan's economy out of nearly two decades of deflationary recession, along with aggressive monetary easing and large-scale public works projects.

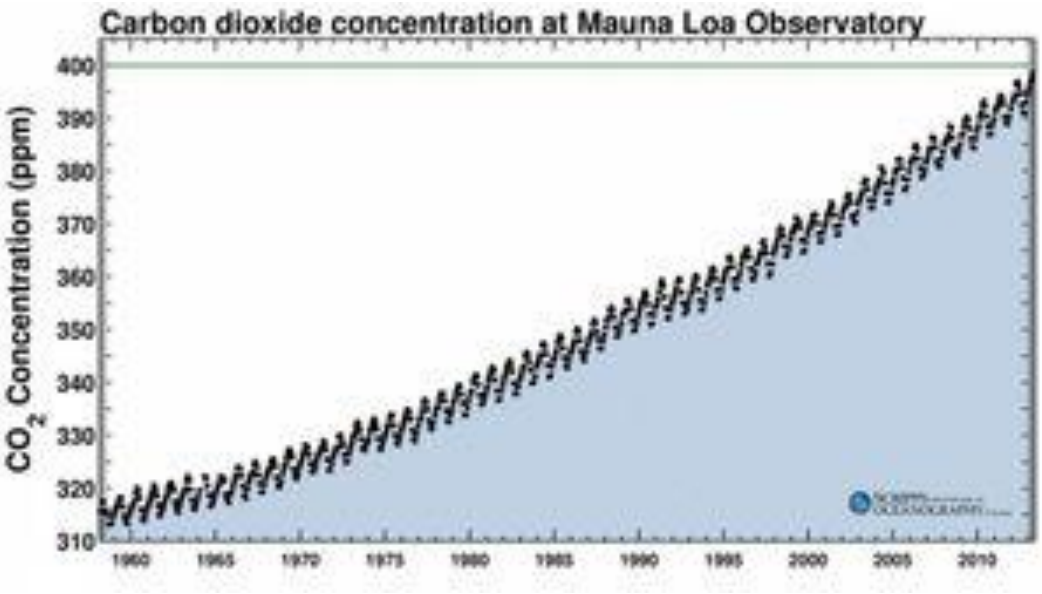
Of the 50 commercial reactors in Japan, only two are currently online amid safety concerns over the use of nuclear power in the wake of the 2011 Fukushima Daiichi plant disaster.

The draft policy says use of nuclear power plants is needed for the country's stable power supply, and the government will complete the separation of electric power companies' electricity generation and distribution operations by 2020, the sources said.

For a "truly lasting legacy", don't let the nuclar village decide for Japan

Mr. Abe: Bag the nukes and heed the Keeling Curve

by Stephen Hesse
http://www.japantimes.co.jp/life/2013/05/26/environment/mr-abe-bag-the-nukes-and-heed-the-keeling-curve/#.UaDgo9hBpg4



Dear Prime Minister Abe,

As you ride your recent wave of popularity, I know you are well aware that waves end, either in a crash or a fade. And you are luckier than most to have another chance since being elected as prime minister for the second time despite crashing out of the job in 2007 after serving for less than a year.

Today, at the peak of your ride before the summer Upper House election, you are making promises to everyone, from farmers and advocates of the Trans-Pacific Partnership to the business community and national universities.

But I can't help wondering if you are really committed to providing Japan's young people with a better future in the form of a safe and sustainable society they can be proud of.

Others will challenge your plans to jumpstart the economy, assume control of Japan's backyard and amend the Constitution. My question is this: With all your talk of a beautiful, bright future, why are you still wedded to a backward-looking, business-as-usual nuclear-energy policy?

Economies rise and fall, and recover if we're lucky. But a comprehensive plan for nationwide reform of energy generation, distribution — and efficient use — could ensure Japan a safe, sustainable, low-carbon future for decades.

Japan could be a world leader in the development of alternative energy sources and a showroom for cutting-edge technologies. This would strengthen and stabilize Japan's fragile economy — something that so-called quantitative easing will not.

Dare to dream even bigger, and a comprehensive, non-nuclear, low-carbon energy plan could make the Abe name synonymous with reversal of the Keeling Curve (see later) — something that would truly be an Olympian legacy.

First, though, let's be honest: Japan is no place for nuclear power. Elsewhere, perhaps, but not here, where "Shake, Rattle and Roll" ought to be the nation's anthem.

Still, the three reactor meltdowns at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co. (Tepco) and the ongoing leakage there of radioactive cooling water have not been enough to convince you along with Japan's so-called nuclear village that our young people deserve far better.

(See Jeff Kingston's Counterpoint column in today's Japan Times, where he defines the nuclear village as "nuclear advocates, and beneficiaries, in the utilities, regulatory agencies, the Diet [Japan's parliament], big business, the media and academia.")

Nor do the active faults running near, and under, our "safe" reactors dent your denial, Mr. Abe, or lessen your commitment to a deadly, outdated status quo.

However averse you may be to the policies of your rivals, you could prove yourself a better man by endorsing the energy policies of your predecessors in the Democratic Party of Japan, who recognized the wisdom of a non-nuclear, low-carbon energy future.

You already have the business community on your side. Few, if any, will abandon you simply because you choose to pursue a sustainable long-term energy vision that is non-nuclear and low-carbon.

In the end they will thank you for creating a new domestic industry that will rival Japan's global success with automobiles.

In fact, your insistence on nuclear energy, even as common sense and new technologies point in the opposite direction, leaves many of us wondering what plans you have for the nuclear-power industry.

Are you committed to keeping Japan free of nuclear weapons? Or is this on the table, too, along with "reform" of the Constitution?

And if keeping the nuclear-weapons option alive is not the purpose, then can we assume that those who profit most from nuclear energy, Japan's utilities, are pulling your strings regarding energy policy?

By choice or not, you are letting the nuclear village call the shots and they are controlling Japan's energy future, which does not bode well for your legacy — nor for the future of Japan's young people.

"Lobbying power belongs to people who've made money already. It represents the accumulated money and power of the last 50 years, not the next 50 years," the renowned U.S. academic, author and environmentalist Bill McKibben noted in a recent interview with Kristine Wong on Greenbiz.com, speaking of the fossil-fuel industry in the United States.

"Fifty years from now, I have no doubt that the wind-industry lobby will be powerful, and perhaps obnoxious. Maybe it will be stepping on the neck of the tidal-power industry, or whatever else is coming next," he added with characteristic humor.

McKibben is well known for having established 350.org, an organization dedicated to bringing carbon-dioxide emissions under control and stabilizing the level of CO2 in the atmosphere at 350 parts per million (ppm). Which brings us back to the Keeling Curve: If you are searching for a simple, easy-to-understand indicator of the pernicious character of our energy status quo, you need look no further.

In 1958, David Keeling (1928-2005), a U.S. climate scientist affiliated with the Scripps Institution of Oceanography at the University of California, San Diego, set up a CO2 monitoring system at the Mauna Loa Observatory atop the 4,169-meter Hawaiian volcano of the same name. That system has now taken hourly readings of CO2 in the atmosphere for 55 years, creating an unimpeachable record of our planet's changing atmospheric profile.

For many people, their first glimpse of the Keeling Curve was in Davis Guggenheim's Oscar-winning 2006 documentary, "An Inconvenient Truth," about former U.S. Vice President Al Gore's campaign to educate citizens about global warming. For climate scientists, the graph has long been a haunting gauge of an inexorable climb in CO2 levels.

The line is jagged because each spring the trees in the northern hemisphere grow new leaves, which pull carbon from the air, creating a noticeable drop in CO2 concentrations in the atmosphere. In autumn, when those same trees drop their leaves, CO2 levels once again begin to rise.

Each year, however, CO2 spikes at levels slightly higher than in the year before. And this month, according to climate scientists, the Keeling Curve has hit a psychological red line because our planet's atmospheric concentrations of CO2 have, in recent weeks, reached 400 ppm. — a level not seen for between 3 million and 5 million years.

For humans, this is totally unknown territory, as we have only been around for about 200,000 years.

And so it goes. Year by year, one saw tooth at a time we are driving the Keeling Curve steadily upward, at an angle of ascent that shows no hint of abating.

Which is why McKibben points out in his interview with Wong, "For the moment, we need everybody who's at all concerned about climate change — the biggest problem facing the world — to make it their business. This, at this point, is everybody's business. And it better be because the economic consequences of not doing anything about it are staggering, quite aside from the moral human consequences."

In Japan, however, following two decades of failed efforts to jumpstart the economy with massive public-works spending, we are so eager for good news that the recent ersatz economic uptick — a bubble even more fragile than the last one that burst in the early 1990s, leading to Japan's extended "lost decade" — has voters giddily in love with you, Mr. Abe.

Machinery orders are up, the yen is down, gross domestic product has hit an annualized rate of 3.5 percent, the Nikkei stock-market index is higher than it's been in five years. … Finally, surely, happy days are here again.

A closer look, though, shows that all is not well in Brave New Japan. There is fear of the government bond market crashing, the costs of daily necessities are climbing while salaries are not, and Japan and its neighbors have not been this bellicose in years.

For me, the greater concern is that the nuclear village has become emboldened to tout nuclear power once again, even as Japan continues to reel from the economic and psychological costs of the meltdowns and despite ongoing radioactive leaks at Tepco's Fukushima.

The only talk of energy we hear is about buying cheap liquefied natural gas from the U.S. Yet this is nothing more than another stopgap measure to avoid crafting a sustainable energy policy based on Japan's domestic low- and no-carbon energy resources that include abundant potential solar, wind, geothermal and marine energy.

And while Japan myopically fiddles with 20th-century measures, China is charging ahead with 21st-century technologies.

"China has halved its growth in electricity demand, dramatically increased its renewable-energy capacity and decelerated its emissions growth," reports Tim Flannery, the head of the Australian Climate Commission and one of the world's leading authors on climate change, in a recent interview.

A non-nuclear, low-carbon future for Japan is eminently doable and offers a stable, sustainable economy. Plus, it's better to compete with China over energy solutions rather than uninhabited islets.

So go for a truly lasting legacy, Mr. Abe, and prove you're committed, not to Tepco, but to **providing a safer and more inspiring future for all today's young people, worldwide.**

Indo-Japanese deal on nukes - Converging interests?

May 30, 2013

Abe pushes ahead with India nuclear agreement, despite concerns

http://ajw.asahi.com/article/behind_news/politics/AJ201305300078

THE ASAHI SHIMBUN

Despite major concerns about the effects on the global nuclear nonproliferation structure, Japan and India have agreed to push forward with negotiations for a nuclear agreement.

The joint statement released May 29 by Prime Minister Shinzo Abe and his Indian counterpart Manmohan Singh was the result of both countrries' converging interests.

The Abe administration has placed the export of nuclear plant technology as a key plank in its economic growth strategy, and a nuclear agreement is needed with India to clear the way forward.

This spring, Abe visited the United Arab Emirates, Saudi Arabia and Turkey to sell them on Japanese nuclear technology.

However, unlike those three nations, India is a nuclear power and has not yet signed the Nuclear Nonproliferation Treaty.

Japan has lobbied for India to abandon its nuclear arsenal and join the NPT, but to no avail.

An exception was made for the export of nuclear plant technology to India in 2008 by the 48-nation Nuclear Suppliers Group, to which Japan belongs. The decision to exempt India was made at the behest of the United States.
In exchange, India has pledged a moratorium on nuclear testing.

Japan says it will suspend cooperation in the nuclear energy field with India if the country does not keep to the moratorium.

While the nuclear weapons issue is a sensitive one for Japan, the country has compromised with India because of its potential as a huge market for nuclear energy technology.

In addition to six reactors now under construction, there are also plans to build at least 20 more. The construction costs for a single reactor run between 400 billion and 500 billion yen ($3.9 billion and $4.9 billion).

With the prospects for constructing new nuclear reactors in Japan fading as a result of the 2011 disaster at the Fukushima No. 1 nuclear power plant, the export of nuclear energy technology is of extreme interest to roughly 10,000 companies in Japan that are connected in some way with the field.

A high-ranking industry ministry official said, "The economic trickle-down effects from exports are huge."
A government source said, "Japan's technology is indispensable for the United States and France, which having been selling nuclear plant technology to India."

Because the United States and France use Japanese-made parts for nuclear plants, the absence of a nuclear agreement between Japan and India slows down nuclear business deals for those two nations as well.

In late April, French Foreign Minister Laurent Fabius pressed Japanese government officials to move quickly on signing a nuclear agreement with India.

India also wants to move quickly on such an agreement because it faces chronic electricity shortages due to inadequate power generation facilities and power transmission lines.

Its 9-percent energy shortfall could stymie India's economic growth in the years ahead if the deficiency is left unattended.

While the May 29 joint statement made no mention of the NPT in connection with India, Abe said he hoped the Comprehensive Nuclear-Test-Ban Treaty would go into force as soon as possible.

India has also not signed the CTBT, but Abe said that he received a commitment from Singh on the voluntary nuclear test moratorium.

However, concerns still remain over exporting nuclear technology to India. The Fukushima disaster raised questions about whether Japan should export such technology. Groups of atomic bomb victims have also criticized plans to export the technology to India.

Chief Cabinet Secretary Yoshihide Suga said on May 29 that a major precondition for negotiations with India was gaining assurances that the technology would only be used for peaceful purposes.

There is a liability risk involved in exporting nuclear technology to India as well. In the event of an accident, responsibility for compensation is not limited to the plant operator and could also extend to the companies that constructed the reactor.

One executive of a nuclear plant manufacturer said: "We have no idea to what extent we would be held responsible. There will likely be few companies that are eager to jump into the market."

DIFFERENT ATTITUDES ON CHINA

While Abe also wanted to strengthen political ties with India as a means of countering China, those efforts did not go as smoothly as the talks on the nuclear agreement.

Like Japan, India also has a territorial dispute with China. Abe hoped to take advantage of that fact to bring India to his corner when dealing with China about the sovereignty of the Senkaku Islands.

India, however, wants to emphasize its economic ties with China as a means of expanding exports for such major industrial sectors as information technology and pharmaceuticals.

Chinese Premier Li Keqiang visited India last week, and the joint statement released at that time said that the two nations recognized each other as partners not rivals.

(This article was written by Jun Tabushi, Yuriko Suzuki and Masaaki Shoji in New Delhi.)

Abe, Singh ink statement on nuclear deal

by Reiji Yoshida
Staff Writer
http://www.japantimes.co.jp/news/2013/05/30/national/abe-singh-ink-statement-on-nuclear-deal/#.UaZg0NhBpg4

India moved a step closer Wednesday to acquiring Japanese nuclear technology and equipment when its prime minister, Manmohan Singh, and his Tokyo counterpart, Shinzo Abe, signed a joint statement to promote talks to conclude a cooperation pact to this end.

In addition to talks on nuclear power cooperation, the statement issued in Tokyo also supports expanded joint naval exercises.

"I'm very pleased that I'm able to hold a summit with you . . . as the prime minister of Japan again," Abe said at the outset a summit session with Singh, going on to praise Singh for developing a strategic and global bilateral partnership.

A subsequent pact would allow Japanese firms to export nuclear technologies and equipment to India, which is struggling to meet energy demand to sustain the country's rapid economic growth.

However, because it's not a party to the Nuclear Non-Proliferation Treaty, there is concern that India could use Japanese technologies and equipment to further develop nuclear weapons.

Japanese diplomats say New Delhi has pledged strict nonmilitary use of Japanese nuclear know-how and hardware. A future pact would lay out specific conditions and measures to ensure the peaceful use of nuclear exports, they say.

"The two prime ministers reaffirmed their shared commitment to the total elimination of nuclear weapons," the two leaders declared in their joint statement.

On Wednesday Singh also reiterated his country's commitment to its unilateral and voluntary moratorium on nuclear weapons tests.

The two countries also agreed to promote talks on the Fissile Material Cutoff Treaty, a proposed international pact prohibiting further production of weapons-grade uranium and plutonium.

Pressure to restart talks on a nuclear cooperation pact, which reportedly hit a snag following the meltdowns at the Fukushima No. 1 nuclear power plant in 2011, have increased due to growing Indian energy demands and Abe's ambition to export more Japanese infrastructure technologies, including nuclear reactors and related equipment.

At a ceremony at the Prime Minister's Office, the two leaders also agreed to conduct more frequent and regular joint sea exercises by the Indian Navy and the Maritime Self-Defense Force. They also hailed drills held last year by the two nations' coast guards.

The two countries will work together to secure "the freedom of navigation and unimpeded commerce based on the principles of international law," Singh and Abe said in the statement.

Abe meanwhile pledged to continue providing official development assistance "at a substantial level" to India, including for social infrastructure.

Since his first stint as prime minister in 2006 and 2007, Abe has regarded India as a key strategic partner for Japan, particularly as a counterbalance to China's growth.

May 29, 2013

Japan, India to work toward civil nuclear deal
http://www3.nhk.or.jp/nhkworld/english/news/20130529_32.html

The leaders of Japan and India say they will speed up negotiations for the early signing of a civil nuclear pact.

Japanese Prime Minister Shinzo Abe and Indian Prime Minister Manmohan Singh signed a joint statement after their meeting in Tokyo on Wednesday.

The statement calls for accelerating talks for an early signing of a nuclear deal that would allow Japanese firms to export atomic power-related technology. India is planning to build more nuclear power plants.

The joint statement also calls for bilateral efforts for the total abolition of nuclear weapons.

The statement says Japan and India will promote joint exercises between Japan's Maritime Self-Defense Force and India's navy. The move comes at a time when China has been increasing its maritime activities.

The prime ministers also agreed to set up a joint working group and continue to discuss exports of Japan's US-2 amphibious rescue aircraft to India.

Japan has agreed to help develop India's infrastructure, by offering loans worth 71 billion yen or about 700 million dollars to build a subway line in India's western city of Mumbai. The 2 countries will also conduct a joint survey on a project to build a high-speed railway system in western India.

The 2 governments will also arrange a visit to India by Japan's Emperor and Empress between late November and early December.

Speaking at a joint news conference with Singh, Abe expressed his wish to strengthen Japan's ties with India based on a strategic global partnership, on the occasion of the Indian leader's current visit.

Singh said he will work to expand trade and private investment and continue their cooperative bilateral relationship for development, especially in India's infrastructure.
May 29, 2013 - Updated 12:25 UTC

Japan, India seek early agreement on civil nuclear pact

http://ajw.asahi.com/article/behind_news/politics/AJ201305290115

REUTERS

Prime Minister Shinzo Abe and his Indian counterpart agreed on May 29 to speed up talks on a deal to allow Japan to export nuclear plants and to strengthen security cooperation as both sides keep a wary eye on China's military clout.

The Indo-Japanese summit meeting follows Chinese Premier Li Keqiang's visit last week to India, which has been shaken by a recent border spat with China and is cautious about Beijing's friendship with rival Pakistan.

Japan, for its part, has been locked in a territorial dispute with China over a group of East China Sea islets. "In the political and security area, maritime security cooperation will further be strengthened ... On civil nuclear cooperation, negotiation will be accelerated toward the early conclusion of the agreement," Abe told a ceremony alongside India's Manmohan Singh.

Unable to rely on a coal sector crippled by supply shortages and mired in scandals, India is pushing ahead with constructing nuclear reactors despite global jitters over safety. Hundreds of millions of Indians still live without power and factories suffer frequent blackouts.

A civil nuclear energy pact with India would give Japanese nuclear technology firms such as Toshiba Corp. and Hitachi Ltd. access to India's fast-growing market when they search for opportunities overseas to offset an anti-nuclear backlash at home in response to the Fukushima nuclear crisis.

India operates 20 mostly small reactors at six sites with a capacity of 4,780 MW, or 2 percent of its total power capacity, according to the Nuclear Power Corporation of India Limited. New Delhi hopes to lift its nuclear capacity to 63,000 MW by 2032 by adding nearly 30 reactors.

Abe and Singh welcomed expanding defense cooperation and decided to hold regular joint naval exercises. The first such exercise was held last June.

Faced with China's maritime expansion, Singh and Abe said they were committed to freedom of navigation and unimpeded commerce, and agreed to promote cooperation on maritime issues.

In a separate move, Japan agreed to extend up to 71 billion yen ($694 million) in official development assistance for a subway project in Mumbai, India's financial capital.

"Our discussions were guided by the fundamental belief that at the time of global uncertainties, change and challenges, India and Japan are natural and indispensable partners," Singh said.

"We attach particular importance to intensifying political dialogue and strategic consultation and progressively strengthening defense relations."

UNEASE OVER CHINA

India has often been nervous about Chinese agreements with its neighbors that are not strictly military but could be leveraged in a conflict.

Indians sometimes refer to these as a "string of pearls," which include China's ties with Pakistan, access to a Myanmar naval base, Chinese construction of a deep-water port in Sri Lanka, and its deepening ties with Nepal and the Maldives.

India and Japan also agreed to strengthen cooperation in renewable energy, energy conservation, clean coal technologies and liquefied natural gas.

Singh expressed interest in working with Japan in extraction of natural gas from undersea methane hydrate deposits.
State-run Japan Oil, Gas and Metals National Corp. said in March it extracted gas from offshore methane hydrate deposits for the first time in the world, as part of an attempt to achieve commercial production within six years.

30 trillion yen over 10 years for Japan's electricity - A very unclear investment plan

June 7, 2013

Abe plan lifts renewables at utilities' expense

Power companies fear government will weaken monopoly after July election

http://www.japantimes.co.jp/news/2013/06/07/business/abe-plan-lifts-renewables-at-utilities-expense/#.UbDm0dhBpg4

by Chisaki Watanabe and Tsuyoshi Inajima
Bloomberg

Shinzo Abe's pledge to spur **¥30 trillion of investment in Japan's electricity industry** opens the way for a surge in clean energy projects at the expense of traditional utilities.

The prime minister endorsed proposals to deregulate an industry that produces power mostly from fossil fuels, as well as to boost competition among generators and make it easier for wind and solar energy to be distributed to consumers. His speech Wednesday in Tokyo didn't mention restarting nuclear reactors idled since the earthquake-tsunami disaster in 2011.

Utility shares in Japan tumbled, led by Tokyo Electric Power Co., which owns the plant in Fukushima that suffered three meltdowns after the earthquake-tsunami double-punch two years ago.

Abe's remarks raise the chances the government will move to weaken the monopoly power producers now enjoy after the July Upper House election. That would benefit Marubeni Corp. and Softbank Corp., both of which are planning renewable energy investments.

"His push to liberalize power markets is a bold attempt to increase competition and bring in new market players," said Nathaniel Bullard, an industry analyst at Bloomberg New Energy Finance in Hong Kong.

Abe said in the speech: "For 60 years after the war, one giant power company in each region has dominated from power generation to transmission to retail. The times are changing. We are in the age where consumers themselves produce power."

He discussed the emergence of fuel cells and power storage batteries and the "need to create more innovation" that would use those technologies to help integrate variable supplies of renewable energy into the transmission grid.

He said he "will bring about the potential for such innovations" by "unbundling transmission and distribution" — two businesses that currently are mostly integrated at utilities.

To be sure, Japan has made four previous attempts to restructure its electric utility industry, which has remained little changed since World War II, according a panel that advised the government in February. It was led by Motoshige Itoh, an economics professor at the University of Tokyo.

Abe also indicated coal would benefit from his policy, with the nation funding cutting-edge coal-fired power plants at home with technology that can be exported.

The Fukushima nuclear crisis that started in March 2011 led to an outcry among voters and the halt of all but two of the nation's reactors, changing the government's stance on energy policy to shift the nation toward cleaner sources of energy. More than 70 percent of respondents in an opinion poll by the Asahi Shimbun in February said Japan should scrap atomic power.

The government wants to pass the power reforms bill, which has been submitted to the Diet, "by all possible means," Abe said. Investment in wind, geothermal and other renewable sources will be accelerated by "drastically" speeding up environmental assessment processes, he added.

His speech was short on detail, since the government is working on a review of its energy policy due later this year. Abe's Liberal Democratic Party, which came to power in December, is seeking to consolidate its grip on power in the July 21 Upper House poll.

The suggestion that Abe is moving to restructure the power generation business is a threat to the utilities, which were hoping the government would allow them to restart their nuclear plants.

All except two of Japan's 50 reactors remain offline. When they were all running, they provided more than a quarter of the nation's electricity.

Instead, Abe signaled his support for the recommendations of the government advisory panel, which in February said ministers should push utilities to spin off their distribution networks. Japan's 10 regional

power companies own more than 70 percent of the nation's generation capacity and control transmission and distribution networks.

One result is average power prices twice as high as in the U.S. Japan's households paid 23.2 cents per kilowatt-hour in 2010, compared with 11.6 cents in the U.S., the Ministry of Economy Trade and Industry said in a November 2012 report.

Since the Fukushima crisis started, fossil fuels such as coal and natural gas have replaced nuclear power, driving up Japan's trade deficit and making it more difficult for the nation to reduce the pollution blamed for global warming. Japan's previous administration said it wouldn't sign on to the next round of worldwide emissions curbs under the Kyoto Protocol.

Abe said renewables such as wind and geothermal may be part of the solution, giving environmental campaigners hope that clean energy technology will get a boost. Japan is forecast to rival China as the world's biggest market for solar power this year, boosting sales for panel manufacturers such as Canadian Solar Inc. and Sharp Corp. Marubeni is pushing to revive long-dormant geothermal drilling projects in Japan.

"Unless Japan pushes through power industry reform, the country won't have the ground to develop clean energy," said Masako Konishi, climate and energy project leader for the environmental group WWF Japan.

The ¥30 trillion in investment in the power industry as outlined by Abe will take place over the next 10 years and represents a 50 percent increase from levels in the past decade. **No details were provided on where the money will be spent or how much of the investments will go to clean energy.**

Masayoshi Son's Softbank may also benefit, since the company has pledged to invest as much as ¥20 billion with investors in renewable energy project. Mitsubishi UFJ Financial Group Inc., Mizuho Financial Group Inc. and Sumitomo Mitsui Financial Group Inc. expect Japan's solar market to be worth as much as ¥1.8 trillion in the next three years, spurring the institutions to write loans for developers.

Abe's target may include investment in storage batteries, said Mika Ohbayashi, director of the Japan Renewable Energy Foundation. Japan has been promoting the development of storage batteries to help stabilize power generation that depends on the sun shining and wind blowing.

"Rather than storage batteries that are still expensive, we need to invest in new transmission lines to strengthen power infrastructure," Ohbayashi said.

A pillar of power industry reform is the establishment of an independent system operator for power grids, said Hiroshi Takahashi, a senior fellow at Fujitsu Research Institute.

Setting up such an institution will help control the demand and supply of power, which in turn can help expand the market for clean energy, he said Tuesday. Takahashi sat on the government-appointed committee that recommended the reform earlier this year.

Japan aims to capture a total ¥26 trillion worth of energy technology sales home and abroad by 2020, from the current ¥8 trillion, according to a draft strategy paper released by the Industrial Competitiveness Council after Abe's speech.

Japan will further strengthen areas the country excels in so that investment in renewable energy will not weaken the economy, but instead strengthen it, according to the document.

Japan intends to become the first country to commercialize floating offshore wind power technology by around 2018, according to a timetable also released by the council. As for solar, the country aims to lower the generation cost to less than ¥7 per kwh after 2030 from more than ¥30 currently, according to the timetable.

Reform, without specific commitments and targets for renewables, may not be enough, WWF Japan's Konishi said.

"It's possible to set ambitious targets for renewable energy and energy saving without setting targets for nuclear," Konishi said. "Such targets will have an impact on investment by companies."

A super collider for Japan?

June 13, 2013

Japan a candidate to house planned super-collider

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201306130067

By AKIRA HATANO/ Staff Writer

An international physicist group plans to build an $8.75 billion (830 billion yen) particle accelerator with Japan as a leading candidate to be home to the 31-kilometer, next-generation super-collider.

The Linear Collider Collaboration project team released a technical design report on June 12 for the International Linear Collider project in the hope of unraveling more mysteries of the universe using a huge particle accelerator.

According to its report, the length of the planned collider is 31 kilometers, which would make it the longest in the world.

Japan and the United States, along with nations in Europe and elsewhere, will discuss the feasibility of the collider construction based on the report.

At issue is where to construct the collider and what proportion of construction costs each nation will have to bear.

The project would allow researchers to accelerate electrons and positrons to more than 99 percent the speed of light, and turn them each into a beam.

After causing a head-on collision of the two beams, they will be able to catch Higgs bosons and other particles generated by the collision to see their characteristics. The Higgs boson, often referred to as the "God particle," is an elementary particle that scientists believe allows all substances to acquire mass.

The construction costs are current estimates. The United States and European nations have shown less appetite for building the collider within their borders, citing severe fiscal constraints.

The LCC has high expectations for Japanese assistance.

Candidate sites for the particle accelerator in Japan include the Kitakami Mountains straddling Iwate and Miyagi prefectures, and the Sefuri Mountains straddling Saga and Fukuoka prefectures.

Japanese researchers plan to choose a final candidate by the end of July for submission to the government for approval.

Particle collider project possible for Japan

http://www3.nhk.or.jp/nhkworld/english/news/20130614_03.html

The head of an international group promoting the building of an advanced particle collider says he hopes Japan will bid to host the huge experimental facility.

A plan is underway to complete the International Linear Collider, or ILC, in the mid-2020s. It would allow physicists to smash electrons and positrons in a 30-kilometer straight tunnel, at close to the speed of light.

The goal is to create an environment similar to that just after the birth of the universe, and shed more light on its origin.

Lyn Evans is director of the international science organization, Linear Collider Collaboration. He held an exclusive interview with NHK on Thursday.

Evans stressed his group is working on the premise that Japan will host the collider, and take the lead in building an international research facility like the Large Hadron Collider near Geneva. Scientists at the European Center for Nuclear Research, known as CERN, are presently using the Geneva facility for particle physics research.

Evans noted that it is difficult to construct the ILC in Europe as the region already has the Geneva experimental facility. He added that the United States will join the project but will not be able to play a leadership role.

Constructing the ILC is estimated to cost about 830 billion yen, or nearly 9 billion dollars. The host country will have to bear half the cost of the facility.

The Japanese government will decide whether to bid for the particle collider based on a report from the Science Council of Japan.

Japan currently has 2 candidate sites. One is the Kitakami mountain region in Iwate Prefecture in the northeast. The other is the Sefuri mountain area straddling Fukuoka and Saga prefectures in the southwest.

Local governments, businesses and academia are pushing to host the ILC. The project is expected to bring thousands of researchers from around the world together, creating major economic benefits.

Japan plans to decide on one candidate site in July. The final location will be selected after talks among participating nations.

How much state involvement in decommissionning?

EDITORIAL: Special agency needed to accelerate decommissioning of reactors

http://ajw.asahi.com/article/views/editorial/AJ201306130046

The Fukushima nuclear disaster convinced many Japanese they urgently needed to **build a new energy future that is not dependent on nuclear power.**

But scrapping a nuclear power plant is a costly and complicated endeavor. It takes a great deal of time and money to dismantle structures contaminated with high levels of radiation and dispose of spent nuclear fuel. The process also entails many tough technological challenges. Electric power companies tend to hesitate to decommission their reactors because of the heavy burden that such work requires.

CONCERNS ABOUT DELAYS IN DISMANTLING RISKY REACTORS

It is against this background that the Ministry of Economy, Trade and Industry (METI), which supervises the electric power industry, has embarked on creating an environment that will make it less burdensome for utilities to decommission reactors. The ministry plans to relax the accounting rules concerning losses incurred through reactor decommissioning in order to provide financial incentives to take the step.

We regard this as a move in the right direction. But such measures alone will not lead to quick progress toward the dismantling of nuclear plants.

The current system concerning decisions to decommission reactors, and the management and disposal of radioactive waste, needs to be changed so that the government will take the leadership in these matters. At the same time, the establishment of **a new expert institution** responsible for related operations should be considered.

In Japan, nuclear power plants have been built and operated by private-sector companies under the government's policy of promoting the use of atomic energy. Nuclear power plants are assets of their operators, which are primarily responsible for decommissioning and dealing with the problem of spent nuclear fuel.

This system is based on the assumption that utilities can use their nuclear plants for as long as possible in order to recoup the huge construction costs while putting aside money for future decommissioning.

But the devastating accident that unfolded at the Fukushima No. 1 nuclear power plant in 2011 dramatically changed the situation.

The Nuclear Regulation Authority has endorsed an expert panel's conclusion that a seismic fault running underneath the No. 2 reactor at Japan Atomic Power Co.'s Tsuruga nuclear power plant in Fukui Prefecture is active.
In due course, more reactors will likely have to be decommissioned after scientific findings show that they fail to meet the new safety standards.

Complicating the situation are deteriorating earnings of most electric utilities due to the suspension of reactor operations following the nuclear disaster. Eight of the nine regional electric power suppliers that own nuclear power plants reported losses in the year through March, according to their financial results. Their bottom lines were dented by increased fuel costs due to expanded use of thermal power generation to compensate for the loss of nuclear power. Their combined net loss came to nearly 1.6 trillion yen ($16.52 billion).

The situation raises concerns that utilities may be tempted to postpone dismantling reactors due to their financial problems.

Such concerns prompted METI's decision to apply special accounting rules to losses related to decommissioning.
When an operator shuts down a nuclear power plant earlier than it had anticipated, the company will be allowed to spread out certain related losses for tax purposes over a period of years. The rule will be applied to losses caused by a shortage of reserves for the costs of decommissioning or a decline in the value of the assets.

DECOMMISSIONING AROUND THE WORLD

Globally, the governments of many countries are involved in dealing with matters related to the closure of nuclear power plants. That is partly because nuclear plants were state-run enterprises.

State involvement is necessary because the process includes steps that require lengthy and difficult negotiations and cooperation both domestically and internationally, such as selecting candidate sites for final disposal of spent nuclear fuel and measures to deal with the risks of nuclear proliferation and terrorist attacks.

Britain, for instance, established the Nuclear Decommissioning Authority (NDA) in 2005 to integrate policies and monitoring systems related to the dismantling of nuclear power facilities.

In actual projects to decommission reactors, Britain selects the contractors through international bidding and gives them licenses and targets. This is intended to ensure that the operations don't become inefficient.

The NDA is also in charge of managing and disposing of plutonium generated through recycling of spent nuclear fuel.

In Germany, major electric utilities are, in principle, required to pay all the costs of decommissioning the nuclear plants they own. After the government of Chancellor Angela Merkel decided to phase out nuclear power generation, some energy firms sued the government for damages. They assert that the policy change will cause them heavy losses due to the costs of decommissioning reactors earlier than planned.

There is also a state-run specialized corporation called Energiewerke Nord GmbH (EWN), which is mainly engaged in decommissioning and dismantling aged nuclear reactors in the former East Germany. The EWN's operations are financed by the government.

In making decisions on actual projects to decommission reactors, major German utilities are weighing two options: contracting out the work to the EWN, which is trying to expand its operations in expectations of growing demand for its services in the future, or tackling the tasks on their own.

USE OF TAXPAYER MONEY AS AN OPTION

Relaxing the accounting rules alone won't be enough to get Japanese utilities to act swiftly to decommission and dismantle nuclear reactors.

The Fukushima nuclear disaster has highlighted the need to close reactors in areas where it is extremely difficult to ensure swift evacuation of local residents in emergencies, even if the reactors meet the new safety standards.

But there is no hope that utilities will move quickly toward decommissioning as long as they have the right to decide whether to close down specific reactors.

First of all, the government needs to lay down clear rules concerning decommissioning. Then, it should set up an expert institution that shares knowledge and information with similar

organizations abroad. By commissioning the new entity to deal with decommissioning, the government will be able to accelerate the process of reducing Japan's dependence on atomic energy.

There are, of course, many knotty questions that must be answered, such as who should foot the bill in what ways and how the new entity should take over reactors which are assets of the utilities.

There are various possible ways to cover the necessary costs. Since utilities set aside money for decommissioning from electricity charges they collect from consumers, one idea worth consideration is to use taxpayer money to quicken the pace of decommissioning. Another possible option would be to operate a minimum number of reactors for the time being and transfer them to the new expert body so that profits from selling electricity generated by the reactors can be used to cover decommissioning costs.

The electric power industry may have good reason to establish the entity on its own, given the possibility that the body could give the industry a leg up in entering the global decommissioning business in the future.

Another possible option would be to reorganize Japan Atomic Power, a company specializing in nuclear power generation that is mostly owned by utilities, into such an entity.

The government should set up a formal forum for discussions on this topic and sort out related issues for national debate.

What nuclear phase-out?

June 14, 2013

Gov't white paper on energy barely refers to nuclear phase-out goal

http://mainichi.jp/english/english/newsselect/news/20130614p2g00m0bu046000c.html

TOKYO (Kyodo) -- Japan's annual energy report released Friday barely refers to the fact that the previous government upheld a goal to phase out nuclear power generation in the 2030s, reflecting the pro-nuclear stance of the current government.

The latest Energy White Paper covers a period between August 2012 and around March this year, during which the previous government led by the Democratic Party of Japan compiled a new energy strategy following the 2011 Fukushima Daiichi nuclear power plant disaster.

The most controversial part in the strategy was a pledge to "devote all policy resources to enable zero nuclear power plant operation in the 2030s," but the white paper does not use the phrase in explaining the strategy.

"The three pillars (of the strategy) were the achievement of a society that does not rely on nuclear power at the earliest possible date, the realization of green energy revolution and stable supply of energy," the report says.

The strategy has come under review after the Liberal Democratic Party, which supports the use of nuclear power even after the Fukushima crisis, replaced the DPJ as the ruling party in the general election in December.

An official in charge of the white paper denied that the government intentionally dropped the key phrase, insisting that the report records what was written in the strategy "as is."

The zero-nuclear goal shows up in the white paper once, but only as part of Prime Minister Shinzo Abe's quoted statement, which criticizes the energy strategy for stirring concerns and distrust among the local governments hosting nuclear power plants and the business industry.

The goal, if maintained, would have marked a massive shift in Japan's decades-long promotion of nuclear power. Before the Fukushima disaster, triggered by a huge earthquake and tsunami on March 11, 2011, nuclear power supplied about 30 percent of Japan's total electricity.

The white paper also touches on a poll conducted by the previous government to grasp public opinions on energy policy, but does not mention the fact that the government at that time concluded that at least a majority of people are hoping for a society that does not rely on nuclear power.

Of the 50 commercial reactors, only two in western Japan are currently online. Abe's government has said it will push for the resumption of reactors that are deemed safe by the country's new nuclear regulatory authority.

Poland, Czech Republic, Slovakia, Hungary, (France, India, UAEs) and now Brazil

June 20, 2013

Japan, Brazil to restart talks on nuclear deal stalled since Fukushima crisis

JIJI

http://www.japantimes.co.jp/news/2013/06/20/national/japan-brazil-to-restart-talks-on-nuclear-deal-stalled-since-fukushima-crisis/#.UcK169hSb9k

Japan and Brazil are expected to agree at a bilateral summit meeting next week to resume negotiations on concluding a nuclear cooperation accord, a government source said.

The two sides began the talks in January 2011 but they have remained suspended since the nuclear meltdowns at the Fukushima No. 1 complex in March 2011.

The plan to restart them will be included in a joint statement to be issued after Prime Minister Shinzo Abe's meeting with Brazilian President Dilma Rousseff in Tokyo on June 27, the source said Wednesday.

A bilateral nuclear agreement confirming the peaceful use of atomic energy must be concluded before any bilateral trade in nuclear technologies can take place. The Abe administration regards exports of nuclear plant equipment as a pillar of its economic growth strategy.

Brazil currently has two nuclear reactors in operation and aims to secure a more stable electricity supply by building more. Energy demand in the country is projected to rise further on the back of rapid economic growth.

Abe signed bilateral nuclear pacts with the United Arab Emirates and Turkey in May, Japan's first such deals since the Fukushima No. 1 plant was crippled by the March 11, 2011, 9.0-magnitude quake and tsunami. Later that month, Japan and India agreed to resume bilateral nuclear talks that also had been suspended since the Fukushima disaster.

During his current visit to Europe, Abe agreed with the leaders of countries including the Czech Republic on bilateral cooperation in the atomic energy sector.

Japan, Brazil likely to agree to resume talks on nuclear development

http://mainichi.jp/english/english/newsselect/news/20130620p2g00m0dm080000c.html

TOKYO (Kyodo) -- Japan and Brazil will likely agree to resume talks on a civil nuclear cooperation pact at a summit meeting next week, a Japanese government source said Thursday, paving the way for Japanese companies to export atomic power generation technology and equipment.

The agreement is expected to come when Prime Minister Shinzo Abe and Brazilian President Dilma Rousseff meet next Thursday in Tokyo to discuss enhancing bilateral economic ties, according to the source.

With two nuclear power plants currently online, Brazil is hoping to increase the number and shift its focus from hydropower to nuclear energy.

Japan and Brazil began talks in January 2011 with an eye to signing a civil nuclear cooperation pact for the peaceful use of nuclear energy.

The talks, however, have been stalled since the nuclear crisis in Fukushima Prefecture, triggered by the devastating earthquake and tsunami in March 2011.

A civil nuclear cooperation pact sets a legal framework for the peaceful use and transfer of atomic-power technologies and equipment as well as nuclear materials to ensure nonproliferation.

Abe hopes to boost exports of nuclear power technologies and equipment as one of the key areas in Japan's growth strategy.

In May, Japan signed civil nuclear power cooperation pacts with the United Arab Emirates and Turkey, and agreed to accelerate talks on such an accord with India.

Japan agreed on Sunday to deepen cooperation in the field of nuclear power with the so-called Visegrad Group of Eastern European nations -- Poland, the Czech Republic, Hungary and Slovakia.

June 17, 2013

Japan to cooperate with 4 central European nations on nuclear energy

http://ajw.asahi.com/article/behind_news/politics/AJ201306170051

THE ASAHI SHIMBUN

WARSAW--In a first-ever summit, Prime Minister Shinzo Abe on June 16 agreed with leaders of four central European nations to advance cooperation in the energy sector in an attempt to boost exports of nuclear reactors.

"Closer ties with the V4 will lead to infrastructure exports, a goal under Japan's economic growth strategy," Abe said after a summit with the Visegrad 4 (V4) regional cooperation framework, consisting of Poland, the Czech Republic, Slovakia and Hungary.

A joint statement released after the summit said Japan needs to contribute to nuclear safety based on lessons learned from the accident at the Fukushima No. 1 nuclear power plant in 2011.

Japan has upgraded its relationship with the V4 from the foreign minister's level, given the fast economic growth of the four member countries. Visegrad is a Hungarian city where Poland, Hungary and the former Czechoslovakia agreed on the grouping in 1991.

The four countries plan to build nuclear reactors in an effort to lessen dependence on Russia for energy resources.

The International Atomic Energy Agency estimates that nuclear power generation capacity in East Europe will increase 1.6 to 2 times in 2030 from the current 49 million kilowatts.

The figure means that 30 to 50 new reactors will likely be built by 2030, putting the region on par with Asia and the Middle East.

The Czech Republic is expected to select a contractor to build two additional reactors at the Temelin nuclear power plant in September at the earliest.

The team of Toshiba Corp. and its U.S. subsidiary, Westinghouse Electric Co., is competing with a Russian company for the contract.

Japanese and French companies are bidding for two reactors in Hungary, while contractors from Japan and five other countries are vying for two reactors in Poland.

When it exports a nuclear reactor, Japan needs to conclude a nuclear energy agreement, which limits the technology to civilian use.

But no such pact will be required for V4 countries because they are members of the European Atomic Energy Community, with which Japan has already concluded a nuclear energy agreement.

In May, Japan basically agreed with Turkey to build a nuclear plant on the Black Sea, the first export of the technology since the Fukushima disaster. It also in May signed a nuclear energy agreement with the United Arab Emirates. However, Abe's push to resume exports of nuclear reactors is not fully supported by the public.

According to an Asahi Shimbun survey in June, 59 percent of respondents said they are opposed to using nuclear reactors proactively to promote economic growth. A midlevel lawmaker of the ruling Liberal Democratic Party warned if Abe pushes exports of nuclear reactors too strongly, it could affect the Upper House election in July.

Apart from the nuclear energy cooperation, the joint statement released after the Japan-V4 summit also called for accelerating negotiations on an economic partnership agreement between Japan and the European Union.

Abe and his counterparts agreed to make preparations for a foreign ministers' meeting on the sidelines of a session of the Asia-Europe Meeting in November. The leaders also agreed to designate 2014 as the year for promoting exchanges between Japan and the V4.

Prior to the summit with the grouping, Abe met with Polish Prime Minister Donald Tusk and agreed to hold a bilateral meeting of defense officials in autumn.

(This article was written by Takayuki Hayashi in Warsaw and Hajime Horiguchi in Tokyo.)

Poland?

June 21, 2013

Poland may delay nuclear reactor operation
http://www3.nhk.or.jp/nhkworld/english/news/20130621_06.html

Polish Prime Minister Donald Tusk says his country may delay the planned operation of the country's first nuclear reactors. A major Japanese company is aiming to win a contract to build the units.

Tusk held a news conference in the capital Warsaw on Wednesday. He said he is not ruling out nuclear in Poland's energy mix, but it would be later than planned.

Tusk cited the high cost of building reactors and the ongoing domestic development of shale gas as reasons.

Constructing the reactors would cost about 15 billion dollars.

Leading Japanese electronics maker Hitachi is seeking to win the deal to build the reactors.
Japanese Prime Minister Shinzo Abe met Tusk on Sunday in Warsaw to promote Japan's nuclear technology.

Poland abandoned building nuclear plants after the Chernobyl accident. The country now relies on coal-fired plants for more than 80 percent of its power.

But the government decided to build 2 nuclear plants on 2 sites due to an expected decrease in domestic coal production and the need to combat global warming. It plans to start operating the reactors in 2024.

"We will enhance the safety of nuclear power plants"

June 20, 2013

Abe states intention to promote nuclear power via energy market, safety reform

Kyodo
http://www.japantimes.co.jp/news/2013/06/20/national/abe-states-intention-to-promote-nuclear-power-via-energy-market-safety-reform/#.UcK2HNhSb9k

LONDON – Prime Minister Shinzo Abe has clarified his intention to promote nuclear power despite the crisis at the Fukushima No. 1 plant, pledging to make efforts to enhance safety at atomic energy facilities.

"The tragedy that hit Fukushima has yet to end. I can't stand still when I think of the difficulties the victims have been facing," Abe said Wednesday during a speech in London. "But we should change the greatest crisis (postwar Japan has faced) into an opportunity to reform the energy market."

"We will enhance the safety of nuclear power plants and continue to contribute to nuclear nonproliferation. Japan, which has led the world in (this field), will not choose a way to retreat" in the face of the March 2011 meltdowns, said Abe, who stopped by the City of London financial district after attending the Group of Eight summit in Northern Island.

[Abe also promised....]

MOX - But what for?

June 27, 2013

Japan unlikely to use MOX fuel in nuclear reactors

http://mainichi.jp/english/english/newsselect/news/20130627p2a00m0na014000c.html

The government is highly unlikely to go ahead with the use of uranium-plutonium mixed oxide, or MOX fuel, in nuclear reactors as it had planned, even though a freighter carrying nuclear fuel reprocessed in France has arrived back to Japan.

Japan possessed 44.3 tons of plutonium, including that stored in Britain and France, as of the end of 2011, according to the Cabinet Office's Atomic Energy Commission (AEC). If used for power generation, each reactor would spend only 0.4 tons of MOX fuel a year.

Therefore, Japan will likely fail to keep an international pledge it made not to possess plutonium that cannot be used because such fuel could be converted to nuclear arms.

Prior to the outbreak of the Fukushima nuclear crisis in 2011, the government had intended to introduce MOX fuel -- produced by extracting plutonium from spent nuclear fuel -- at 16 to 18 reactors by fiscal 2015. However, it is particularly difficult for the use of such fuel in 26 boiling-water reactors, the same type as those at the tsunami-hit Fukushima No. 1 plant, to meet new safety requirements.

Four utilities are expected to apply to the authorities for permission to reactivate 12 of their idled nuclear reactors beginning in July. All of them are pressurized water reactors.

MOX fuel could technically be used in only four of these reactors, according to government officials. The four reactors are the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama power station, the No. 3 reactor at Shikoku Electric Power's Ikata plant and the No. 3 reactor at Kyushu Electric Power's Genkai plant.

Before the outbreak of the Fukushima nuclear crisis, utilities had gained consent from local communities for the use of MOX fuel in 10 reactors, including J-Power's Oma power plant that is under construction. Such fuel had actually been used at four of the reactors including the No. 3 reactor at the Fukushima No. 1 plant until the nuclear disaster.

But the Fukushima reactor was stopped following the disaster and the three others have been suspended for regular inspections. The three still cannot be reactivated in the aftermath of the nuclear crisis.

The use of MOX fuel is an important part of the government's nuclear fuel cycle project in which spent nuclear fuel is reprocessed and reused. While the use of such fuel allows efficient and effective use of plutonium, there are technical problems, such as a decline in the efficiency of control rods used in the operation of the reactors, according to experts.

The Monju prototype fast-breeder reactor, which produces electric power by causing the nuclear fission of plutonium and generates more plutonium than it consumes, had previously been the core of the nuclear fuel cycle project.

However, there is no prospect that the reactor, whose operation had been suspended following a sodium leak in 1995, will be resumed in the foreseeable future because it has come to light that since November last year workers failed to examine more than 10,000 parts of the reactor.

Komeito on nukes

June 29, 2013

Komeito urges caution for nuclear tech exports

http://www3.nhk.or.jp/nhkworld/english/news/20130628_40.html

The leader of Japan's junior coalition partner is expressing caution about exporting nuclear power plant technology.

New Komeito chief Natsuo Yamaguchi told NHK on Friday that the government can decide whether to export the technology if other countries need Japan's expertise and strict safety standards.

But he said the public will not approve of the government taking the initiative in sales promotions.

He also said many people are still unable to return to their homes since evacuating after the accident at the Fukushima Daiichi nuclear power plant in 2011.

Yamaguchi says exporting nuclear technology requires thorough and careful consideration.

Prime Minister Shinzo Abe is eager to promote exports of civilian nuclear technology.

He and Indian Prime Minister Manmohan Singh agreed last month to speed up negotiations on a nuclear cooperation pact that will enable Japan to transfer its technology to India.

Japan has also signed similar deals with Turkey and the United Arab Emirates.

June 28, 2013

Komeito to campaign for nuke phaseout, denies disconnect with LDP

http://www.japantimes.co.jp/news/2013/06/28/national/komeito-to-campaign-for-nuke-phaseout-denies-disconnect-with-ldp/#.UcyP4NhSb9k

by Ayako Mie
Staff Writer

New Komeito, the junior coalition partner of the ruling Liberal Democratic Party, pledged Thursday to push for a nuclear phaseout at the earliest possible date and bolster the Constitution by adding more provisions, a sharp contrast to the LDP's desire to promote atomic power and rewrite the national charter.

But New Komeito officials said the party aims to maintain policy consistency with the LDP while sticking to its core stands, including opposition to revising the war-renouncing Article 9, only to be vague on aspects of nuclear energy and constitutional revision.

Thursday's policies are New Komeito's campaign pledges for the upcoming Upper House election. The party already hammered out the first set of key policies earlier this month.

On atomic power, New Komeito retained its stance from December's Lower House campaign, saying it will strive to achieve a nuclear-free society as soon as possible, including not allowing new nuclear plants to be built.

Asked about the discrepancy with LDP policy, the party stressed that it is in line with the coalition agreement that the government will gradually decrease reliance on nuclear power by capitalizing on renewable energy.

Yet the LDP's platform says the party will scrap the target set by the Democratic Party of Japan, which was in power when the Fukushima meltdown catastrophe started, to phase out all nuclear power by the 2030s. The LDP also pledged to push for the export of nuclear power technology and other infrastructure.

Asked about this gap within the coalition, New Komeito policy chief Keiichi Ishii dodged the question, saying the government is in charge of diplomacy to export atomic power. Ishii also emphasized that New Komeito has not taken a stance on nuclear exports, even though he said earlier this month that exporting nuclear technology could be one way for Japan to make an international contribution.

On the Constitution, New Komeito said it will push to add more provisions, including environmental rights and a clause to achieve decentralization. Yet the party remained vague about Article 96, saying revising this provision should be discussed only within the context of overall reform.

The LDP plan to rewrite the Constitution starts with weakening Article 96, which requires a two-thirds majority vote in both Diet chambers to revise the charter before putting proposed changes before voters.

LDP sole proponent of nuclear future

July 1, 2013

LDP alone in fighting nuclear power exit

JIJI, Kyodo
http://www.japantimes.co.jp/news/2013/07/01/national/ldp-alone-in-fighting-nuclear-power-exit/#.UdB0ZdhSb9k

OSAKA – The ruling Liberal Democratic Party was the sole opponent of abolishing nuclear power in a policy debate involving the secretaries-general of nine major political parties Saturday.

While the representatives of the eight other parties backed ridding Japan of atomic energy generation, LDP Secretary-General Shigeru Ishiba said lawmakers should not mislead the public by calling for a zero-nuclear option. Ishiba said the LDP will aim to reduce the nation's dependence on atomic energy but underscored his party's plans to push for a restart of idled reactors once they are deemed safe.

"If we don't (suggest) ways to reduce dependence on nuclear power, it is not responsible politics," said Ishiba. "(Other parties) should not delude the public by using phrases like 'zero nuclear power.' "

But Ishiba found himself in a minority of one, as the secretaries-general of New Komeito, the LDP's junior coalition partner, and opposition groups including the Democratic Party of Japan and Your Party voiced support for the elimination of all nuclear power plants.

During the debate, held in Osaka ahead of the Upper House election, the secretaries-general were asked to hold up a board with either a circle or a cross to indicate their support or opposition for the zero-nuclear power goal. Ishiba was the only one to hoist a cross in the air.

Among the proponents, Japanese Communist Party Secretary-General Tadayoshi Ichida said it would be inconceivable to restart reactors or export Japan's nuclear technologies given that the disaster at the Fukushima No. 1 plant has yet to be resolved. His Your Party counterpart, Kenji Eda, said it would be irresponsible to bring reactors back online when locations for disposal facilities for spent nuclear fuel have yet to be decided.

Among other issues likely to dominate campaigning for the July 21 House of Councilors poll, the party representatives debated Prime Minister Shinzo Abe's proposed constitutional revision and his government's promotion of nuclear-related exports.

On Abe's plan to water down Article 96 to make it easier to amend the Constitution, the LDP's Ishiba and his Nippon Ishin no Kai (Japan Restoration Party) counterpart voiced support.

But DPJ Secretary-General Goshi Hosono slammed Abe and said efforts should be made to retain the two-thirds majority requirement needed in both chambers of the Diet for any constitutional amendment, as currently stipulated by Article 96.

New Komeito's Yoshihisa Inoue supported him, saying that altering the charter should not be proposed before the public has thoroughly debated the issue.

June 30,2013

LDP only party opposed to moving toward zero nuclear plants

http://ajw.asahi.com/article/behind_news/politics/AJ201306300018

THE ASAHI SHIMBUN

OSAKA--The ruling Liberal Democratic Party separated itself from the nine parties that participated in a public debate on June 29, being the only one that supports the continued use of nuclear power far into the nation's future.

Party executives of the nine major parties that will compete in the Upper House election to be held on July 21 gathered in Osaka to debate various issues, such as economic policy and constitutional revision.

At one point, the nine lawmakers were asked whether they favored moving toward a future when Japan had no nuclear plants in operation.

LDP Secretary-General Shigeru Ishiba was the only one who voted "No."

He pointed out that unless operations were resumed at nuclear reactors "energy costs would increase, carbon dioxide emissions would increase and trade balance would worsen."

Only two reactors are now online as the remaining 48 have suspended operations in the wake of the March 2011 accident at the Fukushima No. 1 nuclear power plant. Four electric power companies plan to apply to the Nuclear Regulation Authority to restart 12 nuclear reactors soon after new stricter safety standards take effect on July 8.

Ishiba criticized the move to eliminate all nuclear plants. "Unless the negative aspects are taken into consideration before thinking about how to reduce the weight of nuclear power generation, we cannot make responsible political decisions," he said.

Even junior coalition partner New Komeito favored moving toward a nuclear power-free future.

All the opposition parties also supported such a goal.

"After the decision is made to eliminate nuclear plants, efforts should be made to encourage research and development as well as other efforts by companies," said Yasuko Komiyama, the Diet affairs committee chairperson for the People's Life Party.

Tadatomo Yoshida, acting secretary-general for the Social Democratic Party, also criticized the LDP's moves toward allowing electric power companies to resume operations at nuclear reactors.

"Last summer demonstrated that electricity could be supplied without operating any nuclear reactors," he said.
Ishiba stressed the progress made by the Abe administration in the six months it has been in office on the economic front through its package of measures, commonly known as Abenomics.

No intention whatsoever to do away with nukes

July 6, 2013

Japanese power firms have no plans to scrap more nuclear reactors: poll

JIJI
http://www.japantimes.co.jp/news/2013/07/06/national/japanese-power-firms-have-no-plans-to-scrap-more-nuclear-reactors-poll/#.UdhrW6xSb9k

Although tighter nuclear safety standards will be implemented Monday, none of the nation's 10 atomic power plant operators is planning to retire any reactors other than those already destined for the scrap heap, a survey showed Saturday.

Due to the huge costs of meeting the new regulations drawn up in light of the Fukushima meltdowns in 2011, the operators had been expected to designate more aging reactors for decommissioning. But some of the operators are even planning to apply for permission to continue running reactors beyond the maximum 40-year limit, the Jiji Press survey found.

Japan's 50 commercial reactors are operated by nine regional utilities and Japan Atomic Power Co. Of this total, seven units are in the process of being dismantled, including reactors 1 to 4 at the crippled Fukushima No. 1 power station.
The operators' reluctance to retire reactors is apparently due to the sky-high decommissioning costs, which are estimated at around ¥55 billion for a 1.1 million kw unit.

The operators would thus have to book huge impairment losses if they decided to scrap more reactors. The oldest reactor in the nation, unit 1 at Japan Atomic Power's Tsuruga plant in Fukui Prefecture, would cost a projected ¥23 billion to dismantle.

"Generally, older reactors have higher risks," said Hideyuki Ban, co-director of the Citizens' Nuclear Information Center.
"If power firms put off decommissioning reactors to secure short-term profits and avoid (massive) losses, that could see the recurrence of a (major) nuclear accident," he warned.

Further away from renewables

July 7, 2013

Japan's growth in renewable energy dims as nuclear strives for comeback

http://ajw.asahi.com/article/behind_news/politics/AJ201307070012

By MARI FUJISAKI/ Staff Writer

The shining light that was once Japan's renewable energy industry is beginning to dim as reality sets in and it faces competition from a rejuvenated nuclear power industry.

The green energy industry was buoyed by the nation's distrust and fear of nuclear power triggered by the 2011 earthquake and tsunami disaster that crippled the Fukushima No. 1 nuclear power plant.

According to a February nationwide survey by the Japan Renewable Energy Foundation, 34 of the 79 solar energy producers who responded said they had given up on at least one solar power project. Roughly 45 percent of those respondents cited difficulties in land procurement, followed by 25 percent who said they had problems joining the power grid.

One such project in Hokkaido, located near the New Chitose Airport, called for a 100-hectare solar power generation facility. The site adjacent to the Abiragawa river remains covered in weeds to this day.

"We call it an April 17 crisis," said Hiroaki Fujii, the 43-year-old executive vice president at SB Energy Corp., a Tokyo-based company that designed the plans.

On that date this year, Hokkaido Electric Power Co. said it would only purchase a total of 400 megawatts of electricity as part of the feed-in tariff system from the so-called mega-solar power plants, each with a generation capacity of 2 megawatts or more. That amounts to turning down as many as 70 percent of the 87 applications to sell it power, filed through March, with a combined output capacity of 1.568 gigawatts.

One Hokkaido Electric official justified the decision: "Our power grid has a limited capacity. Accepting too much power from solar plants, where output levels fluctuate wildly depending on the weather, compromises a stable supply of electricity."

One Sapporo-based real estate company lost money speculating. The company purchased two plots of land to host solar power plants that never materialized. "We were taken in by a renewable energy bubble," the company's president lamented.

Hokkaido is one of the prime choices for hosting renewable energy plants, with solar power in the south of the island and wind power in the north.

"No growth target for renewable energy would be feasible without Hokkaido," said Toru Suzuki, chairman of the nonprofit Hokkaido Green Fund.

The renewable energy feed-in tariff system was introduced in July 2012. It obligates utilities to purchase electricity generated by solar and wind plants at predetermined prices. The then-ruling Democratic Party of Japan initiated the system in a bid to bolster the nation’s renewable energy production, which accounted for less than 2 percent of the total power generation at the time, to 30 percent.

The regional utility's decision to limit its purchases of solar power cannot be assigned to grid capacity alone. The decision was taken in large part due to Hokkaido Electric's expectations that all three idled reactors at its Tomari nuclear power plant will eventually go back online.

Power demand in Hokkaido at its minimum is just 3 gigawatts. The three Tomari reactors have a combined power generation capacity of 2.07 gigawatts, leaving a difference of roughly 1 gigawatt if they

are returned to service. But if utilities revert to relying on nuclear power to levels before the Fukushima disaster, that could leave very little room for the emerging renewable energy industries to grow.

Enter the savior of Japan's nuclear energy sector: Prime Minister Shinzo Abe's growth strategy. The Abe administration is eager to export Japan's nuclear technologies and expertise. Not only did his government help secure a contract to build nuclear reactors in Turkey, but Abe himself, acting as the country's top salesman, visited Saudi Arabia, India and Central Europe to promote Japanese nuclear capabilities.

In late March, a group representing the Japan Atomic Industrial Forum (JAIF) also visited the Sizewell nuclear power plant 160 kilometers northeast of London. The forum's constituent members include power utilities and manufacturers dealing in nuclear technologies.

There are plans to build two more nuclear reactors on the grounds of the Sizewell site.

"Expanding our nuclear operations overseas has come to play a larger role in our perspective since the Abe administration came to power," said Akihiro Matsuzaki, an official in the JAIF Department of International Affairs and a member of the mission to Sizewell. Foundation work is already under way there.

Hitachi Ltd., which acquired Britain's Horizon Nuclear Power Ltd., said it also hopes to boost the annual sales of its nuclear business division from the current 160 billion yen ($1.64 billion) to 360 billion yen by fiscal 2020.

"We will be part of Abenomics (Abe's economic policy)," Hitachi Senior Vice President Tatsuro Ishizuka told a briefing session for investors on June 13.

Parties positions on nuclear power differ

July 9, 2013

Election: Parties are differed on nuclear policy

http://www3.nhk.or.jp/nhkworld/english/news/20130709_15.html

Parties contesting in the July 21st Upper House election have clarified their positions on Japan's nuclear energy policy.

All 50 of Japan's nuclear power reactors are offline except for 2 after the meltdown at the Fukushima Daiichi plant in March 2011. The country's nuclear regulator will decide whether to allow the reactors to resume based on its new safety guidelines. Four power companies applied for the early restart of 5 nuclear plants on Monday.

The ruling Liberal Democratic Party says the government is responsible for providing a steady supply of cheap energy. It says it will make utmost effort to seek understanding of host municipalities to restart the reactors on condition the reactors pass the new safety standards.

The party says it will reduce dependence on nuclear power generation by promoting renewable energy resources.

New Komeito, the LDP's ruling coalition partner, says it will decide whether to restart the reactors after receiving approval from citizens and residents near the reactors. It says it will disapprove the construction of new reactors and will seek a nuclear-free society.

The largest opposition Democratic Party says the opinions of host communities need to be taken into consideration when restarting the reactors. It says all possible measures should be used to halt all reactors in Japan by the 2030s.

The Japan Restoration Party also seeks to reduce dependence on nuclear energy and turn all existing reactors offline by the 2030s.

Your Party says it will also seek to reduce dependence on nuclear power by the 2020s by banning the construction of new reactors and making better use of renewable energy.

The People's Life Party says it will oppose both the resumption of existing reactors and the construction of new ones. It says it will seek to abolish all reactors by 2022 at the latest.

The Japanese Communist Party says it will seek to suspend the resumption of reactors and reactor exports. It is calling for a drastic shift to renewable energy.

The Social Democratic Party opposes resumption of reactors. It says the government should work on a complete resolution of the Fukushima accident and relief of the victims first and foremost.

Green Wind says it won't seek the resumption of reactors and plans to start decommissioning all reactors by 2023.
Jul. 9, 2013 - Updated 03:25 UTC

New emission targets - after restart

July 9, 2013

Japan to study new emissions cut target

http://www3.nhk.or.jp/nhkworld/english/news/20130709_14.html

The Japanese government plans to work out a new target for cutting greenhouse gas emissions, following applications by some nuclear plant operators to restart their reactors.

The Environment Ministry and other bodies plan to come up with a draft emissions target around September. They hope to finalize the plan in time for a UN climate change conference in November.

Japan previously set a target of cutting emissions by 25 percent from 1990 levels by 2020. But the target was scrapped following the March 2011 nuclear disaster at the Fukushima Daiichi power plant.

The country has been relying more on thermal power generation, as all but one nuclear plant in Japan remain offline after the disaster.

On Monday, the operators of 5 nuclear plants, including the one in operation, applied for government screening under new safety guidelines that took effect the same day.

Environment Ministry officials are taking the move into account as they work out the new emissions target. They will estimate the operational status of the plants in 2020 and calculate the emissions target from there.

But some government officials are cautious about setting an emissions target without clear prospects for restarting nuclear plants. Operators need to pass rigorous safety screening and obtain local consent to restart their reactors.

Nuclear deterrence very risky

July 8, 2013

Deterring an Asia nuke race

by Michael Richardson
http://www.japantimes.co.jp/opinion/2013/07/08/commentary/deterring-an-asia-nuke-race/#.UdsySKxSb9k

SINGAPORE – How many nuclear weapons and delivery systems does a country need as an effective deterrent against the threats of attack? Finding an acceptable balance is critically important in Asia, where four of the world's nine nuclear-armed states are located.

The Stockholm International Peace Research Institute (SIPRI) reported in June that all four Asian nations with nuclear weapons — China, India, Pakistan and North Korea — appeared to be expanding their arsenals while the United States, Russia, France, Britain and Israel were either reducing them or holding the number static.

Asia may be sliding into a nuclear arms race, aggravated by underlying tensions and mistrust. As one nuclear weapons state enlarges its arsenal, other regional atomic powers do the same. SIPRI estimated that China, India and Pakistan had each added about 10 warheads to their operational stockpiles in 2012.

Meanwhile, as the SIPRI report noted, each is improving delivery systems: the ballistic or cruise missiles or bomber aircraft that could carry nuclear warheads.

Without mutual restraint in Asia, other regional countries with civilian nuclear reactor experience and the necessary resources and skills could also decide to protect themselves by developing their own nuclear arms. Such potential "threshold" countries include South Korea, Japan, Taiwan, Australia, Indonesia and Vietnam.

Former U.S. Sen. Sam Nunn, a driving force for a nuclear threat reduction group of security specialists and former senior officials from 18 countries, cautions that **when "a large and growing number of nuclear-armed adversaries confront multiple perceived threats, the risk that deterrence will fail and that nuclear weapons will be used rises dramatically."**

Another prominent member of the group, former U.S. Secretary of Defense William Perry, says that there is only a short time left to pull back from the edge of a nuclear precipice. "Asia is an important backdrop for this discussion, as a nuclear-armed North Korea threatens regional stability and could spark a new wave of proliferation," he warns.

Their comments follow a recent call by U.S. President Barack Obama for America and Russia to open new arms control talks to further cut their deployed long-range nuclear arms by as much as one-third.

The last bilateral Strategic Arms Reduction Treaty (START), signed by Moscow and Washington in 2010, requires each nation by 2018 to cap its stockpile of fielded nuclear warheads at 1,550. So under Obama's proposal, a new ceiling could become approximately 1,000 deployed strategic warheads apiece.

Under the current START pact, the two former Cold War adversaries also agreed to limit fielded nuclear delivery vehicles, including bombers and missiles based on land and at sea, to 700, with an additional 100 allowed in reserve.

But the START deal does not cover all nuclear warheads or delivery systems, only those classed as long range. Nor does it encompass all nuclear armed states, although at least 90 per cent of atomic arms belong to the U.S. and Russia.

The SIPRI report estimates that at the start of 2013, eight of the nine nuclear armed nations had approximately 4,400 operational atomic weapons, with nearly 2,000 "in a state of high operational alert."

North Korea was assessed to have perhaps six or eight nuclear bombs, none of them operational. This evidently means they cannot yet be made small enough to be carried by North Korean missiles or bombers.

SIPRI said that if all the nuclear warheads held by the nine nations with atomic weapons were counted, the total would amount to **approximately 17,270 nuclear weapons**, with a variety of short-, medium- as well as long-range delivery systems. The total warhead count includes spares, those in both active and inactive storage, and intact warheads set to be dismantled, as well as operational warheads.

Obama also called for the reduction of U.S. and Russian nonstrategic, or tactical, nuclear weapons in Europe. These have never been officially counted or limited by any international treaty.

One reason Russia gives for being reluctant to negotiate further bilateral nuclear cuts with the U.S. is that some other nuclear-armed countries are strengthening their warhead and missile capabilities. This is an

evident reference to China among others, even though Moscow and Beijing have formed a “strategic partnership” to oppose U.S. and Western domination.

China’s position is that the U.S. and Russia have the overwhelming majority of strategic nuclear weapons and delivery systems, meaning those capable of traveling intercontinental distances and causing massive destruction. So Washington and Moscow should continue to make “drastic” cuts in their stockpiles in a verifiable and irreversible manner.

Cheng Jingye, China’s top envoy to a U.N. nuclear nonproliferation conference, said last year that once this was done, “other nuclear-weapon states, when conditions are ripe, should also join the multinational negotiations on nuclear disarmament.”

But when might that be?

One of the concerns of U.S. critics of Obama’s latest proposals is that China could use any extended new round of START negotiations that involve only America and Russia to enlarge and modernize its own nuclear arsenal in secret. Some U.S. analysts say that this is already happening.

The critics argue that if the size of the U.S. and Russian arsenals keep dropping, China might be able to achieve numerical parity, or near-parity, quite quickly with the today’s two dominant nuclear powers.

Nonnuclear Asian states, such as South Korea and Japan, look to their ally, the U.S., to protect them from nuclear attack under Washington’s extended deterrence policy. If U.S. nuclear strength and resolve appears to be weakening, they might become so alarmed at the heightened nuclear threats they face, whether from North Korea or China, that they would make their own dash for atomic arms.

Supporters of Obama’s proposals dismiss such concerns, saying that Beijing would not want to incur the heavy financial costs of moving beyond minimum credible deterrence and risk triggering a full-scale nuclear arms race in Asia that would threaten China’s own security.

SIPRI estimates that China has about 250 nuclear warheads, compared with 300 for France and 225 for Britain. It reckons that India has 90 to 110 atomic warheads, Pakistan has 100 to 120, and Israel 80.

These are well within minimum credible deterrence limits. Keeping them there will be the key to preventing a post-Cold War nuclear arms race in Asia.

Crucial vote

July 11, 2013

CRUCIAL VOTE: Parties clearly divided on nuclear policy as overall emphasis in campaign declines

-

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307110061

By ATSUSHI HIROSHIMA/ Staff Writer

The nuclear issue is losing energy among candidates of the major parties running in the July 21 Upper House election.

While a clearer division of opinion on nuclear energy policy has emerged, the overall emphasis on that issue during the campaign has also decreased sharply, according to a recent survey of candidates.

The survey was conducted jointly by The Asahi Shimbun and a research team at the University of Tokyo led by Masaki Taniguchi, a professor of Japanese politics.

The results of the survey were compared with a similar one conducted of candidates who ran in December's Lower House election.

That comparison found that candidates of the ruling Liberal Democratic Party have become more inclined toward promoting nuclear energy, while those from the Democratic Party of Japan and New Komeito have become more cautious about resumption of operations at idle nuclear reactors.

Candidates were asked to give their position on a five-grade ranking on two issues related to nuclear policy: the resumption of operations at reactors that have been offline for periodic inspections and the goal of zero-percent electric power generation through nuclear energy by the 2030s.

LDP candidates both in the December Lower House election and this time leaned in favor of resuming operations and opposed the zero-percent objective. However, in the recent survey, there was an increase in the percentages of those who favor resuming operations as well as those who are cautious about pursuing the zero-percent goal.

That finding likely reflects the fact that the LDP has clearly stated in its Upper House campaign platform that it will work toward resumption of nuclear reactor operations.

Candidates for the Japan Restoration Party still tend to oppose resumption of operations and tend to favor a zero-percent goal for nuclear energy. However, like the LDP, candidates for the Japan Restoration Party have moved closer to promotion of nuclear energy this time around.

There has been a major shift among DPJ candidates. While their position on resumption of operations was more neutral in the December Lower House election, a much clearer stance in opposition to resumption has been taken for this election.

The previous stance was a reflection of the fact that the DPJ-led government of then Prime Minister Yoshihiko Noda had approved resumption of operations at two reactors at the Oi nuclear plant in Fukui Prefecture. However, now that the DPJ is in the opposition, candidates have been freed up to take a clear stance that differs markedly from that of the ruling LDP.

New Komeito candidates have become more cautious about a resumption of operations. Candidates from Your Party and New Party Daichi have also strengthened their opposition.

Candidates from the Japanese Communist Party and Social Democratic Party have been consistent in their opposition. All candidates from the People's Life Party and Green Wind are also opposed.

The survey also asked candidates to select the three policy issues they would emphasize during the campaign.
Compared with the December Lower House election, the overall percentage of candidates who said "nuclear power and energy policy" declined from 47 percent to 30 percent.

While only 6 percent of LDP candidates chose that policy issue in the Lower House election, the figure dropped to 4 percent this time.

Even among DPJ candidates, emphasizing nuclear policy has declined from 36 percent to 19 percent, while among New Komeito candidates there has been a decline from 22 percent to 5 percent.

Among Your Party candidates, the number has fallen from 78 percent to 47 percent, while for Japan Restoration Party candidates there has been a decline from 16 percent to 5 percent.

With the much lower interest in nuclear policy, there does not appear to be much discussion of it during the campaign.

Is Masako Mori avoiding the issue of nukes?

July 13, 2013

Reactor restarts haunt Fukushima race

LDP candidate in a jam over Abe reactivation plan

JIJI

http://www.japantimes.co.jp/news/2013/07/13/national/reactor-restarts-haunt-fukushima-race/#.UeGO-qxSb9k

FUKUSHIMA – Masako Mori is concerned about her party's pledge to restart nuclear reactors in Japan.

Mori is facing a bruising battle as the ruling Liberal Democratic Party's candidate for the Fukushima prefectural district in the July 21 House of Councilors election.

The prefecture is home to the No. 1 nuclear plant crippled by the March 2011 earthquake and tsunami. Her rivals include Emi Kaneko of the main opposition Democratic Party of Japan, which pledged to reduce the country's dependence on nuclear energy to zero by the 2030s.

The two women are both incumbent Upper House lawmakers. But only one seat is being contested in the constituency this time as a result of electoral reform.

"This is a tough election, as only one candidate can win," Mori said in a speech in front of JR Fukushima Station on July 4, when campaigning for the election kicked off.

Prime Minister Shinzo Abe, also LDP president, visited the prefecture that day to rally support for Mori. "In a bid to accelerate reconstruction of Fukushima and other parts of the country, I want you all to empower Mori," Abe said.

Before the number of seats in the Fukushima constituency shrank, Mori's re-election was considered a near certainty because she is a member of the Abe Cabinet. In the election six years ago, Kaneko came in first with a margin of 130,000 votes against Mori, who won the other seat in second place.

In addition to the reduction of seats, the Abe government's intention to restart nuclear plants is also casting a shadow over Mori's re-election bid, though strong public support for Abe himself is working in her favor.

Currently, only two of the country's 50 commercial atomic reactors are in operation, while the other 48 have been idled due to safety concerns following the 2011 crisis.

With Fukushima still reeling from the nuclear meltdowns, the LDP's Fukushima chapter pledged to abolish all reactors in the prefecture in its own campaign platform.

While calling for stronger measures to deal with the accident, Mori has refused to state clearly where she stands on the issue of firing up reactors.

"She is attempting to avoid the nuclear reactor restart issue," a senior official on her campaign team said.

Kaneko, for her part, is facing the backlash of public disdain for the DPJ, which relinquished power to the LDP in the House of Representatives election last December.

"The key is how to hold onto the 500,000 votes she won six years ago," a senior official from Kaneko's campaign said.

She has highlighted the DPJ's pledge to reduce the country's dependence on nuclear power in order to set her apart from Mori and win the support of fence-sitters.

Kaneko is also going after the LDP by criticizing gaffes made by the party's policy chief, Sanae Takaichi, who last month said nobody has died due to the Fukushima disaster.

"The country's future cannot be left to the (LDP-led) government, which disregards human life in such a way," Kaneko said in a stump speech in the city of Fukushima on July 4.

Among other candidates, Tomo Iwabuchi, who is running on the Japanese Communist Party ticket, is urging the government to immediately eliminate all nuclear reactors nationwide.

Risks of nuclear terrorism out of control

Beyond Control: Our Loosening Grasp on Nuclear Security

July 12, 2013

http://akiomatsumura.com/2013/07/beyond-control-our-loosening-grasp-on-nuclear-security.html

To most, nuclear security means Iran and North Korea. While these do present global security threats, the intersection of many under-discussed components of nuclear power, such as nuclear waste, reprocessing, and more power plants in the developing world, has the ability to cause major global crisis if not immediately prepared for by military and civilian leaders.

In early July, the UN International Atomic Energy Agency concluded a week long ministerial conference on nuclear security where analysts found, *Bloomberg*'s Jonathan Tirone reported, "Japan's Fukushima Dai-Ichi nuclear plant, whose 2011 meltdowns dislocated 160,000 people, **may provide a new blueprint for terrorists seeking to inflict mass disruption**."

The nuclear industry is burgeoning worldwide. Some 100 new reactors have been proposed to be constructed in coming years, bringing the world total near 600 reactors. This proliferation of nuclear power will tip the balance so the security risks outweigh the benefits and place the world's people in harm's way.

The big business opportunities that go with plant construction and the prestige that comes with being a nuclear power generator cause companies and countries to gloss over potential disaster and proliferation risks.

Many of these new plants will be in developing countries — first-time owners of nuclear power with relatively unstable governments, uncertain security capacities, and higher percentages of unskilled labor. Developed countries — with strong regulatory frameworks, good training programs, and competent engineers, managers, and scientists — have proven several times over that their plants are susceptible to human error or natural disaster. To put it differently, how much do we trust in the disaster response teams of the developing world?

The risks associated with more fissile material in less stable hands are obvious. Terrorists can more easily obtain the material from weaker governments and its greater availability will inevitably lead to less oversight and greater chance of it falling into the wrong hands. Nuclear power plants themselves are also a prime target for terrorists. With more plants under less security, the likelihood of an attack goes up.

All of these risks are surely adequately discussed within the government; they are clear dangers and part of the traditional proliferation conversation.

The security risk I consider greatest, and one that will only multiply as new plants come online, is that presented by spent fuel. Since the inception of nuclear power, governments have faced the conundrum of nuclear waste: no one can find a politically and environmentally sound solution of where to dispose of the highly radioactive material that the electricity-generating process produces. In the United States, much of this highly radioactive material is cooling in pools at the plants or in offsite storage warehouses. Why these pools have not been major terrorist targets remains a mystery.

Fuel reprocessing, which Japan hopes to resume, does not solve the problem and only increases the chance of attack or theft through the shipping of radioactive materials between countries (much of Japan's radioactive material that it would reprocess is held in Europe) and by creating additional plutonium.

The best options for waste disposal are dry casks or burial deep underground. While burying our nuclear fuel is a savvy short term political maneuver, passing our issues onto future generations is highly irresponsible and no real solution at all. Again, if the United States and Europe are still bogged down with the dilemma of waste disposal, will the inchoate democracies of the developing world be able to do better?

There is still a certain awe and mystery shrouding the true impact of nuclear power and a conviction that the short term economic and energy benefits are worthwhile. The main lesson I've taken from the Fukushima accident is the permanence of our current decisions. Any nuclear accident, whether through human error, natural disaster, or terrorist attack, will leave us with radiation and other health risks for a minimum of several hundred years. The nuclear issue we've constructed in the last 70 years will impact our society for hundreds of generations.

When will the United States and international communities recognize the irreversible nature of our actions and mistakes? Frankly, we have let the nuclear issue already get out of control.

Why haven't world political leaders yet asked this simple question?

In democratic system, the military leaders are supposed to be independent from the views of short term of political party line or economic and energy benefits, instead focused solely on national and international security issues. As a military leader, the general is always walking on a tightrope between being a winner or a loser, leading in war and peace. They carry their nation's destiny on their shoulders. It is a time for military leaders to look at the permanence of our current decisions.

Sir Brian Flowers, a prominent British nuclear physicist, pointed out that if nuclear power plants had been built and deployed in Europe before WWII, then large parts of Europe would be uninhabitable today because of conventional warfare and conventional sabotage directed against those nuclear plants.

An insufficient power supply to the plant, whether through terrorism, natural disaster, or human error, would deliver the same end.

Fukushima Shows Nuclear-Terrorism Risks at UN Meeting

http://www.bloomberg.com/news/2013-07-01/fukushima-shows-nuclear-terrorism-risks-at-un-meeting.html

By *Jonathan Tirone - Jul 3, 2013 6:55 PM GMT+0200*

Japan's Fukushima Dai-Ichi nuclear plant, whose 2011 meltdowns dislocated 160,000 people, may provide a new blueprint for terrorists seeking to inflict mass disruption, security analysts said at a United Nations meeting.

The UN's International Atomic Energy Agency convened a weeklong meeting of 1,300 diplomats, scientists and security analysts today in Vienna to examine ways to boost protection against nuclear terrorism. It is the IAEA's first ministerial conference on nuclear security.

"Fukushima sent a message to terrorists that if you manage to cause a nuclear power plant to melt down, that really causes major panic and disruption in a society," Matthew Bunn, a Harvard University professor and former White House adviser, said at a briefing. "All you need to do to do that is cut off the power for an extended period of time."

World leaders have pledged to secure the world's loose nuclear material by 2014 to reduce the likelihood of an atomic attack by terrorists. While national nuclear facilities endeavor to track the millions of pounds of uranium and plutonium that are unaccounted for, some focus has shifted to the threat posed by power plants.

Fukushima "has provided a number of findings and lessons that are also useful for preparations for an incident caused by human hand, such as a terrorist attack at a nuclear power station," said Shunichi Suzuki, Japan's envoy to the meeting.

'Security Problem'

Japan's Atomic Energy Agency will present steps it's taken to boost security against terrorism tomorrow in Vienna. Most of the IAEA conference is taking place behind closed doors.

"Fukushima is a nuclear security problem as much as it was a nuclear safety problem," Kenneth Luongo, who with the U.S. Department of Energy helped secure atomic material in Russia after the Soviet Union disintegrated, said at a briefing.

The IAEA has projected nuclear power is set to expand worldwide even after the March 11, 2011, earthquake and tsunami caused meltdowns and radiation leaks at Tokyo Electric Power Co.'s Fukushima plant.

A nuclear-armed terrorist attack on the port in San Jose, California, would kill 60,000 people and cost as much as $1 trillion in damage and cleanup, according to a 2006 Rand study commissioned by the U.S Department of Homeland Security.

Decommissioned Material

Even a low-level radiological or dirty-bomb attack on Washington, while causing a limited number of deaths, would lead to damages of $100 billion, according to Igor Khripunov, the former Soviet arms-control envoy to the U.S, who's now at the Athens, Georgia-based Center for International Trade and Security.

Because a terrorist needs only about 25 kilograms (55 pounds) of highly-enriched uranium or 8 kilograms of plutonium to improvise a bomb, the margin of error for material accounting is small. There are at least 2 million kilograms of stockpiled weapons-grade nuclear material left over from decommissioned bombs and atomic-fuel plants, according to the most recent estimates by the International Panel on Fissile Materials, a nonprofit Princeton, New Jersey, research institute that tracks nuclear material.

That's enough to make at least 100,000 new nuclear weapons on top of the 20,000 bombs already in state stockpiles.

"The threat of nuclear terrorism is real and serious, and it will endure for the foreseeable future," U.S. Secretary of Energy Moniz Ernest said today in prepared remarks.

Overview

Nuclear terrorism is such a disturbing prospect that we shy away from its details. Yet as a consequence, we fail to understand how best to defeat it. Michael Levi takes us inside nuclear terrorism and behind the decisions a terrorist leader would be faced with in pursuing a nuclear plot. Along the way, Levi identifies the many obstacles, large and small, that such a terrorist scheme might encounter, allowing him to discover a host of ways that any plan might be foiled.

Surveying the broad universe of plots and defenses, this accessible account shows how a wide-ranging defense that integrates the tools of weapon and materials security, law enforcement, intelligence, border controls, diplomacy, and the military can multiply, intensify, and compound the possibility that nuclear terrorists will fail. Levi draws from our long experience with terrorism and cautions us not to focus solely on the most harrowing yet most improbable threats. Nuclear terrorism shares much in common with other terrorist threats--and as a result, he argues, defeating it is impossible unless we put our entire counterterrorism and homeland security house in order.

As long as we live in a nuclear age, no defense can completely eliminate nuclear terrorism. But this book reminds us that the right strategy can minimize the risks and shows us how to do it.

Nukes proliferation

July 15, 2013

Kennedy's nuke prediction more applicable now than ever

http://mainichi.jp/english/english/perspectives/news/20130715p2a00m0na004000c.html

The spread of nuclear weapons is unstoppable, as is the construction of nuclear power plants. We are entering an age of the highest risk of nuclear war, nuclear terrorism, or a nuclear accident in history.

Recently, at a speech in Berlin, U.S. President Barack Obama quoted a part of former President John F. Kennedy's famous Berlin speech from June 26, 1963. It was at the peak of a nuclear war crisis that Kennedy showed a will to overcome the problem and encouraged the people of West Berlin. Obama followed this example, repeating an April 2010 proposal to cut back on nuclear weapons and a call for the eventual end worldwide to such deadly devices.

Speaking of Kennedy, there is a little-known story about him. During the famous 1960 presidential debate where he defeated Richard Nixon, he predicted that "10, 15, or 20 nations will have a nuclear capacity... by the end of the presidential office in 1964." Post-election, he revised his prediction, saying, "I see the possibility in the 1970s of the president of the United States having to face a world in which 15 or 20 or 25 nations may have these weapons."

These predictions proved not to be true. This is because of the Nuclear Non-Proliferation Treaty that went into effect in 1970, which only permitted nuclear weapons to be held by the United States, Russia, Great Britain, France and China, and gradually came to have the agreement of 190 nations.

Four nations -- India, Pakistan, Israel and North Korea -- went on to acquire nuclear weapons, but the total number of nations with the weapons today is only nine. However, the shadow of a possible 10th has appeared -- Iran. This could cause a domino effect of nuclear armament in the Middle East, for Saudi Arabia, Egypt, Turkey, the United Arab Emirates and other countries.

Meanwhile, in the Far East, there are those who say that North Korea could force South Korea and Japan to possess nuclear weapons. It is also possible that forces belonging to the black nuclear market, which was led by Pakistan's nuclear scientist Abdul Qadeer Khan, could help the nuclear armament of more

developing nations or even terrorist groups. Kennedy's prediction of "15 or 20 or 25 nations" possessing nuclear weapons could now come true.

Before Obama's speech, Prime Minister Shinzo Abe met with state leaders from Poland, the Czech Republic, the Slovak Republic and Hungary in Warsaw. He promised technological help to these countries in their plans for more nuclear plants. Since a visit to Vietnam in January, Abe has been singularly focused on selling Japan's nuclear technology.

This cannot be said to be completely without relation to the ongoing international proliferation of nuclear weapons. Take India, for example. Looking into the peaceful use of nuclear technology, this country built nuclear power plants with technology from Canada and other nations. In 1974 it tested a nuclear weapon produced using that very power plant technology, advancing on the road to nuclear armament. The common explanation is that it was prompted by China's nuclear tests and wanted to make a display of force toward neighboring Pakistan.

I do not believe that Abe is the only one trying to export nuclear plant technology. It is also the strategy of the governmental-industrial complexes of Japan, the U.S., France and other countries. If Japan, the U.S. and France do not sell the technology, Russia, China or another country will.

Nuclear weapons and nuclear power plants are inseparable technologies. The peaceful and military uses of the technology are connected. Currently, there are over 400 nuclear reactors operating around the world. Add in those under construction or planned for construction, and there will be almost 600. A policy of exporting more nuclear technology is also a policy that increases the chances of nuclear arms proliferation.

Furthermore, while nuclear power is called a peaceful use of the technology, it generates waste that is beyond people's ability to manage. Can we fully control the nuclear power plants we have sold to the world? The time has come to review from the ground up the assumption that nuclear technology is fine as long as it is used peacefully. (By Takao Yamada, Expert Senior Writer)

Exporting to Jordan

Japanese FM to promote nuclear tech in Jordan

http://www3.nhk.or.jp/nhkworld/english/news/20130715_02.html

Japan's Foreign Minister Fumio Kishida will promote the country's nuclear technology to help Japanese companies win contracts in Jordan.

Kishida plans to visit Israel, Palestine and Jordan later this month to discuss Middle East peace and Japan's economic cooperation with the region.

A Japanese-French consortium is competing with a Russian firm to build a nuclear power plant in Jordan.

Kishida plans to explain to Jordanian ministers that Japan has top-level nuclear technology.

He will also stress that the government and the private sector have been improving the safety of nuclear power generation since the Fukushima Daiichi accident in 2011.

Prime Minister Shinzo Abe is eager to help Japanese firms export their nuclear technology.

When he toured the Middle East in May, he agreed with leaders from Turkey and United Arab Emirates to conclude agreements to transfer nuclear power technology.

Where do nukes stand in the future image of Japanese society?

July 19, 2013

Parties' campaigns should show new society with less nuclear power

http://mainichi.jp/english/english/perspectives/news/20130718p2a00m0na002000c.html

The United States has recently seen a string of decisions to have nuclear reactors decommissioned even though their life-spans have yet to expire. There have been some setbacks to building the first new nuclear plants in more than 30 years in the country. On top of the so-called "shale gas revolution," the Fukushima nuclear disaster has cast a shadow over those plans, with reinforcement of safety measures making nuclear generation more costly than before.

If such a matter-of-course market principle worked in Japan, decisions to decommission reactors may have seen progress by now. **Considering risks faced by Japan as an earthquake-prone country, the future image of a society in which nuclear plants are cut back on should have been the focal point of contention during campaigning for the July 21 House of Councillors election.**

In reality, however, the focus of campaign debates has boiled down to the Liberal Democratic Party (LDP)'s promotion of nuclear plant reactivation versus the opposition camp's "zero nuclear power" policy,

with discussions far from being deepened. Part of the responsibility may lie with the governing party, which has been narrow-minded and obscured the whole picture of the country's energy policy.

If Japan is to observe the 40-year limit defined in the revised Nuclear Reactor Regulation Law and decommission nuclear reactors in Fukushima Prefecture, the country could drastically slash the number of its reactors. There are only a few reactors that could be reactivated under the LDP's policy, considering the risks of earthquakes and locations hosting multiple reactors and repercussions in the event of accidents. Reactor safety of a global-leading standard, which has been sought by the Abe administration, is also costly. If liberalization of electricity and the separation of power generation and transmission progress, the competitiveness of nuclear power generation would further deteriorate.

Faced with these challenges, how many reactors are needed to be reactivated while the public is forced to coexist with the risk of accidents? How are they going to deal with massive amounts of nuclear waste, which would continue to pile up as long as reactors remain online? Isn't the LDP skirting the focal point of contention by not presenting these issues in its campaign debates?

On top of market principles, it is also important to facilitate sufficient investment in energy reforms without underestimating the risks involved in nuclear power generation. Because the "zero nuclear power" policy advocated by opposition parties, if set with target years, should encompass a potential to bring that about, those parties should focus more on that point in their debates.

In spite of many members of the public hankering for zero nuclear power, they can't eradicate misgivings about its possible effects on their lives and the economy apparently because it is hard to imagine the future of alternative energy. However, it is natural for them to find it difficult to envisage a new energy society compared to that with nuclear power, in which colossal amounts of funds and human resources have been invested for so many years.

Opposition parties are urged to highlight the potential of renewable energy, which has been rapidly growing across the globe, the path for nurturing such energy and the effect of energy-saving -- all with conviction. To that end, it may be necessary to ask the public to settle for an increased burden for a certain period of time. Voters, on the other hand, should envisage Japan in the future, instead of only focusing on the near-term economy dependent on nuclear power.

It is also the role of politics to improve a system to rationally proceed with the decommissioning of reactors in case reactors are found to face such risks as being located above active faults. Politicians must also pave the way for drawing the curtain on stalled nuclear fuel cycle programs and dealing with nuclear waste disposal. If the postponement of such issues as the decommissioning of reactors and nuclear waste disposal resulted in helping prolong the lives of aging nuclear reactors it would be an injustice to society. (By Yuri Aono, Editorial Writer)

Mitsubishi won't take the blame in US

July 20, 2013

Mitsubishi to fight nuke plant negligence claim

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201307200018

THE ASSOCIATED PRESS

LOS ANGELES--Mitsubishi Heavy Industries Ltd. will fight Southern California Edison's allegations of gross negligence in the design and manufacture of steam tubes built for the San Onofre nuclear power plant, which has been permanently shut down due to excessive wear in the tubes.

Mitsubishi sent a reply on July 18 to a contract dispute filing from Southern California Edison that said the company “grossly failed to appropriately model” conditions in the steam generators it designed and built, leading to the early retirement of the power plant.

Edison argues that Mitsubishi is liable for costs that could run into the millions or even billions of dollars.

In a statement, Mitsubishi called SCE's contentions “factually incorrect, legally unsound and inappropriate.” The company said it will defend itself through a dispute resolution process.

The steam generators “were designed and manufactured with SCE's full supervision and approval and in accordance with well-established and accepted codes and standards along with our own knowledge and experience plus that of outside experts,” Mitsubishi said.

The plant was shut down last year because of premature wear on thousands of steam generator tubes that carry radioactive water from the plant's twin reactors.

The steam generators were installed in a $670 million overhaul in 2009 and 2010. SCE announced last month that it will be closing the plant for good.

In legal documents, the utility claims Mitsubishi Heavy Industries Ltd. and Mitsubishi Nuclear Energy Systems are liable for the defective generators, along with costs ranging from buying replacement power to the investment in the now-shuttered plant that the company earlier estimated at over $2 billion.

Majority owner SCE and co-owners San Diego Gas & Electric and the city of Riverside “continue to incur significant financial harm as a result of Mitsubishi's total and fundamental failure to meet its obligations,” the filing said.

Mitsubishi said that its contract with SCE limits its liability to around $137 million.

The action represents an early step in what could be a protracted battle over blame for the plant's closure and who should cover the losses.

In a separate case, state utility regulators are considering who should pay for Mitsubishi's replacement generators, ratepayers or shareholders.

A decision could be months, or years, away. Any money Edison recovers from Mitsubishi could reduce the exposure of ratepayers.

What to expect after victory by (pro-nuke) LDP

July 21, 2013

What can be anticipated after the pro nuclear government stands

Posted by **Mochizuki** on July 21st, 2013 ·
http://fukushima-diary.com/2013/07/column-what-can-be-anticipated-after-the-pro-nuclear-government-stands/

House of Councillors election just ended today. Now Japanese people are waiting for the definitive result.

The prompt report says anti nuclear activist, Yamamoto Taro won, at the same time, the pro nuclear party LDP is going to win over half of the seats with the clean government party.

I've not been posting about the political issues on Fukushima Diary because I know what the readers want to know the most is not there.

However, this is a very important thing so I'd like to make one post.

Taro's winning is a bright side but generally the election result is going to be devastating as expected.

Since last election, LDP has been attempting the amendment of national constitute.

Now it is possible for them to do it with the support of a couple of other political parties.

Also, they are forward to restart all the nuclear plants in Japan. It would cause the serious shortage of the plant workers in Fukushima.

The amendment of national constitution enables them to start conscription for the supply of the workers.

Fukushima Diary has been warning about this since last year, and now legally and officially, it's 99% in real.

You may say most of the Japanese people asked for the pro nuclear government.
but they are not aware of the possibility of the conscription.

Moreover, even if they didn't vote for LDP, they must follow their order.

Bukowski said, in democracy, you obey after voting, but in communism, the voting process is curtailed. Fukushima Diary will continue to update the world.

Dashed hopes

July 22, 2013

Utilities cheer LDP victory, nuclear opponents disappointed

http://ajw.asahi.com/article/economy/business/AJ201307220068

THE ASAHI SHIMBUN

The ruling coalition's overwhelming election victory will likely further accelerate moves toward restarting Japan's idle nuclear reactors while dashing hopes for the movement to make the country nuclear-free.

The Liberal Democratic Party, which has been pushing for reactor restarts, and junior coalition partner New Komeito were widely expected to win the Upper House election. Still, those opposed to nuclear energy felt the sting when results were announced on July 21, two years and four months after the start of the crisis at the Fukushima No. 1 nuclear power plant.

"The central government's policy on nuclear power generation will return to the pre-disaster one," said Tatsuya Murakami, mayor of Tokai village in Ibaraki Prefecture, on July 21. "By postponing a solution to the problems resulting from the nuclear accident, the government will do what it wants to do.

"It is disappointing that Japan will not be able to change itself despite the serious accident it caused," he said.

Before the election, Murakami watched moves being made over his objections to restart the only reactor at the Tokai No. 2 nuclear power plant in the village. That reactor started operations in 1978, but it was shut down after being flooded by the tsunami caused by the Great East Japan Earthquake on March 11, 2011.

The quake and tsunami also led to the meltdowns at the Fukushima No. 1 plant, a disaster that prompted the Tokai government to demand the decommissioning of the reactor in the village.

However, the Tokai No. 2 plant's operator, Japan Atomic Power Co., has ignored that demand and started work to bring the reactor online without notifying the village government.

Last month, Japan Atomic Power began installing filter-attached vent equipment and erecting sea walls to meet the Nuclear Regulation Authority's new safety rules on nuclear power generation that took effect on July 8.

On July 11, the company announced its plan to apply to the NRA to restart the reactor.

Four other electric power companies-- Hokkaido Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.--have applied to the NRA to restart 12 reactors at six nuclear power plants.

If approved, the first restart will be the No. 3 reactor at Shikoku Electric's Ikata nuclear power plant in Ehime Prefecture.

Prime Minister Shinzo Abe's LDP pledged during the election campaign to restart reactors that are confirmed safe by the NRA. It said it will make the utmost efforts to obtain the understanding of local governments that host nuclear power plants.

If all 12 reactors are restarted, about 10 percent of Japan's electricity supply will be generated by nuclear power.

"The victory by the LDP will have a positive effect (on the restarts)," said an executive of Kansai Electric Power, which applied to the NRA to restart four reactors at its Takahama and Oi nuclear power plants in Fukui Prefecture. Two reactors at the Oi plant are currently the only ones in the nation that are operating.

After the Fukushima nuclear accident, the Democratic Party of Japan-led government vowed to phase out nuclear energy in Japan by the end of the 2030s.

However, the DPJ was dumped from power in December, replaced by an LDP-led administration that scrapped the nuclear phaseout policy and incorporated "utilization of nuclear power generation" in its economic growth strategy.

The "nuclear power village" of close relations and vested interests among industries, bureaucrats and academics was partly blamed for the measures that failed to prevent the Fukushima disaster. The "village" will regain momentum after reactors are restarted.

Even Tokyo Electric Power Co., the harshly criticized utility that continues to have problems dealing with its crippled Fukushima plant, is trying to join the move toward restarts.

This month, TEPCO announced plans to hasten the restarts of reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture. The company did not offer any advance explanation to the local governments hosting the plant.

The LDP's pro-nuclear stance could also start the ball rolling on construction of new nuclear power plants, such as Chugoku Electric Power Co.'s planned Kaminoseki plant in Yamaguchi Prefecture.

The Abe administration plans to compile its basic energy plan by the end of this year. However, the plan will not include the expected ratio of nuclear power generation to the entire electricity needs.

The government, in fact, said it will spend about 10 years to decide how much of Japan's electricity needs should be supplied by nuclear energy. During that period, operations of nuclear reactors will be restarted throughout the country.

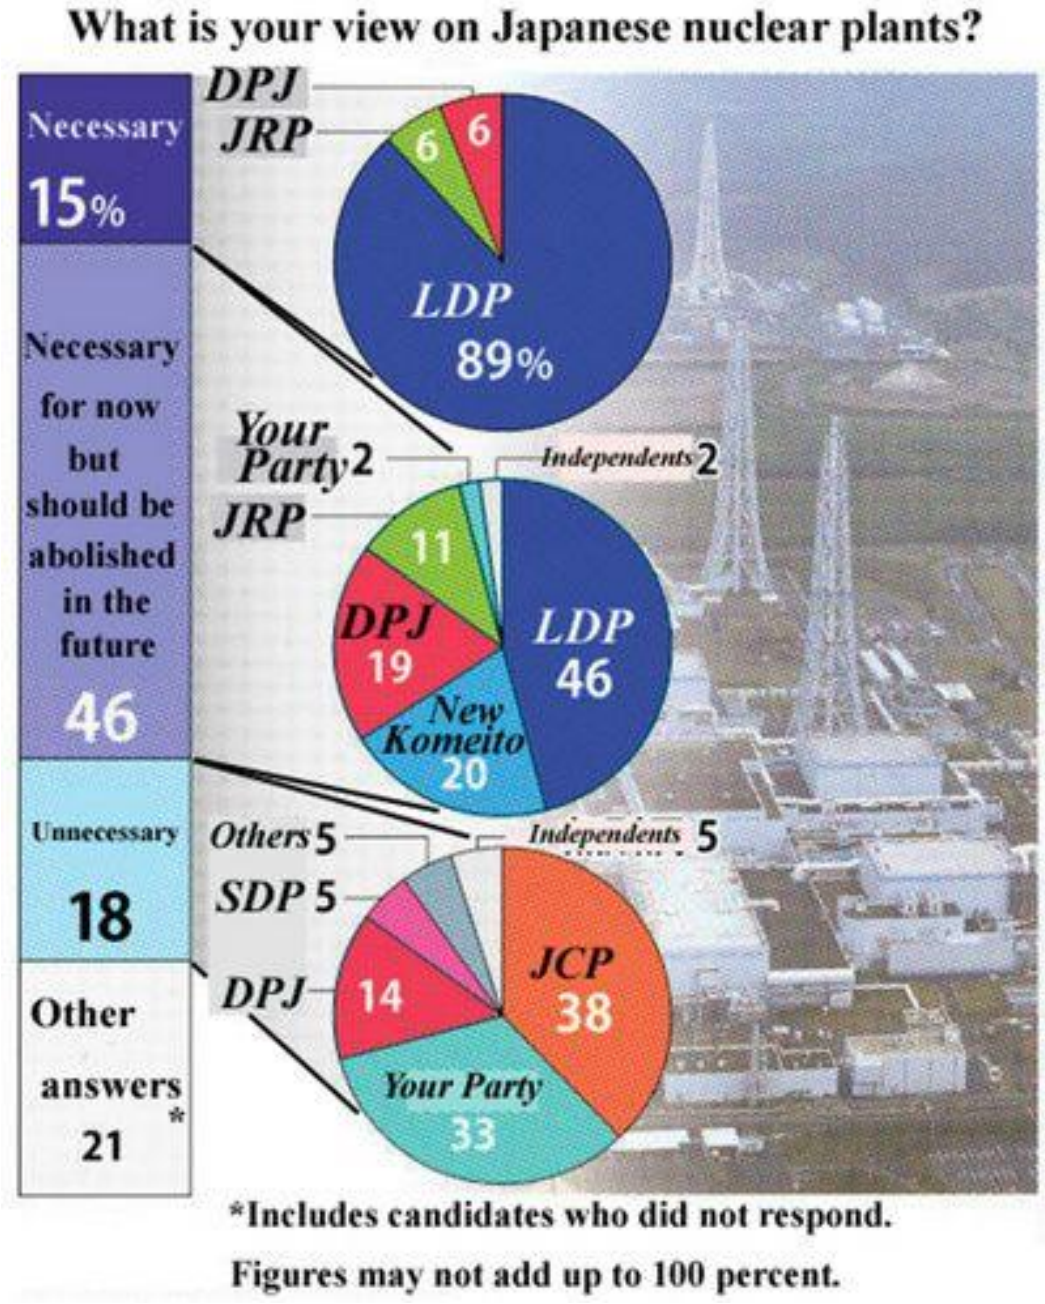
The administration also has yet to examine whether reactors should be decommissioned or whether the costs of nuclear power generation are really lower than those of other methods.

About 150,000 people in Fukushima Prefecture are still living as evacuees from the nuclear disaster.

Nukes - What's behind the elections

July 23, 2013

Only 15% of election winners support need for nuclear plants: Mainichi survey



http://mainichi.jp/english/english/newsselect/news/20130723p2a00m0na015000c.html

Only 15 percent of winners of the July 21 House of Councillors election said Japan needs nuclear power stations, according to a Mainichi Shimbun survey.

Nearly half, 46 percent, said nuclear plants should be eliminated in the future although they need to be retained for now.

The ruling Liberal Democratic Party (LDP) is the only political party that has stopped short of clearly calling for the future elimination of nuclear plants, but only 25 percent of individual LDP winners said Japan needs nuclear plants. Forty percent said nuclear plants should be done away with in the long run although Japan needs to rely on them for the time being.

Only 7 percent of the winners on the ticket of the largest opposition Democratic Party of Japan (DPJ) said nuclear power stations are necessary for Japan, while 67 percent said such power stations should be abolished in the future. Twenty percent said nuclear plants are unnecessary.

All the successful candidates fielded by New Komeito, the LDP's coalition partner, and 75 of those on the ticket of the Japan Restoration Party (JRP) said nuclear plants should be retained for now but abolished in the long run.

All the Japanese Communist Party (JCP) and Social Democratic Party (SDP) winners as well as 88 percent of those on the ticket of Your Party responded that Japan does not need nuclear power plants.

The government intends to review the basic plan on energy, which outlines the nation's energy policy, possibly by the end of this year. The "Japan Revitalization Strategy -- Japan is Back," which the Cabinet of Prime Minister Shinzo Abe approved in June, calls for active use of nuclear reactors whose safety has been confirmed.

Four utilities have applied with the Nuclear Regulation Authority (NRA) for safety inspections on 12 reactors at their six nuclear plants in preparation to restart them. The NRA has already begun inspection procedures.

The government is required to determine how it will characterize nuclear power as its future energy strategy will be called into question.

In the meantime, successful candidates in the upper house election are split over whether Japan should promote the export of nuclear reactors -- with 32 percent calling for the promotion of sales of nuclear reactors overseas and 37 percent opposing the idea.

By party affiliation, 48 percent of LDP winners called for the promotion of nuclear plant exports, well above the 11 percent who were opposed. Similarly, just half of the JRP winners called for the promotion of nuclear reactor exports, while 25 percent were opposed. Nearly half, or 47 percent of the DPJ successful

candidates and 73 percent of New Komeito winners as well all the JCP and SDP winners were opposed to exporting nuclear reactors.

New Komeito leader Natsuo Yamaguchi has suggested the party will approve the export of nuclear reactors with some conditions attached while many of its legislators are wary of such a move. Since Prime Minister Abe is actively promoting the sale of nuclear reactors overseas, New Komeito is expected to support the move to prevent a split within the coalition government.

The survey has also hinted that the upper house is gradually leaning toward considering the possession of nuclear weapons.

Over half, or 64 percent of the overall winners, said Japan should not consider possessing nuclear arms both now and in the future, down 13 points in a survey on winners of the 2010 upper house poll. Nearly one in three successful candidates -- 28 percent -- said Japan should consider arming itself with nuclear weapons depending on the international situation, an increase of 10 points from 2010.

Of successful candidates in the LDP that scored a landslide victory in the election, 46 percent said Japan should consider possessing nuclear arms depending on the international situation, slightly above the 43 percent who were opposed to the idea. Of the 2010 LDP winners, 34 percent are supportive of the idea. The increase apparently reflects the increasingly severe security environment surrounding Japan as a result of the progress in North Korea's nuclear weapons development.

All New Komeito winners said Japan should not consider possessing nuclear arms, highlighting a wide gap in nuclear policy within the ruling coalition.

Among opposition parties, an overwhelming majority, or 93 percent of successful candidates fielded by the DPJ, as well as all Your Party, JCP and SDP winners said Japan should not consider possessing nuclear bombs.

In contrast, over 60 percent of JRP candidates who won the July 21 poll called for considering whether Japan should possess nuclear arms

Editorial: Election result not an endorsement for nuclear power

http://mainichi.jp/english/english/perspectives/news/20130723p2a00m0na010000c.html

Some people might be led to think the landslide victory the Liberal Democratic Party (LDP) registered in the July 21 House of Councillors election gives the party the go-ahead to promote nuclear power. They would be wrong.

Admittedly, the LDP was the only party that did not advance a zero-nuclear policy during its election campaign. The party said it would restart nuclear reactors that had cleared new safety standards, and would do its utmost to win understanding from local bodies in areas where these reactors are located.

But looking at opinion polls to date, there is no mistaking the fact that many people desire a society free from reliance on nuclear power. In a poll by the Mainichi Shimbun before the election, the majority of respondents said they thought that nuclear reactors should not be restarted even if they had passed new safety standards.

In the upper house election, the parties that could accommodate people seeking a society free of nuclear power plants or free from reliance on nuclear power were scattered about. This, and the LDP's failure to bring the full scope of its energy policy into the light, meant there was no deep debate between the ruling and opposition parties over nuclear power. As a result, the public's preferences weren't consolidated.

Still, Japanese Communist Party (JCP) newcomer Yoshiko Kira, and independent newcomer Taro Yamamoto, who both campaigned on a platform of getting rid of Japan's nuclear power plants, won seats in the Tokyo electoral district -- a sign that a significant number of voters were focusing on eliminating nuclear power.

We should remind ourselves that the LDP itself is not actively promoting nuclear power. In the lead-up to the election, Prime Minister Shinzo Abe stated he wanted to "reduce Japan's reliance on nuclear power." And the LDP's coalition partner New Komeito, has called for an end to nuclear power.

That being the case, the LDP now needs to show the public its energy policy in its entirety, and indicate how it will reduce the nation's reliance on nuclear power. It also needs to decide on a course for the nation's nuclear fuel cycle and the disposal of nuclear waste. One starting point is basic policy on energy to be compiled at the end of the year.

The LDP maintains that it will set out to introduce the greatest possible degree of renewable energy over the next three years and decide on the best ratio of nuclear power and other energy sources within the next 10 years. But if it takes 10 years to reach a decision, the party's stance can neither be called a "project" nor a "policy"; it is simply an "outcome."

First the party should unveil its vision for nuclear power and present targets for other sources of energy to fit this mold. If it fails to do this, the desire for renewable energy, highly efficient forms of thermal power and energy conservation will grow weak. Energy and power reforms, such as liberalization of the power market and the separation of power generation and transmission, will also languish. The LDP needs to let the public know that in order to reverse the nuclear power promotion policies that have stood to date, Japan will face a heavier burden for a certain period.

Naturally, the government must avoid rushing to restart nuclear reactors or interfering in the decisions of the Nuclear Regulation Authority. We must not forget that restarting a nuclear reactor is naturally accompanied by a degree of risk.

Diet's recommandations have been ignored (NHK video)

July 26, 2013

Atomic bombing: Never again!

August 5, 2013

Yoroku: In a world drifting toward atomic confrontation, remember Hiroshima and Nagasaki

http://mainichi.jp/english/english/perspectives/news/20130805p2a00m0na004000c.html

Late last month, we saw something ominous during an enormous North Korean military parade in Pyongyang: soldiers in three open-top trucks, backpacks emblazoned with the black and yellow nuclear symbol sitting on their laps. Were those portable atomic bombs?

Until the end of the 1980s, the United States military stocked portable nuclear bombs called SADM, or Special Atomic Demolition Munitions. They each weighed nearly 70 kilograms, but were small enough for a person to wear on their back, if not comfortably. So, were those backpacks we saw during the Pyongyang parade North Korean SADM? South Korea has said that its northern neighbor "doesn't have the technology to make bombs so small," but that unit showing off those nuclear symbols was surely established with nuclear war in mind.

These days, the danger of nuclear war once again feels realistic. North Korea detonated a test warhead in February this year. Soon after, some in South Korea were calling for their own nation to acquire nuclear weapons. During joint U.S.-South Korean military maneuvers in March, the U.S. Air Force deployed B52 and B2 warplanes -- heavy bombers perfectly capable of carrying nuclear weapons if needed.

The North's February A-bomb test brought down the wrath of Pyongyang's only real ally China, which had never criticized similar actions in the past. Meanwhile, the Stockholm International Peace Research Institute has estimated that North Korea built 10 nuclear warheads in 2012. To make matters worse, the institute has also said that the North is steadily increasing its stockpile of ballistic missiles capable of carrying those warheads.

Is humanity really moving closer to nuclear war? In mid-June, U.S. President Barack Obama told a Berlin audience that the world would never be safe as long as nuclear weapons existed, and that the U.S. would

reduce its own atomic arsenal by 1,000 warheads. Obama's call for an end to nuclear arms in his famous speech in Prague four years ago was met with enthusiasm. His Berlin statement, however, mostly failed to resonate.

On Aug. 6 in Hiroshima, and on Aug. 9 in Nagasaki, we will once again remember two days of atomic fire. **Meanwhile, the rest of the world seems increasingly numb to the idea of all-out nuclear warfare**. **And so, 68 years after the destruction of those cities, Japan must redouble its efforts to tell the world what happened on those August days in 1945, what horrors are contained in those terrible weapons.** ("Yoroku," a front-page column in the Mainichi Shimbun)

Abe against nuclear arms?

August 6, 2013

Abe vows pursuit of world free of nuclear arms; Hiroshima mayor skeptical

Kyodo

http://www.japantimes.co.jp/news/2013/08/06/national/abe-vows-pursuit-of-world-free-of-nuclear-arms-hiroshima-mayor-skeptical/#.UgCbnaxSab0

HIROSHIMA – At a ceremony Tuesday marking the 68th anniversary of the U.S. atomic bombing of Hiroshima, Prime Minister Shinzo Abe vowed to do whatever he could to realize a world without nuclear arms and to offer better support to atomic-bomb survivors fighting radiation-caused health problems.

In his speech at the ceremony at Peace Memorial Park near ground zero, Abe also said Japan will maintain its three nonnuclear principles of not producing, possessing or allowing the entry of nuclear weapons into its territory.

This year's commemoration comes as Abe's ruling Liberal Democratic Party, which won a landslide victory in last month's Upper House election, seeks to restart nuclear power plants, sell Japanese nuclear technology abroad and change the nation's pacifist Constitution.

Hiroshima Mayor Kazumi Matsui expressed worries over the government's drive to strike a civil nuclear cooperation deal with nuclear-armed India, saying even if such an agreement "promotes their economic relationship, it is likely to hinder nuclear weapons abolition."

Matsui also urged the central government to strengthen its ties to nations pursuing the abolition of nuclear weapons, noting more and more countries have issued this call.

Matsui made the remark after Japan recently declined to back a statement urging that nuclear weapons never again be used under any circumstances. The statement was prepared in April at a preparatory committee session in Geneva for the next Nuclear Non-Proliferation Treaty review meeting.

Antinuclear groups and other peace campaigners have criticized the government stance, which they believe stems from Japan's reliance on the deterrence offered by the U.S. nuclear umbrella.

But Matsui stopped short of clarifying the city's stance on the appropriateness of nuclear power as an energy source and on amending the Constitution.

He only said, "Hiroshima is a place that embodies the grand pacifism of the Japanese Constitution," and "We urge the central government to rapidly develop and implement a responsible energy policy that places priority on safety and the livelihoods of the people."

Nearly all of Japan's 50 commercial nuclear power reactors remain offline because of the Fukushima plant crisis that began in March 2011.

A moment of silence was observed at 8:15 a.m., the time the atomic bomb detonated over Hiroshima at an altitude of about 600 meters, ultimately killing an estimated 140,000 people by the end of 1945. A second atomic bomb was dropped on Nagasaki on Aug. 9 that year, and Japan surrendered six days later, bringing World War II to an end.

The ceremony was attended by representatives of about 70 countries, including U.S. Ambassador to Japan John Roos as well as Vuk Jeremic, president of the U.N. General Assembly.

Other planned participants included Tamotsu Baba, mayor of Namie, Fukushima Prefecture, Oscar-winning U.S. filmmaker Oliver Stone, who made a documentary series examining why the bombs were dropped, and representatives of nuclear powers Britain, France and Russia. China was not represented at the event for the fifth consecutive year.

Abe, who attended the annual ceremony in 2007 during his first stint as prime minister, said Japan bears responsibility to keep conveying the cruelty of atomic weapons to future generations and beyond the country's borders.

A message from U.N. Secretary General Ban Ki-moon was read out by his proxy, saying, "Together, let us reaffirm our commitment to create a world free of nuclear weapons." It added that would be the "most meaningful way" to pave the way for a better future for all. Ban in 2010 became the first U.N. chief to attend the Hiroshima ceremony, but he has not come since.

Among those who took part from Fukushima Prefecture, Maki Nitto, 30, said that while she had learned about the bombing at school, until the Fukushima disaster caused her to temporarily evacuate, she had "never thought it had anything to do with me."

"Although nuclear power plants and nuclear bombs are different, both nuclear issues have the same roots," said Nitto, who came to the event with friends.

Many hibakusha and others started gathering before daybreak around the park to offer prayers for their relatives and other victims.

One of the early visitors to the memorial monument, a 70-year-old Hiroshima man who identified himself only as Toshikazu, said he lost his uncle, who was 12.

"When I was a child, I didn't like to hear my mother talking about what it was like after the bombing and ran away. But now I think I should have listened to her more. I regret it," he said.

Terumi Manno, 86, who lost "many" of her family members, said she wants to continue to come to pray on Aug. 6 at the memorial "as long as I have breath."

"No matter what happens, I don't want war again. I want people to solve (issues) with words," she said. "We went through the bombing. There is something that can never be understood unless you experience it."

The number of hibakusha from both bombings stood at 201,779 as of March, down 9,051 from a year before. Their average age was 78.80.

Nagasaki mayor Tomihiza Taue: Nuclear weapons "inhumane"

August 9, 2013

Nagasaki mayor calls on Japan to ink statement denouncing nuke weapons

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201308090070

By YASUSHI SAITO/ Staff Writer

NAGASAKI--In a ceremony on Aug. 9 marking the 68th anniversary of the atomic bombing of Nagasaki, Mayor Tomihisa Taue criticized the central government for not signing a joint international statement declaring nuclear weapons "inhumane."

In his Peace Declaration, Taue criticized the failure to sign the international document.

"This stance contradicts the resolution that Japan would never allow anyone else to become victims of a nuclear bombing," the Nagasaki mayor said.

At a session of the Preparatory Committee for the 2015 Nuclear Nonproliferation Treaty Review Conference, held in Geneva in April and May, 80 nations signed the joint declaration, but Japan refused on the grounds it would contradict its policy of reliance on the U.S. nuclear umbrella for national security.

Taue said that refusal was "betraying the expectations of the global society" and pointed out "the government would approve of (the use of nuclear weapons) under some circumstances."

He said such a position goes against the fact that Japan is the only nation to have suffered a nuclear bombing.

Taue also criticized the resumption of negotiations with India for a nuclear energy agreement that would allow Japan to export such technology to India, which has not joined the Nuclear Nonproliferation Treaty.

Taue also touched upon the fact that of the 17,000 nuclear warheads in the world, about 90 percent are possessed by the United States and Russia. He called on the presidents of those two nations to commit "to a speedy, drastic reduction" of their nuclear arsenals.

Taue also quoted from the preface of the Constitution, which states the Japanese people have "resolved that never again shall we be visited with the horrors of war through the action of government" and said that reflected the firm resolution of the people to work for world peace. He said in order to not forget that desire for peace, it would be important to continue to hand down the experiences of war and the atomic bombing.

Taue also mentioned Senji Yamaguchi, a Nagasaki atomic bomb survivor who was a leader in the campaign against nuclear weapons. Yamaguchi died in July. Taue said that highlighted the fact that hibakusha were decreasing in number as their average age has exceeded 78.

Recalling Yamaguchi's speech in which he called for "no more hibakusha," Taue asked young people to listen to what the survivors of the atomic bomb have to say.

A moment of silence was observed by participants at the ceremony at 11:02 a.m., the exact time the atomic bomb detonated over Nagasaki on Aug. 9, 1945.

Prime Minister Shinzo Abe also gave a speech in which he pledged to uphold the three non-nuclear principles and to work toward the abolition of nuclear weapons and for the realization of eternal world peace.

About 5,800 people attended the ceremony. For the first time, India sent a representative. A total of 44 nations were represented, matching the record high.

U.S. Ambassador John Roos attended for the second straight year. The United States has now sent a representative for three straight years.

Over the past year, 3,404 of those who experienced the bombings died, bringing the total number of victims to 162,083.

August 9, 2013

Nagasaki mayor criticizes gov't's refusal to demand that nuclear powers shun nuclear weapons

NAGASAKI -- As Nagasaki marked the 68th anniversary of the atomic bombing in a ceremony on Aug. 9, the city's mayor Tomihisa Taue criticized the national government for its passive attitude toward nuclear disarmament.

In the Nagasaki Peace Declaration presented at the ceremony, Mayor Taue pointed out that during the Preparatory Committee for the 2015 Nuclear Non-Proliferation Treaty (NPT) Review Conference, which was held in Geneva in April, Tokyo had stopped short of signing a joint statement urging that nuclear weapons not be used.

"The Japanese government did not sign (the statement), betraying the expectations of global society," Taue said. "If the Japanese government cannot support the remark that 'nuclear weapons (should never be) used again under any circumstances,' this implies that the government would approve of their use under some circumstances."

Taue also expressed worries about Japan's resumption of negotiations on nuclear power cooperation with India, which is not a party to the NPT.

"Cooperating on nuclear power with India, who has not signed the NPT, would render the NPT meaningless as its main tenet is to stop the increase of the number of nuclear-weapon states," he said. "Japan's cooperation with India would also provide North Korea, which withdrew from the NPT and is committed to nuclear development, with an excuse to justify its actions."

The mayor then urged the central government to take proactive measures to fulfill its duty as the only nation to have suffered an atomic bombing.

Moreover, Mayor Taue expressed grave concern about the moves to revise the war-renouncing Constitution, citing a phrase from the Constitution's preamble which reads, "Japanese people have resolved that never again shall we be visited with the horrors of war through the action of government."

Taue underscored the importance of not forgetting the terrible experiences of war and atomic-bombing. "In order not to forget this original desire for peace, it is essential to impart the experiences of war and atomic devastation to succeeding generations."

He also talked about Senji Yamaguchi, an atomic-bombing survivor, or hibakusha, who died in July this year at the age of 82. Yamaguchi had previously visited the United Nations, where he called for the abolition of nuclear arms, saying, "No more hibakusha."

"Listen to their (hibakusha's) voices," Mayor Taue said, noting that the average age of the hibakusha now surpassed 78. "Please consider whether or not you will allow the existence of nuclear weapons in the world today, and in the future world of your children."

In his address, Prime Minister Shinzo Abe vowed to stick to the three non-nuclear principles of not producing, possessing or introducing nuclear arms, and also promised to contribute to lasting world peace. He stopped short of saying that his government will abide by provisions in the Constitution, however, which he had mentioned in his 2007 Nagasaki speech while he was previously in power.

Moreover, Abe made no mention of his government's nuclear power policy, although prime ministers Naoto Kan and Yoshihiko Noda had declared at the 2011 and 2012 Nagasaki peace ceremonies that their administrations would seek to end Japan's reliance on atomic power.

The ceremony began at 10:35 a.m. at the Peace Park in Nagasaki. It was attended by about 6,300 people, including hibakusha and bereaved families of atomic-bombing victims, as well as representatives from 44 countries.

The attendees offered a silent prayer at 11:02 a.m., when the atomic bomb was dropped in the city on Aug. 9, 1945.

A total of 3,404 hibakusha are confirmed to have died over the past year, bringing the number of Nagasaki atomic-bombing victims to 162,083.

Nagasaki mayor urges government to do more to eliminate nuclear weapons

Kyodo

http://www.japantimes.co.jp/news/2013/08/09/national/nagasaki-mayor-urges-government-to-do-more-to-eliminate-nuclear-weapons/#.UgSeuKxSab0

NAGASAKI – As Prime Minister Shinzo Abe vowed to push for the abolition of nuclear weapons on the 68th anniversary of the U.S. bombing of the city of Nagasaki, Mayor Tomihisa Taue criticized the government Friday for its recent inaction in opposing nuclear weapons and urged it to show leadership as the world's only atomic-bombed country.

"I call on the Japanese government to consider once again that Japan is the only country to have suffered a nuclear bombing," Taue said twice in his latest Peace Declaration delivered at a ceremony in the city's Peace Park, attended by representatives from over 40 countries.

He also said Tokyo's failure to sign a statement rejecting the use of nuclear weapons under any circumstances at an international meeting in April is "betraying the expectations of global society" and "implies that the government would approve of their use under some circumstances."

Taue also expressed worries over the resumption of Japan-India negotiations for a nuclear cooperation agreement, saying such cooperation with India, a de facto nuclear power which has not signed the Nuclear Non-Proliferation Treaty, would render "meaningless" the NPT regime and give North Korea "an excuse to justify" its nuclear development.

Abe, for his part, pledged Japan will make every effort to eradicate nuclear weapons, as he did during a ceremony Tuesday in Hiroshima commemorating the 1945 atomic bombing of the city.

On the government's decision not to endorse the joint statement, which was supported by 80 countries at the preparatory committee session in Geneva for the next NPT review meeting, Abe told a press conference in Hiroshima that "the severe reality in which North Korea has been implementing nuclear development" had an influence.

The speeches at Friday's ceremony came after participants offered silent prayers for the victims at 11:02 a.m., the time the bomb detonated over Nagasaki.

Representing hibakusha, Shohei Tsuiki, 86, who was then 18, said what he saw after the bombing was "just a scene from hell" filled with people without ears and noses, with burned skin dangling from their bodies, or holding their dead children.

"It is obvious that nuclear power and human beings cannot coexist," he said, referring to the Fukushima nuclear crisis as well as the bombings of the two cities. "I ask the government to take action sincerely and proactively toward the elimination of nuclear weapons and nuclear power plants."

Nuclear powers Britain, France and the United States were represented. India was a first-time attendee among de facto nuclear powers that are not NPT signatories.

U.S. Ambassador to Japan John Roos, who became the first U.S. ambassador to attend Hiroshima's memorial ceremony in 2010, also attended the Nagasaki ceremony for the second time.

Three days after Hiroshima was devastated by an atomic bomb dropped by a U.S. B-29 bomber, the United States dropped another on Nagasaki on Aug. 9, 1945. An estimated 74,000 people were killed in the blast and its immediate aftermath in a city with a population of about 240,000.

In his speech, Taue said Nagasaki "supports" U.S. President Barack Obama's desire to seek a nuclear-free world, expressed in Prague in April 2009, and his statement in June this year to work toward a reduction of nuclear arsenals.

But touching on the reality that at least 90 percent of over 17,000 nuclear warheads still in existence belong to either the United States or Russia, Taue said, "President Obama, President (Vladimir) Putin, please commit your countries to a speedy drastic reduction of your nuclear arsenal."

Taue highlighted the importance of imparting the experience of atomic devastation to future generations and called on the government to provide better support for aging hibakusha, while pledging Nagasaki's continued support for the people of Fukushima Prefecture following the meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant that began in March 2011.

Other attendees included Oscar-winning U.S. filmmaker Oliver Stone, who made a documentary series examining why the bombs were dropped, and Foreign Minister Fumio Kishida, a Hiroshima native, who was the first foreign minister to attend the Nagasaki ceremony.

As of the end of March, the number of survivors, or hibakusha, officially recognized by the city stood at 37,574. They had an average age of 78.2 years.

Nagasaki officials confirmed that a total of 3,404 hibakusha died over the past year, raising the official total of registered deaths to 162,083.

Japan's Gov't clearly not ready to sign anti-nuke declarations

August 11, 2013

Japan's reluctance to condemn nukes shows in refusal to sign anti-nuclear declarations
http://mainichi.jp/english/english/newsselect/news/20130811p2a00m0na007000c.html

HIROSHIMA -- By refusing to sign joint declarations against nuclear weapons usage at United Nations meetings since last year, the Japanese government has shown that its reliance on the United States' nuclear umbrella keeps it from taking stronger action against the weapons.

Since 1994, every year at U.N. General Assembly meetings the Japanese government has proposed a resolution for a worldwide end to nuclear weapons. However, it has been unenthusiastic about efforts in recent years, primarily by non-nuke-holding countries, to make concrete progress in eliminating nukes.

According to Yokohama-based NPO Peace Depot, of 21 resolutions at the 2012 U.N. General Assembly that involved nuclear weapons, Japan abstained from voting on four, including one that called for the start of talks to create a nuclear weapons convention. The Japanese government argued that "to accomplish sure

progress on nuclear arms reduction, realistic measures are needed," as it pointed out that nuclear-armed countries were not agreeing to the convention resolution.

Joint declarations calling for work to illegalize nuclear weapons were announced at both the Preparatory Committee for the Review Conference on the Nuclear Non-Proliferation Treaty (NPT) in May last year and at an arms reduction committee at the General Assembly in October. Sixteen countries signed the first declaration and 34 the second, but Japan refused to sign either, as the declaration's call for an immediate end to nuclear weapons is at odds with Japan's defense strategy of using the U.S. nuclear umbrella.

Later, at the second NPT review preparatory committee in April this year in Geneva, Switzerland, a new joint declaration against nuclear weapons was released. In deference to countries relying on nuclear deterrence, this one limited its scope to denouncing the morality of the weapons' use. It received the signature of 80 nations, but Japan again refused to sign.

The Ministry of Foreign Affairs explained that, while it "agrees with the general argument" of the declaration, it had disagreements over some of the particular language. At an April press conference, Chief Cabinet Secretary Yoshihide Suga revealed that Japan had wanted the phrase "under any circumstances" removed from the declaration's sentence, "It is in the interests of the very survival of humanity that nuclear weapons are never used again, under any circumstances."

Associate professor at the Hiroshima Peace Institute of Hiroshima City University and Korean national Kim Mikyoung, 49, views the Japanese response as "overreacting to the threat of North Korea."

"Hiroshima and Nagasaki view peacefulness and an anti-nuke stance as important messages, but I get the impression that is not getting through to the Japanese government," she says.

Other foreigners familiar with Hiroshima were also asked for their opinion. Visiting professor at Hiroshima University, American Suri Jeremy Avril, 40, defended the Japanese government, saying he could understand its reluctance to sign a declaration that conflicted with its reliance on the U.S. nuclear umbrella.

Meanwhile, Arthur Binard, 46, an American-born poet who has written many works about the atomic bomb victims, suggested that people around the world trying to get rid of nuclear weapons may no longer bother to deal with Japan after its refusals to sign the declarations

LDP committee : construction of new reactors should be halted

August 16, 2013

LDP panel to recommend freezing construction of new nuclear plants

http://mainichi.jp/english/english/newsselect/news/20130816p2a00m0na015000c.html

A Liberal Democratic Party (LDP) subcommittee probing the Fukushima nuclear disaster is set to recommend that Japan freeze construction of any new nuclear power plants until it decides how to deal with its spent nuclear fuel.

The subcommittee, part of the LDP's strategic research council on resources and energy, included the suggestion in a proposal it plans to submit to Prime Minister Shinzo Abe this month. The proposal, which also calls to shut down nuclear power plants whose operation is not financially viable, is likely to cause a stir within the Abe administration.

A subcommittee member pointed out that Japan had no final disposal site for the highly radioactive spent nuclear fuel that nuclear plants generate.

"It is not possible for the government to fulfill its responsibility to provide an explanation to the public if it builds new nuclear plants when there is still no final disposal site for spent nuclear fuel -- which is like having an 'apartment with no toilet,' " the member said.

The subcommittee was formed after the outbreak of the ongoing crisis at the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co. (TEPCO). Its proposal expresses reservations about the way TEPCO has struggled to handle the disaster, with contaminated water escaping into the sea. It makes a wide range of proposals, from those governing the handling of contaminated water to the nation's future nuclear power policy.

At its outset, the proposal points out that high radiation levels at the Fukushima plant have hindered inspections of the reactors and associated buildings, and asks the government to further probe the cause of the nuclear disaster.

The tsunami following the March 2011 Great East Japan earthquake has been cited as the direct cause of the nuclear disaster, but the subcommittee's proposal says that **the effects of the temblor on the nuclear disaster should be further investigated**, with specialists on commercial reactors becoming involved in the nuclear regulation agency.

Regarding nuclear policy, the proposal says the construction of new reactors should be frozen, and that operations of reactors that are too expensive to manage due to the high costs of tsunami countermeasures should be halted.

Nuclear deterrence an illusion

August 18, 2013

Global threat of nuclear deterrence

by Ramesh Thakur
http://www.japantimes.co.jp/opinion/2013/08/18/commentary/global-threat-of-nuclear-deterrence/#.UhG6a39Sab0

BEIJING – Nuclear weapons are uniquely destructive and hence uniquely threatening to all our security. There is a compelling need to challenge and overcome the reigning complacency on the nuclear risks and dangers, and to sensitize policy communities to the urgency and gravity of the nuclear threats and the availability of nonnuclear alternatives as anchors of national and international security orders.

The transformation of anti-nuclear movements into coalitions of change requires a shift from street protest to engagement with politics and policy.

A nuclear catastrophe could destroy us anytime. Because we have learned to live with nuclear weapons for 68 years, we have become desensitized to the gravity and immediacy of the threat.

The tyranny of complacency could yet exact a fearful price if we sleepwalk our way into a nuclear Armageddon. It really is long past time to lift the shroud of the mushroom cloud from the international body politic.

Witnessing the first successful atomic test on July 16, 1945, Robert Oppenheimer, director of the Manhattan Project, which developed the A-bomb, recalled the sacred Hindu text the Bhagvad Gita: "If the radiance of a thousand suns were to burst at once into the sky, that would be like the splendor of the mighty one."

Birth and death are symbiotically linked in the Hindu cycle of life. So Oppenheimer recalled too the matching verse from the Gita: "Now I am become Death, the destroyer of worlds."

Let me put seven propositions regarding the role of nuclear weapons for defense and deterrence:

(1) The normative taboo against this most indiscriminately inhumane weapon ever invented is so comprehensive and robust that under no conceivable circumstances will its use against a nonnuclear state compensate for the political costs. We know this from the fact that nuclear powers have accepted defeat at the hands of nonnuclear states rather than escalate armed conflict to the nuclear level.

(2) Against nuclear-armed rivals, they cannot be used for defense. The mutual vulnerability of such rivals to second-strike retaliatory capability is so robust for the foreseeable future that any escalation through the nuclear threshold really would amount to mutual national suicide. Their only purpose and role is mutual deterrence.

(3) However, here too national security strategists face a fundamental and unresolvable paradox. In order to deter a conventional attack by a more powerful nuclear adversary, each nuclear-armed state must convince its stronger opponent of the ability and will to use nuclear weapons if attacked.

But if the attack does occur, escalating to nuclear weapons will worsen the scale of military devastation even for the side initiating nuclear strikes.

Because the stronger party believes this, the existence of nuclear weapons may add an extra element or two of caution, but does not guarantee complete and indefinite immunity for the weaker party.

If, for example, Mumbai or Delhi was hit by another major terrorist attack that the Indian government believed had Pakistan connections, the pressure for some form of retaliation across the border might well prove stronger than the caution about Pakistan having nuclear weapons.

(4) The role of nuclear weapons in having preserved the long peace among the major powers during the Cold War is debatable. How do we assess the relative weight and potency of nuclear weapons, West European integration and West European democratization as explanatory variables in that long peace?

Nor has there been any evidence produced to show that either side had the intention to attack the other at any time during the Cold War, but was deterred from doing so because of nuclear weapons held by the other side.

What is beyond dispute is that the Soviet Union's dramatic territorial expansion across Eastern and Central Europe behind Red Army lines took place in the years of U.S. atomic monopoly, 1945-49; and that the Soviet Union imploded after, but not because of, gaining strategic parity. Therefore, the putative security benefits of nuclear deterrence have to be assessed against the real risks, costs and constraints, including human and system error.

(5) To those who nonetheless profess faith in the essential logic of nuclear deterrence, let me pose a simple question: Would they prove their faith by supporting the acquisition of nuclear weapons by Iran in order to contribute to the peace and stability of the Middle East which at present has only one nuclear-armed state?

The late professor Kenneth Waltz was one of the very few who had the courage of his intellectual conviction to argue that because nuclear weapons contribute to the stability of deterrence, a world of more nuclear-weapon states would be a generally safer world.

(6) It is equally contestable that nuclear weapons buy immunity for small states against attack by the powerful.

It seems highly plausible to postulate that the biggest elements of caution in attacking North Korea — that is, if anyone has such intention in the first place — lies in uncertainty and anxiety about how China would respond, followed by worries about North Korea's conventional capability to hit Seoul and other parts of South Korea. Pyongyang's current arsenal of nuclear weapons and the capacity to deploy and use them credibly is a distant third factor in the deterrence calculus.

(7) Against the contestable claims of utility, there is considerable historical evidence that we averted a nuclear catastrophe during the Cold War as much owing to good luck as to wise management, with the 1962 Cuban missile crisis being the most starkly graphic example of all.

Moreover, compared to the sophistication and reliability of the command and control systems of the two Cold War rivals, those of some of the contemporary nuclear-armed states are dangerously frail and brittle.

Almost half a century after the Nuclear Nonproliferation Treaty was signed, the world is still perched precariously on the edge of the nuclear precipice.

As long as anyone has nuclear weapons, others will want them; as long as nuclear weapons exist, they will be used again some day by design, accident, miscalculation or rogue launch; any nuclear exchange anywhere would have catastrophic consequences for the whole world.

We need authoritative road maps to walk us back from the nuclear cliff to the relative safety of a less heavily nuclearized, and eventually a denuclearized, world.

Ramesh Thakur is director of the Center for Nuclear Non-Proliferation and Disarmament, Australian National University. This is based on a paper delivered at the “Arms Control and Strategic Stability” conference in Beijing. Email: ramesh.thakur@anu.edu.au

Maybe Ukraine can help

August 24, 2013

Japan foreign min. visits Chernobyl to apply insight to Fukushima

http://mainichi.jp/english/english/newsselect/news/20130826p2g00m0dm002000c.html

CHERNOBYL, Ukraine (Kyodo) -- Japanese Foreign Minister Fumio Kishida visited Chernobyl, site of the 1986 nuclear disaster in Ukraine, on Sunday to observe the nuclear power plant and areas surrounding it.

Kishida is expected to apply the lessons of the postdisaster work being conducted there to Japan's ongoing efforts to deal with the aftermath of the crisis at the Fukushima Daiichi nuclear power plant in northeastern Japan, triggered by the massive earthquake and tsunami in March 2011.

"I directly saw that the battle to contain the accident still continues 27 years after the disaster. Ukraine's experience and knowledge serve as a useful reference for workers coping with the Fukushima nuclear crisis," Kishida told reporters accompanying him.

Japan and Ukraine signed an agreement in April last year to cooperate in dealing with nuclear disasters.
The foreign minister viewed the No. 4 reactor at the Chernobyl plant, which exploded in April 1986 and is now enclosed in a concrete sarcophagus, from a distant point guided by the head of the plant.
He also visited a deserted town near the plant from which around 50,000 people evacuated following the disaster.
Kishida heard from the plant chief and other Ukrainian officials about the country's decontamination efforts and measures to ensure nuclear safety.
He is scheduled to meet with his Ukrainian counterpart Leonid Kozhara in Kiev on Monday. He is due to return to Japan on Tuesday.

Kishida visits Chernobyl for insights into bungled Fukushima cleanup

http://www.japantimes.co.jp/news/2013/08/25/national/kishida-visits-chernobyl-for-insights-into-bungled-fukushima-cleanup/#.Uhr0TH9Sab0

Kyodo
CHERNOBYL, UKRAINE – Foreign Minister Fumio Kishida on Sunday paid a visit to Chernobyl, site of the 1986 nuclear disaster in Ukraine, to tour the wrecked nuclear power plant and areas around it. ....

Japan's Foreign Minister visits Chernobyl

http://www3.nhk.or.jp/nhkworld/english/news/20130826_04.html

Japan's Foreign Minister has visited the site of 1986 Chernobyl nuclear accident in Ukraine.

Fumio Kishida said he wants to increase cooperation with Ukraine in the reconstruction of areas affected by Fukushima Daiichi nuclear accident two years ago.

Kishida was shown the concrete and metal sarcophagus that covers the No. 4 reactor.

Ukrainian officials and engineers explained to Kishida how difficult it was to contain radioactive substances immediately after the accident. They said highly radioactive materials are still inside.

Kishida inspected the construction of a dome-like structure that will cover the sarcophagus.

He also visited a deserted town where nuclear plant workers once lived.

Kishida told reporters that he realized the fight to contain the Chernobyl accident continues and that Japan is learning much from what Ukrainians experienced after the accident.

In April 1986, an explosion at the No. 4 reactor of the Chernobyl Nuclear Power Plant became the worst nuclear accident in history.

Soon after the accident, workers built a metal and concrete cover called a sarcophagus to stop radioactive materials from spreading.

In April last year, the Ukrainian government began constructing a new structure to envelop the aging sarcophagus.

The arch is more than 250 meters wide and 105 meters tall. Workers are assembling it about 300 meters from the sarcophagus. Once completed in 2015, the structure will be moved into position on rails.

The cost is estimated at more than a billion dollars. Ukraine is getting support from Japan, the United States and other countries.

Engineers plan to disassemble the reactor in a project that's expected to take 50 years.

27 years have passed since the accident, but radiation levels are still high around the plant. A no-entry zone extends 30 kilometers from the site.

More than 160,000 people were forced to move out of contaminated areas. They live on subsidies from the government.

About 30 firefighters and plant workers died soon after the accident due to acute radiation exposure.

A UN survey suggests many children in the area have developed thyroid cancer. Others have developed heart and circulatory diseases. Some complain of physical disorders, including headaches and dizziness.

The Ukrainian government provides free health checks and other support to about 2 million people.

Cooperation Japan-Ukraine on nukes

August 27, 2013

Japan, Ukraine to jointly tackle nuclear disasters
http://www3.nhk.or.jp/nhkworld/english/news/20130827_07.html

The foreign ministers of Japan and Ukraine have agreed to step up cooperation in studying the effects of the nuclear disasters each country has experienced.

Leonid Kozhara received Fumio Kishida on Monday in Kiev.

The ministers agreed to share knowledge on the disasters at Chernobyl nuclear power plant in 1986 and Fukushima Daiichi plant in 2011.

They also agreed to promote a plan to study the spread of radioactive material in Fukushima using Japanese micro satellites launched with Ukrainian rockets.

Kishida told reporters he hopes Japan and Ukraine can work together to face their challenges.

International help

August 26, 2013

Outside help offered to deal with Tepco debacle

U.S., French experts also ready; water woes escalate

Bloomberg

http://www.japantimes.co.jp/news/2013/08/26/national/outside-help-offered-to-deal-with-tepco-debacle/#at_pco=tcb-1.0&at_ab=-&at_pos=3&at_tot=8

Russia repeated an offer first made two years ago to help Japan clean up its radiation-ravaged Fukushima No. 1 nuclear station, welcoming Tokyo Electric Power Co.'s decision to seek outside help.

As Tepco pumps thousands of tons of water through the wrecked Fukushima station to cool the melted cores of three reactors, the tainted runoff was found to be leaking into groundwater and the ocean. The approach to cooling and scrapping the plant will need to change and include technologies developed outside Japan if the cleanup is to succeed, said Vladimir Asmolov, first deputy director general of Rosenergoatom, Russia's state-owned nuclear utility.

"In our globalized nuclear industry, we don't have national accidents, they are all international," Asmolov said. Since the Liberal Democratic Party took power in December and Shinzo Abe became the prime minister, talks on bilateral cooperation on the Fukushima cleanup have turned "positive" and Russia is ready to offer its assistance, he said from Moscow last week.

After 29 months of trying to contain the radiation from Fukushima's molten atomic cores, Tepco said last week it will reach out for international expertise in handling the crisis. The water leaks alone have so far sent more than 100 times the annual usual release of radioactive elements into the sea, raising concern it will enter the food chain through fish.

The latest leak of 300 tons of highly radioactive water prompted the Nuclear Regulation Authority to label the incident "serious" and question Tepco's ability to deal with the crisis, echoing comments Abe made earlier this month. Zengo Aizawa, a vice president at Tepco, made the call for help at an Aug. 21 briefing in Tokyo.

"It was clear for a long time that Tepco was not adequately coping with the situation," Asmolov said. "It looks like Tepco management were the last to realize this," he said. "Japan has the technologies to do this, but they lacked a system to deal with this kind of situation."

The Fukushima crisis, which started in March 2011, is the world's biggest nuclear disaster since the Soviet Union faced the explosion at Chernobyl in 1986.

Tepco's solution to cooling melted nuclear rods at No. 1 that otherwise could overheat into criticality, or a self-sustained nuclear chain-reaction, has been to pour water over them. That's left more than 330,000 tons of radioactive water in storage tanks at the site, and the amount is growing daily. The water is treated to remove some of the cesium particles in it, which in turn leaves behind contaminated filters.

The sheer quantity of water used is the most involving a crippled nuclear plant since the 1972 London convention banned the dumping of waste and radioactive water into the sea, said Peter Burns, formerly Australia's representative on the United Nations scientific committee on the effects of atomic radiation.

"Until they figure out how to deal with such vast volumes of water, how to manage it, the problem, including leaks, will persist," Burns, a retired radiation physicist, said from Melbourne.

Retaining thousands of tons of radioactive water in tanks was the wrong strategy from the start and Tepco's handling of the task is a "textbook picture of a failure of management," said Michael Friedlander, who has 13 years of experience running U.S. nuclear stations.

The idea of pumping water for cooling was never going to be anything but a "machine for generating radioactive water," Asmolov said. Other more complex methods, such as the use of special absorbents like thermoxide to clean contaminated water and the introduction of air cooling, should be used, he said.

Russia's nuclear company, Rosatom, of which Rosenergoatom is a unit, sent Japan a 5 kg sample of an absorbent that could be used at Fukushima almost three years ago, Asmolov said. It also formed working groups ready to help Japan on health effect assessment, decontamination and fuel management, among others, Asmolov said. **The assistance was never used,** he said.

"Since the arrival of the new Japanese government, the attitude's changed," he said. "So far the talks have been on a diplomatic level, but they are much more positive. And we remain open to working together on this issue. To follow developments, I monitor Fukushima news every morning."

Japan can tap experts in France and the U.S. as well as Russia to help it tackle the situation at Fukushima, he said.

America's long history with atomic research, including the nuclear weapons site at the Hanford Engineer Works in Washington state, has provided expertise in cleaning up contaminated sites, said Kathryn Higley, who heads the nuclear engineering and radiation health physics department at Oregon State University in Corvallis.

"We have individuals that are working on groundwater contamination and using technology and developing new technologies to clean up strontium in groundwater, for example, at the Hanford site," she said. "So there are individuals around the world that have been doing this and certainly they would be more than willing to help in this process."

France's Areva SA had designed a radiation filtration system that was used for several months at the Fukushima site as temporary cover before Tepco installed its own facilities.

Tepco is in talks with a team of retired U.S. government officials who worked on water management after the Three Mile Island accident in 1979, according to Dale Klein, chairman of an advisory panel to Tepco and a former head of the U.S. Nuclear Regulatory Commission

Japan needs global assistance

August 30, 2013

Japan under increasing pressure to accept outside nuclear help

by Eric Johnston
Staff Writer

http://www.japantimes.co.jp/news/2013/08/30/national/japan-under-increasing-pressure-to-accept-outside-nuclear-help/#.UiDFxn9Sb9k

OSAKA – Prime Minister Shinzo Abe, just back from a trip to the Middle East and Africa, where he promoted Japanese nuclear technology, faces mounting international criticism that his administration is not taking the Fukushima crisis seriously and growing calls both at home and abroad for long-term global assistance.

Since Tokyo Electric Power Co. admitted on July 22, the day after Abe's Liberal Democratic Party won a landslide Upper House victory, that radioactive groundwater was reaching the Pacific from the Fukushima No. 1 plant, international media attention has been intense.

Reporters, commentators and a wide range of experts have speculated on worst-case scenarios and warned that the leaks demonstrated the massive problems still to be resolved in dismantling the crippled plant.

For many abroad, the latest revelations only demonstrate yet again that the crisis is too big for either Tepco or the government to handle, and that consulting international experts has to mean going outside Japan's "nuclear power village" or the International Atomic Energy Agency, which, they note, also has a mandate to promote nuclear power.

"Expertise in the areas of hydrology, reactors and civil engineering is needed. But the issue is not whether it's domestic or international. What is needed is nonvested-interest expertise, not the IAEA, Areva (the French nuclear conglomerate) or (companies like) Bechtel. Contractors should come later after deciding what needs to be done," said nuclear opponent Aileen Mioko Smith of the Kyoto-based group Green Action.

Japan recently announced it would seek Russian assistance and advice regarding the recent leaks. Mycle Schneider, a Paris-based energy and nuclear policy consultant who opposes nuclear power, said he welcomes the decision but added that it carries its own problems.

"First, there are too many political and economic biases involved. Second, the complexity of the challenges are such that Japan should make sure it reaches out to the most competent individuals in water management, spent-fuel handling and storage, waste disposal, building integrity and radiation protection," he said.

Last year, Schneider offered a detailed proposal for an international task force for Fukushima. While noting three basic challenges, including site stabilization, protection from radiation and ensuring food safety, his proposal focused only on assistance for stabilizing the reactors.

His proposed task force would be led by two people, one Japanese and the other non-Japanese. There would be a core group of a dozen experts working full time on the project for a minimum of two years. At least half would have no links to the nuclear industry.

Charles Ferguson, president of the Washington-based Federation of American Scientists, agrees Japan should include more experts from other countries. He added that while there is a need to be concerned about the water leaks, it was also important to keep matters in perspective.

"We need to recognize that although 300 tons of contaminated water sounds very serious, it's only about 80,000 gallons, which is much less than the 660,250 gallons used in an Olympic-sized swimming pool. Once this contaminated water has gotten past the plant, there's a substantial dilution of the contamination," Ferguson said.

"Nonetheless, there are concerns fish caught near the stricken nuclear reactor plant could ingest strontium-90 or cesium-137. Monitoring of fish in the surrounding waters needs to be continued. There are many scientific experts in countries like Russia and Norway who have experience in examining marine life in radioactive-contaminated waters."

Ferguson said the role of his organization has been to collaborate with the Maureen and Mike Mansfield Foundation and the Sasakawa Peace Foundation in forming the U.S.-Japan Nuclear Working Group, which published its recommendations about Fukushima earlier this year.

"The U.S. has a special role to play in supplementing Japanese decommissioning and decontamination expertise, given the long American experience in radiological remediation and the unique level of trust

and interoperability between the American and Japanese governments and nuclear industries," the report says.

Japan's reluctance to engage the international community more broadly on Fukushima is the subject of much conjecture. Numerous critics say it is because Tepco and the pro-nuclear LDP are concerned that admitting the problem will make restarting other reactors more difficult.

And many who oppose the Tokyo Olympic bid charge that nobody in the government or the media wants to draw international attention to Fukushima and risk giving the International Olympic Committee an excuse to reject the Japanese bid.

Former Ambassador to Switzerland Mitsuhei Murata, who has written to Abe and U.N. Secretary-General Ban Ki-moon calling for more international involvement in Fukushima and protesting the Olympic bid, sees these reasons as valid.

"The nuclear dictatorship in Japan persists. There's an international strategy to consider that Fukushima did not happen. Japan's media seems to be fulfilling its duty in a way that does not indispose the strong nuclear dictatorship, and has succeeded in creating a 'business as usual' atmosphere," Murata said.

Collider good for Japan - or not ?

August 30, 2013

Collider project needs consensus

http://www.japantimes.co.jp/opinion/2013/08/30/editorials/collider-project-needs-consensus/#.UiGSwX9Sb9k

A panel of a group of scientists who want to invite the International Linear Collider to Japan have decided to promote the Kitakami area of Iwate and Miyagi prefectures as a candidate site. The particle accelerator will cost an estimated ¥830 billion, and the total including particle detection equipment and research will exceed ¥1 trillion.

Particle accelerators have helped expand the frontier of physics. But scientists and politicians who want Japan to host the ILC must present convincing reasons — including the expected economic, scientific, educational and social benefits — to the public and the government to justify the cost. At present the government and the Science Council of Japan are lukewarm about the idea.

The Large Hadron Collider at the European Organization for Nuclear Research (CERN) in the suburbs of Geneva is the largest and most powerful particle accelerator. It consists of a 27 km ring of superconducting magnets with a number of accelerating structures to boost the energy of the particles along the way. In 2012, the LHC helped discover Higgs boson particles. It is theorized that soon after the universe formed, Higgs boson particles filled space and clung to other weightless particles moving at the speed of light— an interaction thought to have made the latter acquire mass.

The ILC will feature a straight, 31 km tunnel. From each end, beams of electrons and positrons will be accelerated to close to the speed of light by means of a series of superconducting accelerating tubes before they are made to collide. The collision will recreate the high-energy environment that existed one-trillionth of a second after the universe was formed 13.7 billion years ago by the Big Bang. The ILC's first task is expected to be accurate measurement and analysis of Higgs bosons. Scientists at the High Energy Accelerator Research Organization in Tsukuba, Ibaraki Prefecture, have accumulated substantial amount experience by running an accelerator that makes electrons and positrons collide.

The ILC is an enormous international project that will require time-consuming negotiations so construction won't begin for five years. Its construction will involve the participation of some 1,000 engineers and researchers from both Japan and abroad, and take 10 years. If research and improvement are taken into account, 40 years will be needed, and there is also a plan to extend the ILC tunnel to 50 km. The project will result in the formation of a community of some 10,000 people, including scientists and their family members.

The panel expects that Japan will have to cover about half the total cost of more than ¥1 trillion, with the remaining shouldered by other countries. But the Science Council of Japan fears that Japan's share of the expenses will reach 80 percent. Given the project's enormous financial cost, the weak state of Japan's economy and the soaring size of its national debt, scientists and politicians must discuss the merits and demerits of hosting the ILC in Japan in a concrete and transparent manner before any final decision is made.

Only one reactor left online

September 2, 2013

Oi reactor halt leaves just one unit still online

Kyodo

http://www.japantimes.co.jp/news/2013/09/02/national/oi-reactor-halt-leaves-just-one-unit-still-online/#.UiR2qn9Sb9k

TSURUGA, FUKUI PREF. – Japan moved closer to another period without nuclear power as one of the nation's two operating reactors was set to be taken offline for routine checks late Monday.

Reactor 3 at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture was scheduled to go offline at around 11 p.m., while reactor 4 at the same plant will be taken offline for checks on Sept. 15.

Kansai Electric Power, serving the region centering on Osaka Prefecture, said Friday that the halt of reactor 3 is unlikely to create an energy shortage this week as the high summer temperatures are expected to ease.

Reactors must undergo periodic inspections every 13 months.
Once the two reactors are halted, all of the nation's 50 commercial reactors again will be offline, repeating a situation that only happened previously after the 2011 start of the Fukushima No. 1 disaster.
For two months starting in May 2012, the nation experienced a period of no nuclear power for the first time in more than 40 years.
Kepco has already applied for the restart of reactors 3 and 4 at the Oi plant after their routine checks end.
But it is not clear when or if the two units can restart, because it is necessary to check to determine if they sit atop active faults, a scenario that could render their further operation illegal.

All Japanese reactors offline in 14 months

September 2, 2013
Japan's online nuclear reactors to be halted
http://www3.nhk.or.jp/nhkworld/english/news/20130902_43.html

The only 2 nuclear reactors online in Japan will soon be shut down for regular inspections. That means all nuclear power generators in the country will be offline for the first time in about 14 months.

Due to the nuclear disaster at the Fukushima Daiichi power plant in 2011, all of Japan's nuclear reactors were offline at one point in the past 2 years.

But last year, Kansai Electric Power Company, the operator of the Ohi nuclear power plant on the Sea of Japan, restarted the facility's Number 3 and Number 4 reactors.

The 2 are the only reactors currently online in Japan.

On Monday afternoon, Kansai Electric began lowering the power output of the Number 3 reactor for regular inspections. The reactor will come to a halt on Tuesday morning.

The plant operator also plans to halt the Number 4 reactor for a regular check on September 15th.

To gain approval for the restart of their offline reactors, Ohi and 5 other nuclear plants are undergoing assessments by the Nuclear Regulation Authority.

How to justify exporting nukes

September 9, 2013

Reactor makers look abroad as home market fizzles

by Kazuaki Nagata
Staff Writer

http://www.japantimes.co.jp/news/2013/09/09/reference/reactor-makers-look-abroad-as-home-market-fizzles/#.Ui4H0H9Sb9k

The Fukushima meltdowns and the continuing radiation crisis may have turned the public off of atomic energy at home, but it's full steam ahead for Prime Minister Shinzo Abe and Japan's heavy industries when it comes to exporting that technology to power-hungry economies abroad.

The marketing push being led by Abe and his Liberal Democratic Party, which brought Japan into the nuclear age, has angered nuclear protest groups, which, like many members of the public, blame the party's cozy ties with big business for setting the stage for the Fukushima meltdown debacle.

Here are some questions and answers about Japan's nuclear technology exports:

How does the process of exporting nuclear plants work?

Landing a contract to build an atomic plant overseas is more complex than a typical business deal because it requires political involvement: The governments of the exporting and host nations must conclude a nuclear cooperation pact to ensure the technology will only be used for peaceful purposes.

Because nuclear technology has weapons potential, strict international laws are applied to its export and import. This means reactor manufacturers must have politicians on their side to pave the way for entering overseas markets.

Once an accord is signed, it is basically an open bid. But in some cases, especially with countries that do not have their own advanced technology, national leaders get involved in the process to offer safety assurances and special deals to boost their companies' bids.

What nuclear cooperation pacts has Japan joined?

The country to date has entered accords with the United States, the United Kingdom, Canada, Australia, France, China, the European Atomic Energy Community (consisting of 28 EU members), Kazakhstan, South Korea, Vietnam, Jordan and Russia.

Abe has recently signed pacts with Turkey and the United Arab Emirates that will be finalized once they are approved by the Diet.

Japan is also approaching Brazil, South Africa and India.

Has Japan been exporting reactors?

Not yet. Japan hasn't exported a single domestically built reactor yet because it's a late-comer to the global nuclear power market.

That changed quickly in October 2006, when Toshiba Corp. succeeded with its blockbuster acquisition of U.S.-based reactor maker Westinghouse Electric Co., kicking off a string of other tie-ups with Japanese companies.

In 2009, Toshiba won an order for two reactors in Texas. In 2010, Vietnam effectively chose Japan for a roughly ¥1 trillion nuclear plant project, although the manufacturer hasn't been selected yet. Hitachi Ltd. subsidiary Horizon Nuclear Power plans to build two or three reactors on Anglesey Island in Wales in the early 2020s.

In May, Abe visited Turkey and signed a deal to build a sprawling nuclear plant on the Black Sea coast. The deal will be given to a Japanese-French consortium that includes Mitsubishi Heavy Industries Ltd, which also builds reactors.

Who are Japan's rivals?

Because nuclear power is complex and sensitive, there are not many competitors.

Japan has three major reactor makers — Toshiba, Hitachi and MHI, who are all looking to expand overseas. The three firms are partnering with overseas makers to get ahead of the competition.

Toshiba bought Westinghouse, Hitachi is allied with U.S. giant General Electric Co., and Mitsubishi Heavy is working with Areva SA, France's biggest nuclear power company.

South Korea has Doosan Heavy Industries, while Russia runs the state-owned Rosatom Nuclear Energy State Corp.

Is nuclear power use expected to grow on a global scale?

Apparently, yes. There are about 400 reactors worldwide, and the Ministry of Economy, Trade and Industry projects that 90 to 370 new reactors will be built by 2030 to support rapid economic growth in emerging countries.

Given the expected increase, is exporting nuclear plants a promising business?

That's actually debatable.

"I think it will be very challenging (for Japanese makers) to keep their nuclear power business strong," said Hitoshi Ikuma, an executive and energy expert at Japan Research Institute.

Ikuma noted that the number of nuclear power plants is expected to grow worldwide, and if Japanese makers compete successfully, it will benefit the nation. But the situation for the domestic nuclear industry has changed drastically since the Fukushima crisis.

In the five decades before the Fukushima disaster, 54 reactors had been built to achieve the government's goal of securing stable sources of affordable energy to ease its dependence on overseas energy imports. Things were going relatively well, Ikuma said.

Three meltdowns later, the nation now faces the prospect of having to cut its dependence on atomic power.

Since there is little likelihood of new reactors being built, reactor makers are looking to sell their technology abroad while maintaining state-of-the-art equipment, but this means engaging in more atomic diplomacy to forge cooperation pacts.

Then there's the matter of competition, not only among themselves but from their Korean and Russian rivals as well.

"It's hard for the manufacturers to predict for certain that they can land deals even if the government backs them," said Ikuma.

A Toshiba spokesman said that his group now feels confident it can be a major global player with world-renowned Westinghouse under its wing.

In light of the Fukushima fiasco, some may question why anyone would want to import reactors from Japan, but Ikuma said Japan was exporting other electricity generating technology, including thermal power plants, long before the disaster, proving their quality and earning buyers' trust.

The crisis at the poorly protected 40-year-old Fukushima plant was more a failure of governance than manufacturing, he said.

What are the risks involved in exporting plants and reactors?

Ikuma expressed concern that if more and more atomic plants are built in emerging economies, there is a greater risk of crises.

He noted that Chernobyl, Three Mile Island and Fukushima all happened in countries whose nuclear technology was considered top class.

"I think that exporting plants and reactors to countries that do not have their own technology to build such equipment increases the risk of accidents," he said.

When signing contracts with overseas customers, the Japanese side will probably have to stipulate the extent to which it will bear liability in the event of a crisis, but this may not cover any notion of moral responsibility, Ikuma said.

Future of nukes as unclear as ever

September 15,2013

ANALYSIS: Future of nuclear energy still clouded even as all reactors go offline

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309150020

THE ASAHI SHIMBUN

Japan is on the verge of being without nuclear power again with the scheduled shutdown of Kansai Electric Power Co.'s No. 4 reactor at the Oi power plant for a regular safety inspection.

With the facility set to go offline late on Sept. 15, all 50 nuclear reactors in Japan will be out of operation.

Given that this will be the first time in 14 months that Japan is fully without nuclear power, questions inevitably are being raised about the future of nuclear energy in this country.

However, the Abe administration has made clear it will allow reactors to resume operations as long as they pass safety inspections. The Nuclear Regulation Authority is now in the process of appraising 12 reactors at six nuclear plants to determine if they meet new stringent standards put in place after the 2011 Fukushima disaster that forced all reactors to shut down in Japan.

The uncertainty about the future of nuclear energy stems mainly from the fact the Abe administration has yet to offer a clear picture of the extent to which Japan will depend on this form of power generation in years to come.

What it has done is to move away from the goal set by the previous Democratic Party of Japan-led government to stop operations at all nuclear plants by the 2030s.

Prime Minister Shinzo Abe has also pitched Japan's nuclear energy technology during trips abroad and helped a consortium of Japanese companies win an order for a 2 trillion yen ($20 billion) contract to build a nuclear facility in Turkey.

At the same time, after Tokyo was awarded the right to host the 2020 Summer Olympics at an International Olympic Committee meeting held in Buenos Aires, Abe said at a news conference: "We will reduce the ratio of electric power generated by nuclear energy. Over about three years, we will make every effort to accelerate the spread of renewable energy sources and promote energy conservation."

But before the government can set a goal for the dependence on nuclear energy, it will first have to secure alternative energy sources. It won't be able to do that until at least next year.

The administration faces an even more immediate challenge: the leakage of radiation-contaminated water from the crippled Fukushima No. 1 nuclear power plant.

After the reactor meltdowns in Fukushima, the electric power industry said that unless other nuclear plants were put back in operation it would be unable to provide the electricity needed, especially during the summer.

The unprecedented nature of the nuclear disaster drove home to households and companies the need to conserve energy. Even though this past summer saw record high temperatures, no blackouts occurred due to an electricity shortage.

As a result, electric power companies were forced to shift the focus of their arguments for resuming operations at nuclear plants. The utilities are now pointing to increases in electricity fees to cover the increased use of thermal power plants to argue that nuclear plants are needed to reduce the cost burden on households.

The higher fuel costs brought about by the shift to thermal plants led six electric power companies to raise rates. Tokyo Electric Power Co. raised the standard monthly rate for households to above 8,000 yen in September, a 30-percent increase from the level before the Fukushima disaster.

Higher fuel costs caused eight of the 10 utilities to record a total net loss of 1.6 trillion yen in fiscal 2012.

Even as electric power companies call for the resumption of operations at nuclear plants to alleviate the burden on households, heightened public concern about nuclear safety coupled with strong opposition to nuclear power generation will make it more difficult to authorize a return to the way things were before the disaster.

Of the 12 reactors for which operators have applied for inspections as a first hurdle to resuming operations, eight have proceeded fairly smoothly in the appraisal process. The evaluation for the No. 3 reactor at the Ikata nuclear plant in Ehime Prefecture could be completed as early as this winter, which might make it the first to resume operations.

However, even if the reactor does pass the evaluation process, the electric power company will still have to gain the consent of the municipalities that host the plant.

In July, TEPCO tried to submit applications for inspections at the No. 6 and 7 reactors at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture. However, Niigata Governor Hirohiko Izumida criticized the rush to resume operations. He also was critical of the new safety standards established by the Nuclear Regulation Authority on grounds the screening was meaningless in the absence of a thorough analysis and evaluation of what caused the Fukushima disaster.

After the 2011 accident, the central government expanded the area for disaster management measures to a radius of 30 kilometers from any single nuclear plant. That means there are now more municipal governments that fall within that radius from which consent has to be gained by utilities before they can resume operations at nuclear plants.

Japan capable of doing without nukes, says Jaczko

September 24, 2013

Ex-top U.S. nuclear regulator counsels end to atomic power

by Kazuaki Nagata
Staff Writer
http://www.japantimes.co.jp/news/2013/09/24/national/ex-top-u-s-nuclear-regulator-counsels-end-to-atomic-power/#.UkHcylM0_9k

The ongoing crisis at the Fukushima No. 1 plant is a sign that the world needs to seriously rethink nuclear safety and consider possibly ending its dependence on atomic power, the former chairman of the U.S. Nuclear Regulatory Commission said Tuesday in Tokyo.

"When you look at what happened around the Fukushima Daiichi (No. 1) area, it's simply unacceptable," as tens of thousands of people have been unable to return to their homes due to radioactive contamination, said Gregory Jaczko, who served as the top U.S. nuclear regulatory official for nearly three years until July 2012.

Given that Japan is extremely prone to earthquakes and tsunami, among other disasters, using nuclear power poses serious risks unless some kind of new technology is created to completely eliminate the possibility of severe accidents, Jaczko told reporters at the Foreign Correspondents' Club of Japan.

However, Jaczko also said that creating such zero-risk technology is next to impossible.

Instead, Jaczko said, he hopes Japan pours its resources and energy into coming up with ways to function without atomic power.

"I think the Japanese people have the ability to do that," he said.

While Japan's atomic watchdog, the Nuclear Regulation Authority, is now examining requests from utilities to restart reactors, Jaczko stressed the importance of getting the public actively involved in the process.

"There needs to be a thorough public debate and a public dialogue to ensure that those decisions" have received as much support from the public as possible, said Jaczko, who headed the NRC when the Fukushima crisis erupted on March 11, 2011.

As for the ongoing issue of tainted groundwater flowing into the ocean at the No. 1 plant, Jaczko expressed befuddlement that the issue has only recently come under the spotlight.

"This was known from the beginning that there would potentially be these contamination problems," he said.

If they say so...

25.09.2013_No234 / News in Brief

Nuclear Growth To Continue Despite Fukushima, Says IAEA

Plans & Construction
http://www.nucnet.org/all-the-news/2013/09/25/nuclear-growth-to-continue-despite-fukushima-says-iaea

25 Sept (NucNet): Growth in nuclear energy following the Fukushima-Daiichi nuclear accident is expected to continue, but at a rate lower than estimated before the March 2011 accident, the International Atomic Energy Agency has said.

In its latest projections for nuclear energy generating capacity the IAEA said this year's low projection indicates 17 percent growth in world total nuclear power capacity by 2030, while the high projection suggests a 94 percent growth, or nearly a doubling in global generation capacity.

The annual projections made since 2011 have indicated that growth has slowed, but not reversed. The 2013 updates, taking into account developments until April 2013, reinforce this conclusion, the IAEA said.

In the 2013 updated low projection, the world's installed nuclear power capacity grows from 373 gigawatts (GW) today to 435 GW in 2030. In the updated high projection, it grows to 722 GW in 2030.

The strongest projected growth is in regions that already have operating nuclear power plants, led by Asian countries, including China and South Korea. From 83 GW at the end of 2012, capacity grows to 147 GW in 2030 in the low projection and to 268 GW in the high projection.

Eastern Europe, which includes Russia, as well as the Middle East, India and Pakistan, also shows strong growth potential. Nuclear capacity grows from 48 GW in 2012, to 79 GW in the low projection and 124 GW in the high projection.

Western Europe shows the biggest difference between the low and high projections. In the low projection, Western Europe's nuclear power capacity drops from 114 GW at the end of 2012 to 68 GW in 2030. In the high projection, nuclear power grows to 124 GW.

In North America, the low case projects a small decline, to 101 GW in 2030, while the high projection shows an increase from 116 GW at the end of 2012 to 143 GW, or a 24 per cent increase.

The IAEA said that over the short term, the low price of natural gas and the promotion of renewable energy sources in some energy policies are expected to impact nuclear growth prospects in several regions of the developed world.

The agency said that over the past year, most countries have finalised their post-Fukushima nuclear safety reviews, providing greater clarity with respect to nuclear power development. "Nevertheless, challenges remain, given that policy responses to the Fukushima-Daiichi accident are still evolving in some key regions," a statement said.

"Once greater certainty about the policy and regulatory responses is established, these projections will likely need to be refined."

The Economist on Japanese nuke future

Electricity in Japan

Power struggle

The shadow of Fukushima, the world's worst nuclear disaster after Chernobyl, hangs over Japan's energy future

http://www.economist.com/news/asia/21586570-shadow-fukushima-worlds-worst-nuclear-disaster-after-chernobyl-hangs-over-japans-energy

Sep 21st 2013 | TOKYO

THIS week Japan's last working nuclear reactor was switched off. At Oi, on the west coast of the country's main island, the closure was supposedly for routine maintenance and safety checks. Yet no firm date is in sight for reopening Oi or any other of Japan's 50 reactors, shut in the wake of the triple meltdown at the Fukushima Dai-ichi plant. Before the earthquake and tsunami of March 2011 turned so much of Japan's world upside down, the country counted on nuclear power for 30% of its electricity—one of the highest proportions in the world. Now it is entirely without nuclear power for only the second time since 1970.

In government since December, the Liberal Democratic Party (LDP) warns of the economic costs of mothballed plants. The industry ministry says that the need to import extra oil, gas and coal to fire conventional power stations will have cost Japan an extra ¥9.2 trillion (about $93 billion) by the end of 2013. A sharply weaker yen and higher oil prices have not helped, and Japan is now running trade deficits for the first time in three decades. Businesses and consumers face much higher electricity costs in Japan than in many countries.

The cosy community of electricity utilities, bureaucrats, academics and heavy industry, known in Japan as the "nuclear village", is urging the LDP to restart the reactors. The prime minister, Shinzo Abe, would love to oblige. Earlier this year his government purged an energy-policy board of anti-nuclear types. The street demonstrations in Tokyo against nuclear power that took place in the wake of the Fukushima disaster were dwindling. The way had seemed open to fire up the reactors again.

It will not prove so simple. For one, a new, strengthened nuclear agency, the Nuclear Regulation Authority (NRA), must declare any plant safe before it starts—and several sit on or near active faults (Japan accounts for a fifth of the world's big earthquakes). In addition, the law gives towns and villages a say over nearby plants, and most Japanese want to ditch nuclear power for good. To cap it all, news of the mess at the stricken Fukushima plant gets no better. Recently, it transpired that hundreds of tonnes of radioactive water were leaking each day into the Pacific.

So Mr Abe has to tread carefully. If the NRA rules that Japan's oldest and riskiest plants may not reopen, the LDP can do nothing about it. Although the understaffed agency has come under political pressure, including to speed up the publication of new safety rules, it is making a stand over reactors on active faults.

Nor can the prime minister easily overcome public opposition. Local towns that play host to nuclear plants are not the problem: in the past, the government and the power utilities conspired to site power stations in isolated, economically deprived places that could be bought off with largesse. Several of these towns are clamouring for the reactors to restart. But in places a little farther afield, opposition mounts. Hirohiko Izumida, governor of Niigata prefecture on the main island's north-west coast, says that around 70% of the prefecture's population are against starting the reactors at Kashiwazaki-Kariwa, the world's biggest nuclear plant. Mr Izumida says that governors do not have the power to block restarts once the NRA has given the go-ahead. Yet overriding popular local politicians would take bravado from the government and the utilities.

Besides, the LDP itself contains many more critics of nuclear power than it did before March 2011, countering the influence of nuclear backers such as the economy minister, Akira Amari. They think that starting the reactors could become a liability before the next general election, due in 2016. The LDP's anti-nuclear coalition partner, New Komeito, also constrains the government somewhat. Meanwhile, rising business optimism appears to undermine the case that economic recovery depends on nuclear power. Probably no more than 12-15 reactors will be switched back on, says Kazuhiro Ueta, a renewable-energy specialist who sits on the government's energy-advisory board. For the nuclear village, which once expected to supply at least half of Japan's power, that would be a grave disappointment.

Instead, Japan is preparing for other long-term energy supplies. Since 2011 the number of independent power producers tapping renewable sources, such as solar power, has tripled, thanks in part to a new "feed-in" tariff system for renewables. Including hydro-electricity, renewables now represent 10% of the energy mix, leading to hopes that they might one day replace the share that nuclear power once claimed.

Yet scepticism is warranted. The power grids are still owned by the big utilities, which can find excuses to deny access. And where in a crowded, mountainous country to put all the needed solar panels and wind turbines? Paul Scalise of Tokyo University says that a square metre (10.8 square feet) of land devoted to wind power generates just two watts of power. For solar power, the equivalent area generates 20W. Nuclear power generates about 1,000W a square metre.

For a long time to come, therefore, Japan will turn to oil, gas and coal to make up most of the nuclear shortfall. In May the government won American approval for imports of cheap shale gas from the United States. That could handily slash the cost of energy imports and alleviate concerns about energy security.

The cranking-up of fossil-fuel power stations, many working at well under capacity before March 2011, is one reason why the predictions of widespread black-outs never came about after the Fukushima scare.

But another reason was the room for conserving energy. Tokyo alone has slashed electricity consumption by a tenth since 2011, according to the Japan Renewable Energy Foundation. The demand for power-saving devices has leapt. Sales of light-emitting diodes (LEDs) have shot up from 3% of all Japanese bulbs sold in 2009 to over 30% today. By 2015, says the head of Philips Electronics Japan, Danny Risberg, incandescent and fluorescent lights will be nearly a thing of the past.

Long-overdue proposals to liberalise the electricity market may do much to diversify energy sources and lower electricity bills. The government's plan, easier to push through now that TEPCO, the biggest utility, has been brought low by its handling of the Fukushima fiasco, is to split generation and transmission, with the residential electricity market open to new competition. If the reform succeeds, says Hiroshi Takahashi of the Fujitsu Research Institute in Tokyo, the share of nuclear power in the energy mix would fall as new, non-nuclear providers won customers. It would, at long last, give the public some say over Japan's energy choices.

Growth in nuclear industry expected to continue (NucNet)

25.09.2013_No234 / News in Brief

Nuclear Growth To Continue Despite Fukushima, Says IAEA

Plans & Construction
http://www.nucnet.org/all-the-news/2013/09/25/nuclear-growth-to-continue-despite-fukushima-says-iaea

25 Sept (NucNet): Growth in nuclear energy following the Fukushima-Daiichi nuclear accident is expected to continue, but at a rate lower than estimated before the March 2011 accident, the International Atomic Energy Agency has said.
In its latest projections for nuclear energy generating capacity the IAEA said this year's low projection indicates 17 percent growth in world total nuclear power capacity by 2030, while the high projection suggests a 94 percent growth, or nearly a doubling in global generation capacity.

The annual projections made since 2011 have indicated that growth has slowed, but not reversed. The 2013 updates, taking into account developments until April 2013, reinforce this conclusion, the IAEA said.

In the 2013 updated low projection, the world's installed nuclear power capacity grows from 373 gigawatts (GW) today to 435 GW in 2030. In the updated high projection, it grows to 722 GW in 2030.

The strongest projected growth is in regions that already have operating nuclear power plants, led by Asian countries, including China and South Korea. From 83 GW at the end of 2012, capacity grows to 147 GW in 2030 in the low projection and to 268 GW in the high projection.

Eastern Europe, which includes Russia, as well as the Middle East, India and Pakistan, also shows strong growth potentiWestern Eural. Nuclear capacity grows from 48 GW in 2012, to 79 GW in the low projection and 124 GW in the high projection.

Western Europe shows the biggest difference between the low and high projections. In the low projection, Western Europe's nuclear power capacity drops from 114 GW at the end of 2012 to 68 GW in 2030. In the high projection, nuclear power grows to 124 GW.

In North America, the low case projects a small decline, to 101 GW in 2030, while the high projection shows an increase from 116 GW at the end of 2012 to 143 GW, or a 24 per cent increase.

The IAEA said that over the short term, the low price of natural gas and the promotion of renewable energy sources in some energy policies are expected to impact nuclear growth prospects in several regions of the developed world.

The agency said that over the past year, most countries have finalised their post-Fukushima nuclear safety reviews, providing greater clarity with respect to nuclear power development. "Nevertheless, challenges remain, given that policy responses to the Fukushima-Daiichi accident are still evolving in some key regions," a statement said.

"Once greater certainty about the policy and regulatory responses is established, these projections will likely need to be refined."

Koizumu urges ending nuclear generation

September 29, 2013

Former Prime Minister Koizumi urges Abe to end nuclear power immediately

http://ajw.asahi.com/article/behind_news/politics/AJ201309290107

By HISANORI IMAMURA/ Staff Writer

Former Prime Minister Junichiro Koizumi said that Japan should immediately pull the plug on nuclear power before it is too late, and left the responsibility at the doorstep of current Prime Minister Shinzo Abe.

Koizumi told Your Party head Yoshimi Watanabe and other leaders at a dinner that Abe and other officials should demonstrate leadership in ending nuclear power generation.

"I will be dead decades from now and may not be able to see a Japan without nuclear power plants," the former prime minister was quoted as saying by one of the participants at the event in Tokyo on Sept. 27. "But making it happen is what a true statesman should do."

Koizumi, 71, who was in office from 2001 and 2006, expressed disappointment that Abe is not steering the nation toward a nuclear-free future. Abe succeeded Koizumi as prime minister in 2006 in his first stint in office, which lasted less than a year, before returning to power in December after his Liberal Democratic Party swept the Lower House election.

"Abe is gathering momentum as a leader," Koizumi is reported as saying. "Japan will be able to make progress in moving away from nuclear power only once he decides on it. That is unfortunate."

Koizumi spoke of details of his visit to Finland in August, where he toured the Onkalo repository, the final disposal site for highly radioactive spent nuclear fuel. The facility is expected to store the nuclear waste for 100,000 years until it is neutralized.

Koizumi stressed the importance of ending nuclear power generation in Japan quickly in light of the problem of the final disposal of the spent fuel, referring to the volume generated by Japan's 50 reactors, compared with Finland's four.

Koizumi and Watanabe talked for four hours at the dinner. The Your Party leader said he was greatly encouraged by the former prime minister's views.

Koizumi: "It is irresponsible to pursue nuclear power"

October 2, 2013

Ex-PM Koizumi raps gov't push for nuclear power as 'irresponsible'

http://mainichi.jp/english/english/newsselect/news/20131002p2g00m0dm037000c.html

NAGOYA (Kyodo) -- Former Japanese Prime Minister Junichiro Koizumi criticized the government's push to restart nuclear power generation and urged it to reconsider.

"It is irresponsible to pursue nuclear power when there is no permanent disposal site for radioactive waste," Koizumi said at a lecture in Nagoya, Aichi Prefecture.

The government under Prime Minister Shinzo Abe has retracted its predecessor's goal of phasing out nuclear power and opened the way for the restart of idled reactors.

The former prime minister, who appointed Abe as his chief Cabinet secretary, said that during his time as a lower house lawmaker, he believed expert opinion that nuclear energy is environmentally friendly and the cheapest source of power.

Following the March 2011 earthquake and tsunami, and subsequent nuclear crisis, he said, "I started having doubts about whether (nuclear power) is really safe and cheap."

"Japan can still stand even without nuclear power plants," Koizumi said, calling on the government and ruling Liberal Democratic Party to take the initiative in pursuing a policy that does not depend on nuclear plants.

Koizumi said that after visiting Germany and seeing the way the country is pursuing renewable energy, he changed his mind and wants Japan to make use of natural energy sources.

Currently, all of Japan's 50 commercial reactors are offline and have to be checked by the Nuclear Regulation Authority to determine whether they satisfy a set of new safety requirements before they can be restarted.

October 02, 2013(Mainichi Japan)

Ex-PM Koizumi raps government push for nuclear power as 'irresponsible'

Kyodo

http://www.japantimes.co.jp/news/2013/10/02/national/ex-pm-koizumi-raps-government-push-for-nuclear-power-as-irresponsible/#.UkvZ11M0_9k

NAGOYA – Former Prime Minister Junichiro Koizumi criticized the government's push to restart nuclear power generation and urged it to reconsider.

"It is irresponsible to pursue nuclear power when there is no permanent disposal site for radioactive waste," Koizumi said at a lecture in Nagoya.

The government under Prime Minister Shinzo Abe has retracted its predecessor's goal of phasing out nuclear power and opened the way for the restart of idled reactors.

The former prime minister, who appointed Abe as his chief Cabinet secretary, said that during his time as a Lower House lawmaker, he believed expert opinion that nuclear energy is environmentally friendly and the cheapest source of power.

But the March 2011 earthquake and tsunami, and subsequent nuclear crisis, changed his mind. "I started having doubts about whether (nuclear power) is really safe and cheap," he said.

"Japan can still stand even without nuclear power plants," Koizumi said, calling on the government and Liberal Democratic Party to take the initiative in pursuing a policy that does not depend on nuclear plants.

Koizumi said that after visiting Germany and seeing the way the country is pursuing renewable energy, he changed his mind and wants Japan to make use of natural energy sources.

Currently, all of Japan's 50 commercial reactors are offline and have to be checked by the Nuclear Regulation Authority to determine whether they satisfy a set of new safety requirements before they can be restarted.

Koizumi's argument reasonable

October 3, 2013

VOX POPULI: Koizumi's anti-nuclear stance strikes a chord

http://ajw.asahi.com/article/views/vox/AJ201310030030

Vox Populi, Vox Dei is a daily column that runs on Page 1 of the vernacular Asahi Shimbun.

Comments by famous politicians who have retired from the front lines tend to be viewed as having been made with an ax to grind. If the politician is a former prime minister, it's pretty much certain that he will come under scrutiny for making any controversial remarks. But in this instance, I wish to listen carefully to what former Prime Minister Junichiro Koizumi said.

I am referring to his Sept. 27 comment calling for a nuclear-free Japan. He also made his anti-nuclear stance clear in a lecture he gave in Nagoya on Oct. 1. With regard to the argument that Japan may do away with nuclear power generation in the future but not now, Koizumi said, "The sooner the government comes up with a policy for the abolition of nuclear power plants, the sooner companies and citizens can prepare for it and make an effort and study."

Koizumi said when he was prime minister, he believed that nuclear power was a clean and inexpensive energy source but came to have doubts about it after the March 2011 Great East Japan Earthquake. It is true that in May of that year, he said he was "wrong" to have believed in the safety of nuclear power plants.

Apparently, a trip to Finland this August served as a catalyst to strengthen his conviction.

There, Koizumi visited the Onkalo facility, a final disposal site where high-level radioactive waste from nuclear power plants is buried in the ground. It is the world's first attempt to build a "toilet" for a "toilet-less housing complex," so to speak. However, even when nuclear waste is buried deep underground there, it takes as long as 100,000 years for radiation levels to drop close to zero.

Can the facility be maintained over such a long period? In the first place, how will humans be after tens of thousands of years from now? There is no guarantee that they would be using the same languages and writing systems as we do now. How can we inform them that the waste buried there is hazardous? It is almost like science fiction. Koizumi must have thought seriously about the issue.

In the lecture, he refuted pro-nuclear arguments supported by the business world. "Some people say it is irresponsible to call for abolition of nuclear power plants. But it is far more irresponsible to promote nuclear power generation when there are no prospects for building a disposal site." His argument is reasonable. It is time we came to our senses.

--The Asahi Shimbun, Oct. 3

Koizumi's argument (2)

October 5, 2013

Editorial: Koizumi's call to end nuclear power in Japan reaches core of issue

http://mainichi.jp/english/english/perspectives/news/20131005p2a00m0na002000c.html

Former Prime Minister Junichiro Koizumi's call urging the government to pursue a society without nuclear power -- which has drawn attention from the public in recent months -- cuts to the heart of the energy issue.
Koizumi's argument, which raises questions about what Japan is going to do with its spent nuclear fuel and underscores the importance of the government setting a specific goal of eliminating the nation's nuclear plants, is reasonable. All politicians should lend an ear to his line of reasoning -- all the more so because the Cabinet of Prime Minister Shinzo Abe is leaning toward resuming operations at that nation's idled nuclear reactors.
In a speech in Nagoya on Oct. 1, Koizumi, who has already retired from politics, pointed out that it is irresponsible to promote nuclear power without any clear idea about how the resulting radioactive waste will be disposed of. Touching on the seriousness of the ongoing Fukushima nuclear crisis, the former prime minister said, "Nothing is more costly than nuclear power." He furthermore urged the Liberal Democratic Party (LDP)-led government to pursue complete elimination of nuclear power stations.
Koizumi's call for elimination of nuclear power has drawn particular attention from the public since the Mainichi Shimbun introduced his remarks on the issue in its "Fuchiso" (Japan Political Pulse) column in late August. Koizumi, who raised doubts about the government's nuclear power policy following the outbreak of the crisis in March 2011, visited the Onkalo spent nuclear fuel repository under construction in Finland in mid-August. He said he was convinced it is impossible to control radioactive waste after seeing the facility where spent nuclear fuel will be stored underground for 100,000 years until the substance is believed to become harmless.
It remains to be seen whether Koizumi will take political action to seek to rid Japan of all nuclear reactors, but his argument should be taken seriously.
The government has so far failed to give any responsible answer to a question as to how radioactive waste should be dealt with. The government has stuck to the so-called nuclear fuel cycle project, in which plutonium is extracted from spent nuclear fuel and reused in nuclear reactors, but there are no prospects that a fast-breeder nuclear reactor, the core of the project, can be put into practical use anytime in the

foreseeable future. Under the circumstances, even if the government speeds up the construction of a nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture, it will only cause surplus plutonium to pile up. With this point fully in mind, we have pointed out that the policy of promoting nuclear power is irresponsible.

Koizumi's call for the elimination of nuclear plants has reminded the public of the importance of setting a clear goal for any key issue in national policy. The former prime minister has warned that unless the government sets a goal of completely eliminating nuclear power stations now, it will be difficult to do so in the future. It is no easy task to reverse Japan's nuclear power policy, because this form of power has been deeply incorporated in the country's economy and society. Unless a clear political direction for atomic power policy is presented, it will be difficult to draw up specific plans to develop energy sources to replace nuclear energy.

What is incomprehensible is that political forces that have constantly criticized the proposal to end Japan's reliance on nuclear plants have not stepped forward to refute the statements from Koizumi, who still has a huge influence on society. In particular, Prime Minister Abe, who respects Koizumi as his political mentor, should express his view on the issue.

If you can't build in Japan...

Toshiba set to buy British nuclear power firm for 10 billion yen

http://ajw.asahi.com/article/economy/business/AJ201310060021

By OSAMU UCHIYAMA/ Staff Writer

With the future of the domestic nuclear industry uncertain, Toshiba Corp. is looking to bolster its overseas business with the acquisition of a company planning a nuclear plant in Britain for upward of 10 billion yen ($100 million), sources said.

Toshiba is in the final stage of negotiations for purchasing more than 50 percent of NuGeneration Ltd. through subsidiary Westinghouse Electric Co., a U.S. nuclear reactor builder.

Toshiba, which holds a leading 30 percent share of the global market of nuclear reactor construction with Westinghouse, hopes to close the deal by year-end, the sources said.

NuGeneration, based in Britain, is owned equally by two major electric utilities, France’s GDF Suez SA and Spain’s Iberdrola SA.

The joint venture hopes to open a 3.6-gigawatt nuclear power facility, about the capacity of two to three large reactors, in central Britain by 2023.

It will be the first time that Toshiba has acquired a nuclear plant operator overseas. Operation of the British plant will be commissioned to other companies.

Toshiba plans to reinforce its nuclear power business in Europe, Asia and elsewhere because construction of new reactors will be difficult in Japan given the crisis at the Fukushima No. 1 nuclear power plant and mounting public opposition.

The company is bidding for two reactor construction projects in Finland and also aims to win contracts in the Middle East and India. Europe is a powerful domain of France's Areva SA, the world's second-largest reactor builder after Toshiba.

Toshiba plans to increase sales from its nuclear power business, including construction and maintenance of reactors, to 800 billion yen in fiscal 2017 from 500 billion yen, or slightly less than 10 percent of its group revenue, in fiscal 2012.

Domestic rival Hitachi Ltd. acquired a British nuclear plant operator for 85 billion yen last year.

Indecent?

October 7, 2013

Cultural critic Azuma wants to turn Fukushima nuclear plant into tourist spot

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310070075

By YOHEI FUKUI/ ASAHI SHIMBUN WEEKLY AERA

Philosopher and writer Hiroki Azuma isn't joking when he pitches the possibility of turning the wrecked Fukushima No. 1 nuclear power plant into a sightseeing spot.

Azuma, a professor of philosophy at Waseda University and known as a cultural critic, wants to combine nuclear disaster and tourism in what, at first glance, seems to be an indecent pairing of words. But he is straightforward about his intention.

"To make sure the memories of the disaster don't fade away," Azuma said.

The key proponent of his plan centers around J-Village, a soccer facility in Fukushima Prefecture, which was a training center for the Japanese national soccer team. Currently, it is a base for relaying those working to control the accident at the Fukushima No. 1 plant.

According to Azuma, opening an immense visitor center for both amusement and education, the Fukushima Gate Village, on the site would allow people to tour the plant as the cleanup work continues. Azuma proposes that this be what the Fukushima No. 1 nuclear plant site becomes in 2036.

LEARNING FROM CHERNOBYL

Two and a half years after the Fukushima nuclear disaster following the March 11, 2011, Great East Japan Earthquake and tsunami, there are still 150,000 evacuees. Azuma proposed the plan to make the site into a "tourist destination" last fall.

A team of architects, artists and journalists--including the likes of Hiroshi Kainuma, the sociologist who wrote " 'Fukushima' theory--the birth of a nuclear village"--came together and are engaged in activities such as workshops in Minami-Soma, a city affected by the nuclear disaster, and seminars.

This past April, Azuma, Kainuma and other members "toured" the area around the Chernobyl nuclear power plant in Ukraine, where a meltdown occurred in 1986. The fruits of their investigation were compiled in the mook (a book designed like a magazine) "Chernobyl Dark Tourism Guide."

Azuma said he remembers what survivors in the Tohoku region of northeastern Japan said in interviews--that their greatest fear is that memories of the accident will fade--and the therapeutic effect and self-affirmation talking about their experience in the disaster gave them.

"We don't want to turn (the Fukushima nuclear power plant) into a tourist destination to build a big theme park on a disaster site," he said. "We want a complete disclosure of information."

Twenty-seven years after the accident, the Chernobyl plant and surrounding area are now beginning to actively embrace tourists. In fact, Chernobyl still retains some of its function as a power plant and transmits power. Visitors can get an up-close look at this work as well as the decommissioning of the No. 4 reactor where the accident occurred. Azuma argued that making it easy for anyone to see the entire situation will pass on memories and knowledge of the accident to the next generation.

This is why he believes the Japanese must avoid making a mere park or a boring public building simply filled with data and graphs at the site; instead, create a center that attracts people by making it into a tourist destination. That is the idea behind Azuma's proposal.

"The main hall of the National Chernobyl Museum in (the Ukrainian capital of) Kiev has artistic displays that make use of Russian Orthodox Church symbols," he said. "I believe this sort of scheme, which many people would look on dubiously in Japan, is exactly what we need."

VACANT LAND UNACCEPTABLE

Opponents to the idea question whether Azuma has the right to "butt in" on how to use the site of the crippled plant, because he is not a "concerned party." He offers a strong retort.

"I certainly don't butt in when it comes to other natural disasters, but the Fukushima No. 1 nuclear power plant belongs to Tokyo Electric Power Co., so I, and all the other residents of Tokyo, are without a doubt 'concerned parties,' " he said. "This accident doesn't just affect Fukushima; it affects all of humanity. Even if, hypothetically speaking, the people of Fukushima were to say they don't want to see it anymore and demand the site be turned into vacant land, it would still be unacceptable."

All the Ukrainians Azuma interviewed said they viewed Chernobyl as an accident affecting the entire world, and that it will remain a notable event in the history of mankind. If the Fukushima accident is not viewed from the same broad perspective, then memories of it will disappear, and the same thing will occur again.

Azuma said the significance of spreading information from Tokyo, far removed from Fukushima, is to share this point of view.

"Even if it goes against the spirit of the time, I still want to take an intellectual, cultural approach," he said.

Koizumi's son on energy

October 8, 2013

Koizumi's son says it's time to thoroughly discuss energy policy

http://ajw.asahi.com/article/behind_news/politics/AJ201310080054

By RYO AIBARA/ Staff Writer

NAGOYA--The lawmaker son of retired Prime Minister Junichiro Koizumi is clearly sympathetic to his father's much-publicized call for a radical change in energy policy, putting him in step with growing popular sentiment.

Shinjiro Koizumi said during a speech here Oct. 7 that the ruling Liberal Democratic Party needed to have wide-ranging discussions on future energy policy, such as how to promote the use of renewable energy sources.

His remarks carry weight for a number of reasons. At age 32, Koizumi--partly due to his name value--is widely regarded as a candidate for a future prime minister. He is not only his father's designated successor, but is also popular with the younger generation of LDP lawmakers, as well as the public at large.

Koizumi was recently appointed as parliamentary secretary in charge of reconstruction from the 2011 earthquake and tsunami disaster that led to reactor meltdowns at a nuclear power plant in Fukushima Prefecture.

"(Following the Great East Japan Earthquake and tsunami), looking toward the future, everyone thought it was time for Japan to change," Koizumi said. "It is a good opportunity for the LDP to alter itself. The party has to change."

Many people regard Koizumi as a future savior for the LDP. He was elected to the Lower House for the first time in 2009, and re-elected in December 2012. He served two years as director of the party's youth division, a position that is regarded as one path to success in the LDP.

"I want to make him the prime minister someday," LDP Secretary-General Shigeru Ishiba has said on occasion. Koizumi was named to his first government post on Sept. 30.

Asked about his father's recent call for Japan to immediately pull the plug on nuclear power, Koizumi replied: "I think there is a feeling of suspicion among Japanese citizens."

"There is continuing concern that it may be inappropriate (to maintain or further increase dependency on nuclear power) without debate," Koizumi added. "Because the economy is now apparently in the process of recovery, people are keeping silent."

He reminded the audience that promoting nuclear power is not his party's only option.

"The LDP does not only promote nuclear power generation," Koizumi said. "Its campaign platform for the Upper House election (in July) pledged it will make every effort to enhance the introduction of renewable energy sources. ... The LDP has a chance to discuss (its energy policy)."

By RYO AIBARA/ Staff Writer

Spain and Japon sign agreement on nuke safety...

08.10.2013_No247 / News in Brief

Spain And Japan Regulators Sign Nuclear Information Agreement http://www.nucnet.org/all-the-news/2013/10/08/spain-and-japan-regulators-sign-nuclear-information-agreement

Security & Safety
8 Oct (NucNet): The nuclear regulators of Spain and Japan have signed an agreement to exchange information about nuclear safety and radiation protection focusing on operational experience and lessons learned from nuclear accidents.
Spain's nuclear regulatory authority Consejo de Seguridad Nuclear (CSN) said in a statement that the agreement, signed in Tokyo with Japan's Nuclear Regulation Authority, would also see the two organisations sharing information about improving crisis communications, emergency response and the management of radioactive waste.

CSN said the two regulators would increase their collaboration, establishing channels for information exchange and cooperating in areas such as Nuclear Energy Agency and International Energy Agency working groups.

Cooperation would also be increased within the context of the International Nuclear Regulators

Association (INRA), which Spain and Japan helped establish in 1997.

The INRA is an association that comprises the most senior officials of the nuclear regulatory authorities from Canada, France, Germany, Japan, Spain, Sweden, the UK and the US. The US Nuclear Regulatory Commission says the main purpose of the association is to influence and enhance nuclear safety, from the regulatory prospective.

Bilateral agreement on nukes with India

October 11, 2013

Japan, India OK to speed up talks on nuclear cooperation pact

http://mainichi.jp/english/english/newsselect/news/20131011p2g00m0dm029000c.html

BANDAR SERI BEGAWAN (Kyodo) -- Japanese Prime Minister Shinzo Abe and his Indian counterpart Manmohan Singh agreed Thursday to speed up negotiations aimed at concluding a bilateral nuclear cooperation pact, a Japanese official said.
The agreement during their meeting on the sidelines of summits related to the Association of Southeast Asian Nations in Brunei was made bearing in mind Japan's export of nuclear technology to India.
Prior to any export of such technology from Japan to India, a civil nuclear cooperation pact must be forged between the two nations. The pact sets a legal framework for the peaceful use of atomic-power technology.
India is a de facto nuclear weapons state that has not signed the Nuclear Non-Proliferation Treaty.
When Abe and Singh met in May, they agreed to resume the bilateral negotiations on the nuclear cooperation deal that were halted in the wake of the March 2011 nuclear crisis at the Fukushima Daiichi power plant.
The two leaders also reaffirmed the promotion of discussions on exporting to India US-2 amphibious aircraft used by Japan's Maritime Self-Defense Force and implement joint maritime drills between the MSDF and Indian Navy, the official said.
They agreed as well to expand their economic ties, with Japan vowing to support India's development of a high-speed railway and other infrastructure needs.
Abe was also quoted by the official as asking Singh for India to help make the visit by Emperor Akihito and Empress Michiko to the country from late November to early December a memorable one, to which Singh said India will do the best it can.

Hopeful news for abolition of nuclear weapons

October 11, 2013

Japan to sign joint U.N. statement to abolish nuclear weapons

http://ajw.asahi.com/article/behind_news/politics/AJ201310110074

THE ASAHI SHIMBUN

In a reversal of its longstanding policy toward nuclear weapons, Japan, the only nation that has experienced the devastation of atomic bombings, will sign a joint statement by the United Nations calling for their abolition.

Japan had steadfastly abstained from voting since the United Nations began adopting resolutions in 1995 urging the start of negotiations toward concluding a treaty to ban nuclear weapons. It had maintained a position over the years that supporting such a call will conflict with the nation's defense policy, which relies on the U.S. nuclear umbrella.

The Japanese government announced on Oct. 11 its intention to sign the joint statement expected from the U.N. General Assembly First Committee next week.

The statement, supported by Switzerland, New Zealand and 14 other countries, calls for the elimination of nuclear weapons, saying they could create a catastrophe in terms of a humanitarian viewpoint, the sources said.

The policy reversal comes after Japanese government officials came under heavy fire for not signing a joint statement adopted in Geneva in April at the second session of the Preparatory Committee for the 2015 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons.

More than 70 countries, including Switzerland, endorsed the document.

Japan initially sought to find a way to back the statement, but gave up its effort.

The sticking point was the wording, which stated: “it is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances.”

The Japanese government concluded that ruling out the use of nuclear weapons would run counter to its longtime national security policy.

But it has since reviewed its position after the mayors of Hiroshima and Nagasaki, which were devastated by atomic bombs near the end of World War II, as well as civic groups, blasted Japan’s refusal to sign.

Prime Minister Shinzo Abe ordered the Foreign Ministry to work with relevant nations over the forthcoming joint statement.

“I want to explore the possibility of signing (a joint statement) concerning a similar theme,” Chief Cabinet Secretary Yoshihide Suga quoted Abe as saying.

Although the document effectively stated that nuclear weapons should not be used under any circumstances, sources said the Japanese government decided to sign it as it concluded the overall wording reflected consideration for Tokyo’s position.

A joint statement underscoring the inhumane nature of nuclear weapons was suggested for the first time at the first session of the Preparatory Committee for the 2015 Review Conference of the Parties to the NPT last year.

Japan to sign U.N. statement against use of nuclear weapons

http://mainichi.jp/english/english/newsselect/news/20131011p2g00m0dm030000c.html

TOKYO (Kyodo) -- The Japanese government has decided to sign for the first time a joint statement to be issued at the United Nations calling on countries not to use nuclear weapons under any circumstances, Japanese government sources said Thursday.

Similar U.N. statements have been drafted three times before but Japan refused to endorse them on the grounds that they would contradict its policy of relying on the U.S. nuclear umbrella, they said.

Tokyo will join more than 80 other countries in upholding the statement to be released, possibly on Oct. 17, at the First Committee of the U.N. General Assembly, as it has confirmed with New Zealand, one of the drafters of the initiative, that the document will not be legally binding, the sources said.

Japanese Foreign Minister Fumio Kishida, a native of Hiroshima, is eager to promote nuclear disarmament and thought it would not be desirable for Japan to continue opposing U.N. initiatives calling on nations not to use nuclear weapons, they said.

People in Hiroshima and Nagasaki, which suffered U.S. atomic bombings in 1945, have criticized Japan's past refusal to sign U.N. documents on nuclear arsenals.

Hiroshima is scheduled to host a foreign ministers' meeting of the 10-member Non-Proliferation and Disarmament Initiative group in 2014.

Not to be used "under any circumstances"

October 12, 2013

Draft U.N. statement says nukes not to be used 'under any circumstances'

http://mainichi.jp/english/english/newsselect/news/20131012p2g00m0dm054000c.html

NEW YORK (Kyodo) -- A draft of a joint statement on nuclear disarmament that Japan has decided to join in crafting along with other countries for release at the United Nations says nuclear arsenals should never be used again "under any circumstances" in the interest of humanity's survival.

The draft, obtained by Kyodo News, also says the inhuman nature of atomic weapons "became evident from the moment of their first use," apparently alluding to Hiroshima, the first city devastated by a nuclear explosion in history.

Similar U.N. statements were issued three times in the past. But Japan did not endorse them on the grounds that a reference that nukes should not be used "under any circumstances" would contradict Japan's policy of relying on the U.S. "nuclear umbrella."

In a shift of position, Japanese Foreign Minister Fumio Kishida on Friday announced that Tokyo would endorse the joint statement.

A group of countries are currently fine-tuning the wording of the document expected to be unveiled Thursday or later, diplomats said.

The draft statement says nuclear weapons use would cause devastating consequences with "deep implications for human survival; for our environment; for socio-economic development; for our economies; and for the health of future generations."

Noting the uncontainable catastrophic effects of a nuclear weapon detonation, by design or accident, the statement says, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances."

It has also been speculated that Japan did not endorse past statements because they did not conform to the country's policy of seeking the elimination of nuclear weapons in a phased manner.

The upcoming statement, however, mentions "all approaches and efforts towards nuclear disarmament," allowing a broader range of countries to support it.

The past documents also had cited "outlawing" nuclear weapons, an expression rejected by Japan but the word "outlaw" was eliminated in the last statement issued in Geneva in April.

The Geneva statement noted the application of international humanitarian law to the use of nuclear weapons. This was not included in the draft statement, weakening the advocacy of a ban on nuclear weapons through international law.

What is behind Japan's move on (abolition of) nuclear weapons?

October 12, 2013

EDITORIAL: Time for Japan to end reliance on U.S. nuclear deterrence

http://ajw.asahi.com/article/views/editorial/AJ201310120028

Japan for the first time has decided to sign a United Nations statement calling for the abolition of nuclear weapons.

Saying nuclear arms are inhumane and should never be used, the government announced on Oct. 11 its intention to sign the joint statement that will soon be proposed at the U.N. General Assembly First Committee. Foreign Minister Fumio Kishida said the government decided it “can support" the document.

The international movement to highlight the inhumane nature of nuclear weapons and ban them altogether has been gathering momentum since a meeting three years ago of the Review Conference of the Parties to the Treaty on the Nonproliferation of Nuclear Weapons.

Since last year, a joint international statement for promoting the cause has been issued three times. In April, 80 countries endorsed a statement adopted in Geneva at a session of the Review Conference.

But Tokyo has so far refused to sign these statements, saying their content is inconsistent with Japan's defense policy, which relies on the U.S. nuclear umbrella for security.

Japan became the first country to suffer nuclear devastation 68 years ago, when Hiroshima and Nagasaki were attacked with atomic bombs. What reason could there be for Japan not to support such a statement?

This summer, Nagasaki Mayor Tomihisa Taue, in the Nagasaki Peace Declaration 2013, bitterly criticized the government's stance, saying it “contradicts the resolution that Japan would never allow anyone else to become victims of a nuclear bombing."

Although it is a grossly belated move, we welcome the policy change by the administration of Prime Minister Shinzo Abe as a step forward. **But there are reasons to be skeptical.**

Explaining the policy reversal, Kishida said the text of the statement has been “revised appropriately."

The text is now being worked out by New Zealand, Switzerland and other countries. But details have not been revealed.
However, the Abe administration appears to believe the text will not put any pressure on Japan to change its defense strategy dependent on extended nuclear deterrence provided by the United States.

Japan's move to sign the statement will be less meaningful if it does so only because the document poses no threat to its traditional defense policy.

The policy shift should be a first step in Japan's long-term quest to carve out a secure future that is not dependent on the U.S. nuclear umbrella.

The nuclear deterrence theory, which calls for using the threat of nuclear weapons to maintain peace, is based on Cold War-era thinking.

Despite a quarter century having passed since the end of the Cold War, Japan is putting increasing importance on the U.S. nuclear deterrence.

China is expanding its military presence in the region, while North Korea is developing nuclear weapons and ballistic missiles. Japan's defense policy is based on the assumption that only the U.S. nuclear arsenal can guarantee the nation's security in the face of these threats.

In the United States, however, the perception that the nuclear deterrence theory is outdated is spreading among policymakers and experts. The administration of President Barack Obama is keen to reduce the

role of nuclear arms in the U.S. defense strategy. There is even the view that Japan's policy stance is an impediment to U.S. efforts to slash its stockpile of nuclear weapons.

Behind the growing trend toward stressing the inhumane nature of nuclear arms is the view that human beings, not nations, would be the true victims of nuclear attacks, and that they should be protected.

A nuclear attack kills countless citizens and leaves many survivors suffering from the horrible aftereffects of exposure to radiation. Japan knows the brutality of nuclear attacks more than any other country.

As the only nation that has ever experienced the devastation of atomic bombings, Japan has a duty to commit itself to international efforts to promote the trend toward banning nuclear arms for a nuclear-free world.

Growing Korean discontent over nuclear power

October 13, 2013

Study group: South Korea should lower reliance on nuclear

http://ajw.asahi.com/article/asia/korean_peninsula/AJ201310130060
REUTERS

SEOUL--South Korea should reduce its reliance on nuclear power in view of public discontent with corruption in the industry and Japan's difficulty tackling the aftermath of the Fukushima disaster, a group weighing up the problem said on Oct. 13.

The Energy Ministry published the findings of a study group of 60 representatives from industry, academic institutions and civic bodies that recommended reducing to between 22 percent and 29 percent the portion of electricity that can be generated by nuclear power.

That compares to 41 percent proposed in a government plan for 2030.

Asia's fourth-largest economy currently generates one-third of its electricity from nuclear power as part of long-term efforts to replace imported oil and gas.

Agreement on a range of 22-29 percent was reached "based upon consensus to minimize social conflict over the proportion of nuclear power generation," the study group said in a statement released by the energy ministry.

The government will hold public hearings over the report's conclusions and plans to draw up final revisions to energy policy in December, it said.

The group also recommended keeping the proportion of renewable energy at 11 percent as planned. It suggested imposing taxes on coal-fired power stations and lowering taxes on liquefied natural gas and kerosene.

Public discontent over nuclear power has been fanned by a scandal over the use of fake certificates which, since 2012, has prompted a series of reactor shutdowns in South Korea.

The nuclear industry has been criticized for breeding a culture of secrecy that led to corrupt practices among officials involved in safety certification.

Six of 23 reactors remain off line, including three halted in May to replace cables supplied using bogus certificates. Authorities on Oct. 10 said 100 people, including a top former state utility official, had been indicted on corruption charges.

The head of the group, Kim Chang-seob, said the figures provided were intended strictly as guidelines to take account of trends and growing discontent over the nuclear sector.

"Our suggestion is to set the direction in the policy for social consent, as there are huge social conflicts," Kim said.

Anxiety has also risen over repeated setbacks by the Tokyo Electric Power Co. in its efforts to halt radiation leaks and make safe the Fukushima No. 1 plant, which was crippled by an earthquake and tsunami in 2011.

TEPCO said on Oct. 10 that radiation levels in seawater just outside the plant had climbed to their highest level in two years.

Prime Minister Shinzo Abe has been criticized since he declared the problems at Fukushima "under control." Japan's Nuclear Regulation Agency earlier this month ordered TEPCO to draft in additional workers and report on its measures to tackle the clean-up.

Japan to remain committed to nuclear power

October 15, 2013

Nuclear power still vital part of Japan energy mix: officials

AFP-JIJI

http://www.japantimes.co.jp/news/2013/10/15/national/nuclear-power-still-vital-part-of-japan-energy-mix-officials/#.UlwjtFM0_9k

SEOUL – Nuclear power is set to remain a key part of Japan's energy profile despite the safety concerns raised by the Fukushima disaster, senior Japanese energy officials predicted Monday.

"The Japanese government still considers nuclear as an option for the energy mix. It must not be excluded from the overall energy mix," said Zengo Aizawa, vice president of Tokyo Electric Power Co. which operates the stricken Fukushima plant.

"The government has rethought the idea of abandoning nuclear energy," Aizawa told a session of the World Energy Congress being held in Daegu, South Korea.

Japan shut down all 50 commercial reactors in the wake of the 2011 earthquake and tsunami that triggered a nuclear crisis at the Fukushima plant.

Two reactors were restarted in July last year, but were taken offline again last month for inspections, leaving the country without any nuclear power.

Prime Minister Shinzo Abe has openly backed a return to the widespread use of atomic energy, but the Japanese public remains divided, with opponents citing continued safety fears.

Makoto Yagi, Chairman of the Federation of Electric Power Companies of Japan, told the gathering of energy officials in Daegu that Japan should remain committed to nuclear power in the medium and long term.

"It is important to resume nuclear power plants as soon as their safety can be guaranteed," Yagi said.

He stressed the importance of regaining public trust by explaining the post-Fukushima safety measures that were being put in place.

"It is a Japanese responsibility to help improve nuclear safety standards worldwide," based on the lessons learned from Fukushima, he added.

Nuclear power supplied about one-third of Japan's electricity before the 2011 tsunami.

World Nuclear Industry Status Report 2013

October 18, 2013

http://www.beyondnuclear.org/home/2013/10/18/global-nuclear-retreat-continues-while-renewables-soar.html

Nuclear power continues its decline worldwide while investements in, and development of, renewables soar. The findings of the newly released 2013 World Nuclear Industry Status Report, prepared by Mycle Schneider, Antony Froggatt et al., show that only three reactors started up worldwide in 2012 while six were shut down. Meanwhile, China, India, Germany and Japan now generate more power from renewables than nuclear. Read the report.

Another pledge

October 18, 2013

Abe pledges to minimize nuclear power dependence

http://www3.nhk.or.jp/nhkworld/english/news/20131018_28.html

Japan's Prime Minister Shinzo Abe has pledged to reduce the country's reliance on nuclear energy as much as possible.

Abe was answering a question by the Japanese Communist Party in the upper house on Friday.

The party's secretariat head Tadayoshi Ichida said all of Japan's nuclear power plants are offline, but people are leading their usual lives and the economy has not collapsed.

Ichida suggested that Abe decide now to end nuclear power generation in Japan.

Abe replied that suspending the plants has increased dependence on oil and other fossil fuels.
He said people's lives and economic activity have been greatly affected because fuel imports have risen by 3 trillion yen, or more than 30 billion dollars, and electricity bills have gone up.

He also said the government will draw up a responsible energy policy that includes nuclear power generation.

Abe pledged to promote renewable energy and power-saving measures for the next 3 years or so.

He added that the government will screen the safety of nuclear power plants using the world's toughest standards, while minimizing reliance on nuclear power.

Japan ready to sign?

Oct. 18, 2013

Japan to sign latest U.N. statement on nuclear weapons abolition

http://mainichi.jp/english/english/newsselect/news/20131018p2a00m0na016000c.html

NEW YORK -- A renewed statement from the First Committee of the United Nations General Assembly calling for an end to the use of nuclear weapons, which Japan is expected to sign, will include phrases from a previous statement that Japan had objected to on the grounds that it could hinder U.S. nuclear deterrence, a final draft obtained by the Mainichi has shown.

The final draft states, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances." It also mentions "all approaches and efforts towards nuclear disarmament" -- a phrase not included in an earlier statement that Japan had refrained from signing.

The wording of the statement accommodates many countries including Japan, which aims to gradually eliminate nuclear weapons while relying on U.S. nuclear deterrence. It is believed that Japan reversed its policy and decided to sign the statement as changes including alterations to the section mentioning efforts toward nuclear disarmament mean the document does not totally deny nuclear deterrence.

U.N. sources say over 80 countries have expressed their intention to sign the statement, which is due to be announced either on Oct. 18 or 21 by a New Zealand representative who drafted it.

The draft states that nuclear weapons "have deep implications for human survival; for our environment; for socio-economic development; for our economies; and for the health of future generations." It adds that the "consequences of nuclear weapons became evident from the moment of their first use" -- an apparent reference to the atomic bombs dropped on Hiroshima and Nagasaki during World War II.

The draft points out that for years, the humanitarian consequences of nuclear weapons "have not been at the core of nuclear disarmament and nuclear non-proliferation deliberations." But it says that now, the humanitarian focus is "well established on the global agenda." It says that since the 2010 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons, the issue has been brought up at various international conferences with a trend toward nuclear disarmament.

The proposed statement also says that the only way to prevent nuclear weapons from being used again is through their "total elimination." It adds, "We owe it to future generations" to rid the world of the threat posed by nuclear weapons.

Similar statements have been released three times since a meeting of the Preparatory Committee of the Nuclear Non-Proliferation Treaty Review Conference in May last year, but Japan has not signed any of them. However, on Oct. 11, Foreign Minister Fumio Kishida announced that Japan would sign the latest declaration.

Asia not so depressed by Fukushima disaster

October 19, 2013

Nuclear husk: The destroyed No. 4 reactor building at Tokyo Electric Power Co.'s Fukushima No.1 nuclear power plant is seen in May 2012. | BLOOMBERG

Asia drives global nuclear growth despite debate raised by Fukushima

AFP-JIJI

http://www.japantimes.co.jp/news/2013/10/19/business/asia-drives-global-nuclear-growth-despite-debate-raised-by-fukushima/#.UmJrOVM0_9k

SEOUL – Safety concerns in the wake of the Fukushima nuclear disaster in Japan have done little to curb Asia's ambitious plans for expanding the role of atomic power in the regional energy mix.

Led by China and India, Asia will continue to drive growth in the global nuclear industry over the next two decades, according to experts attending the World Energy Congress (WEC) in Daegu, South Korea.

"There will be an increase of nuclear power globally, but Asia will be at the center of that, especially China, India and South Korea," Yukiya Amano, head of the International Atomic Energy Agency said on the sidelines of the triennial gathering that ended last Thursday.

Doubts over the safety of atomic energy following the Fukushima disaster caused the IAEA to marginally cut its long-term outlook for the nuclear industry.

In its last annual report, the U.N. atomic agency projected the industry could nearly double its capacity by 2030, mainly due to growth in Asia.

Amano noted that around 70 new nuclear power reactors are being built at the moment — 50 of them in Asia — in addition to the more than 430 already in operation worldwide.

At the annual gathering of the IAEA's 159 member states in Vienna last month, China made it clear that the ongoing crisis in Fukushima would not derail its own expansion policy.

China has 17 nuclear reactors in operation, another 30 under construction and plans to build an additional 59.
"Energy in China is very much diversified and nuclear power will become one of our main alternatives," said Liu Zhenya, the president and CEO of State Grid Corp. of China.

"That will not change, despite the nuclear crisis in Japan," Liu said on the summit's sidelines.

As China's energy requirements soar along with economic growth and rapid urbanization, experts say Beijing cannot afford to stop developing its nuclear sector, although they expect it to increase its share of renewables such as solar and wind power in the longer term.

"China needs to invest in all forms of energy more than any other country. It has no other choice in the short term," said Karl Rose, the WEC's senior director for policy and scenarios.

Asia's third-largest economy, India, which is still plagued by energy shortfalls, also has ambitious plans for its nuclear sector.

With 20 reactors already in operation, seven under construction and another 18 on the drawing board, India hopes to generate 63,000 megawatts from nuclear power by 2030 — part of a planned near 15-fold rise from current levels.

Nuclear energy has been a priority for India since 2008 when then-U.S. President George W. Bush signed into law a deal with New Delhi that ended a decades-old ban on civilian nuclear trade with the country.

The country's largest nuclear plant, in the southern state of Tamil Nadu, began operations in July, despite large public protests and opposition from anti-nuclear activists.

Critics said the plant was located in an area vulnerable to earthquakes, which could spur a disaster reminiscent of the one at Fukushima.

"There is a lot of public unease after Fukushima about the dangers of nuclear power stations, but countries with no other alternatives have to use nuclear power," Rose said.

South Korea's nuclear industry is struggling to regain public confidence after a torrid year that saw a major scandal over forged safety certificates at a number of plants add to post-Fukushima concerns.

Until now, Seoul has insisted it will push ahead with plans to add another 16 reactors to the 23 existing units by 2030.
Earlier this month, however, a government advisory group recommended scaling back the nuclear expansion plans to "minimize social conflict."

Instead of aiming for a 41 percent share for nuclear power in the national energy profile by 2035, the panel suggested a figure of under 30 percent.

Japanese officials in Daegu argued that nuclear power should also remain a key part of their nation's energy mix.
Japan shut down all 50 commercial reactors in the wake of the crisis at the Fukushima plant.

Two reactors were restarted in July last year, but were taken offline again last month for inspections, leaving the country without any nuclear power.

Prime Minister Shinzo Abe has openly backed a return to the widespread use of atomic energy, but the public remains divided, with opponents citing continued safety fears.

Rose said keeping the reactors permanently switched off would be disastrous for such a highly energy-intensive economy as Japan's.

"Whatever transition you have to make, it has to be in a measured phase," he said.

No immediate end to nukes

October 20, 2013

Abe to retain nuclear power in nation's basic energy policy

JIJI

http://www.japantimes.co.jp/news/2013/10/20/national/abe-to-retain-nuclear-power-in-nations-basic-energy-policy/#.UmQBrFM0_9k

The Liberal Democratic Party-led government will clarify its medium- to long-term policy of maintaining the share of nuclear power at a certain level in the nation's energy mix on condition that its safety is secured, according to sources.

By the end of the year, the government plans to revise the current basic energy policy, which was drawn up in 2010 when the Democratic Party of Japan was in power, to reflect lessons learned from the meltdown calamity at the Fukushima No. 1 nuclear plant, which was wrecked by the March 2011 earthquake and tsunami.

A subcommittee of the industry ministry's advisory committee for natural resources and energy will start full-fledged work on the revision next month, the sources said.

At a meeting Wednesday, members of the subcommittee stated their opinions about nuclear power.

Kyoto University professor Hajimu Yamana said that nuclear power is important from the viewpoint of energy security. Keigo Akimoto of the Research Institute of Innovative Technology for the Earth argued nuclear power is an affordable source of electricity and useful for combating global warming.

Before the LDP returned to power last December and its leader, Shinzo Abe, became prime minister, many members of the committee under the predecessor government, led by the DPJ, had called for the country's dependence on nuclear power to be phased out.

After Abe and the LDP took over, subcommittee members have been reshuffled and there have been no demands from new members for an immediate end to nuclear power.

The existing basic energy policy sees nuclear power as a key source of electricity and has a goal of increasing the proportion of energies that do not emit carbon dioxide, including atomic and hydraulic power, to some 70 percent of the country's energy mix by 2030.

In the forthcoming revision, the government has no plans to include a numerical target for a desirable level of reliance on nuclear power because it is not known how many reactors can be brought back online under new safety standards introduced in July, the sources said.

While the government is seeking to restart reactors once their safety has been confirmed, Abe has said the government will reduce dependence on nuclear power as much as possible.

At the subcommittee meeting, Kikuko Tatsumi of the Nippon Association of Consumer Specialists said the government should make it clear how much and by what means it aims to reduce dependence on nuclear power.

Japan backs UN non-nuclear arms statement

October 22, 2013

Japan finally backs U.N. statement against use of nuclear weapons

http://ajw.asahi.com/article/behind_news/politics/AJ201310220037

THE ASAHI SHIMBUN

For the first time, Japan has thrown its support behind a United Nations statement that calls nuclear warfare inhumane.
The joint statement was presented Oct. 21 to the U.N. General Assembly First Committee during a discussion on disarmament and national security.

On a number of occasions since last year, Japan has stopped short of backing similar statements that have been presented at international conferences.

This was mainly due to inconsistencies that would arise with Japan's national security policy, given that it relies on the nuclear umbrella provided by the United States.

However, prior consultations between Japan and the nations drawing up the latest statement led to revisions that made allowances for Japan's position.

The joint statement was compiled through the initiative of 16 nations, including neutral New Zealand and Switzerland. A total of 125 nations, including Japan, have expressed their support.

When a similar statement was released in April, Japan raised objections to the phrase, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances."

Although that phrase remains in the latest joint statement, additional wording was included that supports "all approaches and efforts toward nuclear disarmament."

According to several sources, the revised wording is believed to have been included to take into consideration the "realistic approach" taken by Japan. This refers to Japan's efforts for gradual disarmament by the nuclear powers, including the United States, while also maintaining a nuclear deterrent. That is in addition to the "humanitarian approach" taken by the nations who initiated the effort with an eye toward eventually making nuclear weapons illegal by focusing on the humanitarian consequences.

A joint statement expressing humanitarian concerns about nuclear weapons was first proposed in May 2012 at the first session of the Preparatory Committee for the 2015 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons. A similar statement was presented to the U.N. General Assembly First Committee in October 2012. On both occasions, Japan refused to sign.

When it also failed to sign the joint statement prepared at the second session of the preparatory committee in April, the Japanese government was criticized, especially by survivors of the 1945 atomic bombings of Hiroshima and Nagasaki.
(This article was written by Yoshiaki Kasuga in New York and Hajimu Takeda in Osaka.)

JOINT STATEMENT ON THE HUMANITARIAN CONSEQUENCES OF NUCLEAR WEAPONS
(Delivered by New Zealand Ambassador Dell Higgie)

Mr. Chairman

I am taking the floor on behalf of the following Member States: Afghanistan, Algeria, Angola, Antigua and Barbuda, Argentina, Austria, Bahamas, Bahrain, Bangladesh, Barbados, Belarus, Belize, Benin, Bolivia, Bosnia and Herzegovina, Botswana, Brazil, Burkina Faso, Cambodia, Cameroon, Cape Verde, Central African Republic, Chile, Colombia, Congo, Costa Rica, Côte d'Ivoire, Cuba, Cyprus, DR Congo, Denmark, Djibouti, Dominican Republic, Ecuador, Egypt, El Salvador, Equatorial Guinea, Eritrea, Fiji, Gabon, Georgia, Ghana, Grenada, Guatemala, Guinea, Guinea Bissau, Haiti, Honduras, Iceland, Indonesia, Iraq, Ireland, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kiribati, Lao PDR, Lebanon, Lesotho, Liberia, Libya, Liechtenstein, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Marshall Islands, Macedonia, Mexico, Mongolia, Montenegro, Morocco, Mozambique, Myanmar, Namibia, Nauru, Nepal, Nicaragua, Niger, Nigeria, Norway, Palau, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Qatar, Rwanda, Samoa, San Marino, Senegal, Serbia, Seychelles, Sierra Leone, Singapore, Solomon Islands, South Africa, South Sudan, Suriname, Swaziland, Switzerland, Tanzania, Thailand, Timor-Leste, Togo, Tonga, Trinidad and Tobago, Tunisia, Tuvalu, Uganda, Ukraine, United Arab Emirates, Uruguay, Vanuatu, Viet Nam, Yemen, Zambia, my own country New Zealand, and the Observer State the Holy See.

Our countries are deeply concerned about the catastrophic humanitarian consequences of nuclear weapons. Past experience from the use and testing of nuclear weapons has amply demonstrated the unacceptable humanitarian consequences caused by the immense, uncontrollable destructive capability and indiscriminate nature of these weapons. The fact-based discussion that took place at the Conference on the Humanitarian Impact of Nuclear Weapons convened by Norway last March allowed us to deepen our collective understanding of those consequences. A key message from experts and international organizations was that no State or international body could address the immediate humanitarian emergency caused by a nuclear weapon detonation or provide adequate assistance to victims.

The broad participation at the Conference, with attendance by 128 States, the ICRC, a number of U.N. humanitarian organizations and civil society, reflected the recognition that the catastrophic humanitarian consequences of nuclear weapons are a fundamental and global concern. We warmly welcome Mexico's announcement of a follow-up
Conference, scheduled for Feb. 13-14, 2014. We firmly believe that it is in the interests of all States to participate in that Conference, which aims to further broaden and deepen understanding of this matter, particularly with regard to the longer-term consequences of a nuclear-weapon detonation. We welcome civil society's ongoing engagement.

This work is essential, because the catastrophic consequences of nuclear weapons affect not only governments, but each and every citizen of our interconnected world. They have deep implications for human survival; for our environment; for socio-economic development; for our economies; and for the health of future generations. For these reasons, we firmly believe that awareness of the catastrophic consequences of nuclear weapons must underpin all approaches and efforts toward nuclear disarmament.

This is not, of course, a new idea. The appalling humanitarian consequences of nuclear weapons became evident from the moment of their first use, and from that moment have motivated humanity's aspirations for a world free from this threat, which have also inspired this statement.

The humanitarian consequences of nuclear weapons have been reflected in numerous U.N. resolutions, including the first resolution passed by this Assembly in 1946, and in multilateral instruments, including the Nuclear Non-Proliferation Treaty. The world's most eminent nuclear physicists observed as early as 1955 that nuclear weapons threaten the continued existence of mankind and that a war with these weapons could quite possibly put an end to the human race.

The First Special Session of the General Assembly devoted to Disarmament (SSOD-1) stressed in 1978 that "nuclear weapons pose the greatest danger to mankind and to the survival of civilization." These expressions of profound concern remain as compelling as ever. In spite of this, the humanitarian consequences of nuclear weapons have not been at the core of nuclear disarmament and nuclear nonproliferation deliberations for many years.

We are, therefore, encouraged that the humanitarian focus is now well established on the global agenda. The 2010 Review Conference of the NPT expressed "deep concern at the catastrophic humanitarian consequences of any use of nuclear weapons." That deep concern informed the Nov. 26, 2011, resolution of the Council of Delegates of the Red Cross and Red Crescent Movement, and the decision last year of this General Assembly to establish an open-ended working group to develop proposals to take forward multilateral nuclear disarmament negotiations. It underlies the Community of Latin American and Caribbean States' call to the international community, in August 2013, to emphasize the humanitarian consequences of nuclear weapons during any discussion of nuclear issues.

Last month, at the High-Level Meeting on Nuclear Disarmament, numerous leaders from around the world again evoked that deep concern as they called for progress to be made on nuclear disarmament. Today, this statement demonstrates the growing political support for the humanitarian focus.

It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances. The catastrophic effects of a nuclear weapon detonation, whether by accident, miscalculation or design, cannot be adequately addressed. All efforts must be exerted to eliminate the threat of these weapons of mass destruction.

The only way to guarantee that nuclear weapons will never be used again is through their total elimination. All States share the responsibility to prevent the use of nuclear weapons, to prevent their vertical and horizontal proliferation and to achieve nuclear disarmament, including through fulfilling the objectives of the NPT and achieving its universality.

We welcome the renewed resolve of the international community, together with the ICRC and international humanitarian organizations, to address the catastrophic humanitarian consequences of

nuclear weapons. By raising awareness about this issue, civil society has a crucial role to play side-by-side with governments as we fulfil our responsibilities. We owe it to future generations to work together to do just that, and in doing so, to rid our world of the threat posed by nuclear weapons.

Japan joins UN non-nuclear arms statement
http://www3.nhk.or.jp/nhkworld/english/news/20131022_12.html

Japan has for the first time signed up to a UN statement that says nuclear weapons should not be used under any circumstances.

The statement was adopted on Monday at the UN General Assembly's First Committee on disarmament. The document, proposed by New Zealand, was released by 125 countries.

The statement says nuclear weapons have immense, uncontrollable destructive capabilities and are indiscriminate in nature.

It says past use and testing of these weapons have clearly shown their unacceptable humanitarian consequences.

The statement says that for the sake of humanity's survival nuclear weapons must never be used again, under any circumstances.

Similar statements have been released 3 times in the past, including one in April at a conference on the Nuclear Non-Proliferation Treaty.

Until now Japan has not signed such documents. The government says the phrase rejecting the use of nuclear arms "under any circumstances" is incompatible with the country's reliance on the US nuclear umbrella.

That attitude has come under fire, as Japan is the only country to have experienced atomic bombings.

But the government made an about-face, saying the overall aim of the statement now conforms to Japan's security policy and its disarmament efforts.

In the run-up to the release of the statement, Japanese officials lobbied New Zealand to revise some of its wording to make it more acceptable to Japan.

The document now expresses support for "all approaches and efforts" toward nuclear disarmament.

This strikes a balance between countries that want a treaty banning the use of atomic weapons, and those favoring a more gradual approach.

The latter camp includes nuclear powers such as the United States and countries like Japan and Australia that rely on nuclear deterrence.
Oct. 22, 2013

Japan for first time backs U.N. nuke disarmament statement

KYODO
http://www.japantimes.co.jp/news/2013/10/22/national/japan-for-first-time-backs-u-n-nuke-disarmament-statement/#.UmZrD1M0_9k

NEW YORK – Japan on Monday endorsed a U.N. statement on nuclear disarmament for the first time, joining more than 120 other countries in issuing a statement expressing deep concern about the "catastrophic consequences" of atomic weapons and opposing their use.
After declining to back similar statements three times in the past, the government decided to endorse a New Zealand-led initiative that drew a record 125 supporting countries, roughly two-thirds of the 193 member states of the United Nations.
Previously, Japan deemed similar statements as incompatible with its security policy due to its reliance on the nuclear deterrence provided by the United States.
New Zealand Ambassador Dell Higgie said "some changes" had been made to the text "at Japan's request, which has facilitated their involvement." Unlike last year's, this year's text did not mention the "outlawing" of nuclear arsenals. Higgie downplayed Tokyo's previous opposition to the statements.

Gov't discussing radical overhaul of nuke sector

October 23, 2013

Nuclear industry amalgamation mulled

LDP examining idea to bring all reactors under one company
Bloomberg
http://www.japantimes.co.jp/news/2013/10/23/business/ldp-mulls-amalgamating-all-nuclear-plants-under-one-firm/#.Umi8llM0_9k

The government is discussing a radical overhaul of the nuclear power sector that would combine the nation's 50 operating reactors into a single company to rebuild an industry that's been effectively halted by the Fukushima disaster that started in March 2011.

The company would be owned by the nine regional utilities, along with wholesalers Japan Atomic Power Co. and Electric Power Development Co., **while the government and reactor makers would give**

financial and technical support, Taku Yamamoto, who chairs the Liberal Democratic Party's energy committee, said in an interview.

Part of the profit from sales of the new company's electricity would be funneled toward the cleanup of the Fukushima No. 1 power plant and victim compensation, which combined may cost more than ¥11 trillion. The plan would keep Tokyo Electric Power Co. alive to shoulder Fukushima costs.

"The plan is based on Tepco's profits covering Fukushima costs without taxpayers' money and to increase the government's role in the nuclear industry," Yamamoto said. "Who's going to like a bankruptcy of Tepco? The company has to go on working hard for the Fukushima disaster until it dies."

Setting up a comprehensive nuclear-management company should help Japan expand its exports of reactors and operation skills as domestic electricity demand slows, Yamamoto said.

Tepco spokesman Tsuyoshi Numajiri declined comment on lawmakers' discussions about spinning off nuclear operations at utilities, saying such plans are subject to change.

Discussions of such a dramatic overhaul of Japan's nuclear industry — the third-biggest in the world — signal growing momentum in the government to restructure an electricity supply model that helped rebuild the economy after World War II, only to be exposed by safety lapses that culminated in the Fukushima disaster.

All 50 reactors have been shut down since Kansai Electric Power Co. turned off units 3 and 4 at its Oi plant in Fukui Prefecture in September for regular safety checks.

None of the idled reactors may be restarted by the end of March 31, as preparations by power companies for the Nuclear Regulation Authority's safety review are behind schedule, the Sankei Shimbun reported Monday.

LDP lawmakers have discussed other options to restructure Tepco. Tadamori Oshima, head of the party's 2011 quake reconstruction task force, proposed to Prime Minister Shinzo Abe that Tepco form a separate company to deal with decommissioning Fukushima No. 1 and the government provide financial aid, Kyodo News reported Sept. 21.

The Abe administration is seeking the Diet's endorsementthis month for a bill designed to end the 60-year-old monopolies of the regional utilities, led by Tepco.

The other entities — which like Tepco dominate electricity generation and transmission in their respective regions — are Hokkaido Electric Power Co., Tohoku Electric Power Co., Chubu Electric Power Co., Kansai Electric, Hokuriku Electric Power Co., Chugoku Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.

The draft bill would unbundle generation and transmission operations and allow households to choose power suppliers for the first time. In theory, 60 percent of the electricity market has been deregulated, though in practice the dominance of the regional utilities stands in the way.

The regional utilities produced 90 percent of the nation's electricity output in the year that ended March 31, Ministry of Economy, Trade and Industry data show.

"The power industry reform bill would help stop utilities' dominance in Japan and encourage more newcomers from home and abroad to enter the mature power market," Yamamoto said.

"The passage of the legislation is a prerequisite for the unification of nuclear plant management to move forward," said Yamamoto, who has studied Japan's nuclear power industry for three decades and chairs the LDP's committee to discuss strategic natural resources and energy policy.

Tepco should sell all its power-generating assets, including the gigantic Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, and reshape itself as an electricity transmission and distribution company, according to Takeo Kikkawa, a commerce professor at Hitotsubashi University.

"A breakup of Tepco would create a wave of asset sales in the greater Tokyo power market as Japanese oil refiners and gas companies are expanding power-generation business to diversify their business portfolios," said Kikkawa. "It'd be a time of big mergers and acquisitions in the power industry in years ahead."

Replace aging reactors?

October 24, 2013

Gov't mulls replacing aging nuclear reactors with new ones

http://mainichi.jp/english/english/newsselect/news/20131024p2a00m0na008000c.html

The government has begun mulling replacing aging reactors at nuclear power plants with news ones in a move to continue Japan's dependence on nuclear power.

The government and the ruling Liberal Democratic Party (LDP) started considering the replacement plan on Oct. 23 as part of the country's medium- and long-term nuclear energy policy. The government is eyeing to include the project in its basic energy plan to be compiled by the end of the year.

As the administration led by Prime Minister Shinzo Abe is poised to reactivate idled reactors that have cleared regulatory standards, it aims to clarify its policy to maintain a certain amount of nuclear power generation in the future.

However, as the Fukushima No. 1 Nuclear Power Plant disaster is hardly under control following the recent spate of radiation-contaminated water leaks and other problems, the move to push forward Japan's dependence on nuclear power is expected to draw fire.

There are also proposals to have the basic energy plan refer to the best energy mix to define nuclear power as the country's key power source. The government is also considering including in the basic plan additional construction of reactors on the premises of existing nuclear plants, while some have expressed reservations about the move on the grounds that it has low feasibility.

The government is set to avoid including in the basic plan the new construction of nuclear plants as "there is no prospect of obtaining residents' understanding in the aftermath of the Fukushima nuclear disaster," according to a senior LDP official.

Prime Minister Abe has stated that while the ratio of nuclear power generation will be lowered, the reactivation of idled reactors will "be decided based on the world's toughest safety standards."

That being said, Japan is expected to have no reactors online in 2049 if it does not replace or additionally construct reactors under the 40-year service life rule, with many reactors already being offline for regular inspections or other reasons.

In an attempt to dodge public criticism, some in the government and the LDP insist underlining a plan to replace reactors with new ones that are safer and more capable by utilizing existing nuclear plants rather

than newly building such facilities. In consideration of the public's distrust in nuclear energy, however, the ratio of nuclear power generation in the future will not be specified in the basic plan.

Riding on the wave of the Abe administration's growth strategy, many in the government, the LDP and economic circles advocate that certain nuclear plants are necessary for Japan to keep its economy afloat.

A legislators' group for promoting a stable supply of electricity, comprising pro-nuclear energy members of the LDP, is set to submit its proposals for the government's basic energy plan in early December. "We must consider replacing or additionally building reactors," said a senior official of the group in a move to spur the Agency for Natural Resources and Energy, which is tasked with mapping out the basic plan.

In order to maintain nuclear power stations, however, there remain outstanding issues such as the absence of a final disposal site for radioactive waste. Prime Minister Abe is poised to make a final decision on the country's energy policy by taking into account the prospects for reactor restarts and trends in public opinion.

"First step toward nuclear abolition"

October 25, 2013

VOX POPULI: U.N. statement marks 1st step toward nuclear abolition

http://ajw.asahi.com/article/views/vox/AJ201310250021

Vox Populi, Vox Dei is a daily column that runs on Page 1 of the vernacular Asahi Shimbun.

Olof Palme, prime minister of Sweden from 1969 to 1976 and then from 1982 until his assassination in 1986, visited the Hiroshima Peace Memorial Museum in 1981. While in the museum, Palme grew increasingly quiet. He later insisted that all governments of the world should require people in positions of responsibility to visit Hiroshima.
Were this anti-nuclear pacifist statesman alive today, he would certainly be gratified that Japan has finally signed a United Nations statement condemning the inhumanity of nuclear weapons.

Even though Japan experienced two atomic bombings in 1945, it had refused to endorse similar statements, claiming they ran counter to Japan's policy of reliance for its national security on the "nuclear umbrella" provided by the United States.

Signed by 125 countries and presented on Oct. 21 to the U.N. General Assembly First Committee, the Joint Statement on the Humanitarian Consequences of Nuclear Weapons says, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances."

Japan should have signed it sooner. I hope this statement marks the first step toward total nuclear disarmament.

But nuclear weapons still figure prominently in the international community. The U.N. Security Council is dominated by nuclear powers, and nations that have recently joined their ranks are gaining influence, while North Korea's dictatorial regime continues to pose a nuclear threat. However, the world will never change so long as we let this reality remain our excuse for abandoning our ideals.

According to a book written by an Asahi Shimbun reporter, it was well before nuclear weapons became a reality that British writer H.G. Wells (1866-1946) suggested one way to eliminate wars would be to develop weapons to the bitter end. It is as if Wells foresaw the chilling paradox of the theory of nuclear deterrence.

I certainly do not want our world to keep relying on this terrible paradox. "The only way to guarantee that nuclear weapons will never be used again is through their total elimination," says the U.N. statement. This is the truth that will spare the world a third nuclear tragedy, and thereby do right by the victims of Hiroshima and Nagasaki.

--The Asahi Shimbun, Oct. 25

Japan should play leading role in nuclear disarmament

October 23, 2013

Editorial: Japan can do more to lead global move toward nuclear disarmament

http://mainichi.jp/english/english/perspectives/news/20131023p2a00m0na007000c.html

Japan joined 124 other countries in announcing a joint statement opposing the use of nuclear weapons at the U.N. General Assembly's First Committee. This is the first time that Japan has endorsed such a statement, marking an important step forward.

The next step that Japan should take is to play a leading role in efforts toward nuclear disarmament through various venues, such as the foreign ministerial conference of the Non-Proliferation and Disarmament Initiative (NPDI) to be held in Hiroshima in April 2014 with the participation of 12 non-nuclear powers.

The statement drafted by New Zealand says, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances."

Similar statements were released in May and October last year and April this year, but Japan refused to support any of them. This is because Japan cannot keep consistency between such a statement and its security policy of relying on the U.S. nuclear umbrella, although it remains the only atomic-bombed country in the world.

As many as 80 countries backed the April statement largely because a phrase, "outlawing nuclear weapons," was deleted from its draft. Japan came under fire internationally and domestically for refusing to sign the statement. In the Peace Declaration on the Aug. 9, 2013 atomic bombing anniversary, Nagasaki Mayor Tomihisa Taue bitterly criticized the national government over its response and urged it to "consider once again that Japan is the only country to have suffered a nuclear bombing."

Tokyo chose to support the latest statement because its request that the document express support for all approaches and efforts toward nuclear arms reductions was accepted. The government explains that the statement is consistent with Japan's policy of promoting nuclear arms reductions on a step-by-step basis while depending on the nuclear deterrence provided by the United States.

However, the Japanese government's actions leading up to the decision to support the statement were lukewarm.

Moves by like-minded countries to ban the use of nuclear arms because of the inhuman nature of such weapons are gaining momentum on a global scale. The U.S. government of President Barack Obama is also seeking to reduce the roles of nuclear weapons.

Japan has made efforts toward nuclear disarmament by submitting to the United Nations every year a draft resolution calling for efforts to reduce the number of nuclear weapons on a step-by-step basis, but is wary of the moves by like-minded countries that could lead to the creation of a convention banning nuclear arms. Critics have pointed out that Japan is trying to dampen these moves because it heavily relies on the nuclear deterrence provided by the United States.

The security environment surrounding Japan is severe as a result of North Korea's nuclear program and China's military buildup. This time, Japan also joined 17 other countries including Australia and member countries of the North Atlantic Treaty Organization (NATO) in backing a similar statement. This statement underscores the need for discussions on security guarantees. The move highlights the delicate positions of Japan and NATO members.

However, there are many things that Japan can do even though it relies on the U.S. nuclear umbrella. To fulfill Japan's responsibility as a supporter of these statements, the executive and legislative branches of

the government should seriously discuss specifically what it can do to lead the global move toward nuclear disarmament, while listening to opinions from experts.

Japan should work toward nuclear disarmament

October 28, 2013

Pushing for nuclear disarmament

http://www.japantimes.co.jp/opinion/2013/10/28/editorials/pushing-for-nuclear-disarmament/#.Um6njlOwT9k

Japan on Oct. 21 joined 124 other countries in signing a United Nations statement that underlines the inhuman nature of nuclear weapons and calls for the nonuse of such weapons. This is the first time that Japan has supported such a joint statement despite its being the only nation to have suffered from nuclear attacks. Now that Japan has signed the statement, it should play a constructive role in global efforts to realize the abolition of nuclear weapons.

If Japan had not signed this time, the international community could have doubted its seriousness on the matter. Japan had stopped short of signing similar joint statements issued in May and October 2012 and last April because it held that the phrase against nuclear weapons being used "under any circumstances" was incompatible with its policy of relying on the U.S. nuclear umbrella.

The Japanese government faced strong criticism from survivors of the August 1945 U.S. atomic bombings of Hiroshima and Nagasaki and by the mayors of the two cities for its failure to support the three earlier statements.

The countries that possess or are suspected to possess nuclear weapons did not sign the past and latest statements. But this time, about two-thirds of the 193 U.N. member countries signed the statement, demonstrating that an opinion pushing for the nonuse of nuclear weapons and eventual abolition of such weapons is becoming strong in the international community.

The latest joint statement was presented to the U.N. General Assembly First Committee to discuss disarmament and national security. It partly said, "It is in the interest of the very survival of humanity that nuclear weapons are never used again, under any circumstances." It also said, "All efforts must be exerted to eliminate the threat of these weapons of mass destruction."

The Japanese government explained that the latter sentence agrees with Japan's approach of taking realistic and gradual steps toward nuclear disarmament.

Stressing the inhumane nature of nuclear weapons, the statement went on to say, "Past experience from the use and testing of nuclear weapons has amply demonstrated the unacceptable humanitarian consequences caused by the immense, uncontrollable destructive capability and indiscriminate nature of these weapons" and "The catastrophic effects of a nuclear weapon detonation, whether by accident, miscalculation or design, cannot be adequately addressed."

Japan should pay attention to the fact that while it enjoys the protection of the U.S. nuclear umbrella, U.S. President Barack Obama is working toward the eventual abolition of nuclear weapons and that Norway and Denmark, also under the U.S. nuclear umbrella as NATO countries, signed the statement.

Although Japan is protected by the U.S. nuclear umbrella, it should help deepen discussion on the abolition of nuclear weapons both at home and abroad, and consider what concrete actions will help the international community realize this goal.

Japan's seriousness on the matter will be tested at a foreign ministers' meeting of the Non-Proliferation and Disarmament Initiative — which will also be attended by Australia and 10 other non-nuclear weapons countries — in Hiroshima next spring .

Opposition parties & nukes

October 28, 2013

Two tasks for the opposition

http://www.japantimes.co.jp/opinion/2013/10/28/editorials/two-tasks-for-the-opposition/#.Um6oDlOwT9k

The Abe administration's plan to change the interpretation of the war-renouncing Article 9 of the Constitution so that Japan can exercise the right to collective self-defense and its push for a bill to allow the government to designate almost all information concerning defense and security as "special secrets" — thus jeopardizing freedom of the press and the people's right to know — are dangerous moves that must be thoroughly discussed by the Diet in the current extraordinary session that started Oct. 15.

The Diet also must fully scrutinize the Abe administration's moves to restart some of Japan's 50 nuclear reactors that are now offline. The opposition parties should highlight the irrationality of the government and power industry's efforts to restart the dormant nuclear plants at a time when the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant continues — and growing worse in some respects — and in view of the fact that Japan is an extremely quake-prone country and that another large-scale nuclear accident would cause irreparable damage.

Mr. Banri Kaieda, leader of the Democratic Party of Japan, posed questions concerning the leaks of radioactive water from the Fukushima plant to Prime Minister Shinzo Abe. Mr. Abe said that the government will push forward efforts to solve the issue.

Mr. Abe also said that the situation at the nuclear power plant is "under control as a whole" as the "effect" of radioactive substances from the plant is contained inside the harbor adjacent to the plant.

But the facts — worsening leaks and rising radiation levels — do not support his claim. It is also unclear what kind of structure a government organization set up to cope with the contaminated leaks will take and who will be responsible for specific work inside the organization. Although the government plans to build a wall of frozen soil to block the intrusion of ground water into the nuclear plant site, thorough discussions have not been carried out to determine whether this is the best method to stop the leaks. And few people feel that Mr. Abe's replies are convincing.

More importantly the DPJ should challenge the Abe administration on the wisdom of its move to restart the nuclear reactors. When it was in power, the DPJ government's position was that all available means should be mobilized so that Japan could cease nuclear power generation in the 2030s.

The DPJ and other opposition parties must point out the serious problems related to nuclear power generation and present policy proposals to drastically increase the weight of renewable energy sources in Japan's power-generation portfolio.

In addition to the constant threat posed by natural disasters to the nation's nuclear reactors, if the reactors are restarted, the nuclear waste storage facilities at each plant will become full in several years. And because technology to safely store high-level radioactive waste on a permanent basis has yet to be established, nuclear waste has the potential to cause grave environmental problems for tens of thousands of years. It is ethically untenable to saddle future generations with such a dangerous burden.

The DPJ and other opposition parties must strongly oppose the government and power industry's plan to restart nuclear power plants. They should instead push alternative policies that can end Japan's dangerous reliance on this dangerous source of energy.

Exporting nukes "a central pillar of Abe's growth strategy"

October 28, 2013

Abe heads for Turkey to sell nuke technology

Kyodo
http://www.japantimes.co.jp/news/2013/10/28/national/abe-heads-for-turkey-to-sell-nuke-technology/#.Um9gTFOwT9k

Prime Minister Shinzo Abe left Monday for a three-day trip to Turkey, where he is expected to affirm closer bilateral economic cooperation, including on exports of Japanese nuclear reactors, with Turkish Prime Minister Recep Tayyip Erdogan.

The trip, following one in May when the two governments signed an accord for the peaceful use of atomic power, is also aimed at bolstering security cooperation and exploring the possibility of launching negotiations on a bilateral free trade agreement, according to Japanese officials.

It is rare for a prime minister to visit the same country twice in such a short period. It is also unusual for a prime minister to make an overseas trip during the week while the Diet is in session.

Turkey is "an extremely important country in strategic meaning," Abe told reporters at Haneda airport in Tokyo. "I would like to solidify the relationship of mutual trust between the leaders."

Abe stressed the importance of "securing and promoting national interest through summit diplomacy" as he sought the opposition camp's acceptance of his absence during Diet deliberations on major bills.

In a meeting Tuesday in Istanbul, Abe and Erdogan are expected to call for speeding up talks for installing reactors in Turkey in line with the bilateral nuclear accord.

Exporting nuclear reactors is a central pillar of Abe's growth strategy.

Formal agreement with Turkey on nuclear reactors

October 30, 2013

Abe oversees Japan's 1st nuclear plant export after 2011 disaster

http://ajw.asahi.com/article/behind_news/politics/AJ201310300043

By KOTARO ONO/ Staff Writer

ISTANBUL--A corporate alliance led by Mitsubishi Heavy Industries Ltd. reached a formal agreement with the government of Turkey on Oct. 29 to construct nuclear power reactors on the Black Sea coastline.

It is the first time Japanese firms have won a formal order to build nuclear reactors since the 2011 earthquake and tsunami disaster triggered meltdowns at the Fukushima No. 1 nuclear power plant.

The project involves building four reactors in the city of Sinop, northern Turkey, at an expected cost of more than $22 billion (2.1 trillion yen).

Officials from both nations signed the agreement to coincide with Prime Minister Shinzo Abe's visit to Turkey. Abe and Recep Tayyip Erdogan, his Turkish counterpart, announced the deal during a joint news conference here, following summit talks.

Abe and Erdogan signed a joint statement that calls for closer bilateral ties in science and technology, including nuclear power generation.

"Japan has a responsibility to share the lessons of the Fukushima nuclear disaster with the rest of the world and to promote nuclear safety," Abe said at the news conference. "We will help ensure the safety of nuclear power in Turkey and other countries that decide to introduce nuclear technology by assisting in their institution-building and human resources development."

Abe has been eager to act as Japan's top salesman to export nuclear and other infrastructure technology. When he last visited Turkey in May, he confirmed with Erdogan that both countries will conclude a nuclear energy agreement, a precondition for Japan's export of nuclear technology.

The Abe administration hopes to have a Japan-Turkey nuclear energy agreement ratified during the current Diet session and to enter export procedures in earnest once the agreement has taken effect.

But it could face a backlash from public opinion because the problem of radioactive water accumulating at the stricken Fukushima plant came to public attention after the informal agreement in May.

Spent fuel good enough for weapons, said US in 1977

October 30, 2013

Cause of concern: Japan Atomic Energy's Tokai Reprocessing Plant in Tokai, Ibaraki Prefecture, is seen in 1997. Declassified Japanese diplomatic records show the United States believed in 1977 that nuclear weapons could be produced from spent nuclear fuel at Japan's light water reactors and conveyed its view to Tokyo. | KYODO

National / History

Spent fuel good enough for bomb, U.S. told Japan in 1977

Kyodo

The United States believed in 1977 that nuclear weapons could be produced from plutonium extracted from spent nuclear fuel at Japan's light water reactors and conveyed its view to Tokyo, according to Japanese diplomatic records declassified Wednesday.

A U.S. arms control official told a Japanese diplomat based in Austria that the common belief that reactor-grade plutonium is unfit for weapons production is wrong, according to a cable sent by then-Ambassador to the U.S. Fumihiko Togo to the Foreign Ministry in Tokyo on Feb. 23, 1977.

At the time, the administration of U.S. President Jimmy Carter was pursuing nonproliferation following a nuclear test carried out by India in 1974.

Nuclear experts in Japan, including Ryukichi Imai, a former adviser to the governmental Japan Atomic Energy Commission, long believed that plutonium extracted from reprocessed fuel was not suitable for atomic bomb production.

Washington was opposed to Tokyo's plan to open the country's first nuclear reprocessing plant in Ibaraki Prefecture.

The U.S. arms control official also told the diplomat from the Japanese Embassy in Austria that compared with high-purity weapons-grade plutonium, reactor-grade plutonium is not optimum for arms production because of its relatively low explosive power.

The official did not want the information made public but reiterated that nuclear weapons could be made from plutonium extracted from spent fuel.

The diplomatic record also revealed that the U.S. pressured South Korea into abandoning its plan to purchase a nuclear reprocessing facility in the mid-1970s.

Resource-poor Japan promoted a policy from the late 1950s of recycling nuclear fuel by extracting plutonium from spent fuel. The Carter administration later endorsed a plan by Tokyo to open the reprocessing plant in Ibaraki that limited the amount of reprocessed fuel.

The Nuclear Non-Proliferation Treaty does not clearly ban nonnuclear states from acquiring nuclear fuel reprocessing technology that can produce weapons-grade plutonium. At present, Japan keeps 44 tons of plutonium.

What hope for nuclear-free world?

October 31, 2013

Nagasaki mayor sends protest letter to Obama over plutonium test

http://mainichi.jp/english/english/newsselect/news/20131031p2g00m0dm040000c.html

NAGASAKI (Kyodo) -- The mayor of Nagasaki sent a letter of protest to U.S. President Barack Obama on Wednesday after the United States revealed it had conducted an experiment using a small amount of plutonium to examine the capabilities of its nuclear weapons between July and September.

Mayor Tomihisa Taue and Hiroyuki Itasaka, chairman of the Nagasaki city assembly, said in the letter they cannot help but harbor doubts about the nuclear-free world proposed by Obama in Prague in 2009.

They also said the plutonium test trampled on the efforts of atomic bomb survivors and citizens of Nagasaki to eliminate nuclear weapons. The southwestern Japan city suffered a U.S. atomic bombing on Aug. 9, 1945.

The U.S. National Nuclear Security Administration has said on its website that a plutonium test involving a device called a "Z machine" was conducted in the July-September period, following one in the April-June quarter.

The Z machine generates strong X-rays to create a fusion reaction to assess the performance of nuclear weapons.

Give nuclear power it rightful place in the energy policy

October 31, 2013

Business leader calls for use of nuclear power

http://www3.nhk.or.jp/nhkworld/english/news/20131031_29.html
The head of a major business organization has urged the Japanese government to give nuclear power a position of importance in its new energy policy.

Japan Chamber of Commerce and Industry chairman Tadashi Okamura met on Thursday with trade and industry minister Toshimitsu Motegi.

The government plans to draw up a new basic energy plan by the end of this year.

Okamura argued nuclear power should be included in the variety of energy options in order to create a feasible policy.

He said nuclear power is essential to the stable power supply necessary for smooth economic activity.

And Okamura urged the minister to revise the policy set by the former Democrats-led government of abolishing nuclear power by the 2030s.

Motegi responded on the basis of mid- to long-term policy, saying the planned roles for each energy source will be clarified within the next 3 years.

And he said the government will work to build a full, responsible policy within 10 years

Japan' nuclear industry not really back on its feet

Source : Financial Times,

Fukushima hurts nuclear revival hopes

By Jonathan Soble - October 30, 2013 8:00 pm

Japan's successful bid to host the 2020 Olympics has reminded the world of the country's many attractive qualities, from delicious food to safe streets and punctual trains. But it has also refocused attention on a sore spot: the continuing efforts to deal with the aftermath of the Fukushima nuclear disaster.

Two and a half years after the triple meltdown, new failures at the stricken plant seem to be reported each week. Most have to do with contaminated water. Hundreds of tons of water cycle through each day, either as coolant pumped into still-hot reactors, or as groundwater seeping in and out of cracked plant basements.

Containing it all has proved to be beyond the capacity of Tokyo Electric Power (Tepco), the much-criticised owner. Some water has leaked out, exposing workers to radiation and contaminating the sea around the coastal site.

Experts say there is little risk to Olympic-hosting Tokyo, 240km south, but the situation looks a shambles: in a Nikkei newspaper poll, 80 per cent of respondents said they distrusted an assurance given to the International Olympic Committee by Shinzo Abe, the prime minister, that the clean-up was "under control".

All this has complicated Mr Abe's efforts to get Japan's nuclear industry back on its feet. In the months after the accident in March 2011, nearly all of Japan's 50 surviving reactors were closed indefinitely, amid public anxiety over safety and political wrangling between local governments and Tokyo.

The result pleased many Japanese – slightly more than half say they want the country to go nuclear-free – but left utilities struggling to replace an energy source that had provided 30 per cent of Japan's electricity.

Power bills have risen by 8-17 per cent, greenhouse gas emissions have jumped, and the cost of importing gas and other fuels has pushed a country that ran fearsome trade surpluses into a persistent deficit.

Mr Abe has been pushing gently but firmly for change – or, in the view of the anti-nuclear movement, a return to a scaled-down version of the pre-Fukushima status quo. Since coming to power in December, he has effectively abandoned a pledge by the previous, left-leaning government to end nuclear power by 2040. Instead, he has supported applications by utilities to restart a dozen idled reactors.

A new and more vocal nuclear regulator has both helped and hindered Mr Abe's cause. The Nuclear Regulation Authority has been more critical of safety flaws than its predecessors: at least one plant has been deemed unfit to reopen because it is sitting on an active faultline.

Mr Abe is counting on the NRA's perceived strictness to assuage public fears and inhibit opposition to restarting the plants. Utilities submitted the first applications for recertification in July; the NRA is expected to take until next spring to inspect the facilities, which have undergone safety upgrades, and make its first rulings.

Most expect permission to be granted. Still, even if all the reactors are allowed to reopen, Japan would have just a third the number of working reactors that it had before Fukushima.

More could be put back in service, but experts say at most half are new enough or far enough from Fukushima to be viable. That will keep pressure on the government to cultivate alternative energy sources, from renewables to US shale gas.

"Japan is thinking hard about its energy mix," says George Borovas, head of nuclear projects at Pills-bury, an international law firm. Japan's nuclear-equipment builders – Hitachi, Toshiba and Mitsubishi Heavy Industries – have become more assertive in pursuing deals abroad, he adds. Hitachi's acquisition of the Horizon nuclear project in the UK last year, for instance, put the company in charge of an entire atomic-energy enterprise – a departure from its usual, more limited role as a builder of reactors.

Meanwhile, there is still Fukushima to contend with. Ahead of the Olympic host-city decision in September, Mr Abe's government began asserting more control over the clean-up. In August, it said it would fund a project to freeze soil around the plant, to prevent groundwater seeping in and mixing with irradiated coolant.

"This is a critical issue of strong interest to the Japanese people," Mr Abe said at the time. "Instead of leaving everything to Tepco, we need to create a firm national strategy."

Some are now urging a re-examination of Tepco's future, reviving a debate dormant since the months after the meltdowns.

Clean-up and compensation costs had threatened the utility with bankruptcy until the previous government stepped in with Y1tn ($10bn) in capital and a promise to underwrite payments to tens of thousands of evacuated Fukushima residents.

Tepco is in effect owned now by the state, but through a complicated structure that allows the company to operate independently. Critics say that has left ultimate responsibility for the Fukushima site unclear, and may have contributed to the string of problems at the site.

Yasuhisa Shiozaki, a senior LDP politician and former chief cabinet secretary, says the government might end up taking clearer control – either of Tepco itself, the Fukushima site or of all Japanese reactors that are to be abandoned rather than restarted.

"I think it's inevitable," he said in September.

Energy policy should also reflect public opinion

November 4, 2013

Editorial: Gov't must reflect public opinion in new energy policy

http://mainichi.jp/english/english/perspectives/news/20131104p2a00m0na004000c.html

The Atomic Energy Commission (AEC) has set the basic direction for the government's nuclear energy policy for more than half a century. Previously, the commission worked out long-term plans, but it now draws up a framework for nuclear energy policy roughly every five years to review the policy's direction.

However, a government panel of experts that has reviewed the AEC's role since the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, recently agreed in principle to abolish the policy framework. The direction for nuclear energy policy will instead be included in a basic plan on energy that the Economy, Trade and Industry Ministry is considering drawing up

.

The decision is rational in the sense that nuclear energy policy should be incorporated within the government's overall energy policy. Still, there is a serious problem with the decision: Nuclear energy policy would be determined under the leadership of the Ministry of Economy, Trade and Industry, which has promoted nuclear power. Lessons learned from the Fukushima nuclear disaster could be rendered ineffective if policy-making were left to the discretion of the organization that promotes nuclear energy.

Following the outbreak of the nuclear crisis, the Democratic Party of Japan (DPJ)-led government set up a panel of Cabinet ministers involved in energy and environmental policies and set a goal of ridding Japan of all nuclear power stations by the end of the 2030s. It also decided not to allow the installation of any new nuclear reactors and to decommission any reactor that had been in operation for 40 years. An advisory council -- one-third of whose members are in favor of relying less on atomic power -- then began compiling a basic plan on energy. Although the DPJ-led government's move might have been insufficient, it could be appreciated as an effort to reform the way in which energy policy is worked out.

The situation changed under the government of Prime Minister Shinzo Abe, which abolished the panel of Cabinet ministers on energy and environmental policies, dropped the zero-nuclear policy and now intends to commission an advisory council to the Economy, Trade and Industry Ministry to draw up a basic plan for nuclear energy policy by the end of this year. The council is dominated by pro-nuclear power members, which could have a bearing on how Japan's atomic power policy in the wake of the nuclear accident will change.

While maintaining the basic policy of decreasing Japan's dependence on nuclear power, the Abe government has not clearly shown specific measures to achieve this goal, nor has it held in-depth discussions on the nuclear fuel cycle project, in which spent nuclear fuel is reprocessed and reused in nuclear reactors. Moreover, calls persist within the government to urge that nuclear power plants be retained and that aging ones be rebuilt. One cannot help but be astonished by such discussions -- held as if the Fukushima nuclear disaster never occurred.

Furthermore, and more seriously, it remains unclear how public opinion is being reflected in the discussions on Japan's atomic power policy. One of the problems highlighted by the nuclear crisis was that all decisions relating to nuclear policy had been determined by the exclusionary "nuclear power village," the title used to refer to the electric power industry, pro-atomic power bureaucrats and scholars who colluded to promote nuclear power. The government could repeat the same mistake unless it changes the policy-making process handled by the ministry advisory panel without clarifying the criteria for selecting its members.

The Economy, Trade and Industry Ministry is unlikely to specify the ratio of nuclear power to total power consumed in Japan. The basic plan on energy that the ministry will draw up could therefore send the public a message that Japan will maintain the status quo, hindering energy policy reform and leaving Japan to continue relying on atomic power.

The public has never given the Abe administration carte blanche over nuclear power policy. The government should review the nation's energy policy in a transparent way, so that policy fully reflects public opinion.

So they say

November 5, 2013

Experts Say Nuclear Power Needed to Slow Warming

PITTSBURGH November 3, 2013 (AP)
By KEVIN BEGOS Associated Press

http://abcnews.go.com/Technology/wireStory/experts-nuclear-power-needed-slow-warming-20767882

Some of the world's top climate scientists say wind and solar energy won't be enough to head off extreme global warming, and they're asking environmentalists to support the development of safer nuclear power as one way to cut fossil fuel pollution.

Four scientists who have played a key role in alerting the public to the dangers of climate change sent letters Sunday to leading environmental groups and politicians around the world. The letter, an advance copy of which was given to The Associated Press, urges a crucial discussion on the role of nuclear power in fighting climate change.

Environmentalists agree that global warming is a threat to ecosystems and humans, but many oppose nuclear power and believe that new forms of renewable energy will be able to power the world within the next few decades.

That isn't realistic, the letter said.

"Those energy sources cannot scale up fast enough" to deliver the amount of cheap and reliable power the world needs, and "with the planet warming and carbon dioxide emissions rising faster than ever, we cannot afford to turn away from any technology" that has the potential to reduce greenhouse gases.

The letter signers are James Hansen, a former top NASA scientist; Ken Caldeira, of the Carnegie Institution; Kerry Emanuel, of the Massachusetts Institute of Technology; and Tom Wigley, of the University of Adelaide in Australia.

Hansen began publishing research on the threat of global warming more than 30 years ago, and his testimony before Congress in 1988 helped launch a mainstream discussion. Last February he was arrested in front of the White House at a climate protest that included the head of the Sierra Club and other activists. Caldeira was a contributor to reports from the Intergovernmental Panel on Climate Change,

Emanuel is known for his research on possible links between climate change and hurricanes, and Wigley has also been doing climate research for more than 30 years.

Emanuel said the signers aren't opposed to renewable energy sources but want environmentalists to understand that "realistically, they cannot on their own solve the world's energy problems."

The vast majority of climate scientists say they're now virtually certain that pollution from fossil fuels has increased global temperatures over the last 60 years. They say emissions need to be sharply reduced to prevent more extreme damage in the future.

In 2011 worldwide carbon dioxide emissions jumped 3 percent, because of a large increase by China, the No. 1 carbon polluting country. The U.S. is No. 2 in carbon emissions.

Hansen, who's now at Columbia University, said it's not enough for environmentalists to simply oppose fossil fuels and promote renewable energy.

"They're cheating themselves if they keep believing this fiction that all we need" is renewable energy such as wind and solar, Hansen told the AP.

The joint letter says, "The time has come for those who take the threat of global warming seriously to embrace the development and deployment of safer nuclear power systems" as part of efforts to build a new global energy supply. Stephen Ansolabehere, a Harvard professor who studies energy issues, said nuclear power is "very divisive" within the environmental movement. But he added that the letter could help educate the public about the difficult choices that climate change presents

Japan-led resolution approved by UN

November 5, 2013

U.N. committee passes Japan-led nuke elimination resolution

http://mainichi.jp/english/english/newsselect/news/20131105p2g00m0dm058000c.html

NEW YORK (Kyodo) -- A Japan-led resolution calling for the elimination of nuclear weapons was approved Monday by the U.N. General Assembly's First Committee on disarmament with endorsements by 164 countries, marking the 20th year in a row that such a resolution has been passed.

The resolution, which is expected to be approved by the General Assembly at a meeting in early December, drew a record 102 co-sponsors.

North Korea was the only country to vote against it. The resolution condemned "in the strongest terms the nuclear test conducted" by North Korea in February this year and called on Pyongyang to "abandon all nuclear weapons and existing nuclear programs."

Fourteen other countries including China, Russia, India, Pakistan and Israel abstained.

Among other nuclear powers, the United States co-sponsored and voted for it, while Britain and France backed it without joining as sponsors.

In Tokyo, Foreign Minister Fumio Kishida welcomed the resolution's approval at the U.N. committee, saying that it would contribute to further building momentum toward a world free of nuclear weapons.

"Japan intends to lead the efforts of the international community toward the goal of a world without nuclear weapons through our continuing proactive efforts like this," Kishida told reporters.

The resolution calls for achieving "a world without nuclear weapons" and reaffirms "the crucial importance of the Treaty on the Non-Proliferation of Nuclear Weapons."

This year's resolution expresses "deep concern at the catastrophic humanitarian consequences of any use of nuclear weapons," in a similar fashion as a U.N. statement Japan joined for the first time and unveiled at the First Committee last month.

Last month's statement serves as an expression of will at the committee meeting by the participating countries.
In contrast, the resolution represents a formal decision of the committee of the General Assembly comprising 193 members.

Before the resolution was put to a vote at the committee, North Korea said it categorically rejected the resolution, adding that "Japan has no qualification and reputation" to table this draft because "plutonium is piled up," which can be used to create nuclear weapons.

Toshio Sano, the Geneva-based Japanese ambassador for disarmament who leads discussions at the First Committee, told reporters in New York that "our country's view to push forward nuclear disarmament through solid and joint efforts involving nuclear powers received overwhelming support."

Gov't must not evade responsibility- What structure for TEPCO?

November 9, 2013

Editorial: Failure of nuclear power policy shows Japan must get rid of all nuke plants

http://mainichi.jp/english/english/perspectives/news/20131109p2a00m0na004000c.html

The government's unreasonable policy of forcing a private electric power company to pay the full costs of dealing with a nuclear plant accident while promoting atomic power has come to a deadlock. The government should review its nuclear power policy and draw up a blueprint for a society that will not depend on such an energy source.

The ruling coalition comprised of the Liberal Democratic Party (LDP) and New Komeito is set to propose to Prime Minister Shinzo Abe that the government speed up efforts to bring the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant under control and restore areas affected by the disaster.

Specifically, the coalition will call for the use of taxpayers' money to build a temporary storage facility for soil contaminated with radioactive substances, to decontaminate areas affected by the disaster and to treat radioactively contaminated water accumulating at the Fukushima No. 1 Nuclear Power Plant. The total amount of money that the government is expected to pay is likely to amount to several trillion yen. The executive branch of the government will consider complying with the recommendation by the coalition. The move represents a departure from the government's policy of requiring Tokyo Electric Power Co. (TEPCO), the operator of the plant, to foot all the costs of dealing with the nuclear disaster.

The ruling coalition's proposal reflects its serious sense of crisis over the current situation in which work to restore areas hit by the nuclear crisis has been delayed.

The prime minister has said ensuring Fukushima's recovery from the disaster is the top priority for his government. Nevertheless, the government had been reluctant to play an active role in dealing with the nuclear disaster because it was unsure of how much such efforts would cost taxpayers. As a result, work to treat contaminated water has been delayed and little progress has been made on the restoration of nuclear disaster-hit areas.

It is obvious that work to deal with the meltdowns should not be left entirely to TEPCO. The government that has promoted nuclear power and actively helped power companies secure land and construction costs for nuclear plants must not evade its responsibility. The use of taxpayers' money is inevitable.

Since the government is set to use taxpayers' money, it must not repeat the mistakes of the past. In other words, the government needs to admit that its nuclear power policy was wrong and fundamentally review it. Electric power companies are required to shoulder unlimited liabilities for accidents at nuclear plants

they operate under the Act on Compensation for Nuclear Damage. However, even TEPCO, the largest company in the industry, cannot fully shoulder the costs of dealing with the disaster.

Still, the problem will never be solved even if an upper limit is to be set on utilities' liabilities for nuclear accidents because such a measure would require the government to bear the costs beyond the upper limit. In other words, **it is inevitable for taxpayers to shoulder a huge amount of financial burden once a serious accident occurs at an atomic power station**.

Electric power firms are forced to operate thermal power plants powered by natural gas and oil at full capacity to make up for the loss of nuclear power, costing the utilities more than 3 trillion yen in extra fuel expenses a year. Those in favor of nuclear power say nuclear fuel is far less expensive than fossil fuels as one of the reasons why they are promoting atomic energy. The cost-effectiveness of power generation cannot be ignored in Japan, which is beginning to show signs of overcoming its longstanding deflation as a result of "Abenomics," economic policies promoted by Prime Minister Abe.

However, the promotion of nuclear power was based on the myth of the infallible safety of nuclear plants. Since that safety myth has collapsed, nuclear plants have lost their edge even in terms of cost-effectiveness.

Such being the case, the government should eliminate nuclear power stations as quickly as possible while developing and introducing substitute energy sources, such as renewable energy, and promoting energy-saving measures. The government needs to draw up a clear road map toward that end.

The proposal that the LDP-New Komeito coalition will make shortly calls for the use of public funds to build infrastructure to support Fukushima's disaster recovery. This suggests that the coalition intends to fend off criticism from the public that taxpayers would be forced to shoulder the costs of bailing out TEPCO. However, the responsibility of TEPCO, which caused such a serious accident as a result of making light of safety measures, is extremely grave. If public funds were used solely to bail out TEPCO, the measure would never win the public's understanding.

Critics insist that TEPCO be liquidated as a precondition for an injection of public funds. Of course, ordinary businesses would be liquidated in such a case because it would be unreasonable to use taxpayers' money before their creditors -- including shareholders and financial institutions that buy the firms' bonds or extend loans to them -- assume their own responsibility for their failures.

However, electric power companies operate under special circumstances. They need to issue corporate bonds to raise massive amounts of funds to make investments in facilities including nuclear plants.

Therefore, priority is placed on utilities' redemption of their bonds under legislation in case they go under. No one can foresee how far TEPCO's debts will snowball.

In explaining at a recent Diet session why the government will not liquidate TEPCO, Economy, Trade and Industry Minister Toshimitsu Motegi expressed concern that priority could be placed on the protection of investors who hold TEPCO bonds over compensation payments to disaster victims, which could delay the decommissioning of the Fukushima reactors and countermeasures against contaminated water. The ruling coalition's proposal is based on the assumption that TEPCO will not be liquidated.

Still, calls persist within the ruling coalition urging the utility be liquidated. If the government could not persuade opponents within the coalition, use of taxpayers' money to deal with the disaster would never win support from the public. If the government intends to avoid liquidating TEPCO, it must provide a thorough explanation to convince taxpayers.

Furthermore, the government should demand TEPCO drastically reform its management in an effort to win the public's understanding for the use of public funds. TEPCO claims that it has streamlined its operations more thoroughly than required by its corporate rehabilitation plan endorsed by the government. Still, the government's Board of Audit has pointed out that the utility has wasted some money in procuring materials and equipment. Moreover, TEPCO should consider disposing some of its assets. The utility needs to be fully aware that it has come under pressure to thoroughly streamline its operations.

The ruling coalition's proposal also suggests that TEPCO can either split its division specializing in decommissioning nuclear reactors or transform itself into an independent administrative agency.

In reforming itself, however, TEPCO must aim to maintain the morale of workers struggling to bring the nuclear crisis under control and make steady progress in the work, as well as step up the streamlining of its operations to the extent that it will not sacrifice the safety of its nuclear plants in an effort to lessen the financial burden on taxpayers. Moreover, TEPCO must secure a stable supply of electric power.

To that end, it is necessary to consider the most appropriate management structure of the company.

Japan-India nuclear pact

Japan, India agree to promote nuclear pact talks

http://www3.nhk.or.jp/nhkworld/english/news/20131112_30.html

The Japanese and Indian foreign ministers have agreed to promote negotiations on concluding a civil nuclear pact at an early date.

Japan's Fumio Kishida and India's Salman Khurshid met in New Delhi on Tuesday. Kishida is there to attend foreign ministerial talks of the Asia-Europe Meeting.

He said Japan hopes to more closely cooperate with India to expand their bilateral strategic partnership. Khurshid replied that the 2 countries should hold summit and ministerial meetings to build deeper relations.

Kishida and Khurshid agreed to accelerate negotiations on a pact that would allow Japan to export nuclear power technology to India. The country plans to build nuclear power stations.

The foreign ministers also discussed security cooperation. They agreed to hold joint exercises of Japan's Maritime Self Defense Force and India's Navy at an early date.

They also confirmed that working group meetings should be held as soon as possible to discuss ways for Japan to export US-2 amphibious rescue aircraft to India.

Answer Koizumi's questions first

November 12, 2013

Ex-PM Koizumi urges Abe to break away from nuclear power

http://mainichi.jp/english/english/newsselect/news/20131112p2g00m0dm078000c.html

TOKYO (Kyodo) -- Former Prime Minister Junichiro Koizumi on Tuesday urged incumbent Japanese leader Shinzo Abe to break away from nuclear power generation, saying other politicians will follow once such a decision is made.

"It is a matter of judgment, or foresight. But I want (the prime minister) to shift to that direction," Koizumi said during a speech delivered at the Japan National Press Club in Tokyo.

The retired lawmaker from the ruling Liberal Democratic Party also said during a question-and-answer session that followed the speech, "The power a prime minister holds is enormous. If a prime minister says zero (nuclear), there wouldn't be much opposition."

Koizumi, meanwhile, suggested Abe can visit the Yasukuni Shrine in Tokyo, which honors convicted Japanese Class-A war criminals along with war dead, if he wishes to do so, even if it may trigger criticism from China.

November 11, 2013

Koizumi's nuclear power questions

http://www.japantimes.co.jp/opinion/2013/11/11/editorials/koizumis-nuclear-power-questions/#.UoEy-yewT9k

While political repercussions continue over former Prime Minister Junichiro Koizumi's surprise calls for ending nuclear power generation in Japan, what the once popular leader points out are all sensible and legitimate questions about Japan's energy policy that remain unanswered by members of the Abe administration. Any energy policy that fails to squarely answer the questions posed by Koizumi will not have any credibility.

Koizumi, who kept largely out of the media spotlight after retiring as lawmaker in 2009, has been speaking out in recent months that Japan should end its reliance on nuclear power. He says the Fukushima nuclear disaster changed his perception of nuclear power as a low-cost and safe source of energy and now says, "There is nothing more costly than nuclear power." He urges the government to divert the massive energy and money needed to maintain nuclear power in Japan into more investments in the development and promotion of renewable energy sources.

Many of his former Liberal Democratic Party colleagues initially tried to dismiss Koizumi as a retired politician who has nothing to do with the party today. Prime Minister Shinzo Abe, who served in key Cabinet and LDP positions during Koizumi's 2001-2006 rule, said it is "irresponsible" to commit to ending nuclear energy at this point. Meanwhile, hopes have emerged within the opposition camp that an alliance with Koizumi — who drew strong popular support while in office — on the zero nuclear agenda could provide them with ammunition against the LDP's dominance in the Diet.

The political ripple effects — and some criticism over his flip-flop after promoting nuclear power while in office — aside, what seems missing in the controversy are discussions on the very real and pressing issues highlighted by Koizumi. He points to poor prospects for finding a permanent storage site for highly radioactive waste after spent fuel is reprocessed. This problem — for which Japan's nuclear power industry has long been likened to a "condominium without a toilet" — has been set aside since well before the Fukushima crisis.

Abe has told the Diet that a technology has been established to store such waste in geological layers deep underground. Koizumi says the problem is that despite the existence of this technology, the government has been unable for more than a decade to find a candidate site anywhere in Japan. And this technology, Koizumi says, might be problematic in this quake-prone country — a point that Abe conveniently neglects to mention. Given the safety concerns over nuclear power following the triple meltdowns at the Fukushima plant, it is even more doubtful that a candidate site will ever be found, Koizumi says. Thus radioactive waste will continue to pile up as long as nuclear power plants are operated.

Japan's nuclear fuel cycle program is at a standstill. Completion of a fuel reprocessing plant in Rokkasho, Aomori Prefecture, has been delayed for years, and the Monju fast-breeder reactor in Tsuruga, Fukui Prefecture, has been idled for much of the time since a sodium leak and fire in 1995. Meanwhile, storage space for spent nuclear fuel from reactors around the country, and in the Rokkasho complex, is nearly 70 percent full.

As Koizumi points out, the myth that nuclear power is cheaper than other sources of energy is thrown in doubt when the expenses for siting nuclear plants, their future decommissioning and waste disposal are included. And on top of this there is the massive cost of dealing with the aftermath of the Fukushima No. 1 meltdowns, including compensation, which far exceeds the financial capacity of its operator, Tokyo Electric Power Co. This is necessitating the injection of a huge amount of taxpayer money.

Abe's rebuttal is that increased fossil fuel imports for thermal power generation to make up for the nuclear plant shutdowns is costing the nation trillions of yen a year. But his rhetoric does not answer the question whether nuclear power is really the affordable source of energy — as it has long been touted to be by the government — especially after the costs of compensation and decontamination in the wake of the Fukushima nuclear crisis are taken into account.

Abe has vowed to scrap the nuclear phaseout policy of the Democratic Party of Japan-led administration that his LDP ousted from power last year. But the prime minister has yet to present a new vision for the nation's energy policy — except to say that he would reduce as much as possible Japan's reliance on nuclear power while maximizing energy-saving efforts and development of alternative energy.

While the future of Japan's energy policy remains elusive and the Fukushima nuclear crisis is continuing, Abe has been pushing for the sale of Japanese nuclear power plant technology overseas as part of his bid to boost infrastructure exports. When Mitsubishi Heavy Industries and France's Areva clinched a joint-venture deal in October to build a nuclear power plant with four advanced reactors in Turkey, Abe said Japan "is responsible for helping improve the safety of atomic power in the world by sharing the experience and lessons" from the disaster at the Fukushima plant — whose situation he has described as "under control."

At home the Abe administration and the LDP are pushing for the restart of some idled nuclear reactors once they have cleared a new set of safety criteria, even though radiation-contaminated water continues to leak from the Fukushima compound nearly 2½ years after the meltdowns.

Abe should lay out a new energy vision that will fully address the doubts about nuclear power raised by Koizumi. His legitimate concerns are likely shared by a large part of the public — a majority of whom, according to media surveys, oppose restart of the idled nuclear reactors. As Koizumi says, only Japan's political leaders can set the direction for the nation's energy policy. The Abe administration has an obligation to choose a path that ensures Japan will not have to contend with another nuclear power plant disaster in the future.

Koizumi/Abe: same goal?

Suga: Govt., Koizumi seek nuclear reduction goal
http://www3.nhk.or.jp/nhkworld/english/news/20131112_23.html

Japan's Chief Cabinet Secretary Yoshihide Suga says the government and former prime minister Junichiro Koizumi share the same goal of reducing reliance on nuclear power generation as much as possible.

The former prime minister has repeatedly proposed that Japan end its reliance on nuclear power and switch to sources of renewable energy.

Suga told reporters on Tuesday that the government is responsible to ensure a steady and cheap supply of affordable energy.

He said the current policy is to reduce the country's reliance on nuclear power generation as much as possible.

It's up to Abe

November 11, 2013
Koizumi: It's up to Abe to make the move toward a nuclear-free society

http://ajw.asahi.com/article/behind_news/politics/AJ201311120095

By IZUMI SAKURAI/ Staff Writer

Former Prime Minister Junichiro Koizumi on Nov. 12 used his first public session with reporters since retiring from politics to continue pressing Prime Minister Shinzo Abe to abandon nuclear energy.

"There are no prospects for securing disposal sites for nuclear wastes produced through nuclear power generation," Koizumi said in a lecture at the Japan National Press Club in Tokyo. "The nuclear reactors should not be restarted. They should be abolished as early as possible."

He also urged an immediate halt to the government's nuclear fuel recycling project that reprocesses spent nuclear fuel.

After stepping down as prime minister in 2006, Koizumi remained largely out of the spotlight. But his recent anti-nuclear proclamations have generated a buzz in the political world and the media.

More than 300 people, including foreign correspondents from South Korea and embassy staff members, crowded the venue to hear Koizumi speak.

Koizumi did not reveal any specific plan for his anti-nuclear ideas. But he did bring politics, specifically Abe, into his arguments.

"Opposition parties are basically opposed to the promotion of nuclear power generation. If we explore the real intentions of (ruling) Liberal Democratic Party lawmakers, about half of them are against nuclear power generation while the other half are pro-nuclear," Koizumi said.

The LDP, which controls both chambers of the Diet, has been pushing for the restarts of nuclear reactors that have remained idle following the March 2011 accident at the Fukushima No. 1 nuclear plant.

"If Prime Minister Abe shows the determination (to create a nuclear-free society), many pro-nuclear LDP lawmakers will follow his determination. There will be no better environment than the current one (to realize a nuclear-free Japan)," Koizumi said.

He encouraged Abe to use his power as prime minister to create a huge project of abolishing all nuclear reactors and developing alternative energies.

The former prime minister gave a lecture for about an hour and then received questions from only four reporters.

He also addressed criticism that he is irresponsible for calling for the abolition of nuclear reactors without providing an alternative solution to the energy needs of the nation.

"It is impossible for me alone to show alternative proposals. If politicians adopt a broad policy, people with wisdom will undoubtedly present good ideas," he said. "The government should think about converting to and promoting renewable energies by gathering experts, bureaucrats and other intellectuals."

Pro-nuclear opponents have said use of thermal power generation in place of nuclear energy has proved costly in terms of imports of fossil fuels and emissions of carbon dioxide.

Koizumi responded: "Japanese technologies are quick in dealing with the changes of the times. The Japanese people and companies are also cooperative."

The core of Koizumi's anti-nuclear argument is that it is irresponsible for the government to promote nuclear power generation when it cannot secure space for nuclear waste disposal sites.

He repeated that his anti-nuclear stance stems from a tour to the Onkalo repository, the final disposal site for highly radioactive waste, in Finland in August.

Meaning "cave," Onkalo is an artificially constructed tunnel on an island in the Baltic Sea about 250 kilometers northwest of the Finnish capital of Helsinki.

Nuclear waste will be stored there in a square measuring 2 kilometers by 2 km around 400 meters below the surface.

It will take about 100,000 years for the nuclear waste to become harmless.
"Humans are curious," Koizumi said. "Until that time (100,000 years later), how should people tell later generations that the nuclear waste is dangerous so that future people will not try to dig it out thinking, 'What's this'?
"Letters and languages will change. Is it really possible to continue to store (nuclear waste) for such a long period?"
He also compared quake-free Finland and its stable bedrock to the situation in Japan.
"Onkalo will deal with waste from two nuclear reactors. In Japan, there are as many as 54 nuclear reactors," Koizumi said. "Besides, Japan is an earthquake-prone country and its bedrock is not strong. Where in Japan can we construct such a facility?"

Use "political clout" to achieve nuclear-free Japan

November 12, 2013

Pro-reactor incumbent's political capital high; public in right mood

Koizumi calls on Abe to ditch nuclear power

http://www.japantimes.co.jp/news/2013/11/12/national/koizumi-calls-on-abe-to-ditch-nuclear-power/?utm_source=rss&utm_medium=rss&utm_campaign=koizumi-calls-on-abe-to-ditch-nuclear-power#.UoMmFSewT9k

by Ayako Mie
Staff Writer

Prime Minister Shinzo Abe has abundant political capital and should declare an end to nuclear power, as the public mood for such a decision couldn't be better, predecessor Junichiro Koizumi said Tuesday.

"Nobody has had more favorable conditions to achieve a nuclear-free option than Abe," the popular ex-prime minister said in a rare news conference at the Japan National Press Club in Tokyo. "For first time in a long time, the Japanese are ready to support a project and I want him to use his strong political clout."

Tuesday's event was Koizumi's first official press conference since the Mainichi Shimbun reported in late August his call for Japan to immediately cease its reliance on atomic energy.

Over 350 reporters and club members attended the 90-minute speech and question-and-answer session, when Koizumi demonstrated his trademark no-nonsense style.

Koizumi, 74, said Abe is in a better position to accomplish a nuclear-free Japan, unlike when he dissolved the Lower House in 2005 to achieve the postal system privatization. Back then, Koizumi faced fierce opposition from both his Liberal Democratic Party and the opposition camp.

"Now the opposition camp advocates for a nuclear-free society, and only the LDP opposes it. But I think 50 percent of LDP lawmakers favor scrapping atomic energy," said Koizumi. "LDP lawmakers cannot voice opposition to nuclear power because Abe is promoting it. If Abe decides to scrap nuclear power, no one in the party will protest."

While Koizumi was prime minister, he, too, supported nuclear power. But he said the March 2011 Great East Japan Earthquake made him realize it was wrong to believe atomic energy is a source of clean and cheap energy, because nuclear power is uncontrollable.

He also noted Japan has no viable way to process or dispose of radioactive waste.

Koizumi was especially critical of an Oct. 8 editorial by the pro-nuclear Yomiuri Shimbun, which criticized his stance by saying it is the fault of politicians that Japan cannot find sites to dispose of nuclear waste.

"We have not been able to find nuclear waste disposal sites for the last 10 years," Koizumi said. "It is too optimistic and irresponsible for them to say that politicians should be responsible for not having a clear prospect (for radioactive waste sites) especially after the earthquake."

Koizumi has reportedly not met with Abe to talk about this issue. But Abe, who served as his chief Cabinet secretary and subsequent successor, has rejected going nuclear-free, saying it is irresponsible to chart such a course when energy costs are surging.

Koizumi may be retired but he still commands popularity. A recent Asahi Shimbun poll found 60 percent of respondents support his views, while 25 percent oppose them.

Koizumi: Japan should give up nuclear power now

http://www3.nhk.or.jp/nhkworld/english/news/20131112_34.html

Former Prime Minister Junichiro Koizumi says Japan should immediately give up nuclear power generation. He suggested that Prime Minister Shinzo Abe decide promptly on a zero nuclear policy.

Koizumi reiterated his opposition to nuclear energy at a news conference in Tokyo on Tuesday.

He rebutted criticism that he is irresponsible and overly optimistic for not offering an alternate energy plan. He said that what is most important in politics is to show a policy, and that if the government comes out with a policy of zero nuclear power, wise people will come up with good ideas.

On the timing of realizing zero reliance on nuclear power, Koizumi said he thinks immediately would be good.

Koizumi said the government wants to restart the country's nuclear reactors after confirming their safety, but that this plan is certain to face difficulties. He said there will not be many nuclear reactors to be restarted and that the gap should be filled by alternate energy sources. He pointed out that the government is still unable to find a final disposal site for radioactive waste.

Koizumi said most opposition parties are in favor of giving up nuclear energy. He said the governing Liberal Democratic Party officially supports nuclear power, but that about half of the party's lawmakers are probably against it in their hearts.

Koizumi urged Abe to make a decision. He said nobody would oppose him if he decided to give up nuclear power and create a state of natural energy sources.

Koizumi also commented on opposition from China and South Korea to visits by Cabinet members to Tokyo's Yasukuni Shrine. The shrine honors Japan's war dead. Those remembered include leaders convicted of war crimes after World War Two. He said leaders of every country visit memorial facilities to pay their respects to their war dead, and that only the leaders of China and South Korea criticize the practice.

Koizumi referred to Abe's current diplomacy towards China, saying it is on the right track. He said that if a summit meeting is not possible, other politicians should promote exchanges. He said there is no need for Japan to ask China for a summit.

Koizumi said a time will come when China feels embarrassed about its claims on the Yasukuni issue. He said Japan must maintain its present stance, as China knows the importance of maintaining friendly bilateral ties.

Majority of Japanese wants zero-nuclear country

November 13, 2013

55% of Japanese want zero-nuclear Japan: Mainichi survey

http://mainichi.jp/english/english/newsselect/news/20131113p2a00m0na002000c.html

Some 55 percent of Japanese agree with former Prime Minister Junichiro Koizumi's call for an end to nuclear power generation in Japan, a Mainichi opinion poll has found.

According to the survey conducted on Nov. 9-10, just 34 percent of those polled said they did not agree with abolishing nuclear power. Meanwhile, anti-nuclear sentiment ran particularly high among female respondents, at 60 percent. Only 27 percent of women disagreed with a zero-nuclear policy.

Even among respondents who said they support the Cabinet of Prime Minister Shinzo Abe -- which is considering replacing aging reactors with new ones -- 49 percent said they favored a zero-nuclear policy. Forty-two percent said they were against the idea. Among supporters of the ruling Liberal Democratic Party as a whole, the for and against camps came out nearly even, at 44 percent versus 46 percent, respectively.

Among supporters of the opposition parties, 59 percent of respondents backing the Democratic Party of Japan favored an end to nuclear power, as did 74 percent of Japan Restoration Party supporters, 67 percent of Your Party supporters, and 79 percent of Japanese Communist Party backers.

Among independents, 56 percent of respondents wanted atomic power abolished, versus 30 percent who said they were against such a move.

Abe has "power"

November 14, 2013

VOX POPULI: Abe has the power to settle the nuclear issue once and for all

http://ajw.asahi.com/article/views/vox/AJ201311140044

Vox Populi, Vox Dei is a daily column that runs on Page 1 of the vernacular Asahi Shimbun.

Though it feels longer, it has only been a year since then Prime Minister Yoshihiko Noda declared during a debate with Liberal Democratic Party President Shinzo Abe that he would dissolve the Lower House two days later.

I was there closely watching Noda's facial expressions during the Nov. 14 encounter. For some reason, he often cast his eyes upward. He was looking at a clock on the wall. The debate was short and whatever it took, he had to steer the discussion to make the declaration within his allotted time. I remember coming to the realization I was witnessing an unscripted verbal battle.

If a snap election were to be called, it was clear that Noda's Democratic Party of Japan would lose. An angry DPJ member echoed the sentiment among many in the party questioning "why the president of a company would choose to intentionally lead that company to destruction?" They were outraged. Noda was convinced the consumption tax rate had to be raised, no matter what. Noda played his trump card and exercised the power vested in him as prime minister. It was one of the most dramatic moments in Japanese politics.

I wonder if Noda had former Prime Minister Junichiro Koizumi's declaration to dissolve the Lower House to advance postal privatization in mind when he made the decision. While the outcome of the elections were the exact opposite, with the DPJ suffering a crushing defeat and the LDP scoring a landslide victory, both prime ministers launched a fight that turned their parties against them.

Now, Koizumi is calling on Abe, the current prime minister, to exercise those very same powers vested in him. During a public session with reporters at the Japan National Press Club on Nov. 12, Koizumi called on Abe to use his power to make the decision to end the use of nuclear power. News conferences where the word "**power"** is used so frequently are rare.

Koizumi said prime ministers have great power. Once Abe makes a decision, opposition will fall silent. The general public is also pinning their hopes on Abe to use that power. In that regard, no prime minister is luckier than Abe, he said.

Although the prime minister's authority stems from the people, power can be dangerous. If the prime minister puts it to good use while being aware of the dangers, I welcome it. Noda believed that raising the consumption tax rate was the right thing to do. Meanwhile, Abe seems to be less interested in realizing a nuclear-free society.

Ending nuclear power up to the public?

November 14, 2013

EDITORIAL: It is up to the public to end Japan's reliance on nuclear power

http://ajw.asahi.com/article/views/editorial/AJ201311140042

Former Prime Minister Junichiro Koizumi recently fired the latest salvo in his spirited campaign for weaning Japan from its dependence on nuclear energy.

In a speech Nov. 12 at the Japan National Press Club in Tokyo, Koizumi said, “I think it will be good (for Japan) to end (nuclear power generation) immediately.”

It was a brutally clear message from the mouth of a person who had long been at the center of political power.

Koizumi’s argument is very simple. Since it is not realistically possible to find a location to build final disposal facilities for radioactive waste in Japan, nuclear power plants should not be operated. This is the kernel of his case against using atomic energy.

People who are promoting nuclear power have criticized his argument from various angles.

Some of his critics say it is irresponsible to call for an end to nuclear power generation when the nation does not have strong prospect of coming up with reliable alternative energy sources to replace it. Other proponents of nuclear power warn that dependence on thermal power generation would drive up fuel costs and make further increases in electricity rates inevitable.

But it is difficult to refute the straightforward argument made by Koizumi, who says it is “too optimistic and irresponsible to assume that the site for final disposal of nuclear waste can be eventually found in today’s Japan.”

In an opinion poll conducted by The Asahi Shimbun last weekend, 60 percent of the respondents agreed with Koizumi. Among the supporters of the ruling Liberal Democratic Party, 58 percent agreed.

Prime Minister Shinzo Abe has pledged to reduce Japan’s reliance on nuclear energy as much as possible. But he has also said, “It would be irresponsible for me to promise now to completely abandon nuclear power.”

The Abe administration apparently intends to continue the struggling program to establish a nuclear fuel recycling system that is designed to reprocess spent nuclear fuel for reuse in reactors. However, even if the key reprocessing plant in Rokkasho, Aomori Prefecture, could start operation, the program would only further increase Japan’s already massive stockpiles of plutonium for which there is no realistic use. It is glaringly obvious that this program is fundamentally flawed.

This nation has experienced a catastrophic nuclear accident that still forces more than 100,000 people to live as evacuees away from their hometowns near the Fukushima No. 1 nuclear power plant. But the government and the business community are seeking a way back to the era before the March 11 disaster as if nothing happened.

Many Japanese, exasperated by the nonchalant attitude of political and business leaders toward the risks of nuclear power, have taken to the streets and the Internet to protest plans to restart idled reactors. But policymakers have turned a deaf ear to their voices, making them even more disgruntled. Koizumi's series of anti-nuclear remarks have resonated deeply among these people.

During his tenure from 2001 to 2006 as prime minister, Koizumi used his brand of sound-bite politics to capture the hearts and minds of people, frequently using catchy and powerful slogans like "I will destroy the LDP."

His simple and clear political style won overwhelming support of Japanese voters. Capitalizing on his great public popularity, Koizumi revived and pushed through the legislation to privatize the nation's postal services, a proposal that was once killed by the LDP.

That's why Koizumi's anti-nuclear campaign now is irritating and perplexing policymakers of the Abe administration.
The question is how Abe will respond to Koizumi's calls for the government to pull the plug on nuclear power.
It should not be forgotten that only the people's strong will to seek a future without nuclear power can give Abe the push he needs.

UN climate conference criticises Japan reduced CO2 goals

November 17, 2013

Japan's new CO2 goal dismays U.N. climate conference

http://ajw.asahi.com/article/economy/environment/AJ201311170028

REUTERS

TOKYO/WARSAW--China, the EU and environmentalists criticized Japan at U.N. climate talks on Nov. 15 for slashing its greenhouse gas emissions target after its nuclear power industry was shuttered by the Fukushima disaster.

The Japanese government on Nov. 15 decided to target a 3.8 percent emissions cut by 2020 versus 2005 levels. That amounts to a 3 percent rise from a U.N. benchmark year of 1990 and the reversal of the previous target of a 25 percent reduction.

"Given that none of the nuclear reactors is operating, this was unavoidable," Environment Minister Nobuteru Ishihara said.

Japan's 50 nuclear plants were closed on safety concerns after the March 2011 earthquake and tsunami wrecked the Fukushima No. 1 nuclear power plant northeast of Tokyo. Nuclear accounted for 26 percent of Japan's electricity generation and its loss has forced the country to import natural gas and coal, causing its greenhouse gas emissions to skyrocket.

Japan's new policy was widely criticized in Warsaw, where some 190 nations are meeting from Nov. 11-22 to work on a global climate pact, due to be agreed in 2015.

China's climate negotiator Su Wei said: "I have no way of describing my dismay" about the revised target.

The European Union also expressed disappointment and said it expected all nations to stick to promised cuts as part of efforts to halt global warming.

"It is regrettable," Christiana Figueres, the U.N.'s climate chief, told Reuters of Japan's goal. But she predicted that Japan's planned investments in energy efficiency and renewable power would prove that the target could be toughened.
"This move by Japan could have a devastating impact," said Naoyuki Yamagishi of environmental campaign group WWF Japan. "It could further accelerate the race to the bottom among other developed countries."

Climate Analytics, a think-tank, said Japan could still achieve a 17-18 percent CO2 reduction from 2005 levels by 2020 even if it replaced nuclear with its current fossil fuel mix.

GLOOM

Japan's decision added to gloom at the Warsaw talks, where no major countries have announced more ambitious goals to cut emissions, despite warnings from scientists about the risks of more heat waves, droughts, floods and rising sea levels.

Poor nations want the rich to commit to deeper emissions cuts while providing more finance to help developing nations deal with the impacts of climate change, a major issue at the talks after the Philippines was devastated by typhoon Haiyan, one of the most powerful ever recorded.

Australia has been criticized for watering down its climate policies, and Brazil reported on Nov. 14 a rise in the rate of deforestation in the Amazon--releasing more CO2 that had been stored in trees.

Natural-gas consumption by Japan's 10 utilities was up 8.4 percent in October from a year earlier and coal use was up 4.4 percent as the companies used more fossil fuels to compensate for the nuclear shutdown, industry data showed on Nov. 15.

Prime Minister Shinzo Abe advocates a return to nuclear, but says he wants to reduce Japan's reliance on it over time. The process of restarting reactors will begin next year at the earliest and some will never come back on line due to safety concerns.

With Abe facing opposition to nuclear power even from within his own party, the weaker emissions commitment could be an argument for restarting reactors, given that Japan for decades has touted the technology as clean energy.

The Japanese delegation got a standing ovation when it arrived at U.N. climate talks in Bangkok in 2009, weeks after then-Prime Minister Yukio Hatoyama announced the 25 percent target, the most ambitious by any major developed nation.

"Our energy mix, including the use of nuclear power, is currently being reviewed. In that context, we decided to set this target at this point," Chief Cabinet Secretary Yoshihide Suga said of the new goal.

Hiroshi Minami, Japan's chief negotiator at the U.N. talks, said the new goal "is based on zero nuclear power" in future. He said the original target was based on a nuclear share of more than 40 percent of electricity generation.

The nuclear shutdown could prove convenient for Abe in that it allows his government to abandon a target that some said was too optimistic. "Anyone could have seen that this was just impossible," said energy analyst Akira Ishii.

November 16, 2013
Japan's new CO2 reduction target fuels criticism

http://www3.nhk.or.jp/nhkworld/english/news/20131116_06.html

Delegates at the UN climate change conference in Warsaw have reacted sharply to Japan's decision to dramatically scale down its target to reduce greenhouse gas emissions.

The Japanese government on Friday officially decided to target a 3.8 percent emissions cut by 2020 from 2005 levels.

The figure is equal to a 3.1 percent rise from a UN benchmark year of 1990 and also reverses the previous 25 percent reduction target.

The Japanese government set the new target under the assumption that all its nuclear reactors will remain idled.

Japan's nuclear reactors have been offline following the accident at a nuclear plant in Fukushima in March, 2011.
Representative of the European Union said discussions are ongoing to give momentum to efforts to reduce global warming. He criticized Japan for making a move that clearly reverses the trend.

The Chinese climate negotiator said that he has no words to express his dismay over Japan's revised target.

Chief negotiator Hiroshi Minami said he expected Japan to come under harsh criticism for its new target. He said the Japanese delegation will try not to have a negative impact on the overall talks.

Greenhouse gas emissions reduction goal uncertain with reactors offline

http://ajw.asahi.com/article/behind_news/politics/AJ201311160030

THE ASAHI SHIMBUN

Uncertainty over the extent to which nuclear reactors will resume operations is severely limiting the government's ability to set long-term goals for the reduction of greenhouse gas emissions.

The government on Nov. 15 approved a goal of reducing greenhouse gas emissions in 2020 by 3.8 percent from 2005 levels.

However, later the same day, Environment Minister Nobuteru Ishihara said the goal would likely be revised next autumn, once it becomes clearer how many nuclear reactors will go back online.

Ministry officials indicated that a major impetus for such a review would be the summit meeting on climate change to be held next September and hosted by the secretary-general of the United Nations.

According to Ishihara, the approved goal is only a temporary one based on the precondition that no nuclear reactors are in operation.

"Given that we cannot foresee the extent to which nuclear reactors will resume operations, it represents the world's highest levels of energy conservation," he said.

The latest goal is a major step backward from the objective set in 2009 shortly after the Democratic Party of Japan took over control of government.

At that time, Prime Minister Yukio Hatoyama pledged to reduce greenhouse gas emissions by 25 percent from 1990 levels.

In addition to the new reduction goal, the government also announced its "aggressive diplomacy policy to fight global warming."

Among the measures included in that package are aid to developing nations over a three-year period totaling 1.6 trillion yen ($16 billion) and the launching in fiscal 2017 of a satellite to measure greenhouse gases.

In addition, 11 trillion yen would be set aside for domestic investment for technological improvements.

While such measures aimed at helping other nations are meant to counter criticism from the international community about the lower emissions reduction goal, representatives meeting in Poland at an international conference on climate change blasted Japan for not doing more.

A major objective of the 19th Conference of the Parties to the U.N. Framework Convention on Climate Change (COP 19) being held in Warsaw is to increase emissions reduction goals set by member nations.

Japan's new goal was criticized by the representatives of the European Union who expressed major disappointment at the weakening of Japan's goal.

While understanding was expressed for the problems Japan faces in the aftermath of the 2011 natural disasters and Fukushima nuclear accident, some EU representatives also said as an advanced nation Japan had to demonstrate leadership.

Su Wei, the deputy head of the Chinese delegation, said about Japan's new goal: "It is a retreat from the 6-percent goal set under the Kyoto Protocol. Japan should fulfill its responsibility."

The Climate Action Network, an international nongovernmental organization, selected Japan for its "Special Fossil of the Day" award for the weak new goal.

Meanwhile, Japanese business leaders had mixed reviews for the new goal.

Hiromasa Yonekura, chairman of Keidanren (Japan Business Federation), expressed opposition at setting a goal before all factors were considered.

"Thought should be given to whether the goal is achievable by also taking into consideration the appropriate burden to place on the public as well as the central government's economic growth strategy," he said.

However, Yasuchika Hasegawa, chairman of Keizai Doyukai (Japan Association of Corporate Executives), said, "There is meaning in transmitting the fact that the goal set by former Prime Minister Yukio Hatoyama was impossible to achieve."

While the latest goal pales in comparison to the one made by Hatoyama at a U.N. General Assembly session, the 2009 goal was based on the premise that about 40 percent of electricity generated in Japan would be through nuclear energy.

In the wake of the Fukushima nuclear accident, the Abe administration has not even been able to establish a new ratio for nuclear energy in terms of total power generation, despite the fact that reducing greenhouse gas emissions was once considered a specialty of Abe's.

In June 2007, during his first stint as prime minister, Abe proposed at a Group of Eight summit meeting that the world reduce such emissions by half by 2050.

However, Abe now faces a public strongly opposed to resuming operations at nuclear reactors. At the same time, setting a strong goal for reducing greenhouse gas emissions could prove to be a major burden on corporate performance, which in turn could slow down the effects of the "Abenomics" economic policy measures.

Restart nuclear plants also means building new ones

November 16, 2013

LDP official hints at building new nuclear plants

http://www3.nhk.or.jp/nhkworld/english/news/20131116_22.html

The secretary general of Japan's ruling Liberal Democratic Party has hinted at the possibility of studying building new nuclear power plants in Japan as long as their safety can be guaranteed.

Shigeru Ishiba spoke to reporters on Saturday about the country's future energy policy.

Ishiba said the government will first have to restart existing idled nuclear plants after ensuring their safety.

But he said even if the percentage of renewable energy increases in the country's total power supply, he would not deny the possibility of studying building new nuclear plants from the viewpoint of energy security.

Ishiba said new nuclear plants would be built if safer ones become available in response to the March 2011 accident at the Fukushima Daiichi power station.

He added that theoretically, it is impossible to accept restarting nuclear plants and reject building new ones.

Ishiba also spoke about the issue of building a final nuclear waste disposal site. Former Prime Minister Junichiro Koizumi cites the absence of such a disposal site in Japan as one of the reasons for his call for the country to abolish nuclear power plants.

Ishiba suggested that the government should take the initiative of designating which area would be

suitable for building a final nuclear waste disposal site, rather than wait for a local community to express its candidacy for hosting such a site.

Reality for Japan to face: Nukes no solution for India

November 14, 2013

Can Nuclear Power Be an Answer to India's Electricity Needs?

http://akiomatsumura.com/

Read in German.
M. V. Ramana

M. V. Ramana is with the Program on Science and Global Security at the Woodrow Wilson School of Public and International Affairs, Princeton University.

The Indian government is engaged in discussions with the Japanese government aimed at concluding a bilateral nuclear cooperation pact; this would allow India to import nuclear reactor parts from Japan. The primary argument given for India's plans to expand nuclear power is that the country already suffers electricity shortages and its electricity demand is fast growing.

There are at least three sad realities that underlie this discussion. The first, and perhaps most poignant, is that Japan, which is currently facing tremendous democratic opposition to restarting nuclear reactors within the country, is considering exporting nuclear reactor parts to a country where, again, there is significant opposition to nuclear power, especially at all the sites that have been selected for installing reactors imported from companies like Westinghouse, General Electric and Areva. Their reasons for such opposition are not difficult to discern. In the aftermath of 11 March 2011, people near an existing or proposed nuclear reactor can—and do—imagine themselves suffering a fate similar to those of the inhabitants of the areas around Fukushima. These nuclear reactors are also located in areas that support thousands of people living off farming, fishing, and other occupations, and these people see, quite correctly, the reactor as a major threat to their livelihoods. The Indian government's response to the opposition has been a combination of coercion, bribery, and propaganda. Support for the Indian government's nuclear efforts, therefore, cannot be considered respectful of democratic rights.

The second reality that I elaborate in my book, *The Power of Promise: Examining Nuclear Energy in India,* is that nuclear energy will not be the answer to India's electricity problems. The multiple reasons for this assertion include a history of failure, poor technology choices and a lack of organizational learning. To start with, the current nuclear capacity in the country—more than sixty years after the atomic energy program was established—is just 5,780 MW, about 2.5 percent of the total generation capacity. Even with optimistic assumptions about the future, this fraction is unlikely to increase to more than 5 percent for decades. But optimism is not warranted. The Indian Department of Atomic Energy (DAE) has long made ambitious projections and failed to deliver. The DAE's plans also involve constructing hundreds of fast breeder reactors. In the early decades of nuclear power, many countries pursued breeder reactor programs, but practically all of them have given up on breeder reactors as unsafe and uneconomical. The DAE has simply not absorbed the lessons from the sorry history of breeder technology globally, and thus shows a lack of organizational learning. In contrast, wind energy, which began in earnest only in the 1990s, has overtaken nuclear power, not just in terms of installed capacity, but in the number of units of electricity (kWhs) fed into the grid.

The third reality is that India, and industrializing countries in general, need electricity that is cheap and affordable. Nuclear power is in that sense badly suited to many of these because it is expensive. This has been amply borne out in the Indian case, where coal based thermal power has been much cheaper than nuclear electricity. Future reactors, both imported light water reactors as well as fast breeder reactors, promise to be much more expensive, which will make electricity generated in these unaffordable to the weaker sections of society. Expectations that the nuclear industry will learn from past experience and lower the construction costs have also been belied repeatedly.

Finally, what of the other commonly heard argument – that nuclear power would significantly reduce India's carbon emissions and thereby help with climate change mitigation. First, India's planners do not see it as a question of nuclear power or fossil fuels, but nuclear power *and* fossil fuels. Second, if nuclear power cannot expand rapidly and substantially, then it cannot help with climate change in any significant fashion, especially if the achieved expansion comes at the cost of investment in other potential solutions to these concerns. Third, because of its centralized character and the huge costs involved, nuclear power cannot play a significant role in solving the energy needs of the vast majority of India's population, much less do so in a way that offers any net environmental gains. In particular, trying to use nuclear power as a solution to climate change only brings with it two of the familiar—and so far insoluble—problems associated with nuclear energy: susceptibility to catastrophic accidents, and having to deal with radioactive waste that stays hazardous to human health for millennia.

To summarize, there is no justifiable case for supporting a large scale expansion of nuclear power in India. Japan's leaders should face up to this reality as they contemplate entering into nuclear commerce with India.

M. V. Ramana is with the Program on Science and Global Security at the Woodrow Wilson School of Public and International Affairs, Princeton University and the author of The Power of Promise: Examining Nuclear Energy in India *(Penguin 2012).*

3/11 has created business opportunities abroad

November 26, 2013

A total of 150 kilograms of plutonium is stored in 10 metal containers in an MOX fuel manufacturing factory in Marcoule, France, on Oct. 17. (Jun Ueda)

Fukushima accident has ripple effect in worldwide nuclear industry

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311260071

THE ASAHI SHIMBUN

The Fukushima nuclear crisis is creating business opportunities for Britain's nuclear industry, helping Germany shutter its nuclear reactors and leaving questions over the future of Japan's nuclear fuel recycling ambitions.

Britain is awash in plutonium, some 120 tons, due in part to the nuclear crisis spawned by the March 2011 Great East Japan Earthquake and tsunami. The country now sees the opportunity to make money in storing unused plutonium.

Due to the accident at the Fukushima No. 1 nuclear power plant, the Japanese power companies with nuclear reactors that used mixed oxide (MOX) fuels consisting of a mixture of reprocessed plutonium and uranium suspended their operations. That, in turn, forced the closure of the British factory that manufactured the fuel in August 2011.

Given that Japanese electric power companies were its largest customers, that created a backlog of stored plutonium.

At present, more than 260 tons of plutonium is stored globally. Of that, 120 tons were located in Britain as of the end of 2012. Of that amount, 96 tons came from British nuclear facilities, with the remaining 24 tons coming from other countries, including 17 tons from Japan. No nuclear plants in Britain currently use MOX fuels.

CONVERSION TO STORAGE BUSINESS

As many as 1,300 nuclear related facilities, both military and non-military, make up the six-square-kilometer Sellafield nuclear complex in northwestern Britain. One of the core facilities at the complex is the Thermal Oxide Reprocessing Plant (THORP), which extracts plutonium from spent nuclear fuel.

THORP is scheduled to end operations in 2018 when it completes reprocessing of all of the spent nuclear fuel on hand. As a result, nearly 140 tons of plutonium will need to be stored in Britain.

In 2012, the British Nuclear Decommissioning Authority, which manages plutonium storage, constructed a plutonium repository, the size of a soccer field, next to THORP.

The windowless 30-meter-high facility, designed for long-term storage, is surrounded by thick walls and fences to protect the plutonium inside from terrorists.

The new facility is expected to target Japanese companies for future business given that most of the overseas plutonium in Britain already comes from the Asian nation. Japan also stores 17.9 tons of plutonium in France and another 9.3 tons back home.

Japan is also building its reprocessing plant in Rokkasho, Aomori Prefecture, which is expected to produce seven additional tons of plutonium a year. That surplus will need to be stored somewhere until Japan's nuclear plants go back online, if they clear tougher government safety regulations and are allowed to do so.

An official of the British government, who is involved in the new business, said that Britain is very interested in Japan's surplus plutonium.

Next to the THORP plant also stands the factory that manufactured MOX fuels before it closed. That factory was behind the 1999 quality falsification scandal on fuel that was to be used in the Takahama nuclear power plant in Fukui Prefecture. The factory has since been renovated.

GERMANY THINKS OUTSIDE THE BOX

After the Fukushima nuclear accident, Germany decided to decommission all of its nuclear power plants by 2022. Until then, it still has more than five tons of plutonium in Britain in the form of powder that it intended to turn into MOX fuel.

Germany hit upon the idea of a "swap." It suggested exchanging its plutonium in Britain with plutonium from Tokyo Electric Power Co., the operator of the Fukushima No. 1 nuclear plant, stored in France that could then be turned into MOX fuel at the factory in Marcoule. It also meant the plutonium had to travel shorter distances and was more easily secured.

In April this year, a German electric power company and TEPCO agreed to exchange 650 kilograms of plutonium stored in Britain with the same amount stored in France. Germany made similar

swaps with other countries of its remaining plutonium in Britain. Britain also was paid to accept what was left.

The plutonium exchange was convenient for TEPCO as well. It is still uncertain when, or if, the utility can restart its idled nuclear reactors. Therefore, even if it processes the plutonium into MOX fuels in France and then transports them back to Japan, they still have the problem of storage until they can be used.

According to internal German government documents, **Germany will process its plutonium into 164 MOX fuel assemblies for use in nuclear reactors. It expects to use all the assemblies by 2016, six years earlier than scheduled and achieve its goal of becoming "plutonium zero."**

Michael Sailer, former chairman of Germany's Reactor Safety Commission, said that even if Germany said that it will never manufacture nuclear weapons, France and other surrounding countries would not believe it. Severing Germany's relationship with plutonium will help allay those fears, he said.

On the other hand, Japan will continue to store its unused plutonium in Britain.

JAPAN NO CHOICE BUT TO RECYCLE NUCLEAR FUEL

Japan is set to venture in earnest into a nuclear fuel recycling program exactly at a time when the Fukushima nuclear disaster has tolled an alarm on the safety of similar nuclear operations.

Leading nations of the world began studying ways to use plutonium to generate electricity after U.S. President Dwight Eisenhower called for a peaceful use of nuclear power in "Atoms for Peace," a December 1953 speech at the United Nations.

The nuclear fuel recycling program was touted as a "dream" system, whereby use of plutonium in a fast breeder reactor would generate more fuel than the amount consumed.

Six decades later, the world has learned that reprocessing of spent nuclear fuel to extract plutonium is too costly to be commercially viable. Reprocessing also involves the risk of nuclear proliferation.

The United States and Germany were quick in backing out of a fuel recycling program.

By contrast, Japan is planning to soon start operations at a reprocessing plant in Rokkasho, Aomori Prefecture, to activate a nuclear fuel recycling program in earnest. In addition, Tokyo still pins its hopes on developing a fast breeder reactor, although many other countries have given up on similar plans.

Japan cannot decide to pull out of the nuclear fuel recycling program because doing so would make it impossible for the country to continue operating its 50 nuclear reactors. If the stockpile of spent fuel, currently lying in storage pools at nuclear plants, was to stop being a resource and be rebranded as waste, those storage pools would quickly fill up unless dumping grounds are located. That is leaving **Japan with no other option but to stick to the unrealistic policy of planning to reprocess all spent nuclear fuel**.

The ad hoc nature of Japan's nuclear policy is partly attributable to a "private business under national policy" setup, wherein the government sets the course and utilities are in charge of the actual operations. The locus of responsibility has also been made ambiguous under a system whereby reprocessing costs are included in the electricity rates, which are calculated by adding a certain profit margin to the expenses involved.

Fukushima disaster, "a warning to the world", says Hirose

November 19, 2013

Source : The Guardian
http://www.theguardian.com/environment/2013/nov/19/uk-government-new-plant-fukushima-nuclear-disaster-warning?INTCMP=SRCH

Fukushima nuclear disaster is warning to the world, says power company boss

Exclusive: UK government must learn from Japan's catastrophe as it plans a new generation of plant, nuclear chief claims
Tuesday 19 November 2013 18.10 GMT

The catastrophic triple meltdown at the FukushimaDaiichi nuclear plant in March 2011 was "a warning to the world" about the hazards of nuclear power and contained lessons for the British government as it plans a new generation of nuclear power stations, the man with overall responsibility for the operation in Japan has told the Guardian.

Speaking at his Tokyo corporate headquarters , Naomi Hirose, president of the Tokyo Electric Power Company (Tepco), which runs the stricken Fukushima plant, said Britain's nuclear managers "should be prepared for the worst" in order to avoid repeating Japan's traumatic experience. "We tried to persuade people that nuclear power is 100% safe. That was easy for both sides. Our side explains how safe nuclear power is. The other side is the people who listen and for them it is easy to hear OK, it's safe, sure, why not?

"But we have to explain, no matter how small a possibility, what if this [safety] barrier is broken? We have to prepare a plan if something happens … It is easy to say this is almost perfect so we don't have to worry about it. But we have to keep thinking: what if …"

British ministers recently agreed a commercial deal with the French state-owned energy company EDF Energyto build the UK's first new nuclear reactor in a generation at Hinkley Point in Somerset. The agreement included the UK government providing accident insurance.

Tepco's Fukushima Daiichi facility on the coast about 124 miles (200km) north-east of Tokyo, comprising six nuclear reactors, was hit by a giant tsunami with waves peaking at 17 metres high caused by the Great East Japan earthquake on 11 March 2011. In what quickly became one of the world's worst nuclear disasters, operators lost control of the plant when the power supply, including emergency back-up, failed amid massive flooding. As cooling systems malfunctioned, reactors 1, 2 and 3 suffered meltdowns.

Reactor 4 was closed for routine maintenance at the time. But one of several hydrogen explosions blew the walls and roof off the reactor building. This week a delicate and lengthy operation to remove fuel rods from that reactor began.

Radiation leakage following the explosions forced the evacuation of tens of thousands of people from the surrounding area. An exclusion zone roughly 11 miles by 19 miles remains in force around the plant two and half years later. The entire facility is now being decommissioned, but Tepco's clean-up, which has been strongly criticised by environmentalists, is expected to take up to 40 years.

Hirose said that although the situation facing Fukushima Daiichi on 11 March was exceptional, measures could have been adopted in advance that might have mitigated the impact of the disaster. Tepco was at fault for failing to take these steps, he said.

"After I became president [in 2012], we formed a nuclear safety review committee. We focused mainly on what we could do, what we could learn. We had a lot of data by then. Three other reports, one from the Diet [Japan's parliament], one from government. We had a lot of information. Tepco's own report, too. We concluded that we should have avoided that catastrophic accident, and we could have. We could see what we should have done."

Preventative measures included fitting waterproof seals on all the doors in the reactor building, or placing an electricity-generating turbine on the facility's roof, where the water might not have reached it. In addition, wrong assumptions were made, he said.

"I don't know if I could have seen or thought this before the accident … Probably I assumed that people had discussed counter-measures to avoid a huge tsunami by something very special like a complete shutdown."

It transpired that the huge cost and technical complexity of a multiple shutdown, in what was considered the unlikely event of an abnormally large tsunami, had led managers to discount such a scenario as implausible and inefficient, he said.

"What happened at Fukushima was, yes, a warning to the world," he said. The resulting lesson was clear: "Try to examine all the possibilities, no matter how small they are, and don't think any single counter-measure is foolproof. Think about all different kinds of small counter-measures, not just one big solution. There's not one single answer.

"We made a lot of excuses to ourselves … Looking back, seals on the doors, one little thing, could have saved everything."

Tepco was willing to share its experience with British and other nuclear plant operators if they wished, Hirose said. "We can share all the information, all the data we obtained, that we learned from this accident, and then hope that people will use the data and information to prevent the same thing happening."

Hirose confirmed that his company has paid a large price for the disaster. It planned to "streamline" the business and shed hundreds of jobs through voluntary retirement to keep itself in business. "We have a huge debt for the compensation for damages and losses and for decommissioning … We have to be sustainable as a going concern."

Concerned that Tepco may be unable to cope and responding to criticism that the company has bungled parts of the clean-up operation, Japan's government has agreed to spend 47bn yen (£292m) on dealing with hundreds of static tanks to store radiated water at the plant.

It is also considering paying part of the cost to decommission Fukushima's damaged nuclear reactors. Tepco will reportedly seek 500bn yen (£3.1bn) in bank loans by the end of the year to help keep itself afloat.

Asked about the severe domestic and international criticism that followed the discovery in July of leaks from some of the tanks storing contaminated water, Hirose said the problem stemmed from a "simple mistake" in managing the tanks. Since the discovery, the monitoring system had been changed and new welded tanks installed, instead of the old bolted together versions.

Hirose said he could not state categorically that all leakage of contaminated groundwater into the sea had ceased, but the outflow was much reduced. "Probably there is some leakage. It is very difficult to say where it comes from and how much it is, but the harbour [radioactivity] level does not go down, so that means there is some leakage … We are trying to stop it."

Hirose said he felt deeply sorry for the estimated 150,000 local residents who have been forced to leave their homes due to potentially harmful radiation levels, and may in some cases never be able to return.

"I have visited Fukushima many times, met the evacuees, the fishing union, the farmers, many people whose businesses have been damaged very much. I feel very sorry for them. We have to compensate them fully for the damage we caused by our accident."

Tepco was investing in the area and creating jobs by building a new thermal power plant. But he acknowledged reconstruction and rebuilding would take many years.

After the Fukushima catastrophe, the UK's Office for Nuclear Regulation conducted a safety review and its chief inspector, Mike Weightman, concluded there were "no fundamental safety weaknesses" in UK nuclear plants. He said: "We already require protection of nuclear sites against the worst-case scenarios that are predictable for the UK."

But his report found 38 areas for improvement including risks associated with flooding and the state of preparedness for emergencies. In 2012, documents released under freedom of information rules showed that all eight coastal nuclear locations in the UK, including Hinkley Point, were at risk of flooding and coastal erosion, which would worsen with climate change. EDF Energy said it was confident its UK sites were adequately protected against storms and floods. "Without these arrangements in place the regulator would have the authority to close us down," said an EDF spokeswoman.

Hirose said that although there are currently no nuclear powerplants operating in Japan, nuclear power had a future in the country. Popular former prime minister Junichiro Koizumi called last week for Japan to abandon nuclear power altogether, saying it was demonstrably dangerous.

The best course for Japan and other developed countries was energy diversification, Hirose said, combining nuclear power with other forms of generation, including oil, gas and renewables.

"Time to move beyond nuclear energy"

Imagining post-nuclear Japan

by Jeff Kingston
Special To The Japan Times

Former Prime Minister Junichiro Koizumi has sent shock waves through the political establishment by calling for the end of nuclear power generation in Japan. "There is nothing more costly than nuclear power," Koizumi was quoted as saying during an interview with Tokyo Shimbun — something Japanese taxpayers are coming to understand very well.

Koizumi may be a late convert to the anti-nuclear movement, but he remains popular, persuasive and, on this issue, absolutely right. Prime Minister Shinzo Abe might get some reactors back online in 2014, but he risks a powerful popular backlash because people are not ignoring the lessons of Fukushima. Koizumi is correct in saying that most politicians would go along with Abe if he stood up to the nuclear village and declared "Abenomics" meant tapping the green growth potential of smart, renewable energy. This is a sustainable and affordable low-carbon model that is far more suitable for Japan and developing nations than pricy nuclear reactors.

The old motto of the nuclear village — "safe, cheap and reliable" — now seems like a bad joke. It is hard to put a price tag on the overall consequences of the meltdowns at Fukushima and the ballooning costs of bailing out Tokyo Electric Power Co., but by some estimates it's $100 billion and rising. There are still more than 100,000 nuclear refugees driven from their homes by the catastrophe. In early November, the government finally acknowledged that many can never return to their ancestral homes. Local farmers and fishermen have a deep hole to climb out of to regain consumer trust, while tourism has been hammered

and faces tough prospects. Lingering stigma and health concerns are also exacting a stiff psychological toll on residents.

In the global lexicon, Fukushima is shorthand for nuclear disaster in much the same way as Chernobyl before it. It is indelibly tarnishing the Japan brand and will linger ominously despite Abe's reassurances that the situation is under control. It doesn't help that polls show that only 11 percent of Japanese believe Abe, and even Tokyo Gov. Naoki Inose has suggested that Abe mislead the International Olympic Committee. The lesson of Fukushima, Mr. Abe, is not the need for better public relations.

Problematically, Abenomics relies heavily on nuclear energy. Abe wants to restart domestic reactors in order to lower fuel imports and, at the same time, reassure potential overseas customers of Japan's nuclear plant and technology exports. It gets back to the unpersuasive argument that nuclear energy is cheap. It is relatively cheap but only if all the associated costs are excluded from calculations. But associated costs related to rigorous safety inspections, repair and maintenance (most utilities saved money on this by falsifying reports), temporary and permanent radioactive-waste disposal, safety upgrades, more comprehensive and continuous training of workers, evacuation drills and the decommissioning of reactors are backend costs that boost the sticker price substantially.

The Economist magazine, like Koizumi, recanted and in a special report on nuclear energy argues that it is not commercially viable. Politically, however, the nuclear village is well entrenched in Japan, as it controls the commanding heights of national energy policy. This explains why Tepco is on government-funded life-support at the taxpayers' expense.

Abe knows that Japan's 50 viable reactors represent a huge investment and the vested interests in the nuclear village need reactor restarts to recoup their investments and pay off loans. Influential investors and lenders are fighting bankruptcy for Tepco so they don't have to take a haircut. These vested interests are members of Keidanren, Japan's most influential business lobby group, and have much to lose if the plug is pulled on nuclear energy and are counting on Abe to fast-track restarts and save their bacon.

But Koizumi's awkward questions about Japan's lack of a plan for permanently storing vast stockpiles of highly radioactive nuclear waste can't be shrugged off; temporary sites are more than 70 percent full. Pro-nuclear advocates have a faith-based policy that something will eventually work out, but in the meantime we have a house without a toilet.

Are renewable energy sources the answer to Japan's costly nuclear nightmare? Nuclear proponents argue that renewables can't serve as a baseload source of continuous power like nuclear reactors (when not idled, as they often are for periodic safety checks). They also argue that solar and wind power are expensive and require vast amounts of space that make them unviable alternatives. Thermal plant advocates made similar arguments against nuclear reactors decades ago just as landline phone companies pooh-poohed the potential of mobile phones and skeptics were slow to wake up to the computer revolution.

It is time to move beyond nuclear energy, a flawed "miracle" technology of the 20th century, to 21st-century technology in renewables and radical efficiency improvements made possible by information and communications technology. And Japan is already doing so at breathtaking speed.

Since the introduction of a feed-in tariff system in July 2012 that provides incentives for investment in a range of renewable energies, Japan has brought online about three reactors' worth of renewable electricity generating capacity, mostly solar. Anyone driving around depopulating rural Japan understands space is not a major constraint, and indeed renewable energy initiatives offer declining communities a lifeline. Decentralizing Japan's power generation away from centralized nuclear plants prone to cascading disasters also enhances disaster resilience and explains why so many local communities are funding renewable initiatives. Innovations mean that Japan's largest solar farm is now floating off the coast of Kagoshima and floating platforms now enable Japan to tap its vast wind power potential.

But the grid has to be modernized to tap the potential of renewables, and legislation now under consideration in the Diet might hasten the process by breaking up the utilities' current monopoly and decoupling electricity generation from distribution. The key is spreading smart-grid technologies essential to managing intermittent sources of energy and reducing energy consumption, an area where Japan is a world leader.

Andrew DeWit, a Rikkyo University energy policy specialist, notes that ongoing smart-city projects in Kitakyushu and Yokohama demonstrate the vast potential of information and communications technology. Major Japanese companies such as Panasonic, Toshiba, Mitsubishi, Mitsui and Hitachi are betting big on smart-city projects at home and targeting megacity projects around the globe. It's a huge potential market and Japan is well positioned to lead this green revolution. Japan is on the cusp of a breakthrough and, instead of squandering more money on nuclear power in an archipelago prone to major seismic events, it should incentivize investments in green technologies that offer enormous potential and greater disaster resilience. Koizumi reminds us what bold leadership looks like.

Atomic Energy Commission : What change?

December 5, 2013

Gov't to retain nuclear power promotion organization

http://mainichi.jp/english/english/newsselect/news/20131205p2a00m0na011000c.html

The government is likely to retain an organization to promote atomic energy despite calls to end Japan's reliance on nuclear power following the outbreak of the Fukushima nuclear crisis in 2011.

A government panel of experts released a report on Dec. 5, recommending either that the Atomic Energy Commission (AEC) of the Cabinet Office be retained after its organization is downscaled or that a new body to replace the AEC be set up.

Specifically, the report states that the reformed AEC or a new organization should work on the peaceful use of atomic power and nuclear non-proliferation as well as the disposal of radioactive waste including the nuclear fuel cycle project -- in which spent nuclear fuel is processed and reused. The AEC has so far played these roles.

Established in 1956 as the "command post" of Japan's nuclear energy policy, the AEC has drawn up a framework for the country's nuclear energy policy almost every five years, making calls to put fast-breeder reactors into practical use and to reprocess spent nuclear fuel.

The 2005 framework calls for an increase in the ratio of nuclear power to the total electric power consumed in Japan to 30 to 40 percent and to put fast-breeder reactors into practical use in 2050.

Since the March 2011 outbreak of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant, however, panel members have discussed how to reform the AEC, including its abolition.

The panel has decided to abolish the atomic policy framework and instead recommended that the basic direction of Japan's nuclear policy be shown in the basic energy policy that the government is currently revising.

However, a majority of experts on the panel call for the retention of a nuclear energy promotion organization because the AEC has played an important role in Japan's atomic energy policy.

December 05, 2013(Mainichi Japan)

Role of Atomic Energy Commission to be changed

http://www3.nhk.or.jp/nhkworld/english/news/20131205_31.html

An expert panel reviewing the Japanese government's Atomic Energy Commission is set to recommend that it redefine its role in promoting the use of nuclear energy.

The 2011 Fukushima nuclear disaster prompted the review of the role played by the commission for more than 50 years. The panel agreed this year that the commission should no longer set the country's nuclear policy.

The panel on Thursday compiled a draft set of recommendations, including that the number of commissioners be cut from the current 5 to 3.

The draft says that to ensure the commission's neutrality, its secretariat should not accept employees on loan from power utilities or nuclear plant makers. It recommends using personnel from universities and research institutes.

It also says the commission should handle limited tasks that require cross-ministry efforts, such as disposal of radioactive waste.

It also recommends that the commission confirm that nuclear technology is used only for peaceful purposes such as power generation and research.

The panel is expected to finalize its recommendations next Tuesday.

Nukes will remain "important" in Japan, says Gov't

December 6, 2013

Motegi: Govt. to abandon nuclear-free energy plan
http://www3.nhk.or.jp/nhkworld/english/news/20131206_29.html

Japan's economy and industry minister, Toshimitsu Motegi, has repeated his view that the government plans to end the nuclear-free energy policy to maintain nuclear power generation.

Motegi told reporters on Friday about the government's draft of Japan's basic energy policy that will be submitted to a ministry panel later in the day.

The draft states that nuclear power generation is an important "base" source of electricity. The term refers to a power source capable of stably supplying a set amount of electricity.

Motegi said he understands that a debate is underway to continue nuclear power generation on the condition that the safety of power plants is ensured.

He added that this method of power generation allows the steady supply of electricity at a lower cost and without aggravating climate change.

Motegi said the government aims to compile a feasible, balanced and responsible energy plan as part of its efforts to review the contradictory energy policies of the past.

The remark implies that the government will reverse the energy policy of the previous Democratic government that seeks to end nuclear power generation in the 2030s.

Motegi also announced that the government will earmark funds worth about 470 million dollars in the current fiscal year's supplementary budget to deal with contaminated wastewater leaks and accelerate the decommissioning of the crippled Fukushima Daiichi nuclear plant.
Dec. 6, 2013 - Updated 04:33 UTC

New energy plan calls nuclear generation important

http://www3.nhk.or.jp/nhkworld/english/news/20131205_44.html

A draft of Japan's basic energy policy that government officials are composing calls nuclear power generation an important "base" source of electric energy.

The term refers to a power source capable of supplying a set amount of electricity stably.

Its inclusion in the draft appears to signal a major shift in Japan's energy policy under the administration of Prime Minister Shinzo Abe.

A policy drawn up last year by the government of the Democratic Party aimed to end nuclear power generation in the 2030s.

That policy also said Japan would not build any more reactors. The new draft policy is likely to drop these goals.

Government officials say the plan will not specify the percentages of different energy sources in the overall supply due to uncertainties about when nuclear reactors could go back online.

The government hopes to finalize the plan early next year.

December 6, 2013

Japan to say nuclear power is 'important' in draft energy plan

Kyodo

The Abe administration plans to say in a draft of the national medium-term energy plan that nuclear power should continue to be "important" in supplying electricity despite the Fukushima nuclear crisis, sources said.

The draft was to be presented Friday to a meeting of a panel tasked with compiling the so Basic Energy Plan before the end of December. The plan will become official after securing Cabinet approval, possibly early in the new year.

According to the sources, the draft will say nuclear power should be seen as an "important source of electricity," because relying too much on thermal power generation would mean having to import more fuel and damaging the trade balance.

Concerns also remain over being highly dependent on Middle East countries for fossil fuel, given the region's political instability.

Because it is unclear how many reactors will pass the stricter safety requirements compiled after the Fukushima catastrophe, the draft will not provide a concrete percentage for nuclear power's role in the medium-term.

The draft will, however, say the nation will try to reduce its reliance on nuclear power in the future by introducing more renewable sources and promoting highly efficient thermal power generation.

It also include a policy change on the method for selecting the final disposal site for high-level radioactive waste, a long-running problem.

The government is now seeking to choose candidate sites across Japan that are suitable for building a disposal facility, rather than waiting for local governments to step to the plate.

The previous Basic Energy Plan compiled in 2010 aimed to boost reliance on nuclear power to some 50 percent of the nation's energy needs in 2030 from around 30 percent.

After Fukushima, the previous administration led by the Democratic Party of Japan decided on an energy strategy aimed at phasing out nuclear power by the 2030s.

But it did not go so far as revising the Basic Energy Plan that was expected to stipulate detailed measures to achieve that strategy's goal.

Nuclear power there to stay...

December 6, 2013

Govt. to keep nuclear power as base source

http://www3.nhk.or.jp/nhkworld/english/news/20131206_48.html

Japanese government officials have drafted a basic energy policy designed to keep nuclear power generation as an important base source of electricity.

The draft presented on Friday to an industry ministry energy policy panel says Japan must reduce its reliance on nuclear power as much as possible.

But it also says the country will continue nuclear power generation if power plant safety is ensured. It

says the method produces a steady electricity supply at a low cost without worsening climate change.

The plan marks a major shift from a policy drawn up last year by the Democratic Party government aimed at ending nuclear power generation in the 2030s. It also called for a halt to building reactors.

The new draft does not mention any plan to build or rebuild nuclear power plants.

On renewable energy sources, the draft says Japan aims to promote renewable energy sources as promising domestic resources for the next 3 years or so.

The government plans to get the new policy approved by Cabinet early next year.
Dec. 6, 2013 - Updated 10:45 UTC

Back to square one: Nukes "important and fundamental"

December 13, 2013

Energy plan revised for nuclear emphasis

METI champions atomic power by blaming high electricity prices
http://www.japantimes.co.jp/news/2013/12/13/business/energy-plan-revised-for-nuclear-emphasis/#.Uqt0gyfij9k

Kyodo

The Ministry of Economy, Trade and Industry has redrafted the nation's national long-term energy plan by adding words that place more emphasis on nuclear power, it was learned Friday.

Nuclear power is an "important base-load power source that serves as a foundation" for the stability of Japan's energy supply, the new draft says. The previous version just said it is an "important base-load power source."

Base-load power refers to sources of electricity that are cheap, stable and usable on a continuous basis.

The ministry is expected to present the revised draft to a panel tasked with devising the Basic Energy Plan. The panel is likely to endorse the draft because many of its members are supportive of nuclear power despite the weaknesses in handling it that were laid bare by the triple core meltdowns at the Fukushima No. 1 power plant in 2011, which was termed a "man-made disaster" that has cost trillions in damage and will cost trillions more in compensation, decontamination and cleanup.

The revised draft also promotes the reactivation of the reactors since idled by writing in detail about the negative impact of rising electricity prices driven by the growing cost of importing fuel for thermal power generation to offset the loss of atomic power.

Japan's imports of liquefied natural gas jumped to ¥6 trillion in 2012 compared with ¥3.5 trillion in 2010. The economy also logged its first annual trade deficit in 31 years in 2011.

The revised draft states that higher electricity rates are causing companies to transfer production abroad and that some have been forced to go out of business. But it doesn't discuss the government's hamstrung effort to expose Japan's regional power monopolies to real competition and liberalize the electricity market to welcome generators of renewable energy. New entrants only accounted for about 3.6 percent of the power sold to large-lot clients in fiscal 2011 as legacy generators charged them exorbitant fees for using the existing power grid.

The government is legally required to review the Basic Energy Plan at least every three years by taking into consideration changes in the energy situation. The 2010 plan aimed to boost Japan's reliance on nuclear power to some 50 percent of its energy needs in 2030 from around 30 percent — the assumed level before the Fukushima catastrophe.

Last year, the government led by the Democratic Party of Japan, now the main opposition party, decided on what it called an "energy strategy" of aiming to phase out nuclear power, but the content raised hackles, and the government didn't go so far as revising the 2010 Basic Energy Plan that was expected to stipulate detailed measures to bring the strategy to fruition.

Coal, LNG use hits record

BLOOMBERG

The regional power companies burned a record amount of coal and liquefied natural gas for November as they relied on the fossil fuels to make up for lost output from offline nuclear reactors.

The 10 electricity utilities increased their use of LNG by 1.9 percent to 4.6 million metric tons, the biggest volume ever for a November, according to data from the Federation of Electric Power Companies.

Coal consumption climbed 20.5 percent to 4.78 million tons, a record for the month, according to the industry group, which started compiling the data in 1972.

All 50 of Japan's reactors are shut pending safety reviews by the Nuclear Regulation Authority. With no dates set for restarting the units, utilities will need to rely on thermal power to meet electricity demand.

Nuclear energy accounted for 29.2 percent of all electricity in Japan in the fiscal year that ended March in 2010, before the Fukushima nuclear crisis led to the shutdown of all reactors. Power plants using LNG, coal and crude provided more than 60 percent, the Ministry of Economy, Trade and Industry said in an annual report published in June 2010.

Last fiscal year, atomic power generated about 2 percent of the country's total electricity, according to METI data.

The utilities, consisting of the 10 regional monopolies, generated 54.15 billion kilowatt-hours of electricity using thermal power in November, up 2.1 percent from a year earlier, the industry group said in a statement Friday.

The firms had no output from nuclear stations after Kansai Electric Power Co. shut two reactors at its Oi plant in Fukui Prefecture in September for maintenance.

December 13, 2013
Japan should embrace nuclear power, government panel says

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312130094

REUTERS

Japan should embrace nuclear power as an "important and fundamental" energy source, a government panel said on Dec. 13, in advice that looks almost certain to be accepted, despite widespread anti-nuclear feeling after the Fukushima disaster.

Prime Minister Shinzo Abe is keen to restart Japan's idled nuclear reactors to cut the cost of fossil fuel imports used by power stations, which have swelled the trade deficit to a record and driven up electricity prices.

The recommendation, if adopted, could put atomic power back into Japan's energy mix after the previous government decided to abandon it following triple meltdowns at the Fukushima No. 1 nuclear power plant north of Tokyo, the world's worst nuclear disaster since Chernobyl in 1986.

"Nuclear energy is an important and fundamental base energy source that will support the stability of energy demand and supply," the panel wrote in its report, adding that securing safety was paramount in utilizing atomic power.

There was no recommendation on the proportion of energy that should come from nuclear power.

The panel is headed by Akio Mimura, honorary chairman of Nippon Steel & Sumitomo Metal Corp, Japan's largest steel maker and one of its heaviest electricity users.

The Fukushima disaster highlighted regulatory shortcomings and lack of preparation in an industry long cosseted by Abe's Liberal Democratic Party, which swept back to power a year ago.

The panel also said Japan should publicize information on safety measures taken after the disaster, its new regulatory standards and the economics of nuclear power.

The crisis led to the gradual shutdown of all Japan's nuclear reactors. They remain idled, while a new, more independent regulator assesses their ability to withstand natural disasters, such as the earthquake and tsunami that wrecked the Fukushima nuclear plant.

The previous Democratic Party of Japan government had accepted a recommendation from a similar panel to abandon nuclear power sometime in the 2030s.

Opposition to atomic energy remains high and all of Japan's political parties, including the LDP's coalition partner, oppose nuclear power, which provided about 30 percent of electricity before the Fukushima disaster in 2011.

Prior to the disaster the government had envisaged increasing the contribution of nuclear energy to 50 percent.

Nuclear - A pact with the devil

December 17, 2013

Making a nuclear pact with the devil

http://mainichi.jp/english/english/perspectives/news/20131217p2a00m0na009000c.html

Is the government hurtling toward post-war national policy on nuclear power? I actually think it's having second thoughts, like Faust in the face of the Mephistopheles's temptations: "Come on, nuclear power is easy. Just take it."

A report compiled earlier this month by a subcommittee of the Ministry of Economy, Trade and Industry's Advisory Committee for Natural Resources and Energy on the government's three-year energy plan stated that nuclear power was an important base-load electricity source. Meanwhile, the report also said that Japan would reduce its reliance on nuclear power as much as possible.

The report has been criticized as a regressive step from the Democratic Party of Japan (DPJ) administration's plan for zero nuclear power. However, the recent report is much more cautious than the 2010 basic energy plan compiled prior to the March 2011 disasters, when Japan was still drunk on the nuclear renaissance.

Take, for example, the painstaking choice of the phrase "base-load electricity source." This means that the committee sees nuclear power as a power source necessary for the stable supply of electricity, and carries the nuance that we are resigned to using it in order to avoid blackouts.

Compare this to the basic plan laid out three years ago, which called nuclear power a core energy source, and said the government would promote it with enthusiasm.

The theme of the German legend "Faust" is the making of a deal with the devil. Faust trades in happiness in the next life for pleasure in the present. If we substitute the next life in "Faust" with the happiness of our children and grandchildren, the nuclear dilemma is the same as the dilemma faced by Faust.

Nuclear power may guarantee ample electricity and economic activity, but a disaster could rob people of their land and cause genetic damage. Even without a disaster, nuclear reactors continue to produce extremely toxic radioactive waste for which we have yet to develop the technology to control, and that future generations must contend with.

I was reminded of Faust upon reading the contents of a lecture given by the economist Sadakazu Chikaraishi immediately after the March 11, 2011 triple disasters.

"We should no longer increase our energy consumption, utilize oil and natural gas on a small and long-term scale, and commit 100 percent to the development of green energy," he said. "It's ridiculous to make a Faustian pact and rely on nuclear energy."

Chikaraishi, 87, had provided theoretical support to the All-Japan Federation of Students' Self-Governing Associations (Zengakuren) in its early stages, soon after World War II. He studied in what is today Kyoto University's humanities department, where he was exposed to German literature, and the faculty of economics at the University of Tokyo. I still remember his smile as a popular host of an NHK television program on economics in the 1970s.

The professor emeritus of Hosei University, who is spending his retirement in Zushi, Kanagawa Prefecture, sent me a copy of the speech he made at his alma mater. Surprisingly, his argument in the speech is almost exactly the same as the one he made in an article in the May 1977 issue of the monthly journal "Sekai" (The World).

How did Chikaraishi have such insight back in 1977, when neither the Chernobyl disaster nor the Three Mile Island accident had yet to take place? When I met him to ask this question, I noticed that his smile had not changed over the years.

"Contemporary technology merely combines the laws of physics and chemistry in an excessive pursuit of convenience, speed, and economizing. Environmental biology is ignored. Nuclear power is a classic example. Even though the technology is incomplete, it has been promoted with the idea that 'we'll figure it out sooner or later,' which goes against the principles of technology assessment. We have to shift our selection of technology toward that which is ecologically sound."

The social structural reforms associated with such a shift in technological selection are difficult. There are bound to be countless views on such potential change.

However, we've had enough of the "we'll figure it out soon" line of thinking of his country's pro-nuclear advocates. In October, operations of the Rokkasho Nuclear Fuel Reprocessing Facility in Aomori Prefecture were postponed for the 20th time. Even the U.S. and France have abandoned their fast-breeder nuclear reactor programs. When is Japan going to wake up? (By Takao Yamada, Expert Senior Writer)

Democratic Party & gov't energy policy

December 18, 2013

Democratic Party criticizes govt.'s energy policy
http://www3.nhk.or.jp/nhkworld/english/news/20131217_46.html

Members of the opposition Democratic Party have harshly criticized a government draft energy policy designed to retain nuclear energy as an important basic source of electricity.

The government's draft policy presented earlier this month says Japan will continue to utilize nuclear power generation if plant safety can be ensured, in order to secure a steady supply of low-cost electricity, without worsening climate change.

At a meeting on Tuesday, many Democratic Party members in charge of energy policy criticized the government's draft.

One member said it is irresponsible to restart nuclear reactors while there is nowhere to dispose of high-level nuclear waste.

Another said nuclear power is not low-cost energy, if the costs of decommissioning reactors and compensation after nuclear disasters are taken into account.

The members hope to wrap up their energy proposal in line with their party's policy of aiming to end nuclear power generation by the 2030s.

They will present the proposal at the party's convention in February.

The Nagasaki view

December 23, 2013

Japan anti-nuke stance to reflect Nagasaki view

http://www3.nhk.or.jp/nhkworld/english/news/20131223_08.html
Japan's Foreign Minister says he will reflect the views of the atomic-bombed city of Nagasaki in the government's efforts toward nuclear arms reduction.

Fumio Kishida is scheduled to give a lecture on nuclear disarmament at Nagasaki University on January 20th.

He plans to say the government's first aim is to achieve a reduction in the number of nuclear weapons so

that it can promote nuclear disarmament in a realistic manner, while Japan remains under the US nuclear umbrella.

Kishida also plans to explain that as the only atomic bombed country, Japan will continue to stress the horror of nuclear weapons.

The foreign minister says he hopes for a frank exchange with audiences so their views can be included in the government's efforts toward nuclear arms reduction.

In October, Japan for the first time signed up to a UN committee statement saying nuclear weapons should never be used under any circumstances.

The government plans to hold an international conference on disarmament and nuclear non-proliferation next April, in the country's other atomic-bombed city of Hiroshima.

Q & As on Japan's energy plan

December 22, 2013

News Navigator: What are the key points of the new basic energy plan?

http://mainichi.jp/english/english/perspectives/news/20131222p2a00m0na002000c.html
The Mainichi answers some common questions readers may have about the key points of Japan's long-term energy plan, a draft of which was recently approved by a government panel.

Question: The country's new energy policy has been firmed up, hasn't it?

Answer: You are talking about the Basic Energy Plan, aren't you? Resource-poor Japan drew it up for the first time in 2003 as its medium- to long-term program to secure a stable energy supply. The government reviews it every three years in principle. The basic plan lays out targets for improving energy self-sufficiency through nuclear and solar power generation, promoting resource development, and reducing greenhouse gas emissions, among other measures. The targets are nonbinding, but they serve as key guidelines for businesses to decide which energy sectors they should place priority on for their investments. The draft basic plan was approved on Dec. 13. The new Basic Energy Plan is expected to be formally approved by the Cabinet as early as next January.

Q: What are the key points of the basic plan?

A: The biggest point is where the country's nuclear policy will stand. The draft basic plan lists nuclear power as an "important base-load electricity source," setting out a government policy of maintaining nuclear power on a certain scale. The plan paves the way for building new nuclear power stations or rebuilding existing ones.

Q: That is quite different from the policy adopted by the previous government led by the Democratic Party of Japan (DPJ), isn't it?

A: The DPJ-led government, which had initially planned to proactively use nuclear power under its policy of combating greenhouse gas emissions, worked out a basic energy plan in June 2010, which would boost the ratio of power generated by nuclear reactors to the total electricity produced in the country to at least 50 percent by 2030. But in September, 2012 in the wake of the outbreak of the Fukushima nuclear crisis, the government shelved the basic plan and instead drew up the Innovative Strategy for Energy and the Environment, which called for a "zero nuclear" policy. But the strategy itself is different from the basic plan, and therefore it was not approved by the Cabinet.

Prime Minister Shinzo Abe's government, weighing economic growth, reviewed the "zero-nuclear policy." Many members of an advisory panel of the Ministry of Economy, Trade and Industry were replaced in March this year by those complying with views of the ruling Liberal Democratic Party (LDP). The new panel members have been discussing a new basic energy plan in the direction toward endorsing the use of nuclear power. Therefore, attention is being focused on to what extent the nuclear policy will be reversed.

Q: What will be the ratio of nuclear power to Japan's overall electricity supply?

A: Although nuclear reactors, that are currently offline, must pass the Nuclear Regulation Authority (NRA)'s safety checks in order to be restarted, it still remains unclear which reactors will actually pass the screening. Because of all this, the government will unlikely be able to set the target ratio for the time being of power generated by nuclear reactors to the total electricity produced in the country as previously planned. Some NRA members argue that it is "irresponsible" not to show the ratio. (Answers by Wataru Okubo, Tokyo Economic News Department)

Toshiba in UK nukes

December 24, 2013

Toshiba gets 50% stake in UK nuclear consortium
http://www3.nhk.or.jp/nhkworld/english/news/20131224_13.html

A major Japanese electronics firm, Toshiba, has decided to buy a 50 percent stake in a British consortium. The conglomerate plans to construct a nuclear power plant.

Spanish utility Iberdrola made the announcement on Monday. The utility had a 50 percent stake in the British outfit NuGeneration.

Toshiba agreed to buy all of Iberdrola's 50 percent stake in NuGeneration. The deal is worth 85 million pounds, or about 139 million dollars.

The British company plans to construct a 3.6-gigawatt nuclear plant in Sellafield, England, on the coast of the Irish Sea.

Toshiba wants to expand its nuclear construction business overseas due to uncertainty in the domestic market.

Rival Japanese firm Hitachi last year acquired a utility that plans to build up to 6 nuclear reactors in Britain.

Nukes as "transitional" option

December 30, 2013
LDP group seeks semantic solution to energy revamp
http://www.japantimes.co.jp/news/2013/12/30/national/ldp-group-seeks-semantic-solution-to-energy-revamp/#.UsHa27T8nIU

Kyodo

A group of lawmakers from the Liberal Democratic Party seeking to phase out nuclear power has compiled a proposal for drastically revising the nation’s basic energy plan that is to be approved by the Cabinet in January, according to sources close to the group.

While the current draft version of the energy plan says nuclear power is an important power source that serves as a foundation for a stable energy supply, the group’s proposal would describe nuclear power as a “transitional” energy source, the sources said.

The group, led by Deputy Secretary-General Taro Kono, also wants the Abe administration to present a road map for lowering dependence on nuclear power in line with an LDP campaign pledge in the general election last year.

How will energy demand be met in 2014?

December 31, 2013

Energy rivals to face eased demand

Reactor restarts sought but OKs no given; LNG, coal also figure

by Eric Johnston
Staff Writer
http://www.japantimes.co.jp/news/2013/12/31/national/energy-rivals-to-face-eased-demand/#.UsMkOLTrXIU

Even as new renewable energy projects come online and changes in the law designed to increase competition and use power generated from all sources more efficiently start to come into effect this year, predictions for the nation's energy landscape show total energy consumption slightly down.

However, the real issue is how many idled nuclear reactors will be restarted in 2014. At present, the nation's 50 viable reactors are offline, a legacy of the Fukushima meltdown calamity that started on March 11, 2011.

The economic impact such restarts will have, regardless of whether nuclear energy will still be cost-competitive with liquefied natural gas, which Japan is pushing to increase, and, most importantly, what will happen to the atomic waste the restarted reactors generate, are all questions that must be addressed in the coming months.

The Institute of Energy Economics, Japan noted in mid-December that projections on how many reactors are in operation by the March 31, 2015, end of fiscal 2014 depend on how long the Nuclear Regulation Authority takes to inspect candidate units under new safety rules that took effect in July.

It is assumed that it will take nine months to inspect and actually put a reactor back online. This includes time required for gaining local government consent for the restart. Officially, local approval is not required, but it has always been sought. To break that precedent would create political problems for both the central government and the utilities.

"This (nine-month scenario) would result in no nuclear power plant restarts within this fiscal year, which ends in April 2014," the IEEJ said

.

However, if the NRA assessment and approval period took six months, the IEEJ predicts 16 reactors could be restarted and operating for an average of seven months in fiscal 2014.

On the other hand, an inspection and approval period of a year means only six reactors would be operating by the end of fiscal 2014. If there was an increase in the number of NRA inspection staff from April, and a smooth restart application process by the utilities, the time could be shortened to the point where the IEEJ sees 22 restarted and operating for an average of eight months during fiscal 2014.

Compared with 2010, the last year nuclear plants were running, the additional cost of importing fossil fuels in 2014 to replace atomic power is expected to be ¥7.3 trillion, according to the IEEJ.

Restarting 22 reactors will save ¥2.4 trillion. But the IEEJ also predicts the restarted units would not be generating electricity at the 2010 cost of ¥8.2 per kilowatt-hour. If 16 reactors were restarted, the cost would be ¥11.4/kwh, which is more expensive than generating power from some fossil fuels.

The IEEJ prediction is comprehensive. But it assumes the NRA will not reject most applications. Nor does it address either long-term issues related to nuclear power that are rapidly becoming short-term issues, or questions about costs that are more political than economic.

Restarting reactors in 2014 may mean more electricity. But it also means Japan will have to quickly address a fundamental problem that nobody has an answer for, which is what to do with the spent nuclear fuel.

Nationwide, spent fuel pools at 17 reactor sites are about 70 percent full on average. The spent fuel pools at 33 of the remaining 50 reactors will be completely full within six years if those reactors are restarted and run at pre-3/11 levels. Another 14 reactors could see their spent fuel pools fill up within a dozen years.

“In order to restore public trust in nuclear power, it’s critical that Japan address the issue of what to do with its spent fuel, of which 17,335 tons was in storage as of September,” said Tasujiro Suzuki, vice chairman of the Japan Atomic Energy Commission.

The Rokkasho reprocessing plant in Aomori Prefecture was supposed to recycle spent fuel, and there are still hopes it will finally open next fall. But the NRA is reviewing the Rokkasho construction plan to ensure it meets the new earthquake safety standards and it is unclear what or when its final decision will be.

Unknown variables such as the intensity of local opposition to a restart and local government heads demanding that Tokyo first guarantee funding for their pet projects before granting approval will also determine the timing of any restart.

Assuming 16 reactors will be restarted, the IEEJ predicts a slight increase in natural gas and coal imports but an 8.8 percent decrease in oil exports for 2014, and a slight total decrease in total energy consumption. Domestic demand for natural gas is forecast to reach 91.1 million tons in fiscal 2014. That's 1 percent higher than the expected 90.2 million tons for fiscal 2013.

To meet domestic energy demand, two new coal plants with a total capacity of 1,600 megawatts are due to begin operation soon, while 2014 and 2015 will see 14 new gas-fired plants coming online that will consume about 5.8 million tons of LNG annually.

Six utilities have already raised electricity bills between 6 and nearly 10 percent for certain customers. Price hikes due to external factors, a colder than predicted winter or a hotter than predicted summer, could also affect utility bills in 2014. At the same time, the April sales tax hike to 8 percent may curb some energy use.

Renewable energy, solar in particular, made great gains in 2013, a year after a feed-in tariff was introduced, and increased capacity is expected for 2014. Operating capacity of renewable energy is predicted to reach 36.6 gigawatts by the end of fiscal 2014, an increase of 6.8 gigawatts over this year.

This year will see Japan's largest mega-solar power plant open in Oita Prefecture. Built by Marubeni, the 81.5 megawatt plant, big enough to supply about 30,000 homes, will sell power to Kyushu Electric. The Oita plant follows a 70 megawatt mega-solar plant that went online in November with enough power to supply about 70,000 homes within the prefecture. In July, a joint solar park operated by Mitsui & Co. Ltd. and SB Energy Corp., a subsidiary of SoftBank, will open in Osaka, providing about 19.6 megawatts, enough for 5,700 homes.

Due to land issues, grid connection costs, a lack of financial incentives, political opposition locally and in Tokyo, by the nuclear power lobby, the future of new mega-solar parks after 2014 is uncertain.

On the other hand, this year is likely to be one of anticipation for new firms looking ahead to changes in the law that are designed to liberalize the nation's power market between 2015 and 2020 in three phases. Last April, Prime Minister Shinzo Abe's Cabinet approved electricity reform that included expanding the operation of wide-area electrical grids, fully liberalizing the retail market for power generation, and legally separating the power transmission and distribution networks at the utilities.

In November, the law was revised to meet the goals of the first phase, which begins in 2014 and includes establishing a new authorized entity to monitor the state of national electricity supply and demand and to order utilities to supply power when demand is tight. It is also supposed to arrange for renewable energy generation, which can vary greatly, to be distributed more widely and effectively.

Turning back to Nuclear Power (NHK video)

December 26, 2013

http://www3.nhk.or.jp/nhkworld/newsline/201312261107.html

Japan should play leading role in global nuclear disarmament

January 4, 2013

Japan expected to lead nuclear disarmament
http://www3.nhk.or.jp/nhkworld/english/news/20140105_02.html

Japan is expected to come under pressure from the international community this year to play a leading role in the push for nuclear disarmament.

Government officials recently made the historic decision to commit Japan to a United Nations statement that opposes the use of nuclear weapons under any circumstances.

Previously they said this policy was incompatible with the country's reliance on the US nuclear umbrella.

The UN statement came amid arguments between countries that want a treaty banning atomic weapons, and those favoring a more gradual approach that allows for nuclear deterrence.

An international conference in Mexico next month will study the humanitarian impact of a nuclear attack.

Japan also plans to host an international conference in April to discuss nuclear disarmament. The meeting of foreign ministers from countries that do not possess nuclear arms will take place in Hiroshima, the site of a nuclear attack in World War Two.

Meiji Gakuin University Professor Takao Takahara says the international community hopes Japan, the only country to have suffered atomic bombings, will play an active role in global nuclear disarmament.

India, Turkey: Nuclear pacts

January 7, 2013
New Komeito seeks nuclear pact with India

http://www3.nhk.or.jp/nhkworld/english/news/20140107_14.html

The head of the junior party in Japan's governing coalition is hoping to hasten the conclusion of a nuclear pact with India.

New Komeito chief Natsuo Yamaguchi, met with Indian Foreign Minister Salman Khurshid in New Delhi on Monday.

He said the Japanese public is very sensitive about nuclear power, due to the atomic bombings of Hiroshima and Nagasaki, as well as the Fukushima accident.

So he said the pact, which would allow Japan to export nuclear power technology to India, must be advanced with the understanding of the public.

Yamaguchi said his party has no major differences with its coalition partner, the Liberal Democratic Party, and that he hopes for flexibility in working-level talks.

Khurshid commented on the controversial visit to the war-related Yasukuni Shrine in Tokyo by Prime Minister Shinzo Abe. He noted that it is best to learn from the past and go forward.

Yamaguchi replied that Japan must humbly accept the concerns expressed about the visit by not only China and South Korea, but by the US, Russia and EU countries as well.

He said Prime Minister Abe must better explain Japan's position that it desires world peace and never start a war again.
Jan. 7, 2014 - Updated 02:43 UTC

Erdogan in Japan to discuss EPA and nuclear pact
http://www3.nhk.or.jp/nhkworld/english/news/20140107_19.html

Japan welcomed Turkish Prime Minister Recep Tayyip Erdogan with a ceremony at Tokyo's Akasaka palace on Tuesday.

Prime Minister Erdogan and Prime Minister Shinzo Abe received an honor guard salute. The Turkish prime minister was also greeted by Deputy Prime Minister Taro Aso and other Cabinet ministers.

A summit between Erdogan and Abe is scheduled for later on Tuesday. The leaders are to discuss opening bilateral talks for an economic partnership agreement.

They are also likely to confirm that the 2 sides will strive for the early implementation of a civil nuclear cooperation pact.

The pact would allow the export of Japanese nuclear technology to Turkey, where a Japanese-French consortium has won an order to build a nuclear plant.

The meeting will be the 3rd between the 2 premiers, following talks last May and October. Abe is apparently hoping to bolster ties with Turkey, whose economy is growing steadily.
Jan. 7, 2014 - Updated 03:38 UTC

Concerns about proliferation of nuclear weapons

January 7, 2014

Japan's energy pact with Turkey raises nuclear weapons concerns

http://ajw.asahi.com/article/behind_news/AJ201401070060

THE ASAHI SHIMBUN

A pact required for Japan's first nuclear plant export after the Fukushima disaster faces opposition over concerns about a possible proliferation of nuclear weapons.

Debate over the issue is expected when the government seeks Diet approval for the nuclear energy agreement with Turkey during a session that convenes this month.

Japan and Turkey agreed to conclude the nuclear energy pact, a precondition for exporting nuclear technology, in May. It requires the recipient country to use technology, as well as equipment and materials, only for peaceful purposes.

However, the pact includes a provision allowing Turkey to enrich uranium and extract plutonium, a potential material for nuclear weapons, from spent fuel if the two countries agree in writing. A senior Foreign Ministry official said the clause was added at the request of Turkey.

The agreement would also pave the way for exporting Japan's enrichment and spent nuclear fuel reprocessing technologies if revisions are made.

The provision has sparked criticism that it contradicts Japan's stance against nuclear weapons.

"There is a risk that (the government) accepts unreasonable demands in relation to projects sponsored by a prime minister," Shigeaki Koga, a former industry ministry bureaucrat, said.

A consortium that includes Mitsubishi Heavy Industries Ltd. won a contract to build four nuclear reactors in the Black Sea city of Sinop with strong backing from Prime Minister Shinzo Abe, who is pushing nuclear plant exports as part of his growth strategy.

Abe and his Turkish counterpart, Recep Tayyip Erdogan, met in Tokyo on Jan. 7. The two leaders discussed the project and overall atomic energy cooperation when Abe visited Turkey in May and October.

The Sinop project will be Japan's first nuclear plant export after the triple meltdown at the Fukushima No. 1 nuclear power plant triggered by the March 2011 Great East Japan Earthquake and tsunami.

The senior Foreign Ministry official stressed the need to swiftly conclude the pact with Turkey.

"(The agreement) will not be in time for the first reactor scheduled to start operations in 2023 unless it is approved by the Diet soon," the official said.

Although the opposition Democratic Party of Japan promoted nuclear plant exports when it was in power, some of its lawmakers, including those from areas affected by the Fukushima nuclear accident, are against the pact.

The Japan Restoration Party, another opposition party, has decided to oppose the agreement.

Even the foreign affairs division of Abe's ruling Liberal Democratic Party withheld its approval in October because some members said the provision on uranium enrichment and plutonium extraction will run counter to nuclear nonproliferation.

The LDP division gave its approval only after Foreign Minister Fumio Kishida offered reassurances in the Diet that Japan will not allow spent fuel reprocessing in Turkey.

Japan placed restrictions on enrichment and reprocessing in its nuclear energy agreements with Vietnam, South Korea, Jordan and Russia, which took effect in 2012.

The agreements with Vietnam and Jordan, as well as the pact with the United Arab Emirates, which has yet to be approved by the Diet, basically say enrichment and reprocessing will not be conducted in those countries.

Yuki Tanabe of the Japan Center for a Sustainable Environment and Society, a nonprofit organization, also pointed out a seismic risk in Turkey, where more than 17,000 people died in a major earthquake in 1999.

"Even if Japanese nuclear reactors are highly resistant to earthquakes, an accident could occur when facilities around them are damaged," Tanabe said.

Erdogan is trying to acquire nuclear and other technologies from abroad to promote economic growth, which has underpinned his more than 10-year-long administration.

It is important for Turkey, which aims to eventually build nuclear plants on its own, to win support from Japan not only on nuclear technology but also on human resources development.

Japan promised to set up a science and technology university in Turkey when Abe visited in May.

Turkey is also discussing a project with Japan to establish a joint venture between a local company and MHI to produce engines for tanks used by its military.

(This article was compiled from reports by Sachiko Miwa in Tokyo and Kazuyuki Kanai in Istanbul.)

Caution should be exercised before deciding on nuclear pacts

January 8, 2014

EDITORIAL: Urgent rethink needed on Japan-Turkey nuclear energy pact

http://ajw.asahi.com/article/views/editorial/AJ201401080039

Prime Minister Shinzo Abe met Jan. 7 with his Turkish counterpart Recep Tayyip Erdogan and confirmed that Japan would export its nuclear reactor technology to Turkey.

The export strategy is a pillar of the Abe administration's push for economic growth. In this matter, we urge caution for the simple reason that a serious accident at a plant exported by Japan could have ramifications far beyond the country in question. That could result in Japan being held accountable.

Moreover, how to store or permanently dispose of spent nuclear fuel is a matter of mounting international concern. But the Japan-Turkey nuclear energy pact addresses this only in vague terms.

Diet approval is necessary for the bilateral pact to take effect. Lawmakers of both the ruling and opposition parties would be well advised to get the Abe administration to rethink the pact. That, we believe, is their responsibility as members of the legislature.

The pact contains a provision that would enable Turkey to eventually enrich uranium and extract plutonium by reprocessing spent nuclear fuel. But this could be problematic because the technologies for uranium enrichment and plutonium extraction can lead to the production of nuclear weapons. In this matter, the international community has been acting with extreme caution.

But even after the bilateral nuclear energy pact takes effect, Turkey will not be able to go right ahead and reprocess spent nuclear fuel.

Foreign Minister Fumio Kishida assured the Diet during the previous session that Japan would not approve fuel reprocessing by Turkey.

But this was not spelled out in the bilateral pact, and the reported reason is that Japan complied with Turkey's request that "affirmative wording" be used. The Abe administration compromised, apparently because it wanted to conclude the pact as soon as possible to pave the way for exports of nuclear-related technology to Turkey.

Until recently, only a limited number of countries relied on nuclear power generation. But the reliance is now spreading among developing nations that suffer from energy shortages. And it is precisely these nations that Abe is targeting in his efforts to sell Japanese technology and hardware.

A number of these countries that are eager to have their own nuclear power plants are undemocratic or are in politically unstable regions. Great care needs to be exercised in selling nuclear energy technologies.

If too little thought is given, and countries can get away with dictating the terms of nuclear energy pacts, the world's already shaky framework of nuclear nonproliferation would be further destabilized.

It has been pointed out that there are limits to what the International Atomic Energy Agency can do, given its lack of the power to fully enforce its inspections.

Japan has failed to make its nuclear fuel recycling system a going concern. Japan's massive surplus plutonium, which has been stockpiled by entrusting fuel reprocessing to contractors overseas, has become a matter of global concern.

It is the Abe administration's responsibility to focus on resolving these problems at home and live up to its international obligations by working out how nuclear waste should be managed or disposed of.

Opposition parties in this country are against hasty exports of nuclear power plant technology and the Japan-Turkey nuclear energy pact. Even some members of the ruling Liberal Democratic Party are preaching caution.

We hope that both the ruling and opposition camps will work together to prove their mettle as responsible members of the legislature.
--The Asahi Shimbun, Jan. 8

Lack of coordination on nukes delays decision on new energy policy

January 11, 2013
Gov't to delay Cabinet decision on new energy policy
http://mainichi.jp/english/english/newsselect/news/20140111p2a00m0na010000c.html

The government will postpone a Cabinet decision on Japan's new basic energy policy to February or later due to a lack of coordination among ruling coalition members on nuclear power, and the Tokyo gubernatorial election that month, government sources said.

The decision came as members of the ruling Liberal Democratic Party (LDP) and its coalition partner New Komeito have failed to agree on a draft policy that would position atomic energy as a foundational power source to support a stable supply of energy. The decision also suggests the government is looking to put off setting energy policy until after the Feb. 9 Tokyo gubernatorial election as former Prime Minister Morihiro Hosokawa, an anti-nuclear power advocate, looks increasingly likely to enter the race.

Chief Cabinet Secretary Yoshihide Suga told a news conference on Jan. 10 that establishing a responsible energy policy needs thorough discussion, taking into account some 19,000 comments from the public on the matter. While Suga denied any relationship between the Cabinet decision delay and the Tokyo election, the government is likely to settle on an energy policy after the February race.

Meanwhile, Akira Amari, minister in charge of economic revitalization, commented, "I want the government to work on a basic policy that is applicable for 10 to 20 years. It is understandable that such an important plan takes time to form."

The government had initially planned to reach a Cabinet decision on the policy this month after reviewing the public's input. However, some LDP politicians, such as Deputy Secretary-General Taro Kono, are set to propose drastic changes in the draft policy, claiming that the draft is inconsistent with the party's manifesto for the 2012 House of Representatives election. That document stated the party will work to create a socio-economic structure that does not rely on nuclear power.

LDP policy chief Sanae Takaichi on Jan. 7 demanded that the government handle the matter carefully for fear that pro- and anti-nuclear power members of the party could clash head-on.
Meanwhile, New Komeito is not at all satisfied with the basic policy ideas, as the party has campaigned for a zero-nuclear power society in the future.

Junichiro Koizumi announces backing for fellow ex-prime minister Morihiro Hosokawa as candidate in Tokyo poll focused on the future of Japan's nuclear power industry

PUBLISHED : Tuesday, 14 January, 2014, 3:33pm
UPDATED : Tuesday, 14 January, 2014, 3:33pm

Agence France-Presse in Tokyo

Japan's popular former prime minister Junichiro Koizumi said on Tuesday he was backing fellow ex-premier Morihiro Hosokawa in the race to become the next Tokyo governor, setting the stage for an electoral clash over nuclear power.

Hosokawa, who served in the nation's top job in 1993-4 as head of a now-defunct coalition, announced his independent candidacy and scored a ringing endorsement from the influential Koizumi, with the two men both playing up their anti-atomic stance.

"I have made my decision to run in the Tokyo governor election," Hosokawa said. "I have a sense of crisis myself that the country's various problems, especially the nuclear issue, are matters of survival for the country."

The move positions him as the main alternative to the candidate backed by current premier Shinzo Abe and his pro-business Liberal Democratic Party (LDP), which wants to restart the nation's mothballed nuclear power plants.

Japanese voters have become wary of nuclear power since the tsunami-sparked disaster at Fukushima began in March 2011, but the issue failed to materialise in the national polls that brought Abe to power, with his opponents' apparent haplessness neutralising their anti-nuclear stance.

Tokyo's governor oversees a budget of some US$60 billion and exercises control over the economic, political and cultural heart of Japan. The position is one of the most powerful roles in Japanese public life.

In addition to numerous powers to set policy, the Tokyo government is also a major shareholder in Tokyo Electric Power (Tepco), the operator of the Fukushima plant, as well as several other nuclear power stations.

An anti-nuclear governor could use this position to curb the utility's drive to re-start its shuttered reactors.

Koizumi, whose flamboyant style and luxurious head of hair made him a popular prime minister between 2001 and 2006, has become an anti-nuclear convert in recent years, putting him at odds with his status as an LDP grandee.

"I will work hard and actively for Mr Hosokawa's election," Koizumi told reporters.

"The election will be a battle between a group of people who say Japan cannot advance without nuclear power and another group of people who say Japan can."

Observers say with Koizumi's backing, Hosokawa, who celebrates his 76th birthday on Tuesday, is a serious challenger to the current favourite, former health minister Yoichi Masuzoe.

The post of Tokyo governor fell vacant last month when Naoki Inose stepped down in a money scandal after admitting he had been naive to accept an undeclared US$500,000 from a hospital tycoon.

Inose, 67, had been one of the main faces of Tokyo's successful bid to host the 2020 Olympics.

A former air defence force chief with outspoken nationalist views, an anti-nuclear liberal lawyer and others have already thrown their hats in the ring.

Candidates have to formally declare themselves during office hours on January 23, and the vote takes place on February 9.

No need to rush

January 14, 2014

Motegi: Basic energy policy won't be rushed

http://www3.nhk.or.jp/nhkworld/english/news/20140114_27.html

Japan's industry minister Toshimitsu Motegi says he doesn't want to rush the process of finalizing the government's new basic energy policy, which includes the future of nuclear power.

Speaking to reporters on Tuesday, Motegi indicated that parts of the ministry's draft need to be amended and Cabinet approval could be put off until next month. The ministry had aimed at gaining approval by the end of this month.

Motegi noted that the government has received more than 19,000 comments on energy policy from the public. He also said the ruling Liberal Democratic Party has given a questionnaire to its legislators.

Motegi said that opinions on nuclear power are greatly divided and more in-depth discussions are necessary, especially on how to ultimately dispose of nuclear waste.

Motegi disclosed that the new basic policy would not include specific plans on construction of new nuclear power plants.

Governor race causes political waves

January 15, 2014

Koizumi's support of Hosokawa in gubernatorial race creates political waves

http://mainichi.jp/english/english/perspectives/news/20140115p2a00m0na010000c.html

Former Prime Minister Junichiro Koizumi, who has been gathering public attention recently over his anti-nuclear stance, has thrown his full backing behind another former prime minister, Morihiro Hosokawa, as a candidate in next month's election to choose a new governor of Tokyo.

Public opinion is split over the restarting of nuclear reactors in Japan -- an issue that could end up taking the wind out of the sails of the robust-looking administration of Prime Minister Shinzo Abe. By declaring his intention to play a central role in the election, Koizumi has managed to garner support from across the political spectrum, as lawmakers look to form an anti-Abe element.

Koizumi's declaration of support for Hosokawa came after Abe's ruling Liberal Democratic Party (LDP) threw its backing behind former Health Minister Yoichi Masuzoe. The fact that Koizumi, a former major actor in the LDP, has confronted the current administration head-on has dealt a blow to the ruling party.

Elaborating on his position in a news conference to announce his support for Hosokawa, Koizumi, 72, spoke firmly.

"There is no election that could influence national politics as much as the upcoming Tokyo gubernatorial election," he stated. "It's a battle between the group that says, 'Japan can develop even without nuclear power,' and the one that says, 'Japan can't develop without nuclear power.'"

Koizumi earlier proved his strength in the 2005 election, as he moved to privatize Japan Post. Now he has simplified the election issues by drawing a line between supporters and opponents of nuclear power. At first the LDP had thought it would be easy to beat the 76-year-old Hosokawa, who could face a tougher job winning recognition from younger voters. But now Koizumi has entered the picture and declared that focus will be placed on eliminating nuclear power. Accordingly, the LDP's opponent has evolved into a Hosokawa-Koizumi alliance.

As Koizumi advances, the ruling LDP has at times remained steadfast and at other times been left on the back foot. In a news conference, Chief Cabinet Secretary Yoshihide Suga stated that it would be lying to say that Koizumi wouldn't have any effect on the party's election strategy, but he stressed that there would be no great effect. At a news conference in Kyoto, Natsuo Yamaguchi, leader of the LDP's coalition partner New Komeito, sided with the LDP, telling reporters that the elimination of nuclear power "is not what Tokyo residents are interested in."

However, aware of Koizumi's impact, some LDP members sense danger. One senior party member who served under Koizumi warned, "If Koizumi goes to the streets (to back Hosokawa), then it's all over. He'll be causing headaches for Prime Minister Shinzo Abe."

Another former prime minister, Yoshiro Mori, commented in a speech before Koizumi announced his support that Koizumi would probably hesitate to go up against Abe as he had raised Abe up in the political sphere like a younger brother. But Koizumi's latest move proved him wrong.

Koizumi's attack on nuclear power has seen the governing LDP waver over the fate of nuclear power plants in Japan. Economy, Trade and Industry Minister Toshimitsu Motegi explained at a news conference that the government's basic energy policy that currently aspires to maintain nuclear power would be revised to emphasize the introduction of renewable energy -- something Koizumi has called for. Meanwhile, a party caucus on energy policy that has been hesitant to promote nuclear power has gained momentum, with members confirming in a meeting on Jan. 14 that they would compile a recommendation to abolish nuclear power plants and the so-called nuclear fuel cycle in the future.

The opposition parties, which have been looking for a way to stand up against the ruling coalition, are happy to lean on Koizumi's popularity. On Jan. 14, the opposition Democratic Party of Japan (DPJ) decided to support Hosokawa in the gubernatorial election, though not officially. At the same time, members of the opposition Japan Restoration Party who hail from the Osaka Restoration Association and support the elimination of nuclear power are also poised to back Hosokawa.

Social Democratic Party leader Tadatomo Yoshida, who is supporting anti-nuclear candidate Kenji Utsunomiya, commented, "It would be desirable to unite the anti-nuclear candidates." However, even if anti-nuclear opinion is aligned, there exists no figure to take the reins, and with parties differing in their closeness to the current administration and their position on realignment of the government, many unknown elements lie on the road to forming an anti-Abe movement.

Masuzoe, meanwhile, is trying to avoid simplification of the election issues, raising topics such as the Olympic Games, disaster prevention, and the declining birth rate in addition to a declaration of an eventual departure from nuclear power. Masuzoe came out on top in an election survey prediction conducted by the LDP at the end of last year, but it is possible Hosokawa could win many votes from unaffiliated voters.

One LDP official commented, "There's nothing to do but to wage a thorough, organized election. If it turns into a 'Koizumi theater' and the voting rate goes up, then we've lost."

Nukes in the spotlight but not so for Fukushima evacuees

January 15, 2014
Editorial: Nuclear power a major point of contention in Tokyo gubernatorial race

http://mainichi.jp/english/english/perspectives/news/20140115p2a00m0na005000c.html

The issue of nuclear power has emerged as a major point of contention in the upcoming Tokyo gubernatorial race as former Prime Minister Morihiro Hosokawa announced on Jan. 14 that he will throw his hat in the ring on an anti-nuclear power platform.

Former Prime Minister Junichiro Koizumi, who has insisted that Japan should end its reliance on atomic power, has pledged to extend all-out support to 76-year-old Hosokawa. Former Health, Labor and Welfare Minister Yoichi Masuzoe, 65, has also affirmed his candidacy in the race, clashing head-on with Hosokawa. Others who intend to run include Kenji Utsunomiya, 67, former head of the Japan Federation of Bar Associations who also calls for the elimination of atomic power, and Toshio Tamogami, 65, former chief of staff at the Air Self-Defense Force.

The official campaign for the election kicks off on Jan. 23 and voters go to the polls on Feb. 9. Vote counting will start immediately after polling stations are closed.

Since the election will pick the leader of Japan's capital, candidates should have thorough debate on the nuclear power issue, which is a major theme in national politics. It is hoped that a variety of candidates will run in the election, heightening Tokyo voters' interest in the race and spurring policy discussions during the campaign.

Hosokawa, who had retired from politics, has been interested in the country's energy policy. When he declared his candidacy, the former prime minister said the issue of nuclear power will determine the fate of Japan. His alliance with Koizumi, who is skillful in dispatching messages that impress the public, will have a huge impact on his election campaign.

Critics argue that the nuclear power issue should not be a point of contention during the gubernatorial race, with some saying that it is not an issue suitable for a local election.

However, questions should be raised over such arguments. The election to pick the leader of the capital is not just one of ordinary local elections. It is of great significance to debate the pros and cons of the nuclear power policy in Tokyo, which consumes the largest amount of electrical power of all local bodies even though it does not host a single nuclear plant.

Despite the outbreak of the unprecedented disaster at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant, the nuclear power policy was not sufficiently debated in the two post-disaster national elections. This is because both the Liberal Democratic Party (LDP), which took over power after winning the December 2012 general election, and the Democratic Party of Japan (DPJ), which was in government at the time of the nuclear accident, were reluctant to make the issue a point of contention. The governor and the metropolitan assembly blocked a move to hold a local referendum in Tokyo on the pros and cons of restarting idled nuclear reactors.

The Tokyo Metropolitan Government is a major shareholder in Tokyo Electric Power Co. (TEPCO), the operator of the crippled nuclear power station. As Koizumi points out, the outcome of the election will have a huge impact on the direction of national politics. Tokyo, characterized by an excess concentration of the population, central government functions and industry, is the perfect place to debate the nuclear power issue as a major point of contention in elections

.

In the campaign, Hosokawa should discuss specific energy policy, including power supply and the final disposal of spent nuclear fuel, rather than simply calling for the elimination of atomic power. His ability to convince Tokyo voters that the capital can do without nuclear power, just as Koizumi says, will be tested during the campaign.

Response to the aging of the population and measures to prevent powerful natural disasters from devastating the capital are also important issues during the gubernatorial race. The number of elderly people aged 75 or over will likely reach 2 million in Tokyo in 2025, and a magnitude-7 earthquake occurring directly beneath the metropolitan area is estimated to leave up to 23,000 people dead. Candidates should not disregard important issues other than nuclear power as they aim to take the helm of the capital's administration.

Major political parties have decided which candidates they will support even though they were initially swaying. The gubernatorial election should be an opportunity for the whole nation to think about challenges that Japan faces through discussion on policies that the capital should pursue.

January 15, 2014(Mainichi Japan)

Fukushima evacuees show tepid response to Tokyo gubernatorial candidates' nuclear policies

http://mainichi.jp/english/english/newsselect/news/20140115p2a00m0na012000c.html

Japan's nuclear power policy has come under the spotlight following former Prime Minister Morihiro Hosokawa's announcement of his candidacy in next month's gubernatorial race, but for many Fukushima Prefecture residents who have evacuated to Tokyo the race bears little meaning for them.

As of December last year 8,048 people who evacuated in the aftermath of the March 2011 Great East Japan Earthquake, tsunami, and ensuing nuclear disaster were living in the capital. Around 1,100 of them reside in Shinonome Jutaku, a residential complex for civil servants in the capital's Koto Ward. Most of these residents are from Fukushima Prefecture.
On Jan. 14, the day Hosokawa announced his intention to run in the gubernatorial election, around 20 elderly residents had a get-together. One of them intently read a Fukushima newspaper, but no one brought up the Tokyo race.

"I'm anxious because I don't know how long I'll have before I'm told to leave. If I had some reassurance that I could stay here a long time I could plan out my life, but as it is I can't even buy furniture," said evacuee Kozo Misawa, 71. His home is in Minamisoma, Fukushima Prefecture, near the crippled Fukushima No. 1 Nuclear Power Plant and within an area still under government evacuation orders.

Since the nuclear disaster, the Tokyo Metropolitan Government has been offering metropolitan government-managed housing and housing for civil servants free to disaster evacuees. In September last year it extended the original three-year accommodation period by another year. Shinonome Jutaku is considered "temporary housing" and could be subject to additional extensions, but for now residents are only assured they can stay through March next year.

What Misawa wants is stability in his life. He feels that Hosokawa's anti-nuclear stance is just a ploy to get votes.

"I wish he'd first focus on the many other issues (like how to support evacuees)," says Misawa.

A 38-year-old woman who evacuated with her husband and child is similarly worried about how long she can stay in the complex.

"After my child starts going to school, it won't be easy to switch to another one. Honestly, I'd prefer the candidates in the gubernatorial race to talk about what they'll do for evacuees, rather than about nuclear power plants," she said.

Many evacuees, keeping the option of returning to Fukushima on the table, have not changed their registered addresses to Tokyo and so cannot vote in the election.

Hisako Sanpei, 59, who evacuated from Tomioka, Fukushima Prefecture, to the city of Machida, is one such evacuee.

"Until now, Tokyo used as much electricity from the Fukushima power plant as it liked. This (gubernatorial race, in which nuclear power is an issue) will provide a good chance for people in Tokyo to think about their responsibility for having used that power and the dangers of nuclear plants," she says.

On her inability to vote, she says, "It's frustrating because we're here living in Tokyo. Even if it's small, my one vote could bring change."

In June last year, the Science Council of Japan proposed that evacuees be given the same residential rights as they have at their registered homes. Hosei University professor Harutoshi Funabashi, who was involved in putting together the proposal, commented, "Many evacuees cannot decide whether to change their registered address, due in part to the national government's vague policies. It's absurd that almost three years after the start of evacuations the evacuees don't have the right to vote in the areas they have evacuated to. If nuclear power policy is to become an issue in the gubernatorial race, I hope they'll also look at this and other situations that evacuees face."

Why the Tokyo election is important

http://akiomatsumura.com/2014/01/the-nuclear-olympics-crisis-and-opportunity-in-tokyos-election.html

The Nuclear Olympics: Crisis and Opportunity in Tokyo's Election
January 15, 2014Japan, Nuclear, Politics

Akio Matsumura

Since the Fukushima accident, I have presented the opinions of several eminent scientists on the Fukushima disaster and we have received many insightful responses from other experts in many fields. Many thanks to our friends for constantly translating this work into French, Spanish, Japanese, and German – hard work that brought in thousands of new readers. Our joint efforts have gained a high level of international credibility and helped bring these issues the urgent attention they deserve.

Over these past three years I have begun to understand nuclear power and how its heavy risks – 10,000 years of environmental damage – are beyond what most are willing to accept as reality.
Next month the Japanese people have an opportunity to question Fukushima's safety again. A special election for the governor of Tokyo will take place February 9, an election the entire world will watch and comment on, and one which include serious discussion of energy. Candidates have already declared themselves for or against nuclear power.

Why is a gubernatorial election of international importance? The honor and responsibility of hosting the 2020 Summer Olympic Games.

Over the next weeks, as election debates revisit the question of the ongoing crisis at Fukushima and nuclear power's safety, it is useful to review the lessons learned from the March 2011 and the disaster that ensued.

8. We have arrived at a very basic realization: every potentially dangerous machine should have an emergency "off" switch that shuts everything down completely — but nuclear power reactors don't have one, because radioactivity cannot be shut off and therefore the irradiated nuclear fuel will continue to produce dangerous amounts of heat for many years after the plant's shutdown.
9. While nuclear power plants are generating electricity, they are also mass-producing enormous quantities of radioactive poisons that remain dangerous for centuries after the plant has been permanently shut down — poisons capable of contaminating food and water supplies long after they have been released to the environment.
10. Water used to cool a damaged reactor core becomes radioactively contaminated, and as the cooling must continue for years the volume of contaminated water grows very large and is difficult to keep out of the environment; this is especially true of subterranean waters
11. We have no radioactive waste repository in Japan where irradiated nuclear fuel can be safely isolated from the environment for 100,000 years, not do we have an interim radioactive waste repository for the temporary safe storage of these nuclear wastes for one hundred to two hundred years.
12. Japan cannot complete the decommissioning and removal of the radioactive cores of the crippled Fukushima nuclear power plants for at least 50 years, during which time radioactivity may continue to be emitted into the atmosphere, the soil, and the groundwater, while contaminated water will continue to flow into the Pacific Ocean.
13. Because nuclear power plants raise national security issues, governments try to hide the internal workings of these plants from public attention, including failures and episodes of mismanagement that could compromise public safety.
14. Since the medical effects of radiation exposure such as the appearance of thyroid disorders, cancers, leukemia, and damage to the gene pool will take several years or decades to become apparent, society will experience a gradually flowering crop of radiation-induced illnesses.
15. Exporting our nuclear power technology to developing countries can increase the risk of more uncontrolled nuclear disasters from this immature technology not only from accidental causes but as a result of conventional warfare or terrorist attack in politically unstable regions.
16. Every nuclear reactor also produces a man-made element called plutonium, which is the primary nuclear explosive material used in the world's arsenal of nuclear weapons, and which will remain available for tens of thousands of years after the last reactor has been shut down.

These nine truths are easily digested here, but operators, bureaucrats, and many journalists let them sit shrouded mystery for the past three years. Public worries are further compounded with no good solution to contain the radiation emanating from the crippled reactors and a still-unknown number of children affected by thyroid and other cancers, a number we will only see over the next five to ten years.

Coinciding with that period is the preparation for the Tokyo Summer Olympics. There are few events more prestigious to host. The Games are a huge investment of money and pride – Japan has budgeted more than $8 billion, and their international reputation depends on a smooth performance. The foremost concern for the IOC and Japan during the bidding process was safety: what impact will Fukushima and its radiation have on athletes and spectators? Japan satisfied the IOC's qualms. The IOC president Jacques Rogge said to Japan, "You have described yourself as a safe pair of hands." The information coming from

Fukushima should have led to a different conclusion. I hope this is more directly addressed through the debates as Tokyo elects a governor.

The best way to address Fukushima as a safety threat to the Olympic Games will be when the "safe hands" include those of Japan, the IOC, and international scientific and engineering experts. It will be this concerned consortium that will assess and confirm that everything that can be done to mitigate the threat from Fukushima has been identified and that appropriate and timely action has been taken. That will be the most respected Gold Medal of the games.

Five candidates will race to govern Tokyo and the city's 13.2 million inhabitants. The next governor of Tokyo will be in a once-in-a-century position to help Japan build new international relations and a new energy policy. The ideal candidate will have unique qualifications: long term perspective, first-rate diplomatic skills, a clear grasp of energy policy, and municipal experience. With this special skill set in mind, Mr. Morihiro Hosokawa, a former Prime Minister and former Governor of Kumamoto who entered the race earlier this week, stands a head above the rest.

I wish Tokyo a successful Olympic Games. The city's people can show they wish this as well by putting their confidence in a leader cut out to find opportunity in the crisis ahead.

Nukes in the (election) spotlight

January 16, 2014

Election spotlight on nuclear power

http://www.japantimes.co.jp/opinion/2014/01/16/editorials/election-spotlight-on-nuclear-power/#.UtkQ2rTrV1s

Whether Japan should rely on nuclear power generation will be a main theme in the Feb. 9 Tokyo gubernatorial election as a result of former Prime Minister Morihiro Hosokawa's announcement Tuesday that he will run in the election on a "zero nuclear" platform.

His entry will have a great impact on the gubernatorial race as he has secured the wholehearted support of former Prime Minister Junichiro Koizumi, who has renounced his earlier stance favoring nuclear power and now is a strong anti-nuclear advocate, causing embarrassment to Prime Minister Shinzo Abe and his Liberal Democratic Party. One issue that is likely to come back and haunt Hosokawa, however, is his

questionable borrowing of ¥100 million from Sagawa Express Co., which led to his resignation as prime minister in April 1994. He should give a full explanation.

Making a zero-nuclear goal the focus of policy debate in the gubernatorial election is both timely and welcome in view of the devastation that the meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant have caused and of the fact that Japan is a quake-prone country. Moreover, there is no established technology that will ensure safe storage of high-level radioactive waste from nuclear power plants for tens of thousands years.

Kenji Utsunomiya, a former head of the Japan Federation of Bar Associations, had already announced his candidacy focusing on abandoning nuclear power. However, Hosokawa's entry into the gubernatorial race will likely arouse more interest than Utsunomiya's candidacy in both the election and the nuclear issue, because Hosokawa, especially given Koizumi's backing, wields much greater political weight.

Although the election is a local one, it will give voters in Tokyo, which has the highest energy usage among Japan's prefectures — accounting for some 10 percent of Japan's total electricity consumption — a chance to express their views on Abe's energy policy. The Abe administration is pushing the restart of nuclear power plants — despite the ongoing struggle to contain the nuclear disaster in Fukushima — by overturning the Democratic Party of Japan government's policy of ending nuclear power generation by the end of the 2030s. The DPJ government's policy was based on nationwide deliberative polls. The Abe administration is trying to change the energy policy without taking any such step.

Tepco is effectively under the central government's control, but the Tokyo Metropolitan Government still owns a sizable stake in the power company. If an anti-nuclear candidate becomes Tokyo governor, he could use this position to put a brake on Tepco's attempt to restart its shuttered nuclear power plants.

More importantly, if Hosokawa becomes the top leader of Japan's capital with the backing of Koizumi, a former LDP prime minister who was a political mentor of Abe, it will have a strong impact on the Abe administration not only in the area of energy policy but also in an overall political context.

Whether Japan should abandon nuclear power or not will be a major election issue. Given the scope of the Fukushima nuclear crisis, the vulernability of nuclear power plants in this quake-prone country and the absence of technology to safely store high-level radioactive waste, clearly much is at stake regarding Japan's future.

Hosokawa said he feels a sense of crisis because the nuclear issue relates to the question of the state's very life and death. Koizumi said that the Tokyo gubernatorial election will be a contest between two

groups — a group that thinks Japan can advance without nuclear power and a group that does not think so.

Meanwhile, former health and welfare minister Yoichi Masuzoe, another candidate, said that he also has been calling for the abandonment of nuclear power since the Fukushima crisis but that he does not follow Koizumi's black and white thinking. He should present more details on his nuclear power policy.

While the nuclear issue is important, it is not the only pressing concern. Each candidate also must come up with policy proposals to deal with other important items such as bolstering Tokyo's quake resistance, improving social welfare, eradicating poverty and management of the 2020 Tokyo Olympics and Paralympics.

In short, each candidate must present voters with convincing policy proposals on a variety of issues.

Tokyo a model for energy-saving?

January 16, 2014
Hosokawa states determination to transform Tokyo into model city for saving energy
http://mainichi.jp/english/english/newsselect/news/20140116p2a00m0na015000c.html

Former Prime Minister Morihiro Hosokawa, who is set to run in the Feb. 9 Tokyo gubernatorial race on an anti-nuclear power platform, has said that if elected, he is determined to transform Tokyo into a model city for saving energy.

"I'd like to showcase Tokyo to the world as a model for saving energy," Hosokawa, 76, said in an exclusive interview with the Mainichi Shimbun in the capital on Jan. 15. "I'd like to create bases for renewable energy in Fukushima and other parts of the Tohoku region, and to supply power generated in these areas to Tokyo."

The former prime minister said with regard to the 2020 Summer Olympics, which are scheduled to be held in Tokyo, "I'd like to make sure that Tohoku will benefit from the Games. I thought of holding the marathon event there, but it turned out to be difficult. I'm now considering setting up a site there for soccer training and player dormitories."

Hosokawa criticized "Abenomics," the economic policy mix promoted by Prime Minister Shinzo Abe, for placing too much emphasis on economic growth -- citing the government's efforts to export nuclear plants.

Hosokawa also expressed concerns about the deadlock in Japan's diplomacy toward Asia. "I'd like to promote inter-city diplomacy," he said.

The former prime minister revealed that 88-year-old philosopher Takeshi Umehara had sent him a message encouraging him to run in the gubernatorial election, which he says helped him to affirm his candidacy.

Hosokawa said additionally that he will clarify suspicions surrounding a 100 million yen loan that he obtained from the Tokyo Sagawa Kyubin parcel delivery company, which forced him to step down as prime minister in 1994 after only nine months in office.

"I'll clearly express my view on the case, including the contents of the Diet deliberations that took place at the time (that the scandal surfaced)," he told the Mainichi Shimbun.

Hosokawa said that he is presently working out the details of his policy pledges, which he will announce at a news conference that he intends to hold on Jan. 20.

Vietnamese doubts about nukes ?

January 18, 2014

Nuclear safety concerns in Vietnam could delay Japanese project

http://ajw.asahi.com/article/asia/south_east_asia/AJ201401180056

THE ASAHI SHIMBUN

Growing safety concerns in Vietnam could affect the Abe administration’s strategy of making exports of nuclear energy technology a pillar of Japan’s economic growth strategy.

Vietnamese Prime Minister Nguyen Tan Dung indicated that construction of the country’s first nuclear plant scheduled to start this year could be delayed until 2020, the Vietnam newspaper Tuoi Tre reported.

At a Jan. 15 meeting, Dung instructed PetroVietnam to secure a sufficient supply of fuel for power generation to prepare for a possible delay in construction, according to the report.

"Building nuclear power plants will be done with the highest safety and efficiency, and the project will not go ahead unless standards are met," Dung reportedly said.

It was the first time Dung has mentioned the possibility of a delay.

The nuclear plant in question will be built at Phuoc Dinh in Ninh Thuan province in southern Vietnam. A Russian company was awarded the contract to build two reactors at the plant.

But a postponement in the project could affect plans for a second nuclear plant in Vinh Hai, also in Ninh Thuan province. A Japanese consortium of companies won a contract to build two reactors there.

"While we believe the latest move is directed at construction of the nuclear plant by Russia, we will continue to carefully monitor the situation for possible future effects," said an official with Japan's Ministry of Economy, Trade and Industry, which is promoting the export of nuclear technology.

Vietnamese officials have increasingly indicated a need to review the safety of nuclear technology since the 2011 accident at the Fukushima No. 1 nuclear power plant.

Nguyen Quan, the science and technology minister, has touched on the possibility of a delay in construction work because of nuclear safety concerns.

The plan by the Russian company calls for starting construction on the reactors this year and to begin operations in 2020 and 2021, respectively.

The project won by the Japanese consortium would have had a total construction cost of about 1 trillion yen ($9.6 billion), with the plant starting operations around 2020.

The Vietnamese government has placed priority on the first nuclear plant and has not decided on the type of reactor to be used for the second plant.

The Japanese consortium won the project in October 2010 through efforts made by the Democratic Party of Japan government led by Prime Minister Naoto Kan. Among the Japanese companies involved are Toshiba Corp., Mitsubishi Heavy Industries Ltd. and Hitachi Ltd.

Tokyo Electric Power Co., the operator of the Fukushima No. 1 plant, would also have been involved as plant operator.
An official with a Japanese company tried to put the best light on Dung's recent comment.

"The Fukushima accident had heightened concerns about nuclear safety, and since no decision had yet been made on the type of reactor, we felt there would likely be a delay in the start of operations," the official said.

The Japanese government is pushing exports of nuclear technology to such regions as the Middle East, Eastern Europe and Asia as a major element of its economic growth strategy. The government says that sharing the experience and lessons learned from the Fukushima nuclear accident will contribute to an improvement in global nuclear plant safety.

Last autumn, Prime Minister Shinzo Abe personally visited Turkey to gain a general agreement for the export of nuclear technology to that nation.

Toward the end of last year, Abe met with Dung when he visited Japan and confirmed their intention to cooperate in construction of the nuclear plant.

Michiko Yoshii, a professor at Mie University who is knowledgeable about the nuclear energy issue in Vietnam, said suspicions about nuclear safety in the country became much more deep-rooted after the Fukushima nuclear accident.
"The former head of the national nuclear energy research institute called for a 10-year delay in the construction plan from the standpoint of safety and the lack of human resources," she said. "Quan, the science minister, has also repeatedly said the development of human resources would not keep pace with the construction plans."

Yoshii said when she visited Vietnam last September, she was asked to give lectures and contribute a piece to a national newspaper about life in Japan after the Fukushima nuclear accident.

"The Vietnamese government likely could not ignore such opinions, and that may have led to the decision to delay construction," she said.

(This article was written by Manabu Sasaki in Hanoi and Yuriko Suzuki in Tokyo. Izumi Sakurai contributed to this article.)

Hosokawa to pledge immediate breakaway from nukes

January 18, 2014
Hosokawa to pledge 'immediate zero-nuclear' policy in Tokyo election

http://mainichi.jp/english/english/newsselect/news/20140118p2a00m0na013000c.html

Former Prime Minister Morihiro Hosokawa is poised to pledge an immediate breakaway from nuclear power as part of his election promises in the upcoming Tokyo gubernatorial race, it has been learned.

Hosokawa, 76, who earlier announced his intention to throw his hat into the ring for the Feb. 9 election, decided to make the pledge a main pillar of his campaign promises. He is planning to announce the decision at a press conference on Jan. 22.

By putting forward a policy to disallow the restart of idled reactors in Japan, Hosokawa aims to move in step with former Prime Minister Junichiro Koizumi, an anti-nuclear advocate who has expressed his support for Hosokawa. Hosokawa's move is also apparently aimed at distinguishing himself from other competitors, including former Health Minister Yoichi Masuzoe, 65.

According to sources in Hosokawa's camp, the policy goal of an immediate departure from nuclear power and measures for sustainable energy will top the handful of election promise "pillars" that Hosokawa is going to announce next week. He is also set to call for cultural promotion and disaster-resistant urban development.

When Hosokawa announced his planned candidacy in the Tokyo election on Jan. 14, he hadn't clarified how to proceed with a breakaway from nuclear power, while describing nuclear power as "an issue that has bearings on the survival of the country."

While rival candidate Masuzoe has also expressed his support for breaking away from nuclear power generation, he maintains that the decision to restart reactors should be left up to the Nuclear Regulation Authority and local governments hosting nuclear power stations.

"It will become a main campaign issue because there are candidates who advocate discontinuing nuclear power," a source close to Hosokawa who is formulating the former premier's campaign pledges said on Jan. 17.

Under the current legal system, however, governors of prefectures that do not host nuclear power stations do not have a say over whether to allow reactor restarts.

Kenji Utsunomiya, 67, another anti-nuclear candidate who formerly served as head of the Japan Federation of Bar Associations, has also spoken out against reactor restarts and nuclear plant exports. Public attention now turns to how Hosokawa will go about presenting specific measures toward an "immediate zero-nuclear policy."

Hosokawa: end of nukes by 2020

January 18, 2014

Double trouble: Ex-Prime Ministers Morihiro Hosokawa (left) and Junichiro Koizumi face reporters in Tokyo on Tuesday. | AFP-JIJI

Hosokawa eyes no nukes by 2020

Tokyo gubernatorial candidate, wielding Koizumi's clout, has LDP on defensive, probing for weaknesses

KYODO

Former Prime Minister Morihiro Hosokawa will pledge in his campaign for the Feb. 9 Tokyo gubernatorial election to set out a road map for Japan to break with nuclear power generation by 2020, according to a close aide.

"By making 2020 his target year, he will change Tokyo and Japan, with the focus on a complete end to nuclear energy," Shusei Tanaka, who was a special adviser to Hosokawa during his 1993-1994 prime ministership, said Friday in an interview.

With Tokyo slated to host the Olympics in 2020, Hosokawa, if elected, will "present (the road map) at the Olympics as an example" to the international community, Tanaka said.

Also in the event of a Hosokawa victory, "Japan will never be able to restart nuclear reactors," Tanaka said, adding, "No restart of reactors means 'zero' nuclear power generation."

Hosokawa's decision to run has made the outcome of the Tokyo gubernatorial race harder to predict, since he is backed by Junichiro Koizumi, who remains popular with voters more than seven years after leaving the prime minister's office.

The two former prime ministers were brought together by their common goal of phasing out nuclear energy, and Hosokawa is expected to be the main rival of former health minister Yoichi Masuzoe.

Hosokawa is slated to announce his candidacy and campaign pledges on Wednesday after postponing the press conference twice.

In the absence of strong contenders, the 65-year-old Masuzoe was expected to be able to cruise to victory when Prime Minister Shinzo Abe's Liberal Democratic Party pledged earlier this month to support him.

But the Hosokawa-Koizumi alliance changed the picture, prompting the LDP to go on the defensive. The ruling party is now reassessing the possibility of a Masuzoe victory amid persistent public distrust in the safety of nuclear power in Japan and the robust attention Koizumi always garners.

"Mr. Hosokawa is past tense, but we have to watch out for Mr. Koizumi, who is still very popular," said a senior LDP member in the Tokyo Metropolitan Assembly.

According to a source in the Hosokawa camp, he is also considering apologizing for the money scandal that ended his stint as prime minister in just nine months and explaining why he once opposed Japan hosting the 2020 Olympics.

In an interview in a book published by journalist Akira Ikegami last year, Hosokawa said Japan would be praised around the world if Prime Minister Shinzo Abe were to give up on Tokyo hosting the Olympics because of the problems at the Fukushima No. 1 nuclear plant.

As prime minister, Hosokawa formed a ruling bloc to end the LDP's 38-year rule in August 1993. But in 1994, he was found to have borrowed ¥100 million from a transport firm in September 1982, allegedly off-the-book funds, before he was elected as the governor of Kumamoto.

Hosokawa, 76, has been away from politics and making pottery since he quit the Lower House in May 1998.

Ahead of the Tokyo gubernatorial race, the LDP will have to go through another challenging local election in Okinawa. In Nago, an LDP-backed candidate has to upset incumbent Mayor Susumu Inamine, who is seeking a second four-year term and opposes the hosting of a new U.S. military base amid safety concerns.

The dominant party wants to avoid seeing LDP-backed candidates lose both Sunday's Nago mayoral election and the Tokyo gubernatorial election.

If that happens, opposition parties such as the Democratic Party of Japan will likely be able to step up pressure over pressing national issues when the Diet opens later this month.

Since Abe became prime minister for the second time in December 2012, the LDP-led government has moved toward restarting idled nuclear reactors and exporting the country's nuclear technology.

As the Hosokawa-Koizumi alliance is widely expected to put emphasis on their anti-nuclear agenda in the gubernatorial campaign, the LDP leadership is trying to weaken the pair's momentum by calling attention to other issues related to voters in Tokyo, such as the shortage of day-care centers and the rapidly aging population.

LDP executives including Secretary-General Shigeru Ishiba and Chief Cabinet Secretary Yoshihide Suga have asserted that energy policy is the realm of the central government, not the Tokyo Metropolitan Government.

Many voters, however, may cast ballots for anti-nuclear candidates because the man-made Fukushima disaster, triggered by the massive earthquake and tsunami on March 11, 2011, raised questions about the viability of Japan's future.

Naoto Kan of the DPJ, also a former prime minister, is urging Tokyo residents in his blog to concentrate on backing Hosokawa if they think Japan should phase out nuclear power, calling Hosokawa's run "a nightmare for the LDP."

"Japan has faced many problems, and the issue of nuclear power generation leads to the fate of this country," Hosokawa said after securing Koizumi's support.

In an apparent bid to foil Hosokawa's challenge, Suga posed a question about the way Hosokawa quit as prime minister in April 1994 after being in office for only about nine months.

"He resigned over a money scandal involving Sagawa Express Co. We'll see how Tokyo citizens take that," Suga said Tuesday.

Hosokawa to end Tokyo's dependence on nukes

January 22, 2014

Ex-prime minister finally announces policy pledges

Hosokawa to play Tokyo nuke card

http://www.japantimes.co.jp/news/2014/01/22/national/hosokawa-to-play-tokyo-nuke-card/#.UuAcPrTjJ1t

by Masaaki Kameda and Reiji Yoshida
Staff Writers

Morihiro Hosokawa pledged Wednesday he would try to end Tokyo's dependence on nuclear power as he finally made his candidacy for governor official just a day before campaigning officially starts.

The 76-year-old former prime minister said he would set up a strategic panel of experts to explore basic energy policies to abolish nuclear power.

"In order to realize a Tokyo that is not dependent on nuclear energy, I would prompt the public and private sectors to generate renewable energy as well as to ask for cooperation from the residents of Tokyo to conserve energy," Hosokawa told a news conference, finally revealing his election pledges after two delays.

He said he would like to set the year 2020, when Tokyo will host the Summer Olympics, as a target for creating a "new Tokyo and Japan." He acknowledged that he did not initially welcome the successful bid to bring the Olympics to Tokyo because resolution of the Fukushima nuclear crisis is not yet in sight.

He said as governor he would also address the capital's needs in disaster prevention, welfare and support for households raising children.

Other candidates also talked Wednesday about their election pledges.

Former health minister Yoichi Masuzoe, another of the leading candidates, appeared to back off from his earlier anti-nuclear stance by saying it is up to the Nuclear Regulation Authority and the central government to decide whether to restart the nation's idled reactors.

Earlier, Masuzoe said he advocated "datsu-genpatsu" (phasing out nuclear power) by saying all nuclear plants should eventually be mothballed.

The ruling Liberal Democratic Party, which urges reactor restarts once they clear the NRA's new safety tests, is giving semi-official support to Masuzoe, an apparent reason for toning down his stance.

At another news conference at the Japan National Press Club, candidate Kenji Utsunomia, a former chairman of the Japan Federation of Bar Associations, said he will not hold talks with Hosokawa to unify the anti-nuclear forces for the election.

Some anti-nuclear activists have urged Utsunomia, an opponent of nuclear power, not to run and thus avoid a split in the no-nukes vote

.

Utsunomiya pointed out that Hosokawa had not made public his campaign pledges yet, and he could not forgo his candidacy just because of his anti-nuclear policy.

“This is an abnormal gubernatorial election. Candidates have already decided to run, but we can’t have a policy debate yet,” Utsunomiya said.

Toshio Tamogami, a former chief of staff of the Air Self-Defense Force, said Wednesday he would use his crisis-management experience as a top military officer to improve Tokyo’s preparedness for a major disaste

Ex-PM Hosokawa set to pledge to turn Tokyo into world's most energy-efficient city

http://mainichi.jp/english/english/newsselect/news/20140122p2a00m0na003000c.html

Former Prime Minister Morihiro Hosokawa will pledge to press for "zero nuclear power" and try to make Tokyo the most energy-efficient city in the world in his campaign platform for the Feb. 9 Tokyo gubernatorial election, sources in his camp have revealed.

In his campaign platform due to be announced at a news conference on Jan. 22, Hosokawa, 76, will vow to set up a "Tokyo Energy Strategic Council" of experts to draw up a medium- to long-term road map for Tokyo's energy policy, the sources said.

After official campaigning for the Tokyo gubernatorial election kicks off on Jan. 23, Hosokawa will take to the streets every day to drum up voter support, as will former Prime Minister Junichiro Koizumi, 72, according to the sources.

The platform consists of five pillars: pursuing zero nuclear power; taking measures for disaster prevention and landscape protection; hosting a "simple" 2020 Tokyo Olympics; upgrading urban infrastructure; and creating an urban model that is child- and elderly-friendly.

As for nuclear power, Hosokawa says it "has a fatal flaw in that radioactive waste cannot be disposed of," and that "now is the only chance to make a political decision to stop the reactivation (of idled nuclear reactors)." He emphasizes that a shift in the energy policy will create new growth. Pledging not to give the central government a free hand over the power policy, Hosokawa says the Tokyo Metropolitan Government will tackle reforms in Tokyo Electric Power Co. (TEPCO) as a shareholder.

On the 2020 Tokyo Olympics, Hosokawa says Tokyo will take measures to promote culture and hold events jointly with cities in the Tohoku region in order to show the world how the disaster-hit region has been restored. He also proposes to host a simple Tokyo Olympics unique to Japan and set up a "Tokyo Volunteer Team" designed to spread Japanese-style hospitality known as "omotenashi" throughout the world. He says he will review over-the-top construction plans for Olympic facilities. As for disaster prevention, Hosokawa vows to press for a policy that values forces of nature and "risk communication" with citizens and create a "corridor of water and green" that doubles as a landscape preserver.

Meanwhile, former Japan Federation of Bar Associations President Kenji Utsunomiya, who plans to run in the Tokyo governor's race, released the details of his campaign platform at his campaign office in Tokyo's Shinjuku Ward on Jan. 21. Utsunomiya, 67, has pledged to make Tokyo the world's best place to work and live and enact ordinances to regulate so-called "black companies," or firms with poor labor practices, as

well as so-called "dappo houses," or small living quarters that skirt the law. He also vows to consider making medical treatment for people aged 75 and older free of charge and maintain subway fares at current levels even after the consumption tax is raised.

As for nuclear power, Utsunomiya stands against any move to reactivate nuclear reactors and vows to extend support for victims of the crisis at the Fukushima No. 1 Nuclear Power Plant. "While I have not had a chance to hold policy debates with other people who plan to run in the election, I made the effort to present my policies to make the election fruitful," he said.

"The path Tokyo should take in the election is clear"

January 20, 2014

Weighing the risks of nuclear power against a zero-nuclear society

http://mainichi.jp/english/english/perspectives/news/20140120p2a00m0na012000c.html

As the capital's gubernatorial election approaches, the elimination of nuclear power is not just one of many issues. It's a major point of contention that will determine Tokyo's future. Those who see it as a central issue aim to reform society and people's lifestyles, while those who consider it a mere side issue are trying to maintain the status quo. That's what the situation boils down to. It's certainly not a case of people who place emphasis on the elimination of nuclear power being simple-minded and those who don't attach much weight to the issue being balanced.

The race to elect a new governor on Feb. 9 is already under way. Former prime ministers Morihiro Hosokawa, 76, and Junichiro Koizumi, 72, have teamed up in a call for the elimination of nuclear power, but suspicions over money borrowed by Hosokawa in the past and his previous comment about giving up the Olympic Games have surfaced in line with his bid to be elected.

While Hosokawa's camp appears to show concern for issues, it also seems to be lacking in preparation. I would urge it to show some prudence. Don't go forming illicit alliances or turning to surprise moves in the pursuit of fleeting success. Have the backbone to choose a rational defeat over a muddy victory, and value the quality of debate in the election.

On Jan. 10, the state minister in charge of economic revitalization poked fun at Hosokawa during a news conference, suggesting he was going mad. His remark was no more than an early skirmish in the run-up to the election. But other comments he made during the news conference demand attention.

"All of Japan's nuclear power plants are now idle. We're discharging 10 billion yen of our national gains overseas each day (due to increased imports of fuel being used as a substitute for nuclear power). I think any politician who leaves this discharge unattended isn't putting enough effort into their job," he said.

I don't want to argue that the minister is wrong. What I do want to say is that his statement is no more than the expression of a political decision founded on a particular set of values. And such an argument is not something that those calling for the elimination of nuclear power will sit back and listen to without any objections.

It's a fact that imports of liquid natural gas (LNG) and other fuels are rising due to reliance on thermal power generation, and Japan's trade deficit is increasing as a result. But as our economics textbooks tell us, a trade deficit in and of itself does not equate to a "loss" or a "defeat." In the same way, a trade surplus is not a "gain" or a "win."

Beneath the trade deficit is the acquisition of goods corresponding to the amount spent. The government has boosted its purchases of LNG since the March 2011 disasters, to safeguard conveniences that were available prior to the disasters. This is simply the manifestation of a political decision recognizing that there is value in keeping the situation unchanged, and refusing to accept the risk of change.

Naturally, if the trade deficit continues without end, then debt will balloon to an enormous amount. The zero-nuclear camp wants to alter the quality of economic society before that happens, but those critical of a zero-nuclear policy won't listen to them; they take the optimistic view that it will be possible to control nuclear power plants, and search for ways to maintain the current situation, relying on nuclear power.

Those seeking the total elimination of nuclear power plants take a different approach. They say it is impossible to control nuclear plants, and have made the political judgment that it is necessary to introduce fundamental changes that will turn Japan into a society that does not rely on nuclear power.

Both sides face risks. Zero-nuclear proponents face the risk of reforms failing. Those critical of a zero-nuclear policy, meanwhile, face the risk of having national wealth stored up, only for it to be siphoned out of state coffers in the form of funds to cover another nuclear disaster should one occur -- an expense that could range anywhere from several trillion yen to tens of trillions of yen. At the heart of the upcoming Tokyo gubernatorial election is a choice between these two risks.

Last week, I went to Fukushima Prefecture with a group from the Japan National Press Club covering the Fukushima nuclear disaster, and we toured the Fukushima No. 1 Nuclear Power plant by bus. The airborne radiation level was as high as 600 microsieverts per hour near the plant's No. 3 reactor -- equal to 60 percent of the upper yearly limit for the general population (1,000 microsieverts). I felt that the cleanup was still a long way off from being completed.

The state of melted fuel inside the No. 1-3 reactors at the plant is still unknown, and I haven't been able to find any grounds to support the optimistic view that nuclear power plants can be controlled. I think the path that Tokyo should take in the election is clear. (By Takao Yamada, Expert Senior Writer)

Gobernatorial campaign kicks off

January 23, 2014

Tokyo governor race kicks off with nuclear energy issue looming large

http://ajw.asahi.com/article/behind_news/politics/AJ201401230070

THE ASAHI SHIMBUN

Campaigning kicked off Jan. 23 in the race for a new governor of Tokyo, a closely watched contest with the future of the nation's nuclear energy policy shaping up to be a key issue.

"At issue is whether we will abolish nuclear reactors and build a vibrant nation with renewable energy or will we hold on to nuclear reactors and have our country decline," Morihiro Hosokawa, a former prime minister, said outside the Tokyo metropolitan government building in Shinjuku Ward.

The 76-year-old Hosokawa devoted much of his speech to his key agenda of weaning Japan from nuclear power and turning the nation into a leader in renewable energy.

"I felt a strong sense of crisis about the government trying to restart nuclear reactors on grounds that they are essential for growth," Hosokawa said, standing next to Junichiro Koizumi, another former prime minister who has become staunchly anti-nuclear.

Speaking to drum up support for Hosokawa, Koizumi, 72, said, "The most important issue is what to do with the nuclear reactors."

Nuclear energy emerged as a major issue for the Feb. 9 election after Hosokawa announced his candidacy on Jan. 14. He decided to run after enlisting support from Koizumi, a vocal critic of the Abe administration's nuclear energy policy.

The nation's 50 nuclear reactors all remain offline for safety checks after the triple meltdown at the Fukushima No. 1 nuclear power plant triggered by the March 2011 Great East Japan Earthquake and tsunami.

Prime Minister Shinzo Abe is moving to restart the reactors once their safety has been confirmed by the Nuclear Regulation Authority, the watchdog set up after the Fukushima nuclear disaster.

Yoichi Masuzoe, 65, a candidate backed by the ruling Liberal Democratic Party and junior coalition partner New Komeito, did not touch on the nuclear energy issue during his speech outside JR Shinjuku Station, one of the capital's main rail hubs, on Jan. 23.

He has said that Japan must reduce its dependence on nuclear energy over the long term, but cannot dispense with it immediately.

Masuzoe started his campaign by emphasizing that the capital will host a successful Summer Olympics in 2020.
"Some things cannot be done even in 10 years, but we can advance them in six years if we work for the Olympics," he said, standing with chiefs of the Tokyo chapters of the LDP and New Komeito.

Masuzoe, who served as welfare minister for two years, pledged to transform Tokyo into a city with the most advanced welfare services in the world.

According to sources, a survey conducted by the LDP showed that Masuzoe has been extending his comfortable lead over Hosokawa.

"Hosokawa's initial momentum has been losing steam," said a senior administration official. "We do not have any concern."

Lawyer Kenji Utsunomiya, endorsed by the Japanese Communist Party and the Social Democratic Party, is another outright opponent to nuclear energy in the governor's race.

"Let's make a stride toward a nuclear-free society from Tokyo," the 67-year-old said at a different entry and exit point to JR Shinjuku Station on Jan. 23.

"Tokyo was the largest user of electricity generated at the Fukushima plant," he said. "The Tokyo metropolitan government is also a major shareholder of (plant operator) Tokyo Electric Power Co."

Utsunomiya, former president of the Japan Federation of Bar Associations, also stressed the need to narrow wealth gaps and expand welfare services.

"Tokyo will be turned into the easiest place to live in for everyone--the elderly and the young, men and women, and those with disabilities," he said.

Citizens groups working for a nuclear-free Japan had tried to persuade either Utsunomiya or Hosokawa to drop out of the race, fearing the anti-nuclear vote would be split.

But their efforts failed partly because Utsunomiya called for a public debate with Hosokawa. The Hosokawa camp also declined support from any organization, even though the Democratic Party of Japan, the People's Life Party and the Unity Party, all part of the opposition bloc, are backing Hosokawa on their own volition.

Other contenders include Toshio Tamogami, 65, a former chief of staff of the Air Self-Defense Force, Kazuma Ieiri, 35, an executive of an Internet-related company, and inventor "Doctor" Nakamatsu, 85.

Tamogami, who has the support of former Tokyo Governor Shintaro Ishihara, co-head of the Japan Restoration Party, has said Japan can continue to use nuclear power by addressing safety concerns.

Ieiri supports lowering Japan's reliance on atomic energy, while Nakamatsu is calling for the development of new energy sources.

In addition to the issues of nuclear energy, the Tokyo Olympics and social welfare, the candidates will discuss improving disaster preparedness and enhancing education during the 17-day campaign.

Hosokawa touches on nuclear power, past problems ahead of Tokyo gubernatorial race

http://mainichi.jp/english/english/newsselect/news/20140123p2a00m0na012000c.html

Former Prime Minister Morihiro Hosokawa announced on Jan. 22 his intention to wage a "historic" battle to be elected governor of Tokyo, stating that the focal point of the election was the elimination of nuclear power.

Hosokawa made the remarks in a packed news conference at the Tokyo Metropolitan Government headquarters a day ahead of the commencement of campaigning for the Feb. 9 election. Roughly 200 reporters attended, and some were unable to squeeze into the conference room. Hosokawa, who said it was the first time in a long time for him to wear a tie, was hit by a barrage of camera flashes as he sat down for the conference.

The former prime minister said the risk of another major nuclear accident prompted him to make the elimination of nuclear power a focal point in his election bid.

"This is something that is related to the lives and finances of Tokyo residents," he said. He added that if there were any requests Tokyo needed to make regarding the state of the central government, he would make them.

Referring to comments during his term as prime minister that Japan needed to "advance the use of nuclear power," he said, "I was told that it was green and safe, and I swallowed that explanation. I'm ashamed of my lack of insight."

Speaking on his reasons for turning against nuclear power, Hosokawa said a documentary on a radioactive leak in Britain and a film released in 2006 on the Rokkasho Nuclear Fuel Reprocessing Facility in Aomori Prefecture had enlightened him on the issue. He said the March 2011 earthquake and tsunami that triggered a disaster at the Fukushima No. 1 Nuclear Power Plant was a decisive turning point for him.

He said that if Japan didn't hammer out a zero-nuclear policy now, it would probably not be able to avoid reliance on nuclear power for the next 50 or 100 years. He said that he was determined to stand with the people who believed that Japan could develop without nuclear power.

Hosokawa brought along documents relating to his borrowing of 100 million yen from Tokyo Sagawa Kyubin -- an incident that triggered his resignation as prime minister. He said the documents were based on Diet records and other information.

"I provided a sincere explanation before the Diet, but I couldn't get the opposition parties to understand me," Hosokawa recounted, casting his eyes on the documents several times. "I spent 10 years paying back the full amount," he added. "There hasn't been a day over the last 20 years in which the thought that I let everyone down has left my mind." He did not provide any new documents relating to his borrowing or return of the money.

Referring to a statement made during an interview for a book that was published last year that could be taken as a suggestion that Tokyo should have bowed out of hosting the 2020 Olympic Games, Hosokawa said he had rethought his position. He said he wondered if the disaster-hit Tohoku region could play some role in the games.

When questioned why he had taken some time to hold a news conference after announcing his candidacy in the gubernatorial election, he said, "One week has passed since I declared my intention to run. I can't say anything careless about nuclear power, and I had to work through the details." Accordingly, he said any criticism that he had wanted to make a move after other candidates had made theirs was unwarranted.

Touching on a Cabinet member's jibe that he was out of his mind, he drew laughs by commenting, "You couldn't turn up at a place like this unless you were out of your mind."

At first a joint news conference for candidates in the gubernatorial race had been planned at the Japan National Press Club on Dec. 22, but Hosokawa announced he would be absent so the conference ended up as a series of interviews with each candidate, leaving little room for debate.

Another candidate in the race, Toshio Tamogami, questioned the lack of debate, saying, "It's the mission of candidates to provide Tokyo residents with information on the election through policy debate. Is the sort of election that resembles a popularity vote really all right?"

Fellow candidate Yoichi Masuzoe, said that he had not compiled a list of policies because the election was being held suddenly and he had simply not had enough time. At the same time he said, "It would have been better to have more debate with everyone gathered together."

Candidates in Tokyo gubernatorial race differ sharply over nuclear policy
http://mainichi.jp/english/english/newsselect/news/20140123p2a00m0na008000c.html

Major candidates running in the Feb. 9 Tokyo gubernatorial election are taking quite different approaches to the country's nuclear energy policy -- the biggest campaign issue that could affect the future of the Japanese capital and the entire nation.

Official campaigning kicked off on Jan. 23. Four people who planned to run in the election -- former Prime Minister Morihiro Hosokawa, 76, former Health Minister Yoichi Masuzoe, 65, former Air Self-Defense Force Chief of Staff Toshio Tamogami, 65, and former Japan Federation of Bar Associations President Kenji Utsunomiya, 67 -- presented their views on nuclear power at news conferences on Jan. 22.

Utsunomiya and Hosokawa both called for an immediate breakaway from nuclear power, but Utsunomiya said, "The most important thing is whether to make Tokyo the best place to work and live." Hosokawa, on the other hand, differentiated himself from Utsunomiya by saying that he would place top priority on efforts to carry out a zero nuclear policy. Masuzoe said he would pursue a policy of reducing the country's dependence on nuclear power on a long-term basis. Tamogami distanced himself from all of the other three candidates over nuclear power and expressed his intention to accept nuclear power.

Utsunomiya, Tamogami and Masuzoe attended separate news conferences hosted by the Japan National Press Club, while Hosokawa held a news conference at the Tokyo Metropolitan Government building and formally announced his candidacy for the election.

Hosokawa said, "If an accident occurs at the Kashiwazaki-Kariwa Nuclear Power Plant (in Niigata Prefecture), for example, the citizens of Tokyo will suffer catastrophic damage. It is indisputable that the nuclear power issue is the most important theme." He concentrated his efforts on explaining the significance of promoting energy-saving and renewable energy. He said he would set up a "Tokyo Energy Strategic Council" of experts to discuss Tokyo's energy policy in order to realize a breakaway from nuclear power. He then said that one of the options would be to hold a local referendum in Tokyo over whether to pursue an immediate breakaway from nuclear power ahead of next year's unified local elections.

Utsunomiya also emphasized the significance of Tokyo pressing for a zero nuclear policy, saying, "If Tokyo takes a step, it will greatly affect the country." He said he would urge the central government to refrain from reactivating idled nuclear reactors and exporting nuclear facilities and technology. He also said his Tokyo government, if elected, would propose Tokyo Electric Power Co. (TEPCO) decommission the Kashiwazaki-Kariwa Nuclear Power Plant as a major shareholder. But he did not treat the nuclear issue as a top policy priority.

On the evening of Jan. 21, he revealed that he had been asked by those who wanted to see only one anti-nuclear candidate running in the election to withdraw his bid to succeed Naoki Inose, who stepped down as Tokyo governor over a money scandal. But Utsunomiya said he had turned down the request.

Masuzoe, who showed his stance to break away from nuclear power on a long-term basis, said, "If we are to eliminate nuclear power immediately, what will be the alternatives?" He said that whether the country can reduce its dependence on nuclear power hinges on the advancement of technological innovation. On the issue of whether to reactivate idled nuclear reactors, Masuzoe said, "Experts with the Nuclear Regulation Authority will decide and the central government will then make decisions from there on."

Meanwhile, Tamogami said there was nothing wrong with reactivating idled nuclear reactors, saying, "We will be able to use nuclear power plants while fully ensuring their safety." He denounced views that nuclear power is dangerous as "unscientific." On the fact that Tokyo is consuming massive amounts of electricity produced outside the capital, he said, "Tokyo can make contributions to local regions as profits generated in Tokyo, the center of economic activities, reach out to rural regions."

As of Jan. 22, there were 10,820,567 eligible voters in Tokyo -- the largest number in the history of Tokyo gubernatorial elections. Voters will go to the polls on Feb. 9 and vote counting will start immediately after polling stations are closed on the same day.

January 22, 2014

Hosokawa to call for nuclear-free Japan in Tokyo governor race

http://ajw.asahi.com/article/behind_news/politics/AJ201401220060

By SACHIKO MIWA/ Staff Writer

Former Prime Minister Morihiro Hosokawa announced that a departure from nuclear energy will be a major part of his campaign promises for the Tokyo gubernatorial election a day before official campaigning gets under way on Jan. 23.

“I decided to run because I received a strong message from former Prime Minister (Junichiro) Koizumi, my ally in our efforts to abandon nuclear power, that I should perform my last public service,” Hosokawa, 76, said at a news conference at the Tokyo Metropolitan Government building in Shinjuku Ward.

Hosokawa led a short-lived eight-party coalition government that ended 38 years of Liberal Democratic Party rule in 1993. He resigned after eight months as prime minister and retired from politics in 1998, before returning to run in the Feb. 9 Tokyo gubernatorial poll.

Hosokawa said his entry into the race was also spurred by the nation’s political situation.

“I am alarmed by the direction Japan is heading and the manner it is proceeding on issues such as the Constitution, national security and relations with neighboring countries,” he said.

Sources in Hosokawa's camp said he will call for blocking restarts of Japan's idled nuclear reactors. Currently, Japan is effectively nuclear-free as none of the nation's 48 reactors are online.

The Abe administration is pushing to restart idle reactors after their safety is confirmed by the Nuclear Regulation Authority. Hosokawa, who opposes Prime Minister Shinzo Abe's stance on the nuclear issue, has co-opted some policy lines championed by Koizumi, a popular LDP prime minister from 2001 to 2006, who has come out publicly in support of Hosokawa.

The 72-year-old Koizumi, widely seen as Abe's mentor, now is openly at odds with his former protege over the nuclear issue. Hosokawa will stand side by side with Koizumi when he makes his first campaign speech Jan. 23, the sources said.

The call for doing away with nuclear energy tops the list of five items in Hosokawa's campaign promises. "Now is the time for making a political decision to stop reactor restarts," the pledge says.

It also promises to turn Tokyo into "the world's leading energy-saving city" by introducing pioneering measures to help achieve Tokyo's existing goal of having renewable energy sources account for 20 percent of all its energy supply by 2020.

Hosokawa will also pledge to set up a panel of experts to help realize Tokyo's original energy policy, and to take aggressive action to enhance the transparency of Tokyo Electric Power Co.'s management and optimize the utility's electricity rates.

The Tokyo metropolitan government is the fourth-largest shareholder in TEPCO, operator of the Fukushima No. 1 nuclear power plant, which suffered meltdowns after the March 2011 Great East Japan Earthquake and tsunami.

The campaign promises also include a review of plans for venues and facilities for the 2020 Summer Olympics in Tokyo, which have been criticized as being too grandiose and costly.

"I will design an Olympic Games that embraces the natural world with Japan's iconic simplicity and elegance instead of flaunting gaudy facilities," the pledge says. Hosokawa's platform also calls for jointly planning Olympic events with communities in northeastern Japan that were affected by the 2011 disaster.

Can't ignore nukes

January 23, 2014

Can’t bury the nuclear issue

http://www.japantimes.co.jp/opinion/2014/01/23/editorials/cant-bury-the-nuclear-issue/#.UuJh87Qo-aQ

Campaigning kicked off on Thursday for the Feb. 9 Tokyo gubernatorial election, which will not only decide the leader of the nation’s capital but also influence the debate on whether Japan should continue to rely on nuclear power — a major issue that will help determine the shape of Japan’s future.

The nuclear issue has assumed great importance because former Prime Minister Morihiro Hosokawa has entered the race with the backing of former Prime Minister Junichiro Koizumi and is running on a “zero nuclear” platform — a stance shared by Koizumi. Both Hosokawa and fellow candidate Kenji Utsunomiya, a former head of the Japan Federation of Bar Associations, are calling for the immediate halt of nuclear power generation. They oppose the Abe administration’s plan to restart idled nuclear power plants if their safety is confirmed by the Nuclear Regulation Authority.

Candidate Yoichi Masuzoe,a former health and welfare minister, calls for ending Japan’s reliance on nuclear power over the long term while another candidate, former ASDF Gen. Toshio Tamogami, favors the continued use of nuclear power.

Some people, in particular Prime Minister Shinzo Abe, oppose the idea of treating nuclear power as a major issue in the Tokyo gubernatorial election. In an apparent effort to prevent the nuclear power issue from rousing wide interest among Tokyo voters, Abe said energy policy is an issue not just for Tokyoites but for all Japanese, adding that various issues that the Tokyo governor must deal with should be discussed in a balanced manner.

Yet Tokyo, which consumes about 10 percent of Japan's total electricity, is the biggest power user among Japan's 47 prefectures. And it must not be forgotten that the Fukushima nuclear disaster happened as a result of the central government's long-standing policy of promoting nuclear power generation without taking sufficient steps to ensure that these plants were managed in a proper manner by both the government and the power companies.

To say that nuclear power should not be an issue in the Tokyo gubernatorial election is ludicrous as the question of what to do about nuclear power affects everyone in this small, quake-prone country — including the tens of millions of people living and working in the nation's capital. Discussions of technological, environmental and ethical problems related to the nation's need to permanently store high-level radioactive waste from nuclear power plants and what kind of society Japan should evolve into should be embraced rather than avoided. But Abe is eager to avoid such discussions because he is keen to continue doing "business as usual" in the area of energy policy.

Apparently in view of the devastation caused by the Fukushima nuclear crisis, Hosokawa said he feels a sense of crisis because the nuclear issue relates to the question of the state's very life and death. Koizumi said the Tokyo gubernatorial election will be a contest between two groups — a group that thinks Japan can advance without nuclear power and a group that does not think so. Their statements are anything but trivial.

The Tokyo Metropolitan Government can do quite a few things in the field of energy, such as making serious efforts to save power, promote green energy and using waste heat to generate electricity. Through such efforts it should strive to present an urban model that greatly reduces or ends reliance on electricity generated by nuclear power plants. This would not doubt impact the policies of other local governments as well as the central government.

It is true that Tokyo faces many problems, and the credibility of the candidates advocating a zero-nuclear policy will also depend on whether they can also present viable proposals on issues such as improvements in social welfare, bolstering preparedness against a large earthquake expected to strike in the not-too-distant future, job creation and eradication of poverty, and astute management of the 2020 Olympics and Paralympics. Let the debates begin.

Energy plan revision

January 24, 2014
Gov't to alter description of nuclear power in basic energy policy plan
http://mainichi.jp/english/english/newsselect/news/20140124p2a00m0na012000c.html

The government is set to change the description of nuclear power in the draft of its basic plan on energy, it has emerged.

The draft currently describes nuclear power as an "important base power source that serves as the foundation" for energy.

"We'd like to come up with an appropriate description while considering opinions within the ruling coalition," Economy, Trade and Industry Minister Toshimitsu Motegi told a news conference on Jan. 24.

Motogi denied that the government will change the phrase, "base power," meaning electricity that is constantly generated and consumed.

"Base power refers to electricity that is constantly used, even if it accounts for only 1 percent of power consumed in the country," Motegi said.

However, the minister added, "If such a description gives the public the impression that it corresponds to a large amount or high priority, we'd like to consider changing the wording according to context."

In December last year, an advisory panel to the Ministry of Economy, Trade and Industry drafted a basic plan on energy calling for a departure from the policy of ending Japan's reliance on nuclear power under the previous government led by the Democratic Party of Japan.

However, some ruling coalition members have voiced concerns that the draft could give the public the impression that the government intends to revive its policy of promoting atomic power.

The government will make a final decision on the description of atomic power in its basic plan on energy after the Tokyo gubernatorial race, in which the pros and cons of restarting nuclear plants is a major point of contention.

Energy plan revision eyed to avoid nuclear reliance 'misunderstandings'

http://www.japantimes.co.jp/news/2014/01/24/business/energy-plan-revision-eyed-to-avoid-nuclear-reliance-misunderstandings/#.UuJhD7Qo-aQ

Kyodo

The Abe administration will consider revising a draft energy policy so it doesn't stir "misunderstandings" that the nation will rely heavily on nuclear power in the medium to long term, industry minister Toshimitsu Motegi said Friday.

The draft says nuclear power is an "important base-load power source," but Motegi said "base-load power" refers to an electric source that is used continuously regardless of how much power it supplies.

"I do not intend to change the term 'base-load power.' But if it is perceived as an electricity source used for an extremely large amount . . . I will consider changing the context," he told a news conference.

The administration is in the final stage of deciding the Basic Energy Plan, which will be the first of its kind since the Fukushima nuclear disaster started in 2011, having already solicited opinions from the public.

The plan also says Japan will seek to reduce nuclear dependence as much as possible, but this has stirred controversy among ruling party lawmakers who see it as still taking too strong a pro-nuclear tone.

Nuclear policy has become one of the key issues in the Tokyo gubernatorial campaign that kicked off Thursday, with former Prime Minister Morihiro Hosokawa tying up with fellow former Prime Minister Junichiro Koizumi in calling for an end to nuclear power.

The administration is apparently wary the high-profile effort will provoke anti-nuclear sentiment still lingering from the Fukushima debacle

Nukes not the only issue

Other issues getting overlooked
Tokyo voters unhappy with nuclear focus
http://www.japantimes.co.jp/news/2014/01/23/national/tokyo-voters-unhappy-with-nuclear-focus/#.UuJgibQo-aQ

by Atsushi Kodera**,** Magdalena Osumi**, and** Tomohiro Osaki
Staff Writers

As campaigning for the Tokyo gubernatorial race got under way Thursday, just a little more than a month since Naoki Inose resigned over a money scandal, voters expressed bewilderment over how fast the focus seems to have turned to nuclear energy.

A 50-year-old construction company employee from Itabashi Ward said he was disappointed.
"It's completely wrong (for nuclear power to become a key issue)," he said. "I think the (2020 Tokyo) Olympics is a big subject. Inose's resignation came so unexpectedly it has clouded what the real issues are."

The man, who did not want his name used, added that none of the 16 candidates has earned his vote yet in the Feb. 9 race.

According to pre-campaign polls conducted by media organizations, the strongest contenders are former health minister Yoichi Masuzoe and former Prime Minister Morihiro Hosokawa, followed by lawyer Kenji Utsunomiya and nationalist Toshio Tamogami.

Hosokawa, after spending the last 15 years away from politics, has enlisted support from another former prime minister, Junichiro Koizumi, to push his anti-nuclear agenda.

The Hosokawa-Koizumi duo has quickly become a favorite among those who consider nuclear power the most important issue.

But Yoshitaka Shimoda, a 20-year-old university student, said his vote will go to Masuzoe.
While admitting that none of Masuzoe's pledges resonate with him, Shimoda said he finds the former health minister the most affable candidate, citing his telegenic smile.

"Plus he's the only one (of the candidates) I can recognize by name," he said.

Meanwhile, foreign residents expressed what they want the next Tokyo leader to do.

Pole Piotr Grzywacz, 38, who works for a major U.S. company specializing in Internet-related services, said his natural interest in politics has weakened somewhat, influenced by what he described as Japan's general political apathy.

Grzywacz said that during his 13 years in Japan he hasn't noticed any major changes in his daily life despite many changes on the political stage.

He added, however, that the tourism infrastructure in Tokyo should be made more convenient for foreigners, especially those who can't speak Japanese.

While refraining from commenting about the candidates, 36-year-old German Stephan Matthiesen said he expects some changes in economic policies.

"The economy is growing now," said Matthiesen, a financial controller at a firm in Tokyo. "The question is how you can stimulate the domestic economy sustainably, and deregulating and opening the country more towards foreign investors is one of the key issues."

Asked his opinion about nuclear energy, Matthiesen said that the country is not ready to build the infrastructure for a grid in which nuclear power plays no role.

"You need to build the whole infrastructure and you can't do it over one night. It takes a couple of decades," he said.

Besides nuclear energy and the Olympics, preparing for a major earthquake and child-rearing support have climbed to the top of the election agenda.

Candidates are also expected to be scrutinized for corruption because of Inose's resignation.

But Japan's strained relations with South Korea and China appear to have strengthened support for Tamogami, a nationalist whose platform features building disaster preparedness through use of the Self-Defense Forces.

Tamogami is said to enjoy strong support from the Internet crowd in particular, making him a wild card in the race.

A 24-year-old university student who came to listen to Tamogami deliver a speech Thursday morning in front of Shibuya Station expressed support to the nationalist candidate.

The student, who only gave his family name, Miura, said he supports Tamogami because he finds the former top Air Self-Defense Force officer most ideologically consistent and agrees with his hawkish stance.

Miura, a self-acknowledged frequent Internet user, also said he supports Prime Minister Shinzo Abe.

Editorial: Tokyo election a chance to tackle national problems

http://mainichi.jp/english/english/perspectives/news/20140123p2a00m0na010000c.html

The battle for the Tokyo governor's chair officially began on Jan. 23, and it's shaping up to be a fierce fight among first-time gubernatorial candidates.

The Feb. 9 poll will also be to choose the face of the capital that will host the 2020 Summer Olympics. However, the candidates will lock horns over a whole raft of serious issues, such as atomic power policy in the post-Fukushima nuclear disaster era, the quickly aging Tokyo metropolitan population, and disaster prevention. In other words, the election will be fought over issues of national importance, and will address not just the state of Tokyo but the state of Japan.

On Jan. 22, the day before the start of the campaign, 76-year-old former Prime Minister Morihiro Hosokawa officially announced his candidacy. He joined a slate that already included former Health Minister Yoichi Masuzoe, 65, former Japan Federation of Bar Associations President Kenji Utsunomiya, 67, former Air Self-Defense Force Chief of Staff Toshio Tamogami, 65, and inventor Doctor Nakamatsu, 85.

All the major candidates are running as independents. However, the Tokyo branches of the Liberal Democratic Party (LDP) and New Komeito are endorsing Masuzoe, and the Democratic Party of Japan (DPJ), Unity Party, and People's Life Party are effectively backing Hosokawa. The Japanese Communist Party (JCP) and Social Democratic Party (SDP) have endorsed Utsunomiya, while Tamogami has the support of Japan Restoration Party (JRP) co-leader and former Tokyo Gov. Shintaro Ishihara. It's notable that, as has been the case for the past several Tokyo gubernatorial elections, the major parties were unable to take the lead in finding candidates to back.

Due in great part to the candidacy of Hosokawa and his high-profile backer, former Prime Minister Junichiro Koizumi, the election battle this time around will almost certainly be fought over nuclear energy policy.

Hosokawa has declared that he will not accept the restart of any nuclear reactors in Japan. He has also pledged to make Tokyo the top city in terms of energy conservation and the adoption of renewables, blazing a path for growth that does not depend on nuclear power. Of Fukushima No. 1 nuclear plant operator Tokyo Electric Power Co. (TEPCO), in which the Tokyo Metropolitan Government owns stock, Hosokawa demanded transparent management and reasonable electricity charges.

The Great East Japan Earthquake of March 2011, which knocked out many power stations in a system that had become increasingly concentrated in just a few rural locations, laid bare the fragility of Tokyo's electricity supply. As such, it would be strange for the local government to leave energy policy entirely up to the central government.

Going cold turkey on atomic power, however, would at least in the short term leave Tokyo, and Japan as a whole, dependent on fossil fuels for energy, and very likely push up electricity prices. It would also be necessary to consider ways for Tokyo to help promote the economic livelihood of the local governments forced to watch as nuclear plants in their jurisdictions -- major sources of funds and employment -- were shut down for good.

Hosokawa says that, if elected governor, he'll establish an expert committee to propose concrete policy measures. If, however, he is to emphasize a breakaway from nuclear power as the most important point at issue, those concrete policy measures must be debated during the campaign so that we the voters can pass judgment on them. We also need to hear a convincing explanation from Hosokawa about the 100 million yen loan from courier company Sagawa Express Co. that triggered his resignation as prime minister back in 1994.

Utsunomiya is also running on a zero-nuclear power platform, while Masuzoe has emphasized the need to break Japan's dependence on atomic energy. Masuzoe, however, has the support of Rengo Tokyo, a labor union that has the Federation of Electric Power Related Industry Worker's Unions of Japan under its umbrella -- in other words, power company workers. The Cabinet of Prime Minister Shinzo Abe, leader of the LDP, is moving toward reactor restarts, so Masuzoe must explain exactly what route he plans to take as Tokyo governor.

Former air defense chief Tamogami, on the other hand, approves of atomic energy. What, though, does he think about how to dispose of highly radioactive nuclear waste? Whether or not nuclear power ends in Japan, as the country's greatest consumer of electricity, Tokyo must take some responsibility for energy policy.

However, the Tokyo election also must not be fought solely over nuclear power. While the Olympic mood may be in the air in the capital, Tokyo has serious problems to contend with.

Two especially pressing issues are how Tokyo will deal with its quickly aging population, and the need to set up anti-disaster policies in preparation for a possible powerful earthquake right under the city.

Five years after the Olympics has left town, it's estimated that the number of people in metro Tokyo aged 75 and over will reach around 2 million. The metropolis is, in other words, a microcosm for the sudden aging that will hit all of Japan's major cities.

In 2020, when the Olympic party comes to Tokyo, the city's population will just have begun to decline. It's estimated that there will be 3 million fewer Tokyoites in 2060 than there are now, and there are already wards in the capital with waiting lists a thousand names long for places at intensive-care homes for the

elderly. The problem is made more acute by the honestly weak bonds among Tokyo residents. So how will the city create an effective medical, nursing care and social welfare system?

In the disaster-prevention realm, the metro government must learn from major earthquake measures of other areas of Japan and present a concrete plan to establish "damage reduction" policies in cooperation with local residents. The problems that face Japan as a whole are distilled in Tokyo, so Tokyo should present plans that can be models for the rest of Japan.

Of course, how Tokyo will host its second Olympics will also come up for debate in the campaign, and not just the tremendous cost of the new National Stadium. Compared with the 1964 Summer Games, which were the symbolic embodiment of Japan's economic re-emergence, the 2020 Games will be much more about the vision for Tokyo's future, including issues like environmental conservation, the distribution of public works, transportation network maintenance, and the potential lifting of the city's ban on casinos.

The Tokyo gubernatorial election has often vividly reflected changes in Japanese society and politics. The 1995 election of independent Yukio Aoshima to the post signaled a sudden shift away from mainline party-sponsored candidates, while it could be said that the long run of former Gov. Ishihara presaged the Japanese conservative resurgence that brought Shinzo Abe back to power.

We are bothered by how late the debate on policy has begun in the current election. With Hosokawa waiting until the day before the campaign's start to formally announce his candidacy and his policies, no public debate or news conference with all the candidates was possible before the contest officially began.

Metro Tokyo's population now stands at 13.29 million, its GDP roughly equivalent to that of the Netherlands. The governor of Tokyo is the face of Japan. The battles over nuclear power, social welfare and disaster preparedness that will play out in the gubernatorial election race will work to push us to consider the state of Japan as a whole after such an accelerating centralization in Tokyo.

As such, the election has the significance of questioning the way the capital should stand ahead of the 2020 Olympics. Utilizing Internet campaigning and other means will help ignite the belated start of real debate. We sincerely hope that this election becomes a chance for not just the voters of Tokyo but also the whole nation to consider the present and future of this country.

"An incredible opportunity for Japan"

January 23, 2014

Nuclear energy fight highlights aging economy

http://www.japantimes.co.jp/opinion/2014/01/23/commentary/nuclear-energy-fight-highlights-aging-economy/#.UuJhtbQo-aQ

by William Pesek
Bloomberg

Even mayoral elections often have the biggest repercussions. Japanese Prime Minister Shinzo Abe might want to ponder that as he considers what went wrong in Nago, Okinawa (population 62,000).

Abe's Liberal Democratic Party failed to dislodge incumbent Mayor Susumu Inamine in Sunday's contest, putting Japan-U.S. relations at risk. Inamine has pledged to block the relocation of a U.S. air base to his district, something that Abe had assured Washington was a done deal.

Apparently not.

The question now is what the LDP's setback in Nago says about the Feb. 9 gubernatorial election in Tokyo, one that could topple a central pillar of Abe's economic program.

Morihiro Hosokawa, prime minister from 1993 to 1994, is running for Tokyo governor, arguably the second-most influential job in Japan. The LDP's knives are out for him: Shintaro Ishihara, Tokyo's popular governor from 1999 to 2012, has flatly declared Hosokawa isn't qualified for the job.

The establishment's real gripe with Hosokawa has less to do with his credentials than his policies, which threaten Japan's nuclear-industrial complex — the LDP's political base. This "nuclear village" is at the root of the cronyism, corruption and inertia that continue to prolong Japan's malaise and dent its competitiveness.

Abe's surrogates are trying to paint Hosokawa as some kind of crazed Japanese Che Guevara who would drag the nation backward with his green policies.

But in Hosokawa's corner stands none other than Junichiro Koizumi, Abe's political mentor and the nation's most celebrated economic reformer in decades — hardly a Marxist.

In all the excitement over Abenomics and Tokyo hosting the 2020 Olympics, it's easy to forget the nuclear-disaster zone 215 km away. Radiation has been leaking from the crippled reactors at Fukushima for going on three years now, and nuclear sludge is contaminating groundwater and the Pacific Ocean.

How much?

We don't know. The hapless Tokyo Electric Power Co., which owns the power plant, has consistently hedged the truth about the disaster, enabled by the government. Abe's new national secrets bill ensures we will know even less.

Hosokawa and Koizumi are doing Japanese a favor by highlighting the crisis. If the March 2011 earthquake that damaged Fukushima demonstrated anything, it's that Japan's 54 reactors have no place in such a seismically active nation.

The tragedy also helped expose the nuclear village — a network of power companies, regulators, bureaucrats and researchers that holds great sway over Japanese elections and media.

Just like Hosokawa, the two prime ministers prior to Abe, Yoshihiko Noda and Naoto Kan, hail from the Democratic Party of Japan and sought to rein in this pro-nuke cabal. Noda, for example, pledged to phase out nuclear power by 2040. When the LDP returned to power in December 2012, Abe's first act was to scrap that plan.

Why? It's the easy road. Revitalizing a bloated, aging economy is harder when energy costs are rising.

The difficult route would be to find an alternative to nuclear power. It would also be the more lucrative one.

In October, Koizumi turned on Abe and the LDP and called for a reactor-free Japan. The former prime minister has argued that devising and selling alternatives to nuclear power could be the ultimate growth industry.

At the moment, Abe is traversing the world hawking nuclear technology for Hitachi Ltd. and other companies. But launching a new generation of renewable-energy companies could create millions of jobs and unprecedented wealth.

When it comes to energy efficiency and conservation, few places can trump Japan. Why not harness those capabilities to raise living standards?

All Abe is doing is doubling down on the last 20 years: pumping money into a tired economy, building more bridges and highways, and bailing out Sony Corp. with a weak yen.

Hosokawa and Koizumi are thinking bigger. It would be oddly poetic for Japan — the only country that has suffered a nuclear attack — to rid our planet of an energy source that from Three Mile Island to Chernobyl to Fukushima has proven itself to be anything but safe, clean or cheap.

Unless we can construct reactors out of rubber or elevate them on huge shock absorbers out of the reach of temblors or tsunamis, they shouldn't be part of Japan's future. Arguably, the same holds true for India, Indonesia and Turkey — places to which Japan Inc. is trying to export its vulnerabilities.

If high-technology, hyper-conservative and rules-obsessed Japan couldn't avoid or contain Fukushima, what hope do far more graft-prone political systems have? Even the prime minister's wife, Akie, wants her husband to stop these sales.

Abe's party is circling the wagons to stop Hosokawa. BNP Paribas says investors should sell their stock if Hosokawa becomes Tokyo governor. But I see this moment as an incredible opportunity for Japan.

Call me crazy.

Abenomics and nuclear

January 25, 2014

Abe-genda': nuclear export superpower

A lot is riding on Prime Minister Shinzo Abe's push to export nuclear technology abroad. As Abe visits New Delhi on the occasion of India's Republic Day, we examine the nuclear component of 'Abenomics' infrastructure-exports growth strategy

by Jeff Kingston

http://www.japantimes.co.jp/news/2014/01/25/world/abe-genda-nuclear-export-superpower/#.UuQIhrTjJ1s

Prime Minister Shinzo Abe is now in New Delhi to celebrate the 53rd anniversary of the founding of the Indian Republic. His presence speaks volumes about closer diplomatic, security and economic ties and, at least from Tokyo's perspective, a common agenda on responding to the rise of China. India remains ambivalent, pursuing a shrewd hedging strategy rather than siding with either Beijing or Washington/Tokyo, eager to maximize concessions from all sides.

"The Emperor visited India last month — a huge symbolic event — and now Abe has been invited to be the chief guest at the Republic Day celebrations on Jan. 26 — no other Japanese prime minister has been invited to this before — an invitation extended only to close friends and partners," says Punendra Jain, professor of Asian Studies at Adelaide University in Australia. "This symbolizes their closer and evolving political and strategic relationships. Of course, the elephant in the room is China."

Tensions with China and South Korea have spiraled upward over the past year and thus "Abeplomacy" seeks to offset Japan's isolation in East Asia by nurturing closer ties with the member states of the Association of Southeast Asian Nations and India. Warming ties with New Delhi marks a sharp turnaround

from 1998 when Japan imposed economic sanctions on India (and Pakistan) for conducting a series of nuclear tests. These sanctions were lifted in 2001, at Washington's behest, to reward their support for the U.S.-led "war on terror." Since 2003, India has been the largest recipient of Japanese economic assistance, and economic ties are growing due to the 2011 Comprehensive Economic Partnership Agreement. Bilateral trade in 2011-12 reached $18.43 billion, up 34 percent from the previous year, but remains modest given the $334 billion in Sino-Japanese trade in 2012.

"The Indian nuclear tests of 1998 marked the lowest point in bilateral relations, as Japan reacted strongly to the nuclearization of the subcontinent," says Harsh Pant, professor of international relations at King's College London. "Tokyo suspended economic assistance for three years as well as put on hold all political exchanges between the two nations. This strong reaction from Japan was in many ways understandable, given that the Japanese are the only people to have experienced attacks by nuclear weapons."

However, Pant explains, "many in India saw the Japanese reaction as hypocritical for apparently brushing aside India's genuine security concerns even as Japan enjoyed the security guarantee of the U.S. nuclear umbrella."

Japan, as the sole nation to suffer a nuclear attack, has strongly opposed nuclear proliferation on principle, and as such been an outspoken critic of India's nuclear weapons program and refusal to join the 1968 Nuclear Non-Proliferation Treaty (NPT) or 1996 Comprehensive Test Ban Treaty (CTBT). However, India also bases its nonparticipation in these regimes on principle: the nuclear weapons possessing nations granted themselves a monopoly on nuclear weapons and have not followed up on pledges to eliminate their nuclear arsenals.

From the Indian government's perspective, these nonproliferation agreements created an exclusive club of status quo powers that left their nation marginalized and vulnerable. The 1962 border war with China was an unmitigated disaster for Prime Minister Jawaharlal Nehru's friendly diplomacy toward Beijing, based on the false assumption that the two nations shared a common agenda and could cooperate to reciprocal advantage. The comprehensive defeat was also a shock for the Indian armed forces, exposing inadequate military preparation. Upping the ante China then detonated a nuclear device in 1964, sending shock waves through India's security community and ensuring that it would follow suit. In 1974, India conducted its first nuclear test, dubbed "Smiling Buddha," and its last tests in 1998. India maintains that its nuclear arsenal is for deterrence only and has declared a nuclear no-first-use policy.

In 2008, the International Atomic Energy Agency reached an agreement with India to allow it access to India's civilian nuclear reactors. This agreement paved the way for the Nuclear Suppliers Group (NSG), under intense U.S. pressure, to grant India a waiver in 2008 allowing it access to civilian nuclear technology and fuel from the 48 member states. Since the waiver was granted, India has reached an agreement with the U.S. and France, among others, because they regard India as one of the most promising markets for nuclear reactor exports. Ironically, India's 1974 nuclear test triggered the

establishment of the NSG, but now Washington has abandoned the sanctions regime it once imposed and U.S. President Barack Obama backs India's membership in the group.

Let's make a deal

The 2008 U.S.-India Civil Nuclear Agreement brokered by the administration of President George W. Bush has become the template for subsequent agreements, meaning that India's unilateral pledge to refrain from nuclear tests has been accepted as sufficient guarantee. Until then, the NSG only cooperated with nations that signed the NPT. Under the terms of the agreement, in the event that India does conduct a nuclear test, any decision to terminate the accord and cut access would only be invoked after a year of consultations.

This is where Japan comes in. Exports of nuclear components and technology, as well as conventional arms, are potentially key elements of "Abenomics" and much is riding on the outcome. In 2013, Abe concluded Japan's first nuclear reactor export agreement with Turkey for $22 billion and others are pending with Saudi Arabia and the United Arab Emirates, while the prime minister has also lobbied governments in Central Europe, Vietnam and Indonesia. This is a remarkable turnaround from 2011 when the prospects for post-Fukushima Japan relying on nuclear energy, let alone exporting it, looked unlikely.

Three major nuclear vendors have bagged contracts in India estimated at roughly $60 billion, but the final price will probably balloon given a history of cost overruns. For example, Finland's order for Areva's Evolutionary Pressurized Reactor (EPR) has nearly tripled in cost to €8.5 billion from the original price tag of €3 billion and India has ordered six of these reactors. Each of the major vendors feature significant Japanese stakes — GE/Hitachi, Westinghouse/Toshiba and Areva/Mitsubishi — and all produce key reactor components in Japan. As such, they need the Japanese government to agree to the NSG waiver and hammer out an accord with India. Abe is keen to cut a deal despite reservations within his party and ruling coalition, and has the numbers in the Diet to ignore public opposition as he did when ramming the notorious secrecy legislation through the Diet in December.

Negotiations have stalled since 2008 mostly due to Japan's insistence on India relinquishing its right to conduct nuclear tests and an immediate cessation of cooperation if India violates its self-imposed moratorium. Japan also opposes India's desire to reprocess spent fuel. However, a recent pact with Turkey has a provision that allows it to enrich uranium and extract plutonium if agreed in writing, paving the way for exports of relevant Japanese technologies, so it is hard to imagine that India will settle for less.

Furthermore, the Japanese government wants India to formally restate its commitment to India's no-first-use nuclear weapons policy and support for nonproliferation in the pact. India's position remains clear: Japan should accept the same deal as the U.S. and other NSG members that don't include such provisions.

Discussions were suspended after the Fukushima nuclear reactor meltdowns in March 2011, but resumed in May 2013. At the end of December, negotiators had not yet bridged differences on civilian nuclear

cooperation or the sale of US-2 amphibious search-and-rescue military aircraft produced by ShinMaywa. The plane deal is seen as a significant boost to growing bilateral defense cooperation. To skirt the existing ban on military exports, a stripped down "civilian" version of the plane would be sold without the Identify Friend or Foe system. The Indian Navy is keen to acquire this aircraft and plans to equip it with an Israeli IFF system. Lifting the arms export ban to help Japan's defense sector industries is an Abe priority in 2014.

Abe wants to finalize these deals during this trip because politics might postpone agreement until the next Indian-Japan summit at the end of 2014. With Indian national elections due by May 2014 at the latest, there are countervailing pressures.

"Whether the two nations are able to sign the pact during Abe's January visit would depend on how much risk he is willing to take on the nuclear front and whether it would be a good idea for him to sign a deal with a lame-duck government in Delhi," Pant says. "The Indian government would not be able to deliver any significant change in its posture as elections are round the corner and they can't dilute their traditional stand on the CTBT."

While postponement is possible, Jain believes that "the deal is going to go ahead. I don't see much difference between the BJP (Indian People's Party) and Congress as far as Japan-India relations are concerned. If anything, BJP might seek closer ties with Japan."

"The expectation is to sign the deal when Abe is in New Delhi," Jain says. "As you know, in India, the agreement will be welcomed in all quarters; strategic analysts, former diplomats and military leaders are writing strongly in favor."

Dissensus

But not everyone agrees. Japan's first lady, Akie Abe, who has openly expressed opposition to her husband's support for nuclear energy exports, told a Dec. 29 television program that, "It remains anybody's guess if proper maintenance will be provided overseas. I wonder how Japan would cope in case of an emergency."

According to opinion polls, her doubts are shared by a majority of Japanese, including the mayor of Nagasaki who criticized the deal in August.

Citizens in India worry, too. "(The deal) pushes India's ill-conceived nuclear expansion ahead, creates a bad precedent of rewarding India for its nuclear tests while others face sanctions . . . and the whole dynamics of India, Japan and U.S. cozying up to contain China (will) destabilize Asia," says P.K. Sundaram from the Coalition for Nuclear Disarmament and Peace, India.

He acknowledges that Indian parties across the political spectrum support nuclear energy, but believes that large, sustained public protests against nuclear reactors, especially near a new nuclear plant sited at Kundankulam in Tamil Nadu, represent fallout from Fukushima and widespread skepticism about nuclear safety.

Pankaj Mishra, an acclaimed writer from India, chides the Indian government for blaming "an unspecified 'foreign hand' for the (anti-nuclear) protests. Never mind that the much-despised foreign hand helped build the Kudankulam plant, along with much of India's nuclear infrastructure."

M.G. Devasahayam, a former official of the elite Indian Administrative Service, asked me whether Abe would approve the deal. I said yes, venturing that Abe is pro-India. He replied that he shouldn't. "It is morally inappropriate for a country that has suffered the worst from nuclear holocausts in war as well as in peace to supply nuclear reactors and equipment to an over-populated country like India with limited land and water resources," Devasahayam says. "India needs electricity that is cheap and affordable whereas nuclear power is expensive. If all costs — construction, commissioning, operation, decommissioning and safe storage of spent-fuel — are honestly factored in, nuclear power is way costlier than any other source of electricity."

He worries that "Japan's long-term relationship with India will be seriously jeopardized once the Indian public comes to realize the ill-effects of nuclear power on their life, livelihood, environment and future generations."

A.V. Ramana, a nuclear physicist based at Princeton University, agrees that nuclear energy does not make sense for India due to the high costs and safety concerns. In his book "The Power of Promise: Examining Nuclear Energy in India," Ramana argues that nuclear energy is inappropriate for India on environmental, economic and technological grounds.

"Japan, which is currently facing tremendous democratic opposition to restarting nuclear reactors within the country, is considering exporting nuclear reactor parts to a country where, again, there is significant opposition to nuclear power, a history of failure, poor technology choices and a lack of organizational learning," Ramana says.

He cites the continued emphasis on breeder reactors, abandoned by other nations due to cost and safety concerns, as evidence of institutional myopia. "Because of its centralized character and the huge costs involved, nuclear power cannot play a significant role in solving the energy needs of the vast majority of India's population (and) only brings with it two of the familiar — and so far insoluble — problems associated with nuclear energy: susceptibility to catastrophic accidents and having to deal with radioactive waste that stays hazardous to human health for millennia," he says.

"Their reasons for such opposition are not difficult to discern. In the aftermath of March 11, 2011, people near an existing or proposed nuclear reactor can — and do — imagine themselves suffering a fate similar to those of the inhabitants of the areas around Fukushima," he says.

These anxieties appear warranted after A. Gopalakrishnan, former chairman of India's Atomic Energy Regulatory Board, revealed in April 2013 that the Russians used substandard components in building the Kundankulam reactors, planting a potential time bomb in southern India.

Nuclear liability of suppliers is a key issue because it's a potential deal breaker. According to Arun Jaitley, the BJP opposition leader in India's Upper House, the issue of liability remains murky despite government efforts to finesse the issue. Nuclear vendors are relying on a clause in contracts signed with the Nuclear Power Corp. of India that is designed to insulate them from any right to recourse, but Jaitley argues that legally this won't stand. Without an ironclad waiver on liability, however, most nuclear suppliers won't proceed. As Ramana says, "the nuclear industry doesn't like this business of being liable for anything at all."

Rivals suppliers in Russia and South Korea might capitalize on Japan's misgivings. Seoul signed a civilian nuclear agreement with India in 2011 and earlier this month Park Geun-hye visited New Delhi to explore nuclear prospects. And then there is the geo-strategic angle; China recently announced it would fund and build a nuclear plant in Karachi, Pakistan — India's arch-enemy. The pressures on Japan from the global nuclear industrial complex are also intense, reinforced by lucrative contract awards to consortium involving Japanese firms, including the GE/Hitachi nuclear project in Gujarat, where the presumptive next Indian prime minister, Narendra Modi, is now chief minister.

Abe, the pitchman-in-chief, is determined to seal the deal worth tens of billions while millions of fingers are crossed that his gamble doesn't lead to "Abegeddon."

What if anti-nuke candidate wins on Feb 9?

January 25, 2014
Win by anti-nuclear candidate could affect Japan's policy to restart idled reactors
http://mainichi.jp/english/english/perspectives/news/20140124p2a00m0na010000c.html

The outcome of the Feb. 9 Tokyo gubernatorial election could seriously affect the policies of Prime Minister Shinzo Abe's government.

Former Prime Minister Morihiro Hosokawa is calling for an immediate end to nuclear generation in his election campaign, while Tokyo voters are under scrutiny as residents of a region that consumes massive volumes of electricity.

Evacuation orders are still in place for some residents around the crippled Fukushima No. 1 Nuclear Power Plant, and interest in the central government's energy policy remains strong. There is a possibility that the Abe government may be pressured to review its energy policy depending on how Hosokawa and anti-nuclear candidates like Kenji Utsunomiya, the former president of the Japan Federation of Bar Associations, fare in the Tokyo election.

Former Prime Minister Junichiro Koizumi said in a stump speech for Hosokawa in front of JR Shinjuku Station on Jan. 23, ''The Tokyo gubernatorial election this time will have a bigger impact on national politics than any previous elections.''

The Nuclear Regulation Authority has conducted safety screenings with an eye to restarting idled nuclear reactors, and the central government cannot ignore the outcome of the Tokyo gubernatorial election when deciding whether it will approve restarts or not.

The ruling Liberal Democratic Party (LDP) is supporting former Health, Labor and Welfare Minister Yoichi Masuzoe, who approves of the restarting of reactors, while trying to divert public attention to social security and disaster-prevention measures. The pro-nuclear positions held by Masuzoe and former Air Self-Defense Force chief Toshio Tamogami are similar to that of Prime Minister Abe. If either of the two candidates wins, the central government is expected to proceed with measures to restart Japan's idled reactors.

The Abe government has postponed a Cabinet decision on a basic energy program, a guiding principle for the nation's mid- and long-term energy policy, until after the Tokyo election. Economy, Trade and Industry Minister Toshimitsu Motegi told a news conference on Jan. 14 that the government needs to conduct more in-depth debate on the issue of final disposal sites. His remarks were interpreted as suggesting a revision of the original energy program.

The LDP's energy policy parliamentary league on Jan. 23 proposed reviewing the program, which states that nuclear power is an important basic source of electricity. Its coalition partner New Komeito has also taken issue with the program, which calls for steadily promoting the nuclear fuel cycle. If an anti-nuclear candidate wins in the Feb. 9 election, the Abe government will be pressured from those inside the ruling camp to revise the basic energy program. (By Miho Suzuki, Tokyo Political News Department)

Nuclear power "very much a local issue"

January 25, 2014

Nuke issue could restore power to the regions

http://www.japantimes.co.jp/news/2014/01/25/national/nuke-issue-could-restore-power-to-the-regions/#.UuUD7bTjJ1s

Restarting in the summer?: Tepco's Kashiwazaki-Kariwa nuclear plant is seen from a beach in Kashiwazaki city, Niigata Prefecture, in September. | BLOOMBERG

by Philip Brasor

The Regional Governance Law allows local governments to submit *ikensho*, or "letters of opinion," to the central government on matters that concern them. These opinions should represent the will of elected assemblies, and can include proposals for new bills or revisions of existing ones. About 7,000 ikensho are sent to the Diet every year, and according to an article in the Jan. 19 Asahi Shimbun, the central government rarely pays them any mind.

The administrative office of the upper house says that it has received 1,475 ikensho "related to nuclear energy issues" since the Fukushima nuclear plant accident in March 2011. Asahi went through these letters to determine how many demanded an end to support for nuclear energy as a national policy.

Excluding matters pertaining to things like compensation for Fukushima victims and worries about radiation, the paper determined that 455 prefectural and municipal assemblies have asked the government to abandon nuclear power. That's about 30 percent of all the local governments in Japan.

The Asahi mentions these numbers to point out the "lack of insight" inherent in Prime Minister Shinzo Abe's view that the upcoming Tokyo governor's election should not be about nuclear power, since energy policy is determined at the national level. Abe was referring to former PM Morihiro Hosokawa's platform, which is built primarily on anti-nuclear sentiments with the help of another former prime minister, Junichiro Koizumi, who was Abe's mentor in the Liberal Democratic Party.

The Asahi finds the LDP's stance patronizing. After all, the central government, in league with regional power firms, has promoted nuclear energy generation by placing plants in depopulated areas to provide electricity to large metropolises far away, thus setting up mutually dependent relationships between these localities that can only be mediated by centralized entities.

Since the Fukushima meltdown, however, many local governments have grown resentful of the LDP's "leave it to us" policy. The government recently announced that this summer Tokyo Electric Power Co. will restart two reactors at the Kashiwazaki-Kariwa nuclear power facility in Niigata, the world's largest in terms of potential output. The prefecture's governor, Hirohiko Izumida, told reporters that he doesn't trust Tepco's plan, calling it "very strange," since shareholders and lending institutions don't bear any risk. He asked who will take responsibility if an accident happens, implying that residents and utility users will pay for any problems, just as they are now doing with regard to the Fukushima accident. Theoretically, Tepco can ignore him, since it needs the OK of Kashiwazaki, not Niigata Prefecture, and the city relies on the plant for its economic wellbeing.

But that sort of financial dependence is not assured either. A year after the March 11 earthquake, NHK aired a documentary, still viewable via its On Demand service, about the financial relationship between remote nuclear power plants and their big-city customers. NHK found that on average, 35 percent of the budgets of municipalities that host nuclear plants comes from direct government subsidies and "donations" from regional power companies.

It is thought that these cities, towns and villages can't survive without nuclear plants, but NHK showed that many can't survive *with* them either. Government subsidies used to come with a condition stating that the money be used for "promotional" public works — museums and the like — so that residents would know where the money was coming from and what it was for. Maintenance of these white elephants is very expensive, so since the mid-1990s, subsidies have come with fewer strings attached, but because the tax base deteriorates as plants get older and subsidies are only given when plants are built, it hasn't made that much difference.

Power-company donations have never come with strings. A group made up of various nuclear-power interests regularly gives money to Aomori Prefecture to "promote business." All local governments in the prefecture, which hosts the Rokkasho nuclear fuel reprocessing plant, receive these funds.

The leader of the organization openly told NHK that Rokkasho is an important project and if anti-nuclear forces in the prefecture succeeded in having it shut down, even temporarily, "all our efforts will be for nothing." As one insider said, the power companies established the fund to prevent an anti-nuclear candidate from winning the governorship, which is why they have to give money to all local governments, even those that have no nuclear facilities. Apparently, this scheme works, since there is no vocal opposition to nuclear power generation within local assemblies, though Rokkasho has had so many problems over the years there's a possibility it will never be operational.

So regardless of what the LDP says, nuclear power is very much a local issue, and if regional governments ever decided they prefer to determine their own energy needs, the central government will lose a great deal of control over their affairs. Izumida is popular among his constituents, so even if gaining permission to reopen the Kashiwazaki-Kariwa plant is a courtesy that Tepco can ignore, doing so would intensify public resentment. According to Tokyo Shimbun, the LDP fears that if Hosokawa successfully taps this same sentiment among Tokyoites and wins the election, "the anti-nuclear movement could actually spread to local areas that host plants." Before his ignominious exit in December, former Gov. Naoki Inose was already advocating energy independence for Tokyo.

Such a precedent would not only undermine the LDP's energy policy; it would call into question the whole centralized structure of Japanese administration, a matter now coming to a head with regard to the proposed U.S. air base in Nago, Okinawa. If cities such as Tokyo and Osaka assume responsibility for their energy situations, then the local governments hosting the plants that now provide them with electricity will lose a good part of their income. Maybe they will go bankrupt or maybe they'll figure out a way to survive, but either way they'll do it on their own.

Are nukes an appropriate election issue?

January 25, 2014

Young voters split over nuclear power's emergence as election issue: survey

http://mainichi.jp/english/english/newsselect/news/20140125p2a00m0na009000c.html

Japan's nuclear power policy has emerged as a major issue in the Tokyo gubernatorial race, which officially kicked off on Jan. 23, but Tokyoites have mixed opinions over whether the issue should dominate campaigns.

Candidates are split when it comes to their stance on nuclear power, with their election promises ranging from an "immediate zero-nuclear" policy to reducing dependence on nuclear power in the long term, and maintaining nuclear energy.

On Jan. 23 the Mainichi Shimbun launched a poll targeting 15 students and workers, mostly in their 20s, who are eligible to vote in the capital's Feb. 9 election. The pollees -- including one 19-year-old who will have come of age by voting day -- will be surveyed a total of four times between Jan. 23 and Feb. 9 over their impressions of the various campaigns, their criteria for singling out a candidate to vote for, and which candidate they actually voted for. None of the pollees has any particular party affiliation, and at the start of the survey, none of them had decided who to vote for.

When asked whether nuclear power was appropriate as a campaign issue in the Tokyo election, the respondents' answers were largely divided, though the small sample results cannot be interpreted as representing the general trend among young people. Out of the three response alternatives, four said nuclear energy is appropriate as a campaign issue, while seven answered in the negative, with the remaining four saying they didn't know.

In the meantime, the survey results also showed that nuclear power is not a black-and-white issue for them, with one respondent saying it is suitable as a campaign issue, but demanding that candidates also debate Tokyoites' livelihood. Some other respondents who either answered that nuclear energy is not apt as an election issue or that they didn't know whether it is suitable nevertheless insisted that the issue is something Tokyoites should think about.

Regarding the prospect of breaking away from nuclear power, the respondents offered various views. One said it was right to do so but added, "An immediate zero-nuclear policy is infeasible." Another commented, "I'm scared of nuclear accidents, but discontinuing nuclear power would result in power shortages, causing trouble for Tokyo residents."

Prosperity in the capital had indeed been supported by power supply from nuclear plants in Fukushima, Niigata and other prefectures up until the Great East Japan Earthquake in March 2011. The ongoing campaigns, in which nuclear power is being contested as a major issue, may provide Tokyo voters with a chance to weigh the quality of prosperity. Members of the younger generation living in the capital are now racking their brains over who should be entrusted with the capital's future.

The Mainichi Shimbun will keep track of the 15 pollees, asking them further questions on Feb. 2, 7 and 9 to track their selection of a candidate.

The following are the respondents' answers to the Jan. 23 survey. The choices of (A) to (C) next to their names stand for: (A) Nuclear power is suitable as a campaign issue, (B) Nuclear power isn't suitable as a campaign issue, (C) I'm not sure.

Male university student, 21 (B): The energy issue is important but it's not everything. The cause of the Fukushima nuclear disaster was attributable to Tokyo Electric Power Co., and nuclear power generation itself is not to blame. (Voted for Naoki Inose in the previous Tokyo election)

Female university student, 19 (C): I'm scared of nuclear accidents, but discontinuing nuclear power would result in power shortages, causing trouble for Tokyo residents. I can't figure out what is best. (Not eligible to vote in the previous Tokyo election)

Female university student, 20 (A): It is natural for Tokyoites -- consumers of large amounts of energy -- to have their will reflected in national politics through the Tokyo election. (Not eligible to vote in the previous Tokyo election)

Male university student, 22 (B): There are many other challenges for the metropolitan administration, including restoring fiscal health, tax reductions to attract companies, and urban development with a global outlook. (Voted for Naoki Inose in the previous Tokyo election)

Female university student, 22 (C): I don't understand the link between Tokyo and nuclear power. I believe there are various other issues to be debated. (Abstained in the previous Tokyo election)

Male confectioner, 27 (B): I have a baby and I'm worried that my child will end up on the waiting list for enrollment at nursery school. I want a new governor to take measures to improve the child-rearing environment. (Voted for Shigefumi Matsuzawa in the previous Tokyo election)

Female university student, 22 (C): Nuclear power is an issue to be considered by Tokyoites who use electricity generated by nuclear power stations, but for me, the priority of the issue is low. (Voted for Kenji Utsunomiya in the previous Tokyo election)

Female company employee, 29 (B): Nuclear power is an issue to be dealt with by the central government and local governments hosting nuclear power plants. Now that Tokyo is to host the 2020 Olympic Games, Tokyo should be transformed into an international metropolis that has economic strength. (Voted for Naoki Inose in the previous Tokyo election)

Male company employee, 25 (B): It is important to utter opinions about nuclear power, but the Tokyo governor should do other work considering the legal status and mandate of the position. (Abstained in the previous Tokyo election)
Male graduate student, 28 (A): The Tokyo governor's remarks about nuclear power will have an impact on the entire country. The results of the upcoming Tokyo election will represent the public will in the wake of the nuclear disaster. (Abstained in the last Tokyo election)

Female employee of an organization, 27 (C): All major candidates are calling for a breakaway from nuclear power, and they fail to distinguish themselves. After the Fukushima nuclear disaster, no Tokyoites would view nuclear power favorably. (Voted for Kenji Utsunomiya in the previous Tokyo election)

Male university student, 21 (B): It's not convincing for the Tokyo governor to talk about nuclear power. I have a disabled younger sister, and I'm hoping for the enhancement of welfare services. (Abstained in the last Tokyo election)
Female banker, 23 (A): I don't feel uncomfortable about (candidates vying for) the leadership of Japan's capital arguing over the pros and cons of nuclear power and making it a campaign issue. (Voted for Naoki Inose in the previous Tokyo election)

Male university student, 24 (B): Nuclear power is not an issue to be decided by Tokyoites. Breaking away from nuclear power is right, but the "immediate zero-nuclear" advocated by former Prime Minister Junichiro Koizumi is infeasible. (Voted for Naoki Inose in the previous Tokyo election)

Female university student, 22 (A): It is important to debate the pros and cons of nuclear power, but candidates should also debate Tokyoites' livelihood, such as the declining birthrate and aging society. (Voted for Naoki Inose in the previous Tokyo election)

Governors on nukes

January 28, 2014

Governors address Tokyo nuke debate

http://www.japantimes.co.jp/news/2014/01/28/national/governors-address-tokyo-nuke-debate/#.UufleLTjJ1s

Kyodo

As Tokyo prepares for its Feb. 9 gubernatorial election, governors of prefectures with nuclear power plants are split over whether they believe the nation's reliance on atomic energy should be a campaign issue.

Some welcome the debate while others argue that candidates and voters should pay more attention to other problems.

"It is very meaningful that the issue (of the future of nuclear power in Japan) is debated in Tokyo, a huge energy-consuming place," Fukushima Gov. Yuhei Sato said last Wednesday, a day before the Tokyo campaign officially started.

"I expect people in Tokyo to make decisions through thinking about the situation in Fukushima," said Sato, governor of the prefecture that hosts the devastated Fukushima No. 1 and where nearly 140,000 people are still living in temporary housing as evacuees from radioactive fallout.

There are no nuclear power plants in Tokyo, but the capital consumes almost 10 percent of all electricity in Japan.

Shizuoka Gov. Heita Kawakatsu, who oversees the Hamaoka nuclear plant, recently said that "it is natural that candidates in Tokyo propose ending nuclear power generation to avoid a dangerous accident."

Nuclear energy "can be discussed as long as people in Tokyo have interest in it," Saga Gov. Yasushi Furukawa said last Thursday. "But if I were a Tokyo resident, I would be seeking a clear answer about how to address the issues of an aging society."

Saga hosts the Genkai plant.

Miyagi Gov. Yoshihiro Murai expects the Tokyo election, whatever its outcome, will have only a limited impact on future nuclear policy.

"There will be some impact if the governor of the big energy-consuming place calls for a nuclear-free Japan," Murai said. "But nuclear power generation won't be stopped immediately, as it is a national policy."

Miyagi, one of the three hardest-hit prefectures in the March 2011 disasters, hosts the Onagawa nuclear plant.

The administration of Prime Minister Shinzo Abe wants to restart nuclear reactors if they comply with the government's safety standards, and export Japanese nuclear technology to other countries.

“It can be one of the main issues — whether to end the use of nuclear power — but it is questionable to make it the only issue,” Ishikawa Gov. Masanori Tanimoto said Friday.

The governor of the prefecture with the Shika nuclear plant also said, “I want candidates to come up with prescriptions (for other sources of electricity) if nuclear reactors are scrapped.”

Fukushima evacuees and Tokyo election

Fukushima evacuees living in Tokyo have mixed feelings over gubernatorial race

http://mainichi.jp/english/english/newsselect/news/20140128p2a00m0na006000c.html

Evacuees from Fukushima Prefecture who currently live in the Japanese capital have mixed feelings about the Feb. 9 Tokyo gubernatorial election in which candidates are locking horns over whether to abandon nuclear power.

Many people from Fukushima who evacuated to Tokyo in the wake of the outbreak of the nuclear crisis at the Fukushima No. 1 Nuclear Power Plant have switched their addresses to Tokyo, meaning that they have the right to vote in the race to pick a successor to Naoki Inose, who resigned as Tokyo governor last month over a money scandal.

When the election battle among candidates moved into high gear on Jan. 24, Hiroko Suzuki, 33, who had evacuated from the Fukushima Prefecture city of Iwaki to the Toyama apartment complex in Tokyo's Shinjuku Ward with her two sons, received a ticket for a ballot from the Shinjuku Ward Election Administration Commission. In the summer of 2011, she returned to Iwaki with her children and lived there for eight months. She paid out of her own pocket to measure her eldest son's radiation exposure and found out that he had higher radiation exposure than other children. She then started to feel uneasy. She told herself, "I don't want to have any regrets later."

In March 2012, she returned to Tokyo again, leaving her 38-year-old husband, who had a job in Fukushima Prefecture. Her two sons frequently go to hospital for asthma and other ailments. She changed her resident registration to Shinjuku Ward because she had to apply every month to a municipal government in the area where she is registered as a resident for exemptions from medical bills. Her family can get together only on weekends. She feels pity for her sons who cry a lot when they see their father going back to work. She constantly feels uneasy about her uncertain future.

Since the outbreak of the Fukushima nuclear crisis, she has voted for candidates calling for a breakaway from nuclear power. On the absurdity the nuclear accident imposed on her family, she said, "That is the result of the fact that society depended too much on nuclear power." She added, "I wonder if politicians who accept nuclear power have ever imagined their important people living near a nuclear power station." Although many of the candidates running in the Tokyo gubernatorial election are calling for the elimination of nuclear power, she fears that they could change their stance after winning the race. While being unable to fully trust her favorite candidate, she said, "Still, I want to bet on breaking with nuclear power generation."

Yoko Yamasaki, 66, who also evacuated to the Toyama apartment complex from Iwaki, has different views. "The nuclear issue is important, but I want them to turn the economy around and ensure pensioners can live at ease," she said.

Yamasaki's 72-year-old husband cannot work because he has an artificial bone in his leg. Therefore, she works part-time to make about 100,000 yen a month. In addition to her monthly income, her family has small amounts of pension benefits. She had to spend extra money earlier this month as she was hospitalized for an operation.

Yamasaki has no place to go back to because her house was completely destroyed by the March 11, 2011 earthquake

.

Her family will be allowed to live in the apartment, which has been provided as a temporary evacuation facility, only until March 2015. Therefore, she is preparing to pay rent thereafter. "We pay 10,000 yen for electricity a month even today and electricity charges could further rise if nuclear power is eliminated. I want to vote for a candidate in the Tokyo gubernatorial election who calls for a policy to improve the pension and welfare systems."

Most of a total of about 8,000 disaster victims living in Tokyo are evacuees from Fukushima Prefecture, but it is unclear how many of them have switched their residential registrations to Tokyo and become eligible voters for the Tokyo gubernatorial election. According to a survey conducted by the Tokyo Metropolitan Government in February 2013, all or some members of slightly less than 40 percent of the 1,120 households that responded to the poll changed their addresses to Tokyo.

Build new reactors?

January 31, 2014

Electric power industry steps up push for new nuclear reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201401310204

By SAWAAKI HIKITA/ Staff Writer

Conveniently ignoring the nuclear disaster in Japan nearly three years ago, the electric power industry has been brazenly lobbying members of the ruling party to construct new nuclear reactors.

The Federation of Electric Power Companies of Japan seems to be relying on the fact that the Abe administration is generally sympathetic to its call to continue using nuclear energy.

As yet, Prime Minister Shinzo Abe says no decision has been made on whether to construct new reactors. Doing so would be difficult in light of strong local opposition to nuclear reactors following the meltdowns at the Fukushima No. 1 nuclear power plant in March 2011.

The lobbying was apparently intended to influence the basic energy plan that the Abe Cabinet is planning to adopt.
In January, the LDP polled its lawmakers to determine what measures to include in the basic energy plan.

The FEPC promptly distributed a document to lawmakers which states the need to clarify that nuclear energy is an important energy source in the basic policy related to the supply and demand of electricity.

The document, a copy of which was obtained by The Asahi Shimbun, says, "In order to secure a certain degree of nuclear power generation (there is a need to) clarify the necessity of constructing new reactors or replacing existing ones."

With regard to restarting idle nuclear reactors, the document calls for "an efficient and prompt resumption of operations for nuclear energy that has been confirmed to be safe."

In December 2013, the industry ministry released a draft of the basic energy plan that said nuclear energy was an "important basic power source."

The Abe Cabinet initially sought to approve the basic plan in January, but delayed doing so in the face of objections by some LDP members who said it contravened the party's campaign pledge for the December 2012 Lower House election. At that time, the party said it would "seek to establish a socioeconomic structure that does not have to depend on nuclear energy."

Between Jan. 6 and Jan. 20, the LDP's Policy Research Council canvassed the views of party lawmakers on four points of basic policy regarding the supply and demand of energy.

The documents distributed by the FEPC most likely were intended to secure the backing of LDP lawmakers in promoting nuclear energy.

According to several LDP lawmakers and party sources, FEPC officials visited LDP lawmakers prior to Jan. 20, and distributed documents that contained what the federation considered model responses for the party survey.

It is still unclear how many lawmakers actually received the documents. But it would come as no surprise if the FEPC approached not only the 140 or so lawmakers who belong to a league in favor of nuclear energy, but also those whose fundamental stance is of gradually reducing dependence on nuclear energy while consenting to the resumption of nuclear reactor operations in the near future.
The FEPC released a statement that said, "While the industry has many opportunities to explain its opinions over a wide range of energy policies, we would like to refrain from responding to specific details about individual content."

Nukes on Tweeter

January 30, 2014
Nuclear power most often tweeted issue in Tokyo governor race: poll
http://mainichi.jp/english/english/newsselect/news/20140130p2a00m0na013000c.html

A joint study on Internet-based campaigning, which focuses on the social media site Twitter conducted by the Mainichi Shimbun and Ritsumeikan University in the lead-up to the Feb. 9 Tokyo gubernatorial election, has revealed that the top theme tweeted with respect to all four major candidates is the energy issue, including nuclear power.
The study, led on the Ritsumeikan University side by Special Guest Associate Professor Ryosuke Nishida, revealed that nuclear power -- which was also widely tweeted about during last year's House of Councillors election -- continues to be an issue of deep concern among the public.
Utilizing analysis-based software known as "Garnet" from G-Search corporation, the number of individual messages sent out by Twitter users were tallied during the week-long period from Jan. 20 to 26.
The highest number of tweets sent out regarding candidate Kenji Utsunomiya, 67 -- a former Japan Federation of Bar Associations president who advocates abandoning nuclear power -- focused on the nuclear power issue, at 43,133. The terms "black" -- presumably Twitter shorthand for the term "black corporations," referring to companies that exploit young workers through harsh working conditions -- and "employment" were also highly tweeted with respect to Utsunomiya, which is likely a reflection of his endorsement by the Japanese Communist Party.
Twitter comments related to former Air Self-Defense Force Chief of Staff Toshio Tamogami, 65, and former Health Minister Yoichi Masuzoe, 65, were both also highly concentrated around the nuclear power issue.

Tweets associated with Tamogami also included wide use of the terms "self-defense" -- which is probably due to his association with the Self-Defense Forces, as well as his support for Japan's exercise of the right to collective self-defense -- and "earthquakes/disaster prevention," given his strong focus upon anti-disaster measures.

Often tweeted with regard to Masuzoe was "social welfare," which is presumably attributable to his history with the Health Ministry and his own experience with caregiving -- as well as an indication that his focus upon social security-related issues within the present election campaign is attracting notice within the Twittersphere.

The hands-down highest number of tweets associated with former Prime Minister Morihiro Hosokawa, 76, who is calling for an immediate end to nuclear power, referred to "nuclear power," at 91,212. Also notably high were tweets including the word "prime minister," which -- in addition to Hosokawa's own former title -- is a likely reference to growing public interest in former Prime Minister Junichiro Koizumi, who has lately been appearing alongside Hosokawa during election campaigning on the streets.

January 30, 2014(Mainichi Japan)

"Irresponsible" LDP members want to end nuclear power

February 1, 2014

Roughly 50 ruling LDP lawmakers call for end to nuclear power

http://mainichi.jp/english/english/newsselect/news/20140201p2g00m0dm048000c.html

TOKYO (Kyodo) -- Roughly 50 lawmakers of the ruling Liberal Democratic Party, or more than 10 percent of the party's members in parliament, have called for an end to nuclear power generation in Japan in the future, a senior party member said Friday.

Just four lawmakers were in favor of building new nuclear power plants in a survey of 407 LDP members in both chambers, with responses obtained from about 320.

Among the lawmakers who responded, more than 80 percent called for making use of renewable energy while maintaining nuclear plants to supply electricity to the country.

Prime Minister Shinzo Abe, who heads the LDP, has criticized those advocating an end to nuclear power generation as "irresponsible," while expressing his readiness to reduce the country's reliance on nuclear power.

The senior party member who revealed the results of the internal survey said those calling for an end to nuclear power have a "larger than expected" presence in the party.

The Federation of Electric Power Companies of Japan, the powerful trade group for the nation's power utilities, had lobbied LDP lawmakers to support new nuclear power plant construction in connection with the survey, sources close to the matter said Friday.

In a leaflet distributed to LDP lawmakers, the federation provided model answers to questions in the survey, the sources said, evidence of lobbying by the industry to maintain nuclear power generation in Japan.

The poll was conducted before the LDP begins discussing a new national energy plan to be set by the government.

Currently there are no nuclear reactors online in Japan, in large part because of the Fukushima Daiichi plant accident triggered by a powerful earthquake and tsunami in March 2011.

In the leaflet, the federation says Japan should build new nuclear plants to maintain and develop the highest level of safety standards and technologies, the sources said.

It also calls for early decisions to restart existing nuclear reactors, warning that importing fossil fuels to make up for the absence of nuclear power generation will cause a national wealth outflow.

Nukes not the only issue

February 3, 2014

Coalition shuns nuclear issue in Tokyo election; Masuzoe still in front

http://ajw.asahi.com/article/behind_news/politics/AJ201402030074

THE ASAHI SHIMBUN

The ruling coalition is going all out to defeat former Prime Minister Morihiro Hosokawa in the Feb. 9 Tokyo gubernatorial election and stifle his flamboyant supporter's calls for Japan to abolish nuclear energy.

The strategy appears to be working, according to an Asahi Shimbun poll.

"The Liberal Democratic Party and New Komeito are throwing all their weight behind him," Prime Minister Shinzo Abe said in Tokyo's Ginza district Feb. 2 while canvassing support for Yoichi Masuzoe, 65.

New Komeito leader Natsuo Yamaguchi chimed in, standing side by side with Abe and Masuzoe on the campaign vehicle.

"The metropolitan government and the national government will join hands to make Tokyo No. 1 in the world," he said.

Abe and Yamaguchi hit the streets for Masuzoe, a former welfare minister, for the first time since campaigning started Jan. 23 to ensure his victory over Hosokawa, 76, and other rivals.

Hosokawa is focusing on a zero-nuclear platform, and is backed by former Prime Minister Junichiro Koizumi, another staunch opponent to the Abe administration's pro-nuclear policy.

"We expect the election to prove that whether to phase out nuclear energy will not become a point of contention anymore," a senior LDP official said.

A senior coalition official said the government feels that Masuzoe must prevail at any cost because the election outcome will be tantamount to a midterm report card for the Abe administration.

A victory by Hosokawa could deal a serious blow to the administration's policy to restart idled reactors once they are declared safe by nuclear regulators.

Government and coalition officials have downplayed the nuclear energy debate, emphasizing it is not the only issue in the election.

Masuzoe, Abe and Yamaguchi all skirted the nuclear energy issue Feb. 2.

"Tokyo is facing a number of challenges," Yamaguchi said. "A single-issue election will make Tokyo residents unhappy."
Ministers of the Abe Cabinet, as well as LDP Secretary-General Shigeru Ishiba, began campaigning for Masuzoe in late January after opinion polls indicated he was in the lead.

An Asahi Shimbun survey conducted Feb. 1-2 showed that Masuzoe has maintained the momentum shown in the previous survey Jan. 25-26.

Masuzoe, who is broadly backed by LDP and New Komeito supporters, has gained support from 40 percent of unaffiliated voters, according to the survey.

Hosokawa has secured backing from some supporters of the opposition Democratic Party of Japan, but support among unaffiliated voters remains at 20 percent.

Government officials hope that a landslide victory by Masuzoe will silence the increasingly vociferous Koizumi, whom one senior official described as an "eyesore."

"If Hosokawa loses, Koizumi will not be able to come out in front anymore," a senior government official said.
On Feb. 2, 30 minutes after Abe left, Hosokawa and Koizumi addressed thousands of voters in Ginza.

Hosokawa compared the Tokyo election to an attempt to change the direction of Japanese civilization.

"We will have Japan develop without nuclear plants," Koizumi said.

Although Hosokawa is drawing large crowds for his speeches, a senior official in his camp is worried about his chances in the election.

"People come to see and hear Koizumi," the official said. "Support for zero nuclear plants has not necessarily become widespread."

Media opinion polls have shown that the economy and welfare are greater concerns among Tokyo voters.
Hosokawa has recently spoken more about issues other than nuclear energy, such as measures to deal with Japan's declining birthrate and the aging of society.

Candidate Kenji Utsunomiya, 67, former president of the Japan Federation of Bar Associations, is also calling for a move away from nuclear energy.

A senior official of his camp said the anti-nuclear vote has been split between Utsunomiya and Hosokawa. Utsunomiya garnered 960,000 votes in the 2012 Tokyo gubernatorial election. But the official said it appears that he will be unable to gain as many votes if support fails to widen.

February 2, 2014

Tokyo election goes nuclear

http://www.japantimes.co.jp/news/2014/02/02/national/tokyo-election-goes-nuclear/#.Uu9LXrTrV1s

by Masaaki Kameda
Staff Writer

Whether the powers that be liked it or not, nuclear power took center stage in a debate involving four major candidates for the Tokyo gubernatorial election that was streamed live on the Internet Saturday. Three of the candidates came out firmly against atomic power.

Prime Minister Shinzo Abe's administration has done its best to keep the issue out of voters' minds ahead of Sunday's race, framing it as a national, rather than local, concern.

Packed with Abe allies, public broadcaster NHK appears to be downplaying the matter. A noted economics professor resigned last week as a commentator after being told not to discuss the nuclear issue until after the election on Sunday "to ensure fairness."

But the debate, hosted by seven online firms including Dwango Co., Ustream Asia Inc. and Yahoo Japan Corp., has shown that nuclear power is very much an issue outside the mainstream.

"We have to break away from the system that depends on nuclear energy in the long run, considering the dismal state (caused by the Fukushima crisis)," former health minister Yoichi Masuzoe, 65, said during the 90-minute debate, which, according to the organizers, was seen by some 170,000 people.

Previously noncommittal on the issue, Masuzoe said new energy sources, including shale gas and renewables, could be developed to reduce Japan's dependence on atomic power.

Former Prime Minister Morihiro Hosokawa, running on an anti-nuclear platform, stressed that the issue is relevant to Tokyo residents.

"The principal duty of the Tokyo governor is to protect the lives of its citizens. . . . The nuclear issue would directly affect the people's lives," Hosokawa, 76, said.

If elected, Hosokawa said the metropolitan government would ask Tokyo Electric Power Co. to start using more renewable energy sources to replace nuclear power.

The Tokyo Metropolitan Government is the fourth-largest shareholder in the utility, with a stake of 1.20 percent.

Another opponent is Kenji Utsunomiya, former chairman of the Japan Federation of Bar Associations.

"Nuclear power generation is not suitable in Japan, which has been hit by many earthquakes and tsunami," the 67-year-old said. "We should not restart the idled reactors."

Utsunomiya warned of the possibility of huge expenditures being needed to compensate nuclear accident victims and the high cost of decommissioning any reactors involved in a nuclear power plant accident.
Taking the opposite view, Toshio Tamogami, a former chief of the Air Self-Defense Force, said that nuclear power has been made sufficiently safe and was vital to Japan from an economic perspective.

The higher electricity rates stemming from the cost of importing fuel for the traditional power plants being used to offset the absence of atomic power is weighting heavily on small and midsize firms, the 65-year-old Tamagami said.

"I think many of those firms would go bankrupt" if the reactors are kept offline, Tamogami argued. "We could provide enough energy with the use of nuclear power plants and it could contribute to growth of the nation's gross domestic product."

Another issue the candidates debated was the proposal to legalize casinos. Some lawmakers want to build casino resorts in time for the 2020 Olympics and Paralympics.

Hosokawa and Utsunomiya are firmly against the idea, citing the detrimental influence they would have on young people and the threat of gambling addiction.

Tamogami, on the other hand, said casinos would attract wealthy tourists from around the world. Masuzoe hedged, saying only that the matter needs further study and debate.

Turning to the 2020 Olympics and Paralympics, Masuzoe said he would like the Olympics and Paralympics to be the best and most hospitable ever and urged all citizens to cooperate.

"I'd like participating countries to hold training camps in the Tama area (west of the 23 wards). . . . I also urge citizens to learn English so that all can be a guide (to visiting athletes and guests)," he said.

Tamogami said by holding a "lavish" Olympics he would like to hear foreign athletes and guests say they want to return to Tokyo.

"Japan has been suffering from deflation, and spending on public works projects could contribute to the economic recovery. I'd like to hold the best-ever Olympics in history by investing heavily (in key facilities)," he said.

Hosokawa said he would like to hold a "sustainable" Olympics, indicating plans to review the extravagant facilities being planned, and bring about a successful Olympics that makes use of renewable energy instead of nuclear power.

Hosokawa also said he would like to share the benefits from the Olympics and Paralympics with the people of Tohoku.

Lawyer Utsunomiya said he sees the need to make the Olympics simple and environmentally friendly without spending large amounts of money and by refurbishing existing facilities.

Utsunomiya also pointed to the need to make the city easier for the disabled to live in to have a successful Paralympics. Efforts should be made to make the city more barrier-free, he said.

Nuclear power' cited the most in Tokyo governor election tweets

http://www.japantimes.co.jp/news/2014/02/05/national/nuclear-power-cited-the-most-in-tokyo-governor-election-tweets/#.UvJksLTrV1s

Kyodo

"Nuclear power" far eclipsed other phrases such as "the Olympics" and "welfare and aging issues" in Twitter messages about Sunday's Tokyo gubernatorial poll, a research firm's data show. The finding is in sharp contrast to a conventional phone poll that indicated "the economy" is the top focus.

Hotlink Inc., an analyzer of big data, checked a total of 319,000 messages between Jan. 23 and Feb. 2 that contain both "Tokyo governor" and references to election issues. Posts from those living outside Tokyo were not excluded, the company said.

In the period, "nuclear power" topped the list with around 214,000 tweets. "The Olympics" came in second with roughly 39,000 posts. "Welfare, aging issues" followed with some 29,000 messages.

A telephone poll conducted by Kyodo News on 1,040 randomly selected Tokyo voters on Feb. 1 and 2 found the top issue was "the economy and employment," followed by "the low birthrate, aging and welfare" and then "nuclear power, energy issues."

A daily breakdown indicates that the most tweets related to the election, around 50,000, were sent on Jan. 23, when campaigning for the Feb. 9 election kicked off. That day, there were roughly 29,000 posts containing "nuclear power."

Nuclear issue looms over prefectural gubernatorial elections

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402060067

THE ASAHI SHIMBUN

Nuclear energy looks set to dominate gubernatorial elections outside Tokyo as local government consent is key to bringing nuclear plants back online or building new ones.

The issue has already been raised by candidates in the Feb. 9 race for a new governor of Tokyo.

In Yamaguchi Prefecture, which Prime Minister Shinzo Abe represents in the Diet, there is controversy over a proposal to construct a new nuclear plant in Kaminoseki.

The official campaign for the Yamaguchi gubernatorial race began Feb. 6, with voting scheduled for Feb. 23.

A vacancy in the post emerged when Shigetaro Yamamoto resigned in January for health reasons.

When the Democratic Party of Japan was still in control of the central government, Yamamoto declared he would not approve an application to extend a land reclamation license for the proposed nuclear plant site. However, after the Abe administration took over power, Yamamoto shifted position and said last March that he would hold off on a decision for a year.

In the gubernatorial election two years ago, Tsutomu Takamura, a former DPJ Lower House member, lost out to Yamamoto. Takamura is running this time on a platform that opposes the nuclear plant construction plan.

The Japanese Communist Party candidate, Naoko Fujii, is also calling for an immediate end to nuclear power.

Takamura said, "Even the people of Tokyo have begun to raise doubts about whether they should be satisfied with nuclear energy policy in which (the central government) forces dangers and burdens on isolated rural areas."
On Feb. 1, Takeo Kawamura, who heads the Liberal Democratic Party's Election Strategy Committee, called for support for Tsugumasa Muraoka, who is being backed by both the LDP and New Komeito.

"While attention was focused on the Tokyo gubernatorial election because two former prime ministers have campaigned together, interest will also focus on the Yamaguchi gubernatorial election since it is Abe's home prefecture," said Kawamura, who also represents a district in the prefecture. "We must produce a suitable result."

He touched upon the fact that Morihiro Hosokawa, a former prime minister, is running in the Tokyo election while calling for an immediate end to nuclear power generation. Hosokawa is backed by Junichiro Koizumi, who was prime minister from 2001 to 2006 and remains hugely popular.

Muraoka, seeking to avoid having the nuclear issue come down to the local level, said, "The central government should think about energy policy because it involves the entire nation."

The Abe administration is moving to gain approval to resume operations at nuclear plants before summer when electricity demand peaks.

Later this year, gubernatorial elections will be held in Ishikawa and Ehime prefectures, which both host nuclear power plants.

As local government support is vital to restarting nuclear reactors, those elections could have a major effect on whether operations can resume.

Campaigning for the Ishikawa election will officially begin Feb. 27. The incumbent, Masanori Tanimoto, will be seeking a record-tying sixth term. The prefectural chapters of the LDP, New Komeito and the DPJ have all pledged support for Tanimoto. Even the prefectural chapter of the Social Democratic Party, which has voiced its opposition to nuclear energy in Ishikawa, has come out in support of Tanimoto.

A decision on resuming operations at the prefecture's Shika plant, operated by Hokuriku Electric Power Co., is awaiting the results of a study about whether a fault lies directly under a nuclear reactor.

Tanimoto has taken the position of leaving all political decisions on plant operation resumption to the central government.

He said the central government policy of resuming operations at nuclear plants where safety has been confirmed was "a realistic approach."

Two candidates expected to run against Tanimoto are planning to come out squarely against nuclear energy.

One prospective candidate is Yuichiro Kawa, an Ishikawa prefectural assembly member who bolted from the DPJ after the prefectural chapter decided to back Tanimoto. Kawa plans to argue for a switch in energy policy away from nuclear power to natural energy sources.

"Nuclear energy policy is not only a matter for the central government, but is also a local matter," Kawa said.
The JCP candidate, Yoshinobu Kimura, is also expected to call for an immediate end to nuclear power generation.
Employees of electric power companies will follow the results of the elections closely.

One worker at Tokyo Electric Power Co. said: "Even if the central government has decided on such a major policy issue, the local governors have authority over the details. The backlash would be huge if we lost."

Nuclear energy will also be a key issue for the Shiga Prefecture gubernatorial election, scheduled for July.
The incumbent, Yukiko Kada, was critical of the 2012 decision to resume operations at the Oi nuclear plant in neighboring Fukui Prefecture.

"There are those who say local governments should not comment on nuclear energy policy, but will the central government protect people's lives and the environment?" she asked. "It was unable to protect Fukushima Prefecture. Voters should decide if nuclear energy policy should become a theme of the election."

Kada has not yet announced whether she will seek a third term.

The Fukushima gubernatorial election will be held in autumn. Governor Yuhei Sato has also not yet said whether he would seek a third term. It also remains unclear if energy policy will become an issue in that campaign. The Fukushima prefectural assembly unanimously passed a resolution after the 2011 nuclear accident calling for all reactors in the prefecture to be decommissioned.

Sato has also come out in favor of that position.

Splitting the anti-nuclear vote

February 6, 2014

Activists fear gubernatorial-race standoff could split anti-nuclear vote

http://www.japantimes.co.jp/news/2014/02/06/national/activists-fear-gubernatorial-race-standoff-could-split-anti-nuclear-vote/#.UvPGdLTrV1s

by Masaaki Kameda
Staff Writer

A group of activists said Thursday that neither of the two major anti-nuclear candidates running for Tokyo governor plans to drop out of the race because both feel it's too late and because they differ too much on policy.

The 19-member group, led by journalist Satoshi Kamata, on Monday asked former Prime Minister Morihiro Hosokawa and Kenji Utsunomiya, former chairman of the Japan Federation of Bar Associations, to make sure they don't throw the election away by splitting the anti-nuclear vote.

"I'd like to express my disappointment to both camps," lawyer Hiroyuki Kawai, who belongs to the activist group, said at a Tokyo news conference. "It's going to be very sad if (an anti-nuclear candidate) loses due to disunity in the campaign."

The group said it is acting out of concern that the combined vote tally of the two anti-nuclear candidates will surpass that of any other single candidate. Recent media surveys show former health minister Yoichi Masuzoe, backed by the ruling Liberal Democratic Party and its junior coalition partner, New Komeito, is leading the race, followed by Hosokawa and Utsunomiya.

While Masuzoe just recently said he will phase out atomic power in the long run if elected, his resolve is considered weaker than that of Hosokawa and Utsunomiya.

Kibo no Machi Tokyo wo Tsukuru Kai (Group to Create Tokyo With Hope), Utsunomiya's campaign group, said it decided not to cooperate with the activists for several reasons.

"It would betray those who already cast their ballots for Utsunomiya in advance voting as well as his supporters and volunteers if he accepted the offer," the group said in a statement.

Hosokawa likewise told the group that, although his policies on nuclear energy and the 2020 Olympics and Paralympics are similar to Utsunomiya's, their priorities differ on other issues.

The group's name is Datsu Genpatsu Tochijisenkouho ni Touitsu wo Yobikakeru Kai, which roughly means "group calling for unification of anti-nuclear candidates running for Tokyo governor."

Anti-nuclear candidates won't merge

February 7, 2013
2 anti-nuclear Tokyo governor aspirants decline to unify candidacies due to differences
http://mainichi.jp/english/english/newsselect/news/20140207p2a00m0na010000c.html

Two Tokyo governor hopefuls who are advocating an immediate end to nuclear power -- Kenji Utsunomiya, 67, and Morihiro Hosokawa, 76 -- have declined to unify their candidacies, a group calling for the merger said.

The group, known as the 'Association calling for the unity of anti-nuclear Tokyo gubernatorial candidates,' has 19 members including journalist Satoshi Kamata, as well as cultural figures, academics, and other assorted affiliates.

Association members said that they approached the campaign offices of both candidates with their request on Feb. 3.

Utsunomiya's campaign representative commented, "The official campaign is under way, and early election voting has already begun," and "There is a lack of consensus on numerous issues not related to nuclear power." Meanwhile, Hosokawa's office responded, "It is possible that the two movements may be able to collaborate at some point in the future," and "There are some differences in policy priorities."

Utsunomiya's campaign office added, "Regardless of the election outcome, both candidates have already agreed to get together and hold frank discussions."

"The decision is extremely unfortunate," commented lawyer Hiroyuki Kawai, who is also a member of the group that called for the merger. "For the anti-nuclear movement, this was a once-in-a-lifetime opportunity."

Hosokawa's campaign insufficiently prepared but still a "warning" for Japanese society

February 9, 2014

POINT OF VIEW/ Satoshi Kamata: Anti-nuclear position was not the loser in Tokyo gubernatorial poll

http://ajw.asahi.com/article/behind_news/politics/AJ201402090032

SPECIAL TO THE ASAHI SHIMBUN

Former health minister Yoichi Masuzoe emerged victorious in the Tokyo gubernatorial election held on Feb. 9. He was backed by the ruling coalition of the Liberal Democratic Party and New Komeito.

Going down to defeat was former Prime Minister Morihiro Hosokawa, who made an immediate end to nuclear energy his biggest campaign issue in a bid to slow moves by the LDP government intent on promoting nuclear energy.
Hosokawa was never able to overcome the late start of his campaign bid.

Campaigning alongside Hosokawa was Junichiro Koizumi, another former prime minister. Koizumi called for rebuilding Japan through a zero-nuclear energy policy.

The two former prime ministers showed they were still hugely popular as crowds in excess of 1,000 inevitably formed everywhere they appeared.

If those crowds had translated directly into votes, Hosokawa should have overwhelmed Masuzoe, who was criticized for his personality failings.

However, Hosokawa was unable to break down the organizational votes held by the LDP and New Komeito, which have a conservative base that stretches deep into Tokyo.

The Tokyo gubernatorial election was essentially a three-way race with the LDP and New Komeito backing Masuzoe, the Social Democratic Party and Japanese Communist Party endorsing Kenji Utsunomiya, a former president of the Japan Federation of Bar Associations, and Hosokawa running with the backing of Democratic Party of Japan and two other opposition parties.

Labor unions support DPJ in elections, but unions in companies related to the nuclear energy industry, such as Tokyo Electric Power Co., the operator of the crippled Fukushima No. 1 nuclear power plant, as well as manufacturers of electrical equipment, did not support Hosokawa because those unions, and their companies, all favor a resumption of operations at nuclear power plants.

The Tokyo gubernatorial election was an important one that could have put a stop to the important policies being pushed by the rightward-leaning Abe administration, such as promoting nuclear energy, implementing the state secrets protection law and changing the government's constitutional interpretation to allow for the exercise of the right of collective self-defense.

The election came in the wake of recent polls in which candidates pushed by the LDP were defeated in other important local elections. One was the Nago mayoral election, in which the incumbent who was opposed to relocating U.S. Marine Corps Air Station Futenma to his city won. The other was the mayoral election in Minami-Soma, Fukushima Prefecture, where residents have been forced to evacuate due to the Fukushima nuclear accident.

While arguing for the economic advantages of ending nuclear power generation, Hosokawa and Koizumi also called for changing the current political flow. That was nothing less than criticism from the conservative sector of the political world toward the rightward tilt of the administration.

The only reason Prime Minister Shinzo Abe backed Masuzoe, who had previously been expelled from the LDP, was because there was no other candidate who seemed capable of winning.

The important campaign pledges made by Masuzoe were to make Tokyo the best city in the world and to hold the best Olympics in history when the capital plays host in 2020. It is a fact that such invigorating planks were met with great expectations among major companies that depend on the nuclear energy sector and that are hoping for a construction boom ahead of the Summer Olympics. Those planks, which guarantee short-term benefits rather than what might occur in the future, were also met favorably by small companies and the young who have suffered in the past from economic slowdown and unemployment.

HOSOKAWA CAMP UNPREPARED

When the gubernatorial campaign began, I visited Hosokawa's campaign office. What I found was not encouraging.

There were no campaign workers or fliers. The microphone for the campaign car was too small. The chain of command was unclear. Those volunteers who did show up soon ended up going home because there was nothing for them to do.

It was said that the major direction of those in charge of the campaign was not to depend on a "surface strategy," in which plodding campaign events would be held, but to gain an instant victory through an "air attack strategy."

It was only after those in charge of the campaign were dismissed en masse that the campaign structure was rebuilt and the campaign office appeared to function normally. However, by then, a week had already passed.

In other words, it was more a defeat caused by insufficient preparations by the Hosokawa camp rather than a victory for Masuzoe.

Moreover, two former prime ministers made the important confession in front of the public, "We were ignorant for having allowed nuclear power generation. It was a mistake."

However, the SDP and JCP, which backed Utsunomiya, would not accept those statements and only criticized the policies implemented when Koizumi was prime minister. That led both candidates to fall before Masuzoe. Their inability to cooperate represents the underdeveloped state of Japanese politics today.

Still, with the movement toward resumption of operations at nuclear plants heating up, I believe the Hosokawa campaign made a huge contribution by continuing to speak up about the dangers of nuclear energy.

If another nuclear accident should occur in Japan, there would be no more talk about the economy or the Tokyo Summer Olympics

The slogan of "**Let's bring the Olympics to a Japan with no nuclear plants" is still an effective warning for society.**

Born in 1938 in Aomori Prefecture, Satoshi Kamata is a writer who is known for going to the scene of issues that interest him in order to describe what is happening from an up-close perspective. His books have covered labor and social issues, such as pollution. He has been critical of the dangers of nuclear power generation since the early 1970s.

No hurry?

Suga: no time limit for finalizing new energy plan

http://www3.nhk.or.jp/nhkworld/english/news/20140210_24.html

Japan's top government spokesman says a time limit should not be set in finalizing the country's new basic energy plan. He said thorough discussions on the matter should be held.

Chief Cabinet Secretary Yoshihide Suga was speaking to reporters on Monday.

Suga said the government is working on a new plan based on its policy to maximize renewable energy and minimize dependency on nuclear power.

He said the ruling parties are asking for a thorough debate on energy policy. He added the government wants to coordinate opinions with them in reaching a conclusion.

Suga also referred to the difficulty of finding final disposal sites for radioactive waste from nuclear power plants.

He said it is an extremely important issue. He added that Prime Minister Shinzo Abe does not want to put off the decision on the sites and leave the problem to future generations.

Suga said the government will decide the locations from a scientific standpoint.

The Abe cabinet initially aimed to decide on a new energy plan outlining the country's medium to long term energy policy by the end of January.

Energy future: what challenges for Japan?

February 11, 2014

Editorial: Gov't must ask public if they're prepared to pay extra to kill nuclear power

http://mainichi.jp/english/english/perspectives/news/20140211p2a00m0na003000c.html

The Cabinet of Prime Minister Shinzo Abe is set to approve a basic plan on energy, which outlines Japan's mid- and long-term energy policy, as early as the end of this month.

The government intends to only partially revise the wording of a phrase that attaches importance to atomic power in the original draft before approving it at a Cabinet meeting. The move follows the victory of former Health, Labor and Welfare Minister Yoichi Masuzoe over anti-nuclear candidates in the Feb. 9 Tokyo gubernatorial election, in which the pros and cons of ending Japan's reliance on atomic power was a key point of contention.

However, it is essential for the government to show the people a road map toward ending Japan's dependence on nuclear power, while clarifying the extra costs that each and every member of the general public will need to shoulder. Mere fine tuning of the policy as a stopgap measure is far from making a convincing case to the public.

The original draft that an advisory council to the Economy, Trade and Industry Ministry worked out at the end of last year is based on the assumption that Japan will continue to rely on nuclear power, representing a departure from the "zero nuclear" policy adopted by the previous administration led by the Democratic Party of Japan (DPJ).

The Cabinet had previously intended to adopt the basic energy plan by the end of January. However, it postponed a decision not only because the Abe government gave consideration to the Tokyo gubernatorial election, but because some members within the ruling coalition raised questions about the draft's description of nuclear power as "an important base power source that serves as the foundation" for the nation's energy supply.

Regarding the ratio of atomic power to total electricity consumed in Japan, the original draft states, "The scale of nuclear power necessary should be sufficiently ascertained and that amount should be secured." The government intends to water down this phrase in the final draft.

Prime Minister Abe told the ongoing Diet session, "We can't easily say, 'We'll stop nuclear power.'" Economy, Trade and Industry Minister Toshimitsu Motegi also told the Diet that the government will not change its position that nuclear power is a foundational power source. In other words, the government has no intention of changing its basic direction of maintaining nuclear power even though it plans to

partially change the wording of the original draft, which could be viewed as a cosmetic change aimed merely at dodging criticism from anti-atomic power forces.

Some government officials say that the outcome of the Tokyo gubernatorial race demonstrates that the public supports the plan to restart idled nuclear reactors. However, they should keep in mind that Masuzoe, who won the election, has declared that he is in favor of decreasing Japan's reliance on atomic power. Moreover, the government's policy of maintaining nuclear power for the foreseeable future runs counter to a campaign pledge that the Liberal Democratic Party (LDP) made in the 2012 House of Representatives election to establish a socioeconomic structure that does not need to rely on atomic energy.

The myth of nuclear reactors' perfect safety has collapsed following the March 2011 outbreak of the Fukushima nuclear crisis. Such being the case, the government should pursue a society that does not rely on atomic power, just as the LDP pledged to the public before its December 2012 landslide election victory. The government should also clearly declare that it will abandon the nuclear fuel cycle project, in which spent nuclear fuel is reprocessed and reused in nuclear plants, since the project runs counter to the LDP's campaign pledge.

There is no denying that the whole of society would be required to shoulder extra financial burdens if Japan is to eliminate atomic power. If all nuclear power stations were to be promptly shut down while natural gas and other fuel prices remain high, electricity charges would rise, possibly dealing a serious blow to the economy. Generating more power at thermal power stations could contribute to global warming. Japan's excessive reliance on imported fossil fuel is also risky in terms of energy security.

The government should clarify these challenges and try to find the best ways to minimize the effect that phasing out nuclear power will have on the economy, the environment and security. The government should also ask the public if they are prepared to shoulder the remaining costs of decreasing the country's dependence on nuclear power. The basic plan on energy is essential for these efforts.

February 11, 2014(Mainichi Japan)

A whiteout

February 10, 2014
Nuclear energy issue snowed under in Tokyo gubernatorial poll
http://mainichi.jp/english/english/perspectives/news/20140210p2a00m0na020000c.html

Abandoning nuclear energy did not, in the end, become the lightning rod issue of the Tokyo gubernatorial race. A serious debate over power consumption, which would have shown a commendable self-awareness of Tokyo's electricity-hogging ways, never really got off the ground. Tokyo's nuclear-powered prosperity, built on contradiction and fear, continues unaltered.

How, in the end, was atomic energy discussed during the campaign? One candidate in a televised debate I saw had this to say: "There is not one radiology expert in the whole world saying that nobody can live in that area (around the Fukushima No. 1 nuclear plant)." And, "The government forced residents to evacuate even without a scientific reason, casting those people's lives into chaos."
In response, an anti-nuclear power candidate referenced the number of people killed in the 1986 Chernobyl disaster. The candidates' points failed to mesh, and the atomic energy discussion ended there.

How are we to see this missed connection? If the pro-nuclear power candidate was saying that people could still live around the wrecked reactors, that's an irrational argument. But perhaps that's not what he was trying to get across. Maybe he wanted to say that compared to international standards, the Japanese government's radiation dose limits are too strict. Even if that was his intent, it still clashes with what some experts believe about cancer stemming from indirect radiation exposure.

Meanwhile, the number of dead at Chernobyl includes people killed by direct exposure to radiation, and bringing this up simply complicated the discussion.

Granted, we can allow the candidates a little room for slipups since the debate was live. Still, however, I suspect that there were a lot of viewers out there wondering what on earth the two men were talking about.

Watching the candidates talking past each other, I recalled an NHK documentary called "Fukushima: Hamadori genpatsu to ikita machi," or, "A Fukushima town that lived with a nuclear plant," aired on Jan. 4 this year. The program was part of an oral history series about the hopes and goals of the Japanese people since the end of World War II. The documentary centered on the difficult story of former Futaba Mayor Tadao Iwamoto, who was at first against atomic energy but ended up embracing the nuclear plant in his town.

Iwamoto had been a sitting Socialist Party member of the Fukushima Prefectural Assembly, as well as the chairman of the Futaba regional anti-nuclear power league. In 1985, when the incumbent mayor of Futaba was brought down in a corruption scandal, Iwamoto -- an energetic and a refreshingly new presence on the ballot -- ran to take his place. He was elected, and went on to serve five terms in the post -- finally quitting in 2005.

In July 2011, Iwamoto passed away quietly in a hospital in the city of Fukushima, where he'd been evacuated after the triple meltdown at the Fukushima No. 1 plant forced the abandonment of his town. The Mainichi Shimbun published a long retrospective on his career in its Aug. 25 morning edition.

If I consider Iwamoto's position, I have to admit that it's very human indeed to think, "I don't like nuclear power, but I dislike poverty and inconvenience even more." Fight against atomic energy, or embrace it? That was the dilemma Iwamoto had to face head-on -- and it's also the question that the people of Tokyo, of Japan, and even the entire human species must answer.

The people of Futaba staked their livelihoods on their answer to that question. The people of power-hungry Tokyo felt no such urgency, and atomic power had never been more than one of many topics for discussion.

In 2003, as Iwamoto neared retirement, the mayor had this to say to an interviewer: "Nuclear energy holds so much possibility, but at the same time, it's an enormous gamble. I'd like to see that gamble continue to be proven right."

Futaba gained much prosperity from that gamble, and then on March 11, 2011, it lost everything. So went the fate of that town and its former mayor. While I cannot say that all of humanity faces the same destiny, there is also no proof that we are completely disconnected from it, either.

Starting on the day before the Tokyo gubernatorial vote and continuing into the wee hours of election day, Tokyo was blanketed in the third-heaviest snowfall to hit the city since the end of World War II. Tokyo was covered in white; a whiteout.

Last autumn, a novel about a central government bureaucrat caught up in the turmoil of Japan's energy policy became a best-seller. It was titled, "Genpatsu Whiteout," or "Nuclear energy whiteout." I think it's right to say that debate over atomic power in Tokyo, despite its unquenchable thirst for energy, has been whited-out just as thoroughly as the city's streets in a snowstorm's embrace. (By Takao Yamada, Expert Senior Writer)

February 10, 2014(Mainichi Japan)

Is it just people in Fukushima who hoped the election was about nukes?

February 10, 2014

People hosting nuclear plants voice hope, caution over new Tokyo gov.
http://mainichi.jp/english/english/newsselect/news/20140210p2g00m0dm038000c.html

TOKYO (Kyodo) -- Residents of Japanese towns and cities that host nuclear power plants expressed both hope and wariness over the victory of former health minister Yoichi Masuzoe in the Tokyo gubernatorial race on Sunday.

Some said they expect Masuzoe, 65, to exercise leadership as the new governor of Japan's capital on energy policy, while urging him not to ignore the number of antinuclear votes cast in the closely watched election.

"I wanted a candidate promising to bring the number of nuclear power plants to zero to win," said Kazutoshi Mabuchi, a 68-year-old evacuee from Okuma, Fukushima Prefecture.

"Is it just people in Fukushima who hoped the election was about nuclear power?" Mabuchi said, adding that memories of the nuclear crisis "are fading away like this."

Masuzoe, who received support from the ruling Liberal Democratic Party and the junior coalition New Komeito party, is aiming for less dependence on nuclear power in the long run, differing from other candidates endorsed by opposition parties who sought an immediate end.

"It is a mere political performance to discuss whether or not Japan should keep nuclear power plants, but not their safety," said Hiromi Maeda, a 59-year-old member of a cooperative union that promotes the use of both nuclear and green energy in Kashiwazaki, Niigawa Prefecture.

Tokyo Electric Power Co., the operator of the Fukushima Daiichi nuclear power plant crippled by the March 2011 earthquake and tsunami, approved a plan in January that includes the restart of the Kashiwazaki-Kariwa plant.

Kazuyuki Takemoto, 64, who is opposed to the plant in Kashiwazaki, said the new Tokyo governor should not forget about the local municipalities that supply electricity.

"It's irresponsible for Tokyo to prosper through the sacrifice of other municipalities," Takemoto said.
Other residents said they agree with the idea of zero nuclear power, but also pointed to the fact that their jobs and the local economy depend heavily on hosting nuclear power plants.

Yasuo Miyoshi, 71, who lives in Ikata, Ehime Prefecture, where Shikoku Electric Power Co. is aiming to restart the Ikata plant, expects Masuzoe to guide Japan's energy policy.

"Tokyo should take the lead and show the path...because it will affect the country as a whole," Miyoshi said.

Tokyo election not a clear vote for nuclear energy

The governor's election in Tokyo led to a defeat for the opponents of nuclear energy. But in the wake of the Fukushima disaster, the debate about the course of the country's energy policy hasn't been decided yet.

When former health minister Yoichi Masuzoe was elected governor of Tokyo by a large margin on Sunday, February 9, Japan's conservative premier Shinzo Abe clearly heaved a sigh of relief. "Now we can prepare for wonderful 2020 Olympic Games hand in hand," he said.

But Abe's true source of relief was probably the defeat of candidate Morihiro Hosokawa. The former prime minister had attempted to make the race for governor into a referendum on nuclear power. He was backed by popular politician Junichiro Koizumi, another former premier who was in power from 2001 to 2006.

But their strategy didn't pay off. True, surveys have shown that the majority of the Japanese population favor a gradual phasing out of nuclear energy. Still, energy policy isn't very high up on the list of Japanese priorities. Tokyo's voters ranked the importance of jobs, the economy, an ageing population and social welfare far higher than energy policy. In any case, the 65-year-old Masuzoe received more votes than the two anti-nuclear candidates - Hosokawa and Kenji Utsunomiya, a human rights lawyer - combined.

A step by step reduction

Yoichi Masuzoe was the clear winner in the gubernatorial election in Tokyo

With his promise to gradually reduce Tokyo's dependence on nuclear power, Masuzoe took the wind out of his rivals' sails. The former health minister explained that he intends to increase the amount of power generated in Tokyo from renewable energy from currently six percent.

According to a survey conducted by public broadcaster NHK, a narrow majority of voters supports this new empahsis. 76-year-old Hosokawa has admitted defeat after the election but has pointed out that he feels there is a gap between the result and the enthusiasm of the people that he sensed during his campaign.

Nuclear opponent Koizumi doesn't want to give up yet either. "The result is regrettable but I will continue my struggle to reach a state of zero nuclear energy in the future," explained Koizumi, who changed his mind on nuclear power after Fukushima.

He justified his own pro-nuclear stance during his time as prime minister by claiming that the utility companies had lied to him about the security of the power plants.

Nuclear debate flares up anew

But anti-nuclear campaigners hardly see the election result as a vote in favor of nuclear power. Voter turnout was at low 46 percent, as the country faced the heaviest snowfall in 45 years.

Journalist Satoshi Kamata pointed to Hosokawa and Koizumi's "badly organized election campaigns" to explain the result. He claims that Abe's ruling Liberal Democratic Party (LDP) and its partner New Komeito ran a "veritable campaign machine." In the liberal newspaper Asahi, Kamata explained that the Hosokawa campaign had made a big contribution to rekindling the debate about the dangers of nuclear power.

Still, the result is likely to encourage the Abe-led government to restart the country's 48 nuclear reactors which have been mothballed ever since the devastating earthquake and ensuing tsunamin in March 2011. The new energy bill, which Abe had postponed until after the Tokyo gubernatorial elections, will probably declare nuclear energy a fundamental energy source.

The liberalization of the energy market set for this spring could free the Japanese government from determining the amount of energy it will source from nuclear reactors. Until the Fukushima disaster, nuclear energy was the source for 30 percent of Japan's electricity. According to information provided by

Trade and Industry Minister Toshimitsu Motegi, the government is also considering to allow three unfinished nuclear construction projects to be completed.

Obstacles block a restart

But in practice, there are still several obstacles to restarting Japanese nuclear power plants. The security checks on 16 reactors which the utility companies requested last summer have taken longer than expected. The new supervisory board for nuclear energy only has 90 employees for the task. And they are treating the checks as if the nuclear power plants needed a second operating license - meaning that they are being extremely thorough in their work.

Alongside the government, local authorities and politicians will still have to approve a restart. It could thus be several months until the plants are actually up and running again.

The next battle over nuclear power is likely to take place in just two weeks - on February 23 - in Abe's home province Yamaguchi. Unlike in the capital Tokyo, where nuclear energy was just one of the issues up for discussion, people in Yamaguchi will be deciding on only one question: whether or not to approve a new nuclear power plant in Kaminoseki. There are also elections taking place in the prefectures Ishikawa and Ehime, each of which boasts a nuclear power plant.

What is more, this autumn the population of Fukushima is set to elect a new governor. The current governor Yuhei Sato is demanding that all nuclear reactors in the prefecture be dismantled, including the four that are still intact at the Fukushima Daini plant, located just a dozen kilometers south of the damaged reactors in Daiichi.

LDP: Nukes but not forever

February 13, 2014
LDP group: Nuclear power use must be transitional
http://www3.nhk.or.jp/nhkworld/english/news/20140213_02.html

A group from Japan's ruling Liberal Democratic Party has proposed that the government stipulate the role of nuclear power as 'transitional' in the country's new energy policy.

The LDP-led coalition government has commissioned a panel to draft a new master plan for the country's mid- to long-term energy policy.

The panel is compiling a draft that would define nuclear energy as an 'important basic energy source' for the country. The government intends to draw up a policy that would include resumption of some nuclear reactors.

Taro Kono and other lawmakers within the ruling LDP are advocators of a nuclear-free society in the future.

On Wednesday, they met Chief Cabinet Secretary Yoshihide Suga and handed over their proposal. It says the government's new master plan should be consistent with the party line that aims to establish an economic and social structure independent of nuclear power.

The proposal also requests the new policy include a roadmap to lessen the country's dependency on nuclear power, the building of no new reactors and ending reprocessing of spent nuclear fuel.

Suga said the government will closely discuss the issue with the ruling party in working out on the new energy policy.

Proactive pacifism: Japan must take the initiative

February 19, 2014
EDITORIAL: Japan must take lead in moves to eliminate nuclear weapons
http://ajw.asahi.com/article/views/editorial/AJ201402190023

With 146 countries participating, the two-day Second Conference on the Humanitarian Impact of Nuclear Weapons in Nuevo Vallarta, Mexico, wound up Feb. 14 with a call for a "legally binding instrument" with which to keep nuclear weapons under control.

In 1967, the Treaty for the Prohibition of Nuclear Weapons in Latin America and the Caribbean was signed in Mexico. The chair of the Mexico conference declared in his closing summary: "It is time to take action. The 70th anniversary of the Hiroshima and Nagasaki attacks is the appropriate milestone to achieve our goal."

At the conference, testimonies by Japanese "hibakusha" survivors of the Hiroshima and Nagasaki atomic bombings attracted attention. We welcome the fact that the repeated appeals of these people over the past decades are finally beginning to resonate with the international community.

There are still an estimated 17,000 nuclear warheads in the world today. Many non-nuclear nations, disturbed by the elusiveness of their goal of a nuclear-free world, are now intensifying their efforts to stress the inhumanity of nuclear weapons and ban their use or possession through treaties.

In 2008, the perceived inhumanity of cluster bombs resulted in the adoption of the Convention on Cluster Munitions to prohibit the use, transfer and stockpile of such weapons. Eliminating blatantly inhumane weapons has become a global trend, but the United States, Russia and three other nations that are allowed to possess nuclear weapons under the Nuclear Nonproliferation Treaty still consider them vital to security and are against a treaty banning them. In fact, those five countries did not participate in the Mexico conference.

The position of the Japanese government is complex. Last October, Japan finally supported a United Nations statement denouncing nuclear weapons as inhumane. But at the same time, Japan also endorsed another joint statement that was more cautious about a treaty to ban nuclear weapons. Japan knows the horrors of nuclear warfare better than any other country, but it cannot easily change its security policy that relies on the U.S. nuclear umbrella. This conflict prevents the Japanese government from taking a clear-cut position.

In January, Foreign Minister Fumio Kishida, who is from Hiroshima, explained the government's nuclear disarmament and nonproliferation strategy in Nagasaki. Positioning the strategy as an embodiment of the Abe administration's notion of "proactive pacifism," Kishida said Japan is committed to "reduction of the number of nuclear weapons, reduction of the role of nuclear weapons, and reduction of the incentive for possession of nuclear weapons."

This is an honorable commitment, but how does the administration intend to pursue it in East Asia, which is one of the most tense regions in the world?

With China staying the course of military expansion and North Korea carrying out nuclear tests, the Japanese government is of the view that U.S. nuclear weapons still play a vital role in the region.
But Abe's ambitious security policy, such as bolstering Japan's missile defense capabilities, is putting China and North Korea on their guard and may well enhance, rather than diminish, the role of nuclear weapons.

Also, the continued slide in Japan's relations with South Korea is casting shadows on six-party talks for the denuclearization of the Korean Peninsula.

In the absence of diplomatic efforts to foster relationships of trust with neighboring countries, any nuclear disarmament strategy is nothing more than pie in the sky. And without a security framework that does not rely on nuclear weapons, it would be impossible to lower the need for those weapons.

The Obama administration has been following a policy similar to the "three reduction" proposal Kishida explained in Nagasaki. Japan should work together with the United States, the provider of the nuclear umbrella, to come up with specific plans of action.

If nuclear disarmament stands for "proactive pacifism," Japan must take the initiative.

Former power company president on green technologies

February 21, 2014

Hibakusha: Ex-power company president ponders energy options in post-Fukushima Japan

http://mainichi.jp/english/english/features/news/20140221p2a00m0na002000c.html

"I thought I had to complete this project for future generations after the 2011 earthquake and tsunami," former Chugoku Electric Power Co. President Shigeo Shirakura recently told me about a research paper he'd been working on. This was the first time I'd seen Shirakura in three and a half years.

The paper is about green technologies, including "clean" coal power generation with denitrification and desulfurization -- something the 78-year-old engineer has been involved in for nearly half a century.

"We need energy, but the Great East Japan Earthquake stopped nuclear power generation. Renewable energy is problematic regarding its quantity and quality. All we have left, therefore, is coal."

What drove Shirakura to finish his paper at the age of 76, even after an operation for valvular heart disease, were his pride as a power company engineer and his childhood memories of World War II.

Shirakura was a fourth-grade student at an elementary school in Kaita, Hiroshima Prefecture, when the atomic bomb hit on the morning of Aug. 6, 1945. He was doing his homework with the windows open and saw three U.S. Air Force bombers flying in the blue sky. Just as he thought, "B-29s are here," the young Shirakura was hit with a great flash.

He immediately hid under a table as the blast wave shattered the glass in the windows and tore up tatami mats.

That afternoon, A-bomb victims began pouring into Shirakura's hometown, more than 10 kilometers away from the hypocenter. Among them were schoolgirls who had been mobilized to work in Hiroshima's factories. Their faces were severely burned and they barely had any clothes on. Shirakura's father, who owned a clothing store, cut up cloth he had in stock into large pieces and quickly fashioned them into rough garments so that girls had something to wear. Shirakura remembers helping his father make them.

On the next day, Shirakura went with his mother and elder brother to the Hakushima area of Hiroshima to look for relatives. The city had been reduced to ash.

"We called the bomb 'pikadon' then -- referring onomatopoeically to the flash ('pika') and the blast ('don') of the atomic bomb. I was simply scared. So, I was really relieved when the war ended. It made me realize how wonderful it is to have lights in towns," Shirakura recalled.

Shirakura had been exposed to radiation as he entered the Hakushima district, about two kilometers from the hypocenter. Because of this, he applied for atomic-bomb disease certification three years ago. His application was rejected, however, as the testimonies of Shirakura and his witnesses did not match.

"I didn't apply for certification because I wanted compensation. I did it because I wanted proof that I was there."
Still, he can't help but wonder about the effects of the bomb as his brother died of cancer. He also thinks about the radiation whenever he gets sick.

Being affected by the atomic bombing and radiation, Shirakura understands how Fukushima residents near the crippled Fukushima No. 1 nuclear plant must feel. At the same time, he is aware that most Japanese people never really questioned the country's energy policy before the meltdowns.

"Each of us Japanese people needs to think about the future of the country's energy policy rather than pushing for a 'no nuclear power' policy just because the Fukushima plant accident happened." (By Hidetoo Okazaki, Kyoto Bureau)
February 21, 2014(Mainichi Japan)

Nukes still "important"

February 25, 2014

In latest draft energy policy, government calls nuclear power 'important'

Kyodo

http://www.japantimes.co.jp/news/2014/02/25/national/in-latest-draft-energy-policy-government-calls-nuclear-power-important/#.UwxbyoXrV1s

The government Tuesday unveiled a draft energy policy that characterizes atomic power as an important electricity source, although the draft waters down some wording seen in an earlier version as signaling a strong pro-nuclear tone.

In the draft, the government said nuclear energy is an "important base-load power source" that usually supplies electricity continuously through the day, while vowing to push for the restart of reactors that have satisfied new safety requirements introduced after the 2011 Fukushima No. 1 nuclear power plant disaster.

The government initially planned to secure Cabinet approval of the so-called Basic Energy Plan in January, having already unveiled a draft document a month earlier. But it apparently decided to proceed more slowly after seeing how the content stirred controversy among some ruling party lawmakers who found the tone of the plan to be too strongly pro-nuclear.

The original draft said nuclear power is "important" and also serves as a "foundation" for the stability of Japan's energy supply.

But in the latest draft, the word foundation was removed.

As for Japan's long-standing spent nuclear fuel recycling policy, the revised document said the government will promote it, but added that there should be "flexibility" in the medium to long term.

Meanwhile, the government added emphasis to the section on renewable energy, saying that efforts to accelerate the introduction of such sources will continue "beyond" the period of about three years starting from 2013.

The government is legally required to review the Basic Energy Plan at least every three years by taking into consideration changes in the energy situation.

The previous plan compiled in 2010 aimed to boost the nation's reliance on nuclear power to some 50 percent of its total electricity in 2030 from around 30 percent before the Fukushima disaster.

In 2012 the previous government, led by the Democratic Party of Japan, now the main opposition party, decided on what it called an “energy strategy” aiming to phase out nuclear power by the end of the 2030s, but it did not go so far as to revise the Basic Energy Plan that was expected to stipulate detailed measures to realize the strategy.

All of the 48 commercial reactors in Japan are now offline amid heightened safety concerns after the nuclear crisis, with thermal power generation making up for the shortfall.

Renewable energy accounted for less than 2 percent of the total electricity generated in fiscal 2012 when excluding hydropower.

First energy plan since Fukushima crisis says nuclear power important energy source
http://ajw.asahi.com/article/behind_news/politics/AJ201402250057

THE ASSOCIATED PRESS

Japan unveiled its first draft energy policy since the Fukushima meltdowns three years ago, saying nuclear power remains an important source of electricity for the country.

The draft presented Feb. 25 to the Cabinet for approval expected in March, said Japan's nuclear energy dependency will be reduced as much as possible, but that reactors meeting new safety standards set after the 2011 nuclear crisis should be restarted.

Japan has 48 commercial reactors, but all are offline until and unless they pass the new safety requirements.

The draft of the Basic Energy Plan said that a mix of nuclear, renewables and fossil fuel will be the most reliable and stable source of electricity to meet Japan's energy needs. It did not specify the exact mix, citing uncertain factors such as the number of reactor restarts and the pace of renewable energy development.

The government had planned to release the draft in January but a recommendation submitted by an expert panel was judged to be too pro-nuclear. The draft unveiled on Feb. 25 added slightly more emphasis on renewable energy.

Economy, Trade and Industry Minister Toshimitsu Motegi, in charge of compiling the plan, told reporters that "in principle, the direction has not changed."

He called for additional efforts to accelerate the development of renewable energy over the next few years.

The draft says Japan will continue its nuclear fuel recycling policy for now despite uncertainty at key facilities for the program, but added there is a need for "flexibility" for possible changes to the policy down the road.

Japan has tons of spent fuel and a stockpile of extracted plutonium, causing international concerns about nuclear proliferation.

Officials have said the most realistic way to consume and reduce the plutonium is to restart the reactors to burn it.

The previous energy plan compiled in 2010 called for a boost in nuclear power to about half of Japan's electricity needs by 2030 from about one-third before the Fukushima disaster.

Japan's govt. drafts basic energy plan
http://www3.nhk.or.jp/nhkworld/english/news/20140225_21.html

Japan's government has drafted a new basic energy plan that defines nuclear power as an important "base-load" energy source.

The draft was adopted at Tuesday's meeting of relevant cabinet ministers. How to define nuclear power has been a focal issue since the 2011 accident at the Fukushima Daiichi plant.

An initial draft issued last year defined nuclear power as an important, fundamental base energy source. The description drew criticism from members of governing parties for giving nuclear energy too high a status.

"Base-load energy" refers to a power source that can continuously supply electricity day and night in a stable manner.
Government officials say the phrase is a description of capability, and is not an indication of the power

source's importance in the energy market.

The draft says the government will restart nuclear plants whose safety has been established by the highest standards in the world as designated by the Nuclear Regulation Authority.

It says the nation's policy of recycling spent nuclear fuel should be tackled with strategic flexibility, according to how much nuclear power plants are used in the future.

The government will present the energy plan to the governing parties, and later have it approved by all members of the cabinet.

Hand it over

February 26, 2014
Japan to hand over plutonium to US
http://www3.nhk.or.jp/nhkworld/english/news/20140226_38.html

Japan is preparing to hand over to the United States its stockpile of research-purpose plutonium. It was purchased decades ago from the US and other countries.

Chief Cabinet Secretary Yoshihide Suga said on Wednesday that since the 9-11 attacks in 2001, the US has aggressively tackled reducing nuclear material that could be targeted by terrorists for their use.

He said Japan has been actively cooperating with this effort, hoping to contribute to international nuclear security.

Japan purchased the plutonium in the late 1960s through the mid-70s for research use at Tokai Village, about 100 kilometers north of Tokyo.

Mixed reactions to energy plan

February 26, 2014

Ex-PM Kan criticizes govt. energy plan

http://www3.nhk.or.jp/nhkworld/english/news/20140226_32.html

Former Prime Minister Naoto Kan has criticized the draft of a general energy plan submitted by the Liberal Democrat-led government. He says it aims for increased use of nuclear power.

Speaking at a Lower House subcommittee meeting on Wednesday, Kan said in places the document calls for minimizing reliance on nuclear power. But when read as a whole, it aims for the exact opposite.

Industry minister Toshimitsu Motegi refuted the claim, describing the draft as balanced and practical.

Kan also said support for nuclear fuel recycling in the draft shows the government learned nothing from the accident at Fukushima Daiichi nuclear plant.

Motegi said there are no grounds for criticism, as the government is playing a bigger role in nuclear fuel recycling.

After the meeting, Kan told reporters that his Democratic Party-led administration shifted its nuclear energy policy after he felt remorse for never doubting the safety of nuclear plants until the Fukushima accident.

He accused the administration of Prime Minister Shinzo Abe of trying to turn back the clock on nuclear energy policy to pre-March 2011.
Feb. 26, 2014 - Updated 10:03 UTC

Mixed reactions on govt. energy plan
ttp://www3.nhk.or.jp/nhkworld/english/news/20140226_26.html

The Japanese government's draft of a general energy plan is drawing mixed reactions within the ruling bloc.

The Liberal Democratic and New Komeito parties, which make up the ruling coalition, met separately on Wednesday to discus the draft that had been adopted the previous day.

It defines nuclear power as an important "base-load energy source," which can steadily supply power around the clock. It also calls for restarting nuclear plants that meet safety standards, while minimizing reliance on nuclear power.

Members of the Liberal Democratic Party expressed support for the draft, saying that nuclear power is needed for business activities.

Others said even if there were no longer nuclear plants in Japan, the technology need to decommission reactors would be necessary as long as there are plants in other countries.

Other members said the plan should make clear that Japan aims for zero reliance on nuclear power in the future, and will eventually stop recycling nuclear fuel.

In a separate meeting, members of New Komeito took issue with the designation of nuclear power as a

base-load energy source.

Some supported the decision, claiming it does not mean increased reliance on nuclear power. But others pointed out the term is unfamiliar and might not be understood by the general public.

The ruling parties plan to sum up views on the draft by the end of March. Feb. 26, 2014 - Updated 08:58 UTC

Good news?

February 21, 2014

In light of Fukushima disaster, Vietnam delays construction of 1st nuclear power plant

http://ajw.asahi.com/article/forum/politics_and_economy/southeast_asia/AJ201402210041

Michiko Yoshii

Professor at the Center for International Education and Research of Mie University
Michiko Yoshii is a professor at the Center for International Education and Research of Mie University. She did her postgraduate work at Paris VII University and the University of Tokyo and earned her Ph.D. Her areas of expertise are Vietnamese anti-war songs, the plight of street children and civil society.

Concern over the 2011 nuclear disaster in Japan has caused Vietnam to delay construction of its first nuclear power plant.

The project was initially scheduled to start this year, but the work may now be postponed until 2020.
The decision was announced by Prime Minister Nguyen Tan Dung on Jan. 15.
According to the Vietnamese newspaper Tuoi Tre one day afterward, Dung also said, "Building nuclear power plants will be done with the highest safety and efficiency, and the project will not go ahead unless standards are met."
The remarks pertain to the Ninh Thuan No. 1 nuclear power plant, which was ordered from a Russian state corporation. I truly hope the groundbreaking will be delayed, in line with his words.

OBJECTIONS FROM COMMUNIST PARTY MEMBERS

Many objections were raised in Vietnam after the plan for building the country's first nuclear power plants was finalized.

Typically, political and social issues draw critical comment from Vietnamese living abroad, in the United States for example. But on the issue of nuclear power plants, the outcry has a strong domestic base. Those who oppose the policy are former National Assembly members, university professors and high-ranking Communist Party officials.

In June 2011, three months after disaster unfolded at the Fukushima No. 1 nuclear power plant, Pham Duy Hien, the former head of the governmental Dalat Nuclear Research Institute, where the only nuclear reactor operating in Vietnam is located, argued for a 10-year delay in construction work, citing safety issues and a lack of personnel.

Even within the government, Minister of Science and Technology Nguyen Quan said repeatedly in 2012 that "personnel training will not keep up" with planned construction.

When I visited Ho Chi Minh City in southern Vietnam last September, people sought me out to give lectures. They said, "We want you to tell us about Fukushima."

I hadn't lived in Fukushima, but I suppose they wanted to hear about Japan from a Japanese person who can speak directly to them in their own language. I met many artists and people affiliated with Vietnamese universities and the mass media, and I got the impression that a good number of them are skeptical about the quest for nuclear power.

I was also asked to write an article for the weekend edition of a national Vietnamese newspaper about changes in Japanese lifestyle in the aftermath of the Fukushima accident.

Vietnam's media is subject to strict censorship. Until then, it was the norm for the media to report about the Fukushima accident as something that had happened in the past and was now fully sorted out. I wrote about voluntary evacuees as well as short trips for recreation taken by Fukushima children to places where there was no fear of contamination. These articles seemed to be quite a novelty in Vietnam.

I took a group of students from Japan on a visit to Ninh Thuan Province, the site of the planned nuclear power plant, where we toured a village inhabited by the ethnic Cham people. When we visited the home of Inrasara, a Cham intellectual and poet of considerable world fame, we were all at a loss for words when we heard: "They're going to build a Russian nuclear power plant on the coast five kilometers from here. When it's finished, I'll be able to see it from my home." On the proposed site stands a small shrine where the Cham "god of the tsunami" is enshrined. We heard that the size of the shrine's grounds were reduced as part of preparations to build the nuclear power plant. He told us, "We struggle to put on our annual festival."

Ninh Thuan Province is the Cham heartland, where the Kingdom of Champa (192-1832) used to exist. Until 1975, it was recognized by the former government of South Vietnam as an autonomous area. Building intrusive facilities like a nuclear power plant in such a place is akin to U.S. military bases in Japan, is it not? When I heard about Dung's announcement with regard to nuclear power plants, I imagined the looks on the faces of the Cham minority.

MY SECOND HOME

I'm Japanese, so sometimes people who come hear my lectures applaud my stance, speaking as a Japanese, of opposing exports of nuclear technology from Japan. But they question whether I should be voicing objections to another country's construction of nuclear power plants. They view it as interference in their domestic affairs.

But the Chernobyl and Fukushima disasters show that when an accident occurs, the effects cross national borders. As global citizens, we should speak out on issues of global concern.

My husband is Vietnamese. Our two children spent most of their early childhood in Ho Chi Minh City. Our family of four just only began living in Japan a few years ago. My children, who have Vietnamese citizenship, might live in Vietnam in the future. My husband and I have decided to spend our old age there.

I do not have Vietnamese citizenship, so although their leader is not my prime minister, I wholeheartedly welcome the statement that "we will not execute the plan when we cannot guarantee the highest safety" from Dung, the prime minister of my second home.

TEPCO to expand abroad

February 26, 2014

INTERVIEW: Incoming chairman says TEPCO should expand overseas, streamline

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402260072

THE ASAHI SHIMBUN

Tokyo Electric Power Co.'s incoming chairman, Fumio Sudo, said the utility should look to the business models of Japan's internationally competitive industries, such as the auto and steelmaking sectors, and break away from the virtual regional monopoly it has long enjoyed.

Sudo told The Asahi Shimbun on Feb. 25 that the operator of the crippled Fukushima nuclear plant should increase its earnings by investing overseas and return those profits to the public instead of focusing on the shrinking domestic market.

He also said the utility should streamline its operations before considering additional rate hikes.

Sudo, who is an adviser to steelmaker JFE Holdings Inc. and has served as an outside TEPCO board member since June 2012, will become chairman in April, three years after the Great East Japan Earthquake and tsunami triggered the crisis at the utility's Fukushima No. 1 nuclear power plant.

He played a leading part toward the end of last year in compiling TEPCO's new rehabilitation plan, which promises to cut costs by 4.8 trillion yen ($47 billion) in 10 years and assumes that operations at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture will resume this summer.

Excerpts of the interview follow:
***
Question: What do you think is the biggest challenge facing TEPCO?

Sudo: The company lacks a sense of global competition. Its virtual regional monopoly and general-cost method (in which costs are allowed to be added on to electricity charges) are behind its problems.

TEPCO has been sensitive only to competition among electric power companies in Japan. Demand in the domestic market will shrink as the number of newborns declines and the use of "smart meters" (energy-saving electricity usage indicators) spreads. We have to invest overseas and return those profits to Japanese citizens.

Another problem is that our ability to purchase fuel (such as natural gas at lower prices) has fallen short compared to South Korean power utilities. The prices TEPCO has been buying fuel at have averaged more than 10 percent higher than those paid by South Korean power producers. We plan to form a comprehensive tie-up with other companies in the area of fuel procurement. I hope that plan will be realized by the end of this fiscal year.

Q: The problem of accumulating radioactive water at the Fukushima plant has yet to be resolved. What is your take on that?

A: I sincerely apologize for that. We have been gradually amassing experience and knowledge (about the problem at the plant site). If we switched personnel (every time a new problem occurred) in order to make them take responsibility, (the quality and knowledge of workers) would become endlessly low. As management, we just have to endure now.

Q: Niigata Governor Hirohiko Izumida has taken a cautious approach to the planned restart of the Kashiwazaki-Kariwa nuclear plant, a key step in TEPCO's rehabilitation plan. What do you think?

A: Nuclear power generation involves the "separation of powers" doctrine. We are a player, and the state, which makes the rules, exists above us. The judge is the Nuclear Regulation Authority. We have to train to prepare for the time we are given an opportunity to play. I hope to win the understanding of the local community by advancing safety measures wherever possible.

Q: Will you raise electricity rates again if you fail to resume operations of idled reactors?

A: First, we will reduce expenses in the thermal power division. If we have to increase electricity rates, we would go out of our way to spare every cost to our customers, even in increments of a single yen. And when we can lower the rates, we will decrease them as much as possible.

We should never contemplate rate increases until we make every effort possible until there are no other choices. It is common sense in the auto and steel industries.

(This article is based on an interview by Mari Fujisaki and Takashi Ebuchi.)

Not a "basic plan" really

February 27, 2014

EDITORIAL: New energy plan falls short on ways to reduce nuclear power

http://ajw.asahi.com/article/views/editorial/AJ201402270034

The Abe administration recently decided on the draft of a new basic energy plan, but the proposal still contains no specific measures to deliver on the government's promise to reduce the nation's reliance on nuclear energy.
This is not something that can qualify as a "basic plan."

The administration says it cannot offer figures for the estimated share of nuclear power in the nation's overall energy supply because of uncertainty concerning safety assessments of reactors by the Nuclear Regulation Authority.
Asahi Shimbun editorials have argued that Japan should move toward a future without nuclear power.

But the energy policy of the government of Prime Minister Shinzo Abe calls for the continued production of electricity with atomic energy. Since the administration has promised to reduce nuclear power generation, it should, at the very least, make it clear how it will achieve that goal even if it cannot provide specific figures.

But all the government's draft says with regard to this issue is that it will seek to restart idle reactors while respecting the NRA's safety assessments.

The catastrophic accident at the Fukushima No. 1 nuclear power plant has resulted in tighter nuclear safety regulations.
That means fewer reactors can be brought back online compared with before the nuclear disaster.

If the government chooses to do nothing more to reduce the number of active reactors, it will only be preserving the status quo.

The draft also says the government will continue pursuing the controversial program to establish a system for reprocessing all spent nuclear fuel from reactors. The Abe administration is failing to confront the reality of the program, which has come to a standstill.

There are other important questions that remain unanswered.

For instance, what will the government do to ensure that aging nuclear plants are smoothly closed? How will the emergency response plans of local governments close to a nuclear power plant be used in deciding on whether to approve a plant restart? Municipalities located within a 30-kilometer radius of a nuclear plant are required to work out such plans.

Should the government order the shutdown of a nuclear plant if there is no prospect for finding a site for storing spent nuclear fuel rods from the plant?

The government's nuclear power policy also has great implications for its efforts to revitalize the power market.
Electric utilities are unwilling to upgrade their aging thermal power plants with poor energy efficiency because they are expecting many offline reactors to be reactivated.

Unless the government announces plausible plans to promote a shift away from nuclear energy toward other energy sources, there can be no significant progress in the development of alternative power sources. Nor will there be any significant cut in the costs of purchasing fossil fuels from other countries.

A return to nuclear power will discourage new power suppliers, like companies selling electricity produced with renewable energy sources, from making new investments. That's because existing nuclear power plants are at an advantage over such new players in terms of short-term cost competitiveness.

If the government shows no strong commitment to reducing nuclear power generation, there will be few businesses willing to take risks to enter the power market or spend money to develop new technologies.

Nuclear power generation cannot be economically viable without government subsidies.

Since its new energy supply plan should reflect the lessons learned from the Fukushima nuclear disaster, the government should first take steps to reform its traditional energy policy, which has been heavily dependent on nuclear energy.

Unless the government embarks on an overhaul of its energy policy, the power market reform it is trying to promote is likely to fall through.

The government says its draft of the new energy plan will be discussed by working teams of both the ruling Liberal Democratic Party and its junior coalition partner New Komeito.

Policymakers in the ruling camp should not forget that their discussions on the plan will be closely monitored by the public.
--The Asahi Shimbun, Feb. 27

Hadn't LDP promised the public the end of nuclear dependency?

February 26, 2014

Editorial: Maintaining nuclear energy dependency a violation of LDP election promise

http://mainichi.jp/english/english/perspectives/news/20140226p2a00m0na015000c.html

With only partial edits to wording deemed too emphatic on the importance of atomic energy, the just-released draft of the government's basic energy plan shows the government's intention to continue using nuclear power.

Our worst nightmare has come true. The draft is in violation of the Liberal Democratic Party of Japan (LDP) campaign pledge in the December 2012 general election to establish an economic and social structure that does not depend on nuclear energy. We urge that the government's course be corrected in line with its election manifesto through ruling coalition talks that are set to take place ahead of a Cabinet ruling on the plan.

We are not speaking out against the goal put forth by the energy plan draft of reducing Japan's dependence on nuclear power as much as possible. The problem is, rather, that the plan not only fails to provide a road map toward the realization of that goal, but presupposes the continued use of atomic energy.

The plan explicitly states that the government will promote the reactivation of nuclear reactors that are found to meet the safety standards set by the Nuclear Regulation Authority. It also states that the government will determine the extent to which it will use nuclear reactors based on considerations such as cost reduction. This suggests that the government does not expect to bring the use of nuclear energy to an end.

Maintaining our dependency on nuclear power will require the new construction and reconstruction of reactors. However, the energy policy set down by the Democratic Party of Japan (DPJ) administration, which called for the abolition of nuclear power following the outbreak of the Fukushima nuclear disaster, had banned such building as a general rule. The latest energy plan does not incorporate that rule, however, and opens the way for new construction.

The government had put off finalizing the draft out of concern for its impact on the Tokyo gubernatorial race, and to objections from within the ruling LDP and its coalition partner New Komeito that the draft compiled by a Ministry of Economy, Trade and Industry panel was excessively nuclear energy-oriented. As

a result, the wording used in a previous draft describing nuclear power as "a fundamental and important base energy source" was changed in the latest draft to "an important base-load energy source."

So what changed? Industry Minister Toshimitsu Motegi told a press conference, "My understanding is that our basic direction has not changed." Apparently, the wording was put through some fine-tuning merely to fend off criticism from anti-nuclear blocs. This makes the government's claim to work toward reducing the country's dependence on nuclear power as much as possible suspect.

Realizing a society that is not dependent on nuclear energy, which the LDP promised the public, requires further development and implementation of renewable energy and efficient thermal generation technologies. However, such efforts bring with them high societal costs, such as rising electricity prices. The government must be firm in its convictions if it is to truly create a society that does not depend on atomic power -- instead of making efforts to do so "as much as possible."

The Basic Energy Plan, which will dictate the nation's mid- to long-term energy policy, must clearly state the goal of abolishing nuclear power, and the government must lay out a plan to arrive at that goal. The plan is to be adopted by the Cabinet by March 31 -- the end of the current fiscal year -- following talks between the ruling LDP and New Komeito. We urge responsible deliberations by the involved parties, who have the future of the Japanese public in their hands.

Nukes or no nukes?

March 6, 2014

THREE YEARS AFTER: Experts debate on whether Japan needs nuclear energy
http://ajw.asahi.com/article/0311disaster/analysis/AJ201403060060

THE ASAHI SHIMBUN

Once largely taken for granted, Japan’s electricity supply has remained a hotly disputed issue on a number of fronts since the Fukushima nuclear disaster started in March 2011.

Proponents of nuclear energy say the environment, consumers and the nation’s economy will all suffer without the restart of nuclear reactors.

Opponents say the disaster at the Fukushima No. 1 nuclear power plant caused by the Great East Japan Earthquake and tsunami on March 11, 2011, proves that nuclear energy is just too dangerous to use. They also say Japan has already proved it can get along fine without nuclear energy.

All 48 of the nation's commercial nuclear power reactors have since been taken offline for safety inspections. The Fukushima disaster also underscored the problems related to the cozy community of bureaucrats, industry executives and academics who have together pushed for an increased use of nuclear power.

Since the disaster, Japan has often had to rely on shoestring operations and unorthodox methods to ensure enough electricity to cover peak demand in summer and winter.

Although major blackouts have been averted, the tighter supply means Japan now depends more on thermal power generation. The utilities' need to buy more fossil fuel for these plants has driven up electricity rates.

The burning of fossil fuel also ratcheted up the utilities' carbon dioxide emissions from 300 million tons in fiscal 2010 to 400 million tons in fiscal 2012, an increase commensurate to total CO2 absorption by Japan's forests.

One positive effect of the disaster has been major progress in energy-saving efforts in the nation.
The peak nationwide power demand in the summer of 2013, when temperatures soared to record highs, was down 9.7 percent, or 17 gigawatts, from 2010. The decrease was equivalent to the output of 15 new nuclear reactors.

A feed-in tariff system was introduced in July 2012 to oblige power utilities to buy electricity generated from renewable energy sources at fixed rates. By November 2013, suppliers with a total output of 6.45 gigawatts had entered operations under the feed-in tariff system.

Debate is now focused on restarting idled nuclear reactors. The administration of Prime Minister Shinzo Abe plans to have the reactors reactivated once their safety has been approved by the Nuclear Regulation Authority.

The power industry initially cited supply shortage as a primary reason for seeking restarts of their nuclear reactors. After that rationale gradually became less persuasive, the industry placed more emphasis on the negative impact of higher electricity rates on Japan's economy.

The Asahi Shimbun interviewed two experts for their views on the future of Japan's power industry and energy policy.

They are Kazuhiro Ueta, a professor of environmental economics at Kyoto University, and Tsutomu Toichi, an adviser with the Institute of Energy Economics, Japan.

Excerpts from the interview follow:
* * *

UETA: SET CLEAR COURSE TO END NUCLEAR ENERGY USE

You cannot discuss the future of power supply without addressing our overall socioeconomic setup. Power utilities have held excessive generator facilities so they can cover peak demand that comes only several days in midsummer.

But we should question whether we should go on with our socioeconomic setup, whereby we operate plants at full capacity and have our workers work long hours even amid scorching heat.

Europe's vacation system is well-conceived in that sense. Urban residents go to rural villages if they have three weeks off in midsummer. That helps provincial economies, cuts energy use and enriches workers' lives.

The three years following the 3/11 disaster was a preparatory period for Japan to move toward that kind of mature society. Not only did energy-saving efforts take root in society, but few people now complain about dimmer illumination in public places.

Awareness worthy of a mature society, which says electric power is not without its limits and should therefore be shared, is taking root.

Nuclear reactors should not be brought back online. Not only do questions linger about safety in a broad sense, such as insufficient emergency evacuation plans, but no pathway is yet in sight for deciding what to do with radioactive waste.

Exposure to radiation among nuclear plant workers represents another conundrum, which is not likely to be solved any time soon.

Increased reliance on thermal power has raised electricity rates, but power rates account for only a modest part of expenditures in general manufacturing industries. Any hollowing out of industry should be attributed to other reasons.

Nuclear power plants involve exorbitant "external costs," such as unrest and conflict in local communities, which remain invisible in the financial statements of power utilities. We should set a clear course for pulling the plug on atomic energy and foster a climate for encouraging growth of new industries, including those related to renewable energy sources.

TOICHI: IDLED REACTORS DO MORE HARM THAN GOOD

Retrospectively speaking, no major blackout has occurred, but the situation is not sustainable because power utilities continue to take emergency responses irrespective of cost calculations. We should have some of our nuclear reactors back online after rigorous inspections of their safety.

Electricity rates have risen 20 percent since the 3/11 disaster, but even that figure rests on the premise that nuclear reactors will be restarted. Rates will rise further if reactors remain idled. That could hollow out the economy further and slash available jobs

.

Power utilities have not passed on all of their increased costs to electricity rates. They have been eating into their past savings, but that effort is nearing its limit. A symbolic case is that of Chubu Electric Power Co., which was obliged to request rate hikes despite its low dependence on nuclear power. Financial difficulties could compromise fuel procurement and therefore power supply.

The ballooning carbon dioxide emissions represent another major problem. The United States and China are moving to reduce coal-fired thermal power generation, but Japan is moving in the other direction. While the risk of another nuclear accident is not zero, keeping our nuclear reactors idled involves much larger disadvantages.

Nuclear restarts will help spread renewable energy sources. Consumers are footing the bills for spreading renewables in the form of added electricity rates. Nuclear restarts will curb rate hikes, thereby facilitating the allocation of resources to renewable energy.

Radioactive waste presents no reason to end nuclear power generation now. Waste is already there, and it is up to the political circles to decide on a final disposal site.

How much nuclear power we should keep generating on a longer term will depend on the quantity and costs of renewable energy, the extent of energy-saving efforts and the course of reforms in power markets. We only have to think about it while on the run.

One way of seeing the situation

March 10, 2014
Emerging economies rely on nuclear power
http://www3.nhk.or.jp/nhkworld/english/news/20140310_25.html

Tuesday marks 3 years since the Fukushima Daiichi nuclear power plant accident began.

Despite the accident, many emerging economies are building nuclear plants to meet growing demand for electricity.

The International Atomic Energy Agency says 435 operable reactors exist in 31 countries and region.

The United States has 100 of them. France follows with 58 and Japan 48. All reactors in Japan have gone offline after the Fukushima accident.

Other countries with a large number of reactors include Russia with 33 and South Korea 23. China and India each has 21.

The British-based World Nuclear Association says 70 reactors are under construction worldwide. Of them, 28 are in China.

The association also says 28 countries plan to build 173 reactors by 2030.

China again comes on top with 58, followed by Russia with 31 and India 18.

The Fukushima accident has raised public concerns about nuclear safety. Germany, Switzerland and other European countries have begun taking steps to reduce reliance on nuclear power.

What happened to DPJ's "no-nuclear" bill?

March 10, 2014

THREE YEARS AFTER: DPJ's 'no-nuclear' bill obliterated after regime change
http://ajw.asahi.com/article/0311disaster/fukushima/AJ201403100070

By SHINICHI SEKINE/ Staff Writer

The Democratic Party of Japan administration had devised a specific plan to wean Japan off nuclear energy, but legislation to put that strategy in motion died when the party lost power in 2012.

DPJ lawmaker Satoshi Arai said the bill was designed to reduce Japan's dependence on nuclear power in light of the triple meltdown at the Fukushima No. 1 nuclear plant triggered by the Great East Japan Earthquake and tsunami on March 11, 2011.

Prime Minister Yoshihiko Noda's administration planned to submit the bill to a Diet session in 2013.

The outline of the bill, compiled by DPJ lawmakers and government bureaucrats, called for laying a domestic network of natural gas pipelines to accelerate a shift to thermal power generation and raising power transmission capacities to promote electricity generated from wind and other renewable sources, according to sources.

According to a copy of the outline obtained by The Asahi Shimbun, electric power facilities, natural gas pipelines and oil storage terminals, which were defined as "key energy facilities," would be developed in preparation for a disaster.

In the basic energy plan adopted in 2010, the DPJ had set a goal of increasing the share of renewable energy to 21 percent of the nation's electricity generation in 2030.

A group of DPJ lawmakers, including Arai, Banri Kaieda and Akihiro Ohata, and senior officials from the industry, finance and other ministries met about 10 times between spring and autumn 2012 to study necessary measures.

The outline said the government would approve a basic plan with development goals at a Cabinet meeting and provide financial assistance to projects submitted by businesses and authorized by the prime minister.

The industry ministry planned to formulate a basic policy for building natural gas pipelines, including routes, in fiscal 2012 and asked for related outlays in the fiscal 2013 budget.

But everything changed after the DPJ suffered a crushing defeat to the Liberal Democratic Party in the Lower House election in December 2012.

Japan's 48 nuclear reactors all remain offline for safety checks. The LDP plans to have them reactivated once the Nuclear Regulation Agency confirms their compliance with the new safety standards introduced after the Fukushima nuclear crisis.

In contrast to the DPJ's definition of "key energy facilities," the administration of Prime Minister Shinzo Abe defined nuclear energy as an "important base-load electricity source" in its draft basic energy plan approved in February.

The industry ministry's plan for the pipeline basic policy was shelved and the budget request was dropped after Abe took power.

"There are no signs to promote construction of pipelines under a government initiative," an industry ministry official said.

Under the DPJ's strategy, a ministry study group in 2012 proposed government assistance to Hokkaido Electric Power Co.'s plan to raise power transmission capacities from Hokkaido to the Honshu main island. The study group was disbanded in June 2013.

A ministry official said nothing has been decided on whether the government needs to provide assistance or not.

The Abe administration's draft basic energy plan, the first to be compiled after the Fukushima nuclear disaster, also dropped the DPJ administration's numerical goal of increasing the use of renewable energy for the nation's electricity needs.

Impossible for some reactors to meet new standards

March 12, 2014

THREE YEARS AFTER: Majority of Japan's nuclear reactors face bleak future

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201403120057

THE ASAHI SHIMBUN

Due to stricter government safety regulations, 30 of Japan's idled 48 nuclear reactors have no immediate prospects of restarting operations, at least in the near future, according to an Asahi Shimbun survey of utilities.

Thirteen of those, mainly due to their age, are having particular difficulty in complying with the new standards, according to the survey, and are likely to be decommissioned.

The government tightened safety regulations for the nation’s nuclear power plants in the wake of the accident at the Fukushima No. 1 nuclear power plant, triggered by the 2011 Great East Japan Earthquake and tsunami.

The new restrictions ban electric power companies from locating reactor facilities directly on top of active fault lines. The state also revised the Law on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors to limit, in principle, the operational life of reactors to 40 years.

“No matter how much money and time we spend, it would be impossible (for some reactors to clear certain hurdles),” said an official with an electric power company, referring to the two requirements.

The two restrictions are the main obstacles the utilities face in their efforts to restart idle reactors.

The 13 likely to be decommissioned are the Tokai No. 2 plant in Ibaraki Prefecture; the three reactors at the Mihama plant in Fukui Prefecture; the two reactors each at the Oi, Takahama and Tsuruga plants, all in Fukui Prefecture; the No. 1 reactor at the Shimane plant; the No. 1 reactor at the Ikata plant in Ehime Prefecture; and the No. 1 reactor of the Genkai plant in Saga Prefecture.

Of these reactors, the Tsuruga plant’s No. 1 reactor and the Mihama plant’s No. 1 and No. 2 reactors have exceeded the 40-year limit.

The Shimane plant's No. 1 reactor will mark its 40th anniversary of operation at the end of this month, while the Takahama plant's No. 1 reactor will pass the four decade mark in November.

Furthermore, an investigation by the Nuclear Regulation Authority has concluded that there is an active fault line beneath the Tsuruga plant's No. 2 reactor building. A slip of an active fault directly under a reactor is highly likely to lead to its destruction.

The NRA is also studying the geological structure of the ground beneath the Shika nuclear plant in Ishikawa Prefecture, the Higashidori plant in Aomori Prefecture and the Mihama plant.

The new government standards also require nuclear plant operators to bolster fire prevention measures.

It is also unclear whether the four reactors at the Fukushima No. 2 plant, located 12 kilometers south of the crippled No. 1 plant, will be allowed to resume operations.

Fukushima Prefecture and local municipalities that are home to the Fukushima No. 2 plant have demanded all the reactors there be decommissioned. That makes it difficult for the plant's operator, Tokyo Electric Power Co., to bring those reactors back online.

Utilities operating the remaining reactors among the 30 have said they have yet to decide when they can apply for safety screenings to restart their reactors. They say it would take much time to complete work needed to meet the new safety requirements demanded by the government.

The companies also said they will place priority on bringing back online those reactors that can more easily be brought up to standard.

To date, the NRA has received applications to restart 17 reactors at 10 nuclear plants. Ten of those reactors--the No. 3 reactor at the Tomari plant in Hokkaido, the Oi plant's No. 3 and No. 4 reactors, Takahama's No. 3 and No. 4 reactors, Ikata's No. 3 reactor, the Genkai plant's No. 3 and No. 4 reactors and the No. 1 and No. 2 reactors at the Sendai plant in Kagoshima Prefecture--are currently undergoing screening as originally scheduled.

But the NRA's inspection process is behind schedule for the remaining seven reactors: the Tomari No. 1 and No. 2 reactors; the No. 2 reactor of the Onagawa plant in Miyagi Prefecture; the No. 6 and No. 7

reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture; the No. 4 reactor at the Hamaoka plant in Shizuoka Prefecture; and the Shimane plant's No. 2 reactor.

Although the operator of the Hamaoka plant plans to apply for safety checks to resume operations at the facility's No. 3 reactor by the end of fiscal 2014, the problem is that the facility sits in a location along the Nankai Trough southwest of Tokyo, where it has long been predicted a major earthquake will occur.

Then Prime Minister Naoto Kan ordered the operator of that plant to suspend all its reactors in May 2011 as the Fukushima nuclear crisis was unfurling.

But in the process of suspending operations there, a steam condenser for the No. 5 reactor was damaged, resulting in an influx of large amounts of seawater. Rust has also been found in a pressure vessel at the plant as well.

(Ryuta Koike and Toshio Kawada contributed to this article.)

Ibuki on nukes

March 18, 2014
Lower house speaker clarifies his nuclear phaseout stance

http://mainichi.jp/english/english/perspectives/news/20140318p2a00m0na015000c.html

Remarks made by the speaker of the House of Representatives on Japan's phaseout from nuclear power overtook the political world last week. According to some media reports, Bunmei Ibuki was criticizing the Abe administration. But was he really?

I posed the question to Ibuki directly and got a wry response.

"It's not the case. People would realize this if they actually did their homework," he said.
So I did my homework, and this is what I found out:
1. Ibuki is not arguing for the immediate abolition of nuclear power, and is not opposed to the reactivation of nuclear reactors.

2. However, based on his view that nuclear energy represents the arrogance of humankind in believing it can control nature, going against the Japanese tradition of coexisting with nature, he firmly believes that nuclear power must ultimately be phased out.

3. Based on his philosophy of living humbly amid abundance, Ibuki believes a shift must be made from a lifestyle of wasteful electricity use -- including late-night television, excessive lighting and air conditioning, and 24-hour convenience stores.

On March 11, 2014, at a ceremony commemorating the third-year anniversary of the Great East Japan Earthquake and tsunami, Ibuki said, "We must carry out exhaustive deliberations with a view toward future nuclear phaseout."

On his Facebook page the previous day he wrote, "We have changed direction toward the ultimate goal of phasing out nuclear power."

Asked about his Facebook post, Ibuki said, "You'll find the same content in the Liberal Democratic Party (LDP)'s election pledge."

Despite what he says, however, this is not so clear cut.

Indeed, the LDP's election pledge for the December 2012 general election offers to "aspire to an economic and social structure that does not have to rely on nuclear power." But such phrasing is missing from the party's platform in the July 2013 House of Councillors election.

However, as a native of Kyoto, where Shinto and Buddhist traditions are deeply rooted, and a member of a frugal merchant family, Ibuki's views toward nature and civilization are unwavering.
It's the kind of thinking befitting a man who, out of his passion for cooking simple dishes using seasonal ingredients, published a book of essays and recipes called "Ibuki-tei: Shiki no shokutaku" (Ibuki restaurant: Our dining table throughout the four seasons) in 2008.

So why would Ibuki approve of the reactivation of nuclear reactors, when it would seem to clash with his views toward nature?

"Otherwise we run the risk of foreign financial institutions gaining control of Japan's sovereignty," explained Ibuki, who in the past served as the chief of the Finance Ministry's treasury division.

According to Ibuki, Japan's trade deficit is rising partly because of increased imports of fossil fuels to replace the energy that would have been produced by the halted nuclear reactors. Japan will become

impoverished if this situation is drawn out. If corporations and households begin to dig into their savings, Japanese banks will become incapable of buying up government bonds. Such a state of affairs would open up opportunities for foreign financial institutions to buy Japanese government bonds, and depending on how that plays out, interest rates could shoot up, possibly leading to Japan's financial and economic collapse.

Asked if it's not possible to institute reforms toward a more energy-saving form of economy and society before such a collapse takes place, Ibuki said, "I think we should, and that's what I've been saying, but it's also true that such change will not be easy. We have no choice but to overcome our obstacles using a combination of various measures."

As one of the reasons for putting out a book on home cooking, Ibuki wrote, "I wanted people to realize the error of the notion created by television dramas that all politicians need to hang out at expensive Japanese restaurants."

"Ibuki-tei" begins with recipes for spring cabbage: pickled, sauteed with butter, and two types of pasta. Ibuki's instructions are written in a refined and witty style, and he's filled with gratitude for nature's blessings, which could instantly be reduced to nothing if contaminated with radiation.
At the very least, the sensibility and values held by Ibuki -- who waxes poetic about homemade meals made from the heart over luxurious meals in restaurants -- do not follow a "nuclear-dependence" train of thought. (By Takao Yamada, Expert Senior Writer)

Japan traditional façade of "wa" cracking

March 22, 2014
Energy debate challenges facade of *wa*

by Stephen Hesse
http://www.japantimes.co.jp/life/2014/03/22/environment/energy-debate-challenges-facade-of-wa/#.Uy3ce4XrXIU

Torn between his nationalistic instinct to resurrect what he seems to regard as Japan's great bygone days of empire-building and the mundane demands of caring for the pressing needs of his nation, a remarkably caring soul might almost feel sorry for Prime Minister Shinzo Abe during his first months in office. Almost.

However, after months of bluster and bragging, of tired claims that “Japan is back” and “Abenomics” will set the nation on its feet, the head of the ruling Liberal Democratic Party remains unable to get his priorities right.

If he hopes to create a sustainable economy, gain the global respect he so desperately craves, and give Japan’s residents a sense of optimism about the future, he needs to put aside his ill-conceived notions of grandeur and focus on a practical, long-term domestic vision.

To meet the majority’s demands for safe, secure energy, that vision must include a comprehensive blueprint for transitioning from nuclear power to clean, safe and localized energy generation.

Three years have passed since the Great East Japan Earthquake on March 11, 2011, and the following tsunami and nuclear catastrophe that shattered the Tohoku region, and more than 265,000 citizens of the world’s third-largest economy remain displaced and largely living in subsistence-level accommodation.

These refugees and their communities deserve immediate attention. Restarting nuclear reactors won’t help them, but jumpstarting their local economies with alternative-energy projects can — including solar, wind, water and geothermal opportunities.

The three reactor meltdowns at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co. (Tepco) have turned parts of that prefecture into lethal no-go zones and are contaminating surface and groundwater with radioactivity that has now long been pouring into the Pacific. These ongoing calamities, too, need immediate attention.

The answer is not to simply switch the nation’s energy dependence to other aging reactors in other communities, but to quickly and safely decommission all Japan’s reactors that are disasters waiting to happen. The sooner this happens the better, as it will give Japan an opportunity to showcase new technologies and strategies that can be sold worldwide as other nations struggle to shut down and clean up antiquated reactors.

Rather than traveling the world to hawk Japanese nuclear reactors — a tainted brand at best — Abe needs to listen to the 70 percent of Japanese who polls show are hoping for a nuclear-free future.

Their hopes, and Abe's dreams of greatness, can dovetail in the development of alternative-energy technologies paired with reactor decommissioning strategies that must, by necessity, be perfected in Japan.

Today, a lack of political will is all that stands in the way of Japan becoming the world's leading incubator for safe and clean energy generation — a role that would spur the economy and ensure long-term national and energy security.

Of course, nuclear power will remain with us worldwide for years to come, and reasonable arguments can be made for its continued use as we phase-in safer forms of energy generation: one being the critical need to reduce carbon-dioxide emissions that come from burning fossil fuels such as coal and oil and are driving climate change.

Japan, however, is the last nation on Earth that should harbor hubristic dreams of extending the life of aging reactors and postponing the decommissioning process.

The 3/11 Tohoku quake and tsunami were not unique. Beneath Japan, massive tectonic plates grind against each other unrelentingly, rattling and jolting the entire land mass with continual tremors. For most of us here, it's a no-brainer to adopt a new energy paradigm. But this is not about brains — it's about politics.

Entrenched special interests, the so-called "nuclear village" comprising politicians, bureaucrats, media profiteers and executives of the nation's utilities, have much to lose, politically and financially, if energy is advanced and decentralized.
So, you might ask, is there any cause for optimism in Japan?

Well, that depends on what makes you optimistic. From my perspective, one bright spot is that groups both inside and outside Japan have begun chipping away at its traditional facade of *wa* — a cultural sense of harmony that tends to inhibit protest and reform.

In the March 11 edition of The Japan Times, David McNeill reported on a $1 billion class-action lawsuit filed against Tepco by 80 U.S. Navy personnel.

The sailors were part of Operation Tomodachi (Friend), a massive relief effort undertaken by the U.S. military following the earthquake and tsunami in 2011. McNeill explained that most of the plaintiffs were serving on the giant (nuclear-powered) USS Ronald Reagan aircraft carrier in the Pacific, downwind of the

Fukushima No. 1 plant, and are now suffering illnesses that include leukemia, testicular cancer, brain cancer and brain tumors.

"The suit claims Tepco was negligent about safety and lied to the sailors and the public about radiation levels at the Fukushima No. 1 plant at the same time as Japan was asking for help for the victims of the earthquake and tsunami," wrote McNeill.

Lawyers for the sailors have said that "the utility knew the plaintiffs were going to be exposed to unsafe levels of radiation because it was aware that the plant had experienced a triple meltdown, and chose to keep it secret," McNeill reported.

Proving with sufficient likelihood to win a civil suit that radiation from the Fukushima meltdowns caused the sailors' illnesses will be a difficult legal hurdle, but simply filing the lawsuit — in a U.S. court in San Diego, California, on Feb. 6 — will keep Tepco and the Japanese government in the headlines and on the defensive regarding nuclear power.

From inside, too, Japan's traditional non-litigious veneer is cracking. Last week it was reported that a class-action lawsuit has been filed in Japan against General Electric Co., Toshiba Corp. and Hitachi Ltd.

A statement released by the plaintiffs' Japanese lawyers claims that the three companies "failed to implement safety improvements to the 4-decade-old boiling-water reactors at the Fukushima No. 1 power plant," according an AFP-Jiji report in The Japan Times on March 14.

The lawsuit represents more than 4,000 individuals from Japan and 32 other nations, and seeks a symbolic ¥100 for each claimant.

While neither lawsuit is likely to bring down the walls of the nuclear village, both raise embarrassing questions for Abe, his Liberal Democratic Party and Japan's utilities. And both are also likely to spawn more legal claims.

For those who prefer less confrontational, more pragmatic approaches, however, other initiatives are also already under way. Last week, Japan's national Kyodo news service reported that a coalition of 38 green-power advocacy groups are cooperating to create an association that will focus on information-sharing in order to hasten the nation's independence from nuclear power.

"We want to create a concrete step to realize calls to break away from nuclear energy by generating electricity in communities," Tetsunari Iida, one of the organizers of the plan, told Kyodo. Iida is executive director of the Institute for Sustainable Energy Policies.

Contrary to Abe's present mind-set, a truly strong Japan going forward will require much less jingoism and considerably more support for this nation's local communities to pursue safe, clean and adaptable energy solutions.

Is the joke still on Fukushima this April Fools'?

http://www.japantimes.co.jp/community/2014/03/31/issues/is-the-joke-still-on-fukushima-this-april-fools/#.UzmKBlfi91s

What's wrong with this picture?

Japan's new Basic Energy Plan sees nuclear power as an important base load energy source. But whatever "base load" means politically, the public is lulled — fooled — into a sense that, despite Fukushima, nuclear will remain a logistically viable long-term option.

Yet the realities of Japan's nuclear power industry show keeping nuclear are likely to be far more problematic — and expensive — than the pro-nuclear lobby wants to admit. Here are the most obvious hurdles.

First, as of 2013, of the remaining 48 reactors, three were more than 40 years and 13 were over 30 years old. The reactors were supposed to be decommissioned after 40 years but can now apply for a maximum two-decade extension.

Want to keep those reactors, with their increased risk of technical problems and thus lower efficiency rates, running until they're 60? Even if they meet new safety standards, local governments hosting the reactors are sure to demand funding for pork-barrel projects in exchange for agreeing to any extension. Guess whose tax money will be used to ensure a continued flow of "cheap" nuclear power. Hint: look in the mirror.

Even if restarted reactors run at pre-3/11 levels, estimates are their spent fuel pools will be overflowing like public toilets sooner rather than later. A Tokyo Shimbun calculation shows 33 reactors could see their pools full within six years.

Government figures estimate the pools will be full within three to 16 years, with most filled to the brim within eight years.

What happens then? Tokyo is now pushing local governments to build interim storage facilities for the fuel before it's sent to Rokkasho, Aomori Prefecture, for reprocessing. But despite promises of even more tax money for their coffers, no local government wants to host such a facility.

Finally, Japan's population, about 127 million, will shrink to 107 million by 2040 while the working population, i.e. the large volume of electricity users, will decline by 30 percent. Furthermore, 21 percent of all Japanese will be 75 years or older, also by 2040. Who is going to need how much electricity?

So, the "nuclear will be an important base load" argument assumes: 1. Older plants can be run until they are 60 years without major problems and at a lower cost than other sources; 2. Within the next, say, 16 years, new storage facilities for spent fuel will be built somewhere; and 3. By 2040, a country with 16 percent less people than in 2010 and one-fifth the population over 75 will not use less energy than today.

What's wrong with this picture?

China's worries about Japan's plutonium

March 23, 2014

Japan's Plutonium Plans Stoke
China Tensions on A-Bomb Risk

By Jonathan Tirone and Jacob Adelman Mar 24, 2014
http://tinyurl.com/n27hfry

Japan is planning to start a $21 billion nuclear reprocessing plant, stoking concern in China that the facility's output could be diverted for use in an atomic bomb.
The issue will be one of the flashpoints at the Nuclear Security Summit starting today in The Hague, Netherlands, that Japan Prime Minister Shinzo Abe and China's President Xi Jinping are due to attend. It's adding to bitterness marked by territorial disputes and left over issues from World War II between Asia's two largest economies.
"Japan has stockpiled large volumes of sensitive nuclear materials, including not only plutonium but also uranium, and that's far exceeding its normal needs," Chinese Foreign Ministry spokesman Qin Gang told reporters on March 11.
The Rokkasho Reprocessing Plant in northern Japan will begin separating plutonium from spent nuclear fuel in the third quarter, Japan Nuclear Fuel Ltd. spokesman Yoshi Sasaki said March 7. The plant has missed previous start up dates because of equipment failures.

"The Chinese have said they saw Japan plutonium as a weapons option and I think that many people in Japan do too," said Frank von Hippel, a former White House national security adviser now at Princeton University, who has consulted with Chinese and Japanese nuclear officials. This reflects the tension between the two countries, he said.

Reprocessing Program

Japan was prepared to discuss its reprocessing program at The Hague summit, a Foreign Ministry official who asked not to be identified citing agency policy said at a March 20 press briefing. The country planned to reiterate its policy of not producing more plutonium than it can use, the official said.

Rokkasho is designed to separate as much as 8 tons of plutonium per year for reactor fuel. If diverted, that's enough material to make hundreds of nuclear bombs like the one dropped over Nagasaki in 1945.

While the International Atomic Energy Agency monitors Rokkasho, the facility's throughput is so large, inspectors cannot guarantee that "significant quantities" of material don't go unaccounted for. About eight kilograms (18 pounds) of plutonium are needed for a single bomb.

Neighboring Countries

"Nuclear facilities are very complicated things," IAEA Director General Yukiya Amano said March 3. "It happens from time to time there exists material unaccounted for."

Keeping nuclear material from slipping outside official control, where it may be sold for weapons or passed on to terrorists, is the focus of The Hague meeting.

The IAEA's Amano, a career Japanese diplomat who has headed the Vienna-based agency since 2009, added that inspectors "have drawn the conclusion that all nuclear material in Japan stays in peaceful purposes" and that there's no "reason to be concerned that this will be diverted for military purposes."

China, in discussion with Areva SA (AREVA) to build a plant similar to Rokkasho since 2008, has raised public concern over Japanese atomic fuel stockpiles, set to grow even as the majority of the country's reactors sit idle following the Fukushima nuclear disaster.

Japan agreed to return "hundreds of kilograms" of highly-enriched uranium and plutonium to the U.S., according to a White House statement today. Abe is due to meet with U.S. President Barack Obama at the security summit.

Japan, South Korea

China's own nuclear weapons program, which began in 1955, is thought to have left the country with as many as 75 nuclear-capable intercontinental ballistic missiles, according to U.S. Department of Defense estimates cited by the Washington-based Nuclear Threat Initiative.

The U.S. has sought to dissuade Japan and South Korea from abandoning their nuclear-weapon bans by protecting the countries under its nuclear umbrella.

"We are working with Japan and the Republic of Korea in order to make sure they don't feel so threatened that they move towards nuclearization in self-help," U.S. Secretary of State John Kerry said at a March 13 Senate subcommittee hearing.

The country's decision to reprocess nuclear fuel to extract plutonium may have other knock-on effects.

Asia Chills

South Korea is also looking at doing the same and may be encouraged to proceed, while international negotiators are trying to prevent the build-up of nuclear weapons material in Iran, according to Steve Fetter, the former assistant director in the White House's science and technology policy office.

Japan's ties with China are at their frostiest since diplomatic relations were established in 1972.

Coastguard ships from both countries have been tailing one another through waters around disputed East China Sea islands. The tension rose a notch when China declared an air defense identification zone over much of the East China Sea covering the islands.

Matters got worse in December when Abe visited Tokyo's Yasakuni shrine seen by China and South Korea as a symbol of past military aggression.

"While Japan has no stated plan to use its nuclear fuel for a weapons program, it's ability to do so is causing mistrust among its neighbors," Fetter said. "When you combine those things with disputes over island territories, I think it's easy for people in China to connect that this is another indication that Japan has other motives."

'No Point'

Former Foreign Minister Yoriko Kawaguchi, now a professor at the Meiji Institute for Global Affairs in Tokyo says Japan's membership in the Non-Proliferation Treaty, its protection under the U.S. nuclear umbrella and public antipathy to nuclear arms mean making a bomb is out of the question.

"What would be the point of Japan breaking the treaty and being subject to sanctions by the international community, just like North Korea?" she said in an interview. "There would be no point."

More than 9 tons of separated plutonium are stockpiled in Japan, according to IAEA declarations. Another 35 tons are stored outside the country. Facilities in France and the U.K., two of the five officially recognized nuclear-weapons states, currently reprocess Japanese spent fuel.

"Implementation and functioning of safeguards is for the most part a matter of trust in the impartiality of the IAEA and the competence and diligence of its inspectors," said David Cliff, a researcher at the London-based Verification Research, Training and Information Center.

'Never Before'

The IAEA, which spends more safeguarding Japan's nuclear material than in any other country, worked for more than a decade on a system ensuring Rokkasho's material wouldn't be diverted.

"IAEA had never before been challenged with designing a credible safeguards approach for a large commercial scale reprocessing facility," said a 2009 Department of Energy report, co-authored by Shirley Johnson, the former IAEA official who helped design monitoring at Rokkasho. "It was always recognized that the available verification measurements would have inadequate sensitivity and reliability to statistically detect the diversion of a significant quantity."

Japan must try a bit harder

March 25, 2014

EDITORIAL: Japan needs to do more to reduce its stockpile of nuclear materials

http://ajw.asahi.com/article/views/editorial/AJ201403250036

How should the world respond to the potential security threat of nuclear attacks by terrorist groups?

The Nuclear Security Summit that got under way March 24 in The Hague is wrestling with how to reduce the number of locations across the globe that store nuclear materials capable of being used to make atomic and hydrogen bombs. At the outset of the two-day summit, Japan announced its intention to turn over a large cache of its highly enriched uranium and plutonium to the United States. The stockpile is kept at a research facility run by the Japan Atomic Energy Agency in Tokai, Ibaraki Prefecture.

Japan had claimed that the nuclear materials, including weapons-grade uranium and plutonium, are needed for research on nuclear reactors. Japan needs to be at the forefront of efforts to raise international awareness of the urgent need to deal with the threat of nuclear terrorism. Thus, the Japanese government needs to do more to curtail its stockpile of nuclear materials.

During the Cold War era, both the United States and the Soviet Union provided nuclear materials to their respective allies and satellite states in an apparent move symbolizing the solidarity of their blocs. Many of these materials remain spread across numerable sites around the world.

The Obama administration has been working hard to collect nuclear materials since it announced an ambitious agenda to seek “a world without nuclear weapons” in 2009. More than 10 countries and regions, including Ukraine, Mexico and Taiwan, have done away with their weapons-grade nuclear materials.

There has not been a significant reduction in the nuclear arsenals of major nuclear powers, however. But the removal of surplus fissile materials at least represents noticeable, if not dramatic, progress.

As the only country to have been attacked with atomic bombs, Japan should lead the international efforts to lessen the nuclear risks. But there are still many problems.

In 2012, the Nuclear Threat Initiative (NTI), an international nongovernmental organization, assessed the risks of nuclear terrorism for 32 countries possessing 1 kilogram or more of weapons-grade nuclear materials. Japan was ranked 23rd in the NTI Nuclear Materials Security Index, the lowest score among the seven leading industrial countries.

Japan’s standing in the index rose to 13th among 25 countries this year thanks to the creation of the Nuclear Regulation Authority, an independent nuclear safety watchdog, and the measures to prevent nuclear terrorism taken under the new, tougher safety standards for nuclear facilities. But Japan’s score for “quantities of nuclear materials” was zero--meaning there is no progress toward a major reduction--as it was in 2012.

That's because Japan has stored more than 40 tons of plutonium for many years without offering a clear plan to use the material. Plutonium is extracted from spent nuclear fuel from Japanese nuclear power plants. The process is done at overseas facilities and the material is sent back to Japan in the form of mixed-oxide fuel. The transportation of the MOX fuel is deemed to be fraught with serious risks.

Under its agreement with the United States, Japan has been allowed to reprocess spent nuclear fuel for extracting plutonium as an exceptional case. But the disaster that unfolded at the Fukushima No. 1 nuclear power plant in March 2011 has effectively eliminated the possibility of burning MOX fuel at reactors as a way to reduce the amount of plutonium.

Given this situation, Japan would be viewed with a very critical eye by the international community if it starts full-scale operations of its reprocessing plant and increases its stockpile of plutonium further.

The fact that Japan is stuck with a massive surplus of fissile material while Iran and other countries with new nuclear programs are not allowed to do so inevitably undermines the international efforts to prevent nuclear proliferation.

Japan should pull the plug on its program to reprocess spent nuclear fuel. It should propose realistic measures to reduce its stockpiles, such as the disposal of plutonium in responsible and trustworthy countries.

--The Asahi Shimbun, March 25

Who is in favour of Abe's nuclear pact?

April 2, 2014

Lower House committee approves nuclear deal
http://www3.nhk.or.jp/nhkworld/english/news/20140402_27.html

A committee of Japan's Lower House has approved bills on civil nuclear energy cooperation agreements with Turkey and the United Arab Emirates. The bills would allow Japanese companies to export nuclear power-related technology to the 2 countries.

The foreign affairs committee debated the bills on Wednesday. Foreign Minister Fumio Kishida said Japan experienced the tragic accident at the Fukushima Daiichi nuclear power plant. He added that it has the

responsibility to contribute its knowledge and experience to the safe use of nuclear power for peaceful purposes.

Later, the bills were approved by a majority from the ruling Liberal Democratic Party and New Komeito and the largest opposition Democratic Party.

The Japan Restoration, Unity, Japanese Communist and People's Life parties voted against the bills.

But some members of the Democratic Party oppose the bills, as they run counter to the party's policy of working to abolish nuclear power.

Japan Restoration Party co-leader Shintaro Ishihara spoke against his party's opposition to the legislation.

The bills were carried over from the previous Diet session. The government wants to pass them in the current session. They are to be put to a vote at a plenary session of the Lower House on Friday.

Democratic Party to support nuclear pact

http://www3.nhk.or.jp/nhkworld/english/news/20140401_42.html

Japan's largest opposition Democratic Party has decided to support the government's proposals on civil nuclear cooperation agreements with Turkey and the United Arab Emirates.

The Lower House foreign affairs committee will vote on the draft proposals on Wednesday, allowing the transfer of nuclear power generation technology to the 2 countries.

The Democratic Party held a meeting of what it calls the next cabinet on Tuesday.

Some participants were against the proposals, since they run counter to the party's policy of working to abolish nuclear power by the 2030s.

But the meeting agreed that Japan's nuclear technology can help improve safety at nuclear power plants in other countries.

The participants also said the party should consider the fact that it was the Democratic Party that promoted the negotiations with Turkey when it was in power.

Policy Research Committee Chairman Mitsuru Sakurai said that not all party members are satisfied with the decision, but that it is the result of discussions up until now.

Nothing more than compromise and bargaining

April 1, 2014
The meaning of the 'return of nuclear materials'
http://mainichi.jp/english/english/perspectives/news/20140401p2a00m0na004000c.html

The Mainichi Shimbun ran an article in its March 25 morning edition headlined, "PM Abe declares Japan set to remove all Tokai nuclear materials, return them to U.S."

Prime Minister Shinzo Abe made the announcement at the Nuclear Security Summit 2014 in The Hague, during which the Ukrainian issue and the Japan-U.S.-South Korea summit talks drew particular attention. According to his statement, Japan is set to remove all nuclear materials from the Ibaraki Prefecture village of Tokai, where many nuclear facilities are concentrated, and transfer all of them to the United States.

It appears that Japan is willing to take the lead in returning radioactive substances, which could be a target of terrorists, to the United States. Japan's decision as a peace-loving country appears as if it has reassured its allies, but this is not the case.

Before reaching the decision, Tokyo and Washington had tough negotiations on the prevention of nuclear proliferation. What Abe announced is a product of compromise between the two countries and a result of their bargaining. Behind the accord is pessimism about the future of the management of nuclear substances that is contrary to an international agreement on the matter.

What did Japan and the United States agree on before Abe's announcement?

A research institute in Tokai will surrender highly enriched uranium and plutonium, which it wants to keep, to the United States. In return, Washington will continue to accept spent nuclear fuel from Japanese research reactors beyond 2019 -- when the United States was supposed to discontinue to do so -- over an indefinite period.

As a result of the bargaining, the United States, which has taken the initiative in reducing and controlling nuclear materials on a global scale, has saved face. Japan, for its part, can continue research on nuclear power by relieving concerns in Osaka, Kanagawa and Ibaraki prefectures, which host nuclear research facilities, that dangerous radioactive waste will keep accumulating within their boundaries.

"Tokai nuclear materials" refer to 0.5 tons of highly enriched uranium and plutonium that has accumulated at Japan Atomic Energy Agency (JAEA) in the village, enough to produce dozens of atomic bombs.

About 200 tons of plutonium have so far been generated at Japanese nuclear plants -- 45 tons of reprocessed plutonium, including that being stored in Britain and France, and 152 tons contained in spent nuclear fuel that has not been reprocessed yet -- enough to make 40,000 atomic bombs.

However, it is highly pure nuclear substances at research facilities that terrorists are likely to target because they could easily transform such substances into weapons. Therefore, nuclear materials in Tokai are subject to reductions and strict controls.

Former U.S. President Dwight D. Eisenhower was the first person to advocate the peaceful use of nuclear energy.

"Atoms for Peace," he said in a speech at the United Nations in 1953. Since then, the United States has provided a large amount of uranium and plutonium for fuel and research purposes to its allies, including Japan. As a result, nuclear materials have ended up spreading throughout the world.

Since 2004, the United States has joined hands with Russia in recovering nuclear materials that have spread throughout the world.

Thanks to their efforts, the number of countries possessing certain amounts of highly enriched uranium and plutonium has been decreasing, but illegal transactions in nuclear substances, theft and losses have occurred frequently. As such, the world is more chaotic in terms of the management of radioactive substances.

At the Nuclear Security Summit's general meeting, Pakistani Prime Minister Muhammad Nawaz Sharif sat next to U.S. President Barack Obama.

Pakistan is not a party to the Nuclear Non-proliferation Treaty (NPT), and possesses nuclear arms. What makes matters worse is that terrorist attacks are rampant throughout its territory. Such being the case, the country is far from being able to return nuclear materials to the United States through negotiations.

The United States also has its own problems. It cannot work in harmony with Russia in managing nuclear substances. Washington needs to control nuclear materials constantly arriving in its territory while keeping an eye on the peaceful use of atomic power as well as nuclear weapons.

The transfer of uranium and plutonium in Tokai to the U.S. is nothing but a temporary political arrangement between the two governments. It will not reduce the total volume of nuclear substances on the globe.

While being fully aware of this, Japan is continuing to accelerate nuclear proliferation by promoting exports of nuclear power plants. Human beings are increasing the amount of nuclear materials by postponing a fundamental resolution on such contradictions to the future. (By Takao Yamada, Expert Senior Writer)

April 01, 2014(Mainichi Japan)

Gordon Edwards on weapons-grade plutonium (and Japan)

Weapons-Grade Nuclear Explosive Materials

The good news is that weapons-grade nuclear materials in many countries are being rounded up and confined to a smaller number of high-security locations in order to at least begin to reduce the risk of criminal organizations or terrorist groups getting their hands on the nuclear explosive materials needed to make a powerful atomic bomb.

The nuclear explosive materials in question are (1) Highly Enriched Uranium or HEU, and (2) Plutonium or Pu. These are the only two types of materials that can be used to make an atomic bomb at the present time. The Hiroshima bomb used Highly Enriched Uranium as a nuclear explosive, whereas the Nagasaki bomb used plutonium.

For the would-be bomb-maker, the main advantage of HEU is that it is much easier to make an atomic bomb with it, using a "gun-type" mechanism, compared with plutonium, which requires a more elaborate "implosion-type" mechanism. The gun-type device is so simple and direct that testing is unnecessary -- it is guaranteed to produce a very powerful atomic explosion. The implosion-type device is considerably trickier but not beyond the abilities of a well-equipped terrorist organization.

But bomb-makers find plutonium has many advantages too. (1) Plutonium is a more powerful explosive, so less plutonium than HEU is needed to destroy a city. (2) Plutonium is extracted chemically from irradiated nuclear fuel all at once, unlike HEU which has to be produced by a long slow energy-intensive process of gradual enrichment. (3) Plutonium is used as an explosive "trigger" to set off even more powerful "H-bombs" -- using the nuclear fission to ignite a nuclear fusion reaction.

When nuclear weapons are dismantled, the plutonium "triggers" are removed. Without plutonium these warheads are useless; no nuclear explosion is possible. But the "excess" weapons-grade plutonium has to be carefully guarded forever because we do not know at the present time how to destroy plutonium or eliminate it once it has been created.

Other Nuclear Explosive Materials

The bad news is that weapons-usable nuclear materials are NOT being rounded up and NOT being prohibited internationally. Weapons-grade materials are not the same as weapons-usable materials. Weapons-usable nuclear materials continue to be produced, and will become increasingly accessible to criminal organizations as time goes on.

Plutonium poses the greatest danger in this regard, because ANY form of reactor-produced plutonium can be used to make a powerful, highly effective and completely reliable nuclear weapon. One doesn't need to have "weapons-grade" plutonium for this purpose; any plutonium will do. See http://ccnr.org/plute_sandia.html *.*

"Weapons-grade" plutonium refers to the highest quality of plutonium, in which the predominant isotope is plutonium-239 (Pu-239) with relatively little of the other isotopes of plutonium, especially plutonium-240. On the other hand "reactor-grade" plutonium has up to 40 percent plutonium-240 along with the more abundant plutonium-239. Given the choice, any bomb-maker would prefer to use weapons-grade plutonium because it is easier to handle and more predictable in outcome (the force of the blast). However reactor-grade plutonium can be used to make an effective, highly reliable weapon at any level of technical sophistication. See http://ccnr.org/Findings_plute.html *.*

Because the nuclear industry wants to be able to use plutonium to replace -- or at least to supplement -- uranium as a fuel for nuclear reactors, their public relations machinery has created a myth that has deceived many decision-makers, even in very high places, as well as most of the people who work in the nuclear industry. The myth maintains that reactor-grade plutonium is "unsuitable" for nuclear weapons use. Without plutonium as a fuel, any massive expansion of nuclear power is impossible.

But this particular myth -- that reactor-grade plutonium is unsuitable for bombs -- is not at all true. It would be more correct to say that reactor-grade plutonium is somewhat less convenient than weapons-grade plutonium for nuclear weapons use, but so what? As Sandia Labs declared in one of their major publications, "For nuclear weapons use, ALL plutonium is GOOD plutonium."
See http://ccnr.org/plute_sandia.html *.*

From the point of view of non-proliferation, plutonium poses much greater difficulties in the very long term than HEU does, because HEU can be "denatured" -- made absolutely unusable for nuclear weapons -- whereas plutonium cannot.

It is impossible to make a bomb with unenriched uranium, because there just isn't enough uranium-235 to make an explosion possible. In the case of uranium, the most abundant naturally occurring isotope, uranium-238, is NOT a nuclear explosive material at all, so it can be used as a "denaturing" agent to dilute uranium-235 down to harmless proportions.

There is no counterpart in the case of plutonium.
ANY kind of plutonium -- even pure plutonium-240 -- can be used as a powerful nuclear explosive. In fact plutonium-240 is a more powerful nuclear explosive than uranium-235 -- and the same is true for all other plutonium isotopes. See
''Explosive Properties of Reactor-Grade Plutonium'' by Carson Mark, excerpted with a hot-link in

http://ccnr.org/Findings_plute.html .

Brave New World

As Pierre Elliott Trudeau told the United Nations General Assembly's Special Session on Disarmament in 1978, if we want to have a world without nuclear weapons, then we have to begin by "suffocating" the nuclear arms race by "choking off the vital oxygen on which it feeds". He was referring to the production of nuclear explosive materials -- enriched uranium and plutonium. As long as we continue to produce these materials it will be impossible to eliminate nuclear weapons.

On the other hand, if we stop the production of these nuclear explosive materials worldwide, then we have a chance to dismantle existing arsenals of nuclear weapons and achieve a nuclear-weapons-free world. That means that uranium enrichment plants everywhere (not just in Iran!) and plutonium reprocessing plants everywhere (not just in North Korea!) will have to be internationally outlawed. Then weapons-usable uranium can be down-graded to levels that cannot be used for bombs, and that cannot be upgraded without building a uranium enrichment facility first. Also, existing stockpiles of "separated plutonium" can be re-mixed with the fiercely radioactive liquid wastes contained all the fission products and other nuclear waste materials from the irradiated nuclear fuel, so that the plutonium is no longer accessible without a chemical reprocessing operation.

Such security measures, while not perfect, requiring constant vigilance, would at least create a situation of sufficient stability to allow for the gradual elimination of all nuclear weapons in the world, if that is determined by world leaders to be the sanest objective for the continued survival of the human race.

Reality Bites

But that's not what is happening. Look at Japan for example. While self-congratulatory articles are being written about the significant quantities of highly enriched uranium and plutonium that are being shipped back to the USA from Japan, there is slight mention of the fact that the Japanese Government plans to give the go-ahead this year for the start-up of their $21 billion reprocessing plant, which will begin ***extracting weapons-usable plutonium from irradiated nuclear fuel on a mass-production basis.***

So the security measures associated with weapons-grade materials run the risk of being merely window-dressing, camouflaging and in no way putting the brakes on industry plans to mass-produce nuclear-weapons-usable materials, thereby making a nuclear weapons free world politically impossible.

This kind of decision cannot be regarded as a commercial or economic decision like any other -- it could very well seal the Fate of the Earth. (Jonathan Schell, the author of the profoundly thought-provoking book The Fate of the Earth, passed away in New York City on Tuesday, March 25, 2014.)

It is up to the peoples of the Earth to see the enormity of what is going on and to speak up now and act so as to keep alive the hope for a sustainable future for our great great grandchildren. A non-nuclear-weapons-future should not be foreclosed by the expediency requirements of the commercial nuclear power industry.

Gordon Edwards.

Nuclear exports: New "safety myth" at work

April 5, 2014

Lower House votes to export nuclear technology and 'safety myth'

http://ajw.asahi.com/article/behind_news/politics/AJ201404050048

By SHINICHI SEKINE/ Staff Writer

The Lower House's vote to approve pacts that allow for the export of Japanese nuclear technology to Turkey and the United Arab Emirates has some lawmakers concerned.

With the passage of the agreements April 4, which were supported by the ruling Liberal Democratic Party, its junior coalition partner New Komeito and the main opposition Democratic Party of Japan, it is virtually certain the accords will pass the Upper House before the current session ends in June.

But critics say the failure to establish a system that addresses safety concerns related to the export of the nation's nuclear technology is sure to propagate another "safety myth."

During the vote by the Lower House, LDP lawmaker Masatoshi Akimoto, who has called for the abolition of nuclear power generation, and DPJ lawmakers Shoichi Kondo and Yukio Ubukata walked out in protest.

DPJ lawmaker and former Prime Minister Naoto Kan, as well as Japan Restoration Party co-representative Shintaro Ishihara, were absent from the voting. Despite his party's opposition to the nuclear agreements, Ishihara supports promotion of the industry.

The agreements with Turkey and the United Arab Emirates are the first of their kind for the Abe administration, which listed exports of nuclear technology as one of the pillars of the government's economic growth strategy and part of its efforts to maintain Japan's edge in nuclear power generation.

In October 2013, Prime Minister Shinzo Abe visited Turkey to promote Japan's nuclear industry. As a result, a consortium of Japanese companies succeeded in winning an order to construct a nuclear power plant in the country.

So when Turkish Prime Minister Recep Tayyip Erdogan visited Japan in January, Abe assured him that he would seek early passage of a bilateral nuclear pact with Turkey, saying, "We will put top priority on the issue in the ordinary Diet session (of this year)."

As a result of that pledge, the Abe administration terminated deliberations April 2 by a committee on the issue after just five hours. Though some ruling party lawmakers expressed concern over the hasty manner in which the process was done, the administration still put the nuclear pacts with Turkey and the UAE up for a vote in the plenary session of the Lower House on April 4.

When nuclear power technology is exported, the government is obliged to seek guarantees that it will not be diverted to make weapons. Still, it remains unclear how the safety issue is going to be addressed.

In a meeting of the Lower House Committee on Foreign Affairs held April 2, New Komeito lawmaker Mitsunari Okamoto criticized the government, saying, "There is no organization in Japan that shoulders responsibility (for checking the safety of exported nuclear power infrastructure)."

Before the March 2011 disaster at the Fukushima No. 1 nuclear power plant, the Nuclear and Industrial Safety Agency (NISA), which is affiliated with the Ministry of Economy, Trade and Industry, was in charge of handling safety checks on exported technology.

After the accident, however, NISA was split off from the economy ministry, which had been promoting nuclear power generation, and renamed the Secretariat of the Nuclear Regulation Authority.

The secretariat does not conduct safety inspections or investigations in connection to exported nuclear infrastructure. The economy ministry also has no safety inspection systems in place, either. As a result, no organizations are overseeing safety checks.

In the foreign affairs committee meeting, Foreign Minister Fumio Kishida acknowledged the fact, and said, "As the government, we are going to establish a (new) safety examination system."

Like Japan, Turkey is one of the most earthquake-prone countries in the world. However, Diet deliberations revealed that, in Turkey, the authorities there that regulate the nuclear industry and those that promote it are not completely separate entities. The situation there is like Japan before the Fukushima nuclear accident.

The Abe administration is trying to restart idled nuclear reactors in Japan under what it says are the "strictest safety standards in the world." At the same time, it is ignoring serious safety concerns in its haste to export the nation's nuclear power infrastructure and technology.

Akira Kasai, a lawmaker of the Japanese Communist Party, said that the government is exporting "a new safety myth."

Japan's bilateral nuclear pacts

April 4, 2014
Japan lower house OKs nuclear pacts with Turkey, UAE
http://mainichi.jp/english/english/newsselect/news/20140404p2g00m0dm061000c.html

TOKYO (Kyodo) -- Japan's House of Representatives on Friday passed two nuclear pacts with Turkey and the United Arab Emirates that would pave the way for Japan to export nuclear power infrastructure to the two countries.

The agreements, both concluded last year, would come into force by early May under the Constitution, which stipulates that lower house decisions on state budgets and bilateral treaties prevail in the Diet.

Members of the governing Liberal Democratic party, its junior coalition partner, the Buddhist-backed New Komeito party, and the main opposition Democratic Party of Japan voted for the pacts.

The approval came at a time when anti-nuclear power sentiment still persists among the public as the nuclear disaster at the Fukushima Daiichi power plant has yet to be resolved.

Those nuclear pacts set a legal framework for the peaceful use and transfer of atomic-power technologies and equipment.

Prime Minister Shinzo Abe signed the pacts when he visited the two countries in May 2013.
The Japanese government sought parliamentary approval of the pact during the extraordinary Diet session last fall. But the Diet failed to come to a decision at that time and carried the deliberations to the current 150-day regular session which started Jan. 24.

The opposition DPJ has decided to vote for the treaties as it promoted the export of nuclear power infrastructure when it was in power between August 2009 and December 2012.

As for Turkey, Mitsubishi Heavy Industries Ltd. is a member of a consortium of business corporations which has won an order to build an atomic power plant in the country.

The United Arab Emirates started to construct a nuclear power plant in 2012 and is currently planning to build more reactors, government officials said.

Japan concluded bilateral nuclear accords with 11 countries, including Australia, China, France, Russia and the United States -- and the European Atomic Energy Community, and is currently promoting talks with India and Brazil to conclude similar treaties.

Please visit Hiroshima and Nagasaki

April 8, 2014
Foreign minister pushing leaders of nuclear powers to visit Hiroshima, Nagasaki
http://ajw.asahi.com/article/behind_news/politics/AJ201404080049

THE ASAHI SHIMBUN
Foreign Minister Fumio Kishida is pressing world leaders to visit Hiroshima and Nagasaki so they can get a better understanding of the devastation wrought by atomic bombs.

"It is important for political leaders to see the reality of what happens when atomic bombs are unleashed," Kishida said in an interview with The Asahi Shimbun at the ministry in Tokyo on April 7.

He made the remark in the context of a foreign ministers' meeting of the Non-Proliferation and Disarmament Initiative (NPDI) to be held in Hiroshima from April 11 by 12 non-nuclear countries.

Kishida, who is scheduled to chair the meeting, added that the NPDI plans to incorporate the request into a joint declaration to be issued at the meeting. It will be the first time for the group to issue such a message.

In the 68 years since the atomic bombs were dropped, no leaders of nuclear powers have ever visited Hiroshima or Nagasaki. This is something the NPDI hopes to change.

It will be the first time for Japan to host the NPDI foreign ministers' meeting.

As for holding the gathering in Hiroshima, Kishida, who is from the city, said, "It is very important in a sense that the meeting will heighten the international momentum toward the establishment of a nuclear-free world."

He added: "Nuclear disarmament must be discussed not only by the United States and Russia but also by all of the nuclear powers from various perspectives. We (the NPDI) want to make the real conditions of the disarmament more transparent and issue a message in the field of nuclear nonproliferation as well."

With regard to the review conference of the Treaty on the Non-Proliferation of Nuclear Weapons, known as NPT, which is scheduled to be held in New York in spring 2015, Kishida said that the NPDI plans to get more involved.

"We want to discuss ways to show the inhumanity of nuclear weapons to all generations and all countries (at the NPDI foreign ministers' meeting)," Kishida said.

Of the 12 countries of the NPDI, seven are protected by the U.S. "nuclear umbrella." Of them, six countries, except for Japan, have not yet agreed to the "joint statement on the inhuman nature and non-use of nuclear weapons," which was proposed in the United Nations in October 2013.

"We (Japan) want to become a catalyst to solidify countries of various standpoints and unite their opinions," Kishida said.

The 12 countries of NPDI are Japan, Australia, Germany, the Netherlands, Poland, Canada, Mexico, Chile, Nigeria, Turkey, the Philippines and the United Arab Emirates. They held their first foreign ministers' meeting in New York in September 2010.

The group has worked out documents that request NPT member countries to steadily implement action programs toward nuclear disarmament, and has submitted them to the preparation committee of the NPT review conference.

Concerns about nuclear proliferation

April 10, 2014

Editorial: Nuclear pacts with Turkey, UAE bring concerns about nuclear proliferation
http://mainichi.jp/english/english/perspectives/news/20140410p2a00m0na006000c.html

Nuclear pacts that Japan has signed with Turkey and the United Arab Emirates (UAE), which will be approved during the current Diet session, cannot completely dispel concerns about nuclear proliferation.

The House of Representatives approved the accords last week, and the House of Councillors is also set to endorse them since the ruling coalition controls the upper house.

The pacts, which will allow Japan to provide nuclear plant-related equipment and technology to Turkey and the UAE on condition that the recipient countries use the materials strictly for peaceful purposes, are a prerequisite for Japan to export atomic power stations to these countries.

The government of Prime Minister Shinzo Abe is enthusiastic about exporting nuclear plants as part of its growth strategy. However, Japan, which experienced a serious nuclear accident in 2011, should be prudent in promoting such exports.

The ruling Liberal Democratic Party (LDP), its coalition partner New Komeito and the largest opposition Democratic Party of Japan (DPJ) voted in favor of the pacts in the lower chamber. Other opposition parties -- the Japan Restoration Party (JRP), Your Party, the Unity Party, the Japanese Communist Party, People's Life Party and the Social Democratic Party opposed the agreements.

Even some members of political parties that voted for the pacts abstained from voting, highlighting a lack of national consensus on exports of nuclear plants.

Despite a lack of public support, Prime Minister Abe promoted sales of nuclear plants during the Nuclear Security Summit 2014 held in the Netherlands in March.

The construction of a nuclear reactor costs hundreds of billions of yen. The government estimates that Japanese firms will build up to 370 reactors all over the world by 2030 because officials believe that the exports of nuclear plants can be one of the pillars of the Japanese economy. However, should a serious accident occur at a nuclear plant that a Japanese company exports, the firm would be responsible for paying a massive amount of compensation, which could adversely affect Japan's economy.

The prime minister emphasizes that Japan can provide the world's safest nuclear power technology to other countries. If so, Japan's exports of atomic power stations could help enhance the safety of such plants in the world, and also contribute to efforts to prevent global warming because nuclear plants emit less carbon dioxide than thermal power plants.

However, such contributions would be possible only if Japan's nuclear power technology is truly the world's safest. The cause of the Fukushima nuclear crisis has not been fully clarified even though three years have passed since its outbreak. Japan must not spread the risks of nuclear crisis throughout the world through its reckless exports dependent on the myth of nuclear plants' infallible safety.

The safety of nuclear plants depends largely on the environment of their locations. In this sense, serious questions remain as to exports to Turkey, which like Japan is a quake-prone country. A magnitude-7.4 temblor that occurred in a northwestern part of Turkey, which includes Istanbul, in 1999 left approximately 17,000 people dead. As such, it will not be an easy task to ensure safety of nuclear plants in the country.

Japan's nuclear accord with Turkey is problematic because it includes a clause that allows Turkey to enrich and reprocess uranium, which could be transformed into nuclear weapons, on condition that Japan agrees to the move in advance. In a Diet session, Foreign Minister Fumio Kishida denied Japan will consent to Turkey's enrichment and reprocessing of such a nuclear substance. However, the clause gives rise to

concerns that the accord could lead to nuclear proliferation. The government should fully explain why Tokyo agreed to incorporate such a clause only in its nuclear pact with Turkey to convince the public.

Even if the upper house is to vote down the pacts, the accords would be enforced in accordance with the Constitution that stipulates that the lower house's decision on a treaty overrides the upper house's vote. Therefore, the lower house's decision last week has effectively opened the way for Japan to export nuclear plants and technology to Turkey and the UAE. Still, Japan should hold in-depth debate on the role that the country should fulfill as a member of the international community in preventing nuclear proliferation rather than making haste to export atomic power stations and technology to these countries.

April 10, 2014(Mainichi Japan)

Mixed message

April 10, 2014
Kishida to urge nuclear-free world in Hiroshima
http://www3.nhk.or.jp/nhkworld/english/news/20140410_27.html

Foreign Minister Fumio Kishida says he will convey a strong message at a meeting of foreign ministers in Hiroshima that Japan is seeking a world free of nuclear weapons.

Foreign ministers from Japan, Australia and 10 other countries that do not possess nuclear weapons will gather for a meeting of the Non-Proliferation and Disarmament Initiative on Saturday.

Japan is hosting the meeting for the first time.

Kishida told the Upper House Foreign Affairs and Defense Committee on Thursday that Japan, as the only country in the world to have suffered atomic bombings, has a moral obligation to lead international opinion in seeking a nuclear-free world.

Kishida said it is the first meeting to be held in an atomic-bombed city and that he wants foreign ministers from other countries to learn the reality of the atomic bombings.

Kishida said he also wants to convey Japan's political message that it seeks to bring about a world without nuclear weapons.

Kishida said he will release a statement likely to be adopted at the end of the meeting which will urge nuclear nations to conduct nuclear disarmament negotiations in a more multilateral and transparent manner.

Kishida said he also wants the statement to include calls for tighter surveillance by the International Atomic Energy Agency and for the denuclearization of North Korea.

And what's left for renewables?

April 9, 2014

Bloomberg

Energy plan fails to set targets for renewables

Bloomberg
http://www.japantimes.co.jp/news/2014/04/09/business/energy-plan-fails-to-set-targets-for-renewables/#.U0Y3L1fi91s

The government of Prime Minister Shinzo Abe's final version of a draft energy report reinforces the role of nuclear power in the country's future, but falls short of setting specific goals for renewable energy use.

The policy describes nuclear power as "an important base-load energy source," according to a 78-page draft obtained by Bloomberg News. The plan, the first update to the nation's energy policy since the 2011 Fukushima No. 1 nuclear plant crisis started, is expected to be approved as early as Friday, Deputy Chief Cabinet Secretary Katsunobu Kato has said.

The plan represents a compromise for coalition partner New Komeito, which had pushed for the inclusion of specific targets for renewable energy. The party pledged during the 2012 election campaign that clean energy would provide 30 percent of the nation's electricity by 2030, or 35 percent if hydropower were included.

The new policy says the country will aim to introduce clean energy at levels that "further" exceed previously announced targets. The ruling parties earlier sought to say renewable energy should "significantly" exceed old targets.

A plan published in 2010 by a previous government led by the Democratic Party of Japan envisioned the country getting about 20 percent of its electricity from clean energy and 53 percent from nuclear power by 2030.

The new policy was approved by Abe's Liberal Democratic Party and New Komeito last week, despite deep divisions over nuclear energy. Sixty-nine percent of respondents to a poll last month published by the Tokyo Shimbun said nuclear power should be phased out.

Officials with the Ministry of Economy, Trade and Industry weren't available for comment.

"We will leave behind the energy strategy drawn up before the earthquake and start from scratch," says the draft policy to be considered by the Cabinet.

To promote inter-ministerial cooperation on clean energy issues, the government will set up a council of ministers, according to the policy.

While the policy describes Japan's intention to reduce nuclear reliance, it also says reactors will be restarted once their safety is confirmed. "We will reduce our dependency on nuclear as much as possible," the final draft says.

New Komeito earlier sought to end reliance on nuclear power, a position shared by the DPJ administration, which was voted out of power in December 2012.

The plan also calls coal an important base-load power source, saying it is economical and supply is stable although it emits large amounts of greenhouse gas. "We will push through further technology development to drastically reduce greenhouse gas emissions by improving power generation efficiency" of coal, the report says.

"The government draft does not at all mention changes that are happening in the world" regarding coal, Teruyuki Ohno, executive director of the Japan Renewable Energy Foundation, wrote on March 20 in a column posted on the group's website, referring to an earlier version of the policy.

He said major international banks such as the World Bank are announcing plans not to support coal projects following a U.S. policy not to give loans for coal-fired plants in developing countries. "The draft instead features plans to export coal technology abroad."

Japan will set its energy mix — targets for various energy types — "soon" taking into account reactor restarts and clean energy installations, the policy says.

Nuclear plants provided more than a quarter of Japan's electricity before the Great East Japan Earthquake and tsunami in March 2011 caused meltdowns at Tokyo Electric Power Co.'s Fukushima plant. The nation's 48 operable commercial reactors have since been idled for maintenance or safety checks. The country has been nuclear-free since September 2013.

Eight regional utilities including, Tokyo Electric Power Co., the operator of the Fukushima plant, have applied for safety checks for some of their reactors.

The Nuclear Regulation Authority said in March that it would expedite safety checks on two of Kyushu Electric Power Co.'s reactors, raising the prospect that some nuclear power generation may be resumed ahead of peak power demand in summer.

The DPJ government set a target of phasing out nuclear energy by the end of the 2030s in a policy set in September 2012, but it was never enacted.

The country currently gets 1.6 percent of its electricity from renewable sources such as wind and solar, with hydropower providing a further 8.4 percent.

Japan's energy future: Not convincing

April 12, 2014

EDITORIAL: New basic energy plan offers no convincing vision for Japan's future

http://ajw.asahi.com/article/views/editorial/AJ201404120044

The government formally decided its new basic energy plan on April 11 with Cabinet approval of the primary energy policy document.

This is the first revision to the government's basic energy plan since the catastrophic accident at the Fukushima No. 1 nuclear power plant in 2011.

The revision was a great opportunity to demonstrate the government's commitment to tackle the challenges created by the disaster. It was a chance to clarify where the problems lay and how it intends to translate changes in the public's attitude toward nuclear power generation into its energy policy.

But even though it includes a large variety of ideas, the new plan can by no means be considered a convincing message about the energy future of Japanese society.

Although the plan calls for lowering Japan's dependence on atomic energy, it simultaneously expresses concerns about the growing imports of fossil fuels due to a nationwide shutdown of nuclear reactors, indicating the government's intention to maintain nuclear power generation into the future.

While quietly changing the purpose of the Monju prototype fast-breeder reactor and promising to promote the program to establish a nuclear fuel recycling system, the document stresses "flexibility in medium- to long-term policy efforts" in an apparent attempt to dodge criticism.

All this waffling is part of the devious game the Abe administration has been playing in regard to its energy policy. Its strategy is designed to avoid touching off a public backlash by hiding or soft-pedaling its real intentions.

Three years have passed since the worst nuclear accident in Japanese history. By now, electric utilities must have realized that they can no longer continue relying on nuclear power.

Obviously, the government's job now is to act swiftly to work out a well-focused and practical strategy for phasing out nuclear power generation in this nation.

The basic energy plan describes nuclear power as "low-carbon and quasi-domestic energy" and a "base-load" power source that should be used for continuous, around-the-clock power generation.

If it really intends to make Japanese society less dependent on atomic energy, the government should promote the development of power sources that can substitute for nuclear power, such as geothermal and hydraulic power generation and high-efficiency coal-burning thermal power stations, instead of seeking to build or expand nuclear power plants.

Nuclear power generation can never be free from the risk of severe, large-scale accidents that entail devastating consequences. It is unacceptable for the government to press for early restarts of idled reactors when sufficient safety measures to prevent serious accidents have yet to be put in place.

To be sure, the problem of rising costs due to increasing imports of fossil fuels should not be taken lightly.

But the government's claim that growing fuel imports are causing Japan to lose 3.6 trillion yen ($35 billion) worth of national wealth every year has raised doubts about the calculation formula among various experts.

Electric power companies have accumulated relevant data for three years. Instead of using a simple macroeconomic estimate, it is vital for the government to obtain accurate data concerning amounts and prices of imported fuels from utilities. Then, it should take steps to deal with the problem based on objective data assessments and factor analyses.

Restarting offline reactors could serve as a strong disincentive for new entries into the power market and investment to develop new power sources.

Unless the government quickly offers a medium- and long-term road map to a future less dependent on nuclear power, there will be no substantial progress in the efforts to re-energize the power market.
The new basic energy plan points out the need to create a system that allows the public to become involved in the entire process of developing and executing the energy policy.

The March 11 disaster has made us painfully aware of how the closed nature of the process in which the nuclear energy policy was developed and implemented contributed to the enormity of the damage.

We clearly need a system for public participation in the policy process to ensure that more than halfhearted efforts are made to provide information to the public and listen to the voices of the people.

The government needs to match its words with action.

--The Asahi Shimbun, April 12

What happened to the idea of a nuclear-free Japan?

April 12, 2014

Abe administration steers away from nuclear-free policy
http://ajw.asahi.com/article/business/AJ201404120049

THE ASAHI SHIMBUN

Turning a blind eye to the Fukushima crisis and public outcry over the safety of atomic power, the Abe administration has decided not to pursue a nuclear-free society.

The new basic energy plan, approved by the Cabinet on April 11, is at odds with the policy of the previous Democratic Party of Japan-led government which was in power when the nuclear disaster unfolded in 2011.

The Abe administration made clear it regards nuclear power as a key electricity source and will restart idled nuclear reactors if their safety is confirmed.

Without offering specific measures to reduce the nation's dependence on atomic energy, the administration said it will forge ahead with the promotion of nuclear power generation.

It was the first time since the nuclear accident triggered by the earthquake and tsunami disaster that a Cabinet has taken upon itself to decide the country’s nuclear power and energy policies.

According to the new basic energy plan, the administration will lower the ratio of nuclear power among all electricity sources as much as possible.

However, it did not specify how much nuclear power generation will be reduced, or by when.
With regard to building new nuclear reactors, the energy plan calls for studies into how much additional nuclear power generation will be necessary.

This diverges from the DPJ-led government policy of not constructing new nuclear reactors.
The Nuclear Regulation Authority is now screening 17 reactors of 10 nuclear power plants to judge whether they meet new safety standards. The screening on the No. 1 and No. 2 reactors at the Sendai nuclear power plant in Kagoshima Prefecture is ahead of those on the other 15 reactors.

In a news conference held April 11, Chief Cabinet Secretary Yoshihide Suga said that if the NRA approves operations of certain reactors, Prime Minister Shinzo Abe will put political considerations aside when making the decision to reactivate them.

This suggests that if the safety of certain reactors is guaranteed by the NRA screenings, the Abe administration will approve their restart unconditionally.

The new basic energy plan also specified that the administration will maintain the Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture, and promote a nuclear fuel recycling program. The DPJ-led government was committed to closing Monju.

The plan also states that the administration aims to make the ratio of renewable energies among all the electricity sources higher than the previous target of "about 20 percent in 2030." However, it does not set a fixed target.

GIST OF NEW BASIC ENERGY PLAN

--Nuclear power is an important base load electricity source;
--Nuclear reactors that meet new safety standards will be restarted;
--Dependence on nuclear power will be reduced as much as possible;
--The government will make utmost efforts toward the final disposal of high-level radioactive waste;
--Nuclear fuel recycling program will be promoted;
--Monju will be used as an international research stronghold; and
--Renewable energies will be introduced as quickly as possible during a three-year period from 2013.

New energy policy and nukes ratio

April 11, 2014
Govt. to set ratio for nuclear power
http://www3.nhk.or.jp/nhkworld/english/news/20140411_47.html

Prime Minister Shinzo Abe says his government will set the ratio of nuclear power in Japan's energy mix after considering the situation once the reactors are restarted.

Abe spoke to a plenary session of the Lower House on Friday about the basic energy plan approved by the Cabinet earlier in the day.

He said the government's policy is to develop an energy-saving society and introduce renewable energy sources, while reducing dependence on nuclear power as much as possible.

But Abe said that given Japan's increased dependence on natural gas and other fossil fuels, he can't say that Japan will completely abandon nuclear power.

He added the government does not currently have any plans to build any more nuclear reactors or plants. Abe said the focus will be on diversifying energy resources and on how experts will view the resumption of existing reactors.

Abe said the government will set a target for the optimum mix of energy sources. He said the government will do that after looking into the situation regarding renewable energy and its potential, as well as the status of resumed operations at idled nuclear plants.
Apr. 11, 2014 - Updated 12:21 UTC

April 11, 2014
Japan decides new energy policy that supports use of nuclear power
http://mainichi.jp/english/english/newsselect/news/20140411p2g00m0dm038000c.html

TOKYO (Kyodo) -- The government of Prime Minister Shinzo Abe decided on a national energy policy Friday that supports the use of nuclear power now and in the future, retracting a nuclear phase-out goal introduced by its predecessor after the 2011 Fukushima Daiichi disaster.

The Basic Energy Plan sets the stage for the government to move ahead to restart nuclear reactors, all of which are now offline amid safety concerns, while reaffirming the continuity of the country's spent fuel recycling projects that have not made headway.

The move has been expected since the pro-nuclear Liberal Democratic Party returned to power in December 2012, but the government spent several more months than initially expected before deciding on the plan as draft documents stirred controversy among lawmakers who saw them as too strongly pro-nuclear in tone.

"We have compiled a basic policy on the medium to long-term measures to rebuild a responsible energy policy that supports people's lives and economic activities," Economy, Trade and Industry Minister Toshimitsu Motegi, who was in charge of crafting the plan, told a press conference.

After going through some revisions in the draft, the government decided to define nuclear power as an "important base-load power source" that is cheap in terms of operation costs and can stably generate electricity continuously through the day.

As for the policy direction over the next 20 years or so, the government said it will "proceed with the reactivation of nuclear power plants" that have satisfied what the government calls the world's toughest regulatory standards, and at the same time pledged to "reduce nuclear dependence as much as possible." It also left open the possibility of allowing the construction of new reactors, saying in the plan that the government will "assess the amount of nuclear power that should be secured" to ensure a stable energy supply in a resource-scarce country.

While admitting Japan has faced difficulties to materialize its long-standing nuclear fuel recycling policy, the energy plan highlighted the need to pursue plans to reprocess spent uranium fuel and reuse the extracted plutonium and uranium as reactor fuel.

On the trouble-plagued Monju prototype fast-breeder reactor, which has been developed to play a key role in fuel recycling, the government said the facility should serve as a center for research to reduce the volume of nuclear waste and to improve technologies related to nonproliferation.

Apparently to fend off criticism the government is irresponsible to turn to nuclear power without finding a final disposal site for high-level radioactive waste generated through reprocessing, the plan said the state will play "a proactive" role to resolve the stalled process.

The government did not include specific percentages of the country's future energy mix in the plan, citing the difficulty to foresee at the moment the number of reactors that will be safe enough to restart and the amount of renewable energy available.

But to show its desire to boost renewable energy, the government promised to seek to introduce such energy sources "farther above" the level aimed at in the past, adding a footnote that the previous Basic Energy Plan decided on in 2010 expected renewables to account for about 20 percent of the total electricity demand in 2030.

Motegi said the government will decide the target of the country's future energy composition as quickly as possible, adding that he does not expect the work to take "two or three years."

Japan has had a Basic Energy Plan since 2003. The government is legally required to check the plan at least once every three years and revise it if necessary.

The previous plan aimed to boost the nation's reliance on nuclear power to some 50 percent by 2030. Before the Fukushima disaster, nuclear power supplied about 30 percent of the total electricity supply.

In 2012, the government led by the Democratic Party of Japan decided on what it called an "energy strategy" aiming to phase out nuclear power by the end of the 2030s.

But the landmark decision triggered strong opposition from the business world, and the government at that time did not go so far as to revise the 2010 Basic Energy Plan that was expected to stipulate the details to realize the strategy.

April 11, 2014(Mainichi Japan)

New energy plan not really a "plan"

Editorial: Government's new energy 'plan' off course

http://mainichi.jp/english/english/perspectives/news/20140412p2a00m0na007000c.html

The government has obtained Cabinet approval for its Basic Energy Plan, which sets forth the country's medium- and long-term energy measures.

The plan includes no numerical targets for the ratio of each power source, however -- including nuclear power -- and also fails to present a future vision even after weeks of discussions within the ruling coalition parties. It is very difficult, therefore, to say that this energy policy serves as any sort of guideline.

The public's misgivings about energy -- including the danger of nuclear power plants, rising fuel costs, and fears for power blackouts -- remain strong. In order to dispel such concerns, the government must rush to flesh out the basic energy plan.

The updating of the country's energy plan was prompted by the Fukushima No. 1 Nuclear Power Plant disaster, which was triggered by the March 2011 Great East Japan Earthquake. The plan's renewal had originally been focused on reviewing a previous basic energy plan drawn up in 2010, which had decided that Japan would boost its dependence on nuclear power.

Although the updated energy plan aims to reduce the country's dependence on nuclear power, it ended up showing a positive stance toward reactivating idled nuclear reactors. The policy also presented a plan to maintain a certain level of nuclear power usage in the future, paving the way for the construction of new reactors. Although the country's nuclear fuel cycle projects have effectively hit a snag, the new energy plan upholds the promotion of such projects on the grounds that there are no concrete measures for final disposal of spent nuclear fuel.

In essence, the new energy plan makes a turnaround from the "zero-nuclear power" policy set out by the then Democratic Party of Japan-led government in 2012. The plan also reaffirms the conventional energy plan, which has been dependent on nuclear power. The essence of the new energy plan hasn't changed at all, even after one-month-and-a-half-long discussions held by the ruling coalition parties.

The major focus of the ruling coalition debates was how the new energy plan would treat renewable energy. The New Komeito party, which is the coalition partner of the ruling Liberal Democratic Party, maintained that numerical targets be included in the plan, given its pledge to increase the ratio of renewables to 30 percent in 2030. The government resisted the proposal, however, saying that it's not fair to set numerical targets only for renewable energy.

In the end, both parties reached an agreement to add a footnote including a target from the previous energy plan, which stated that the ratio of renewable energy will be raised to some 20 percent in 2030, and that the country will further aim to introduce more renewables.

Although the plan should present concrete goals and measures, the government failed to present such specifics as it has yet to come up with a picture of the future. If the government keeps glossing over the fact that it is only procrastinating with respect to existing problems, the new energy plan is not worthy of being called a "plan."

During the coalition parties' talks on the beginning part of the energy plan, which states the plan's significance, a sentence expressing remorse over the Fukushima nuclear disaster was once deleted. After some lawmakers made an objection, the sentence was restored almost to its original version.

This incident gives the impression that the "safety myth" about nuclear plants has reemerged within the government and the ruling parties. In fact, however, the safety myth of nuclear power has collapsed -- and they must once again keep this in mind.

We must break away from a dependence on nuclear power as quickly as possible -- a move that will entail social costs.

The government should swiftly flesh out its energy plan while gaining public understanding, and show the path toward a society that does not depend on nuclear power.

Calling for nuclear disarmament

April 12, 2014
12 nations urge nuclear disarmament

The foreign ministers of 12 non-nuclear weapons states have called on nations possessing the weapons to do more to disarm. They also urged world leaders to visit and learn from the 2 atom-bombed cities of Hiroshima and Nagasaki.

The foreign ministers of a coalition known as the Nonproliferation and Disarmament Initiative adopted a joint statement at the end of their 8th meeting in Hiroshima on Saturday. It was their first meeting in the city.

The Hiroshima Declaration calls for a nuclear disarmament conference that would bring together not only the United States and Russia, but all other nuclear weapons states as well.

The statement urges the nuclear powers to clarify the sizes of their nuclear-weapon stockpiles and to reduce the number of such weapons.

The statement condemns North Korea's nuclear program and urges the country to suspend all its nuclear activity immediately.

It also expresses the hope that a resolution to the dispute over Iran's nuclear development can be found through talks between Iran and the 5 permanent UN Security Council members plus Germany.

The ministers suggested that world leaders visit Hiroshima and Nagasaki. They said people of all countries and generations should learn of the inhumanity of nuclear arms toward realizing a world without such weapons.

Japanese Foreign Minister Fumio Kishida held a news conference with the other foreign ministers after the meeting.

He said they all had a chance to see the real picture of the atom-bombed city. He said he believes the Hiroshima Declaration will have universal significance within the international community.

The 12 members of the NPDI are Australia, Canada, Chile, Germany, Japan, Mexico, the Netherlands, Nigeria, the Philippines, Poland, Turkey and the United Arab Emirates.

Apr. 12, 2014 - Updated 12:59 UTC

More promises toward non proliferation

April 12, 2014

Foreign ministers discuss nuclear disarmament in Hiroshima
http://mainichi.jp/english/english/newsselect/news/20140412p2g00m0dm026000c.html

HIROSHIMA (Kyodo) -- Japanese Foreign Minister Fumio Kishida pledged his country's efforts toward nuclear nonproliferation and disarmament Saturday at a meeting of non-nuclear weapon countries in the city of Hiroshima.

At the ministerial meeting, the 12-member Nonproliferation and Disarmament Initiative is expected to call on nuclear powers to scale back their arsenals and for world leaders to visit Hiroshima and Nagasaki, two Japanese cities devastated by U.S. atomic bombings in World War II.

Representatives from the member states visited a memorial monument and a museum at Hiroshima's Peace Memorial Park before entering the eighth meeting of the NPDI, which was launched in 2010 and is being held in Japan for the first time.

"Japan will lead international efforts based on an awareness of the humanitarian consequences of nuclear weapons use and a calm awareness of the diversification of nuclear arms-related risks we are faced with," Kishida, who chairs the talks, said in his opening remarks.

The meeting takes place in the run-up to a session of the preparatory committee for a review of the Nuclear Non-Proliferation Treaty, the cornerstone international treaty on nuclear arms reduction, to be held in New York from April 28

The NPDI has already submitted several working papers to the preparatory committee on topics such as improving transparency in nuclear disarmament and on stalled talks to create a Middle East zone free of weapons of mass destruction.

But doubts linger as to how effective the NPDI will be in bringing about moves to reduce nuclear arsenals, as more than half of the member states, including Japan, are protected by the U.S. and North Atlantic Treaty Organization "nuclear umbrella" deterrent.

Rose Gottemoeller, U.S. undersecretary of state for arms control and international security, is scheduled to attend part of the meeting later as an observer, becoming the first U.S. official to do so at an NPDI meeting.

The NPDI consists of Australia, Canada, Chile, Germany, Japan, Mexico, the Netherlands, Nigeria, the Philippines, Poland, Turkey and the United Arab Emirates.

NHK video: **Toward A Nuclear Arms Free World**

Steven Leeper: "Japan saves the world"

April 13, 2014
Tokyo 2020 Olympics should be celebration of end to atomic arms, says U.S. activist

http://mainichi.jp/english/english/newsselect/news/20140413p2a00m0na001000c.html

The Tokyo 2020 Olympics should be transformed into a festival celebrating an end to nuclear weapons worldwide, says Steven Leeper, former chair of the Hiroshima Peace Culture Foundation and current Hiroshima Jogakuin University visiting professor.

Leeper, 66, has even released a book on that goal, titled, "2020-nen Tokyo Olympic: Nihon ga sekai o sukuu -- kaku nakusu best scenario" (The Tokyo 2020 Olympics: Japan saves the world -- a best-case scenario for the abolishment of nuclear weapons).

Originally from the United States -- a nuclear superpower -- Leeper told the Mainichi that former U.S. presidents Jimmy Carter, Ronald Reagan and Bill Clinton and current President Barack Obama have all wanted to rid the world of atomic weapons. However, he says, the influence of the nuclear weapons industry on Congress has meant that dream has never been transformed into reality.

Leeper said that Japan, as the only nation to have been subjected to nuclear attack, is the ideal leader in the campaign to rid the world of nuclear arms, likening the country's position to that of victims of drunk driving accidents and their families in the campaign to wipe out drinking and driving.

He also pointed out that nuclear materials don't just take the form of weapons, but also nuclear waste from reactors, adding that the number of people abroad worried about contamination from the Fukushima No. 1 nuclear plant disaster is likely a lot higher than most Japanese suspect.

Leeper furthermore said that countries maintain nuclear reactors at least in part as an insurance policy, in case they find themselves in a confrontation with a nuclear power and want to build a bomb to boost their power. Therefore, he said, the effort to abolish atomic weapons is directly connected to abandoning nuclear power.

April 13, 2014(Mainichi Japan)

No simple way of eliminating nuclear weapons

April 20, 2014

Nuclear disarmament challenge

http://www.japantimes.co.jp/opinion/2014/04/20/editorials/nuclear-disarmament-challenge/#.U1OZ8Vfi91s

The recent conference in Hiroshima of foreign ministers from 12 nonnuclear weapons states highlighted the challenges in eliminating nuclear weapons. The statement adopted by members of the Non-Proliferation and Disarmament Initiative urged world leaders to realize the "catastrophic humanitarian consequences" of nuclear weapons use and to make multinational nuclear disarmament efforts — a veiled reference to the need to involve China.

The notable absence of targets for nuclear weapons cutbacks illustrated the divide between nations that advocate an outright ban on nuclear arms and those — including Japan — that rely on a "nuclear umbrella" for security.

The April 12 gathering of NPDI ministers was the eighth since the group was created in 2010 (at Japan and Australia's initiative) and the first in Japan. The group also includes Canada, Chile, Germany, Mexico, the Netherlands, Nigeria, the Philippines, Poland, Turkey and the United Arab Emirates.

Gathering in one of the two Japanese cities devastated by U.S. atomic bombings in August 1945, the foreign ministers said they "witnessed firsthand the catastrophic humanitarian consequences of an atomic bombing that last even to this present day." They invited the world's political leaders to visit Hiroshima and Nagasaki to also witness the consequences. Attending part of the Hiroshima conference, Rose Gottemoeller, U.S. undersecretary of state for arms control and international security, was the first official from a nuclear weapons power to join the NPDI meeting as an observer.

Five years after U.S. President Barack Obama called for a world free of nuclear weapons during a speech in Prague, the momentum for nuclear disarmament has stalled. The NPDI members called for "deeper reductions" in the U.S. and Russian nuclear arsenals beyond those stipulated in the 2010 New Strategic Arms Reduction Treaty. But the Ukraine crisis clouds prospects for any new initiatives by Washington and Moscow.

In addition to condemning North Korea's nuclear weapons program, the NPDI members said they are "deeply concerned about the reported buildup of nuclear arsenals, against the clear intent of the international community to achieve the goal of a world free of nuclear weapon." This was an apparent

reference to China as the only nuclear power suspected of increasing its nuclear arsenal. The group stressed the importance of multinational talks for eliminating nuclear arms.

Consensus among the NPDI members about specific ways to achieve the goal of eliminating nuclear weapons is elusive. Seven of the 12 members, including NATO member countries, depend on the nuclear deterrence provided by the United States; they call for a gradual phaseout of nuclear arms, while the others favor an outright ban. Their statement called for "a systematic and continued reduction … in a pragmatic and step-by-step approach aiming at their total elimination."

By contrast, the chair's summary at the Conference on the Humanitarian Impact of Nuclear Weapons, held in Mexico in February with delegates from 146 countries and several international organizations, called for a diplomatic process for a "legally binding instrument" to eliminate nuclear weapons.

The message from the Hiroshima conference reflects Japan's dilemma as the only country to suffer a nuclear attack and yet dependent on the U.S. nuclear umbrella for security. This quandary must be overcome if Japan is serious about taking stronger initiatives for the elimination of nuclear weapons.

Fukui Governor meets Motegi

April 18, 2014
Fukui governor meets industry minister
http://www3.nhk.or.jp/nhkworld/english/news/20140418_22.html

The governor of Japan's Fukui prefecture has asked the central government in Tokyo to steadily implement its basic energy plan.

Fukui Governor Issei Nishikawa met industry minister Toshimitsu Motegi on Friday to discuss the energy plan approved by the cabinet earlier this month.

It defines nuclear energy as an important power source, but says Japan should minimize dependence on nuclear power.

Nishikawa was a member of the government's panel that compiled the draft plan.

Nishikawa said the government should clarify exactly what percentage of energy will come from nuclear power.

He then asked the government to come up with a plan to rebuild old nuclear plants as quickly as possible.

Nishikawa said he's concerned that reducing the nation's reliance on nuclear power will force utilities to decommission reactors. He said the government should help to create jobs in prefectures that host these

plants.

Nishikawa said Motegi expressed his understanding for these requests. Nishikawa told reporters after the meeting that the basic energy plan made clear the government's stance on nuclear power generation.

However, the governor said it lacks definite ways to resolve the many problems nuclear power generation presents. He added that the government should tackle these problems as soon as possible.

Morally "deplorable"

April 20, 2014

Exports that defy reason

http://www.japantimes.co.jp/opinion/2014/04/20/editorials/exports-that-defy-reason/#.U1OZOlfi91s

Following an April 4 “yes” vote by the Lower House, the Upper House on Friday approved civilian nuclear accords Japan has signed with Turkey and the United Arab Emirates to enable the export of Japanese equipment and technology for nuclear power generation to them.

The big question, though, is why a country that suffered a disaster at a nuclear power plant (which remains ongoing) three years ago would choose to push the export of nuclear power plants — and especially to countries that are prone to earthquakes, like Turkey. **It is deplorable from moral and other viewpoints that the Abe administration treats the export of nuclear power equipment and technology as a pillar in its economic growth strategy**. Japan concluded similar nuclear accords with Jordan, Vietnam, South Korea and Russia under the previous Democratic Party of Japan-led administration.

At present, the government is negotiating civilian nuclear cooperation with five more countries — India, South Africa, Brazil, Mexico and Saudi Arabia.

The Diet approval came with the support of the Liberal Democratic Party, New Komeito and the DPJ at a time when Japan’s own crisis, caused by the triple meltdowns at Tokyo Electric Power Co.’s Fukushima No. 1 nuclear power plant, shows no signs of resolution. More than 130,000 residents of Fukushima Prefecture are still displaced from their homes due to radioactive contamination of their communities more than three years after the nuclear crisis. Although the DPJ after the March 2011 Fukushima disaster called for ending nuclear power generation in the 2030s, it supported plans for Japan to export nuclear power technology.

As demonstrated in the Fukushima catastrophe, a large-scale accident at a nuclear power plant causes irreparable damage to people's lives and the environment. If such an accident occurs at a plant in another country built with exported Japanese technology, both the Japanese government and the manufacturers of the technology would likely be expected to shoulder some of the responsibility. Even if they offer to pay compensation, they could be criticized for giving priority to business interests over human lives and the environment.

In addition, high-level waste from nuclear power plants must be stored underground for more than 100,000 years before its radioactivity declines to safe levels. The safe storage of such waste for such a long period presents extremely difficult technological problems to which solutions have yet to be established. So this toxic burden would pass on to future generations. Given this reality, it would be irresponsible for Japan to export nuclear power technology and equipment.

Although the nuclear accords in principle are designed to prevent military use of the nuclear materials, equipment and technology, the accord with Turkey is problematic.

A clause in the accord states that Turkey can enrich uranium or reprocess spent nuclear fuel if Japan agrees in writing to a specific instance of enrichment or reprocessing. Enriched uranium and plutonium extracted from spent nuclear fuel can be used to make nuclear weapons. Thus the clause runs counter to global efforts against nuclear proliferation.

The Abe administration's policy could also result in Japanese firms continuing to devote a large amount of resources on nuclear power, possibly discouraging them from investing in the development and expansion of renewable energy sources — the "sunrise" industries where Japan's future prosperity lies. The government must rethink its policy of promoting the export of nuclear power equipment and technology.

Mayors for Peace petition Ban Ki-moon

April 30, 2014
Mayors of A-bombed cities issue appeal to U.N. to ban nuclear arms

http://ajw.asahi.com/article/behind_news/politics/AJ201404300026

THE ASAHI SHIMBUN

NEW YORK--The mayors of Nagasaki and Hiroshima delivered speeches at the United Nations nuclear nonproliferation meeting on April 29 that called on the representatives there to join hands to outlaw nuclear weapons.

During the third session of the Preparatory Committee for the 2015 Review Conference of the Parties to the Treaty on the Non-Proliferation of Nuclear Weapons, attended by more than 60 countries, Nagasaki Mayor Tomihisa Taue said non-nuclear countries that rely on the nuclear umbrella are the key to reaching the goal of outlawing nuclear arms. He called on those countries, which include Japan, to play a leading role in that effort.

Hiroshima Mayor Kazumi Matsui emphasized that the world needs to develop a sense of community that replaces nuclear weapons as a deterrence, a system he said is based on fear and threats.

On April 28, the two mayors submitted a petition to U.N. Secretary-General Ban Ki-moon with 210,000 signatures requesting the start of negotiations on a treaty that would outlaw nuclear weapons.

"I felt Ban's willingness to deal jointly over the issue," said Taue after the closed-door meeting at the U.N. headquarters. "Ahead of (the review conference) next year, we hope to start productive discussions on the inhumanity of nuclear weapons and the necessity for a nuclear ban treaty."

The signatures for the petition were collected in a drive organized by Mayors for Peace, a group of mayors from about 6,000 cities worldwide.

Their petition denounces nuclear weapons as "extremely inhumane." It also calls for Ban to take leadership in starting the nuclear ban negotiations.

The mayors said that Ban, during the meeting, also touched on nuclear development in North Korea and Iran, saying he hoped matters will take a turn for the better.

In 2008, Ban said he could envision negotiations on formulating a treaty to outlaw nuclear arms.

About nuclear disarmament

May 3,2014

Nuclear powers report at NPT preparatory committee
http://www3.nhk.or.jp/nhkworld/english/news/20140503_16.html

The United States says it has reduced the stockpile of its nuclear warheads by 85 percent since the end of the Cold War.

Delegates from around the world are meeting in New York ahead of the review conference of the Nuclear Non-Proliferation Treaty next year.

5 nations--the US, Russia, China, Britain, and France--submitted a report on ways they're scrapping nuclear weapons.

US representative Christopher Buck explained on Friday that the latest figure for warheads was 4,804 as of last September. That's a reduction of more than 300 from the number 4 years earlier.

He underlined the US commitment to the NPT and its effort to rid the world of nuclear weapons which is upheld by President Barack Obama.

He said the US is working to reduce the number of nuclear weapons unilaterally, bilaterally, and multilaterally with negotiations.

Chinese representatives emphasized that their country keeps only those nuclear weapons needed for self defense and that it will not use them against non-nuclear countries. But they did not disclose further details.

Some member nations praised the reports. Others said the very slow progress in nuclear disarmament points to the need for a treaty totally banning nuclear weapons.

Japan to Work With France on Future Fast-Breeder Atomic Reactor

http://www.bloomberg.com/news/2014-05-05/japan-to-work-with-france-on-future-fast-breeder-atomic-reactor.html

By Tara Patel and Gregory Viscusi

May 6, 2014 1:47 AM GMT+0200

Japan will join a French research effort to develop a new nuclear reactor that promoters say will use fuel more efficiently and produce less atomic waste.

Japanese Prime Minister Shinzo Abe and French President Francois Hollande agreed to "intensify their civil nuclear research," according to a joint statement yesterday following a meeting between the two leaders in Paris.

As part of Abe's state visit, the Japanese ministries of economy and science and France's atomic research institute Commissariat a l'Energie Atomique et aux Energies Alternatives signed an accord to cooperate on a project for a so-called fourth generation fast-breeder reactor called Astrid. Fast-breeder generators are designed to produce, or "breed," more fuel than they consume for reuse in nuclear fission.

The research deal comes as both countries' nuclear-power industries are at a crossroads. Operators in Japan are still reeling from the 2011 atomic meltdown at Fukushima after which the country shut its reactors because of earthquake damage, maintenance or safety checks.

Japan's Nuclear Regulation Authority said in March that it would expedite safety checks on two of Kyushu Electric Power Co.'s reactors, raising the prospect that some nuclear capacity may be restored ahead of peak power demand in summer.

In France, Hollande has vowed to lower dependence on nuclear power to 50 percent of all electricity produced by around 2025. It currently relies on the 58 reactors operated by Electricite de France SA for about three-quarters of its electricity, a greater proportion that any other country in the world. His plan is scheduled to be clarified in a long-delayed energy law.

Astrid Prototype

In 2011, before Hollande was elected, France earmarked 652 million euros ($905 million) to develop a 600-megawatt Astrid prototype by around 2020 with a plan to deploy a fleet starting in 2040. Astrid stands for Advanced Sodium Technological Reactor for Industrial Demonstration.

The generator is said to be of the fourth generation because it would come after a model being built now in France, Finland and China called the EPR, which is considered third generation. France's CEA research institute is working on the Astrid project with EDF and French reactor developer Areva SA. (AREVA)

Future reactors like Astrid would be able to produce as much as 100 times more power using the same quantity of uranium FUEL, according to documents on the CEA's website. They would also burn long-life radioactive waste.

Even with its nuclear industry hobbled by the aftermath of Fukushima, the Abe government has been actively marketing Japanese nuclear technology around the world. Mitsubishi Heavy Industries Ltd. and Areva signed a $22 billion agreement in May 2013 to build a nuclear power plant in Turkey, the first major order for Japan since the Fukushima disaster in 2011.

EDF last year signed a deal to develop EPRs in the U.K.

France decided to close its Superphenix fast-breeder reactor in 1998 following radioactive leaks. Japan's Monju reactor is idled and has been plagued by challenges including a sodium leak. India has its own fast-breeder reactor program.

France And Japan Announce Cooperation On Generation IV Astrid FBR

http://www.nucnet.org/all-the-news/2014/05/06/france-and-japan-announce-cooperation-on-generation-iv-astrid-fbr

Research & Development
6 May (NucNet): France and Japan will cooperate on the development of Generation IV fast breeder reactors (FBR) including the Astrid project, which is under development in France.
Japanese Prime Minister Shinzo Abe and French President Francois Hollande agreed to "intensify their civil nuclear research," according to a joint statement yesterday following a meeting between the two leaders in Paris.

As part of Mr Abe's state visit, the Japanese ministries of economy and science, and France's atomic research institute France's Commissariat à l'Energie Atomique et aux Energies Alternatives (atomic and alternative energy commission; CEA), signed an accord that includes cooperation the Generation IV prototype sodium-cooled fast reactor Astrid (Advanced Sodium Technological Reactor for Industrial Demonstration).

Astrid will be built at CEA's Marcoule nuclear site in France. CEA is leading the Astrid project and will design the reactor core and fuel. Areva will design the nuclear steam supply system, and will be

responsible for I&C (instrumentation and control) and the nuclear auxiliaries.

An agreement to develop Astrid was signed between the French government and the CEA on 9 September 2010. It gave CEA overall responsibility for the project, providing 652 million euro (about 900 million US dollars) for the programme until completion of the design phase.

Fast neutron reactor projects, which are being explored or constructed in India, Russia, China and Japan, would allow a significant increase in the amount of energy obtained from either depleted or natural uranium.

The technology would also enable plutonium to be used and recycled several times, and minor actinides to be recycled.

The cooperation will also give France the opportunity to carry out tests for Astrid at the Monju FBR in Japan. Monju has been offline since August 2010 because of failures in inspection procedures.

Monju initially started in August 1995, but was shut down four months later after about 700 kilogrammes of liquid sodium leaked from the secondary cooling loop.

The two countries also announced that France's Areva and Japan's Atox, a maintenance services company for nuclear facilities in Japan, are forming a 50-50 joint venture called Anadec to provide decommissioning and dismantling services for Japanese nuclear power plants.

The venture will operate as early as this year at the damaged Fukushima-Daiichi nuclear power plant, Areva said.

A Franco-Japan joint venture between Areva and Mitsubishi Heavy Industries intends to sell reactors to "other countries" including Vietnam, another statement said.

Japan and Turkey have already signed an agreement that could lead to the construction of Turkey's second nuclear power station with four Atmea1 reactor units, a design developed by the Areva-MHI joint venture Atmea.

Japan, France join hands on defense equipment, fast-breeder reactors

http://www.japantimes.co.jp/news/2014/05/05/national/politics-diplomacy/japan-france-join-hands-defense-equipment-fast-breeder-reactors/#.U2j9Blfi91s

Kyodo

PARIS – Japan and France agreed Monday to open talks on joint development of defense equipment, signed a document on developing fast-breeder reactor technology and confirmed plans to foster economic dialogue.

In addition to jointly producing unmanned submersibles for surveillance, Prime Minister Shinzo Abe and French President Francois Hollande reached an accord to hold a summit meeting every year to the extent possible, according to a joint paper that was released after their talks in Paris.

"As the security situation in Europe and East Asia becomes increasingly severe, close coordination between the two countries has never been more necessary," Abe said as he greeted the press together with Hollande.

The French leader expressed a willingness to hold security dialogue with Japan on many occasions.

Abe has been hoping to forge stronger ties with France, which recently been expanding economic coordination with China.

Japan and France will hold a round of "two-plus-two" security talks between their defense and foreign ministers in Tokyo next year.

In an apparent reference to Russia's annexation of Crimea and China's increasing naval assertiveness in Asia, Abe and Hollande voiced opposition to countries that acquire, or assert claims to, part of another country through the use of force in violation of international law, the joint paper said.

To strengthen cooperation on nuclear energy technology, Tokyo and Paris agreed to cooperate on civil nuclear power technology as long as priority is given to ensuring the highest level of safety in the world. In connection with this, officials from both countries signed a document Monday on developing fast-breeder reactor technology designed primarily to reduce radioactive waste.

On the free trade deal being negotiated between Japan and the European Union, the two leaders shared the view that such a deal would be an opportunity to promote growth and employment on both sides and reaffirmed plans to reach an agreement on the pact in the near future.

Abe has so far visited Germany, Britain, Portugal, Spain and France during his swing through Europe. He is scheduled to visit Belgium before returning to Tokyo on Thursday.

May 6, 2014

Japan, France to start talks on joint defense equipment development

http://mainichi.jp/english/english/newsselect/news/20140506p2g00m0dm034000c.html

PARIS (Kyodo) -- Japan and France agreed Monday to start negotiating a deal to jointly develop defense equipment, while confirming plans to strengthen cooperation on nuclear energy technology and foster dialogue between their economic ministers.

In addition to joint development of equipment such as unmanned submersibles for surveillance, Prime Minister Shinzo Abe and French President Francois Hollande reached accord on holding a summit meeting every year to the extent possible, according to a joint paper released after their talks in Paris.

"As the security situation in Europe and East Asia becomes increasingly severe, close coordination between the two countries has never been more necessary," Abe said as he met the press together with Hollande.

The French president expressed his willingness to hold security dialogue with Japan on many occasions.

Abe has been hoping to forge stronger ties with France at a time when China is expanding its economic coordination with the European country.

Japan and France will hold the next round of "two-plus-two" security talks between their defense and foreign ministers in Tokyo next year.

Apparently with Russia's annexation of Crimea and China's increasing presence in regional waters in mind, Abe and Hollande voiced their opposition to a country acquiring, or asserting its claims to, an area of another country through the use of force in violation of international law, according to the joint paper.

On civil nuclear power, Tokyo and Paris agreed to cooperate under the policy of giving priority to ensuring the highest level of safety in the world. In connection with this, officials of the two countries signed on Monday a document aimed at developing fast-breeder technology designed primarily to reduce radioactive waste.

On a free trade deal being negotiated between Japan and the European Union, the two leaders shared the view that it would be an opportunity to promote growth and employment on both sides and reaffirmed their plans to reach an agreement on the pact in the near future.

Abe has so far visited Germany, Britain, Portugal, Spain and France during his latest swing through Europe. He is scheduled to visit Belgium before returning to Tokyo on Thursday.

Alarm bells for other utilities?

May 22, 2014

Editorial: Oi nuclear power plant ban sounds alarm bells for other operators

http://mainichi.jp/english/english/perspectives/news/20140522p2a00m0na003000c.html

A Fukui District Court ruling on May 21 banning the restart of two reactors at the Oi Nuclear Power Plant in Fukui Prefecture sounded alarm bells against the government's intention to reactivate idled atomic power stations one after another.

This is the first court ruling on a lawsuit demanding an injunction on the restart of nuclear plants since the outbreak of the Fukushima nuclear crisis in March 2011. It would be extremely difficult to resume operations at most nuclear plants across the country if the views that the court expressed in the ruling on the safety of atomic power stations are to be respected.

The district court stated that individuals' personal right to protect their lives and livelihoods are of the highest value under the Constitution. The court then concluded that "it would be only natural to suspend nuclear plants if they pose specific risks of danger -- though it would be an extreme argument to say the existence of such plants is impermissible under the Constitution."

It was a landmark decision in that the court placed top priority on the safety of residents of areas hosting atomic power stations. The court also judged that residents within a 250-kilometer radius of the Oi plant are qualified to be plaintiffs in this lawsuit because operations at the power station could infringe on their personal rights, noting that the then head of the Japan Atomic Energy Commission had once considered issuing an evacuation advisory to people in areas within a radius of 250 kilometers from the Fukushima No. 1 Nuclear Power Plant following the plant's meltdowns.

Kansai Electric Power Co. (KEPCO), the operator of the Oi plant, is poised to appeal the ruling to a higher court. Unless the latest ruling is finalized, KEPCO can legally restart the two reactors at the Oi plant if they pass safety inspections by the Nuclear Regulation Authority (NRA). However, if the government is to ignore the ruling and give the green light to restarting the reactors, it would certainly stir protests from the public.

The March 2011 Great East Japan Earthquake that triggered the tsunami and the nuclear crisis has reminded the public that it is impossible to predict where and when a powerful earthquake will occur next in this quake-prone country. Based on the lessons of the triple disasters, the ruling determined that systems to cool down cores of the No. 3 and 4 reactors at the Oi plant in case of a powerful temblor and their structure to prevent radioactive substances from leaking are flawed. In other words, the ruling pointed out that the operator of the plant was too optimistic about the crucial dangers of nuclear plants and failed to develop sufficient safety technologies or create safety equipment.

The court dismissed KEPCO's argument during hearings that restarting the two reactors would help stabilize electric power supply and reduce expenses. "The large trade deficit as a result of the suspension of operations at nuclear plants should not be regarded as an outflow or loss of national wealth. Inability to restore abundant national land and people's livelihoods that have taken root there would be a true loss of national wealth," the ruling said.

Should a serious accident occur at a nuclear plant, it would threaten the lives of numerous residents in areas hosting the facility. The ruling's demand that operators of atomic power stations "take all possible measures to protect citizens from radioactive substances" if a serious accident were to occur is convincing.

The court also rebuffed the view that nuclear plants should be operated to help prevent global warming. "The accident at the Fukushima No. 1 Nuclear Power Plant is the worst pollution -- the worst environmental contamination. It is wrong to base calls for operations at nuclear plants on the need for environmental protection," the court ruled. Many people affected by the Fukushima nuclear crisis apparently agree with this view.

The Cabinet of Prime Minister Shinzo Abe intends to restart nuclear reactors if they pass NRA safety inspections. However, the government should not allow utilities to resume operations at idled nuclear power stations one after another as if it had forgotten all about the Fukushima nuclear disaster.

JFBA: Nukes "cause human rights violations"

May 31, 2014
JFBA opposes right to collective self-defense, nuclear power
http://mainichi.jp/english/english/newsselect/news/20140530p2g00m0dm045000c.html

TOKYO (Kyodo) -- The Japan Federation of Bar Associations on Friday expressed opposition to the government's move to lift the nation's self-imposed ban on the right to collective self-defense.

Japan should pursue "diplomatic and defense policies to achieve global security through peaceful means, not by military power, under the pacifist Constitution," the JFBA said in its resolution adopted at its annual general meeting in Sendai, Miyagi Prefecture, and released by its public relations office.

"Japan's Constitution, which renounces war before the rest of the world, should be the guideline" for that purpose, it noted. "We strongly oppose the move to allow Japan to exercise the right to collective self-defense by reinterpreting the Constitution as it goes against the (constitutional) pacifism."

The resolution came after a panel of security experts proposed the reinterpretation to respond to a changing regional security landscape, given China's assertiveness and North Korea's nuclear and missile programs.
After receiving the panel report, Prime Minister Shinzo Abe, who has a strong will to revise the Constitution, expressed a desire to remove the ban on the right to collective self-defense, or coming to the defense of an allied nation under attack.

Japan has long maintained that it has the right to collective self-defense under international law but cannot exercise it due to Article 9 of the Constitution, which stipulates that people in Japan "forever renounce war as a sovereign right of the nation and the threat or use of force as means of settling international disputes."

While Abe hopes to have Cabinet approval for removing the self-imposed ban, the lawyers' group said it cannot accept the policy as the government aims to revise the basic principle of the Constitution without calling for a vote of confidence of the people.

"It goes against constitutional clauses that designate the Constitution as 'the supreme law' and oblige state ministers and public officials to respect and uphold the Constitution" as a safeguard to restrict the government's power and protect human rights, the JFBA said in the resolution.

The Japanese Constitution seeks to achieve permanent peace without depending on military power and by renouncing the right of belligerence, and these principles "have a pioneering significance that we can boast to the world," it said.

At the general meeting, meanwhile, the JFBA urged the government to withdraw from nuclear power generation and nuclear fuel-cycle policy in the wake of the March 2011 nuclear disaster, triggered by the deadly earthquake and tsunami.

"**It is a quite alarming situation and a serious human rights violation**" that many victims of the triple-disaster still face economic and psychological difficulties even after more than three years have passed since the tragedy, the JFBA said.

Given such recognition, it also urged the government to terminate the policy of exporting nuclear power plants, saying, **"Nuclear plant exports are likely to cause human rights violations and environmental destruction to the importing countries and their surrounding nations."**
May 31, 2014(Mainichi Japan)

Nuclear power treated against U.S. aid in Fukushima

June 13, 2014

Japan may ratify atomic treaty for U.S. aid in Fukushima cleanup

http://www.japantimes.co.jp/news/2014/06/13/national/japan-may-ratify-atomic-treaty-u-s-aid-fukushima-cleanup/#.U5qlVSji91s

Bloomberg

The Abe administration will likely introduce legislation this year to ratify a civil nuclear power treaty that will encourage U.S. companies to assist with the cleanup at Fukushima No. 1, U.S. Deputy Energy Secretary Daniel Poneman said.

The treaty, known as the Convention on Supplementary Compensation for Nuclear Damage, or CSC, is being promoted by the U.S. as a means to compensate victims of accidents and to protect nuclear plant manufacturers from liability.

Atomic plant operators would take on the liability risk and that would permit U.S. companies to help out in Fukushima, Poneman said in an interview in Tokyo on Thursday. As the power plant holds three melted reactors and thousands of tons of radioactive water, the cleanup holds additional risk of accidents.

"Everyone understands that the important thing is to do everything that we can to facilitate the cleanup and decontamination of the Fukushima site," he said. "In so far as the CSC is a means to support U.S. companies in being active in that role, I think that is basically a critical factor in why it is getting the support you're now seeing."

Poneman was in Tokyo for a meeting of the U.S.-Japan Bilateral Commission on Civil Nuclear Cooperation, which was established after the March 2011 catastrophe at Tokyo Electric Power Co.'s Fukushima No. 1 plant.

Participants in the meeting were scheduled to discuss responses to the accident, nuclear safety and security, and research and development in the field, the Foreign Ministry said in a statement earlier this week.

U.S. companies have expressed interest in helping Tepco decommission the three stricken reactors.

Bechtel Group Inc., Babcock & Wilcox Co. and Chicago Bridge & Iron Co. were among 25 companies offering their services at a February business forum in Tokyo.

"If there is confusion about liability, they're just not about to take a business risk of getting into new markets," Poneman said. "To the extent that CSC provides for channeling of liability, focusing that liability on the operator who is the likeliest party to be able to manage and ensure that risk, that's going to give confidence to U.S. companies."

To cover potential damage claims, the CSC would tap member countries for a fund of 300 million "special drawing rights," the equivalent of about $465 million. An nuclear plant operator would have access to that fund after paying out an equivalent amount itself.

The CSC was proposed after the Chernobyl nuclear accident in 1986 and adopted in 1997. The only countries to ratify the pact have been the U.S., Argentina, Morocco and Romania, which together have 316 gigawatts of installed nuclear capacity, according to the International Atomic Energy Agency.

The addition of Japan's 131 gigawatts would carry the treaty past the 400-gigawatt threshold needed for the pact to come into force. Canada, with 46 gigawatts, introduced legislation this year to implement the treaty, though it has yet to ratify it.

Senior US official welcomes Japan's nuclear stance
http://www3.nhk.or.jp/nhkworld/english/news/20140613_01.html

A senior US official is hailing a basic energy plan recently adopted by the Japanese government. The plan calls nuclear power a key energy source.

US Deputy Secretary of Energy Daniel Poneman gave an interview to NHK in Tokyo on Thursday.

Poneman commented on the plan approved by the Cabinet in April. It describes nuclear power as an important, base-load source.

Poneman says Washington agrees with Tokyo, and regards nuclear power as valuable in efforts to cut carbon dioxide emissions.

He expressed hope of further promoting technical collaboration between the US and Japanese governments, as well as private companies. He noted both countries have a high number of nuclear plants.

Japan and the US have strong ties in the nuclear power industry. Private nuclear-related firms from the two countries operate in what can be seen as consortiums. They are leading work to build nuclear plants around the globe.

Tokyo and Washington encourage the use of nuclear power for peaceful purposes.

Annual report: Japan to resume operation of nuclear plants

June 17, 2014

Energy report calls for reliance on nuclear power

http://www.japantimes.co.jp/news/2014/06/17/national/energy-report-calls-for-reliance-on-nuclear-power/#.U5_mZyji91s

Kyodo

The government released an annual energy report Tuesday that called for a return to nuclear power generation, saying increasing fuel costs for thermal power and a surge in CO2 emissions are reasons why Japan should power up its idled reactors.

The report reflects the pro-nuclear government's latest national energy policy, which defined nuclear power as an "important base-load power source."

All reactors nationwide are currently offline, as most of them have remained since the disaster at the Fukushima No. 1 plant, triggered by the massive earthquake and tsunami of March 2011.

The report says 88 percent of Japan's energy consumption depended on fossil fuels in fiscal 2013, higher than the 80 percent at the time of the oil crisis in the 1970s.

Imports of fuels such as liquefied natural gas rose ¥10 trillion from 2010 to ¥27 trillion in 2013, mainly because thermal power plants have been operating flat out to replace lost nuclear capacity.

"Increasing imports of fossil fuels is seen as a problem not only on the energy front but also in the economic arena," the report said.

The report also noted that CO2 emissions by utilities surged 112 million tons to 486 million tons in fiscal 2012 from fiscal 2010, which could "raise a question about our nation's stance, after taking a leadership role in international efforts against global warming."

Japan plans to "resume operations of nuclear plants" that have satisfied what the government calls "the world's toughest" regulatory standards, introduced following the Fukushima accident, under the premise that safety is the top priority.

In the Basic Energy Plan, adopted by the government of Prime Minister Shinzo Abe in April, the government overturned a nuclear phase-out goal introduced by the previous government, led by the Democratic Party of Japan

Shiga gubernatorial election & nukes

June 26, 2014
Campaigning begins for Shiga gubernatorial race
http://mainichi.jp/english/english/newsselect/news/20140626p2g00m0dm053000c.html

OTSU, Japan (Kyodo) -- Official campaigning started Thursday for the July 13 gubernatorial election in Shiga Prefecture, western Japan, with the race among three newcomers expected to focus on the economy and nuclear power.

The three who filed candidacy to succeed Gov. Yukiko Kada were Takashi Koyari, 47, a former Economy, Trade and Industry Ministry official, Taizo Mikazuki, 43, a former Democratic Party of Japan lawmaker, and Ikuo Tsubota, 55, a junior high school teacher, all of them running as independents.

Koyari is backed by local chapters of the ruling Liberal Democratic Party and its coalition partner, the New Komeito party, while Mikazuki is supported by the main opposition DPJ and Kada, who is known for her antinuclear stance. Tsubota is backed by the Japanese Communist Party.

Kada, 64, who is now in her second term, said earlier that she will not seek a third term and instead back Mikazuki as her successor. They have agreed to call for a greater say for Shiga in whether to allow nuclear reactors in neighboring Fukui Prefecture to be reactivated, with plans to form a political group together.

If Mikazuki loses, it would likely deal a blow to DPJ leader Banri Kaieda, with some members within the party speaking of a change in party leadership as the DPJ continues to face difficulties regaining momentum to mount a challenge to Prime Minister Shinzo Abe's LDP.

The main focuses of the election are Kada's record in office over the past eight years, economic revitalization measures as well as the restart of nuclear power generation in Fukui.

Japan Gov't still intent on exporting nukes

July 3, 2014
Toshiba nearing Bulgaria nuclear reactor deal
http://www.japantimes.co.jp/news/2014/07/03/business/corporate-business/toshiba-nearing-bulgaria-nuclear-reactor-deal/#.U7WwkLHi91s

Kyodo, JIJI, AFP-JIJI

Toshiba Corp. is close to striking a deal to build a nuclear reactor for a Bulgarian state-owned utility firm for about ¥500 billion, company sources said Thursday.

The Japanese firm plans to build the reactor with output capacity of around 1.1 million kilowatts through its U.S. unit Westinghouse Electric Co.

It is also considering investing in a company related to the utility, Bulgarian Energy Holding EAD, through Westinghouse.

Toshiba and the energy holding company are expected to reach a basic agreement shortly, the sources said.

The report comes as some European countries are looking to cut their reliance on Russia for their energy needs as the Ukraine crisis rumbles on.

Japanese engineering giants including Toshiba, Hitachi and Mitsubishi Heavy Industries have been eyeing opportunities abroad as they try to rekindle an nuclear energy business hammered by the 2011 Fukushima crisis.

The country's nuclear reactors have been shuttered since a tsunami slammed into the Fukushima plant, sending reactors into meltdown and setting off the worst nuclear crisis in a generation.

Last year, Japan and Turkey agreed on a long-awaited deal to build a sprawling nuclear power plant on the Black Sea coast, marking the first order for Japan's atomic sector since the 2011 tragedy.

Bulgaria, which currently depends heavily on thermal power generation using natural gas imported from Russia, is aiming to increasing the use of nuclear power to ensure a more stable energy supply, according to the company sources.

Earlier this week, Toshiba finished buying a 60 percent stake in British nuclear energy firm NuGeneration Ltd. for £102 million(¥17.8 billion).

NuGeneration plans to install three nuclear reactors to be supplied by Westinghouse Electric Co., a U.S. unit of Toshiba, at a new power station in Sellafield in Britain. The station will enter into service in 2024.

NuGeneration was previously held 50-50 by Spanish power firm Iberdrola SA and French energy giant GDF Suez. Toshiba bought all Iberdrola's holdings in NuGeneration and a 10 percent stake from GDF Suez.

Yes, safety is expensive

July 5, 2014

Nuclear safety expenditures top ¥2 trillion

http://www.japantimes.co.jp/news/2014/07/05/national/nuclear-safety-expenditures-top-%C2%A52-trillion/#.U7gniLHi91s

JIJI

The cost of taking nuclear safety measures at the nation's 10 major power companies has reached ¥2.2 trillion, the latest tally said Saturday, up 1.5-fold from a year ago.

Most of the costs involve complying with the new safety standards introduced in July last year as a result of the Fukushima disaster triggered at Tokyo Electric Power Co.'s old Fukushima No. 1 plant by the March 2011 mega-quake and tsunami.

With some companies planning additional safety measures, the costs are expected to grow further, industry sources said.

The utilities comprise all of the regional power providers and Japan Atomic Power Co., but exclude Okinawa Electric Power Co., which has no reactors.

The data cover the costs that the utilities have incurred since the Fukushima disaster, but only partially include Tepco's costs, which date back to the powerful earthquake that struck central Japan in 2007.

Before restarting, all reactors must comply with the new safety regime set up by the Nuclear Regulation Authority. This includes installing equipment and building facilities to help the power plants withstand major quakes and tsunami.

The costs have ballooned from the utilities' initial estimates because some of them are being asked to do more by the NRA, the sources said.

Tepco applied for NRA safety screenings of the No. 6 and 7 reactors at the giant Kashiwazaki-Kariwa power plant in Niigata last September. The beleaguered utility saw safety costs grow to ¥470 billion from ¥320 billion estimated in July 2013 as it added plans to install filtered vents, as required by the new standards, and enhanced measures for fires.

Filtered vents will reduce the danger of releasing radioactive steam from reactor containment vessels during severe nuclear accidents.

Chubu Electric Power Co., which applied for an NRA safety screening for the No. 4 reactor at its Hamaoka nuclear plant in Shizuoka Prefecture, now expects to spend ¥300 billion on safety measures, compared with ¥150 billion as of July last year.

The measures include building a 22-meter breakwater and reinforcing pipes to prepare for a potential earthquake in the Nankai Trough off the Pacific coast.

Kansai Electric Power Co.'s expenses are now estimated at ¥297.5 billion, up slightly from ¥285 billion the year before. Kepco has applied for NRA screenings for reactors 3 and 4 at its Oi nuclear plant and units 3 and 4 at its Takahama plant, both in Fukui Prefecture.

But Kansai Electric may face a surge in safety costs because it plans to make stronger earthquake projections than currently available.

Tohoku Electric Power Co., which kept its safety costs unchanged, said they will eventually rise.

Utilities are likely to face pressure to engage in more cost-cutting because the nuclear safety expenditures are likely to force them to hike prices.

Nukes policies in Germany and Japan

How Opposite Energy Policies Turned The Fukushima Disaster Into A Loss For Japan And A Win For Germany

Jul 8, 2014

Amory B. Lovins

Japan thinks of itself as famously poor in energy, but this national identity rests on a semantic confusion. Japan is indeed poor in fossil fuels—but among all major industrial countries, it's the richest in renewable *energy* like sun, wind, and geothermal. For example, Japan has nine times Germany's renewable energy resources. Yet Japan makes about nine times less of its electricity from renewables (excluding hydropower) than Germany does.

That's not because Japan has inferior engineers or weaker industries, but only because Japan's government allows its powerful allies—regional utility monopolies—to protect their profits by blocking competitors. Since there's no mandatory wholesale power market, only about 1% of power is traded, and utilities own almost all the wires and power plants and hence can decide whom they will allow to compete against their own assets, the vibrant independent power sector has only a 2.3% market share; under real competition it would take most of the rest. These conditions have caused an extraordinary divergence between Japan's and Germany's electricity outcomes.

Before the March 2011 Fukushima disaster, both Germany and Japan were nearly 30% nuclear-pow-ered. In the next four months, Germany restored, and sped up by a year, the nuclear phaseout schedule originally agreed with industry in 2001–02. With the concurrence of all political parties, 41% of Germany's nuclear power capacity—eight units of 17, including five similar to those at Fukushima and seven from the 1970s—got promptly shut down, with the rest to follow during 2015–22.

In 2010, those eight units produced 22.8% of Germany's electricity. Yet a comprehensive package of seven other laws passed at the same time coordinated efficiency, renewable, and other initiatives to ensure reliable and low-carbon energy supplies throughout and long after the phaseout. The German nuclear shutdown, though executed decisively, built on a longstanding deliberative policy evolution consistent with the nuclear construction halts or operating phaseouts adopted in seven other nearby countries both before and after Fukushima.

Moreover, the *Energiewende* term and concept began before 1980, and Germany's formal shift to renewables—now well over 70 billion watts installed—began in 1991, 20 years before Fukushima, then was reinforced in 2000 by feed-in tariffs. Those aren't a subsidy but a way for customers to buy, and hence developers to finance and build, the renewables society chose, with a reasonable chance for sellers to earn a fair return on their investments. FITs' values have plummeted in step with renewable costs, so developers now commonly opt to earn higher market prices instead.

This integrated policy framework and the solid analysis behind it meant that the output lost when those eight reactors closed in 2011 was entirely replaced *in the same year*—59% by the 2011 growth of renewables, 6% by more-efficient use, and 36% by temporarily reduced electricity exports. Through 2012, Germany's loss of 2010 nuclear output was 94% offset by renewable growth; through 2013, 108%. At this rate, renewable growth would replace Germany's entire pre-Fukushima nuclear output by 2016.

Contrary to widespread misreportage, closing those eight reactors did not cause more fossil fuel to be burned. Whenever renewable sources run in Germany, both law and econom-ics require them to displace costlier sources, so renewables always make fossil-fueled plants run less, though often in more complex patterns. The data confirm this: from 2010 through 2013, German nuclear output fell by 43.3 TWh,

renewable output rose by 46.9 TWh, and the power sector burned almost exactly as much more coal and lignite as it burned less of the costlier gas and oil. German utilities bet against the energy transition and lost. Now they gripe that the renewables in which most of them long underinvested have made their thermal plants too costly to run.

Despite those big utilities' self-inflicted woes, Germany adopted a coherent and effective strategy of boosting efficiency and renewables and ensuring their full and fair competition. In contrast, Japan replaced its own, larger lost nuclear generation almost entirely by increasing its imports of costly fossil fuels. These opposite policies produced opposite results.

Japanese people sweltered through the summer of 2011 with impressive cohesion but inadequate electricity and much personal sacrifice. Spurred by Metropolitan Government policies, Tōkyō peak demand fell by 10.7 billion watts or 18% (for big businesses, a remarkable 30%), roughly displacing TEPCO's lost peak nuclear output. Across the metro area, TEPCO's electricity sales fell 11%. But that was not true for Japan as a whole, so power plants' fuel use soared. In contrast, Germany's electricity supply remained so ample that it continued to export more electricity than it imported, even to nuclear-powered France. Germany's net power exports have set new records in each of the past two years.

Japan's economy wilted while Germany's throve, adding several hundred thousand clean-energy jobs—part of the energy transition's net macroeconomic benefit. Japan's electricity prices soared while Germany's whole--sale electricity prices fell more than 60%—including 13% in 2013 alone, when year-ahead prices hit eight-year lows. That's why French energy-intensive industries complain that they can't beat their German competitors' one-fourth-lower power prices. The latest manufactured myth of German "deindustrialization" is ironic because big German industries pay approximately those low and falling wholesale prices and are exempted from paying for the renewables that cause them, as well as from grid charges. Those burdens were instead heaped on households (whose bills are half taxes), though household tariffs have now stabilized as providers' old contracts roll over.

Japan's carbon emissions soared while Germany's power plants and industries emitted no more carbon. (German power-sector emissions fell slightly in 2013: more solid fuel was burned but more efficiently, saving slightly more than electricity output rose.) To be sure, *total* German carbon emissions rose slightly in 2012 due to a cold winter, and in 2013 due to the record power exports that were coal-fueled because of a trifecta of spiking gas prices, cheap coal diverted from shrinking U.S. markets, and an overallocated European carbon-emissions market. But in the first quarter of 2014, German coal-burning and carbon emissions shrank again, as is expected to continue. Germany remains far ahead of meeting its Kyōto climate obligations—by far the most stringent in Europe.

In short, German policy gave renew-ables fair access to the grid, promoted competition, weakened monopolies, and helped citizens and communities own half of renewable capacity. In 2013, Germany's nuclear generation reached a 30-year low while renewable generation, 56% greater, set a new record, reaching an average of 27% of domestic use in the first quarter of 2014 and a brief peak of 74% on 11 May.

Japan has 5% more land, 68% more people, 74% more GDP, and far more sun and wind than Germany, but through February 2014 had added only about one-fifth as much solar power as Germany, and almost no windpower. These produced just 0.97% of Japan's 2012 electricity—one-third India's share, or #29 worldwide—and 1.5% in 2013. Of the roughly 41 billion watts (95% solar) in Japan's order pipeline, much remains lawfully stalled by utility red tape and intransigence.

More than the sacred sun on Japan's flag, its leaders appear to worship old policies that retard wide use of the energy sources now taking over the global market. Since 2008, half the world's added electric generating capacity has been renewable. Non-hydroelectric renewables, chiefly wind and solar, got a

quarter-trillion dollars of private investment and added over 80 billion watts in each of the past three years. Three of the world's top four economies—China, Japan, and Germany, as well as India—now produce more electricity from non-hydro renewables than from nuclear power. Japan is on that list only because its nuclear production is roughly zero; it remains the rich nations' renewable laggard. Perhaps the unexpected May 2014 court decision that prohibited restart of the Oi reactors as unsafe, and for the first time prioritized public safety over utility profits, may signal an emergent change beyond the cosmetic reforms offered by the executive and legislative branches—2016 "deregulation" in name only.

In 2012 and 2013, China made more electricity from wind than from the world's most aggressive nuclear power program. In 2013, China added more solar power than its first developer, the United States, has installed in its whole history. But Japan is heading in the opposite direction: of the 8 GW of renewables brought into operation in the first 20 months after it introduced renewable FITs in July 2012, 97.5% was solar and only 1% windpower. Windpower (especially onshore where it's cheapest) is stymied, first by uniquely slow and onerous approval processes and then by outright rejection by utility monopsonists who get to bar competitors from their regional grids. Japan's windpower association projects the same market share in 2050 that Spain achieved three years ago.

It's not hard to figure out why. Solar power displaces daytime peak that's costly to generate, but the way the solar feed-in tariff works, it's profitable for utilities. In contrast, they lose money on cheap wind-power that also runs at night, displacing coal and nuclear. Japan's latest rules reiterate utilities' right to refuse renewable power that would displace such legacy "baseload" plants. Japanese business leaders may be upset to learn that their electricity, among the world's costliest, is even costlier because their utilities run their own costlier thermal plants while rejecting windpower with nearly zero operating cost.

The electricity reforms passed in late 2013 by the lower house of the Diet (23 years after Germany's reforms began) still let Japan's utilities reject cheaper renewable power for any reason or no reason. Many claim renewables could harm grid stability. So why do Germany, with 25% renewable electricity in 2013, and Denmark, with at least 47%, have Europe's most reliable electricity, about ten times more reliable than America's? These countries, like three others in Europe (none very rich in hydropower) that used roughly half-renewable electricity in 2013—Spain 45%, Scotland 46%, Portugal 58%—simply require fair grid access and competition. Of all major industrial nations, only Japan doesn't.

Germany also uses energy more efficiently. In each of the past three years, German electricity consumption fell while GDP grew. During 1991–2013, i.e. since reunification, German real GDP grew 33% using 4% less primary energy and 2% less electricity, and emitting 21% less carbon. Even more ambitious savings are available and planned.

In contrast, Japan's world-leading energy efficiency gains in the 1970s later stagnated. Japanese industry has continued to improve, and remains among the most efficient of 11 major industrial nations, but Japan ranks tenth in industrial cogeneration and commercial building efficiency, eighth in truck efficiency, and next-to-last (tied with the U.S.) in car efficiency. Yet Japan's sky-high energy prices make energy efficiency very profitable, most of all in buildings. Semiconductor company Rohm's office opposite Kyōto Station, for example, cut its energy use 46% and repaid its cost in two years. With a few exceptions, like the Tōkyō Metropolitan Government's efficiency efforts, few Japanese buildings have received the kind of *kaizen* (continuous improvement) that has long distinguished Japanese industry.

To revitalize its economy and politics, Japan needs an efficiency-and-renewables leapfrog that enables the new energy economy, not protects the old one. Japanese frogs jump too, says Bashō's famous haiku "The old pond / frog jumps in / plop." But we're still waiting for the plop.

Atom's share of global power at its lowest since 1980s

July 30, 2014

Global nuclear power contribution falls to lowest level since 1980s
http://www.japantimes.co.jp/news/2014/07/30/world/global-nuclear-power-contribution-falls-to-lowest-level-since-1980s/#.U9i0mrHi91s

Reuters

Atomic power's share of the global electricity supply is at the lowest level since the 1980s following the shutdown of Japan's reactors after the Fukushima disaster, and may fall further without major new plant construction.

The forecast is one of the main conclusions of the World Nuclear Industry Status Report 2014, a draft copy of which was passed to Reuters before general release later Tuesday.

The report paints a bleak picture of the industry more than three years after the March 11, 2011, earthquake and tsunami triggered the meltdowns of three reactors at Tokyo Electric Power Co's Fukushima No. 1 power plant.

Rising costs, construction delays, public opposition and aging fleets of reactors will make it difficult for nuclear to reverse the decline in its share of global energy supply, even after two reactors in Japan won provisional approval to restart earlier this month.

Discounting the bulk of Japan's 48 reactors due to their long-term outage, the report said the number of operating units in the world has fallen to 388, 50 less than the peak in 2002.

Nuclear's share of global power generation has fallen to 10.8 percent, down from a high of 17.6 percent in 1996 and the the lowest since the 1980s, it said.

The report also pointed to delays in construction projects, even in China, where the government is strongly pushing for nuclear power to replace heavy carbon emitting coal stations.

Of the 67 reactors under construction globally as at July 2014, at least 49 were experiencing delays and eight had been under construction for 20 years, it said.

The average age of reactors has also increased, rising to more than 28 years, while more than 170 units, or 44 percent of the total, have been operating for more than 30 years or more.

"More than 200 reactors may face shutdown in the coming two decades," Tatsujiro Suzuki, a former Vice Chairman of the Japan Atomic Energy Commission, said in the foreword of the report.

"If new construction pace does not match the pace of shutdown, it is clear that the nuclear share will decline rapidly," Suzuki said.

Renewable energy is taking up an increasing share of the energy mix, the report said. Installed solar capacity in China topped operating nuclear capacity, while in Spain more power was generated from wind in 2013 than any other source, beating nuclear for the first time.

The report's lead authors are industry analysts Mycle Schneider, who is based in Paris, and London-based Antony Froggatt. Both have advised European government bodies on energy and nuclear policy issues.

In Japan, where the pro-nuclear ruling Liberal Democratic Party faces strong public opposition to restarts, the nuclear industry won some relief when the Cabinet reversed the previous government policy of a gradual abolition of atomic power.

But it also endorsed a push for more renewables and set no targets for nuclear energy.

Nuclear pact with India?

August 28, 2014

India's Modi eyes breakthrough nuclear pact on Japan trip
http://www.japantimes.co.jp/news/2014/08/28/national/indias-modi-eyes-breakthrough-nuclear-pact-japan-trip/#.U_9i5mOnrIU
Reuters
NEW DELHI – India is hoping to win Japanese backing for a nuclear energy pact during a visit by Prime Minister Narendra Modi, and to lure investment into its $85 billion market while addressing Japan's concerns about doing business with a nuclear armed country.

India has been pushing for an agreement with Japan along the same lines as a 2008 deal with the United States, under which India was allowed to import U.S. nuclear fuel and technology without giving up its military nuclear program.

But Japan wants explicit Indian guarantees not to conduct nuclear tests, and more intrusive inspections of its nuclear facilities, to ensure that spent fuel is not diverted to make bombs.

India, which sees its weapons as a deterrent against nuclear-armed neighbors China and Pakistan, has sought to meet Japan's concerns. Over the past month, the two sides have sped up negotiations ahead of Modi's visit.

"Serious efforts are being made to resolve any special concerns that Japan has. Whether it will be fully resolved and ready for signing before the end of the PM's trip is unclear," said a former member of India's top atomic energy commission who has been consulted in the drafting of the energy pact.

"I would give it a little better-than-even chance at this point," he said, asking not to be identified because of the sensitivity of the negotiations.

Modi will travel to Japan on Saturday for a five-day visit, his first major bilateral trip since taking office in May. The visit is being billed as an attempt by the two democracies to balance the rising weight of China across Asia.

Modi and host Prime Minister Shinzo Abe are also expected to boost defense ties, speeding up talks on the sale of an amphibious aircraft to the Indian Navy.

Another focus is infrastructure, with the Indian leader seeking Japanese backing for the high-speed bullet trains he promised to voters in his election campaign.

But it is the nuclear pact that can transform ties in a way the deal with the United States did by establishing India as a strategic partner, although nuclear commerce with the United States has since foundered because of concerns over India's liability laws.

Officials in Japan were tight-lipped about the prospects for a nuclear deal.

A civil nuclear energy pact with India would give Japanese nuclear technology firms such as Toshiba Corp. and Hitachi Ltd. access to India's fast-growing market as they seek opportunities overseas to offset an anti-nuclear backlash at home in response to the 2011 Fukushima nuclear disaster.

India operates 20 mostly small reactors at six sites with a capacity of 4,780 megawatts, or 2 percent of its total power capacity, according to the Nuclear Power Corporation of India Limited. The government hopes to increase its nuclear capacity to 63,000 megawatts by 2032 by adding nearly 30 reactors.

India is considering a Japanese proposal for a separate commitment not to test nuclear weapons over and above a self-imposed moratorium it declared after testing in 1998.

Another possibility is that Modi would give a personal assurance to Abe on India's nuclear weapons program to help allay concerns in Japan, the only country to have suffered a nuclear attack, which has since been a champion of nonproliferation and disarmament.

"India and Japan are laying the foundations of a bigger deal," said Lt. Gen. A.S. Lamba, former vice chief of the army and an expert on ties with Japan.

"It's no use rushing into something that fails to get off the ground, which is what happened to the India-U.S. agreement," Lamba said. "This is being constructed slowly, this is a defining moment."

New environment Minister vows to help Fukushima

September 4, 2014

New environment chief Mochizuki takes on Fukushima radiation woes

Staff Writer

New Environment Minister Yoshio Mochizuki on Thursday stressed the ministry's commitment to speeding up efforts to reduce Fukushima's radiation woes and vowed to get the prefecture's radioactive waste storage facility up and running.

Mochizuki's appointment comes after Fukushima Mayor Yuhei Sato on Saturday officially agreed to let the government build a storage facility near the crippled Fukushima No. 1 power plant, where contaminated waste will be kept for 30 years until the government can figure out a way to safely dispose of it.

The exact location of the facility hasn't been decided yet, but it will be somewhere within the boundaries of Okuma and Futaba, the two tainted towns hosting the wrecked plant.

Despite the flimsy details, the government nonetheless hopes to start transporting tainted soil and other waste to the site as soon as next January, but concerns are mounting over the feasibility of the schedule.

"I know the road ahead is rough, but the ministry is determined to follow through on our current plan. We shouldn't let our uncertainty affect our determination, at least for now," Mochizuki said.

Meanwhile, Mochizuki said he was eager to achieve the ambitious goal set forth by his predecessor, Nobuteru Ishihara, to make renewable energy account for as much as 30 percent of Japan's total estimated power output for 2030.

"That's a goal, and I'd probably have to do a lot of thinking from now on to assess its (feasibility)," he said. "But still, I'm determined to ensure that Japan won't lag behind global standards and will live up to its reputation as an environment-friendly nation."

No new nukes

September 4, 2014

New METI chief Obuchi rules out new nuclear power plants

http://www.japantimes.co.jp/news/2014/09/04/national/new-meti-chief-obuchi-rules-new-nuclear-power-plants/#.VAizPWOnq1s

by Kazuaki Nagata

Staff Writer

Newly appointed trade and industry minister Yuko Obuchi on Thursday ruled out the construction of new nuclear power plants anytime soon.

"Safety checks of existing nuclear plants are being conducted now, so I'm not expecting to see new plants built at this point," the first woman ever to head METI said in a group interview with the media. But Obuchi, 40, said the government will support restarting Japan's existing reactors once the Nuclear Regulation Authority confirms they meet its new safety standards.

In July, reactors 1 and 2 at the Sendai plant in Kagoshima Prefecture became the first to pass the stricter safety standards drafted after the Fukushima nuclear crisis emerged in 2011, making them the closes to being restarted.

Obuchi, who is the daughter of the late Prime Minister Keizo Obuchi, is likely to have a tough time overseeing the industry because anti-nuclear forces at both the local and national levels will be fiercely fighting restarts, especially those involving nuclear plants as old as doomed Fukushima No. 1 and those built on or near fault lines.

"I think it is more important than anything to win over people in local areas," she said.
As for national energy policy, Obuchi stressed that Japan needs to reduce its dependence on atomic power as much as possible while attempting to see how far it can go with renewable energy, as stated in the basic energy plan approved by the Cabinet in April.
Prime Minister Shinzo Abe reshuffled his Cabinet Wednesday and appointed five female ministers to show he is committed to female empowerment.

Restart & decommission to win public support

September 10, 2014

Japan to OK nuclear plant return while pushing to close old reactors

http://www.japantimes.co.jp/news/2014/09/10/national/japan-ok-nuclear-plant-return-pushing-close-old-reactors/#.VA_uvmOnq1s

Reuters

Japan is set to give the go-ahead to restart its idled nuclear industry just as it moves to definitively close some of its oldest reactors, launching a cull of the long-monolithic industry.
As Japan nears the end of its first full year without nuclear power since 1966, regulators are expected to give final safety approval on Wednesday to restart a power station in the south of the country.
At the same time, the government is pressing regulators to make the tough decision on whether to decommission the oldest of the country's 48 reactors, which face higher safety hurdles than the rest. A quarter of those reactors could be targeted for permanent shutdown.
By weeding out reactors that are 40 years old or more, the government appears to be trying to win support for the long process of restarts from a public that turned against nuclear power because of the 2011 Fukushima disaster, the worst since Chernobyl in 1986.
"For myself, I would like to proceed with smooth decommissioning (of some plants) and at the same time the restart of nuclear power stations certified as safe," Yuko Obuchi, the new minister for economy, trade and industry, who oversees the nuclear industry, said last week.
The government of Prime Minister Shinzo Abe has been pressing to restart reactors that receive safety approval from the Nuclear Regulation Authority to reduce Japan's reliance on expensive imported fuel. But until recently, the government had not stressed the need for making hard choices about the oldest reactors.
The push for a reckoning on some plants is "clearly part of the strategy by the government and utilities to send a signal to the people of Japan that they are listening and taking into account the lessons of Fukushima," said prominent nuclear power critic Arnie Gundersen, director of Fairewinds Energy Education.
"But it also reflects the challenge faced by utilities in finding the funds to bring older reactors to a standard that can pass NRA approval," Gunderson, a veteran U.S. nuclear engineer who turned against nuclear energy for safety reasons, said by email.
Under post-Fukushima rules, reactors are supposed to be decommissioned after 40 years. They can receive a 20-year extension but that is subject to more rigorous and costly safety regulations.

As many as two-thirds of Japan's 48 idled nuclear units may never return to operation because of the high costs, local opposition or seismic risks, while one-third will probably come back online eventually, a Reuters analysis showed this year.
The NRA is expected to give final safety clearance at a meeting on Wednesday for Kyushu Electric Power Co's Sendai plant, after granting the two-reactor power station preliminary approval in July.
While the approval certifies the upgraded design and safety features of the reactors, the units, which have been shut for more than three years, will still have to undergo operational safety checks and be given the green light to restart by local authorities.
Local media said the restart of the Sendai plant in Kagoshima Prefecture may not come until next year.
Utilities that want to extend the operating life of old reactors must submit detailed safety applications by July 2015, explaining how those facilities could be updated to meet the tougher safety standards put in place.
NRA chief Shunichi Tanaka said it takes time and money to clear the additional hurdles. The ageing reactors' capacity is typically about half that of newer ones and it may not make economic sense to make the necessary massive investments.
Kansai Electric Power Co sees scrapping the Mihama plant's reactors 1 and 2, both over 40 years old, as an option, a company official said.
Kyushu Electric is considering decommissioning its 38-year-old Genkai plant's reactor 1, a government source told Reuters.
Chugoku Electric Power Co President Tomohide Karita said in March the utility was considering scrapping the 40-year-old Shimane plant's reactor 1.
The government is likely to ask the operators of 12 reactors that began operations before 1980 to decide by the end of the year whether to decommission them, media reports said last week.

Worrying

September 18, 2014

Editorial: Nuclear plant support measures run counter to official policy

http://mainichi.jp/english/english/perspectives/news/20140918p2a00m0na003000c.html
The Ministry of Economy, Trade and Industry is considering boosting support for nuclear power plants as Japan moves toward full liberalization of its electricity retailing market.
Under the system eyed by the ministry, consumers would shoulder the huge costs of building and decommissioning reactors so that even if there were an electricity price war, power companies wouldn't go into the red. In essence, the system makes it easy to build and rebuild nuclear power plants and maintain them in the future.
But proposals that attempt to extend the life of nuclear power plants when the government has yet to present a picture for the future of the nation's energy policies cannot be justified.
Nuclear power costs much more than thermal and other forms of power, yet for decades power companies have recovered expenses, protected by regional monopolies and the full cost pricing method that tacks the cost of producing electricity onto power bills.
With the full liberalization of electricity retailing set to be implemented in fiscal 2016, however, those power companies will lose their regional monopolies. And then the full cost pricing method will be

abolished. If more newcomers enter the electricity market and the price of electricity drops, it will become even harder for power companies to recover costs associated with nuclear power.
The Ministry of Economy, Trade and Industry therefore proposed new measures to support nuclear power at a meeting to deliberate the role of the nation's nuclear power plants. With respect to the system guaranteeing a set price for electricity produced though nuclear power, the ministry proposed that the cost of decommissioning nuclear reactors and the disposing of spent nuclear fuel be made part of a standard price, with consumers forced to cover the difference if the market price falls below that standard.
The ministry is also reportedly set to consider revisions to accounting systems to ease the effects of reactor decommissioning on management.
In terms of fuel alone, nuclear power plants can be run more cheaply than oil-fired power plants or those running on liquefied natural gas. This is probably why power companies are rushing to restart reactors. But when it comes to building a new nuclear plant or rebuilding an existing one, then the circumstances are entirely different. The latest support measures indicate that if market principles were to be given free reign, then the option of maintaining nuclear power would vanish.
The basic energy plan that the Cabinet approved in April this year states that Japan will aim to reduce its reliance on nuclear power "as much as possible." At the same time, it describes nuclear power as an "important base-load power source" and says the government will determine the level that should be secured. The proposed measures run counter to the policy of breaking with nuclear power. When considering the government's keenness to restart nuclear power plants, it seems that its real intention is to rely on nuclear power.
It is probably difficult to do away with nuclear power immediately when considering the importance of a stable supply of electricity, global warming countermeasures, energy security and other such issues. But Japan has gone through the Fukushima nuclear disaster, and it should be aiming to achieve a society that does not rely on nuclear power.
The government should therefore outline a path for solving these issues and provide an explanation to the public. Policies that take nuclear power for granted will not win public support.

International nuclear compensation pact?

September 22, 2014

Abe preps bill to join nuclear redress-immunity pact

http://www.japantimes.co.jp/news/2014/09/22/national/japan-joining-nuclear-compensation-pact-would-clear-way-for-international-cleanup-aid/#.VCBrfxanp1s
Kyodo, JIJI, Staff Report
DECON, GOING SLOW: PAGE 3 – The administration of Prime Minister Shinzo Abe plans to submit a bill to the Diet by the end of the year to have Japan join an **international pact on compensation in the event of a nuclear disaster,** Chief Cabinet Secretary Yoshihide Suga said Monday
Under the Convention on Supplementary Compensation for Nuclear Damage, known as the CSC, contributions from member states partially cover damages payments in the event of an atomic disaster.

"By ratifying the treaty, (Japan) can support the participation of overseas companies in the decommissioning of — and measures against radiation-tainted water at — the Fukushima No. 1 nuclear power plant," Suga told a news conference.
Suga's comment echoed one by science minister Shunichi Yamaguchi, who conveyed Japan's plan to submit the bill, to U.S. Energy Secretary Ernest Moniz in Vienna Sunday.
Moniz praised the move, noting Tokyo's ratification will help the pact take force, Japanese officials said.
The treaty has been ratified by the United States, Argentina, Morocco, Romania and the United Arab Emirates.
Japan's participation in the CSC is seen as necessary for U.S. companies to take part in the hazardous decontamination and decommissioning work underway at Tokyo Electric Power Co.'s crippled atomic plant.
It is also seen as crucial for Japanese manufacturers who are considering marketing nuclear technology overseas, because ratification would make them immune from liability claims resulting from a nuclear disaster.
Last October, Abe's team said it planned to join the treaty at the request of the U.S., which was promoting it as a way to compensate accident victims and protect the makers of nuclear plants from liability.
Under the convention, liability falls solely on the operators of the plants, which would make it easier for U.S. firms to help out in Fukushima.
The Japan Federation of Bar Associations, however, is opposed to the treaty.
In a statement Aug. 22, the lawyers' group said the plan is "part of moves to push for the exporting of nuclear plants," a move that is unacceptable as the promotion of nuclear plants overseas "could inflict irreparable damage to the human rights of people in recipient countries and their neighboring countries, and could lead to environmental problems."
The U.S. energy chief vowed support for restarting two reactors at Kyushu Electric Power Co.'s Sendai power plant in Kagoshima Prefecture. Yamaguchi told him the units recently passed the Nuclear Regulation Authority's new safety tests.
Yamaguchi and Moniz are in Vienna to attend the general meeting of the International Atomic Energy Agency, which started Monday in the Austrian capital.

What future for nukes?

September 22, 2014
Source : Climate Spectator
http://www.businessspectator.com.au/article/2014/9/22/energy-markets/rio-tintos-great-big-nuclear-delusion

Rio Tinto's great big nuclear delusion

Matthew Wright

Rio Tinto's energy chief, quoted in *The Australian Financial Review* article this month 'The burning question of coal', believes "there will be a return to nuclear" and that China will lead it, stating that a joint

venture has “quietly developed” between China’s state nuclear technology company and the Toshiba Westinghouse Corporation”.

The problem is that that consortium hasn’t produced a third-generation nuclear reactor. In fact, nobody has and all the so-called Gen III-plus reactors under construction globally are behind schedule and over budget – including those in China.

Kenyon-Slaney is living in hope as Rio is invested so heavily in uranium – a mineral which peaked in 2005, well before Germany decided to exit nuclear and Japan idled their entire reactor fleet.

It would be comical if it wasn’t so serious, but Kenyon-Slaney’s nuclear industry just can’t put a foot right. Delays are mounting up in the west, and OECD countries and huge resources are being spent keeping old ageing reactors online. The expenditure that could be better directed is immense.

As a well-known supporter of serious action on climate change, including decarbonisation of all sectors, I have on numerous occasions written about nuclear energy. Following those articles, supporters of nuclear energy have often asked, if I’m serious about climate change, why would I oppose nuclear (a low emissions source of electricity)? In this column I’ll answer that question. But, first I’ll give an update on a few of the latest nuclear industry disaster stories from around the globe.

Japan

The Fukushima disaster clean-up bill will now exceed $112 billion*.

Another problem is the failed plan to construct an underground ice wall to stop radioactive water from flowing into the Pacific Ocean – Tokyo Electric Power has all but admitted it’s a complete failure.

Elsewhere at the Fukushima site, another reactor that wasn’t destroyed during the earthquake-tsunami had a leak in its spent fuel rod pool, which almost spiralled out of control, which would have created yet another calamity.

Broad public support for restarts is non-existent across Japan – even the country’s first lady, the wife of the pro-nuclear Prime Minister has come out against further use of the technology. In order to rally public support some proposals have been floated, including retiring the oldest 25 per cent (14 units) of reactors – or even as much as 33 per cent (16 units) – to try and convince the public that government and regulators are taking safety seriously. Measures like this are unlikely to sway public sentiment.

The direct cost of importing fuel to substitute for the lost production from Japan’s nuclear reactors is estimated to be about $38 billion per year, while some analysts have put the entire trade deficit, now running at $120 billion, down to direct and indirect costs of having the reactors shutdown. Additionally, in 2012 Japan abandoned its fast breeder reactor program after wasting $13 billion dollars on it since 1984.

Europe

Europe’s nuclear industry is struggling. Many reactors are currently off-line for much longer periods than scheduled, Germany and Switzerland are phasing out their reactors and most countries –including Spain, Austria, Sweden and Italy – won’t be building any reactors.

Areva, the world’s biggest builder of nuclear along with French utility EDF, can’t deliver on a new reactor project. Reactors under construction at Flamanville, France and Olkiluoto in Finland are years behind schedule and billions over budget. In the last couple of weeks, Areva has admitted that the Finnish project, originally planned to be online and delivering electricity in 2008, will now be delayed until late 2018. This is another way of saying 2019, 2020 or ... never.

United States

All four nuclear reactors being constructed in the US are suffering costly delays. The reactors rated at 990MWe (2100MWe gross) under construction in Georgia and South Carolina were supposed to begin power generation in 2016. These four reactors are reported to cost $28 billion. Georgia Power says that “it

remains cheaper to finish building the nuclear plant than to stop and instead build gas-fired power plant", meaning that it would have been far better for consumers if they never started in the first place.
The US reactor building delays are being downplayed but, as we know from previous experience, once builders/authorities announce one delay you can be sure that they will follow with many more. In South Carolina ratepayers are already paying more than 20 per cent of their bill for electricity from nuclear power plants that don't even yet exist.
In the meantime, a number of nuclear plants have been shuttered due to failures including serious radioactive leaks, or inability to compete with renewables in the US wholesale electricity market.
China
The central government had ambitious plans to build a significant amount of nuclear power plants, but since Fukushima their local Gen II designs being used on every project have been scrapped for future projects, and Gen III designs. These Gen IIIs have never been built anywhere, and are the only acceptable options for future projects. And here's the problem: just like in France, Finland, Georgia and South Carolina, China's projects are significantly over budget and behind schedule, adding millions of dollars of cost for every additional day without power generation. Back in 2010, China claimed that it would build 80GW of new nuclear by 2020, but the reality is it is likely to add just 20GW, around 75 per cent short of their target.
So why should we be against nuclear?
If the post-Fukushima Japan reactor shutdown delivers an accrued trade deficit over four years of ~$400 billion, as reported, and the clean-up is to cost $100 billion, then that $500 billion alone would have delivered a 100 per cent renewable Japan. Indeed $500 billion would buy 250GW of wind at today's prices, but due to the massive scale of cash into the sector it would drive learning, scaling, and innovation to deliver in excess of 500GW – or 1½ times the wind energy capacity to provide the equivalent of all of Japan's electricity.
And it would be similar for solar, where learning rates and reduction in costs – including balance-of-plant costs – are even greater with scale. At today's prices $500 billion would buy 310GW of solar PV; enough to provide a third of Japan's electricity. Taking into account continued and accelerated cost reductions in technology, such capital injections would lead to twice or thrice that figure –enough to more than power the entire needs of the Asian superpower.
So, if we want cheap and resilient power sooner, faster and as a viable opportunity for all people in all nations, then it is with renewables. But by taking a diversionary path to expensive options like nuclear we are delaying the point at which we inevitably achieve cheap renewables that can be deployed anywhere by anyone.
So put simply, if the extraordinary amounts of money spent on the nuclear fuel cycle were redirected to renewables we would get a lot more electricity generated for every dollar invested.
**All figure are in Australian dollars.*

Not worried about proliferation

September 30, 2014

U.S. nuclear concerns sidelined by plutonium plans

Bloomberg

http://www.japantimes.co.jp/news/2014/09/30/national/u-s-nuclear-concerns-sidelined-plutonium-plans/#.VCruLBanp1s

VIENNA – U.S. concern over the long-term proliferation risk of nuclear waste isn't stopping countries from planning to extract plutonium from radioactive refuse to power a new generation of atomic reactors.

French, Japanese, Russian and South Korean officials lined up against their U.S. counterparts in September at the International Atomic Energy Agency, where two weeks of meetings on waste, proliferation and energy ended Monday in Vienna.

"We've made it pretty clear that we are not interested or supportive," U.S. Secretary of Energy Ernest Moniz said last week at a briefing.

Countries that do move forward with plans to reprocess nuclear waste into new reactor fuel should make sure to keep plutonium inventories at a minimum, he said.

About 8 kg of plutonium are needed to make a nuclear weapon and it's technically impossible to account for all the material in the biggest reprocessing facilities. With about 50 metric tons of stockpiled weapons-grade plutonium, the U.S. decided in the 1970s not to separate more of the heavy metal for civilian purposes. Other countries are pressing toward a vision that would keep nuclear waste as an asset rather than a liability by stripping it of plutonium.

By reprocessing plutonium "we reduce the amount of waste for disposal and we reduce the footprint of the repository," Gerald Ouzounian, international director at France's Radioactive Waste Management Agency, said Sept. 23 at an IAEA panel.

Russia is nearing a decision to begin selling a new generation of reactors that will run on mixed-oxide, or MOX, fuel using plutonium, Rosatom's director of innovation, Vyacheslav Pershukov, told the IAEA.

Plutonium processing is also "in the pipeline" for South Korea, the country's minister of science, Yanghee Choi, said last week.

Japanese plans to start a $21 billion reprocessing plant stoked tensions with China in March after it emerged that more than 9 tons of plutonium were stockpiled without any use after the country's reactors were shut down following the March 2011 tsunami that wrecked the Fukushima No. 1 nuclear plant.

"A major concern" for the U.S. is that plutonium is piling up in Japan without being used to fuel reactors, Moniz said. "Clearly in Japan, until a significant number of nuclear reactors — if and when — are restarted, there will be no end use of the MOX."

It will be difficult for Japan Nuclear Fuel Ltd. to start its reprocessing plant in Rokkasho, Aomori Prefecture, as planned in October because it is still under regulatory review, spokesman Yoshi Sasaki said Sept. 24. The company has not decided on a revised start date, he said.

The long-term viability of creating a market for plutonium requires the commercialization of new reactors, said U.S. Nuclear Regulatory Commission Chairman Allison MacFarlane. Only Russia's BN-800 sodium-cooled fast reactor is close to commercialization.

The U.S., which stopped developing fast reactor technologies in the 1990s, prefers direct disposal of nuclear waste rather than reprocessing.

"You do have a proliferation issue with the kind of reprocessing that is practiced by France and some other countries," MacFarlane said at the IAEA. "By directly disposing you don't develop that large proliferation hazard."

World Nuclear industry Status Report 2014

World Nuclear Industry Status Report 2014 (2)

Report 2014: Executive Summary

http://www.worldnuclearreport.org/The-World-Nuclear-Industry-Status-Report-2014.html

Tuesday 29 July 2014

Paris, London, Washington, 29 July 2014.

"The 2014 World Nuclear Industry Status Report brings clear, careful, honest, and transparent reporting to a topic often obscured by spin and wishful thinking. Any serious student of this complex industry will reach first for this admirable volume."

Amory B. Lovins, Chief Scientist, Rocky Mountain Institute

The world's nuclear statistics are distorted by an anomaly whose cause is not technical but political. Three years after the Fukushima events started unfolding on 11 March 2011, government, industry and international institutional organizations continue to misrepresent the effects of the disaster on the Japanese nuclear program. In statistical documents on the issue, with the exception of the six units at Fukushima Daiichi, the entire Japanese reactor fleet of 48 units is considered operating. The International Atomic Energy Agency (IAEA) classifies all of these Japanese reactors as "in operation"—11 percent of what the IAEA considers the world nuclear fleet—despite the fact that none of them have generated power since September 2013, only two produced electricity in 2013 and just ten in 2012. The *average* outage of these Japanese "operational" units is over three years, as this report documents. In fact, three units have not generated power for the past *seven* years. To find a more appropriate way to deal with this situation, the *World Nuclear Industry Status Report 2014* proposes a new category called Long-Term Outage (LTO).

Taking into account reactors in LTO, the number of operational reactors in the world drops by 39 (9 percent) from 427 in July 2013 to 388 in July 2014—50 fewer than at the peak in 2002— and brings world nuclear statistics into closer alignment with reality.

Mycle Schneider, Project Coordinator and Lead Author of the WNISR, states: "It is time to match the international nuclear statistics to the industrial reality. The introduction of the new category Long-Term Outage (LTO) more appropriately represents the operational status of nuclear power plants and provides industry analysts, political decision-makers and investors with a tool that mirrors empirical facts rather than wishful thinking."

The *World Nuclear Industry Status Report 2014 (WNISR)* provides a comprehensive overview of nuclear power plant data, including information on operation, production and construction. The WNISR assesses the status of new-build programs in existing as well as in potential newcomer nuclear countries and looks in detail at how the changing market conditions are affecting the economics of nuclear power. WNISR2014 also updates a Fukushima Status Report featured for the first time in 2013 that triggered widespread media and analyst attention. While the Nuclear Power vs. Renewable Energy chapter provides comparative data on investment, capacity, and generation and assesses how nuclear power performs in systems with high renewable energy share.

Finally, a detailed country-by-country analysis provides an overview of all 31 countries operating nuclear power plants, with extended sections on China, Japan, and the United States.

Some of the key features of the *World Nuclear Industry Status Report 2014* include:

• **Declining role.** Nuclear power's share of global commercial primary energy production declined from the 2012 low of 4.5 percent, a level last seen in 1984, to a new low of 4.4 percent.

• **Aging.** The average age of the world's operating nuclear reactors to increase and by mid-2014 stood at 28.5 years.

• **Construction Delays.** At least 49—including three quarters of the Chinese projects—of the total of 69 construction sites have encountered delays, many of them multi-annual. Construction of two units in Taiwan was halted.

• **Project Cancellations.** Several projects have been cancelled and new programs indefinitely delayed, including in the Czech Republic and in Vietnam.

• **Operating Costs Soar.** Nuclear generating costs jumped by 16 percent in real terms in three years in France, and several units are shut down in the U.S. because income does not cover operating costs. The economic survival of nuclear plants is also threatened in Belgium, Germany and Sweden.

• **Renewables vs. Nuclear.** In 2013 alone, 32 gigawatts (GW) of wind and 37 GW of solar were added to the world power grids. By the end of 2013, China had 91 GW of wind power and 18 GW of solar capacity installed, solar exceeding for the first time operating nuclear capacity. China added four times more solar than nuclear capacity in the past year. And Spain generated more power from wind than from *any* other source, outpacing nuclear for the first time. It is also the first time that wind has become the largest electricity generating source over an entire year in any country. Spain has thus joined the list of nuclear countries that produce more electricity from new renewables—excluding large hydro-power—than from nuclear power that includes Brazil, China, Germany, India and Japan.

Beyond Nuclear on the World Industry 2014 Report

Introducing JUST THE FACTS
Our new series, ***JUST THE FACTS*,** delivers timely and topical nuggets of empirical data from the World Nuclear Industry Status Report countering nuclear myths in the media. This week we responded to James Conca's erroneous lead in *Forbes magazine* that "Nuclear energy is growing around the world." Among our points: there are 50 fewer plants operating now than at the 2002 peak; even if the 67 reactors under construction are completed by 2020 (unlikely, given delays and soaring costs), installed nuclear capacity will still drop; the global nuclear market share has in fact decreased; and meanwhile installed capacity for renewables is soaring.

Nuclear growth: the reality check

http://www.beyondnuclear.org/storage/wnisr-blips/BN%20WebForbes_Conca_response.pdf

By Paul Gunter
Director of Reactor Oversight, Beyond Nuclear

Is nuclear power really growing as James Conca asserts in the opening line of his recent column (The Nuclear Weapons States: Who Has Them and How Many)? That rather depends on how you define "growing."

Growing in operating units and if so, compared to what and when? Growing in capacity or output? Growing in share of the world's power generation? Growing in new construction sites?

Let's take a reality check before accepting the "growth" myth. This can readily be done by consulting the independent 2014 World Nuclear Industry Status Report,which deliberately omits plans and aspirations and looks only at empirical data.

Conca cites the 430 "operational number" pulled from the International Atomic Energy Agency, which considers a reactor as "in operation" even when it is idle. The IAEA counts all 48 of the currently shuttered reactors in Japan as "operating." More correctly,
the IAEA number should be defined as "operable." The true count is 388, as found in the WNISR(page 16),50 fewer than the peak in 2002. So operationally, nuclear power is in decline.

There are currently 67 reactors under construction worldwide in 14 countries. But "under construction" does not indicate eventual completion. Eight of the 67 have been "under construction" for more than 20 years including one in the U.S. -- at Watts Bar, TN --
which has been "under construction" for a whopping 41 years.

Significant construction delays and sky-rocketing cost over-runs are par for the nuclear course as witnessed at the remaining four sites underway in the U.S. and the plodding pace of the French EPR in France and Finland also mired in fights over financing and
safety.

While 67 represents "growth" compared to the lowest ebb of 2005, it is far behind the peak years of the 1980s. As the WNISR(pg. 19) states, "simply having an order for a reactor, or even having a nuclear plant at an advanced stage of construction, is no
guarantee for grid connection and power production."

Even if all 67 reactors currently under construction miraculously reached completion and came on line by 2020, installed nuclear capacity would still drop globally by 7.5 GW according to the
WNISR (pg. 23). Therefore, the promise of new reactors, even if
realized, does not in fact represent growth.

Nuclear electricity production has declined dramatically worldwide from its historic peak in 2006. Stability over the last two years does not necessarily indicate growth either, as the trajectory over time remains downward. This is also the case with the nuclear share
of the electricity marketplace, which has declined steadily from a historic peak of 17.6 percent in 1996 to 10.8 percent in 2013, according to the WNISR (page 6.)

The report also observes that any "increases in nuclear generation are mostly as a result of higher productivity and uprating at existing plants rather than due to new reactors." However, this pathway inevitably lowers safety margins.

The WNISR(pg. 24) concludes that "the number of reactors in operation will stagnate at best but will more likely decline over the coming years unless lifetime extension beyond 40 years becomes widespread." The costs of running these aging and degrading plants
60 or even 80 years makes this scenario economically unappealing. In the past year we have already witnessed the closure of four reactors in the U.S., where the owners preferred shutdown over expensive safety fixes (a fifth, Vermont Yankee, is scheduled to shut permanently in December.)

Conca's other myth, that"No nuclear weapons program ever came out of a nuclear energy program," is not borne out by the facts. A look back at the genesis of the nuclear weapons programs in France, India, Pakistan, China, South Africa, Israel and North Korea all point to the development, first, of so-called civilian nuclear power plants to establish the pathway to the bomb. Iran is another case in point where debate still rages around that country's true nuclear intentions. The eagerness to develop expensive nuclear power programs in solar-friendly countries, particularly in the Middle East and Asia, is a clear indicator that even just the potential this affords to transition to an atomic weapons program is a desirable political bargaining tool.

So where is genuine growth to be found in the energy sector?

In terms of installed capacity, renewables have soared since 2000 while nuclear has stagnated. Solar PV has seen an annual growth rate of 43 percent, 25 percent for wind and 0.4 percent for nuclear. Given the rapidity with which renewable energy capacity is installed, and the falling costs (which explains the recent slight decrease in renewable investment globally even as capacity increases) we can fully expect the upward trajectory for renewable energy to continue as nuclear continues to decline.

Spinning the numbers may create an illusion of growth in the nuclear sector, but the hard facts paint a very different story. The real "growth" is happening in the renewable energy sector, which, for the sake of planetary survival, is exactly the way things need
to be.

Paul Gunter is the Director of Reactor Oversight at Beyond Nuclear, a nuclear energy watchdog organization based in Takoma Park, MD

Too much clean energy? (2)

October 4, 2014

EDITORIAL: Measures needed to prevent renewable energy boom from going bust

http://ajw.asahi.com/article/views/editorial/AJ201410040038

The positive growth of electricity production using renewable energy powered by the feed-in-tariff (FIT) system is beginning to show signs of losing steam.
Major power utilities are suspending the acceptance of new entries into the FIT program because the capacity of their transmission lines to take additional electricity has reached its limit in some areas. Of the 10 big utilities that are legally required to purchase all power generated from renewable energy sources at fixed prices, five, including Kyushu Electric Power Co., have stopped making new FIT contracts in almost all the areas they serve.
This inability by utilities to accept all the electricity produced under the FIT program due to capacity deficiency reflects the strong investment interest in renewable energy and the high expectations for the use of green power.
But solar and wind power has one big drawback. The amount of electricity generated with these energy sources tends to fluctuate wildly due to factors such as weather conditions, time of day and the season. Such fluctuations in power generation, unless they are properly adjusted, can affect the frequency and voltage of the power, causing power failures and malfunctioning equipment.

One solution is to expand transmission lines for integrated operations to wider areas so that the effects of the fluctuations in power generation can be buffered more easily.
Thicker power lines between utilities will allow for the transmission of surplus power generated from renewable energy sources in one area, say Kyushu, to other areas where there is demand.
Decisions on investing in power grids in the past had been left up to the individual utilities.
The situation, however, will change when the scheduled power market reform separates the operation of transmission lines from the business of power generation. This will encourage investment in transmission grids based on a broader perspective that is not restricted by the needs of the individual utilities.
Starting in April next year, a new operational entity will take charge of integrating the transmission lines operated by regional power companies. The new body will be responsible for developing trunk transmission lines and connecting lines between utilities.
This new system will make it easier to expand and enhance transmission grids in response to policy needs and requests from power generation companies.
Some issues remain to be sorted out, such as how the costs should be shared. But it is vital to carry through such power system reforms without delay.
It will take time, however, to build up a large network of transmission lines covering wide areas. There are also problems that need to be solved, including the insufficient capacity of transmission lines at locations where they are connected to power plants.
The Ministry of Economy, Trade and Industry will set up a working group to study the formula for calculating the maximum amount of green electricity individual utilities can accept, as well as conditions for such acceptance.
The ministry should consider taking steps to ensure early, preferably ahead-of-schedule, implementation of plans to bolster transformers and storage batteries, instead of leaving utilities to decide when to take these measures.
As for large-scale solar farms, which account for the majority of applications for power sales under the FIT program, the ministry may need to ensure the appropriate scale by using the price mechanism. It can do so, for instance, by reviewing the purchase prices more frequently than the current once a year.
Promoting the use of renewable energy is a global trend. It is important from the viewpoint of developing alternative energy sources that can replace nuclear power and fossil fuels and of tackling global warming.
In its new basic energy supply plan, the government designated about three years from 2013 as a period for "maximum possible acceleration" in the effort to spread the use of renewable energy. It has set a target of increasing the share of clean power as part of the nation's overall electricity production to more than 20 percent by 2030.
The government should figure out ways to prevent the current renewable energy boom from going bust.

Unprepared for green electricity

http://www.japantimes.co.jp/opinion/2014/10/05/editorials/unprepared-green-electricity/#.VDFjNxanp1s

Under the feed-in-tariff system introduced in July 2012 by the then Democratic Party of Japan administration, the nation's major power companies are required by law to buy, in principle, all the electricity generated by solar, wind, geothermal and medium-to-small-scale hydro-power sources and biomass at fixed prices.

The purchase costs are to be added to electricity charges. It was hoped that the system would help revitalize local economies and reduce Japan's dependence on nuclear power. Recently, however, one power company after another has announced a decision to stop such purchases.

They say the oversupply of green electricity due to the required purchase of all such power could wreck the stable supply of electricity to businesses and households.

The situation has prompted the trade and industry ministry to prepare for a review of the feed-in-tariff system. Given what has happened, it is clear that the system was not well thought out and needs to be redesigned.

But in the review, the ministry should not use the recent development as an excuse to put a brake on the expansion of power generation through renewable sources and to maintain the weight of nuclear power in the supply of electricity. It should uphold the goal of expanding green power generation, and bring together the accumulated knowledge and technologies of the power and other industries to achieve it.

On Sept. 24, Kyushu Electric Power Co. announced that it would halt the purchase of green electricity in the whole Kyushu region, starting the next day, including putting on hold some 70,000 plans for generation of green power by entities that have applied to Kyushu Electric for contracts to sell the electricity.

Kyushu Electric's decision affected not only the renewable energy businesses but also local governments, including the Kumamoto prefectural government, which had pushed for introduction of green electricity.

Okinawa Electric Power Co. had stopped the feed-in purchases in August.

Hokkaido Electric Power Co., Tohoku Electric Power Co. and Shikoku Electric Power Co. followed the Kyushu power firm with a decision to suspend the purchase of green electricity beginning this month.

Tokyo Electric Power Co. and Kansai Electric Power Co. have also halted such purchases in some parts of the areas serviced by them.

In making their moves, the power companies have cited a clause in the Law on Special Measures Concerning Procurement of Renewable Electric Energy by Operators of Electric Utilities, which exempts them from the duty to buy green electricity if the purchase of such power poses a danger to stable supply of electricity.

Behind their moves is a rapid increase in the volume of green electricity they have had to agree to buy.

Green energy operators rushed to make last-minute applications for electricity sales to the power firms before the government lowered on April 1 the prices at which the utilities must buy power from various renewable energy sources.

The power companies explain that if all the electricity from renewable energy sources is supplied to their transmission grids, the total supply will exceed their capacity, which could lead to stoppage of the power companies' generators.

They also say that the wild ups and downs in the output of solar and wind power due to weather changes will make it extremely difficult for them to adjust the output of their power generators to cope with the fluctuations. If the adjustments fail, it could damage their power grids.

Both cases could result in blackouts.

The government should be blamed for failing to foresee a large number of applications for sale of green electricity to the power companies.
There may be some entities that have applied to the power firms for the electricity purchase contracts without proper investment plans. However, many entities have already carried out necessary investments for power generation through renewable energy sources on the belief that the power firms will fulfill their duty to buy the electricity from them.
The government and the power companies should realize that power from renewable sources accounted for only 2.2 percent of the total electricity generated in fiscal 2013.
Green electricity has the advantages of emitting very little carbon dioxide in the process of power generation. Severe accidents like the one that may happen at a nuclear power plant are unlikely. Green power generation facilities scattered around the country reduce the risk of severe power shortages. It is clear that green electricity's weight in total power generation in this country should be sharply increased.
In reviewing the feed-in-tariff system, the trade and industry ministry should not forget this point and should remember that the government's energy basic plan adopted in April calls for reducing Japan's reliance on nuclear power as much as possible as well as for aggressive introduction of renewable energy, citing a government advisory body's document that states that green electricity should account for about 20 percent of the total power generation in 2030.
The Natural Resources and Energy Agency estimates that if all the green energy facilities that have signed feed-in-tariffcontracts with power companies and received approval from the government as of the end of May went into operation, their total output in 2030 would top 20 percent of the nation's total power generation.
Development of large-capacity and high-efficiency batteries, an increase in the capacity of the power grids, including building of transmission lines across different service areas, and upgrading of the facilities to convert the different frequencies of electric currents — 50 Hertz in eastern Japan and 60 Hertz in western Japan — are needed to solve major technical problems inherent to the supply of electricity generated through green sources.
Trillions of yen are estimated to be needed for such projects, and power companies are reluctant to invest. To stimulate such investments, the government should first declare clear percentages as goals in expanding the share of green electricity in the nation's total power generation.
Also important for the government would be to clarify what party or parties should shoulder the cost of such investments — which was left unaddressed when the system was introduced in 2012.

The impact of power-saving

October 13, 2014

EDITORIAL: Power-saving efforts should mark transition away from nuclear energy
http://ajw.asahi.com/article/views/editorial/AJ201410140024
This year's summer was Japan's first nuclear-free one since the Fukushima nuclear disaster started in 2011.
Two nuclear reactors of Kansai Electric Power Co. were online last summer. With those reactors idled this summer, Kansai Electric initially planned to ensure a supply leeway of 3 percent at peak demand by

operating other power-generating facilities, such as thermal power plants, at full throttle and procuring additional power from Tokyo Electric Power Co.

As it turned out, the Osaka-based regional utility managed to maintain a supply leeway of 6.6 percent even during the highest demand on July 25, and it never had to obtain electricity from TEPCO.

The relatively mild summer was certainly one factor that dampened general demand for power. But the peak demand in the Kansai region occurred on a day of scorching heat, when temperatures exceeded 37 degrees in Osaka. The supply leeway, however, remained relatively spacious.

Kansai Electric has attributed the situation to **1.08 gigawatts more power being saved on top of its initial expectations. That difference is roughly worth the output of one nuclear reactor.**

Kyushu Electric Power Co.'s Sendai nuclear power plant, for which safety screenings of the Nuclear Regulation Authority are at the most advanced stage, will likely not be restarted before next year, so Japan is expected to remain nuclear-free during the coming winter. Although we cannot afford to be too optimistic, what we have achieved to this point provides promising signs.

More than 90 percent of business offices and nearly 70 percent of households told a survey conducted in Kansai Electric's service area that they had tried to save on power. So many users are willing to cooperate in power-saving efforts to the best extent they can.

Efforts on the side of power utilities only appear tardy in the light of those endeavors.

Utilities adhere to their argument that reactor restarts are essential for ensuring a stable supply of electricity because aged thermal power plants run the risk of failures. Hokkaido Electric Power Co. plans to raise its electricity rates for a second time in November on grounds that growing fuel costs are weighing heavily on its management. Other utilities are seeking to follow suit.

But **their eagerness to stick to nuclear power generation may be applying the brakes on reforms needed to adapt to a changing management environment.**

The more stringent safety measures implemented after the Fukushima nuclear disaster have turned the purported "inexpensive and stable" power source--the longtime promotional blurb for nuclear power--into a thing of the past.

Nuclear power plants could even become a burden on management when the current full-cost pricing method, which allows all expenses to be collected as part of electricity charges, ends with the liberalization of the power retail market from 2016.

The imperative of survival would only necessitate the utilities to seek alternative power sources and phase out their dependence on nuclear energy.

Regional utilities have taken major steps of late to begin supplying power to users outside their own service areas. In the meantime, a number of utilities have stopped signing new contracts to purchase power generated from renewable energy sources on grounds that the capacity of their power grid is running short.

These actions, taken more than three and a half years since the nuclear disaster prompted a national debate on energy policy, seem illogical.

The utilities should see the current availability of broad-based cooperation in power-saving efforts as marking a precious transition period, and they should establish solid management strategies for phasing out their reliance on nuclear power. Merely reiterating their calls for nuclear reactor restarts may no longer pull at the heartstrings of their users.

--The Asahi Shimbun, Oct. 13

Shaking up the power industry

October 21, 2014

New power industry alliances

http://www.japantimes.co.jp/opinion/2014/10/21/editorials/new-power-industry-alliances/#.VEZNbRanp1s

The comprehensive alliance struck recently between Tokyo Electric Power Co. and Chubu Electric Power Co. in their thermal power generation business raises expectations of a further shakeup in the power industry — likely involving companies from other sectors — ahead of the full liberalization of the retail sale of electricity in 2016.

While Tepco and Chubu Electric have their own reasons for the accord, it should be a welcome development if the tieup results in cutting electricity costs for consumers.

According to the basic agreement announced Oct. 7, the two companies will create a jointly owned firm that will integrate their liquefied natural gas (LNG) procurement to reduce fuel purchasing cost. The two firms combined buy roughly 40 million tons of LNG annually — or nearly half Japan's total imports of 88 million tons — and they hope the expanded volume will boost their power to negotiate procurement pricing with producing countries.

Through the new firm, Tepco and Chubu Electric will also seek to replace aging thermal power plants with more fuel-efficient plants as well as to increase output from coal-fired plants, which generate power at less than half the fuel costs of LNG-fueled plants. As a first example, the new firm reportedly plans to work with Electric Power Development Co., popularly known as J-Power, to build and run a latest-generation coal-fired power plant at Tepco's Yokosuka thermal power plant in Kanagawa Prefecture.

Tepco, which faces the massive cost of compensation for people affected by the March 2011 triple meltdowns at its Fukushima No.1 nuclear power plant, sees the alliance with Chubu Electric as a key pillar of its financial reconstruction. Tepco needs to improve its earnings to cover the trillions of yen in compensation, which it has been paying by borrowing from a government-backed fund. Since its nuclear power plants remain shut down in the wake of the 2011 disaster — just like other utilities — it is also imperative for Tepco to lower the cost of procuring LNG to run thermal power plants.

Chubu Electric is relatively unscathed from the shutdown of nuclear power plants, which accounted for only 15 percent of its power generation before 2011. Still, it faces the prospect of greater competition on its home turf in central Japan as a decades-old regional monopoly by major power firms is about to be fully dismantled. In 2016, the remaining restrictions on electricity sales to households will be lifted, making it possible for any power-generating entity to service customers anywhere across Japan. The alliance with Tepco will give Chubu Electric access to a power-generation source and a foothold for sales in the lucrative Tepco-serviced areas.

Moves are afoot by the major power firms to tap into demand in regions previously dominated by the others — often involving companies from other sectors such as gas, oil and general trading firms. Before reaching the accord with Chubu Electric, Tepco also explored other firms including Kansai Electric Power Co., Tokyo Gas Co., Osaka Gas Co. and JX Nippon Oil & Energy Corp. as potential partners. It is reported that Osaka Gas may later join the Tepco-Chubu Electric alliance. There is also the possibility that the firms that did not reach agreement with Tepco may explore their own alliance.

There are uncertainties as to how the Tepco-Chubu Electric alliance will evolve. Tepco is said to have urged Chubu Electric to place all of its main thermal power plants under the umbrella of the new jointly funded firm, but they eventually agreed only on the replacement of aging plants and construction of new

facilities. They say integrating the operation of their thermal power plants will remain on the agenda of future discussions, and the scope of the alliance will substantially differ if they agree on such arrangements.
Given the uncertainties over reactivating its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, which it counts on in its financial reconstruction plan, Tepco will likely need to make greater efforts to restructure its business. Other regional utilities and companies from different sectors are also eyeing the market thus far dominated by Tepco.
But from a consumer viewpoint, active realignment of the power industry, which has for decades been effectively dominated by the regional monopolies, should be a welcome development if it leads to lower electricity bills.

Maintain the momentum

October 21, 2014

New ministers pledge no interruption to nuclear policy, female empowerment

Staff Writers
On his first day in his new job, industry minister Yoichi Miyazawa said Tuesday he will soon be ready to visit communities near nuclear power plants, apparently pledging to maintain the momentum for reactor restarts.
The Nuclear Regulation Authority has cleared the Sendai nuclear power plant in Kagoshima Prefecture, and all that remains before it fires up once more is for the central government to secure local approval.
"Of course, I'd like to visit Kagoshima as soon as possible," Miyazawa said as he began work as minister of economy, trade and industry.
His predecessor, Yuko Obuchi, resigned Monday over a political funds scandal.
At his first news conference at the ministry, Miyazawa, 64, said he doesn't know exactly when he will visit Kagoshima as he has to work out the timing with various municipalities and the prefectural government.
The Kagoshima Prefectural Assembly had been asking Obuchi to go there and explain in person why the central government believes the two reactors at the plant in Satsumasendai should be fired up once more.
A visit is seen as critical to securing the understanding of local communities.
The two Sendai units are the only reactors that have so far cleared new safety hurdles created by the NRA in response to the Fukushima nuclear crisis.
The central government wants to restart reactors that clear the NRA's checks, but some observers have said they believe the shake-up in the Ministry of Economy, Trade and Industry, which oversees the nuclear industry, may slow the process.
Miyazawa, the nephew of the late Prime Minister Kiichi Miyazawa, said he will steadily push ahead with reactor restarts, saying his job is to promote "responsible energy policies."
The new METI chief said nuclear will remain a "baseload power source" for the country.
But he also said Japan must explore ways to boost its use of renewable energy to lower the reliance on nuclear power.

US and Russia join forces against nuke safety

U.S. Said to Join Russia in Blocking Nuclear Safety Moves

http://www.bloomberg.com/news/2014-10-23/u-s-said-to-join-russia-in-blocking-nuclear-safety-moves.html

By Jonathan Tirone Oct 23, 2014 2:57 PM GMT+0200
Photographer: Koji Sasahara/Pool via Bloomberg

The U.S. and Russia are joining forces to block a European plan to raise the protection of nuclear reactors against natural disasters after the meltdowns at Japan's Fukushima Dai-Ichi power plant, diplomats say. Envoys from both countries are trying to derail a Swiss-led initiative that would force nuclear operators to invest more on safety, undermining attempts to harmonize global safety regulation, according to eight European and U.S. diplomats who attended meetings in Vienna last week. All asked not to be named in line with rules kept by the Convention on Nuclear Safety, the legal body overseeing the talks.

Even as relations between Russia and the U.S. have sunk to a post-Cold War low over the crisis in Ukraine, the two powers have come together to press their shared interest in resisting more stringent safety guidelines, said the diplomats. The U.S. is the world's biggest nuclear-power generator, while Russia exports more reactors than anyone else.

"Switzerland, as the initiator of the proposal, will continue to collaborate with all delegations and do everything to find a solution that is acceptable to all of us," Georg Schwarz, deputy director general of the Swiss nuclear-safety regulator, ENSI, said in an e-mailed reply to questions.

Nuclear Secrecy

The U.S.-Russia collaboration reflects a nuclear-safety convention whose secrecy is laid bare in documents obtained by Bloomberg News under a Freedom of Information Act request.

It also underscores the **high stakes for an industry trying to bounce back after the Fukushima accident.** European attempts to impose higher safety standards would make nuclear power more costly just as plant operators come under price pressure from cheaper natural gas.

Atomic Power Looking Better and Worse

Prompted by the March 2011 Fukushima incident, European regulators are seeking to rewrite international standards to ensure nuclear operators not only prevent accidents but mitigate consequences if they occur, by installing costly new structures built to survive natural disasters. The meltdown caused by a tsunami forced 160,000 people to flee radioactive contamination and led to the shutdown of all of Japan's nuclear plants.

The European attempt became public in April during the previous Convention on Nuclear Safety meeting in Vienna. Switzerland consulted with engineers, regulators and diplomats from more than 50 countries before proposing the new rules. The stricter requirements were in line with a European Union directive issued three months later that required nuclear operators to bolster infrastructure at existing plants.

Less Stringent

U.S. regulators aren't requiring the same stringent modifications, according to Edwin Lyman of the Cambridge, Massachusetts-based Union of Concerned Scientists, an advocacy group. European utilities pay as much as five times more to fit out plants to withstand earthquakes and floods as a result, he said.

Electricite de France SA is spending about 10 billion euros ($13 billion) on additional safety features for its 59 reactors, according to its regulator, the Autorite de Surete Nucleaire. U.S. utilities will spend about $3 billion on portable generators and cooling reserves for about 100 reactors, FirstEnergy Corp. (FE) President Pete Sena said in July 31 testimony to the Nuclear Regulatory Commission.

'Hardened Core'

French costs are higher because operators have to build a "hardened core" around their reactors that will be able to contain fallout if an accident occurs, its regulatory chief, Jean-Christophe Niel, said in July testimony to the NRC in Rockville, Maryland. Engineers are designing reinforced bunkers for back-up power and installing emergency cooling systems to contain a meltdown. The country is also reinforcing the concrete bases of its oldest reactors and creating elite teams of emergency responders.

At last week's meeting, convened at the International Atomic Energy Agency's headquarters, Russian envoy Oleg Postnikov offered praise for his American counterpart, Eliot Kang, after the U.S. argued against the European initiative, people who attended the meeting said. U.S. officials confirmed that their delegation fell into an uneasy alliance with Russia.

The U.S. State Department declined to comment on the record. Russian diplomats accredited to the IAEA didn't respond to written requests and phone calls seeking comment.

'Shocking' Secrecy

Created in response to the 1986 Chernobyl nuclear reactor meltdown in Ukraine, the convention has struggled to broaden safety standards. The group's own secrecy has often undermined its intents. One former French envoy, Jean-Pierre Clausner, said that the opacity of the organization was "shocking," according to the documents obtained under the Freedom of Information request.

"The whole process needs to be reviewed and significant changes should be introduced if the contracting parties are willing to maintain the usefulness of the convention," Clausner wrote in 2005, the first year that the body allowed notes taken from its meeting to be preserved.

While nuclear meltdowns are considered cross-border incidents because of the radioactive fallout that can result, no international authority exists to compel countries to adopt safety standards. Instead, regulators from around the world routinely review each other's practices to figure out which works best. Laggards face peer criticism that can make them look bad in forums like the convention.

Falsified Data

At the convention's 2008 meeting -- the last before Fukushima -- Japan was criticized by peers for being slow to overhaul a reporting system that had been caught using "falsified inspection data," the documents show. Participants also urged Japan, then the world's third-largest nuclear-power generator, to review how safe its reactors were against earthquakes.

Countries like China and India, where companies are building new reactors to cover growing electricity demand, have given some support to the European initiative, according to the diplomats. The safety-upgrade costs to new reactors aren't as burdensome as retrofitting existing infrastructure, they said.

The U.S. said that the Europeans bushwhacked their delegation earlier this year by calling a vote to consider the safety amendment. **The country's nuclear industry would suffer if the European measure were to be adopted because it would create an international perception that the U.S. took safety less seriously.**

"The nuclear industry in the U.S. is under great pressure from lower natural gas prices," said Lyman from Vienna, where he is attending an IAEA meeting. "At the same time, the potential for capital upgrades to deal with post-Fukushima requirements was a worry that it could push them over the edge."

Argentina's IAEA envoy, Rafael Mariano Grossi, will convene the next safety meeting Feb. 9 to 13, when countries will decide on the Swiss measure.

The biggest challenge for the U.S. and Russia may not be convincing enough countries to vote against the measure, according to an official who organized last week's talks. Their real test, he said, will be to come up with something better.

Koizumi: For a society without nukes

November 1, 2014

Koizumi calls for society without nuclear plants

http://www3.nhk.or.jp/nhkworld/english/news/20141102_05.html
Nov. 1, 2014 - Updated 23:25 UTC+1
Former prime minister Junichiro Koizumi has called for a society with more renewable energy and no nuclear plants.

In a speech in Tokyo on Saturday, Koizumi referred to the delay in the timetable for decommissioning the No.1 reactor at the Fukushima Daiichi nuclear plant.

He said there have been many human errors and technical failures at nuclear plants. And he said serious accidents have enormous impacts.

Koizumi also said Japan has not experienced a single power outage since its reactors went offline, and he said that is evidence that people can live without nuclear energy.

Koizumi also rejected claims that renewable energy is not ready to meet the needs of communities around the world. He said with government support, it could soon take the place of nuclear power.

What to do with aging nuclear plants

October 30, 2014

Aging nuclear power plants

http://www.japantimes.co.jp/opinion/2014/10/30/editorials/aging-nuclear-power-plants/#.VFM9pxZ5B1s

The government is weighing measures to aid power companies that decommission aging nuclear power plants and host municipalities that will lose nuclear power-related revenue. To facilitate the moves to scrap aging plants, some steps may be necessary to ease the process. But support should not be extended in ways that perpetuate the reliance of the power firms and the host municipalities on nuclear power. Under safety regulations tightened after the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, utilities are not allowed in principle to run nuclear power reactors for longer than 40 years. The operators can seek to extend reactor operations for up to 20 years, but they

need to undergo special inspections by the Nuclear Regulation Authority, which would require huge investments to upgrade aging equipment to beef up their safety.

Of the 48 nuclear power reactors in Japan, four — the No. 1 reactor at Japan Atomic Power Co.'s Tsuruga plant, the Nos. 1 and 2 reactors at Kansai Electric Power Co.'s Mihama plant and the No. 1 reactor at Chugoku Electric Power Co.'s Shimane plant — have already been in operation for more than 40 years, while three others — Nos. 1 and 2 reactors at Kansai Electric's Takahama plant and the No. 1 reactor at the Genkai plant of Kyushu Electric Power — will reach the 40-year mark in July 2016.

The power firms need to apply to the NRA by next summer if they want to extend the reactors' operation.

The utilities are said to be considering the choice of decommissioning the aging reactors, which typically have small output capacity and are unlikely to churn out profits that match the massive cost of renovation.

The government is ready to facilitate the move, apparently on the belief that scrapping aging reactors will help win public support for reactivating other reactors that were put offline after the Fukushima disaster. While urging the power companies to make swift decisions, the government has kicked off discussions on measures to support the moves by the utilities.

Decommissioning a nuclear power reactor takes 20 to 30 years. In addition to the direct cost of scrapping the reactor, there will be other expenses such as those for disposing of the large amount of radioactive waste.

While the utilities have set aside reserves to pay for future decommissioning by adding the cost on to electricity bills, moving forward schedules for scrapping reactors due to new safety regulations will require additional expenses. The power companies also need to devalue the reactors once they are decommissioned and report the losses.

Local governments hosting the nuclear power plants stand to lose national government grants to such municipalities as well as revenue from fixed asset taxes on the reactors to be decommissioned. There are concerns about severe damage to local economies from the cuts of such revenue, along with losses to related businesses.

Under discussion at a panel of the trade and industry ministry are measures such as changing accounting rules that currently require the power companies to report losses on the reactors immediately after decommissioning them, as well as maintaining government financial support for the host municipalities even after the reactors have been scrapped.

Also reportedly under consideration is a system that will include in the price of electricity generated by nuclear power the total power generation costs — including the expenses of future decommissioning of reactors and disposal of spent fuel — even after the retail sale of power is fully deregulated.

The decommissioning of reactors that are aging and more vulnerable to severe accidents or natural disasters should be promoted, and steps will need to be taken to eliminate hurdles, including financial concerns, that deter such moves. But the steps need to be limited to temporary measures that ease the financial burden on the power firms and host municipalities.

Preferential treatment toward nuclear power that could encourage the utilities to keep relying on it as a source of commercial electricity, as well as policies that keep the local economies depending on the nuclear power industry, will run counter to the government's pledge in its latest basic energy plan to reduce "as much as possible" the nation's reliance on nuclear power, and therefore must be avoided.

US continue to conduct plutonium tests

November 5, 2014

Mayors of Hiroshima, Nagasaki protest against U.S plutonium tests

http://mainichi.jp/english/english/newsselect/news/20141105p2g00m0dm037000c.html
HIROSHIMA/NAGASAKI, Japan (Kyodo) -- The mayors of Hiroshima and Nagasaki have sent letters to U.S. President Barack Obama protesting reported U.S. plutonium tests in September and October.
Hiroshima Mayor Kazumi Matsui in his letter criticized the United States for reportedly conducting the tests using plutonium to examine the capabilities of nuclear weapons, saying, "It is unforgivable as they demonstrate will to maintain nuclear weapons although the tests did not involve nuclear explosions."
Such U.S. tests "will give other countries an excuse to develop nuclear weapons" and make it difficult to realize a world free from nuclear weapons as Obama proposed in 2009.
Nagasaki Mayor Tomihisa Taue in his letter urged Obama to take leadership in realizing a nuclear-free world.
Taue, as head of the National Council of Japan Nuclear Free Local Authorities, also mailed a written protest to U.S. Ambassador to Japan Caroline Kennedy, saying the tests would nullify efforts by people worldwide to eliminate nuclear weapons.
Hiroshima Gov. Hidehiko Yuzaki sent a similar letter to Obama on the same day.
The cities of Hiroshima and Nagasaki were devastated by atomic bombs dropped by the United States in 1945 in World War II.

Japan to build nukes in Wales

November 5, 2014

Wales minister says nuclear power remains a good investment

http://www.japantimes.co.jp/news/2014/11/05/business/wales-minister-says-nuclear-power-remains-good-investment/#.VFtTh8l5B1u

by Kazuaki Nagata
Staff Writer
While the nation debates the wisdom of restarting its nuclear power plants, the energy source remains central to some nations' investments for tomorrow. The process to construct a new two-reactor facility in Wales has been going as planned, the British province's economy minister said.
There's a confidence that the plant will be delivered, that it will work well, and that it will do good for the local community in terms of employment opportunities," said Edwina Hart, economy minister of the National Assembly for Wales. She was speaking to The Japan Times last week during a working visit to Japan.
Horizon Nuclear Power, which is wholly owned by Hitachi Ltd., plans to build two advanced boiling water reactors on Anglesey Island.

Known as the Wylfa Newydd project, the program is currently at the community consultation phase. This involves soliciting opinions of local residents and authorities.
"People need to understand what things look like, how they look and everything," said Hart.
"This type of engagement is very important," she said.
When it comes to safety, prime responsibility lies with the operator. The U.K. government oversees the industry and the role of the Welsh Assembly is to get local companies involved in the supply chain and to provide a skilled workforce, she said.
Horizon says the community consultation is a pre-application process. It plans to submit an application for a development consent order in 2017, with completion and operation of the reactors anticipated in the mid-2020s.
"It's a very long process. This is the issue. But the point is that it is a process that is proceeding as we would expect," Hart said.
The firm says construction will create up to 8,500 jobs, while operation of the plant will require 900 to 1,000 new jobs.
Hart also visited Japan last year on a trade mission and tried to encourage Japanese companies to invest in Wales.
It apparently paid off, as she said Friday that Calby Inc., Japan's biggest snack maker, had picked Wales as the location of its first investment in Europe.
The new facility will be a site for manufacturing and distribution, as well as research and development.
Wales hosted 50 Japanese firms as of 2012, including Sony and Toyota.
Another target for Wales is Japanese tourists.
For the past few years, Japanese visitors to the U.K. have numbered 220,000 to 245,000 annually.
They "tend to fly into Heathrow (airport), go into London, nip to the Lake District, the Cotswolds and up to Scotland, and go back down to Heathrow. So, we wanted them to make that journey further west into Wales. We do think there is a market and potential there," said Hart, adding that she has met people in the travel industry and asked what appeals to Japanese tourists.
She said Wales offers a wide range of attractions, such as gardens, castles and coastal sites.
As for Scotland's independence referendum in September, Hart said she was watching with interest because "what the Scots do affects all of us in terms of our respected devolution settlements."
She said opinion polls show there is little support for independence in Wales, but people want to see further powers devolved to Wales from the U.K. government.
For instance, the Welsh government does not have power over railways and energy, she said.
Hart said while the Welsh government supported Scotland's continued membership of the U.K., the independence movement has triggered discussion of devolution settlements across the U.K.

"Drastic reform" needed

November 6, 2014

As I See It: Total picture needed for future electric power system

http://mainichi.jp/english/english/perspectives/news/20141106p2a00m0na005000c.html

Five utilities including Kyushu Electric Power Co. have suspended signing new contracts to buy power generated with renewable energy, such as solar power and wind power, under a system in which major electricity suppliers are required to buy such power at a fixed price. This is because these firms were not fully prepared to accept renewable energy, highlighting the inadequacy of the government's institutional program.

The government, which is now reviewing the system, should proactively and patiently work on drastic reform of the electric power generation and supply system.

The system was launched in July 2012 largely out of reflection of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant that broke out in March 2011. The spread of renewable energy is effective in preventing global warming and power generation using such energy sources has a low risk of accidents. Since businesses that use renewable energy to generate electricity do not have their own power grids, the government requires major power companies to purchase power generated by designated businesses using renewable energy for up to 20 years.

The system is modeled after one in Germany that is an advanced country in terms of the use of renewable energy. However, the five utilities stopped signing new contracts to purchase power generated with renewable energy on the grounds that the amount of such power is likely to exceed their capacity. No wonder the system, which Japan introduced by imitating one in Europe despite power companies not being prepared to accept such power, hit a snag.

To ensure a stable power supply, a demand-supply balance that is perfect must be achieved at all times, according to industry sources. If the supply of power surpasses or dips below demand, it would destabilize the frequency and voltage, which could trigger a power blackout.

However, most renewable energy that utilities are supposed to buy is solar power, which is unstable because the generated amount of such power depends largely on weather conditions. Such being the case, the amount of power could surpass demand on a sunny day, which could cause power outages.

Surplus power should be sold to other utilities that have enough capacity to accept electricity. However, it is technically impossible under the current system. The capacity of power cables connecting power grids owned by different utilities is limited. Therefore, solar power and electricity generated with other renewable energy sources cannot be supplied to these cables in principle because the generating amount cannot be predicted. This is because major power companies have enjoyed regional monopolies and seldom supply surplus power to other firms or receive such electricity from other companies, while the government approved such monopolies.

The service area of Tokyo Electric Power Co. fell seriously short of power following the Fukushima No. 1 plant accident, highlighting the need for power interchange between electric power companies. The government has finally begun to reform the system and set up an organization that will play a leading role in controlling the power interchange next spring. However, the establishment of a broad power interchange system will come later.

A senior official of the Economy, Trade and Industry Ministry admitted that many officials knew that the current system under which power companies are required to buy power generated with renewable energy at a fixed price would be deadlocked sooner or later. Numerous solar power generation companies were set up one after another for the sole purpose of making profits, contributing to the confusion.

Three years have already passed since the law regulating the power purchase system came into force. Nevertheless, the government failed to take any action while being aware of problems with the system, nor did it set a numerical target for expanding the use of renewable energy for power generation. It

highlights the irresponsibility of the government while the administration of Prime Minister Shinzo Abe is enthusiastic about restarting nuclear power stations.
The Fukushima Prefectural Government, which regards the spread of renewable energy as the pillar of its disaster recovery efforts, has solicited solar power generation companies to set up power stations in the prefecture. Therefore, an official of the prefectural government expressed concern that the five major utilities' suspension of signing new contracts to purchase renewable energy could adversely affect the prefecture's recovery plans.
Japan lags behind many other countries in the introduction of renewable energy. According to the International Energy Agency, the ratio of renewable energy to the total power generation amount is high among European countries -- 20.9 percent in Germany and 26.4 percent in Spain. The figure comes to 6.2 percent in the United States, but in Japan it is a mere 2.2 percent. The ratio has doubled from the pre-nuclear disaster period, but still remains low. Therefore, Japan needs a system under which utilities are required to buy renewable energy at a fixed price.
Japan should learn from European countries' efforts to expand the use of renewable energy. The power grids of European countries are connected with each other by cables with sufficient capacity, allowing these countries to supply surplus electricity generated with renewable energy to others within the region. European countries are introducing a system to predict the amount of power that can be generated with renewable energy based on meteorological observations and a device to automatically limit the amount of power generated with such energy sources if the supply of electricity is likely to reach a surplus.
The costs of establishing such systems pose a challenge. A study group within the Economy, Trade and Industry Ministry estimates that it will cost 4 to 6 trillion yen to improve power grids owned by utilities to prevent blackouts if the amount of solar power is increased to 53 million kilowatts -- almost equal to power generated by nuclear plants before the outbreak of the Fukushima crisis -- by 2030. The costs of buying renewable energy are added to utility fees consumers pay. As such, if power grids are reinforced, it will further increase the financial burden on consumers. This is one of the reasons why the government has not reviewed the system under which utilities must buy renewable energy at a fixed price.
However, **power companies are expected to spend a combined amount of over 2 trillion yen on safety measures in preparation to reactivate idled nuclear plants. If utilities are prepared to pay such a huge amount of money, they should trim the financial burden of renewable energy on consumers.**
In the German electric power system, top priority is placed on the use of renewable energy while thermal power is used to make up for fluctuations in generation amounts at power stations using renewable energy.
In contrast, Japan puts priority on nuclear and thermal power while pushing renewable energy to the sidelines. In reviewing the system, it is necessary to rectify Japan's excessive reliance on solar energy among various renewable energy sources. However, efforts to spread renewable energy sources must not be dampened. The government and the electric power industry should present a total picture of the future of Japan's electric power generation and supply system in which renewable energy will play a key role.

Sendai restart & uranium prices

November 8, 2014

Uranium mining stocks jump as Japan clears way to reactors restart

http://www.japantimes.co.jp/news/2014/11/08/business/uranium-mining-stocks-jump-as-japan-clears-way-to-reactors-restart/#.VF-le8l5B1s

Bloomberg

VANCOUVER – Uranium prices and producers' shares soared after Japan cleared the way for restart of the first of the nuclear reactors shut after the March 2011 earthquake and tsunami.

Cameco Corp., Canada's largest uranium producer, increased 11 percent, the biggest gain since August 2010. Denison Mines Corp. climbed 20 percent and explorer Fission Uranium Corp. rose 18 percent in Toronto.

Kyushu Electric Power Co. on Friday received final local approval to resume power generation at its Sendai nuclear plant in Kagoshima Prefecture. All reactors in Japan have been shut since the March 2011 meltdowns crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant.

"We have been waiting for this moment for a long time," David Sadowski, a Vancouver-based analyst at Raymond James Financial Inc., wrote Friday in a note to clients. "Restarts in Japan will reduce the threat that Japan's utilities will dump their uranium inventories into the market."

Sendai's two reactors are in position to be the first in Japan to resume operations under more stringent safety rules set by the Nuclear Regulation Authority, the industry watchdog. Officials in Satsumasendai, which hosts the Sendai plant, last month voted in favor of allowing restart. Final reviews of construction and safety rules must still be completed.

The Solactive Global Uranium Total Return Index, which tracks 21 companies in the uranium mining industry, rose the most since December 2008. The index is still down 80 percent from its highest closing price in 2011.

The price of U3O8, a tradable form of uranium, rose 4.3 percent to $39.50 a pound on Friday, the biggest gain since March 2011, data compiled by Bloomberg show. The metal traded as high as $73 in January 2011.

"We are hearing that several utilities are in the market looking for supply," Sadowski said.

An "unprecedented rate" of decommissioning

November 12, 2014
12.11.2014_No356 / News

World Energy Outlook Warns Nuclear Industry On Decommissioning And Disposal

http://www.nucnet.org/all-the-news/2014/11/12/world-energy-outlook-warns-nuclear-industry-on-decommissioning-and-disposal

Policies & Politics

12 Nov (NucNet): The nuclear energy industry needs to be ready to manage "an unprecedented rate" of decommissioning with almost 200 of the 434 reactors that were operating commercially at the end of 2013 to be retired by 2040, a report by the International Energy Agency says.

World Energy Outlook 2014 (WEO), released today in London, says "the vast majority" of these reactor retirements will be in the European Union, the US, Russia and Japan.

The industry will need to manage this unprecedented rate of decommissioning, while also building

substantial new capacity for those reactors that are replaced, WEO says.

The IEA estimates the cost of decommissioning plants that are retired to be more than $100 billion.

But WEO warns that "considerable uncertainties" remain about these costs, reflecting the relatively limited experience to date in dismantling and decontaminating reactors and restoring sites for other uses.

Regulators and utilities need to continue to ensure that adequate funds are set aside to cover these future expenses, WEO says.

It also warns that all countries which have ever had nuclear generation facilities have an obligation to develop solutions for long-term storage.

In one scenario examined in WEO, the cumulative amount of spent nuclear fuel that has been generated (a significant portion of which becomes high-level radioactive waste) more than doubles, reaching 705,000 tonnes in 2040.

Today – 60 years since the first nuclear reactor started operating – no country has yet established permanent facilities for the disposal of high-level radioactive waste from commercial reactors, which continues to build up in temporary storage, WEO says.

It says nuclear power is one of the few options available at scale to reduce carbon dioxide emissions while providing or displacing other forms of baseload generation. Nuclear has avoided the release of an estimated 56 gigatonnes of CO2 since 1971, or almost two years of total global emissions at current rates.

Policies concerning nuclear power will remain an essential feature of national energy strategies, even in countries which are committed to phasing out the technology and that must provide for alternatives, WEO says.

In WEO's central scenario, global nuclear power capacity increases by almost 60 percent from 392 gigawatts in 2013 to more than 620 GW in 2040. However, its share of global electricity generation, which peaked almost two decades ago, rises by just one percentage point to 12 percent.

This growth is concentrated in just four countries – China, India, South Korea and Russia. These are markets where electricity is supplied at regulated prices, utilities have state backing or governments act to facilitate private investment.

Of the growth in nuclear generation to 2040, China accounts for 45 percent while India, South Korea and Russia collectively make up a further 30 percent. Generation increases by 16 percent in the US, rebounds in Japan – although not to levels seen before the Fukushima-Daiichi accident – and falls by 10 percent in the European Union.

WEO says despite the challenges nuclear faces, it has specific characteristics that underpin the commitment of some countries to maintain it as a future option. "Nuclear plants can contribute to the reliability of the power system where they increase the diversity of power generation technologies in the

system. For countries that import energy, it can reduce their dependence on foreign supplies and limit their exposure to fuel price movements in international markets."

Although the upfront costs to build new nuclear plants are high and, often, uncertain, nuclear power can offer economic benefits by adding stability to electricity costs and improving balance of payments, WEO says.

A new plant on Iwaishima Island?

November 12, 2014

COMMENTARY: Kaminoseki nuke plant plan should be scrapped to end community division
http://ajw.asahi.com/article/views/column/AJ201411120007
By YUSUKE OGAWA/ Staff Writer
KAMINOSEKI, Yamaguchi Prefecture--I realized the need for the earliest possible settlement after I covered a 32-year-old protest movement on Iwaishima island here opposing Chugoku Electric Power Co.'s plan to build the Kaminoseki nuclear power plant on the other side of a strait.
"The central government and Chugoku Electric are probably waiting for us to die," one of the interviewees told me.
Iwaishima island is home to "Tsudoi no Ie: Ohisama" (Community home: The sun), where women in their 80s and similar ages gather twice a week. Kiyoko Sakai, a survivor of the atomic bombing of Hiroshima who was actively opposed to the planned nuclear plant, and her colleagues set up the establishment in a refurbished vacant house four months after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster in March 2011.
About 10 women, who formerly were central members of the islanders' protests against the planned nuclear plant, get together at the community home to chat over lunch.
Sakai died of lung cancer at age 87 in February 2013.
Takako Nakamura, the 84-year-old president of a local women's association who has led protest marches, said fewer people are joining protests these days.
"I have only wished to pass on to posterity the seas and mountains that we inherited from our ancestors," Nakamura said. "I would return as a ghost if a nuclear plant were to be built after I died."
One can only ask how many islanders have died without seeing a resolution of the issue.
The plan to build the nuclear plant became public in 1982. The island had 450 residents as of Oct. 1, about one-third the number 32 years ago. Seventy-five percent of the islanders are aged 65 or more.
The entire town of Kaminoseki has also seen its population halved during the last 32 years.
Chugoku Electric began reclaiming land on the planned plant site in 2009, but announced suspension of the work immediately after the 2011 disasters. The utility applied in October 2012 for an extended license to reclaim land, but the government of Yamaguchi Prefecture has yet to decide whether it will approve or reject an extension.
When Yamaguchi Governor Tsugumasa Muraoka said in May that he would not be making a decision for another year, Toshiyasu Shimizu, 59, the leader of a group of islanders, moaned, "It's like as if we are being kept in a protracted limbo."

The town of Kaminoseki wants to host the nuclear plant because doing so would give it access to a lucrative revenue source.
The town government has received some 7 billion yen ($64.74 million) since fiscal 1984 in central government subsidies related to nuclear power, which it has spent on building facilities and providing services to its residents. It has annual town tax revenues of only about 200 million yen.
Kaminoseki Mayor Shigemi Kashiwabara has openly said there would be no need to have the nuclear plant built if only the livelihoods of the townspeople could be maintained.
The Cabinet of Prime Minister Shinzo Abe in April approved a basic energy plan, which defined atomic power as an “important base-load power source.” The document, however, stopped short of spelling out plans to build new nuclear reactors, which leaves the future of the planned Kaminoseki plant in limbo.
But existing nuclear plants in Japan are not even getting restarted. Some nuclear proponents in Kaminoseki have said they may not be able to see the nuclear plant built in their lifetimes.
Since the work on the nuclear plant was suspended, in the meantime, the town has been seeking ways to revitalize itself without relying on nuclear power, such as by tourism and the development of a so-called “senary" industry, which combines the output of farm and marine products (primary industry) with processing (secondary industry) and marketing (tertiary industry).
The Abe administration is calling for revitalization of regional communities. Given that, I would propose scrapping the plan to build the nuclear plant while providing a source of revenue for stemming depopulation and fostering new industries.
It would be too cruel to keep the plan alive and the local community divided.

Oma plant ready in 2021?

November 13, 2014

J-Power plans to start operating Oma nuclear power plant in fiscal 2021

http://mainichi.jp/english/english/newsselect/news/20141113p2a00m0na004000c.html
AOMORI -- Electric Power Development Co., known as J-Power, notified local municipalities on Nov. 13 of its plan to start operating the Oma Nuclear Power Plant currently under construction in the Aomori Prefecture town of Oma in fiscal 2021.
It is the first time the electricity wholesaler has shown the plan to local governments in Oma and its vicinity. J-Power also reported to municipal governments that it would work out safety measures to raise the so-called "design basis earthquake ground motion" -- the maximum ground motion assumed and required for earthquake-resistant design -- from the current 450 gal to 650 gal, as well as to raise the assumed maximum height of tsunami from 4.4 meters to 6.3 meters.
J-Power President Masayoshi Kitamura attended a special committee meeting of the Oma Municipal Assembly on the morning of Nov. 13. He explained that his company had revised its plan for the completion of the Oma nuclear plant from "undecided" to December 2020. He then said his company would apply with the Nuclear Regulation Authority for safety screening of the nuclear power plant as early as the end of this year. Kitamura subsequently reported the plan to the neighboring villages of Sai and Kazamaura. He is to visit the Aomori Prefectural Government on the afternoon of Nov. 13. At the same time, a senior official of J-Power would also explain the plan to the Hokkaido Government and the Hakodate Municipal Government.

Decommissioning IS expensive

November 12, 2014

IEA: $100 bil. in costs to retire 200 reactors

http://www3.nhk.or.jp/nhkworld/english/news/20141113_29.html
Nov. 13, 2014 - Updated 08:39 UTC+1
The International Energy Agency says about **200 nuclear reactors around the world will be retired by 2040**, and that 100 billion dollars will be needed to decommission them.

The IEA issued its world energy outlook on Wednesday.

The report says about 200 of the 434 reactors that were operating, or could be operational, at the end of 2013 are expected to be retired by 2040. It says **most of them are in Europe, the United States, Russia and Japan.**

The IEA estimates the cost to decommission the reactors at about 100 billion dollars. It points out the need for power companies and regulators to secure adequate funds.

The report also says nuclear power helps countries lower their dependence on foreign energy sources and reduce the impact of fuel price movements.

The IEA estimates the world can cut about 4 years' worth of carbon dioxide emissions with increases in nuclear power production in China, India, Russia, the US and other countries.

The IEA also estimates the amount of spent fuel to double over the period. It says **countries are obliged to work out solutions for long-term storage.**

OMa plant construction

November 13, 2014

Municipalities briefed on Oma plant construction

http://www3.nhk.or.jp/nhkworld/english/news/20141113_40.html
Nov. 13, 2014 - Updated 13:27 UTC+1
A Japanese power company has notified the northern city of Hakodate of its plan to apply for a government safety screening as a step toward operating a nuclear plant in neighboring Aomori Prefecture.

Senior officials of Electric Power Development Company, or J-Power, visited the Hakodate municipal office on Thursday.

The city is challenging construction of the Oma plant in court. It says should an accident occur at the plant, damage to the city would be severe.

Hakodate lies less than 30 kilometers from the plant across the Tsugaru Strait.

The utility officials said they will apply as early as the end of the year to the Nuclear Regulation Authority for a safety screening of the Oma plant, hoping to start operation in fiscal 2021.

They asked the city for understanding, saying that they will step up safety measures at the plant.

Hakodate Mayor Toshiki Kudo expressed his displeasure at a news conference later on Thursday and pledged to continue fighting in court.

The mayor said J-Power is acting based on the assumption it will proceed with the plant's construction. He added that the utility merely presented a safety plan in its favor.

Earlier on Thursday, J-Power President Masayoshi Kimura visited Oma Town, where the plant is being constructed.
Kimura told members of the town assembly the utility will seek to complete construction by the end of fiscal 2020.

He said the utility raised its estimate of the maximum level of shaking of possible earthquakes from 450 gals to 650. He also said his company will start building a quake-resistant facility that would be the operating base in the event of accidents.

The assembly members asked him not to delay the construction plan any longer.

J-Power stopped construction work at the plant after the 2011 Fukushima Daiichi nuclear disaster. It resumed work in late 2012.

The Oma plant is the world's first commercial station to run exclusively on a mixture of uranium and plutonium recycled from spent nuclear fuel, or MOX.
November 13, 2014

J-Power plans to start operating Oma nuclear power plant in fiscal 2021

http://mainichi.jp/english/english/newsselect/news/20141113p2a00m0na004000c.html
AOMORI -- Electric Power Development Co., known as J-Power, notified local municipalities on Nov. 13 of its plan to start operating the Oma Nuclear Power Plant currently under construction in the Aomori Prefecture town of Oma in fiscal 2021.
It is the first time the electricity wholesaler has shown the plan to local governments in Oma and its vicinity. J-Power also reported to municipal governments that it would work out safety measures to raise the so-called "design basis earthquake ground motion" -- the maximum ground motion assumed and required for earthquake-resistant design -- from the current 450 gal to 650 gal, as well as to raise the assumed maximum height of tsunami from 4.4 meters to 6.3 meters.

At the same time, a senior official of J-Power would also explain the plan to the Hokkaido Government and the Hakodate Municipal Government.

Japan to sign international treaty

November 19, 2014

Diet approves nuclear compensation treaty

http://www3.nhk.or.jp/nhkworld/english/news/20141119_23.html
Nov. 19, 2014 - Updated 06:56 UTC+1
Japan's Diet has approved a bill to join an international treaty on sharing the costs of compensation in a nuclear disaster.

The bill on the Convention on Supplementary Compensation for Nuclear Damage cleared the Upper House on Wednesday.

The treaty obliges the signatories to set aside the equivalent of 47 billion yen, about 400 million dollars, to compensate victims in a nuclear accident.

If the cost of compensation in Japan exceeds its reserve, other signatories would provide around 60 million dollars more. Conversely, Japan would have to contribute about 34 million dollars to help compensate for a nuclear accident in another country.
The treaty will be ratified after passage of another bill requiring nuclear plant operators to contribute to the reserve.

The government expects the treaty to encourage foreign companies to join the cleanup and decommissioning of reactors at the Fukushima Daiichi nuclear power plant.

Five countries have signed the convention so far, including the United States and Argentina.

Build new plants or/and extend life of older reactors?

November 14, 2014

Nuclear operators push to open new plant, extend life of aging reactors

http://ajw.asahi.com/article/0311disaster/fukushima/AJ201411140068
THE ASAHI SHIMBUN

Across Japan, utilities are backing the Abe administration's support of nuclear power generation by continuing construction of a new facility and seeking to extend the life of reactors that have been operating for about 40 years.

Electric Power Development Co. (J-Power) announced Nov. 13 that it will apply to the Nuclear Regulation Authority for safety screenings to start operations at its Oma nuclear power plant, which is currently under construction.

The announcement came at a town assembly meeting at Oma, Aomori Prefecture, where J-Power President Masayoshi Kitamura said the company will submit the application by the end of the year and plans to have the new facility fully operational in fiscal 2021.

If everything proceeds as scheduled, the Oma plant will be the first instance in which power companies applied for the start of operations at new reactors that are still under construction.

While the No. 1 reactor at Tokyo Electric Power Co.'s Higashidori plant in Aomori Prefecture and Chugoku Electric Power Co.'s Shimane plant No. 3 reactor in Matsue are also currently under construction, the utilities have not submitted applications to start the reactors.

Although the central government's basic energy plan states that dependency on nuclear power should be reduced as much as possible, it does not clearly mention the construction of new nuclear facilities.

The government does not deem nuclear plants as "new or additional" if their construction started before the March 2011 Great East Japan Earthquake, which set off the nuclear disaster at the Fukushima No. 1 power plant.

Forty percent of the construction of the Oma plant had been completed prior to the disaster.

However, there is no guarantee that the screening process will proceed smoothly because the structure and operation procedures of the Oma facility are different from those of conventional nuclear plants.

The Oma plant will be the world's first 100 percent MOX nuclear facility, where only mixed-oxide (MOX) fuel, consisting of plutonium and uranium, is used at reactor cores for the purpose of consuming plutonium produced in processing spent nuclear fuel.

At conventional plutonium-thermal nuclear plants, MOX fuel is used at just one-fourth to one-third of their reactor cores at most, and conventional uranium fuel is used for the remaining part.

Compared with uranium fuel, it is more difficult for control rods to suppress nuclear chain reactions of MOX fuel.

Although countermeasures, such as enhancing the capabilities of control rods and introducing larger tanks for boric acid water to better control atomic reactions, will be taken at the full MOX facility, those efforts are expected to be carefully examined during the safety screening by the NRA to check if they are sufficient.

"**No full MOX facility has so far gone online around the world,"** NRA Chairman Shunichi Tanaka said at a Nov. 12 news conference. "We will examine extremely carefully (if countermeasures are sufficient)."
Meanwhile, J-Power said Nov. 13 that it will also take the necessary steps to meet the stricter safety standards introduced after the Fukushima nuclear crisis.
The company said it will raise its projected earthquake preparedness scale from the current 450 gals to 650 gals. Measured with seismographs, a gal is a unit of acceleration that measures the extent of an earthquake's seismic waves. Earthquakes with high levels of magnitude also have high gal measurements.
J-Power will also have to set up the required second control room to counter possible terrorist attacks, such as ones utilizing airplanes.
J-Power estimates that the costs needed to introduce additional safety measures to comply with the new regulations will total 130 billion yen ($1.12 billion).

PROLONGING LIFE OF AGED REACTORS

Elsewhere, with the Abe administration supporting the restarts of the nation's idle reactors after they pass NRA safety screenings, Kansai Electric Power Co. is making efforts to prolong the operating lives of aged reactors.
The government set the acceptable operational term of nuclear reactors at 40 years, in principle, after the Fukushima disaster, but it allows utilities to extend the period on a one-time basis by a maximum of 20 years.
Kansai Electric is currently considering applying for prolonging the operation of the No. 1 and 2 reactors of its Takahama plant in Fukui Prefecture. The two reactors began service in 1974 and 1975, respectively .
Seven reactors nationwide that will be more than 40 years old by July 2016 need to submit applications by July 2015 if the plant operators hope to extend their operational periods.
Kansai Electric is expected to apply to the government for the extension as early as next spring.
"From the beginning, we have been upgrading our facilities on the assumption that we will use the reactors for more than 60 years," said a senior Kansai Electric official. "We hope to continue to use them if we will be able to solve safety and cost issues."
Old nuclear power plants can recoup almost all of the costs needed to build them during their prolonged time of operations. Therefore, the longer they are operational, the more profits they are able to produce.
Because the Takahama plant No. 1 and 2 reactors have an output as large as 826 megawatts, if their lives are extended, it is estimated that Kansai Electric will save around 10 billion yen monthly by allowing it to lower its dependency on thermal power.
Although Kansai Electric is expected to spend more than 100 billion yen to introduce additional safety measures to pass the NRA screening, there remain **safety concerns** about prolonging the operational periods of aged reactors.
Hu**ge costs for upgrading could also add a financial burden on reactor operators.**
Kansai Electric is considering decommissioning the No. 1 and 2 reactors of its Mihama plant in Fukui Prefecture, which have turned 40 years old. Considering that the reactors have a power generation capability of 500 megawatts or less, it is difficult for them to help drastically improve the company's financial situation.
(This article was compiled from reports by Gen Kaga, Toshio Kawada, Koji Nishimura and Tomoyoshi Otsu.)

Uilities "stalled in an age of incandescent bulbs"

November 17, 2014

COMMENTARY: In age of LEDs, utilities thinking in incandescent-bulb mode

http://ajw.asahi.com/article/views/column/AJ201411170001

By TOSHIHIDE UEDA/ Senior Staff Writer

MIYAKO, Iwate Prefecture--One recent weekend took me to this northeastern city on the Sanriku coast.

In the Seatopia Naado roadside rest area that faces a port in Miyako, I saw light-emitting diodes illuminating a ground floor shop that sells local products.

The two-story facility, severely damaged by the towering tsunami generated by the Great East Japan Earthquake, reopened in July 2013 following total reconstruction. “Naado” means “What about ...” in the local dialect, I was told.

The quake and tsunami of March 2011 took a toll on many power plants and transmission facilities, causing blackouts in nearly all areas affected by the disasters. People were forced to respond to the unprecedented calamity, which was complicated further by the Fukushima nuclear disaster, in total darkness.

Having learned a lesson from that experience, the Iwate prefectural government is pushing to install facilities using renewable energy sources at regional disaster management bases, such as government offices, schools, hospitals and evacuation shelters, so that those establishments can cover their electricity needs on their own.

In the aftermath of the 2011 disasters, the city of Miyako weighed the option of introducing solar power whenever it builds public facilities.

One pillar of the “master plan on renewable energy sources,” which the city government worked out last year, is “enhancing the energy self-sufficiency rate and realizing local production (of energy) for local consumption.”

The Naado rest area also had solar panels installed on its rooftop and LED lighting introduced during the overall repairs.

As I drove north from the port and entered the Taro district of Miyako, I was greeted by a string of streetlamp-like objects with compact solar panels along National Route No. 45.

The “escape route guide lamps,” as the objects are called, are designed to store solar power in their rechargeable batteries and emit light to indicate escape routes even at night. They were installed by the land ministry before the quake and tsunami and were not damaged in the disasters, officials said.

The city plans to increase the number of similar guide lamps and guide signs as part of its post-disaster rebuilding efforts.

“We plan to install light-emitting signs that lead people to move to higher ground, without their knowing it, as they follow the string of lights,” said an official in the city government’s crisis management division.

“We will not install products that use commercial power sources (provided by utilities). A quest for compact products with modest power consumption would naturally single out LED lighting as the solution.”

A combination of solar panels, rechargeable batteries and LED lighting is helping a disaster-hit community that seeks “local energy production for local energy consumption.”

'GREAT PROMISE' OF LEDS

The announcement of Nobel Prize winners never leaves me unexcited.

That was particularly true this year, when the physics prize was awarded jointly to Isamu Akasaki, a professor with Meijo University, Hiroshi Amano, a professor with Nagoya University, and Shuji Nakamura, a Japanese-born professor with the University of California at Santa Barbara, for developing blue LEDs and bringing them to practical application.

"Using blue LEDs, white light can be created in a new way" (white LEDs), the Royal Swedish Academy of Sciences said in explaining the selection. "The LED lamp holds great promise for increasing the quality of life for over 1.5 billion people around the world who lack access to electricity grids; due to low power requirements, it can be powered by cheap local solar power."

In fact, the blue LEDs constitute a groundbreaking invention that answers the call of the times to preserve the Earth's environment. They already provide more than six times the light intensity per watt of power consumed by incandescent bulbs. They made it possible to provide access to minimum light required for daily lives even in the absence of large power generating facilities.

Power supply is currently available everywhere in Japan.

I wrote in an Asahi Shimbun column in September 2013 about Taimagura village in Miyako, which was the last to gain access to electricity on Dec. 27, 1988, at the height of Japan's asset-inflated economic growth. One theory says Taimagura means a "path leading into deep woods" in the Ainu language.

A practicable incandescent light bulb was invented in 1879 by U.S. master inventor Thomas Edison. The process of modernization since that time has also been a history of electrification.

Building power plants and power transmission facilities represented a major goal of Japan's modernization. And the longtime dream of making power supply available to everybody in the country was achieved 26 years ago in a mountain village in Miyako.

But the power plants and power transmission facilities, which we have taken more than a century to build, are so vulnerable to the workings of nature. The LED lighting, which ended an age of incandescent bulbs, also provides a "great promise for increasing the quality of life" for people in this country.

UTILITIES LAG IN INNOVATION

Japan had 54 nuclear reactors before the quake, tsunami and Fukushima nuclear disaster. All of them are idled now, but there are still no power blackouts.

Figures on the supply and demand of power for this past summer were presented Oct. 1 to a subcommittee of the Advisory Committee for Natural Resources and Energy, a central government panel on energy policy. The peak demand figures relative to pre-disaster levels in 2010 were down 17.0 percent for Tokyo Electric Power Co., down 13.8 percent for Kansai Electric Power Co., down 9.5 percent for Chubu Electric Power Co. and down 8.4 percent for Tohoku Electric Power Co.

Both corporate and household users are saving on their power use.

Power-saving awareness is taking root among the people, and LED lighting is pushing that trend. Disaster-hit communities are eagerly working to realize distributed energy sources. In addition, the population is waning.

But power utilities are stalled in an age of incandescent bulbs.

Five regional utilities--Kyushu Electric Power Co., Tohoku Electric, Hokkaido Electric Power Co., Shikoku Electric Power Co. and Okinawa Electric Power Co.--have said successively, from the end of September, that they are no longer accepting new contracts to purchase power generated from renewable energy sources under Japan's feed-in tariff system.

Nobuaki Abe, an executive vice president with Tohoku Electric, cited concerns that the supply potential could far exceed demand. The utilities, however, continue to seek restarts of their nuclear reactors, with the exception of Okinawa Electric, which has no nuclear reactor.

They continue to bank on gigantic contraptions, which the nuclear reactors are, in this age of waning power demand. One could only guess if they missed an opportunity for technical innovation to keep abreast of the times, or if they are simply not interested in keeping abreast.
That represents a problem, in any case.

Nukes: What future?

November 25, 2014

Nuclear power's dark future

http://www.japantimes.co.jp/opinion/2014/11/25/commentary/world-commentary/nuclear-powers-dark-future/#.VHS3uMl5B1s
by Brahma Chellaney
Nuclear power constitutes **the world's most subsidy-fattened energy industry**, yet it faces an increasingly uncertain future. The global nuclear power industry has enjoyed growing state subsidies over the years, even as it generates the most dangerous wastes whose safe disposal saddles future generations..
Despite the fat subsidies, new developments are highlighting the nuclear power industry's growing travails. For example, France — the "poster child" of atomic power — is rethinking its love affair with nuclear energy. Its parliament voted last month to cut the country's nuclear-generating capacity by a third by 2025 and focus instead on renewable sources by emulating neighboring countries like Germany and Spain.
As nuclear power becomes increasingly uneconomical at home because of skyrocketing costs, the U.S. and France are aggressively pushing exports, not just to India and China, but also to "**nuclear newcomers**," such as the cash-laden oil sheikhdoms in the Persian Gulf. Such exports raise new challenges related to freshwater resources, nuclear safety and nuclear-weapons proliferation.

Still, the bulk of the reactors under construction or planned worldwide are in just four countries — China, Russia, South Korea and India.

Six decades after Lewis Strauss, the chairman of the U.S. Atomic Energy Commission, claimed that nuclear energy would become "too cheap to meter," nuclear power confronts an increasingly uncertain future, largely because of unfavorable economics. The just-released International Energy Agency's World Energy Outlook 2014 report states: "Uncertainties continue to cloud the future for nuclear — government policy, public confidence, financing in liberalized markets, competitiveness versus other sources of generation, and the looming retirement of a large fleet of older plants."

The stock of the state-owned French nuclear technology giant Areva recently tumbled after it cited major delays in its reactor projects and a "lackluster" global atomic-energy market to warn of an uncertain outlook for its business.

For example, the Areva-designed plant in Finland, on Olkiluoto Island, is running at least nine years behind schedule, with its cost expected to rise from €3.2 billion to almost €8.5 billion. Even in Areva's home market, the Flamanville 3 reactor project in northern France is facing serious delays and cost overruns.

In Japan, the last of its 48 commercial reactors went offline in September 2013. Repeated polls have shown that the Japanese public remains opposed to nuclear restarts by a 2 to 1 margin, despite toughened safety regulations after the March 2011 disaster at the Fukushima No. 1 nuclear power plant. Yet the southern city of Satsuma Sendai in Kagoshima Prefecture recently gave its consent to restarting, as soon as early next year, two reactors operated by Kyushu Electric Power Company.

Nuclear power has the energy sector's highest capital and water intensity and longest plant-construction time frame, making it hardly attractive for private investors. The plant-construction time frame, with licensing approval, still averages about a decade, as underscored by the new reactors commissioned in the past decade. In fact, **the World Nuclear Industry Status Report 2014 acknowledges that 49 of the 66 reactors currently under construction are plagued with delays and cost overruns**. Commercial reactors have been in operation for more than half a century, yet the industry still cannot stand on its own feet without major state support. Instead of the cost of nuclear power declining with the technology's maturation — as is the case with other sources of energy — the costs have escalated multiple times. **Just in the past decade, average costs jumped from $1,000 per installed kilowatt to almost $8,000/kW.**

In this light, nuclear power has inexorably been on a downward trajectory. The nuclear share of the world's total electricity production reached its peak of 17 percent in the late 1980s. Since then, it has been falling, and is currently estimated at about 13 percent, even as new uranium discoveries have swelled global reserves. With proven reserves having grown by 12.5 percent since just 2008, there is enough uranium to meet current demand for more than 100 years. Yet the worldwide aggregate installed capacity of just three renewables — wind power, solar power and biomass — has surpassed installed nuclear-generating capacity. In India and China, wind power output alone exceeds nuclear-generated electricity.

Before the Fukushima disaster, the global nuclear power industry — a powerful cartel of less than a dozen major state-owned or state-guided firms — had been trumpeting a global "nuclear renaissance." This spiel was largely anchored in hope.

However, the triple meltdown at Fukushima not only reopened old safety concerns but also has set in motion the renaissance of nuclear power in reverse. The dual imperative for costly upgrades post-Fukushima and for making the industry competitive, including by cutting back on the munificent government subsidies it enjoys, underscores nuclear power's dimming future. New nuclear plants in most countries are located in coastal regions so that these water-guzzling facilities can largely draw on seawater for their operations and not bring freshwater resources under strain.

But **coastal areas are often not only heavily populated but also constitute prime real estate. Moreover, the projected greater frequency of natural disasters like storms, hurricanes, and tsunamis due to climate change, along with the rise of ocean levels, makes seaside reactors particularly vulnerable.**

The risks that seaside reactors face from global-warming-induced natural disasters became evident more than six years before Fukushima, when the 2004 Indian Ocean tsunami inundated the Madras Atomic Power Station. But the reactor core could be kept in a safe shutdown mode because the electrical systems had been installed on higher ground than the plant level.

In 1992, Hurricane Andrew caused significant damage at the Turkey Point nuclear power plant in Florida, but fortunately not to any critical system. And in a 2012 incident, an alert was declared at the New Jersey Oyster Creek nuclear power plant — the oldest operating commercial reactor in the U.S. — after water rose in its water intake structure during Hurricane Sandy, potentially affecting the pumps that circulate cooling water through the plant.

All of Britain's nuclear power plants are located along the coast, and a government assessment has identified as many as 12 of the country's 19 civil nuclear sites as being at risk due to rising sea levels. Several nuclear plants in Britain, as in a number of other countries, are just a few meters above sea level

Yet even as Germany steps out of the nuclear power business, Britain is pressing ahead with a costly new nuclear power station at Hinkley Point, underscoring the divisions among European countries over nuclear power. Britain indeed intends to build several more plants to replace its aging nuclear stations. The Hinkley Point project, however, is running years behind schedule, with the costs mounting.

Globally, nuclear power is set to face increasing challenges due to its inability to compete with other energy sources in pricing. Another factor **is how to manage the rising volumes of spent nuclear fuel in the absence of permanent disposal facilities.** More fundamentally, without a breakthrough in fusion energy or greater commercial advances in the area that the U.S. has strived to block — breeder (and thorium) reactors — nuclear power is in no position to lead the world out of the fossil-fuel age.

Vision for no-nuke society missing

November 25, 2014

Editorial: Clarify vision for a society free of nuclear power

http://mainichi.jp/english/english/perspectives/news/20141125p2a00m0na008000c.html

A vision for how to create a society that does not rely on nuclear power remains unclear although three years and eight months have passed since the outbreak of the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant. Rather than phasing out atomic power, the 2-year-old government of Prime Minister Shinzo Abe has been once again trying to rely on nuclear power stations.

The Basic Energy Plan that the Abe Cabinet approved in April this year recognizes atomic power as an important base-load power source, while declaring that Japan will reduce its dependence on such power as much as possible. Moreover, the government has postponed a decision on an ideal ratio between power sources.

If the government is truly enthusiastic about pursuing a society that does not rely on atomic power, it is the role of politicians to clearly show a road map toward eliminating nuclear plants, set specific targets

including the ratio between power sources and implement specific measures to achieve this goal. The government should also judge whether individual nuclear plants should be restarted within the framework of the policy toward phasing out nuclear power.

The Abe administration's failure to do so suggests that the government intends to put as many nuclear power plants as possible into operation by carrying out a fait accompli.

In fact, the government is attempting to allow Kyushu Electric Power Co. to reactivate its Sendai nuclear plant in Kagoshima Prefecture based solely on the fact that its reactors meet the new regulatory standards set by the Nuclear Regulation Authority. The effectiveness of a plan to evacuate local residents in case of a serious disaster at the plant and efforts to convince residents of municipalities around the plant remain unaddressed. An opinion poll the Mainichi Shimbun conducted this past September shows that 60 percent of the public is opposed to restarting the power station. However, **the government is showing no consideration of public opinion.** Such an attitude could lead to a new safety myth, such as a massive amount of radiation would never be released in case of a meltdown since regulatory standards have been stiffened.

The government's lack of enthusiasm about decreasing Japan's dependence on nuclear power has led to power companies' refusal to sign new contracts to purchase power generated with renewable energy. The promotion of renewable energy sources would help not only lessen the country's dependence on atomic power but also create new industrial sectors and vitalize local economies. If Japan were to lose such chances because the government has failed to thoroughly implement measures to promote the introduction of renewable energy, it could be criticized as a serious policy misstep.

Little progress has been made on a review of a social system based on a policy of promoting atomic power, such as grants to local governments hosting nuclear plants. The government is considering a system to facilitate the decommissioning of aging nuclear reactors. However, measures to phase out atomic power as a whole are far from sufficient.

A more serious problem is that the government has hardly changed the way it decides Japan's nuclear power policy since the pre-Fukushima nuclear crisis era and failed to show an attitude to form public consensus on atomic power policy.

The previous government led by the Democratic Party of Japan (DPJ) attempted to form public consensus by conducting a deliberative poll and taking other steps, and eventually set a goal of eliminating atomic power by the 2030s. In contrast, the Abe government employed an outdated method of relying solely on an advisory panel to the Economy, Trade and Industry Ministry, which is aspiring to promote atomic power, in working out a specific nuclear power policy and considering the ideal ratio between power sources. If the government is to continue such a practice, Japan can not eliminate its reliance on atomic power.

The disposal of spent nuclear fuel also poses a challenge. The Abe government has taken over the nuclear fuel cycle project, in which all spent nuclear fuel would be reprocessed and plutonium extracted from such radioactive waste would be burned at nuclear reactors. A disposal facility and fast-breeder reactors would be used for the project. However, questions remain about the technological feasibility and safety of the project as well as its costs.

Serious doubts have been raised over the project from the aspect of nuclear proliferation. Japan possesses 47 metric tons of plutonium, which can be used to produce nuclear weapons, both domestically and overseas. However, there are no prospects that the material can be consumed. If Japan were to begin reprocessing spent nuclear fuel under such circumstances, it could raise serious concerns in the international community.

Regardless of whether Japan will phase out atomic power, the issue of the final disposal of radioactive waste will pose a challenge. In a major policy change, the government decided late last year to play a leading role in selecting a candidate site for a final disposal facility. In line with the decision, a special panel under the Economy, Trade and Industry Ministry is considering standards for selecting a site. However, superficially changing the way the site is selected alone would not be a solution. What is important is to establish a method acceptable to all concerned parties. However, no efforts to that end have been made. The government has also failed to consider setting the upper limit on the total amount of radioactive waste in line with the policy of phasing out atomic power.

The policy of promoting exports of nuclear plants highlights the Abe government's enthusiasm about restarting idled nuclear reactors. This policy shows that the administration places top priority on economic policy. Moreover, promoting exports of nuclear plants is a policy in line with the intensions of the United States that wants to rely on Japan's technology of building nuclear plants and placing worldwide nuclear technology under its control. However, **by exporting nuclear power stations, Japan will also export risks of nuclear accidents and proliferation of nuclear weapons.** The government is apparently paying little attention to these negative aspects of exporting nuclear plants.

If Japan is to promote a policy of phasing out atomic power, power companies would be forced to increase the operations of their thermal power stations, whose fuel costs are high, and adversely affect economic conditions, just as the Abe government worries. It is no easy task to consider ways to secure a stable supply of electricity and who would shoulder such a burden, while cutting back on energy consumption.

Regardless, as long as a majority of the people of Japan, which experienced a serious nuclear disaster, are calling for a society without atomic power, it is the mission of politicians to make efforts to phase out nuclear power.

Energy policy: Wait till summer

November 26, 2014

Industry minister sets summer deadline for energy policy

http://ajw.asahi.com/article/behind_news/politics/AJ201411260046

THE ASAHI SHIMBUN

With pressure growing from both anti-nuclear activists and proponents of nuclear power, the industry minister said Nov. 25 that Japan’s energy policy will be determined by next summer.

“We want to decide as soon as possible after studying the state of resumption of nuclear power plants, the spread of renewable energies and the results of international negotiations on global climate change,” Yoichi Miyazawa, minister of economy, trade and industry, said after a Cabinet meeting.

Prime Minister Shinzo Abe has been reluctant to make a decision on the ratios of nuclear power and other energy sources amid divided public opinion on nuclear power generation following the Fukushima nuclear disaster.

Both opponents and proponents have called for a numerical commitment from the government.

But with a Lower House election slated for Dec. 14, the Abe administration apparently wants to gain public understanding by showing it is actively working on energy policy.

Miyazawa is the first industry minister to clearly set a deadline for the nation’s energy mix, or the range of energy sources to be used in Japan after the Fukushima disaster.

He added that the decision on the new energy policy could come sooner than the summer deadline.
“I do not mean that we will make the decision next summer, but that we will decide as soon as possible,” he said.
All of Japan’s 48 nuclear reactors are currently offline.
Japan’s new energy policy could also help determine its commitment to cutting emissions of greenhouse gases as part of international efforts to reduce the impact of climate change.
The European Union pledged in October to reduce carbon emissions by 40 percent by 2030, and the United States and China recently agreed to lower their emissions of greenhouse gases.

Tanigaki: Nuke restart "necessary"

December 2, 2014

LDP bigwig Tanigaki stresses benefits of 'Abenomics,' says nuke power 'necessary'

http://mainichi.jp/english/english/newsselect/news/20141202p2a00m0na030000c.html
The 12-day campaign period for the Dec. 14 House of Representatives election has officially kicked off. The Mainichi Shimbun recently talked to leaders of Japan's political parties on their basic policies and will carry a series of special articles based on their interviews during the campaign period. Below is an outline of comments from ruling Liberal Democratic Party (LDP) Secretary-General Sadakazu Tanigaki.
--
Our party has been pushing Prime Minister Shinzo Abe's key economic policies, dubbed "Abenomics," to stop decade-long deflation and create a positive growth cycle. Since the LDP returned to power, jobs have been created for some 1 million people. The ratio of job offers to job seeks has improved in all 47 prefectures of the country, and the average wage growth topped 2 percent at annual labor-management negotiations this past spring. Many companies have enjoyed record-high profits. We are promoting Abenomics as the only way towards economic recovery.
Some say this election does not have a cause, but Prime Minister Abe decided to postpone the sales tax increase from the current 8 percent to 10 percent, which would have a significant impact on Japan's economy and fiscal policies. Therefore, it's right for a prime minister to seek consent from the public as policies will not be carried out as planned. I take this matter very personally as I was the LDP president at the time of the three-party agreement among the LDP, Komeito and Democratic Party of Japan on the tax hike.
Stable supply of energy is also an important issue. We have to mull over what would be the "best mix" (of power sources). We have not changed our goal to reduce Japan's dependence on nuclear power while seeking the possibility of renewable energy, but such a goal cannot be achieved right away. **It is necessary to restart nuclear power plants that have passed safety checkups while we work to win support from local residents.**
On national security, our predecessors had paid special attention not to be a threat to neighboring nations since the end of the war. Some countries, however, want Japan to do what is possible to protect regional peace and security. We look to establish a seamless security system while reinterpreting the Constitution to exercise the right to collective self-defense.
Voters tell us they want a stable government. Winning a combined majority (with Komeito) is a must; the challenge is how to win additional seats. Our goal is to have all LDP official candidates and party-backed candidates to win seats. (Interview by Tetsuya Kageyama, Political News Department)

December 02, 2014(Mainichi Japan)

And this is not reassuring

December 5, 2014

Japan eyes returning to nuclear power, enthusiasm about renewable energy stymied

http://mainichi.jp/english/english/newsselect/news/20141205p2a00m0na011000c.html

Three years and nine months after the outbreak of the Fukushima nuclear disaster, Japan is considering turning to nuclear power once again in a policy shift from abandoning nuclear generation and promoting renewable energy.

On Aomori Prefecture's Shimokita Peninsula dotted with nuclear facilities, Electric Power Development Co. (J-Power), the nation's largest electric power wholesaler, is proceeding with building the Oma Nuclear Power Plant with an output capacity of 1.38 million kilowatts with a view to beginning operations in fiscal 2021. Mitsuo Omi, 83, chairman of a local construction company, says that when the power plant will go on line has been the talk of the town.

Construction began in May 2008 but was suspended in the aftermath of the disaster at the Fukushima No. 1 Nuclear Power Plant triggered by the March 11, 2011 Great East Japan Earthquake and tsunami. Some 1,700 workers were reduced to about 350. J-Power announced Nov. 13 that it is applying to the Nuclear Regulation Authority (NRA) as early as the end of this year for safety screening of the Oma plant under construction. Omi pins hopes on a resumption of the Oma plant construction, saying he and other construction companies will receive orders and guest houses and supermarkets will benefit.

The Oma plant would be the world's first reactor to operate solely on plutonium-uranium mixed oxide fuel. The city of Hakodate in Hokkaido, just north of Oma, filed suit against the central government and J-Power seeking a halt to the power plant project. Despite the plea from Hakodate across the Tsugaru Straits, many townspeople in Oma are turning a deaf ear. In February this year, J-Power suspended construction of a wind power station with an output capacity of about 18,000 kilowatts in the villages of Kazamaura and Sai, citing a shortage of power line capacity. Kazamaura village chief Koichi Iida and other townspeople got angry, saying the municipality should reconsider its cooperation with J-Power.

Aomori Prefecture boasts the country's largest wind power capacity of 333,000 kilowatts. The Shimokita Peninsula is an ideal location for wind power generation thanks to constant strong winds throughout the year but the power lines to power-consuming places are full to capacity. Tohoku Electric Power Co. says it cannot boost its power line capacity to only certain locations.

A 500,000-kilowatt mega solar project by a German company, Japan's largest, in the town of Yokohama was in jeopardy in September when Tohoku Electric announced a suspension of accepting solar power, saying supply tops the district's demand of 9.7 million kilowatts. A Yokohama town official says it is strange for Tohoku Electric to refuse solar power while lamenting idled nuclear reactors.

Similar tales of putting brakes on renewable energy due to a probable renewed reliance on nuclear power are omnipresent in other parts of the country. The main cause of the familiar scenes is the absence of a future energy mix policy.

The government planned to lay out an energy mix policy under a basic energy program adopted by the Cabinet in April, but the Ministry of Economy, Trade and Industry and other parties balked, saying if high-cost renewable energy expands, it would squeeze households and corporate profit. The basic energy program said Japan will utilize nuclear power as an important base-load source of power generation and

restart idled nuclear reactors. It also said Japan would reduce its dependence on nuclear power as much as possible by turning more to renewable energy but stopped short of setting any specific numerical target.

Japan is expected to decide on a future energy mix policy around June next year when the Group of Eight (G-8) major countries will discuss global warming during the annual summit. During the current general election campaign, there has been no specific debate on nuclear power and renewable energy, prompting the anti-nuclear opposition camp to accuse the ruling coalition of the Liberal Democratic Party (LDP) and Komeito of covering up the debate on nuclear power.

Prime Minister Shinzo Abe, who is also LDP president, and Banri Kaieda, head of the largest opposition Democratic Party of Japan, stumped in Fukushima Prefecture at the outset of campaigning Dec. 2 for the House of Representatives election. Kaieda denounced the Abe government for trying to restart idled nuclear reactors while Abe stressed the reconstruction efforts from the multiple disasters in 2011 but made no mention of nuclear power or energy issues.

In the absence of a clear-cut energy mix policy, electric power companies, confronted with aggravating financial conditions, are accelerating efforts to restart their idled nuclear reactors. Due to a shift to thermal power, their fuel costs rose by 3.6 trillion yen a year and the cumulative deficit by the nation's nine major utilities for the last three years since the Fukushima nuclear disaster surpassed 3 trillion yen. As electric power companies are raising prices one after another, an LDP executive warns the Japanese economy could be shaken to its foundations.

But it is not clear how many idled nuclear reactors would restart. The NRA began screening the safety of idled nuclear reactors in July last year but only two reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture cleared the hurdle.

While the government says it will approve restarting idled nuclear reactors after the NRA's clearance, NRA Chairman Shunichi Tanaka says he is not saying it is safe and would not commit to endorsing restarts.

Nagasaki University professor Tatsujiro Suzuki, a former acting chairman of the Japan Atomic Energy Commission, says that first of all there has to be debate on how much Japan should reduce nuclear power. He says the government is not serious about reducing Japan's dependence on nuclear power.

In July 2012, Japan launched a feed-in-tariff system which requires electric power companies to purchase electricity generated from renewable energy at fixed prices. But five electric power companies such as Tohoku and Kyushu suspended their purchases because only solar power increased.

Purchase prices for solar power were set much higher than those for wind power and other renewable energy, attracting massive applications. State-sanctioned solar power through August this year amounted to about 66 million kilowatts, accounting for more than 90 percent of all renewable energy.

The utilities say solar power alone sometimes tops each power district's overall demand and may lead to power failures. They appear to avoid an expansion of renewable energy due to rapid fluctuations of output and their ''poor quality,'' as compared to nuclear and thermal power.

In Europe, the share of renewable energy in relation to overall power generation in 2013 stood at 26.4 percent in Spain and 20.9 percent in Germany, as compared with 2.2 percent in Japan in fiscal 2013. Mika Obayashi, director of the Japan Renewable Energy Foundation, says it is urgent for Japan to reform the nation's electric power system to broadly accommodate excess power generation from renewable energy.

December 05, 2014(Mainichi Japan)

Japan's emissions record high in 2013

December 5, 2014

Thermal power reliance pushes Japan's greenhouse gas emissions to record high

http://ajw.asahi.com/article/sci_tech/environment/AJ201412050033

By DAISUKE SUDO/ Staff Writer

Japan's greenhouse gas emissions hit a record high in fiscal 2013, as the nation's reliance on thermal power generation increased in the absence of nuclear power, the Environment Ministry said.

The figure, equivalent to 1.395 billion tons of carbon dioxide, represents a rise of 1.6 percent over the previous year, according to the ministry's preliminary report released on Dec. 4.

"We must push ahead, root and branch, with energy saving and the introduction of renewable energy as much as possible," a ministry official said.

The ministry said more fossil fuels were burned to run thermal power plants needed to cover the shortfall in electricity produced by nuclear power plants. All nuclear reactors in Japan are currently offline in light of stricter safety standards introduced after the 2011 Fukushima nuclear accident.

The ministry's report showed that greenhouse gas emissions increased over the previous year in the industry and operational sectors, which cover factories, stores and offices. However, emissions in the transportation and household sectors were slightly down.

Although the government has set a target of reducing greenhouse gas emissions in fiscal 2020 by 3.8 percent from fiscal 2005 levels, the fiscal 2013 figure rose 1.3 percent from the fiscal 2005 levels.

The previous record for greenhouse gas emissions in Japan was set in fiscal 2007, with a carbon dioxide equivalent of 1.394 billion tons.

Emissions fell to 1.234 billion tons in fiscal 2009, but they have since continued to increase.

For a comparison purpose, the ministry also calculated fiscal 2013 emissions if average emissions per 1 kilowatt-hour of electricity generated remained on the same level as that in fiscal 2010, when dependence on thermal power plants was much lower.

It found that Japan's total emissions would have dropped by 147 million tons to 1.248 billion tons, a decrease of 9.4 percent from fiscal 2005 levels.

Trying to avoid turning nukes into election issue

December 12, 2014

2014 CHOICE: Ruling, main opposition camp stay cool toward nuclear issue despite heated public interest

http://ajw.asahi.com/article/behind_news/politics/AJ201412120052

THE ASAHI SHIMBUN

Although the public is strongly divided over the Abe administration's pro-nuclear stance, the main opposition camp along with the ruling party are avoiding turning it into a campaign issue for the Dec. 14 Lower House election.

On Dec. 11, in Satsuma-Sendai, Kagoshima Prefecture, which is home to Kyushu Electric Power Co.'s Sendai nuclear plant, Prime Minister Shinzo Abe briefly touched on the issue for the first time since campaigning began earlier in the month.

While Abe spoke of the Sendai reactors, expected to resume operations next year, he did not use the term "nuclear plant" in his speech.

"The cheap and stable supply of energy is essential to protecting the lives of the Japanese people," Abe said, emphasizing the significance of atomic power generation. "I really appreciate your providing electricity."

When the prime minister announced his decision to dissolve the Lower House on Nov. 18, Abe said he hoped to "have fruitful discussions" with opposition parties over atomic power policies.

However, the prime minister had never directly addressed the issue in more than 60 street speeches he's given for the Dec. 14 poll.

"It is not a good idea to make the issue a key point of contention, because many citizens oppose promoting nuclear power," a local lawmaker said.

In contrast to the pro-nuclear Abe, the main opposition Democratic Party of Japan pledges to phase out all nuclear plants in Japan by the 2030s in its campaign manifesto.

But DPJ leader Banri Kaieda has also avoided directly mentioning atomic power in street speeches, because his party is backed by electronics and electricity labor unions that support resuming operations of reactors.

There is also a disagreement within the DPJ membership about whether to restart reactors, which are currently all offline across the nation for safety inspections and other reasons. It appears to be another reason Kaieda is not willing to address the issue.

Minor opposition parties, however, are not shy about taking a public stand on the issue.

The Japan Innovation Party argues that reactors should not be restarted until it becomes clear when final disposal facilities for radioactive waste will likely be completed, while the Japanese Communist Party, the People's Life Party, the Social Democratic Party and the New Renaissance Party are opposed to resumption of operations at nuclear plants.

However, nuclear power has not become the main campaign issue even in Fukushima Prefecture, heavily impacted by the nuclear disaster triggered by the March 2011 Great East Japan Earthquake and tsunami.

LDP member Shinjiro Koizumi, who is a parliamentary secretary in charge of reconstruction from the 2011 disaster, visited Iwaki, Fukushima Prefecture, on Dec. 11.

"We will work to decommission all reactors in Fukushima Prefecture," Koizumi vowed in his speech in front of JR Iwaki Station.

But Masayoshi Yoshino, 66, an LDP member running for the Lower House from the Fukushima No. 5 constituency, did not mention the planned restart of reactors in a speech he delivered prior to Koizumi's.

As residents in six municipalities in the electoral district, which hosts Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, are not allowed to live in the area now, 60,000 people are currently forced to lead their lives elsewhere within and outside the prefecture.

While the Japanese Communist Party's candidate, Eisaku Yoshida, 55, campaigns on a platform of eliminating all reactors across the country as soon as possible, Yoshino and DPJ candidate Izumi Yoshida, 65, have not clarified their stances toward the issue of atomic power in their speeches.

The two have instead spent more time discussing economic policies while campaigning on the street.

The Fukushima prefectural branches of the LDP and the DPJ pledge in their campaign platforms that the parties will work toward the decommissioning of reactors within the prefecture after the Lower House poll. But both do not directly mention possible restarts of reactors outside Fukushima Prefecture.

Behind their passive stances toward the nuclear power issue is the fact that there are many employees of TEPCO and its partner companies in the constituency, so politicians generally avoid vigorously discussing it.
Azusa Fukushima, a 41-year-old DPJ city assembly member in Iwaki, said the trend in the national poll of avoiding a debate over nuclear power may accelerate the dimming of memories of the Fukushima nuclear crisis.
"I am sorry that the nuclear issue has not become the key point of contention, although most of the voters (in the electoral district) are feeling pain from it even now," Fukushima said.

Fukui and nuclear power

December 12, 2014

In Fukui, economy, reactors inseparable in election debate

http://www.japantimes.co.jp/news/2014/12/12/national/politics-diplomacy/in-fukui-economy-reactors-inseparable-in-election-debate/#.VIsgk3tpQW4

by Eric Johnston
Staff Writer
For most of Japan, especially its major cities, the issues of how effective Prime Minister Shinzo Abe and his ruling coalition's economic policies have been and whether to restart the nation's idled nuclear reactors are generally treated by politicians and the media as separate debates.
In Fukui, home to 13 of Japan's 48 operational reactors, the largest concentration in the nation, the two issues are intimately connected in a prefecture that is one of the most conservative in the country, and one where Abe's ruling Liberal Democratic Party dominates.
Under a redistricting change, this election marks the first time that the prefecture will have only two single-seat districts, down from three. Six candidates are running for a seat in the two districts.
But two local media polls put the LDP incumbents well ahead of challengers from the Democratic Party of Japan, Ishin no To (Japan Innovation Party) and the Japanese Communist Party.
The Fukui Shimbun and the Nikkan Kenmin Fukui Shimbun predict strong victories for the LDP's Tomomi Inada, 55, and Tsuyoshi Takagi, 58.A poll by the latter in early December showed 65.3 percent of respondents felt the overall economy was the most important campaign issue. Social welfare was the most important issue for 31.7 percent of the pollees. Twenty-four percent said nuclear power was most important and 20.2 percent said it was local economic revitalization.
Ultra-right LDP policy chief Inada, a close confidante of Abe, is seeking to keep her seat in the first district, which includes the city of Fukui. In the second district, where Fukui's 13 commercial nuclear reactors and the Monju experimental fast-breeder reactor are located, Takagi is seeking re-election.
Taku Yamamoto, who represented the old Fukui No. 2 district, is standing as an LDP proportional representative candidate. He is the husband of another close, far right-wing Abe friend, internal affairs minister Sanae Takaichi.

Those close connections to Abe and the LDP power structure are especially valued in Fukui, which faces particularly difficult social and economic choices in the years ahead. The central government is predicting that the prefecture's population, currently numbering about 790,000, will drop to 760,000 by 2020 and to only 633,000 by 2040.

"Social welfare policies, economic recovery, and bringing back younger people while taking care of older people are all issues on voters' minds. Compared to urban areas, however, it's probable that Fukui will see a higher voter turnout, due to concerns about these issues and the traditional ties that exist between the LDP and Fukui communities," said Akio Takezawa, a local LDP official. Each year, the prefecture estimates at least 2,000 younger residents leave Fukui for work or school, and in recent years, only about 20 percent of the latter have returned after graduation. Getting more to return has long been recognized as the key to economic recovery, but neither of the front-runners has offered much in the way of detailed strategies to achieve this goal.

Inada has offered only vague proposals to address the issue, urging creation of policies targeting young people that would lure them back to the prefecture in order to work, marry and raise families.

"In order to do this, we need policies to persuade Tokyo-based firms to relocate to Fukui and to bring their workers with them," she told supporters at a rally in early December.

For his part, Takagi is only slightly more specific.

"For example, one way to get younger people back would be to create public works projects designed to reduce or prevent natural disasters," he said in a campaign statement, also in early December.

Whoever represents Fukui in the Diet will be expected to push hard for central government approval and financial help to bring the Hokuriku Shinkansen Line to their prefecture as soon as possible. A new route connecting Kanazawa in neighboring Ishikawa Prefecture with Toyama, and then Nagano and Tokyo is expected to open in March. There are plans to extend the line to Tsuruga, in Fukui, by 2025.

But in recent weeks, discussions in the Diet and within Fukui business circles speculate that bullet trains could be running between Tokyo and Tsuruga as early as 2023 if the technical challenges can be overcome and adequate central government funding can be had.

That, in turn, has raised hope in the city of Fukui, which is closer to Kanazawa, that the Fukui-Tokyo section of the shinkansen line might even be ready by 2020, just in time to shuttle Fukui residents to the Tokyo Olympics.

Then there's nuclear power.

Fukui's pro-nuclear camp is pushing not merely for the restart of idled reactors, including those that are over 40 years old, but also for a national energy policy that spells out roughly what percentage of Japan's future electricity supplies should come from atomic power, instead of just accepting the current position that nuclear energy will be an important "base load" source.

Inada, as LDP policy chief, has signaled the Diet will answer this question by spring, although she wouldn't say if the answer will come before or after nationwide local elections.

Before 3/11, Japan had 54 reactors providing 28.6 percent of the nation's electricity. But Fukui's reactors generated just under half of Kansai Electric Power Co.'s electricity in fiscal 2010. Towns in Takagi's second district in particular have received billions of yen in subsidies for hosting the plants.

There is also the problem of aging reactors. Four of Fukui's 13 reactors are already 40 years old and another four are more than 35 years old. By 2030, only two reactors, the Oi plant's units 3 and 4, will be under 40 years.

Official plans still also call for two new Tsuruga reactors originally slated to start operating in 2017 and 2018, but their future is uncertain.

Both Inada and Takagi are facing pressure from Fukui Gov. Issei Nishikawa and senior prefectural corporate leaders in the pro-nuclear lobby who warn of local economic collapse unless the two candidates and their Diet allies formulate a clear plan of action, including economic assistance from Tokyo, for restarting those reactors that can be restarted and for decommissioning the oldest units.
While voters will be looking to elect candidates they believe will stand the best chance of dealing with these issues in the short term, it's the longer-term future that has most, regardless of political stance, worried.
"It's not clear that things are going to get better without fundamental changes, which I don't think any (one) politician can make," said Atsuko Kamado, a Fukui housewife who says she hasn't decided for whom to vote.

Will decommissioned reactors be replaced?

December 18, 2014

Draft hints at replacing decommissioned nuclear reactors with new ones

http://mainichi.jp/english/english/newsselect/news/20141218p2a00m0na011000c.html
A committee of the Ministry of Economy, Trade and Industry began work on Dec. 17 to include, in a midterm report on energy policy, the replacement of decommissioned nuclear reactors with new ones as an open option for future consideration.
The committee writes in a draft for the report, "If the vision of the future of nuclear power, including the replacement of power supply lost from reactor decommissioning, remains unclear, power companies and municipalities hosting nuclear plants will have a difficult time deciding to go through with decommissioning." The draft notes that "this needs to be kept in mind" in making future nuclear policy.
While avoiding direct language, the draft's mention of "replacement of power supply lost from reactor decommissioning" refers to building new nuclear reactors to replace those lost. Currently, the Nuclear Regulation Authority (NRA) is still evaluating a construction plan for restarting the No. 1 and No. 2 reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture, and a source says that, "With not a single reactor yet reactivated, the committee couldn't ignore the NRA and start using direct language (about building nuclear reactors)."
Prime Minister Shinzo Abe's administration has stated a goal of lowering Japan's dependence on nuclear power as much as possible. In order to do this, the administration is pushing for early decisions on whether to decommission seven reactors, such as the No. 1 and No. 2 reactors at the Mihama Nuclear Power Plant in Fukui Prefecture, which in July 2016 will pass 40 years since their activation.
Municipalities hosting those reactors, however, called for the construction of replacement reactors or new economic support because removing the reactors would end government funding they have received for hosting the facilities.
Chubu Electric Power Co. has a plan on hold for building a sixth reactor at its Hamaoka Nuclear Power Plant, where it decided in 2008 to decommission the No. 1 and No. 2 reactors. There were also plans to replace the No. 1 reactor at the Mihama Nuclear Power Plant and to build two new reactors at the Tsuruga Nuclear Power Plant that were being considered before the Fukushima nuclear disaster put them on hold.

If the government gives the OK for a policy of replacing decommissioned reactors, these plans are expected to resume.
Furthermore, by suddenly starting talks about replacing nuclear reactors with new ones right after a general election where the Abe administration avoided comment on the nuclear plant issue, the government could face criticism that it hid the issue during the election.

Is Gov't really planning to phase out nukes?

December 17, 2014

Editorial: Gov't should stick to its policy of phasing out nuclear power

http://mainichi.jp/english/english/perspectives/news/20141217p2a00m0na003000c.html

J-Power has filed with the Nuclear Regulation Authority (NRA) for a safety inspection of the Oma Nuclear Power Plant it is building in Oma, Aomori Prefecture, in preparation to begin its operations. The company is aiming to complete the construction of the power station in December 2020.
It is the first time that an application has been filed with the NRA for a safety inspection of a nuclear plant under construction. If approved, it can be operated for up to 40 years under the government's policy. However, if J-Power is to be allowed to operate the plant over such a long period, it would run counter to the government's policy of phasing out atomic power.
The government has promoted the nuclear fuel cycle project, in which all spent nuclear fuel is reprocessed and plutonium extracted from such fuel is used at atomic power stations.
The Oma plant will play a key part in the nuclear fuel cycle project since its reactors are the world's first commercial reactors that only use mixed-oxide (MOX) fuel of uranium and plutonium.
The construction of the plant started in May 2008 when then Prime Minister Yasuo Fukuda was in power. The work was suspended following the outbreak of the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant in March 2011, but was resumed in October 2012 under the administration of then Prime Minister Yoshihiko Noda. To meet the new safety standards set by the NRA, J-Power reviewed its estimation of the maximum shaking of a powerful earthquake that could hit the plant and the maximum height of tsunami waves. It will cost the company approximately 130 billion yen to take additional steps to protect the power station from such huge disasters.
However, experts have pointed out some problems involving MOX fuel reactors, such as the control rods function less efficiently in such reactors than conventional reactors.
NRA Chairman Shunichi Tanaka says, "We'll cautiously evaluate the safety of the Oma plant because **its MOX fuel reactors are unprecedented in the world.**" It is only natural for the NRA to strictly inspect the power station.
In the first place, the nuclear fuel cycle project itself faces various challenges from an aspect of technology, safety and costs.
The development of fast-breeder reactors to facilitate the efficient use of plutonium is deadlocked because the prototype reactor "Monju" has developed many problems and there was misconduct including a failure to inspect some of the reactor's devices. Japan Nuclear Fuel Ltd. has repeatedly postponed the start

of operations at its nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture, and the NRA is still conducting a safety inspection on the plant. It is more difficult to treat spent MOX fuel than conventional uranium fuel. If spent MOX fuel is to be reprocessed, a specialized plant would need to be built apart from the Rokkasho plant. However, little progress has been made on debate on the issue.
The Hakodate Municipal Government in Hokkaido, situated just across the Tsugaru Strait, has filed a lawsuit against J-Power and the national government, demanding that the construction of the plant be banned. Part of Hakodate falls within 30 kilometers from the Oma plant, and is therefore required to work out an evacuation plan to prepare for a serious accident at the power station. The municipal government insists that the ongoing construction of new nuclear power plants and the start of construction of planned atomic power stations be indefinitely suspended in order not to increase the number of nuclear reactors in Japan.
Hakodate's argument is based on reflection of the Fukushima nuclear crisis and is consistent with public opinion that is cautious about restarting idled nuclear reactors.
In the campaign for the Dec. 14 House of Representatives election, the ruling Liberal Democratic Party (LDP) pledged to reduce Japan's dependence on atomic power as much as possible, while its coalition partner Komeito promised to seek to completely eliminate nuclear power plants. Although it is necessary to give consideration to communities hosting atomic power stations that would be affected by a review of the government's plan on nuclear power, approval of the Oma Nuclear Power Plant apparently contradicts the ruling parties' respective pledges. The government's pledge to seek to cut down Japan's reliance on atomic power should not end up being an empty slogan.

Reconstruction of nuclear complex intolerable

December 25, 2014

Editorial: Moves to reconstruct nuclear power plants unacceptable

http://mainichi.jp/english/english/perspectives/news/20141222p2a00m0na013000c.html

An expert panel to the Ministry of Economy, Trade and Industry is poised to include the approval of rebuilding nuclear power plants in an interim file to be compiled later this year as one of the subjects to be considered. The move appears to signify the government's clear declaration that it is not pursuing a zero nuclear power policy.
After the Dec. 14 House of Representatives election, the Nuclear Regulation Authority (NRA) gave a de-facto stamp of approval to reactivation of the Takahama Nuclear Power Plant's No. 3 and No. 4 reactors in a safety screening. This is one of a series of moves leading to dependence on nuclear power. We cannot tolerate any moves that would promote a U-turn to nuclear power without any debate or seeking of public opinion.
The expert panel -- the Nuclear Energy Subcommittee under the ministry's Advisory Committee for Natural Resources and Energy -- is planning to include acceptance of nuclear plant reconstruction in its interim file by underscoring the need to ensure "the supply capacity to make up for the decommissioning of reactors."

It will be the first time for the government to spell out the need to rebuild nuclear plants since the outbreak of the Fukushima No. 1 Nuclear Power Plant disaster. Reconstruction of a nuclear power complex -- in which a new plant will be built while dilapidated reactors are decommissioned -- is essentially the same as building a new nuclear plant.

Legal revisions that came into effect after the Fukushima disaster have put a 40-year cap on the operational life of nuclear reactors. If no extension was allowed, the power generation capacity at nuclear plants across the country will be halved in 2030 before being reduced to zero in 2049. If rebuilding of nuclear plants is given approval, however, they will manage to persist well into the future.

In the basic energy plan approved by the Cabinet in April, Prime Minister Shinzo Abe's administration pledged to "lower the dependence on nuclear power as much as possible," while calling nuclear energy an "important base load power source." The possible move to approve nuclear plant reconstruction indicates that the administration's real intentions lie in a "U-turn to nuclear power dependence."

The existing nuclear plants boast a number of merits including cheaper fuel costs compared to thermal power plants, lower carbon dioxide emissions and stable energy security compared to oil and natural gas, the supply of which relies upon the politically unstable Middle East region. Realistically, it would be difficult to abolish all nuclear reactors immediately.

However, the "safety myth" that surrounded nuclear power before the Fukushima crisis has fallen apart and the danger posed by nuclear energy to people's lives remain. We have yet to find a place to dispose of spent nuclear fuel. The government should seek to abolish nuclear plants saddled with insurmountable problems at the earliest date possible. Approval of nuclear plant reconstruction, which runs counter to that ideal, should never be tolerated.

If nuclear plants are to be allowed to continue existing in the future, the country's efforts heretofore toward a breakaway from nuclear power reliance would be spoiled.

Major utilities including Kyushu Electric Power Co. and Hokkaido Electric Power Co. estimate that production of government-authorized renewable energy will go beyond their acceptance capacity. In order to expand that capacity, it is necessary to increase storage batteries and power transmission networks, but utilities would lose their motivation for taking such measures if reconstruction of nuclear plants is recognized.

After the Dec. 14 general election, Electric Power Development Co. (J-Power) applied for safety screenings at its Oma nuclear power plant, while the NRA approved the safety of the Takahama nuclear plant for its possible reactivation. Then comes the move to accept reconstruction of nuclear plants. This is not fair considering the fact that the ruling Liberal Democratic Party talked little about nuclear power in its campaigns leading up to the Dec. 14 election.

KEPCO's future should not depend on nuclear power

December 26, 2014

EDITORIAL: For a viable future, KEPCO must part with nuclear energy

http://ajw.asahi.com/article/views/editorial/AJ201412260035

Kansai Electric Power Co. on Dec. 24 applied to the industry ministry for permission to raise electricity rates again in April, citing unexpectedly higher fuel costs of thermal power generation.
The electric utility last raised its power charges in May 2013. This time, it plans to raise rates for households by 10 percent and charges for corporate customers by more than 13 percent.
Kansai Electric Power, or KEPCO as it is more commonly known, has expanded its output capacity by burning fossil fuels to compensate for the loss of nuclear power generation following the triple meltdown at the Fukushima No. 1 nuclear power plant in 2011.
Small and midsized companies in the region served by the utility have been screaming that they can't make any more cuts in their power consumption.
Exhaustive efforts for higher operational efficiency on the part of KEPCO are a basic premise for any rate hike.
The utility claims it has been striving to bolster cost efficiency in every aspect of its operations. But critics say KEPCO has fallen short in a number of areas, especially in regard to labor costs.
The government should evaluate rigorously the company's cost-cutting efforts before approving its rate hikes.
The primary factor behind the company's losses is the shutdown of the reactors at its nuclear power plants. Before the catastrophic accident in Fukushima Prefecture, KEPCO depended on nuclear power for about half of the electricity it generated.
When it raised power rates last year, the company was expecting that some of the reactors would be restarted before long. But that has not happened, forcing the company to apply for additional rate hikes.
Still, Makoto Yagi, the president of the power supplier, has repeatedly stated that he intends to seek to restart offline reactors as soon as possible. In our view, he is way too optimistic about the prospects for idled reactors.
The nuclear disaster raised serious doubts in the public's mind about the safety of nuclear power generation. Although it is spending heavily to ensure the safety of its nuclear facilities, KEPCO still faces a formidable challenge in trying to win approval from the Nuclear Regulation Authority and public support for bringing its reactors back online.
Nine of the 11 nuclear reactors operated by the utility will have been in service for more than three decades by the end of next year.
Replacing these aged reactors with new ones or building new reactors will be an enormous challenge.
The company's future will remain bleak as long as it continues to rely heavily on atomic energy for power generation.
